§ 1.

INTRODUCTION.

It is a somewhat onerous task to write about exotic music, when one has not heard and felt it in its appropriate surroundings. The tissue of factors, which create the peculiar atmosphere: the devotion and concentration of the musicians, the contact between the performers and the audience, the native conditions, the influence of the hour and the season — these cannot be recreated, when listening to records taken by another person. For the phonograph, however excellent, and even indispensible a medium, only reproduces the sounds correctly, — and undoubtedly, this is the most important factor, when one is conducting musical investigations, — but it cannot reproduce the invaluable, intangible, psychic atmosphere, which surrounds this music, when heard on its "native heath".

Nevertheless I felt bound to comply with Mr. Le Roux’s request, to make a study, as complete as lay in my power, of the melodies and phonograms he had brought back from New Guinea, because I am convinced of the great interest of such investigations, and also, because I knew, that anybody else, when undertaking this task, would be faced with the same difficulties.
The making and analysing of this kind of records cannot be done quickly and minutely enough. Von Hornbostel very rightly says: "The few thousand phonographic records hitherto collected in museums and archives are only a beginning; they are haphazard fragments, instead of giving a general view. What we need above all is to register systematically the musical material of all peoples of the world by means of the phonograph". And what this musicologist says in the same paper about African music, might be said with equal justice of the music of a large part of the East Indian Archipelago, and of the South Sea Islands: "It is ...... to be feared, that the modern efforts to protect culture are coming too late. As yet we hardly know what African music is. If we do not hasten to collect it systematically and to record it by means of the phonograph, we shall not even learn what it was"

When studying the literature about New Guinea, one cannot help being struck by the fact, that there are almost as many opinions about the descent and the ethnic composition of the Papuans, as there are ethnologists, who have faced these problems. On
one point, however, there seems to be perfect agreement, viz. that the population of this huge island is not unmixed, or even homogeneous in its component parts, but that these hundreds of larger and smaller tribes possess, in different mixtures, the elements of various races, and that different strata of culture are to be found here, superimposed the one upon the other.

The music of these regions seems to confirm that heterogeneous character fully. The study of this object, nevertheless, has not yet shed much light on this chaos. The investigations are still too few, the insufficiently, or even still entirely unexplored territories still too large, to expect musicology to be, as yet, of great assistance in solving the riddle of the Papuans, — if it will ever be possible to find a way out of this ethnological labyrinth 4).

Still, I venture to suggest, that, from what little musical material the various expeditions have brought back from this part of the world (and that generally as a mere "by-product" 5), valuable indications may be obtained. The expedition of 1926, thanks to

4) Much interest may be felt in the results of the analysis of Papuan phonograms, now being conducted at the Berlin Phonogram Archives by Dr. Kolinski.

5) It was impossible for me to consult the whole of the New Guinea literature, as only the library of the Royal Batavia Society, which however contains a splendid collection of books on this subject, was available for me.
Mr. Le Roux, certainly has amply done its part in furthering our object, as will be shown hereafter.

Even after a superficial study of the musical material, collected by Mr. Le Roux during the expedition, one arrives at the conclusion, that it may rationally be divided into two parts: on the one hand the music of the Kauwerawet from the Van Rees Mountains, and on the other the music of the pygmyoid tribes from the Central Mountains. This division is based, not so much on the locality, as on the great difference in character of these musical effusions. There is no more convincing proof of the fact, that up to the present day there are in New Guinea several kinds of music existing side by side, which cannot be explained or looked upon as successive phases of development, than a comparison between these two groups of melodies just mentioned, or, to put it in a more general way: the comparison between these two melodic groups proves, that more than one civilization has made its influence felt in the cultural development of the Papuans.

Involuntarily one imagines a more or less original

---

6) This paper was nearly finished before the publication of Sachs's "Geist und Werden der Musikinstrumente". After reading this masterly monograph I have brought some modifications in my instrumental divisions, so that they may better compared with those of Sachs. I therefore subdivided originally undivided instrumental groups into more narrowly circumscribed groups, f.i. the panpipes into "raft"-pipes and "bundle"-pipes; the trumpets and shellconchs into instruments with a lateral blowing-hole, and those with a blowing-hole at the apex. Finally, in the index for the distribution map, each instrumental form has been given, as far as possible, the number of the cultural stratum to which it has been assigned by Sachs.
population, which has retreated into its mountain fastnesses, driven back by another more civilized and stronger race from overseas. However, before following up this train of thought, it is better to examine the melodies brought by the 1926 expedition, and to compare them, as far as possible, with the material already published.
§ 2

THE MUSIC OF THE KAUWERAWET.

A. Vocal Music.

The Kauwerawet (Takoetamesso)-melodies recorded, at least the vocal ones, were executed by four different persons, called respectively: Jacob (phon. I), Komaha or Komasa (phon. II, III, IV, and XVI), Bidjowa or Pidjowa (phon. V, VI and VII) and Basakara (phon. XVI); phon. VIII was sung in unison by the four together.

The records at our disposal — photograph nr. I gives a picture of the actual taking of the records — only contain three different tunes. As a result of this fortunate circumstance, we have more than one record of each of them. We have a record of melody α (phon. I, II, III and VI), sung respectively by Jacob, Komasa — who sang it twice, on different occasions — and Pidjowa; melody β (phon. V, VII and VIII) sung respectively by Pidjowa — twice, on different occasions — and by the four together; melody γ (phon. IV and XVI) respectively by Komasa, and by him and Basakara together.

These three tunes are all very short, so that they could be taken several times on one wax cylinder, every time with a different text. This text may be
called strophical, but the metre is rather free; the number of syllables in one line varies considerably\(^7\)), and naturally this affects the rhythm of the melody.

These factors made it possible to determine, which parts of these melodies should be considered as essential, and which parts as variable.

In most cases it was possible to fix the height of the tones sung quite definitely. Of course this applies in the first place to those tones that may be considered as principal tones: in melody \(\beta\) these are the key-note (if we may call it that), its lower fourth and its lower octave; in melody \(\gamma\) four of the five tones used. Of the remaining tones of these two melodies the intonation was not quite constant, and could only be determined approximately. They have been put between brackets in the table of measurements below. In one case only (phon. IV) it proved to be impossible for one of the tones (which occurs only very occasionally and unstressed) to determine the number of vibrations.

In melody \(\alpha\) all the tones were easily measurable.

The performance of this melody \(\alpha\), and occasionally also of melody \(\beta\), is interwoven with birds' voices. Especially Komasa is an expert in this respect; more or less sweet twitterings alternate with highly realistic turkey-like gobblings and the quacking of ducks.

Van der Sande\(^8\)) writes about the playing of the sacred flutes of Nacheibe (N. E. Neth. New Guinea),

---

\(^7\) Compare Le Roux ps. 507/8.
\(^8\) N. G. III p. 296.
that the players often imitate the voices of certain birds\(^9\). From this he concludes, that perhaps these birds play a certain part in the religious ideas. It is therefore possible, that the occurrence of similar sounds also in the *singing* of these tribes finds its origin in their religion. \(\text{Pulle}^{10}\) records of the Pesechem, who inhabit the southern slopes of the Central Mountains in the neighbourhood of the Wilhelmina top, that they also weave into their songs the voices of animals by way of musical ornament. According to the verbal statements of Mr. Le Roux, the tribes, he visited in the Nassau Range, symbolize consciously certain animals by means of their Jew’s harp, and this is not always done, as one would be inclined to suppose, by imitating the call or the cry of the animal in question, but also by producing other sounds, which, to the uninitiated ear, seem to have no connection with the animal at all.

To the ear and eye, trained to European melody, the most remarkable characteristic of these tunes is, beside theirs shortness, their tendency to descend the scale. This is a common trait in primitive melody\(^{11}\). Henceforth it will be styled in this article as "tiled" music.

---

9) See further p. 23.
11) "In purely melodic songs certain natural traits have maintained themselves which in our harmonic music have been superimposed upon or supplanted by other traits. They are "natural", i.e. rooted in the psychophysical constitution of man, and can therefore be found all over the world. The natural motion of melody is downward; like breathing or striking, from tension to rest." (Von Hornbostel V p. 7).
The type of this Kauwerawet music is "Australian". Similar melodies are met with, besides in Australia, on the islands of Torres Straits\(^{12}\)), and in British New Guinea among the tribes of Beagle Bay\(^{13}\)). After the style with narrow intervals of the Wedda and of some of the tribes of Terra del Fuego, it is undoubtedly the most primitive known up to the present day\(^ {14}\).

The rhythmic forms are simple. As a rule one hears every time some tones of small values, followed by a longdrawn note, generally a lower one. It depends upon the text, whether there appear 16th figures or quintoles or trioles. The frequent use of the latter, as shown in melodies \(\beta\) and \(\gamma\), has already been observed in other parts of the Papuan territories, viz. by Williams for the Orakaiva (Brit. New Guinea)\(^ {15}\), by Myers for the islands in Torres Straits\(^ {16}\), by Van der Sande for the inhabitants of Humboldt Bay\(^ {17}\), and by JongeJans for those of the Central Mountains\(^ {18}\). I myself heard 6/8 figures and trioles in the songs of the inhabitants of Humboldt Bay and Japen at the Ethnographical Exhibition at Weltevreden in May 1929.

---

12) Myers passim.
13) Statement by Prof. Von Hornbostel.
14) For a sketch of the development of melody, see Von Hornbostel III and Lachmann; here we find collected typical examples of successive stages of development.
16) C. A. E. ps 244/7 and 262/3.
17) N. G. III p. 309 (as a figure of the drum-accompaniment to the dance).
18) See hereafter p. 25.
However, this use of the ternary rhythm is not a peculiarity which distinguishes the Papuan music from that of the adjacent races, for it seems, that trioles are also very common in the music of the Queensland natives \(^{19}\), and they are not at all rare in Melanesian \(^{20}\) and Indonesian \(^{21}\) melody.

Before reproducing and analysing the melodies recorded, I want to say a few words about the material qualities of the records themselves. They are fairly plain, as regards the sound; as for rhythm, they present some difficulties, because occasionally they ‘‘derail’’ (a result of being played too often before being copied) and a few of them (probably because the gramophone was not quite steady during the making of the record) show an inclination to have a rhythm of their own. These obstacles could only be obviated by hearing the records very often and by comparing all the records at our disposal.

**Melody \(\alpha\)** (Table I).

The form recorded here seems the most usual. Sometimes small non-essential rhythmical changes occur, especially in the second part of the melody;

---

\(^{19}\) "Globus" LVI p. 123; Von Homborstel III p. 21.

\(^{20}\) Eberlein ps. 641/2; Von Homborstel II bicz. 492 and examples of melody Nos. 4, 6, 30 and 31.

\(^{21}\) In Javanese orchestral music they are heard especially in the gambang-kayu paraphrases. — For trioles of different values in Sundanese music see Kunst I Bijl. I and II. There in West-Java they are also found in many gamelan-Degung melodies. — On the island Nias the 6/8 time predominates generally in the songs and in the doli-doli and druri-dana-melodies. — The same must be said with regard to the tunes of some Florinese tribes.
they are the result of irregularities in the text. Schematically the melodic structure may be represented by:

![Musical notation](image)

The measuring of the scale tones resulted in:

**phon. I**  
(Jacob)

![Musical notation](image)

**phon. II**  
(Komasa)

![Musical notation](image)

**phon. III**  
(Komasa)

![Musical notation](image)

**phon. IV**  
(Bijdowa)

![Musical notation](image)

Jacob and Komasa take the lower octave-tone slightly flat. Bidjowa — of the four singers evidently the one endowed with the best ear (and, in my opinion, also with the best voice) — takes that tone perfectly true.
When we look for the average of the intervals, as sung, we find for the four phonograms:

I 275 3/4 II 303 1/4 III 195 1/2 IV 449 1/2 I₁,
and if we make the true octave, as undoubtedly it was meant to do, close the series, we get for the interval IV — I₁ : 425 1/2 C.

If we omit phon. III, where Komasa seems rather below his usual form, the averages are:

I 284 2/3 II 309 2/3 III 196 2/3 IV 429 1/3 I₁,
and with the correction of the octave: IV 409 I₁.

Without doing violence to this scale, we may therefore represent it as:

The compass of the melody is one octave.

Melody β, Entje Mararieo ²²) (Table I).

This melody is rendered with a number of non-essential variations, caused by the text. Schematically it may be represented by:

²²) Le Roux ps. 507/8. The text tells of a bird-hunter, Entje, who came across the sea and was murdered in the interior on account of some love-affair.
As already mentioned, there are 3 phonograms of this melody. Measurements show, that the following scales have been used:

phon. V (Biedjowa)

\[ \begin{align*}
\text{VI} & \quad 258 & \text{II} & \quad 310 & \text{III} & \quad 373 & \text{IV} & \quad 443 & \text{V} & \quad 584 & \text{VI} & \quad 84 & \text{V} & \quad 201 & \text{VI} & \quad 157 & \text{V} & \quad 185.5 & \text{I} & \quad 160
\end{align*} \]

phon. VII (Biedjowa)

\[ \begin{align*}
\text{VI} & \quad 307 & \text{II} & \quad 374 & \text{III} & \quad 445 & \text{IV} & \quad 511 & \text{V} & \quad 82 & \text{VI} & \quad 130 & \text{I} & \quad 160
\end{align*} \]

phon. VIII (chorus)

\[ \begin{align*}
\text{VI} & \quad 204 & \text{II} & \quad 374 & \text{III} & \quad 445 & \text{IV} & \quad 511 & \text{V} & \quad 82 & \text{VI} & \quad 130 & \text{I} & \quad 160
\end{align*} \]

In these phonograms we find an almost pure fourth and fifth, and in phon. VII we find them even quite true (resp. 498 and 702 C.). This is also the case with the octave in all three phonograms.

The average of the intervals sung are:

I 303 II 192 1/3 III 217 1/3 IV 101 V 174 2/3 VI 211 2/3 I₁.

So we may represent the scale in European notation as follows:

\[ \begin{align*}
\text{I} & \quad 100 & \text{II} & \quad 200 & \text{III} & \quad 300 & \text{IV} & \quad 200 & \text{V} & \quad 500 & \text{VI} & \quad 200 & \text{I}
\end{align*} \]
The compass of this melody does not exceed one
none.

We may mention about phon. VIII, that the melody is started every time by one singer; at K the others join in. The four performers do not sing quite true, when singing in unison, and also their rhythm is rather jagged: according to our western ideas the performance is rather "untidy"$^{23}$), as well from a melodic, as from a rhythmic point of view. Only the long-drawn notes are sung with a touching uniformity.

This peculiarity is a well-known characteristic of primitive music. The framework of the fourths and fifths is at a certain stage filled in with one or two tones, the intonation of which is of minor importance$^{24}$).

23) "Jeder singt, wie ihm der Schnabel gewachsen ist, ohne Rück-
sicht auf die Genauigkeit". (Schmidt-Ernstaussen p. 269).
24) Compare Von Hornbostel VI ps. 7/9. — Prof. Von Horn-
bostel kindly sent me some written observations — bearing on the present article, of which I sent him a copy — among which the following on the manner in which the distance between two "Gerüsttöne" (framework-tones) — in this case a fourth or a fifth — is bridged over:
"Die einfachen Intervallverhältnisse, in denen ein größeres Intervall durch einen unbetonten Zwischenton beim natürlichen Singen geteilt wird, sind Glieder der Reihe 12 : 12 : 7 : 5 : 2, d.h., die Centszahlen der Teilintervalle verhalten sich, ganz gleichgültig wie die absolute Grösse der Intervalle ist, so, wie im Maassstab der konsontanten Intervalle Oktave—Oktave—Quint—Quart—Ganzton. Durch die Kons-
onanz eben wird unter den (kontinuierlich variablen, daher unendlich vielen) Distanzsystemen (absoluten Größen) eines ausgezeichnet. Die Intervalle dieses ausgezeichneten Systems sind gegeben durch die Verhältnisreihe der Schwingungszahlen 1 : 2 : 4 : 6 : 8 : 9, die Inter-

Das Gesetz bestätigt sich auch an Ihren Messungen, in manchen Fällen sehr genau, so bei den Quartteilungen nach 5 : 7.
**Melody 7 (Table I).**

Of this melody also some variations have been recorded. A scheme of its structure is as follows:

Measuring the phonograms gave the following results:

The average of the intervals sung comes to:

---

**Note 24 (continued).**

| Phon. IV | gemessen 216 | + 299 | = 515 |
| berechnet 215 | + 301 | = 516 |
| Phon. XVI | gem. 288 | + 206 | = 494 |
| ber. 288 | + 206 | = 494 |
| Phon. VII | gem. 281 | + 217 | = 498 |
| ber. 290 1/4 | + 207 1/4 | = 498 |

Die ersten beiden Beispiele zeigen, wie bei verschiedener, von der reinen abweichender Grösse der Quart, die Teilungsproportion doch erhalten bleibt. Freilich ist in diesen Fällen auch das eine Teilintervall konsonant (204), sie sind also nicht beweisend für das Distanzgesetz. Dieses erklärt aber die Teilung nach 1 : 1 in

| Phon. V | gemessen 241 | + 238 | = 479 |
| berechnet 239 1/4 | + 239 1/4 | = 479 |

und die Teilung nach 5 : 2 in

| Phon. VIII | gem. 354 | + 158 | = 512 |
| ber. 365 | + 146 | = 511 *** |
I 177½  II 293½  IV 204  V, so that — and this especially as regards phon. IV — the scale (after transposition to C) may be rendered by:

The compass of the melody, on phon. IV almost a pure fifth (717, instead of 702 C.), is much smaller on phon. XVI. Still, even then, the melody gives the impression of extending over a full fifth.

B. Flute Music.

From the whole of New Guinea we know a great many kinds of flutes 25), but from the North coast of Neth. New Guinea we have only two types of which it is stated, that they are generally used. (A small signal flute, found in Witriwai and Humbolt Bay 26),

25) See map.
26) Schmeltz V p. 243; Mus. Bat. Soc. No. 18059a; Van der Sande pl. XXIX figs. 4 and 5. Practically it is superfluous to mention these small signal flutes as a separate type; technically they are exactly the same as the longer flutes, which are blown at the upper end, and from which they are only distinguished by their shorter length, which varies from 6—8 cm., the long sacred flutes being sometimes as long as 1.70 m. Moreover there are a number of transitional forms, which nearly fill in the gap between the two extremes. For the sake of expediency these latter forms have been classed with the group of long flutes (on the map represented by the symbolidentalx).
and another flute, open at the upper extremity and semi-closed at the bottom with a pierced nodium, used by the Sabère (east of the Apauwar river), are mentioned for the above regions only.

The two forms, generally used, of the Northcoast are described very minutely by Van der Sande. One of them, which is known in a number of sizes, is thin in proportion to its length and is blown from the upper end (pl. XII, figs. 48—50). The lower extremity is closed by a nodium (the flute is "covered"). Consequently only the uneven aliquot-tones can be produced, besides the principal tone.

The other type, which also occurs in different varieties (figs. 38—46), is proportionally wider and shorter. This type is also closed at one extremity, but occasionally it has in the centre, as a rule however nearer to the closed end than to the open one — although this occur in very rare cases — a lateral (round, oval or square) hole, so that here the even aliquot-tones could also be produced, but for the fact, that the great diameter of the tube seems to preclude the production of more than one single tone. These short, thick flutes are much easier to play, than the long thin ones. These latter are so difficult to

29) Compare Wirz I p. 75 note 55; V p. 331 a. f.
30) However, this does not always seem to be the theoretical groundtone. Van der Sande (ps. 313/4) at any rate, gives in most cases a second tone, besides the groundtone.
31) Comp. Joseph Schmidt II ps. 53 and 56. He mentions two kinds of flutes of the Nor-Papuans, on the reef-islands off Dallmann-
handle, that no European player can draw a tone from them. My own efforts ended in ignominious failure. Only sturdy, broad-chested Papuans, in the prime of life, are able to do so. And Van der Sande 32) tells us, that the blowing of these sacred instruments is so exhausting an exercise, that they can only keep it up for a short time and even then the performers are covered with perspiration from the exertion 33): "I have seldom seen a Papuan exerting himself more, than in producing this sacred music". (Evidently the French "sacré" has not got its double meaning for nothing.)

About the position of the body, and the proper movements for playing, details have been given elsewhere 34), and also about the meaning in social life of these instruments, which no woman must ever behold.

Of the five flute-records, which are numbered XI—XV inclusive, the numbers XI, XII (first and third fragment), XIII, XIV (first fragment) and XV show great similarity; they were taken from performances by the same players, using the same set of instruments. These latter belong to the long narrow type. The middle part of phon. XII, and also phon. XIV (second and third fragment) bear another char-

---

Note 31 (continued).

hafen: one short kind, styled female, which is easy to play, and a long type, styled male, the playing of which is very difficult.

33) Comp. also Bink p. 34, and Koning p. 11.
34) Compare Wraz I ps. 66/8, and V p. 333.
acter, not only as regards the tunes, but — partly at least — also as regards the nature of the instruments, among which are a few flutes of the short thick type with lateral blowing-hole.

The tones of this music have been measured as carefully and accurately as possible, with the intention of determining, which series of aliquot-tones are used. However, this effort failed, one of the reasons of this failure being the untheoretical height of these aliquot-tones. This discrepancy is mentioned already in Van der Sande's report 35).

Already for the first of the flutes, described by him, the author gives for instance C sharp as groundtone; as its harmonics, however, A, c and e. This statement refers to a "covered" flute, so that in this case only uneven part-tones are to be considered. When starting from C sharp as groundtone, we find,
\[
g \text{ sharp } e' \text{ sharp } b' \text{ sharp } d'' \text{ sharp } g''
\]
however, \[
\frac{3}{5} \frac{7}{9} \frac{9}{11}
\]
Now ought we to look upon A, c and e as — too low — 7th, 9th, and 11th part-tones? Or should we accept the possibility, advanced by prof. Von Hornbostel, that the groundtone is not C sharp, but D, so that A, c and e might be taken as 3rd, 7th and 9th part tone? But then, how are we to reconcile the one and the other to Van der Sande's remark, that the blowing is done with so much force, that the 2nd or 3rd harmonic dominates the groundtone? This seems to indicate, that there is no question of sounding the

higher part-tones. (We must, however, remember, that the instruments are "covered", so that the words 2nd and 3rd part-tones are to be understood as 2nd and 3rd of the uneven series, which means part-tones 3 and 5 from the theoretically complete series.)

We may take it, that, partly at least, the solution of these incongruities must be found in the manner of blowing. The performer on such a long thin flute does not touch the instrument with his lips; he holds the upper extremity of the flute with both hands, laying the thumbs along the cheeks, and he blows into his hands in the direction of the mouth-piece 36). Practically the column of air, set vibrating by the blowing, is lengthened by an irregular piece formed by the hands of the player.

However this may be, the series of tones, occurring in these five phonograms, appear to be of a fairly irregular composition.

It is not worth while to make a score of this flute-music. The instruments are generally blown in a regular rhythm, let us say, crotchets or quavers; the tones are alternately stressed and unstressed:

\[ \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \]

36) ibid. p. 295 and plates 189, 191 and 192; Lorentz ps. 152 and 153; Koning p. 11: "The performer takes the mouthpiece of the flute between the balls of the hands, the thumb pointing upwards, and puts the instrument to his mouth in this manner". — Le Roux p. 484: "The flute is not put into the mouth, but the breath is blown through the tightly closed hands into the opening of the bamboo. Both thumbs are laid along the cheeks". — See also Winz I p. 66.
Phonograms XI, XII (first and third fragment), XIV (first fragment) and XV.

The tones produced are the following:

\[
\begin{array}{ccccccc}
\text{I} & 464 & 435 & \text{II} & 394 & 362 & \text{III} & 319 \\
\text{IV} & 265 & \text{V} & 968
\end{array}
\]

In phon. XI, however, it is impossible to fix the height of the tone IV with certainty, because of its transient character (it seems a trifle higher than is stated here), and tone V is missing altogether. Tone III is also very vague. Tone I and II predominate, especially the latter.

At one moment one gets the impression, that tones II and III are produced by the same instrument; at another one imagines, that III, IV, and V belong together. But at least one of these suppositions must be wrong, unless one assumes, that both flutes, the records of which we have here, produce a perfectly similar tone III; and this is hardly possible. The other supposition, that in this phonogram we have the record of only one instrument, must be rejected, as it is customary always to play two flutes at the same time; moreover, Mr. Le Roux assured us, that the phonograms were taken from two instruments.
The development of this record XI is the same as that of phon. XII (first and third fragment).

This starts in slow times, on tone I, blown very softly. Then tones II and III are heard. The time has gradually become normal, viz. about 60 tones per minute\(^{37}\), and the sound strong up to ff. Then follows a swifter part of about 120 tones per minute. Here only tones III, IV, and V are used. Then there is a return to the original time and to the softly breathed tone I and the loud II with its satellite III. Strong crescendo. Again the swift second part with the higher tones and then again a return to the first part at the "normal" time.

Phon. XIII has apparently the same development as phons. XI and XII (first and third fragment), but in places it is not very clear. We may say the same of the beginning of phons. XIV and XV. About the latter record it may be mentioned, that tone II (sounding raw and harsh) predominates and is sometimes intoned a little higher than in the earlier records.

The middle part of phon. XII bears an entirely different character. The four tones of which it is composed have a sweet, soft, organ-like sound, and because they happen to form a, rather true, chord, viz. four tones of a none-chord, which sounds fami-

\(^{37}\) Compare also Winz I p. 67.
liar to Western ears, this part seems quite pleasant to a European:

\[ \text{\begin{music}
\begin{Staff}
\StaffNote {1}{370}
\StaffNote {2}{394}
\StaffNote {3}{410}
\StaffNote {4}{456}
\StaffNote {5}{570}
\StaffNote {6}{459}
\StaffNote {7}{1128}
\end{Staff}
\end{music} } \]

The time is also about 60 tones per minute.

To conclude with, we have record XIV. In this phonogram we can distinguish two other parts besides the first short fragment, of which we spoke above. At first there is a sort of soft, indefinable tangle of sounds, a melodious whispering, in the higher tones, played very swiftly (time approximately 240 tones per minute). After that a plaintive movement, repeated several times (bird-voices?)\(^{38}\), beginning in a time of 148 tones per minute, more or less, increasing to about 196 tones p.m. and then slowing down again to 148 tones p.m. Its "tune" is:

\[ \text{\begin{music}
\begin{Staff}
\StaffNote {1}{1058}
\StaffNote {2}{1016}
\StaffNote {3}{780}
\StaffNote {4}{644}
\StaffNote {5}{294}
\StaffNote {6}{596}
\end{Staff}
\end{music} } \]

Mr. Le Roux tells us, that, as far as he recollects, these four notes were produced on four different flutes, viz. two long ones and two short ones.

\(^{38}\) See before p. 7/8.
§ 3.

THE TRIBES OF THE NASSAU RANGE
(CENTRAL MOUNTAINS)

Although, as the crow flies, not more than 150 km. distant from the tribes of the Van Rees Mountains, and less than 50 km. from the tribes inhabiting the lake-plateau, who also know the sacred flutes mentioned before, the Papuans of the Nassau-Range, though they keep up bartering intercourse with those other tribes 39), know no other musical instrument than the jew's harp (which seems to be found all over New-Guinea) 40). But, what is still more remarkable, is the fact, that, as has been said in the introduction to this sketch, they possess, side by side with melodies of a most primitive character, much more elaborate melodies of an entirely different nature.

Jongejans 41) has already given us some details about the singing of the Uringup, who inhabit the Swart Valley. These details, to which a number of his own observations are added, may be found again in Wirz 42).

40) See the map. Compare also Wirz II p. 120.  
41) Jongejans p. 604.  
42) Wirz II p. 113 a.f.
The greater part of the melodic phrases, hitherto collected, are of that very primitive type, and their compass does not exceed a fourth, as a rule. They seem to remind us of our own nursery rhymes and ditties. As examples Wirz gives:

and a fourth, taken from Jongejeans:

But Jongejeans noted down still another fragment, which is entirely different from all the others:

If we did not know any better, we might take it for a military signal. And this impression is strengthened by a number of melodies and fragments of melodies, which Mr. Le Roux and his assistant Mohammed Saleh brought back from the Awèmbiak and Dèm tribes, who are closely related to the Uri-

---

43) This melody is sung by a chorus, against which the "precentor" sings a continuous cece.
44) The bars, placed after each group of three notes, were put by me; the author did not place them himself, but left a space.
ngup. It is a pity, that these melodies could not be recorded on wax cylinders, but only by ear: through particular circumstances, about which Mr. Le Roux is sure to give some details in his report (which is to be published shortly), the phonographic apparatus was not included in the luggage, taken on the excursion to the central mountains. As a result of this omission we have to be content to work on second hand data. Luckily the excursion lasted long enough for the participants to learn to sing, without mistakes, the fairly simple songs of these mountain tribes, and to commit them to memory. But it is a well-known fact, that there is always a strong tendency "to correct" strange or unusual intervals and to put them in concordance with well-known intervals of one's own musical system, when there is only the musical memory to guide one.\footnote{Compare Von Hornbostel VI ps. 5 and 6.}

If we had no other data about the music of the Central tribes, there would be every reason to regard these melodies, at any rate as regards details, with a certain amount of distrust. However, since music of a very similar nature has been recorded, not only from these regions, but also from elsewhere in New Guinea and the adjacent countries, it is possible to test this music, by comparison with what had already been observed by others, and (partly) described at the hand of phonograms, — although the new material, on account of its \textit{vitium originis}, is not fitted for the demonstration of eventual peculiar
characteristics, by which this music should distinguish itself from that of those other regions. In short: the new material is to be trusted in so far as it is congruent with other Papuan music, but it deserves a certain amount of distrust, in so far as it shows characteristics, unknown from elsewhere.

If the musical data, brought back by Mr. Le Roux from the Nassau Range, do not enable us therefore to arrive at definite conclusions, they undoubtedly contain some very useful suggestions as to the direction in which further investigations should be continued.

The melodies, which could be noted down from Mr. Le Roux's singing and whistling, on his return to Weltevreden, and from the violin performance of his assistant (both performances bearing each other out in details), are to be found in the Table II, hereafter.

What is the origin of this "fanfared", this "flourished triad"-music?

Our ignorance of the music of the adjacent tribes is the great obstacle in the way of solving this problem. Our failure in finding relationship in a certain direction would be by no means conclusive evidence that this relationship does not exist. But the few melodies and fragments of melodies, and the other rather meagre information we have been able to collect from the Northern regions, do not seem to point to the probability of finding any closely related music in those parts.
Neither is this to be expected from the Western districts, which, like the Western part of the North-coast, is fairly strongly under Malay influence 46).

As regards the North I had at my disposal some observations made by Van der Sande, and the melodies of the Sarmi people (near Humboldt Bay), published by Lieutenant Gjellerup, A.M.G. 47).

The latter are unmistakably partly of the "tiled" type, and therefore "Australian", f.i.:

\[\text{Music notation}^2\]

46) Encyclopaedie van Ned.-Indië, vol. II ps. 834/5. In connection with this are mentioned the island Misool together with the islands and the coast east of Cape d'Urville. This should certainly be west of that Cape, firstly because the only islands of any importance lie west of it, and secondly, because the influence of Tidore, which is meant here, could not very well be felt on the east side without showing itself on the west side in a much higher degree. The Encyclopaedia mentions from these regions the following instruments: rebab, rebana (= terbang), gong, and tifa (the Malay drum). Valentijn mentions just the same instruments (vol. I ps. 151/2, 155, 156, 160) as characteristic of the Moluccos, and especially of Ternate and Tidore. — The cylindrical drums (viz. pl. VI fig. 20 hereafter) of the coast districts west of Cape d'Urville, also show the Malay influence very distinctly in the way the skin is fastened. See further the map.

According to Prof. Von Hornbostel some of the phonograms from Misool, taken by TAUERN and transcribed by Henzog, and which are now in the Phonogram Archives in Berlin, also distinctly show Malay influence.

47) Gjellerup II ps. 42, 43, 48, 49, and 50.
The examples given are at the same time specimens of "triad"-melodies, however without being "fanfared".

A single one goes a little further on the way to that "fanfared" music:

\[\text{[Musical notation]}\]

Others of Gjellerup's melodies seem to betray Malay influences, like the following, rather melancholy, but melodious little song:

\[\text{[Musical notation]}\]

However, it would be too risky to draw conclusions from this material in view of the way in which the reproduction was obtained, viz. "Lieutenant Kruyt was kind enough to note down the melodies as well as he could under the circumstances. We are also indebted to Mr. Bouvy for further elaborating (sic!) the material provided by Mr. Kruyt." Grateful as we are for the trouble these gentlemen took for us, it is plain, that a notation, produced in the way mentioned, does not constitute a very trustworthy basis for a hypothesis.

Then there are the data about the Kauwerawët, given in the preceding pages.
Finally, at the Ethnographical Exhibition at Weltevreden in 1929 I had the opportunity of making records of the songs of various tribes from the North, namely the inhabitants of the island Japèn, of the Waropèn Coast and of Humboldt Bay. The songs of Japèn showed closed relationship with these of the Kauwerawèt: pure "tiled" music with all the characteristics mentioned above, f.i.:

\[ \text{Ja-ba-nè, ja-ba-nè, ja-ba-nè, ja-ba-nè, ja-ba-nè.} \]

The songs of the Humboldt Bay people were much more varied, but, for all that, they showed, as a whole, the same marks of relationship, and certainly no "fanfared" character. One instance may suffice:

\[ \text{Some of the songs of the Waropèn Coast, on the contrary, seem to have undergone Malay influence, as I am inclined to deduce from the "pélog-character" of some of those melodies, in which half-tone intervals often occur:} \]

30
Other melodies showed a pronounced "triad"-character; these again however were not "fanfared".

If I remember well, no one of the melodies, I recorded, exceeded the limits of one octave, with one remarkable exception: a festal song from Sarmi (the village, where Gjellerup got his melodies).

That beautiful and varied melody extends over no less than one octave and a fourth, and, therefore has the same compass as one of Mr. Le Roux's Awembiak melodies (Table II mel. α) 48).

Still less has come to light of the music of the tribes on the South Coast. The melodies, published by Myers 49) of the population of Torres Straits, are purely Australian; consequently their style is the same as that of the Kauwerawet melodies, mentioned above. The few small fragments of the Marineland songs, recorded by Koch 50) and Wirz 51),

48) As the copies of the records under consideration, at the moment this treatise was finished, had not reached us from Berlin, where Prof. Von Hornbostel was kind enough to make arrangements for the preparation of matrices, I could only insert the melodies I noted down, when recording them, and could only give a few particulars about the others (which, in general, have a more complicated structure and therefore could not be noted down on first hearing). When back in Java, those records will be transcribed and published soon.

49) Myers ps. 244/7, 262, and 263.

50) Koch II ps. 565 and 566.

show indeed a certain predilection for the third and occasionally a triad, so that they might be classed with the type of the short Dëm-melodies in Table II under $\alpha - \delta$; but for all that they remain far removed from the lively fanfares of the songs, shown in that same table under $\alpha - \delta$:

Finally I noted down from the singing of a Kaoh-river man (Upper-Digul), who came to Bandoeng with Dr. de Rook, the following melody:

When, however, we turn our attention to the East, we find a very different state of affairs.

In 1910 the well-known ethnologist and R. G. missionary Father Wilhelm Schmidt, S. V. D. gave a lecture in Vienna, on the occasion of the Con-
The blowingcouch as a signalling-instrument: a Binandeli on the banks of the Mambare near the village of Sia.
gress of the International Association of Music, on the songs of the Karesau Papuans. Karesau — see the map — is a small island belonging to the Schouten Islands 52) off the coast of the former German New-Guinea. Only a few miles separate this island from the mainland.

The characteristics of Karesau music, mentioned by Father SCHMIDT 53), are:

I. **Subject matter**: 1. ritual songs; 2. popular songs.

II. **Form of the text**:

1. special linguistic forms: a) nasalising; b) duplications;

2. rhythm: alternation of stressed and unstressed syllables; as a rule a verse with three accents alternates with one of two accents;

3. parallelism: the initial words of two lines are the same; the end-words are different;

4. interrupting the rhythm of the verses in singing by the insertion of a "stop-gap"-o. (SCHMIDT calls it: Flick-o.)

III. **Execution**:

1. always with the accompaniment of drums or at least of knocking with the fingers;

---

52) The archipelago north of Geelvink Bay also is called Schouten Islands after that famous navigator.

53) SCHMIDT II ps. 297/8.
2. repeated tremolo (with the root of the tongue), especially in long drawn notes;

3. fioritura;

4. repeated transitional legato, by means of which the singer connects the end of one line with the beginning of the next without taking a new breath.

IV. *Tonal system and melodic structure*:

1. the pieces, formed of triads — very often exclusively so — always are of a ritual character;

2. in the others a pentatonic scale is used;

3. the course of the melodies is generally in the descending line;

4. the melody always ends on the lower keynote, or, starting from this note, it leaps on to its higher octave.

V. *The origin*:

1. the ritual hymns are, so it seems, handed down from generation to generation, or else they have been adopted from other tribes at the same time as the corresponding ceremonies;

2. folk-songs are being made and composed up to the present day.

Now, which of these characteristics do we find in the melodies brought back by Mr. Le Roux?
Some of them are found in the songs of the Kauwerawet (Table I) as f.i.:

II sub 3: parallelism: f.i. mamakånanë < kërè-kånanë

IV sub 2: the use of the pentatonic scale;

IV sub 3: the descending movement of the melodies;

IV sub 4: the lower key-note as final note.

As is the case with the Karesau-music, the characteristics, mentioned above, refer to the folk-songs (I sub 2), which are still being invented at the present day (V sub 2); see p. 12 of this treatise.

As regards the ritual songs of the Karesau (I sub 1), no equivalent of these is found in the music of the Mamberamo Papuans, nor in that of the population of the coast; but, curiously enough, we do find this equivalent in the songs of the Central tribes, the latter being characterized (see Table II) by:

I sub 1: their ritual use;

II sub I b: duplications: melody α: soloe-soloe,
                        naga-naga, mina-mina;
                        melody β: naga-naga, déga-déga;
                        melody γ: waé-waé-waé-waé;
                        melody δ: wé'oe'wé-wé'
                          oe'wé, wie'o-
                          wie'o;

54) Le Roux p. 308.
II sub 3: **parallelism**: melody β: naga-naga dé-wi wowai, dé-ga-déga doewa wowai;

melody γ: jao awie o

jévé awie o;

melody δ: oewa ie a

oewa jo a;

melody ζ: oewé a wé

oewé a kwa;

II sub 4: **interruption of the verse-rhythm by ‘‘stopgap’’**

vowels f.i.:

in melody β: by o, a, o;

in melody γ: by o, a, é.

Wirz also draws attention to this peculiarity 55).

III sub 1: **accompaniment** of the singing by snapping or clicking the fingers;

III sub 2: **tremolo** with the root of the tongue in the long drawn notes;

III sub 4: **interlinking** the lines of the text by peculiar sighs, produced by sucking in the breath 56);

IV sub I: **the melodies are built up of triads**.

As the Central tribes have other, simpler, worldly melodies — as was shown above — besides their ritual chants, we find in the Nassau Range also the

55) N.G. XVI p. 116 (Wirz II): "Die Worte werden beim Singen nicht in üblicher Weise ausgesprochen, endigen vielmehr stets auf einen Vokal, was als erster, tastender Versuch einer Reimbildung auf zu fassen ist. Auch der Melodie wegen pflegt man die Worte stets auf einen Vokal auslaufen zu lassen."

56) Whilst the singer shuts his eyes in extasy.
peculiar phenomenon, which we might term "musical stratification". Myers states, that he found the same peculiarity in the music of the Murray Islanders in Torres Straits: he distinguishes as many as three strata. And according to what Father Schmidt tells us of the music of Karesau, the same may be said of that island.

The texts, especially those of the ritual chants, are generally only half understood by the performers; they are full of obsolete, deformed or distorted words.

It is not necessarily the age of the text only, which makes it (partly) unintelligible: transmigration may easily have played a part here, for shells, tobacco and

57) Myers ps. 255/6.
58) As far as I know, nothing has come yet of the proposed publication of a great number of Karesau songs by Father Schmidt. The plans for this publication were mentioned in Anthropos II p. 1030.
59) The texts of the dance-music of the coast-population provide also instances. Van der Sande says in this respect (N. G. III p. 308): "It is a very remarkable fact that the language of the songs, as well in Humboldt Bay as in the district of Seka and to the West, is said to be an ancient language, which is now no longer spoken and only imperfectly understood .... (Mac Farlane) writes that the short sounds, sung in chorus, have no meaning; — perhaps the meaning has got lost, as suggested above. Similar particulars were gathered by Mac Gregor and in Kaiser Wilhelmsland by Schellong and Pöch ....... The use of that old language enables the villagers, who .... visit other villages, to join in the general song."

For British and former German New Guinea it is indeed the same thing over again: "Wie ein französischer Missionar aus English Neuguinea erzählte, ist es häufig, dass die natiives die eignen alterebten Lieder nicht verstehen, da die Sprache sich mit der Zeit in den einzelnen Distrikten verändert hat. Dieselbe Beobachtung machte ich in Finschhafen........" (Schmidt-Ernsthausen p. 268). — See further also Reche ps. 447/8, who quotes Pöch extensively, and also Pöch himself in Pöch I ps. 232/3, and III p. 610.
stone hatchets were not the only things that were passed on from tribe to tribe.

Father **Schmidt** 60) has been already cited in this respect with regard to Karesau and the adjacent regions. About Torres Straits **Myers** says 61): "They (viz. the songs of the Murray Islanders) show evidence of the great traffic in tunes, which may go on between the inhabitants of neighbouring islands, thus raising the general question as to how far the fundamental characteristics of the music of a given people are fixed or are modifiable, temporarily or permanently, by the importation of foreign airs.'" **Schmidt-Ernsthausen** mentions songs from Rook Island, which have been adopted by the Jabim of the opposite coast of New-Guinea (round Finsch Harbour) without the slightest understanding 62); **Guppy** speaks of a melody, which the inhabitants of Treasury Island (Mono) had appropriated from the Duke of York Island 63); **Seligmann** mentions songs, which the Koita, round Port Moresby, adopted from the Motu 64).

So the striking resemblance between the ritual chants of the Karesau Islanders and those of the pygmoid tribes of the Nassau Range might therefore easily find its origin in the handing on of these melodies from tribe to tribe. The distance bridged over in

---

60) **Schmidt** II p. 298.
61) **Myers** p. 238.
62) **Schmidt-Ernsthausen** p. 268.
63) **Guppy** p. 141.
64) **Seligmann** II p. 152.
this case is certainly considerable, but then we may
assume, that some of the tribes between the two
extremes possess the same kind of melodies. The cul-
tural development of the Mountain tribes at least
seems to be perfectly homogeneous 65).

But handing on the music from tribe to tribe is by
no means the only possible manner in which it has
found its way from one district to another, far remote
from the first. There are some other possibilities, f.i.:
the inhabitants of the Nassau Range and of Karesau
may at one time or other have had intercourse with
each other, when living in each other's neighbour-
hood. And a third possibility: that this "fanfared"
music, which is found at present among tribes far
removed from each other, points to the fact, that at
one time there was a certain civilization, spread
over a wider area, which at a later period, was im-
mersed in waves of a newer culture. Expressed in
terms of geology, we might say, that these scattered
outcrops might be considered as originating from a
sporadically appearing "diluvium" in a territory
entirely covered for the rest by Melanesian and Aus-
tralian "alluvial" deposits.

Before we can decide, which of these possibilities,
advanced here, correspond with the reality, the fol-
lowing questions should be answered satisfactorily
and conclusively:

a. Are these "fanfared" melodies known to occur
among other tribes in or near New Guinea?

65) Wirz II p. 4.
b. To which race — c.q. cultural agent — must these "fanfared" melodies be attributed?

c. Is it possible to find the cause for these melodies being what they are and not being otherwise?

The answer to the first question can be readily given now and in the affirmative: on Bougainville, belonging to the Solomon Islands, East of New Guinea, the same kind of melodies are found. A proof of this is given in the examples reproduced in Table III as melodies $\alpha$ and $\beta$, which have been taken from Von Hornbostel's "Bemerkungen über einige Lieder aus Bougainville". They belong to the songs of the Kon-gara, a mountain-tribe, and were recorded in 1912 and '13 by the ethnologist E. Frizzi. The same kind of melody is heard furthermore in some of the songs of the Jabim (Finsch Harbour), and of the witchsongs of Central New Ireland (= New Mecklenburg); melodies $\gamma$ and $\delta$ on Table III give examples of this.

66) Von Hornbostel IV p. 53 ff. — The music of the N. W. Solomons is, especially in the coastal districts, much richer and much more civilized, than that of the Nassau Range. It presents very remarkable instances of part singing, sometimes with rudimentary canons, and also of the simultaneous performance of pampipe-orchestras and vocalists. Whenever this part singing occurs in New Guinea, it is of a much more primitive nature; sometimes it occurs purely by accident, because the songs, sung by a single performer, or by a chorus, overlap when the performers sing in turn (Koch II p. 566; Pulle p. 191; Rawling p. 247/8; Van der Sande p. 310; Williamson p. 216; Wirz II p. 114; Le Roux — verbal statements about the Awèmbiak and the Dém tribes.)

67) For the rest most of the melodies of the N. W. Solomons do not consist exclusively of triads (comp. Table III mel. $\alpha$); but also when scales with more tones are used, the third, fourth and fifth intervals predominate.

68) Taken from Schmidt-Ernsthausen p. 270 mel. IV.

69) Taken from Peerel I p. 50. See also Abel I p. 821.
But the resemblance is not only found in the melodies; it shows also in the texts, which possess the same peculiarities as the songs of Karesau and the Nassau Range. Von Hornbostel mentions f.i.: a) duplications of words, b) the completion of the text of a melodic phrase by yodling (therefore by vocalising), when the line is too short. And then he points out some other peculiarities, which Father Schmidt does not mention, but which are found in the songs Mr. Le Roux brought back from the Nassau Range, viz. c) the rhythmical variability of polysyllables, and d) the appearance of end-rhyme 70).

Of the first case he gives as an example the word nairoé, which is sometimes stressed on the i, sometimes on the é, and sometimes on the o. We find a parallel case in the songs of the Nassau Range, given in Table II, in the variable pronunciation of the word ambagagé, which in text α is scanned ambagagé, but in melody β as ambagagé(-o). In melody α we find side by side mina and mina, and in melody β ajé and ajé.

End-rhyme is also found in the songs of the mountain tribes, at any rate in melody α: wowai - oedjiwi - ragiwi. In melody β the effort at rhyme is more primitive, at least in the first instance, as here it is made by the "stop-gap" -o: wowai o a o - ambagagé o. But the second rhyme of melody β may again be considered as a real one: asiloé-naga-naga doewang waé.

From the above we may conclude that, if the

70) The texts of the Coast Papuans are said to have no end-rhyme. (Van der Sânde, p. 308).
occurrence of this "fanfared" music in the central mountains is to be attributed to migration, we have to consider in the first place an influence coming from the (north-)east. Before, however, pronouncing a definite opinion on the greater or smaller probability of migration from that direction, or even on migration in general, it will be necessary to investigate other existing possibilities first.

At the hand of a wealth of material Von Hornbostel has proved, that those songs of the tribes of the Central mountains, which, in their essential properties show so striking a resemblance to the songs of the population of Bougainville, are instrumental airs. 71) He demonstrates furthermore, that the melodies of Bougainville probably have their origin in the panpipe, which is found there everywhere (generally forming small orchestras).

Now does this mean that such melodies, wherever they occur, were evolved from the panpipe-technique? Or does it mean, that wherever in Austronesia the panpipe is found, we also meet this "fanfared" music? It means neither the one, nor the other.

Whereas the panpipe is found in many islands of Melanesia, Micronesia and Polynesia 72) (pl. XIII figs. 58 and 59, and pl. XII fig. 54), there are no traces of that "fanfared" music, as far as we

71) Von Hornbostel II pp. 468/9, 492/3, 499, and 503.
72) Compare Sachs III p. 50.
know, outside the N. W. Solomon-group and the adjacent part of the Bismarck Archipelago. As for New Guinea, the panpipe — not counting the few rare and degenerate specimens of the Kaiserin Augusta River and of the lower Markham River \(^73\) (pl. XII fig. 55 and pl. XIII fig. 56) — is restricted to the South Coast, from the d'Entrecasteaux Archipelago and the Bentley Bay as far as Merauke \(^74\) \(^75\) (pl. XIII fig. 57); the ‘‘fanfared’’ music, on the other hand, belongs, as far as we know, exclusively to Karesau and the Central Mountains. And so we see, that the panpipe-area and the ‘‘fanfared’’

\(^73\) Behrmann p. 195; Neuhaus vol. I ps. 383/4 and fig. 306 a/b; Reche p. 425; Werner p. 56. — The Kaiserin Augusta River has been, since times immemorial, the gate-way, through which successive civilizations and races have entered the country. ‘‘Fasst man die Resultate der Untersuchungen am Lebenden und am Schädematerial zusammen, so erhält man den Eindruck, dass sich über eine dunkelhäutige, breitschädliche, plumpgeformte und kleinwüchsige — vielleicht bereits aus mehreren Bestandteilen verschmolzene—pygmäen-artige Rasse ein oder zwei andere gelagert haben, die sich durch hellere Färbung, lange und schmale Körperformen und höheren Wuchs auszeichnen…… Die Eindringlinge scheinen sich hauptsächlich im Mündungsgebiet und am Mittellauf niedergelassen zu haben (vielleicht zu verschiedene Zeiten)……’’ (Reche ps. 56/7). And, according to Neuhaus, it is a fact, that the Laé Womba tribe, the people, living on the banks of the lower Markham River, that know the panpipe — is of Melanesian origin (Neuhaus l.c.).

musical area are by no means identical. But there is
nothing astonishing in this. A melodic system, which
is founded on the phenomenon of part-tones (caused
by "overblowing"; German: "überblasen"), is not
necessarily derived from the panpipe; the music,
drawn from other wind-instruments, as f.i. the com-
mon bamboo flute, may also lead to this kind of

75) The panpipe, mentioned in SCHMIDT-ERNSTAUSSEN's article
on the music of German New Guinea (especially from Finch Harbour),
and which is reproduced and described on ps. 273/3, is undoubtedly an
instrument from the Bismarck Archipelago. The number of pipes (14)
and the careful way in which it is made, with the stepped bindings,
so typical of New Ireland, are sufficient proof of this. Compare VON
HORNBOSTEL I the fig. opposite p. 352, and II p. 464; SACHS I p. 289b.
— This is not the only instrument, which the author places erroneously
at Finch Harbour, but which actually comes from the Bismarck Ar-
chipelago: the peculiar "rubbing"-instrument also, he describes, and
of which he gives a picture (p. 273/4), is only known from New Ireland.
melodies, also through "overblowing". On the other hand we may take it for granted, that such "fanfareted" music can only arise in regions, where wind-instruments are played. And anywhere and everywhere, where such instruments are used, this kind of melody may grow out of the instrumental music, without any influence from elsewhere.

Now, in Karesau we find flutes, and, although the Awèmbiak an Dèm tribes do not know any flutes, they are part of the cultural possessions of the neighbouring tribes from the lake-plateau.

There is another strong argument against the connection between the panpipe and the "fanfareted" music of the Karesau and the mountain tribes. The panpipe, product of a high East Asiatic civilization, in all probability did not make its appearance in the Southern Pacific until rather late, and simultaneously with the tribes, that came from the mainland of Asia and migrated toward the East. In this manner the instrument found its...
way to New Guinea, — perhaps circuitously over island-groups, east of New Guinea — but it always remained a foreign element there. On all occasions one gets the impression, that it has badly assimilated, and has remained everywhere, up to the present day, a degenerate alien. For this reason also it is difficult to believe, that it can really be the origin of the above mentioned melodies; it is all the more difficult to believe — and this is the third argument — because in Karesau, as well as in the central mountains of New Guinea and of New Ireland, only the ritual chant finds its expression in this melodic form, as was pointed out before, but the panpipe fulfills nowhere in those regions the function of ritual or sacred instrument 81).

On the other hand this circumstance makes the relationship with the flute-music much more probable, as the flutes are generally used for ritual purposes. This is especially the case among the population of the lake-plateau and of the North Coast, as well in the Dutch, as in the former German territories.

Although it is possible, that such "fanfared" music arises independently in different regions, one is inclined to think in this case of a certain connection, as it is found among peoples, who are probably

Note 80 (continued).
the Polynesian-South-American stratum (Sachs III p. 79); finally the bundle-pipe he places in a still later, viz. the Indonesian-Melanesian stratum (Sachs III p. 109).
81) Compare also Sachs III p. 51.
bound by a tie of rather near ethnological relationship, among tribes, who possess, what we might call "a great common divisor", like the mountain-people of Bougainville and the pygmoid tribes of the Nassau Range.

Of course it is always more or less risky to draw conclusions about cultural relations from material, which, as a rule, is quite inadequate; it is especially dangerous in this case, because there are so many gaps between the known facts.

Graebner's wise words should still be our guide: "Feststellung und Vergleichung ähnlicher Erscheinungen in den verschiedenen Kulturprovinzen der Erde ist stets ein Verdienst. Jeder Versuch hingegen, solchen Erscheinungen in näheren Zusammenhang zu bringen, ist, wenn auch hier und da instinctiv richtig, ohne weitere Vorarbeit mehr oder weniger spekulativ, die Erklärung der eine durch die andre ein ungenügend begründeter Analogieschluss. Denn nicht nur bleibt die Art des etwaigen Zusammenhanges dunkel, was für Beurteilung und Interpretation der Erscheinung immerhin von Bedeutung ist; bei der flächenhaften Art, wie uns die Kultur der meisten Völker bisher bekannt ist, müsste die Übereinstimmung bis zur Identität gehen, um uns sicher zu machen, dass wir es nicht doch mit völlig heterogenen Erscheinungen zu tun haben" 82).

But still, even when fully agreeing with this point of view, there is no reason why one should not go on

---

82) Graebner II p. 28.
trying to find such cultural links. Only, the work must be done on condition, that we maintain a critical attitude towards the results of our speculations and give them no greater value, than they deserve. They must be taken simply as a working hypothesis, which is to be abandoned the very moment when facts are brought to light with which they cannot be made to tally.

While keeping this principle rigidly before me, I venture to answer the second of the questions, I put before, viz.: "to which race — c.q. cultural agent — must these "fanfared" melodies be attributed?" In doing so, I refer to the third possibility, advanced here, namely, that these melodies — which, as has been said, have, up to the present, been found in the Nassau Range, in Central Bougainville, in New Ireland, and in Karesau — bear witness to the continuance of a primeval common substratum of culture, a primary civilization, which in most places has been supplanted and overlaid by younger cultural waves.

Being part of those cultural possessions, which all peoples are most tenacious in preserving, namely those old forms, connected with religious life, an ancient musical form — be it, as far as the Nassau Range is concerned, without the wind-instruments, from the technique of which it originated — has continued to exist, side by side with different and younger music 83). Assuming this, it also explains, why,

83) So Myers found in Torres Strait Islands older ritual music side by side with unmistakably younger, more variable worldly music.
apart from a small islet off the North Coast of New Guinea, it was apparently only the central mountains of the larger islands (New Guinea, New Ireland, Bougainville — probably also those of New Britain), that preserved that ancient form up to the present: those regions were best protected against the invasion of foreign influences from oversea.

Would it be permissible, to count that form among the cultural possessions, which lead Wirz, in his study of the pygmoide population of the Swart Valley, to make the following statement \(^{84}\): "Sicher aber ist, dass wir hier in Zentral Neu Guinea sehr deutliche Spuren einer ältesten Kulturschicht Melanesis und Australiens deutlich vor uns haben, welche Graebner in seiner Kulturkreislehre als negritische bezeichnet‘’?

If we may answer in the affirmative, this Negrito civilization, although comparatively primitive, stands from a musical point of view on a higher level than the younger cultures, by which it has been pushed aside or overlaid: the "fanfared" melodies are musically more advanced than the Australian "tiled" melodies and than the majority of the other musical phenomena, encountered thus far in New Guinea. Then it is that same cultural superiority, by which those Central tribes, who have preserved the pygmoide-negrito characteristics rather purely, distinguish themselves also in other respects (ethics, attitude towards strangers, pig-breeding, agriculture) from the

---
