PART III
THE SUBJECTS ON GREEK VASES

CHAPTER XII
INTRODUCTORY—THE OLYMPIAN DEITIES

Figured vases in ancient literature—Mythology and art—Relation of subjects on vases to literature—Homer and dramatic themes and their treatment—Interpretation and classification of subjects—The Olympian deities—The Gigantomachia—The birth of Athena and other Olympian subjects—Zeus and kindred subjects—Hera—Poseidon and marine deities—The Eleusinian deities—Apollo and Artemis—Hephaistos, Athena, and Ares—Aphrodite and Eros—Hermes and Hestia

CHAPTER XIII
DIONYSOS AND MISCELLANEOUS DEITIES

CONTENTS OF VOLUME II

CHAPTER XIV

HEROIC LEGENDS

Kastor and Polydeukes—Herakles and his twelve labours—Other contests—Relations with deities—Apotheosis—Theseus and his labours—Later scenes of his life—Perseus—Pelops and Bellerophon—Jason and the Argonauts—Theban legends—The Trojan cycle—Peleus and Thetis—The Judgment of Paris—Stories of Telephos and Troilus—Scenes from the Iliad—The death of Achilles and the Fall of Troy—The Odyssey—The Oresteia—Attic and other legends—Orpheus and the Amazons—Monsters—Historical and literary subjects 93–153

CHAPTER XV

SUBJECTS FROM ORDINARY LIFE

CHAPTER XVI

DETAILS OF TYPES, ARRANGEMENT, AND ORNAMENTATION

CHAPTER XVII

INSCRIPTIONS ON GREEK VASES

PART III
THE SUBJECTS ON GREEK VASES

CHAPTER XII

INTRODUCTORY—THE OLYMPIAN DEITIES

The representation of subjects from Greek mythology or daily life on vases was not, of course, confined to fictile products. We know that the artistic instincts of the Greeks led them to decorate almost every household implement or utensil with ornamental designs of some kind, as well as those specially made for votive or other non-utilitarian purposes. But the fictile vases, from the enormous numbers which have been preserved, the extraordinary variety of their subjects, and the fact that they cover such a wide period, have always formed our chief artistic source of information on the subject of Greek mythology and antiquities.

Although (as has been pointed out in Chapter IV.) ancient literature contains scarcely any allusions to the painted vases, we have many descriptions of similar subjects depicted on other works of art, such as vases of wood and metal, from VOL. II.
Homer downwards. The cup of Nestor (Vol. I. pp. 148, 172) was ornamented with figures of doves, and there is the famous description in the first Idyll of Theocritus of the wooden cup (μυστιβων) which represented a fisherman casting his net, and a boy guarding vines and weaving a trap for grasshoppers, while two foxes steal the grapes and the contents of his dinner-basket; the whole being surrounded, like the designs on some painted vases, with borders of ivy and acanthus. The so-called cup of Nestor (ψευτοποι) at Capua was inscribed with Homeric verses, and the σκύφος or cup of Herakles with the taking of Troy. Anakreon describes cups ornamented with figures of Dionysos, Aphrodite and Eros, and the Graces; and Pliny mentions others with figures of Centaurs, hunts and battles, and Dionysiac subjects. Or, again, mythological subjects are described, such as the rape of the Palladion, Phrixos on the ram, a Gorgon and Ganymede, or Orpheus; and other "storied" cups are described as being used by the later Roman emperors. But the nearest parallels to the vases described in classical literature are probably to be sought in the chased metal vases of the Hellenistic and Roman periods. We read of scyphi Homericici, or beakers with Homeric scenes, used by the Emperor Nero, which were probably of chased silver; and we have described in Chapter XI. what are apparently clay imitations of these vases, usually known as "Megarian bowls," many bearing scenes from Homer in relief on the exterior.

In attempting a review of the subjects on the painted vases, we are met with certain difficulties, especially in regard to arrangement. This is chiefly due to the fact that each period has its group of favourite subjects; some are only found in early times, others only in the later period. Yet any chrono-

logical method of treatment will be found impossible, and it is hoped that it will, as far as possible, be obviated by the general allusions in the historical chapters of this work to the subjects characteristic of each fabric and period.

Embracing as they do almost the whole field of Greek myth and legend, the subjects on Greek vases are yet not invariably those most familiar to the classical student, or, if the stories are familiar, they are not always treated in accordance with literary tradition. On the other hand, it must be borne in mind that the popular conception of Greek mythology is not always a correct one, for which fact the formerly invariable system of approaching Greek ideas through the Latin is mainly responsible. The mythology of our classical dictionaries and school-books is largely based on Ovid and the later Roman compilers, such as Hyginus, and gives the stories in a complete connected form, regarding all classical authorities as of equal value, and ignoring the fact that many myths are of gradual growth and only crystallised at a late period, while others belong to a relatively recent date in ancient history.¹

The vases, on the other hand, are contemporary documents, free from later euhemerism and pedantry, and presenting the myths as the Athenian craftsmen knew them in the popular folk-lore and religious observances of their day. It cannot be too strongly insisted upon that a vase-painter was never an illustrator of Homer or any other writer, at least before the fourth century B.C. (see Vol. I. p. 499). The epic poems, of course, contributed largely to the popular acquaintance with ancient legends, and offered suggestions of which the painter was glad to avail himself; but he did not, therefore, feel bound to adhere to his text. This will be seen in the list of Homeric subjects given below (p. 126 ff.); and we may also refer here to the practice of giving fanciful names to figures, which obtains at all periods, and has before now presented obstacles to the interpreter.

The relation of the subjects on vases to Greek literature is an interesting theme for enquiry, though, in view of what has already been said, it is evident that it must be undertaken with

great caution. The antiquity and wide popularity of the Homeric poems, for instance, would naturally lead us to expect an extensive and general use of their themes by the vase-painter. Yet this is far from being the case. The Iliad, indeed, is drawn upon more largely than the Odyssey; but even this yields in importance as a source to the epics grouped under the name of the Cyclic poets. It may have been that the poems were instinctively felt to be unsuited to the somewhat conventional and monotonous style of the earlier vase-paintings, which required simple and easily depicted incidents. We are therefore the more at a loss to explain the comparative rarity of subjects from the Odyssey, with its many adventures and stirring episodes; scenes which may be from the Iliad being less strongly characterised and less unique—one battle-scene, for instance, differing little from another in method of treatment. But any subject from the Odyssey can be at once identified by its individual and marked character. It may be that the Odyssey had a less firm hold on the minds of the Greeks than the Iliad, which was more of a national epic, whereas the Odyssey was a stirring romance.¹ It may also be worth noting that scenes from the Odyssey usually adhere more closely to the Homeric text than those from the Iliad.

Another reason for the scarcity of Iliad-scenes may be that the Tale of Troy as a whole is a much more comprehensive story, of which the Iliad only forms a comparatively small portion. Hence the large number of scenes drawn both from the Ante-Homerica and the Post-Homerica, such as the stories of Troilos and Memnon, or the sack of Troy. The writings of the Cyclic poets begin, as Horace reminds us, ab ovo,² from the egg of Leda, and the Kypria included the whole story of the marriage of Peleus and Thetis, the subsequent Judgment of Paris, and his journey to Greece after Helen, scenes from all these events being extremely popular on the vases.³ The Patrokleia deals with the events of the earlier years of the war, the Aithiopis of Arktinos with the stories of Penthesileia and Memnon, and the death of Achilles, and the Little Iliad of

¹ See on this subject J.H.S. xiii. p. 83.
² Art. Poet. 147.
Lesches with the events of the tenth year down to the fall of Troy. All provided frequent themes for the vase-painter, as may be seen by a reference to a later page (119 ff.). The *Iliupersis* of Arktinos and Lesches might almost be reconstructed from two or three large vases, whereon all the episodes of the catastrophe are collected together (see p. 134); but when we come to the *Nostoi* of Agias and the Teleogonia, the vase-painters suddenly fail us, the stories of Odysseus' wanderings and Orestes' vengeance seeming to supply the deficiency.

Luckenbach has pointed out that the only right method of investigating the relation is to begin with vase-paintings for which the sources are absolutely certain, as with scenes from the *Iliad* and *Odyssey*. In this way the subjects from other epics can be rightly estimated and the contents of the poems restored. Further, in investigating the sources of the vase-painters, and the extent to which they adhered to them or gave free play to the imagination, the three main periods of vase-painting must be separately considered, though the results in each case prove to be similar. By way of exemplifying these methods he enters in great detail into certain vase-subjects, their method of treatment on vases of the different periods, and their approximation to the text. Thus, the funeral games for Patroklos (II. xxi.i.) are depicted on the François vase (see p. 11) with marked deviations from Homer's narrative; and not only this, but without characterisation, so that if the performers were not named the subject could hardly have been identified. To note one small point, all Homeric races took place in two-horse chariots (*bigae*), but on B.F. vases four-horse *quadrigae* are almost invariably found.

Subjects of a more conventional character, such as battle scenes, farewell scenes, or the arming of a warrior, present even more difficulty. Even when names occur it is only increased. We must assume that the vase-painter fixed on typical names for his personages, without caring whether he had literary authority. In some cases the *genre* scenes seem to be developed from heroic originals, in others the contrary appears to be the

---

2 The only exceptions are in the Pan-athenaic contests, which are of course not epic: cf. B.M. B 130-31.
case.\(^1\) It is not, however, unfair to say that the Epos was the vase-painter's "source." The only doubtful question is the extent of his inspiration; and, at all events, it was a source in the sense that no other Greek literature was until we come to the fourth century.

Turning now to the consideration of later literature,\(^2\) we find in Hesiod a certain parallelism of theme to the vases, but little trace of actual influence. Indirectly he may have affected the vase-painter by his crystallisation of Greek mythology in the Theogony, where he establishes the number of the Muses (l. 77), and also the names of the Nereids.\(^3\) It is, however, interesting to note the Hesiodic themes which were also popular with the vase-painters: the creation of Pandora; the fights of Herakles and Kyknos, and of Lapiths and Centaurs, and the pursuit of Perseus by the Gorgons; the contest of Zeus with Typhoeus (or Typhon); and the birth of Athena.\(^4\)

The influence of lyric poetry was even slighter. Somewhat idealised figures of some of the Greek lyricists appear on R.F. vases, such as Sappho and Anakreon (see p. 152); but this is all. In regard to Pindar and Bacchylides, the idealising and heroising tendencies of the age may be compared with the contemporary tendency of vase-paintings, and the latter may often be found useful to compare with—if not exactly to illustrate—the legends which the two poets commemorate. For instance, in the ode of Bacchylides in which he describes the fate of Kroisos, there is a curious deviation from the familiar Herodotean version, the king being represented as voluntarily sacrificing himself.\(^5\) The only vase-painting dealing with this subject (Fig. 132, p. 150) apparently reproduces this tradition.

With the influence of the stage we have already dealt elsewhere.\(^6\)

---

2 Luckenbach, op. cit. p. 560 ff.
3 There is only one vase (Naples 2296 = Reimach, Répertoire, i. 476) on which the names of the Nereids are derived from Homer.
RELATION OF VASES TO THE DRAMA

With the exception of the Satyric drama, it can hardly be said to have made itself felt, except in the vases of Southern Italy, in the fourth century B.C., but indications of the Satyric influence may be traced in many R.F. Attic vases, no doubt owing to their connection with the popular Dionysiac subjects. On a vase in Naples¹ are represented preparations for a Satyric drama. When we reach the time of tragic and comic influence, we not only find the subjects reproduced, but even their stage setting; in other words, the vases are not so much intended to illustrate the written as the acted play, just as it was performed.

The whole question is admirably summed up by Luckenbach² in the following manner: (1) The Epos is the chief source of all vase-paintings from the earliest time to the decadence inclusive, and next comes Tragedy, as regards the later vases only; of the influence of other poetry on the formation of myths in vase-paintings there is no established example. (2) Vase-paintings are not illustrations, either of the Epos or of the Drama, and there is no intention of reproducing a story accurately; hence great discrepancies and rarity of close adherence to literary forms; but the salient features of the story are preserved. (3) Discrepancies in the naming of personages are partly arbitrary, partly due to ignorance; the extension of scenes by means of rows of bystanders, meaningless, but thought to be appropriate, is of course a development of the artist's, conditioned by exigencies of space. Anachronisms on vases are of frequent occurrence. (4) Such scenes as those of warriors arming or departing are always the painter's own invention, ordinary scenes being often "heroised" by the addition of names. But individuals are not necessarily all or always to be named; and, again, the artist often gives names without individualising the figures. (5) In the archaic period successive movements of time are often very naïvely blended (see p. 10); the difference between art and literature is most marked in scenes where a definite moment is not indicated. (6) Vase-paintings often give a general survey of a poem, the scene not being drawn from one particular passage

¹ Reinsach, i. p. 114.
or episode. The features of one poem are in art sometimes transferred to another.

The attention that has been paid now for many years to collecting, assorting, and critically discussing the material afforded by the vases has much diminished the difficulties of this most puzzling branch of archaeology. It has been chiefly lightened by the discovery from time to time of inscribed vases, though, as has just been noted, even these must be treated with caution; and even now, of course, there are numerous subjects the interpretation of which is either disputed or purely hypothetical. But we can at least pride ourselves on having advanced many degrees beyond the labours of early writers on the subject, down to the year 1850.

When painted vases first began to be discovered in Southern Italy, the subjects were supposed to relate universally to the Eleusinian or Dionysiac mysteries, and this school of interpretation for a long time found favour in some quarters, even in the days of Gerhard and De Witte. But it was obvious from the first that such interpretations did not carry the investigator very far, and even in the eighteenth century other systems arose, such as that of Italynski, who regarded the subjects as of historical import. Subsequently Panofka endeavoured to trace a connection between the subjects and the names of artists or other persons recorded on the vases, or, again, between the subjects and shapes. The latter idea, of course, contained a measure of truth, as is seen in many instances; but it was, of course, impossible to follow out either this or the other hypothesis in any detail.

The foundations of the more scientific and rational school of interpretation were laid as early as the days of Winckelmann, and he was followed by Lanzi, Visconti, and Millingen, and finally Otto Jahn, who, as we have seen, practically revolutionised the study of ceramography. Of late, however, the question of the interpretation of subjects has been somewhat relegated to the background, owing to the overwhelming...
interest evoked by the finds of early fabrics or by the efforts of German and other scholars to distinguish the various schools of painting in the finest period.

Millingen, in the Introduction to his *Vases Grecs*, drew up a classification of the subjects on vases which need not be detailed here, but which, with some modifications, may be regarded as holding good to the present day. He distinguishes ten classes, the first three mythological, the next four dealing with daily life, and the three last with purely decorative ornamentation. A somewhat similar order is adopted by Müller in his *Handbuch*, by Gerhard in his *Auserlesene Vasenbilder*, and by Jahn in his Introduction to the Munich Catalogue (p. cc ff.). In the present and following chapters the arrangement and classification of the subjects adhere in the main to the system laid down by these writers; and as the order is not, of course, chronological in regard to style, reference has been made where necessary to differences of epoch and fabric. It may be convenient to recapitulate briefly the main headings under which the subjects are grouped.

I. The Olympian deities and divine beings in immediate connection with them, such as Eros and marine deities.
   (a) In general; (b) individually. (Chapter XII.)

II. Dionysos and his cycle, Pan, Satyrs, and Maenads. (Page 54 ff.)

III. Chthonian and cosmogonic deities, personifications, and minor deities in general. (Page 66 ff.)

IV. Heroic legends and mythology in general.
   (a) Herakles; (b) Theseus, Perseus, and other heroes;
   (c) local or obscure myths; (d) the Theban and Trojan stories; (e) monsters. (Chapter XIV.)

V. Historical subjects. (Page 149 ff.)

VI. Scenes from daily life and miscellaneous subjects (for detailed classification see p. 154). (Chapter XV.)

The number of subjects to be found on any one vase is of course usually limited to one, two, or at most three, according to the shape. Usually when there is more than one the subjects are quite distinct from one another; though attempts have been made in some cases, as in the B.F. amphorae, to trace

---

1 See also Chapters VI.-XI. throughout.
a connection. On the other hand, the R.F. kylikes of the strong period often show a unity of subject running through the interior and exterior scenes, whether the theme is mythological or ordinary. It was only in exceptional cases that an artist could devote his efforts to producing an entire subject, as on some of the large kylikes with the labours of Theseus, or the vases representing the sack of Troy. The great François vase in Florence is a striking example of a mythology in miniature, containing as it does more than one subject treated in the fullest detail. And here reference may be made to the main principles which governed the method of telling a story in ancient art, and prevailed at different periods. The earliest and most simple is the continuous method, which represents several scenes together as if taking place simultaneously, although successive in point of time. This method was often employed in Oriental art, but is not found in Hellenic times; it was, however, revived by the Romans under the Empire, and prevailed all through the early stages of Christian art. Secondly, there is the complementary method, which aims at the complete expression of everything relating to the central event. The same figures are not in this case necessarily repeated, but others are introduced to express the action of the different subjects, all being collected in one space without regard to time, as in the continuous style. This is of Oriental origin, and is first seen in the description of Achilles' shield; it is also well illustrated in the François vase, in the story of Troilos. Here the death of Troilos is not indeed actually depicted, but the events leading up to it (the water-drawing at the fountain and the pursuit by Achilles) and those consequent on it (the announcement of the murder to Priam and the setting forth of Hector to avenge it) are all represented without the repetition of any figures. Lastly, there is the isolating method, which is purely Hellenic, being developed from the complementary. This is best illustrated by the Theseus

2 Cf. for instance E 39, 45, 47, 48, in B.M.
3 See below, p. 108.
4 See p. 134.
5 This subject has been admirably treated by Wickhoff in his Roman Art (Eng. edn.), p. 13 ff.
kylikes, with their groups of the labours, which, it should be remembered, are not continuous episodes in one story, but single events separated in time and space, and collected together with a sort of superficial resemblance to the other methods.

Some description of the François vase has been given elsewhere (Vol. I. p. 370)\(^1\); but as it is unique in its comprehensiveness, and as a typical presentation of the subjects most popular at the time when vase-painters had just begun to pay special attention to mythology, it may be worth while to recapitulate its contents here. The subjects are no less than eleven in number, arranged in six horizontal friezes, with figures also on the handles, and there are in all 115 inscriptions explaining the names of the personages and even of objects (e.g. ὑδρία, for the broken pitcher of Polyxena). Eight of these subjects belong to the region of mythology:—(1) On the neck: the hunt of the Calydonian boar, and (2) the landing of Theseus and Ariadne at Naxos, accompanied by dancing youths and maidens. (3) On the shoulder: chariot race at the funeral games of Patroclus, and (4) combat of Centaurs and Lapiths (with Theseus). (5) On the body: the marriage of Peleus and Thetis, attended by the gods in procession. (6) On the body: the death of Troilus (see above), and (7) the return of Hephaiostos to Olympos. (8) On each of the handles, Ajax with the body of Achilles. On the flat top of the lip is represented (9) a combat of pigmies and cranes; on either side of the foot (10) a lion and a panther devouring a bull and stag, Gyrhons, Sphinxes, and other animals; and on the upper part of the handles (11) Gorgons and figures of the Asiatic Artemis (see p. 35) holding wild animals by the neck.

It is, of course, impossible to indicate all the subjects on the thousands of painted vases in existence; and it must also be remembered that many are of disputed meaning. The succeeding review must therefore only be considered as a

\(^1\) The publication of this vase by Furtwängler and Reichhold, *Gr. Vasenmaterel*, pls. 1-3, 11-13, with full discussion of subjects and technical details, has now superseded all previous illustrations. The only other complete ones were in *Mon. dell' Inst. iv.* 54-8 (Reinach, i. p. 134-36) and *Wiener Förl.* ii. pls. 1-5. The general view given in Plate XXVIII. is reproduced from the first-named work.
general summary which aims at omitting nothing of any interest and avoiding as far as possible useless repetition. In the
references appended under each subject the principle has been
adopted of making them as far as possible representative of
all periods, and also of selecting the most typical and artistic
examples, as well as the most accessible publications.¹

In dealing with the subjects depicted on Greek vases, we
naturally regard the Olympian deities as having the pre-
eminence. We will therefore begin by considering such scenes
as have reference to actions in which those deities were
engaged, and, secondly, representations of general groups of
deities, either as spectators of terrestrial events or without
any particular signification. It will then be convenient to
deal with the several deities one by one, noting the subjects
with which each is individually connected. We shall in the
following chapter proceed to consider the subordinate deities,
such as those of the under-world and the Dionysiac cycle, and
personifications of nature and abstract ideas. Chapter XIV.
will be devoted to the consideration of heroic legends, mytho-
logical beings, and historical subjects; and in Chapter XV.
will be discussed all such subjects as relate to the daily life
of the Greeks.

THE OLYMPIAN DEITIES

One of the oldest and most continuously popular subjects
is the Gigantomachia, or Battle of the Gods and Giants,
which forms part of the Titanic and pre-heroic cosmogony,
and may therefore take precedence of the rest. The Aloadae
(Otos and Ephialtes), strictly speaking, are connected with a
different event—the attack on Olympos and chaining of Ares;
but the scenes in which they occur are so closely linked with
the Gigantomachy proper that it is unnecessary to differentiate
them. We also find as a single subject the combat of Zeus
with the snake-footed Typhon.²

The locus classicus of Greek art for the Gigantomachia is

¹ For the abbreviations used in the

of course the frieze of the great altar at Pergamon (197 B.C.),
but several vases bear representations almost as complete,
though it is not as a rule possible to identify the giants except
where their names are inscribed.\(^1\) Most vases give only one
to three pairs of combatants.

Some pairs are found almost exclusively together, e.g. Athena
and Enkelados, or Ares and Mimas; Artemis and Apollo
are generally opposed to the Alaoxar Otos and Ephialtes,
Zeus to Porphyryon, and Poseidon to Polybotes (Fig. 112) or
Ephialtes. Hestia alone, the “stay-at-home” goddess of the

![Gigantomachia frieze from the Louvre](image)

hearth, is never found in these scenes, but Dionysos, Herakles,
and the Dioskuri all take their part in aiding the Olympian
deities. Zeus hurls his thunderbolts\(^2\); Poseidon is usually
depicted with his trident, or hurling the island of Nisyros
(indicated as a rock with animals painted on it) upon his

THE BIRTH OF ATHENA

Hera and Rhoitos (miswritten Phoitos): Berlin 2531.
Poseidon and Polybotes: Louvre E 732; Berlin 2531 = Fig. 112.
Poseidon and Ephialtes: Reinach, ii. 188.
Apollo and Ephialtes: Berlin 2531.
Artemis and Otos: Reinach, ii. 164.
Artemis and Aigaion: Berlin 2531.
Hephaistos and Euryalos: B.M. E 47.
Hephaistos and Klytios: Berlin 2293.
Athena and Enkelados: B.M. B 252; Louvre E 732; Él. Cér. i. 8.
Ares and Mimas: Berlin 2531; B.M. B 617.
Hermes and Hippolytos: Berlin 2293.
Hermes and Polybios (?): Louvre E 732.
Athena with arm of Akratos: Berlin 2957 = Él. Cér. i. 88.

Among scenes supposed to take place in Olympia, the most important is the Birth of Athena from the head of Zeus. Usually she is represented as a diminutive figure actually emerging from his head, but in one or two instances she stands before him fully developed, as was probably the case in the centre of the east pediment of the Parthenon. This subject is commoner on B.F. vases, and does not appear at all after the middle of the fifth century. In most cases several of the Olympian deities are spectators of the scene; sometimes Hephaistos wields his axe or runs away in terror at the result of his operations; in others the Eileithyiae or goddesses of child-birth lend their assistance. On a R.F. vase in the Bibliothèque Nationale Athena flies out backwards from Zeus' head.

In accordance with a principle already discussed (Vol. I. p. 378), the composition or "type" of this subject is sometimes adopted on B.F. vases for other groups of figures, where the absence of Athena shows clearly that the birth scene is not

6 Cat. 444.
intended, and no particular meaning can be assigned to the composition.¹

Representations of the **Marriage of Zeus and Hera** cannot be pointed to with certainty in vase-paintings. On B.F. vases we sometimes see a bridal pair in a chariot accompanied by various deities, or figures with the attributes of divinities ²; but the chief figures are not in any way characterised as such, and it is better to regard these scenes as idealisations of ordinary marriage processions. On the other hand, there are undoubted representations of Zeus and Hera enthroned among the Olympian deities or partaking of a banquet.³

**FIG. 113. THE BIRTH OF ATHENA (BRIT. MUS. B 244).**

The story of the enchaining of Hera in a magic chair by Hephaistos, and her subsequent liberation by him, is alluded to on many vases, though one episode is more prominent than the others. Of the expulsion of Hephaistos from heaven we find no instance, and of the release of Hera there is only one doubtful example ⁴; but we find a parody of the former’s combat

THE RETURN OF HEPHAISTOS

with Ares, who forces him to liberate Hera. The episode most frequent is that of the return of Hephaistos in a drunken condition to Olympos, conducted by Dionysos and a crowd of Satyrs; of this there are fine examples on vases of all periods. On earlier vases Hephaistos rides a mule; on the later he generally stumbles along, leaning on Dionysos or a Satyr for support.

On the François vase we see Zeus and Hera, with an attendant train of deities, Nymphs, and Muses, going in a chariot to the nuptials of Peleus and Thetis; on many vases we have the reception of the deified Herakles among the gods of Olympos; and on others groups of deities banquetting or without particular signification. But on the late Apulian vases it is a frequent occurrence to find an upper row of deities as spectators of some event taking place just below: thus they watch battles of Greeks and Persians, or such scenes as the contract between Pelops and Oinomaos, the madness of Lykourgos, the death of Hippolytos, and others from heroic legend, which it is unnecessary to specify here; only a few typical ones can be mentioned. They also appear as spectators of scenes in or relating to the nether-world.

Zeus appears less frequently than some deities, and seldom alone; but still there are many myths connected with him, besides those already discussed. As a single figure he appears enthroned and attended by his eagle on a Cyrenaic cup in the

INTRODUCTORY—THE OLYMPIAN DEITIES

Louvre; or again in his chariot, hurling a thunderbolt; in company with his brother-gods of the ocean and under-world, Poseidon and Hades, he is seen on a kylix by Xenokles. He is also found with Athena, with Hera, Apollo, Artemis, Aphrodite, and Hermes; and frequently with Herakles at the latter’s reception into heaven. In one instance he settles a dispute between Aphrodite and Persephone. He receives libations from Nike, or performs the ceremony himself, attended by Hera, Iris, and Nike, and is also attended by Hebe and Ganymede as cupbearers. His statue, especially that of Zeus, at Troy, sometimes gives local colour to a scene.

Most of the scenes in which he appears relate to his various love adventures, among which the legends of Europa, Io, and Semele are the most conspicuous; but first of his numerous amours should perhaps be mentioned his wooing of his consort Hera. He carries her off while asleep from her nurse in Euoboea, and also appears to her in the form of a cuckoo. The rape of Ganymede by his eagle appears once or twice on vases, but more generally Zeus himself seizes the youth while he is engaged in bowling a hoop or otherwise at play. On a fine late vase with Latin inscriptions Ganymede appears in Olympos, and he is also depicted as a shepherd.

Semele Zeus pursues and slays with the thunderbolt; the

birth of her son Dionysos from his thigh is represented but rarely on vases, and is liable to confusion with other subjects. This story falls into three episodes: (1) the reception of the infant by Hermes from Dirke, in order to be sewn into Zeus’ thigh; (2) the actual birth scene; (3) the handing over of the child to the Nymphs. Of his visit to Alkmena there are no certain representations, but two comic scenes on South Italian vases may possibly refer to it, and one of them at least seems to be influenced by the burlesque by Rhinton, from which Plautus borrowed the idea of his Amphitrite. The apotheosis of Alkmena, when her husband places her on a funeral pyre after discovering her misdeed, is represented on two fine South Italian vases in the British Museum; in one case Zeus looks on. His appearing to Leda in the form of a swan only seems to find one illustration on a vase, but in one case he is present at the scene of Leda with the egg.

He is also depicted descending in a shower of gold on Danae; or as carrying off the Nymphs Aegina and Thaleia; or, again, with an unknown Nymph, perhaps Taygeta. In the form of a bull, on which Europa rides, he provides a very favourite subject, of which some fine specimens exist. One variation of the type is found on an Apulian vase, where Europa advances to caress the bull sent by Zeus to fetch her.

INTRODUCTORY—THE OLYMPIAN DEITIES

The story of Io resolves itself into several scenes, all of which find illustration on the vases: (1) the meeting of Io and Zeus when she rests at the shrine of Artemis after her wanderings; (2) Io in the form of a cow, guarded by Argos; (3) the appearance of her deliverer Hermes; (4) Hermes attacks and slays Argos (Fig. 114).

In addition, the presence of Zeus may be noted in various scenes from heroic or other legends, which are more appropriately discussed under other headings, such as the freeing of Prometheus, the combat of Herakles and Kyknos, or the weighing of the souls of Achilles and Hector; at the sending of Triptolemos, the flaying of Marsyas, the death of Aktaeon,

and that of Archemos; at the creation of Pandora and the Judgment of Paris; the rape of the Delphic tripod and that of the Leukippidae, at Peleus' seizing of Thetis, and with Idas and Marpessa. The story of the golden dog of Zeus, which was stolen by Pandareos, is referred to under a later heading.

Hera apart from Zeus appears but seldom, but there are a few scenes in which she is found alone; of those in which she is an actor or spectator some have been already described, the most important being the story of Hephaistos' return to heaven. As her figure is not always strongly characterised by means of attributes, it is not always to be identified with certainty. As a single figure she forms the interior decoration of one fine R.F. kylix, and her ξόανων, or primitive cult-idol, is sometimes found as an indication of the scene of an action. On one vase she is represented at her toilet.

There is a vase-painting which represents Hera on her throne offering a libation to Prometheus, an aged figure who stands before her. She is also present at the liberation of Prometheus; in a scene probably intended for the punishment of Ixion; at the creation of Pandora; and in scenes from the story of Io. She suckles the child Herakles in one instance, and in another appears with him in the garden of the Hesperides; she is also present at his reconciliation with Apollo at Delphi, and at his apotheosis, receiving him and Iolaos. On an early Ionic vase

INTRODUCTORY—THE OLYMPIAN DEITIES

she appears contending with him in the presence of Athena and Poseidon, and wears a goat-skin head-dress, as in the Roman type of Juno Sospita or Lanuvina.¹

The scene in which she appears most frequently is the Judgment of Paris (see below, p. 122); she is also present at the birth of Dionysos²; at the stealing of Zeus’ golden dog by Pandareos³; at the contest between Apollo and Marsyas⁴; at the slaughter of the Niobids⁵; and with Perseus and Athena.⁶

She appears sometimes with Hebe, Iris, and Nike, from whom she receives libations⁷; and in one scene, apparently from a Satyric drama, she and Iris are attacked by a band of Seileni and rescued by Herakles.⁸

Poseidon is a figure somewhat rare in archaic art as a whole, especially in statuary, but is more frequently seen on vases, mostly in groups of deities, or as a spectator of events taking place in or under the sea, his domain. Among subjects already discussed, he is present at the birth of Athena,⁹ at the nuptials of Zeus and Hera,¹⁰ and in assemblies of the Olympic gods, generally with his consort Amphitrite¹¹; he also takes part in the Gigantomachia and the reception of Herakles into Olympos.¹²

He is represented in a group with his brother deities of the higher and nether world, Zeus and Hades¹³; with Apollo, Athena, Ares, and Hermes¹⁴; among the Eleusinian deities

at the sending forth of Triptolemos; and occasionally in Dionysiac scenes as a companion of the wine-god. As a single figure he is frequently found on the series of archaic tablets or pinakes found near Corinth, and also in company with Amphitrite (Fig. 115); on later vases not so frequently.

Amphitrite and other deities; he watches the Sun-god in his car rising out of the waves; and one vase has the curious subject of Poseidon, Herakles, and Hermes engaged in fishing.

Among scenes in which he plays an active part the most interesting is the dispute with Athena for the ownership of Attica, also represented on the west pediment of the Parthenon; his love adventures, especially his pursuit of Amymone and Aithra, are common subjects, but in many cases the object of his pursuit cannot be identified. He receives Theseus under the ocean, and possibly in one case Glaukos, on his acceptance as a sea-god; he is also present at the former’s recognition by Aigeus. He is seen at the death of Talos, and with Europa crossing the sea. In conjunction with other deities, chiefly on late Italian vases, he is present as a spectator of various episodes, such as the adventures of Bellerophon, Kadmos, or Pelops, the rape of Persephone, the creation of Pandora, the death of Hippolytos, and in one historical scene, a battle of Greeks and Persians. He superintends several of the adventures of Herakles, notably those in which he is specially interested, as the contests with Antaios and Triton; and he supports Hera in her combat with that hero. He is

ATHENA AND POSEIDON CONTENDING FOR ATTICA; VASE FROM KERTCH (AT PETERSBURG).
also seen with Perseus on his way to slay Medusa, and among the Gorgons after that event.

In connection with Poseidon it may be convenient to mention here other divinities and beings with marine associations—such as Okeanos, Nereus, and Triton, and the Nereids or sea-nymphs, daughters of Nereus, with the more rarely occurring Naiads. Of these the name of Okeanos occurs but once, on the François vase. The figure itself has disappeared, but the marine monster on which he rides to the wedding of Peleus and Thetis, and the inscription, remain. Nereus appears as a single figure, with fish-tail and trident, but is most frequently met with in connection with the capture of his daughter Thetis by Peleus, either as a spectator or receiving the news from a Nereid. He also watches the contest of Herakles with Triton, himself encountering the hero in some cases. On one vase Herakles has seized his trident and threatens him by making havoc of his belongings. He appears at Herakles’ combat with Kyknos, and at his apotheosis, and also offers a crown to Achilles. In one case he is found in Dionysos’ company. With his daughter Doris he watches the pursuit of another Nereid by Poseidon.

Triton is found as a single figure, and (chiefly on B.F. vases) engaged in a struggle with Herakles. He also carries Theseus through the sea to Poseidon, and watches the flight of Phrixos and Helle over the sea. The group of deities represented by Ino and Leukothea, Palaimon, Melikertes, and Glaukos

appear in isolated instances, as do Proteus and Skylla—the latter as single figures, without reference to their connection with the *Odyssey*. A monstrous unidentified figure, with wings and a serpentine fish-tail, which may be a sea-deity (in one case feminine), is found on some early Corinthian vases; possibly Palaimon is intended.

The **Nereids**, who are often distinctively named, are sometimes found in groups, especially watching the seizure of Thetis or bearing the news to Nereus; or, again, carrying the armour of Achilles over the sea and presenting it to him. On one vase they mourn over the dead Achilles. They are also present at the reception of Theseus, the contest of Herakles and Triton, and with Europa on the bull. Kymothea offers a parting cup to Achilles; the Naiads, who are similar beings, present to Perseus the cap, sword, shoes, and wallet. They are also found grouped with various deities, and even one in the under-world. Thetis appears once as a single figure, accompanied by dolphins; for her capture by Peleus and relations with Achilles, see p. 120 ff.

**The Eleusinian deities** Demeter and Persephone (or Kore) are usually found together, not only in scenes which have a special reference to their cult, but in general assemblies of the gods. They once appear in the Gigantomachia.

ELEUSINIAN DEITIES

which refer to the Eleusinian cycle are found exclusively on later examples, and as a rule merely represent the two chief deities grouped with others, such as Dionysos and Hekate, and with their attendants, Iacchos, Eumolpos, and Eubouleus. One vase represents the initiation of Herakles, Kastor, and Polydeukes in the Lesser Mysteries of Agra; another, the birth of Ploutos, who is handed to Demeter in a cornucopia by Gaia, rising from the earth, in the presence of Persephone, Triptolemos, and Iacchos; and others, the birth of Dionysos or Iacchos—a very similar composition. Demeter and Persephone are represented driving in their chariot, with attendant deities and other figures, or standing alone, carrying sceptre and torches respectively, or pouring libations at a tomb (on a sepulchral vase). They are present at the carrying off of Basile by Echelos (a rare Attic legend), and Demeter alone is seen, once at the birth of Athena, once at the slaughter of the dragon by Kadmos, once enthroned, and once with Dionysos as Thesmophoros, holding an open roll with the laws (θεσμολ) of her cult.

Closely connected with Eleusis is the subject of the sending forth of Triptolemos as a teacher of agriculture in his winged car. This is found on vases of all periods, but is best exemplified on the beautiful kotyle of Hieron in the British Museum (Plate LI.), where, besides Olympian and Chthonian deities, the personification of Eleusis is present. Besides the other Eleusinian personages, Keleos and Hippothoon are also

seen. Triptolemos is generally seated in his car, but in one or two cases he stands beside it; in another he is just mounting it. On the latter vase Persephone holds his plough. On a vase in Berlin Triptolemos appears without his car, holding a ploughshare; Demeter presents him with ears of corn, and Persephone holds torches.

Persephone is also seen with Iacchos, who, according to various accounts, was her son or brother. She appears with Aphrodite and Adonis, and one vase is supposed to represent the dispute between her and Aphrodite over the latter, which was appeased by Zeus.

The story of the rape of Persephone by Hades, her sojourn in the under-world, and her return to earth is also chiefly confined to the later vases, especially the incident of the rape. In the elaborate representations of the under-world on late Apulian vases she generally stands or sits with Hades in a building in the centre. She is often depicted in scenes representing the carrying off of Kerberos by Herakles, or banqueting with Hades. On both early and late vases Hermes, in his character of Psychopompos, is seen preparing to conduct her back from the nether world (see Plate XLV.), or actually on his way. In another semi-mystical version of the return of Persephone, signifying the return of spring and vegetation, her head or part of her body emerges from the earth.

in one case accompanied by the head of Dionysos, whereat Satyrs and Maenads flee affrighted. The interpretation of some of these scenes, however, has been much questioned.

The number of vases with subjects representing the three Delphic deities—Apollo, Artemis, and Leto—is considerable. The appearances of Apollo, at any rate, are probably only exceeded in number by those of Athena, Dionysos, and Herakles. It is, in fact, impossible to make a complete enumeration of the groups in which Apollo occurs, and a general outline alone can be given.

Apollo as a single figure is often found both on B.F. and R.F. vases, usually as Kitharoidos, playing his lyre; sometimes also he is distinguished by his bow. As Kitharoidos he is usually represented standing, but in some cases is seated. He is sometimes accompanied by a hind or a bull (Apollo Nomios?). He is represented at Delphi seated on the Pythoress tripod, or is seated at an altar, or pours a libation. He rides on a swan or on a Gryphon, and also crosses the sea on a tripod. In some scenes he is characterised as Daphnephoros, holding a branch of laurel, or is represented in the attitude associated with Apollo Lykeios, resting with one hand above his head. In one scene the type of Apollo Kitharoidos closely resembles that associated with the sculptor Skopas.

When he is grouped with Artemis, the latter deity usually carries a bow and quiver, or they pour libations to one another; but more commonly they stand together, without engaging in any action. They are also depicted in a chariot. More numerous are the scenes in which Leto is also included (as Fig. 116), though she is not always to be identified with certainty. In this connection may be noted certain scenes relating to Apollo’s childhood: his birth is once represented, and on certain B.F. vases a woman is seen nursing two children (one painted black, the other white), which may denote Leto with her infants, though it is more probably a symbolic representation of Earth the Nursing-mother (Gaia Kourotophros; see p. 73). Tischbein published a vase of doubtful authenticity,

6 B.M. B 168, 213; Mus. Greg. ii. 39, 1a; Él. Cér. ii. 2. Nyx (Night) was similarly represented on the Kypselos chest (Paus. v. 18, 1).
which represents Leto with the twins fleeing from the serpent Python at Delos; but in two instances Apollo certainly appears in Leto's arms, in one case shooting the Python with his bow.

With these three is sometimes joined Hermes—in one instance at Delphi, as indicated by the presence of the omphalos; or, again, Hermes appears with Apollo alone, or with Apollo and Artemis. Poseidon is seen with Apollo, generally accompanied by Artemis and Hermes, also by Leto and other indeterminate female figures. In conjunction with Athena, Apollo is found grouped with Hermes, Dionysos, Nike, and other female figures; also with Herakles. With Aphrodite he is seen in toilet scenes, sometimes anointed by Eros. In one case they are accompanied by Artemis and Hermes, and on one vase Apollo is grouped with Zeus and with Aphrodite on her swan. He accompanies the chariots of various deities, such as Poseidon, Demeter, and Athena, especially when the latter conducts Herakles to heaven.

Apollo, in one case, is associated with the local Nymph Kyrene on a fragment of a vase probably made in that colony. He frequently receives libations from Nike, and in one case is crowned by her. With Nymphs and female figures of indeterminate character he occurs on many (chiefly B.F.) vases, sometimes as receiving a libation. On several red-figured vases he is

accompanied by some or all of the nine Muses, one representing their contest with Thamyris and Sappho. He and Artemis are specially associated with marriage processions, whether of Zeus and Hera or of ordinary bridal couples. Apollo also appears in a chariot drawn by a boar and a lion at the marriage of Kadmos and Harmonia.

In Dionysiac scenes he is a frequent spectator; he greets Dionysos among his thiasos, joins him in a banquet, or accompanies Ariadne’s chariot or the returning Hephaistos; listens to the Satyr Molkos playing the flutes, or is grouped with Satyrs and Maenads at Nysa. More important and of greater interest are the scenes which depict the legend of Marsyas, and they may fitly find a place here. The story is told in eight different episodes on the vases, which may be thus systematised:

2. First meeting of Apollo and Marsyas: Millin-Reinach, i. 6.
3. The challenge: Berlin 2638.
4. Marsyas performing: B.M. E 490; Reinach, i. 452 (Berlin 2950), i. 511 (Athens 1921), ii. 312; Jatta 1093 = Reinach, i. 175 = Baumeister, ii. p. 891, fig. 965.
5. Apollo performing: Jatta 1364 = Él. Cér. ii. 63; Wiener Vorl. vi. 11.
6. Apollo victorious: Reinach, ii. 310; Petersburg 355 = Reinach, i. 14 = Wiener Vorl. iii. 5.
7. Condemnation of Marsyas: Naples 3231 = Reinach, i. 405; Reinach, ii. 324.
8. Flaying of Marsyas: Naples 2991 = Reinach, i. 406 (a vase with reliefs); Roscher, ii. 2455 = Él. Cér. ii. 64.

Among other scenes in which Apollo (generally accompanied by Artemis) plays a personal part, the following may be mentioned: the slaying of the Niobids by the two deities; the slaying of Tityos by Apollo (in one case Tityos is represented carrying off Leto, who is rescued by Apollo); and various love adventures in which Apollo is concerned. The name of the Nymph pursued by him in the latter scenes cannot, as a rule, be identified; one vase appears to represent him contending with Idas for the possession of Marpessa. He also heals the Centaur Cheiron (this appears in burlesque form) and protects Creusa from the wrath of Ion. He is seen seeking for the cattle stolen from him by Hermes, and contending with that god over the lyre. He frequently appears in Birth of Athena scenes as Kitharoidos, and also at the sending forth of Triptolemos or in the under-world. In one case he appears (with Athena, Artemis, and Herakles) as protecting deity of Attica, watching a combat of Greeks and Amazons. On one vase there is a possible reference to Apollo Smintheus, with whom the mouse was especially associated.

Like other deities, Apollo and Artemis are frequently found on Apulian vases as spectators of the deeds of heroes, or other events in which they are more or less interested; some of these subjects have already been specified (see above, p. 17). Apollo especially is often seen in connection with the story of Herakles, or the Theban and Trojan legends. One burlesque scene represents his carrying off the bow of Herakles to the roof of the Delphic temple, and the subject of the capture

INTRODUCTORY—THE OLYMPIAN DEITIES

of the tripod, with the subsequent reconciliation, is of very frequent occurrence. As Apollo Ismenios, the patron of Thebes, he is a spectator of the scene of the infant Herakles strangling the snakes; in one case he is represented disputing with Herakles over a stag, which may be another version of the story of the Keryneian stag, a scene in which he also occurs. He is seen with Herakles and Kyknos, Herakles and Kerberos, and is very frequently present at the apotheosis of the hero.

Apollo and Artemis watch Kadmos slaying the dragon, and one or other of them is present at the liberating of Prometheus; Apollo alone is seen with Oedipus and Teiresias, and watches the slaying of the Sphinx by the former. Among Trojan scenes he is sometimes present at the Judgment of Paris, also at the sacrifice of Iphigeneia, the pursuit of Troilus, the combats of Achilles and Ajax with Hector, and the recognition of Aithra by her sons. He is, of course, frequently seen in subjects from the Oresteia, both in Tauris and at Delphi, and at the death of Neoptolemos before the latter temple. The pair are also seen at the carrying off of Basile by Echelos (see p. 140).

The ἱερα ψυχα, or primitive cult-statue, of Apollo is sometimes represented; in one case Kassandra takes refuge from Ajax before it, instead of the usual statue of Athena.

The appearances of Artemis, as distinct from Apollo, need not detain us long; she is sometimes found in mythological scenes, but frequently as a single figure, of which there are some fine

examples. A winged goddess grasping the neck or paws of an animal or bird with either hand frequently occurs on early vases, and is usually interpreted as Artemis in her character of πότνια θηρῶν or mistress of the brute creation, sometimes called the Asiatic or Persian Artemis. On an early Boeotian vase (with reliefs) at Athens is a curious representation of Artemis Diktyonna, a quasi-marine form of the goddess, originally Cretan (?); on the front of her body is represented a fish, and on the either side of her is a lion. As a single figure she appears either with bow or quiver, or with lyre, sometimes accompanied by a stag or hind, or dogs; she also rides on a deer or shoots at a stag. Or, again, she is attended by a cortège of Nymphs or rides in a chariot. Like that of Apollo, her ἕοαυον is sometimes introduced into a scene as local colouring.

The myth with which she is chiefly associated is that of Aktaeon, which may find a place here, though in most cases Aktaeon alone is represented, being devoured by his hounds. A curious subject on a vase at Athens appears to be the burial of Aktaeon, Artemis being present. She is also represented at the sacrifice of Iphigencia, for whom a stag was substituted by her agency, and in connection with the same story at her shrine in Tauris. She is especially associated with Apollo in such scenes as the contest with and playing of Marsyas, the rape of the

Delphic tripod by Herakles\(^1\) and the subsequent reconciliation,\(^2\) or the appearance of Orestes at Delphi.\(^3\) The two deities sometimes accompany nuptial processions in chariots, Artemis as *pronuba* holding a torch, but it is not easy to say whether these scenes refer to the nuptials of Zeus and Hera or are of ordinary significance.\(^4\) A scene in which she pursues a woman and a child with bow and arrow may have reference to the slaughter of the Niobids.\(^5\)

Other scenes in which she is found are the Gigantomachia\(^6\) and the Birth of Athena\(^7\); or she is seen accompanying the chariots of Demeter\(^8\) and Athena,\(^9\) and with Aphrodite and Adonis.\(^10\) She disputes with Herakles over the Keryneian stag\(^11\); and is also present when he strangles the snakes,\(^12\) and at his apotheosis in Athena’s chariot.\(^13\) She attends the combat of Paris and Menelaos,\(^14\) and as protecting deity of Attica she watches a combat of Greeks and Amazons.\(^15\) A vase in Berlin, on which are depicted six figures carrying chairs (Diphrophori, as on the Parthenon frieze) and a boy with game, may perhaps represent a procession in honour of Artemis.\(^16\)

**Hephaistos** is a figure who appears but seldom, and never as protagonist, except in the case of his return to Olympos,\(^17\) a subject already discussed (p. 17), as has been his appearance in the Gigantomachia\(^18\) and at the birth of Athena.\(^19\) In conjunction with the last-named goddess he completes the creation and adornment of Pandora on two fine vases in the British Museum\(^20\); he is also present at the birth of

Erichthonios. His sojourn below the ocean with Thetis and the making of Achilles' armour also occur. Representations of a forge on some B.F. vases may have reference to the Lemnian forge of Hephaistos and his Cyclopean workmen. He is also seen with Athena, at the punishment of Ixion, and taking part in a banquet with Dionysos.

More important than any of the other Olympian deities, for the part she plays in vase-paintings, is Athena, the great goddess of the Ionic race, and especially of Athens. Of her birth from the head of Zeus we have already spoken, as also of the part she plays in the Gigantomachia (p. 15). The separate episode of her combat with Enkelados (her invariable opponent) is frequently depicted on B.F. vases; but in one instance she tears off the arm of another giant, Akratos. We have also seen her assisting at the creation of Pandora, and contending with Poseidon for Attica. She receives the infant Dionysos at the time of his birth, and is also generally present at that of Erichthonios and once with Leto at that of Apollo and Artemis. She is, of course, an invariable actor in Judgment of Paris scenes, in one of which she is represented washing her hands at a fountain in preparation for the competition.

From assemblies of the gods she is rarely absent, and she is also associated with smaller groups of divinities, such as Apollo and Artemis (p. 31), with Ares or Hephaistos, or with Hermes, or in Eleusinian or Dionysiac scenes. Thus she assists at

the slaying of the Niobids, and on one vase is confronted with Marsyas, before whom she has just dropped the flutes. Scenes in which she appears receiving a libation from Nike are extremely common; and she is also found with Iris and Hebe. In one instance she herself pours a libation to Zeus.

Generally the companion of princes and patroness of heroes, she protects especially Herakles, whom she aids in his exploits and conveys finally in her chariot to Olympos, where he is introduced by her to Zeus. Some scenes represent the two simply standing together; in others she welcomes and refreshes him after his labours, and in one case he is supposed to be represented pursuing her. It is unnecessary to particularise here the various scenes in which she attends Herakles (see p. 95 ff.); but one may be mentioned as peculiar, where she carries him off in her chariot with the Delphic tripod which he has just stolen. Another rare scene connected with the Herakles myths is one in which, after the fight with Kyknos (see p. 101), Zeus protects her from the wrath of Ares. Another of her favourite heroes is Theseus, and she is even more frequently associated with Perseus, whom she assists to overcome and escape from the Gorgons. She gives Kadmos the stone with which to slay the dragon, and is also seen with Bellerophon, Jason and the Argonauts, and Oedipus. She is present at the rape

of Oreithyia by Boreas,\(^1\) at the punishment of Ixion,\(^2\) and at the setting out of Amphiaraoe\(^3\); at the stealing of Zeus' golden dog by Pandareos\(^4\); also at the rape of the Leukippidae by the Dioskuri,\(^5\) and of Basile by Echelos (see p. 140),\(^6\) and in a scene from the tragedy of Merope.\(^7\)

The scenes where she is assisting the Greek heroes in the Trojan War are almost too numerous to specify, her favourite being of course Achilles; her meeting with Iris (II. viii. 409) is once depicted,\(^8\) and she also appears in connection with the dispute over Achilles' arms.\(^9\) She is not so frequently seen with her other favourite, Odysseus, but in one instance she is present when he meets with Nausikaa,\(^10\) and also when he blinds Polyphemos.\(^11\) On the numerous vases representing Ajax and Achilles (or other heroes) playing at draughts, the figure or image of the goddess is generally present in the background.\(^12\) The same type on B.F. vases is adopted for the subject of two heroes casting lots before her statue\(^13\); lastly, she appears as the friend and patron of Orestes when expiating the slaying of his mother.\(^14\)

As a single figure Athena is represented under many types and with various attributes, seated with her owl\(^15\) or in meditation,\(^16\) writing on tablets\(^17\) or holding the *akroostolion* of a ship\(^18\); playing on a lyre\(^19\) or flutes,\(^20\) or listening to a player on the flute or lyre\(^21\); with a man making a helmet,\(^22\)

or herself making the figure of a horse,¹ and in a potter's workshop.² On an early vase she appears between two lions³; or she is accompanied by a hind (here grouped with other goddesses).⁴ She is depicted running,⁵ and occasionally is winged⁶; or she appears mounting a chariot, accompanied by various divinities.⁷ As the protecting goddess of Attica she watches a combat of Greeks and Amazons⁸; she also attends the departure or watches combats of ordinary warriors,⁹ or receives a victorious one.¹⁰ In one instance she carries a dead warrior home.¹¹

There are many representations of her image, either as a ζωανον or cultus-statue, or recalling some well-known type of later art. Among the former may be mentioned her statue at Troy, whereat Kassandra takes refuge from Ajax,¹² and the Palladion carried off by Odysseus and Diomede.¹³ Among the latter, three can be traced to or connected with creations of Pheidias: viz. the chryselephantine Parthenos statue¹⁴; the Lemnian type, holding her helmet in her hand (Plate XXXVI.)¹⁵; and the Promachos, in defensive attitude, with shield and spear.¹⁶ The last-named type (earlier, of course, than the famous statue on the Acropolis) is that universally adopted for the figure of Athena on the obverse of the Panathenaic amphorae, on which she is depicted in this attitude between two Doric columns surmounted by cocks (on the later examples by figures of Nike or Triptolemos).¹⁷ Her statue is also repre-

ated as standing in a shrine or heroön; or as the recipient of a sacrifice or, offering. Her head or bust alone appears on several vases.

Ares, in the few instances in which he appears on vases, is generally in a subordinate position; he is a spectator at the birth of Athena; and appears twice on the François vase, at the wedding of Peleus and Thetis, and again in an attitude of shame and humility, to indicate the part he played in the story of Hephaistos and Hera; of his combat with the former god mention has already been made (p. 16). In the Gigantomachia his opponent is Mimas, with whom he also appears in single combat; and he aids his son Kyknos against Herakles and Athena. He is seen in several of the large groups of Olympian deities, or in smaller groups, e.g. with Poseidon and Hermes, with Apollo, Artemis, and Leto, or with Athena or his spouse Aphrodite; also with Dionysos, Ariadne, and Nereus. He also receives a libation from Hebe. He is seen at the birth of Pandora, the punishment of Ixion, the slaying of the Niobids, the apotheosis of Herakles, and the contest of that hero with the Nemean lion. In some cases his type is not to be distinguished from that of an ordinary warrior or hero, as in one case where he or a warrior is seen between two women.

Aphrodite seldom appears as a protagonist on vases, and in fact plays a small personal part in mythology. Apart from scenes of a fanciful nature she is usually a mere spectator of events; but as she is not often characterised by any distinctive attribute, there is in many cases considerable difficulty in identifying her personality. This is especially the case on B.F. vases, on which her appearances are comparatively rare. One vase represents her at the moment of her birth from the sea in the presence of Eros and Peitho\(^1\); she also appears (on late vases only) with Adonis,\(^2\) embracing him, and in two instances mourning for him after his death\(^3\); but caution must be exercised in most cases in identifying this subject, which is but little differentiated from ordinary love scenes. One scene apparently represents Zeus deciding a dispute between her and Persephone over Adonis.\(^4\)

More commonly she is seen riding over the sea on a goose or swan,\(^5\) of which there is one exceedingly beautiful example in the British Museum; here she is to be recognised as the Heavenly Aphrodite (Ourania), whereas in her character of Pandemos (profane or unlicensed love) she rides on a goat.\(^6\) In other instances the swan draws her chariot over the sea,\(^7\) or she is borne by a pair of Erotes,\(^8\) or sails in a shell, as in the story of her birth and appearance in the island of Kythera\(^9\); in others, again, her chariot is drawn (on land) by the Erotes,\(^10\) or by a lion, wolf, and pair of boars.\(^11\) She is also represented at her toilet\(^12\) or bathing,\(^13\) in the latter case in the attitude

of the *Vénus accroupie* of sculpture; in these instances again there is often difficulty in distinguishing from scenes of ordinary life. Again, she is represented spinning,¹ playing with a swan,² or caressing a hare,³ or in company with a young hunter,⁴ possibly meant for Adonis.

In many scenes she is grouped with a cortège of attendant Nymphs and personified figures, often with names attached.⁵ Besides Eros, the following are found on these vases: Pothis (Longing) and Himeros (Charm), Hygieia (Health), Peitho (Persuasion), Paidia (Play), Pandaisia (Good Cheer), Eunomia (Orderliness), Euthymia (Cheerfulness), Eudaimonia (Happiness),

two Erotes make a basket of golden twigs. Their heads or busts are also found on late vases, as is that of Aphrodite alone.

In relation to other mythological subjects she is frequently found in assemblies of the gods, especially in the spectator groups on Apulian vases; also at the birth of Athena (rarely), at the marriage of Zeus and Hera, and in the Gigantomachia (very rare). She is seen among the Eleusinian deities and in scenes from the nether world; and she accompanies the chariots of Athena and Demeter. She also accompanies Poseidon in his wooing of Amymone, and is present at the slaying of Argos by Hermes, the punishment of Aktaeon and the contest of Apollo and Marsyas, and the wooing of Europa by Zeus. She is also grouped with Apollo and the Muses listening to Thamyris and Sappho.

She is seldom seen with Herakles, but is present at his apotheosis, and also with him in the Garden of the Hesperides; she is once seen with Theseus, and is present at the rape of the Leukippidae by the Dioskuri. Other heroes with whom she is connected (chiefly as a spectator on the Apulian vases) are Kadmos, Meleager, Perseus, and Pelops.

In the tale of Troy, however, she plays a more important part. The Judgment of Paris is, of course, the scene with which she is chiefly connected; in one instance she appears alone with

Paris, unless Anchises be here meant. She is present at the first meeting and wedding of Peleus and Thetis; at the toilet of Helen, and at her carrying off by Paris; she assists her son Aeneas in his combat with Diomede, and is present at the rape of Cassandra. Helen takes refuge from Menelaus with her in her temple; and finally she assists Aeneas to escape with the aged Anchises from Troy.

Besides the scenes in which he appears with Aphrodite, Eros is a sufficiently important personage on vases to demand a section to himself. On the black-figured vases he never appears, nor on the earlier red-figured ones is it possible to find many instances, but towards the end of the fifth century his popularity is firmly established, while on the Italian vases, especially the later Apulian, his presence is almost invariable, not only in mythological scenes, but in subjects from daily life. As a single figure he occurs again and again, generally holding a wreath, mirror, box, fan, or some object which may be regarded assignifying a lover's present.

Concurrently with his increasing popularity we note the change that comes over the conception of his personality. Beginning as a full-grown youth of fair proportions, his form gradually attenuates and becomes more juvenile, or even in some cases infantile, as in Hellenistic art; while on the Apulian vases it assumes an androgynous, altogether effeminate character. His hair is arranged in feminine fashion, and his person is adorned with earrings, bracelets, anklets, and chains, remaining otherwise entirely nude, except that he sometimes wears soft shoes of a feminine kind (see Plate XLIV. and Fig. 118).

On the red-figured vases he generally appears as a single figure, though on those of the "fine" style he is often in attendance on Aphrodite; roughly speaking, it may be said that he figures in all scenes that deal with the passion of Love,

such as the Judgment of Paris,\(^1\) the story of Adonis,\(^2\) the marriage of Dionysos and Ariadne,\(^3\) or the love-affairs of Zeus, Poseidon, and other gods.\(^4\)

In other legends in which Love plays a part, such as the stories of Jason and Medea,\(^5\) Phaidra and Hippolytos,\(^6\) Peleus and Thetis (or Theseus and Ariadne),\(^7\) Pelops and Hippodameia,\(^8\) Paris and Helen,\(^9\) he is also to be seen; as also at the carrying off of Persephone.\(^10\) Moreover, he occurs in several scenes where the reason is not so apparent, as at the birth of Erichthonios,\(^11\) in the Garden of the Hesperides,\(^12\) at the suckling of Herakles by Hera,\(^13\) with Herakles and a Centaur,\(^14\) and in the nether world;\(^15\) also with deities such as Zeus, Athena, Nike, Helios and Selene, and Dionysos;\(^16\) anointing the head of Apollo.\(^17\) The cosmogonic conception of Eros and his connection with Gaia is referred to in the next chapter under the latter heading (p. 73). Two Erotes draw the chariot of Demeter and Persephone;\(^18\) and he is also seen in company with the Nereids.\(^19\) His presence in Dionysiac scenes, especially on the later vases, is often to be noted, though without any special meaning to be attached to it;\(^20\) in one instance he is carried on the back of a Seilenos.\(^21\) In many of these scenes he merely accompanies Aphrodite, and they do not therefore require enumeration. Lastly, he is seen in company with Sappho,\(^22\) the great poetess of Love.

In non-mythological scenes he is found almost as frequently, especially in toilet scenes, or what we may regard as "scenes of courting"; but on the later vases these exhibit little or no action, and are not worth considering in detail, with a few exceptions. Thus we see Eros in marriage processions, in musical scenes, and at banquets; at a sacrifice to a term; watching girls play the game of morra; ("How many fingers do I hold up?"); swinging them, or being danced on their feet; in scenes of fruit- and incense-gathering; or pouring wine into a krater. He appears with Agon (see p. 89) training in the palaestra. He pursues a youth or a girl, embraces a girl, or is carried by her pick-a-back; offers a hare to a youth, or drives a youth with a whip from an altar; and in one instance is about to chastise with a slipper two youths who are playing with a top and hoop; these two latter scenes may be regarded as implying the power of Eros over youth. He is also seen shooting an arrow at a woman, an idea characteristic of Anacreontic and Alexandrine poetry. Another scene which recalls the wall-paintings of the Hellenistic Age is on a vase in the British Museum, representing two Erotes being weighed in scales.

As a single figure he pursues a hare or kills a snake; crouches before a plant; is represented armed with shield and spear; or places a sash or wreath on a tripod. He is borne in a chariot by horses or swans, or rides on

a horse, deer, dog, or swan. He is also seen playing various games, such as the _kottabos_ or _morra_, see-sawing or playing knucklebones; or with a ball or hoop or toy-boat. Or he plays the flute or lyre; or plays with animals, such as a deer, dove, swan; or finally (on Apulian vases) with a toy which resembles a wheel, and was probably used for magic purposes, as several passages of literature indicate.

Lastly, we must give a survey of the frequent representations of Eros flying through the air carrying some attribute, which are so universal on the Italian vases, though some of the earliest types also represent him in this manner. Thus he carries a hare, or dove or other bird; fruit (such as grapes or pomegranates), flowers, and branches; wreaths, dishes of fruit, baskets, vases of various

forms, and a spit of meat; thyrsi, tambourines, lyres, torches, incense-burners, strigils, and ladders; fans, parasols, mirrors, toilet-boxes, strings of beads, and sashes, or balls.

Among the other associates of Aphrodite the chief are Peitho, Pothos, and Himeros, of whom mention has already been made. Peitho, except where her name is given, is not always easy to identify; the other two are not differentiated from Eros in form, and are, in fact, only variations of the conception of Love, as are the more rarely occurring Phthonos (Amor invidiosus) and Talas (Amor infelix), the latter of whom is associated with Sappho. Peitho is found with Himeros in one instance, and in another with Eukleia; she also accompanies Aphrodite in Eleusinian and other scenes, at the deliverance of Andromeda, in the Garden of the Hesperides, and at the rape of Helen and the Leukippidae, and at the recovery of Helen by Menelaos; she consoles her when mourning for Adonis; and is present at the moment of her birth. Like Eros, she is seen in company with Sappho, and she also appears with Meleager and Atalante.

Pothos and Himeros are seen floating over the sea with Eros on a fine R.F. vase in the British Museum, and at the Judgment of Paris; and grouped together generally as Erotes, they may be distinguished on some late vases. Pothos attends at the

toilet of Helen, \(^1\) and plays the flutes in a Dionysiac scene. \(^2\) Himeros is seen swinging Paidia (another of Aphrodite’s following) \(^3\); at the marriage of Herakles and Hebe \(^4\); presenting a crown to Dionysos, \(^5\) or removing his shoes, \(^6\) and accompanying him in a scene of preparation for the Satyric drama. \(^7\)

**Hermes**, the messenger of the gods, is a common figure on vases of all periods, but chiefly as a subordinate agent, though he plays a leading part in some scenes, and frequently occurs as a single figure. \(^8\) Some small vases are decorated merely with his head, wearing the winged petasos. \(^9\) He is represented passing over the sea with a lyre, \(^10\) carrying a ram, \(^11\) riding on a ram or goat, \(^12\) or reclining on the latter animal \(^13\); also as making a libation \(^14\) or sacrificing a goat. \(^15\) He presides over the palaestra, \(^16\) and is also seen standing between Sphinxes, \(^17\) or again (apparently as a statue) standing by a fountain. \(^18\) In one scene he leads a dog disguised as a pig, \(^19\) and he is also represented tending a flock of sheep, \(^20\) or fishing. \(^21\)

The story so vividly recounted in the Homeric hymn of his infantile theft of Apollo’s oxen is given in several scenes, including his taking refuge in his cradle (Fig. 119) \(^22\); he is also represented with his mother Maia, \(^23\) and disputing with Apollo over the lyre which he invented. \(^24\) The only other myth in which he plays a chief part is his pursuit of the Nymph Herse

with Aphrodite mourning for Adonis,\footnote{Reinach, i. 234. \textit{Ibid.} i. 124. \textit{Ibid.} i. 499. \textit{Ibid.} i. 244; i. 463; i. 175. \textit{Ibid.} ii. 4. B.M. B 203 (Athena); Reinach, ii. 22, 26, 73; Benndorf, \textit{Gr. u. Sic. Vasenb.} 4; 1. B.M. B 349; E 44, 459; Reinach, ii. 125, 152, 275.}
he is also seen with Eos and Selene,  
Kastor and Polydeukes,  
Prometheus,  
Leda at the finding of the eggs,  
and at the birth of Pandora. He is specially associated with Zeus, Apollo, 
Athena, and Dionysos; and also appears with Aphrodite Pandemos;  
he is not infrequently found in Dionysiac scenes;  
and to him is entrusted the newly born Dionysos to be handed over to the Nymphs of Nysa. On B.F. vases he is frequently seen leading a procession of Nymphs.

As a Chthonian deity he is present in many scenes relating to the nether world, especially on the large Apulian vases, and in connection with the Eleusinian myths, such as the carrying off of Persephone. As Psychagogos or Psychopompos he is seen in Hades waiting to conduct Persephone to earth, or actually en route with her. He frequently performs the same office for mortals, conducting them to Charon's bark. He is also found in company with Thanatos, and with Herakles bringing back Alkestis. A unique scene with Hermes in his Chthonian capacity is on a vase where he is represented chaining up Kerberos; and another, yet more curious, depicts him standing by a jar (πιθος) from which a number of small winged figures (εἴδωλα or ghosts) are flying out, with a supposed reference to the Athenian festival of the Πιθοτέμα.

and p. 75 below.
In the stories of Herakles he plays an important part, as also in those of Theseus and other heroes, and he is frequently visible in scenes from the Trojan legends. He conveys the infant Herakles to Cheiron for instruction,\(^1\) and conducts the hero to Hades to fetch Kerberos\(^2\); he is also seen feasting or bathing with him,\(^3\) and in company with him and Athena,\(^4\) and most frequently in connection with his apotheosis.\(^5\) With Theseus he is found more rarely; but he frequently accompanies Perseus in his flight from the Gorgons.\(^7\) In other heroic scenes he is often one of the spectator deities on Apulian vases. In one instance he is seen banqueting with an unidentified hero.\(^8\)

In the Trojan legends his chief appearance is as conductor of the goddesses to the Judgment of Paris; and in one case he accompanies Peleus when bringing the infant Achilles to Cheiron.\(^9\) He also assists Zeus in weighing the souls of Achilles and Hector,\(^10\) conducts Priam to Achilles,\(^11\) and is present in many other scenes which need not be recounted in detail. A scene difficult of explanation represents him accompanying Odysseus in a chariot.\(^12\)

A Herm or terminal figure of Hermes is a not uncommon feature on vases, especially of the R.F. period,\(^13\) and generically as the object of a sacrifice made to it.\(^14\)

Last of the Olympic deities comes Hestia, who is usually coupled with Hermes; she, however, only appears on a few vases in gatherings of the Olympic deities,\(^15\) as on the François vase, where she attends the nuptials of Peleus and Thetis, and at the marriage of Herakles and Hebe.\(^16\)

CHAPTER XIII

DIONYSOS AND MISCELLANEOUS DEITIES

§ 1. DIONYSOS AND HIS ASSOCIATES

The most important deity in Greek mythology outside the Olympian circle is undoubtedly Dionysos; but the part that is played by him and his attendant train in Greek art is out of all proportion even to this, at least in the vase-paintings. Apart from what we may regard as strictly mythological subjects, such as the Birth of Dionysos and scenes in which other gods or heroes are introduced, the number and variety of the themes are so great that an exhaustive enumeration is quite impossible; nor indeed would it repay the trouble to give a complete list of what may for convenience be termed Dionysiac scenes. Suffice it to say that they occur with equal frequency on the vases of all periods from the middle of the sixth century onwards.

The personages with whom we have to deal in this section are, besides Dionysos himself, his spouse Ariadne, Pan, with his "double" Aegipan, and the motley rout of Satyrs, Seileni, and Maenads, who appear either in the wine-god's company or by themselves. Dionysos is generally accompanied by one or more Maenads or Seileni, whether engaged in some definite action, such as pouring wine or playing flutes, or no; but he is
DIONYSOS

also not infrequently seen as a single figure. On the earlier vases he is elderly, and bearded, but on the later youthful and beardless. He is occasionally represented with horns, or in the form of a man-headed bull. He is depicted sacrificing at an altar, pouring a libation, or slaying a fawn or goat (χαιροφόνος); banqueting, or playing on the lyre. He rides on a bull, goat, mule, or panther, or in a winged chariot—in one case drawn by Gryphons, in another by a Gryphon, bull, and panther—or in a chariot shaped like a ship; or is carried by a Seilenos. On a beautiful cup by Exekias he sails over the ocean in a boat, the mast of which grows into a vine. We are reminded in this scene of the Homeric hymn (xix.) and the story of the Tyrrhenian pirates, a subject which, according to one interpretation, is represented on a vase at Athens.

His birth is not often represented, and chiefly on R.F. vases; it has been referred to already in detail, in reference to Zeus. When handed over to Hermes, the newly born infant is conveyed by that god to Nysa, where he is finally delivered to a Seilenos, to be nursed by the Nymphs of that place. Or he is handed directly to a Nymph by Zeus, or, by a curious error or confusion on the artist's part, to Ariadne, his future bride.

There is a possible representation of the Indian Dionysos or Bassareus,\(^1\) India being the land whence he was fabled to come; and other vases represent various events connected with his first manifestation of himself in Greece: such as the madness he brought on Lykourgos, who refused to receive him,\(^2\) and his subsequent sacrifice after his triumph\(^3\); the death of the similarly contumelious Pentheus (the story on which the plot of the Bacchae turns)\(^4\); or his supposed visit to the Athenian Ikarios.\(^5\) He sometimes appears with his mother Semele, whom he brings back from Hades\(^6\); in one or two instances their heads are seen rising from the ground to indicate their return from the nether world.\(^7\) They are then solemnly introduced into Olympos.\(^8\)

Dionysos is frequently grouped with various deities, such as Apollo, Athena, and Hermes\(^9\); or they are seen in his company at a banquet.\(^10\) He sometimes appears at the birth of Athena,\(^11\) the apotheosis of Herakles,\(^12\) and his marriage with Hebe\(^13\); or in heroic scenes, such as the Judgment of Paris,\(^14\) or the combat of Herakles and Kyknos.\(^15\) He appears with the Seileni who attack Hera and Iris,\(^16\) and brings back Hephaistos to Olympos.\(^17\) He frequently takes part in the Gigantomachia, usually in single combat,\(^18\) being aided by his panther, and sometimes by Seileni and Maenads.\(^19\) Sometimes he is seen preparing for this event,

wearing a cuirass, while Satyrs or Maenads hold the rest of his armour. ¹ He is also grouped with Gaia Κουρωτρόφος,² and with Poseidon and Nike³; or accompanies the chariot of Athena⁴; and is seen in more than one assembly of the Olympian deities.⁵

His wooing and consoling of the deserted Ariadne⁶ is an attractive and popular subject, and several vases seem to represent the nuptial ceremonies between the pair,⁷ or the preparations for the same, with Eros assisting at the bride’s toilet.⁸ Numerous are the instances in which he is seen grouped with Ariadne, often in loving embrace,⁹ and generally surrounded by his cortège,¹⁰ but also alone. Or, again, he and Ariadne drive in a chariot drawn by lions,¹¹ panthers,¹² stags,¹³ or goats¹⁴; in two cases Ariadne drives her own chariot alone,¹⁵ in another Dionysos is seen alone in a four-horse chariot.¹⁶ They are also seen reclining together at a banquet,¹⁷ sometimes accompanied by Herakles and other deities.¹⁸ On a vase of quasi-Etruscan style¹⁹ we see the sleeping Ariadne surrounded by Dionysos, Satyrs, and Maenads. This presumably refers to the scene in Naxos.

The numerous vases on which Dionysos appears, with or without Ariadne, accompanied by a throng of Satyrs and Maenads, sometimes in high revelry, sometimes in more peaceful circumstances, may next be mentioned, though it is not necessary

to cite more than a few typical examples; equally numerous are smaller groups, where only one or two followers appear, but only a few of these need be particularised. Thus we see him in peaceful converse with Maenads or Nymphs; seizing them with amorous intent; listening to a Satyr playing the lyre or flute; or going to a banquet, accompanied by Satyrs with torches; or feeding a bird. In banquet scenes he receives drink from a Satyr, or plays at the kottabos (see p. 182); or Seileni steal his food and drink. He watches a Lydian woman dancing in armour, or dances himself to the flutes played by an actor. In one instance he is seen leaving his chariot to join in the revels of his followers; in another he takes part in the orgies of the Scythian Agathyrsi, and he is seen in a drunken condition, supported by one of his followers. He is not infrequently grouped with Eros, from whom he receives drink or a wreath; also with Pan, or with semipersonified figures such as Komos (Revelry) or Oinopion (Wine-drinker).

Pan only makes his appearance on late vases, usually in Dionysiac groups, or as a single figure on the smaller Apulian wares; when he is depicted with goat's legs and squat propor-

FIG. 120. DIONYSOS WITH SATYRS AND MAENADS (HYDRIA BY PAMPHAIOS IN BRIT. MUS.).
tions, he is usually called Aegipan\(^1\); or, again, Paniskos, when he has the form of a beardless youth.\(^2\) He surprises a Nymph asleep,\(^3\) and is sometimes associated with the Nymph Echo.\(^4\)

Dionysos' connection with the Attic drama is more specially indicated by scenes in which he appears as the inventor or patron of tragedy, presenting a tragic mask to a young actor;\(^5\) he also appears in an elaborate scene representing the preparations for a Satyric drama.\(^6\) As the object of worship he is sometimes seen in a form which implies a reference to some primitive cult, as an aniconic pillar-image (ξυπατις or βαιτυλος)\(^7\); or, again, in the form of a tree (Dionysos Dendrites), and homage is paid to him by Maenads.\(^8\) Besides sacrifices to his image, we see sacrificial dances performed,\(^9\) or choragic tripods consecrated to him.\(^10\) His statue is once seen at a fountain.\(^11\)

We must now treat of the scenes in which Seileni and Satyrs, Maenads and Nymphs, appear independently of Dionysos, or in particular actions without relation to him. They are, indeed, often, if not invariably, present in all scenes in which he takes part, whether mythological or of a less definite character; as, for instance, the return of Hephaistos to Olympos,\(^12\) in which the gods are usually accompanied by a more or less riotous escort of Satyrs, and others as already mentioned. The attack of the Satyrs on Iris and Hera has been alluded to in connection with the latter; and they seldom elsewhere appear in relation to the Olympian deities or other myths, except in those scenes which depict the rising of Persephone or Ge-Pandora from the earth.\(^13\) But Satyrs and Maenads are sometimes represented

as performing sacrifices, not only to Dionysos, but also to Herakles, or to a terminal figure of Hermes. We turn next to scenes of more general character.

There are numerous vases, especially of the R.F. period, on which groups of Satyrs and Maenads are represented in revels of a more or less wild and unrestrained character, or else in more peaceable association. Those in which Dionysos himself is present have already been enumerated, but the general types may be now considered. It may, perhaps, be possible to distinguish two, or even three, classes of this subject: the inactive groups of Satyrs and Maenads; those in which they rush along in frenzy and unrestrained licence, brandishing their thyrsi, or with tambourines (tympana) and other musical instruments; and, lastly, scenes of convivial revelry (kômôi), in which they are engaged in drinking from all sorts of vessels. Sometimes these revels are strictly confined to Satyrs, and then they become absolutely licentious in character; or, again, a group of Maenads unattended tear along with torches, thyrsi, and musical instruments; or, lastly, both join in dances hand-in-hand, a subject which on early vases is often adopted for a long frieze encircling a vase.

As a pendant to these, many subjects and single figures must here be mentioned which seem to be excerpts from the larger compositions, as well as independent motives presenting special features found in the more elaborate scenes. We begin with subjects in which both Satyrs and Maenads take part, among which we find a favourite subject to be the gathering of fruit,

11 Louvre F 334.
especially grapes, and the processes of the vintage. Satyrs offer drink to Maenads, or play the flutes for them to dance to; and there is a favourite series of subjects of an amorous character, in which the Satyrs pursue the objects of their passion, or surprise them asleep, seize them and overcome their struggles to escape, and finally enfold them in embraces, or carry them on their shoulders. Satyrs are also seen surprising women while bathing; and a group of them appear astonished at the sunrise.

We may next dismiss briefly the scenes which depict Maenads alone, usually as single figures. They sometimes appear in a state of frenzy (Fig. 121), dancing with snakes twisted round their arms, or playing castanets, or tearing a kid to pieces (χυαρινοφόνος). In quieter fashion they ride on a mule or bull, or are seen accompanied by hinds, goats, and panthers, or playing with a cat and bird.

Satyrs in independent scenes often appear in burlesque guise, attired and acting as athletes, or as warriors, with the

Satyrs fight with torches; sport with deer and other animals; ride on goats, asses, and mules or lead them along; and in one instance a Satyr has fallen off his mule, and a companion runs to help him; in another, two Satyrs draw a third in a cart. They are seen carrying chairs and vessels of various kinds, such as amphorae, situlae, kraters, rhyta, or wine-skins; also seated on wine-skins or wine-jars, playing games with jugs and wine-jars, balancing drinking-cups on their backs, pouring wine into a jar or drawing it out from the mixing-bowl, or playing games, such as see-saw or ball. Many of these scenes are from the interiors of R.F. cups, to which they were well adapted, the varied attitudes giving so much scope for the ingenuity of the daring artists of the period. Scenes in which Satyrs play the lyre or flute are very numerous.

A feature of the numerous Dionysiac subjects on vases is the tendency to individualise Satyrs and Maenads by means of names, sometimes meaningless, sometimes names otherwise known in mythology, and frequently personifications of abstract conceptions, such as we shall see later to be very common on vases of all periods; in these cases they usually have some relation to the character or occupation of the personages to whom they are attached. The Satyrs Marsyas and Olympos sometimes appear in the larger compositions; the former has been already mentioned in another connection. There is also a curious representation of Akhratos, the deity of unmixed wine (a liquid which to the Greeks implied an

18 J.H.S. vii. pl. 62, p. 54.
extravagance of revelry, owing to the intoxicating nature of the undiluted beverage. A type of Seilenos covered from head to foot with shaggy skin, and known as Papposeilenos, is often found on the later vases. It is difficult to distinguish in all cases between Seileni and Satyrs on the vases, and the exact differences between the various types have not yet been properly elucidated, so that the terms are of necessity somewhat conventional. The equine type of Satyr, with horse’s hoofs as well as tail, which is so frequently found on the sixth-century Ionic vases, has been noted elsewhere. The young beardless Satyr is mostly found in the later period.

The number of vases on which Satyrs and Maenads are distinguished by name is very large, but only a few of the more important need be mentioned, along with some of the more curious names from the isolated instances. On a vase in Berlin no less than ten Maenads are named—Anthe (Flower), Choro (Dance), Chrysis (Gold), Kale (Beauty), Kisko (Ivy), Makaria (Blessed), Naia, Nymphé, Phanope, and Periklymene (Renowned); on one at Leyden six—Dorkis, Io, Klyto, Molpe (Song), Myro, and Xantho (Fair-hair). On the former vase a Seilenos is expressly so named, and on the latter are four Satyrs with names; on a kylix by Brygos in the British Museum the Seileni attacking Iris are styled Babacchos, Dromis, Echon, Terpon, etc.

Other Satyr-names are Briacchos, Dithyrambos, Demon, Hedyoinos (Sweet Wine), Hybris (Insolence), Hedymeles

The Under-World, from an Apulian Vase at Munich.
therewith it will be convenient to treat of Death-deities of all kinds, as well as scenes representing the life of the nether regions.

Of Demeter and Persephone, the Chthonian goddesses par excellence, we have already spoken (p. 27), and of the myths connected with them, such as the rape of the latter by Hades or Pluto, the king of the realms named after him. It is owing to this connection with Persephone that Hades is found in such scenes as the sending forth of Triptolemos,1 or at her return to the upper world,2 as well as at the rape of his consort. He is frequently seen in company with her, as the rulers of the nether world,3 especially on the large Italian "under-world vases" referred to below, and sometimes they are represented banqueting together.4 As king of the nether world he is appropriately grouped with his brothers Zeus and Poseidon, the rulers of the air and ocean.5 He is occasionally carried by Herakles on his shoulders,6 but the meaning of this subject is uncertain. He also appears as a single figure, with sceptre and cornucopia.7

The only general representations of the under-world are to be found on the large Apulian vases made for sepulchral purposes (Vol. I. p. 476), of which some half-dozen are conspicuous for the number of subjects and figures they contain. All these are collected together in the Wiener Vorleseblätter, Series E., the list being as follows:—

7 Roscher, i. p. 1802.
nether-world scenes, and one is also represented at the punishment of Ixion. They pursue Orestes, after the slaughter of his mother and Aigisthos to Delphi and Tauris, and even when with Pylades he comes to make himself known to Electra. Among other mythological scenes they are found at the combat of Herakles and Kyknos; with Pelops, and with Medea and Jason; and threatening with punishment the hero Agrios, who is seized and bound upon an altar by Oineus and Diomedes. Kerberos is once seen without Herakles in the under-world vases; and there is a very curious representation of his being chained up by Hermes.
Hekate as a Chthonian deity frequently appears on the under-world vases,\(^1\); she is also connected with Eleusinian scenes and legends,\(^2\) such as the sending of Triptolemos,\(^3\) the birth of Dionysos or Iacchos,\(^4\) or with the rape and return of Persephone.\(^5\) She appears also as a single figure.\(^6\) Allusion has already been made to the Chthonian associations of Hermes, Triptolemos, and Iacchos (pp. 27, 52).

Thanatos, the personification of Death, appears on vases almost exclusively in one aspect, as the bearer of souls in conjunction with Hypnos (Sleep); they convey the body of Memnon from Troy to his home in Egypt,\(^7\) and this type is borrowed for other scenes (e.g. on the funeral lekythi) in which an ordinary warrior is borne “to his long home.”\(^8\)

\(^7\) See Ubell, Thanator, p. 22 ff. He doubts the possibility of the identification of Thanatos on Greek vases.

\(^8\) Athens 1093 = Roscher, ii. 2678; Reinach, i. 149 = Baumker, i. p. 727, fig. 781: cf. Louvre F 388 (where Pottier identifies the warrior as Sarpedon).

\(^8\) B.M. D 58 (=Fig. 123), E 12 (=Wiener Vorr. D. pl. 3, figs. 1-3); Athens 1654 = Dumont-Pottier, i. pl. 29; Arch. Anzeiger, 1893, p. 86 (in Berlin); with body of woman, Athens 1653 = Dumont-Pottier, i. pls. 27-28, and Jahrbuch, 1895, pl. 2. All but two of these are funeral lekythi.
In one instance Thanatos is seen urging Ajax on to commit suicide; he also appears on another vase where the subject may relate to the story of Ixion. Representations of Death-demons or Harpies, and of \( \kappa\rho\varepsilon\ \theta\varphi\alpha\nu\varepsilon\tau\omicron\omicron\omega \), or small winged figures boding or signifying death, are by no means uncommon. It has been held by some writers that the personifications of Thanatos above referred to are more properly to be regarded as \( \kappa\rho\varepsilon\ \theta\varphi\alpha\nu\varepsilon\tau\omicron\omicron\omega \). These small winged figures are also employed to represent a soul escaping from a deceased person; or, again, to indicate the souls of Achilles and Hector (or Memnon) when weighed by Zeus (see below, pp. 130, 132). We also find actual representations on B.F. vases of the ghost of a hero, especially in Trojan scenes; he floats through the air fully armed, with large wings.

§ 3. COSMOGONIC AND OTHER DEITIES

In the next instance it will be found appropriate to discuss sundry representations which are connected with the earlier or Titaniac cosmogony, although, with the exception of the Gigantomachia, already discussed, allusions thereto are comparatively rare on vases.

---

1. Reinach, i. 278.
2. B.M. E 155.
3. Berlin 2157 = Jahrbuch, i. p. 211; Arch. Anzeiger, 1895, p. 37 (see under Herakles, p. 103, note 3).
4. See J.H.S. xii. p. 340 (Ker seizing soul of fallen warrior); also for a Ker in combats, Reinach, ii. 63, 126 (Munich 781), 97 (in the latter case protecting Aeneas against Diomedes); also i. 113 (Berlin 1713, 1714), 223, where they represent demons of good or evil according to the will of the gods.
5. See Robert, Thanatos, and J.H.S. xii. p. 345. The Ker hovering over Alkyoneus (see below, p. 100) in Reinach, i. 255, 451, may be a Hypnos (see Köpp in Arch. Zeit. 1884, p. 42 ff.).
6. B.M. D 54; Benndorf, Gr. u. Sic, Vaseb. pls. 14, 33; Athens 688 = Reinach, i. 165 = Roscher, ii. 1147; Stackelberg, pl. 48; and cf. Reinach, i. 347 (= Bourguignon Cat. 19) and Benndorf, op. cit. pl. 42, 2; in the former the soul is armed; in the latter the winged figure may be the \( \kappa\phi\rho\). There often seems to be a confusion between the \( \epsilon\theta\omega\lambda\nu\nu\) or ghost and the \( \kappa\phi\rho \) or \( \delta\alpha\mu\nu\tau\omicron \), both in its functions and its art-form. Thus, on the vase given in J.H.S. xx. p. 101 (see p. 52), small winged figures like souls are seen flying out of the jar, which are here intended to represent evil spirits or maleficient ghosts, like the evils let out of the jar by Pandora.
7. B.M. B 639; Reinach, i. 89; Millin-Reinach, i. 19.
8. B.M. B 240, B 543; Berlin 1921.
Chief among these personages is Ge or Gaia, the Earth-mother, half Titanic, half Chthonian, who is usually represented as a figure rising half out of the ground, with flowing hair. She thus appears in several Gigantomachia scenes (as the mother of the giants, who were Τηρέων, earth-born), and at the birth of Dionysos and Erichthonios, where she hands the child to Athena. As a full-length figure she appears protecting her sons Tityos and Antaios against Apollo and Herakles respectively; also in certain doubtful scenes on B.F. vases as the Nursing-mother (Κουροτρόφος), with two children in her arms, though we have already seen (p. 30) that these are susceptible of another interpretation. Finally, the series of scenes in which men are represented hammering on the head of a female figure rising from the earth may be regarded as referring to Gaia, with allusion to the custom of smiting on the earth to raise spirits. In this connection Gaia is undoubtedly to be identified with Pandora (see below). A cognate subject is that of a similar female head or bust in company with Eros, sometimes found on late Italian vases. If Gaia is here intended, her connection with Eros finds some support in the poetic cosmogonies; otherwise it may be Aphrodite.

The story of Kronos, who swallowed the stone given to him by his wife Rhea in place of his children, is possibly depicted on one vase, though the genuineness thereof is open to

9 Gaz. Arch. 1875, pl. 9.
doubt. The stone is enveloped in drapery to prevent discovery. A bust of Kronos has also been identified on a vase.\textsuperscript{1} The story of Zagreus and his destruction by the Titans, which belongs to the same cycle, also finds one or two representations. One vase appears to represent them devouring him piecemeal.\textsuperscript{2}

Another personage who may perhaps be regarded as of pre-Olympian origin is Themis, who comes between Gaia and Apollo in the occupation of the prophetic stool at Delphi (Aesch. \textit{Eum}. 2). Aigeus, the father of Theseus, is represented as consulting her seated on her tripod,\textsuperscript{3} and one vase has been supposed to depict her conversing with Zeus before the birth of Dionysos.\textsuperscript{4} She also appears at the Judgment of Paris.\textsuperscript{5}

\textit{Kybele}, the mother of the gods, only occurs in one or two doubtful instances, with the lion which is usually associated with her.\textsuperscript{6}

Among the primitive and recondite Greek cults which go back to a remote origin, that of \textbf{the Kabeiri} may perhaps be mentioned here. Previous to the discovery, in 1887-88, of their sanctuary near Thebes, little was known, either from literary or monumental sources, of these mysterious deities; but the excavations on this site yielded large quantities of pottery with scenes relating to their cult, mostly of a burlesque character.\textsuperscript{7} Among these was one very interesting fragment representing (with names inscribed) the Kabeiros and his son (Pais) banqueting, and attended by two deities known as Mitos and Pratoleia.\textsuperscript{8} Lenormant noticed that the spectator-deities on an under-world vase in the British Museum correspond exactly to the four Cabeiric deities as described by certain ancient authorities.\textsuperscript{9}

Turning next to myths which treat of the semi-divine personages of the earliest cosmogony, we have the legends given

by Hesiod of Prometheus and the creation of **Pandora**; and we may include with them the Titan Atlas. Pandora, it has been already noted, is only a variation of Gaia,¹ and this is borne out by the name given to her on a beautiful polychrome cup in the British Museum representing her creation, completed by Hephaistos and Athena.² She is there named 'Ἀνεσιδῶρα, “She who sends up gifts,” i.e. from the earth. The subject is not so popular as might have been expected, but appears on two other vases in the Museum, in each case with Olympian deities as spectators of the event, and on a beautiful vase now at Oxford.³ The story of the opening of the πίθος has not found its way into art, but its connection with the Athenian feast of the πιθούμα is curiously illustrated in one instance.⁴

**Prometheus** too is seldom seen, and chiefly on B.F. vases. In one case he receives a libation from Hera,⁵ and there are two or three representations of his liberation by Herakles.⁶ On a Cyrenaic cup he is grouped with Atlas, the vulture pecking at his breast, while the other groans under the burthen of the heavens.⁷ **Atlas** is found almost exclusively with Herakles in connection with his visit to the Garden of the Hesperides. Either he is actually present in the Garden or is confronted with the hero, who in some cases bears his burden for him while he obtains the apples.⁸ He is also seen in company with a Sphinx.⁹

We now come to discuss a few subordinate deities or semi-divine personages who do not fall into any of the preceding categories.

¹ See above, p. 73, note 6, for representations of Ge-Pandora rising from the earth, which may be considered in connection with the creation of Pandora.

¹⁰ Reinach, i. 471.
A**klepios**, chiefly a figure of later art, is exceedingly rare on vases. There is, in fact, only one on which he can certainly be identified. This is a late R.F. vase at Athens, on which he is seen reclining on a couch feeding a serpent and accompanied by Hygicia.¹ Nor does the latter occur elsewhere, though her name, as already noted (p. 43), is sometimes given to one of the personified figures attending on Aphrodite.² **Eileithyia**, the goddess of childbirth, generally appears, in duplicated form, assisting Zeus at the birth of Athena,³ or Leto at that of Apollo and Artemis.⁴ She is closely related to Artemis, and a representation of a goddess who has been identified as Artemis-Eileithyia may be seen on an early Boeotian vase with reliefs at Athens.⁵

**Iris**, the messenger of the gods, is usually distinguished from Nike by her caduceus or herald's staff, and from Hebe by her wings. She is often depicted as a single figure,⁶ or pouring a libation to Hera, Athena, or other deities.⁷ She is associated more especially with Hera, as Hermes is with Zeus, and attends on the former in several scenes of assemblages of the gods.⁸ In company with Hera she is attacked by a troop of Seileni and defended by Herakles,⁹ and on another vase she is similarly surprised by a troop of Centaurs.¹⁰ She assists at the creation of Pandora,¹¹ at the Judgment of Paris,¹² and at the wedding of Peleus and Thetis,¹³ and also appears in the Garden of the Hesperides.¹⁴ She is also seen with Paris carrying off Helen¹⁵; and with Menelaos fetching her

¹ Athens 1926 = Reinach, i. 515. Possibly also on a Berlin vase (Arch. Anzeiger, 1890, p. 89) with a similar subject, which may, however, denote a "sepulchral banquet." See Harrison, Prolegomena to Gk. Religion, p. 349.

back; and in another scene, apparently drawn from a Homeric source (Il. viii. 397 ff.), where she dissuades Athena and Hera from taking sides in the war, at the behest of Zeus. She conveys the infant Herakles to the Centaur Cheiron, and is also seen in company with a warrior.

Hebe in Olympus performs somewhat similar functions to Iris, more particularly that of pouring out wine for the gods. She is also specially associated with Herakles at and after his apotheosis, appearing as his bride in several instances. Besides these, she frequently appears in assemblies of the gods, or at the punishment of Marsyas, or the Judgment of Paris.

§ 4. Personifications

The next group of deities with which we have to deal is that of the various personifications which are to be found in great numbers on vases of all periods, especially the later. These naturally fall under several headings, which, following the lines of the classification adopted by M. Pottier in a valuable article on the subject, we may distribute as follows:

1. Physical (Sun, Moon, Dawn, Winds, etc.).
2. Geographical (Cities, Rivers, Mountains, etc.).
3. Products of earth (Wine, Harvest, etc.).
4. Groups of various kinds (Muses, Nymphs, etc.).
5. Physical conditions (Health, Old Age, etc.).
6. Social advantages (Wealth, Peace, Victory, etc.).
7. Ethical ideas (Justice, Envy, Strife, etc.).
8. Metaphysical ideas (Necessity, Law, etc.).
9. Social enjoyments (Comedy, Tragedy, Revelry, etc.).
10. Descriptive names.

78 DIONYSOS AND MISCELLANEOUS DEITIES

Of some of these, indeed, we have already treated—such as the beings included in the following of Aphrodite and Dionysos, Ge-Pandora, Hebe (Youth), and the deities of the nether world. The rest we now proceed to consider in order, beginning with natural phenomena, and firstly those of an astronomical character.

I. Helios, the Sun, who in some senses, especially in the mythology of the Roman poets, is identical with Phoebus Apollo, is only once so identified on vases.¹ He is usually depicted in his four-horse chariot rising out of the sea (as on the eastern pediment of the Parthenon), either as a single figure or in connection with some myth, indicating that the action takes place at sunrise. As a single figure he appears both on early and late vases, on the latter, usually, as an upper decoration on the large Apulian kraters.² He is also accompanied by Eos (Dawn) and Selene (Moon), by Hemera (Day), or by Eros³; but in most cases he and Selene appear together, the latter descending as he rises (as on the Parthenon pediment). Thus on R.F. vases they denote the time of the action, as when Theseus descends below the sea to visit Poseidon,⁴ or as on the Blacas krater in the British Museum, when Eos pursues Kephalos.⁵ On the latter vase four stars are also depicted diving into the sea, to indicate their setting. On Apulian vases he is present at the seizure of Persephone,⁶ at the flight of Pelops from Oinomaos,⁷ at the madness of Lykourgos,⁸ at the Judgment of Paris,⁹ and in the Garden of the Hesperides,¹⁰ In one instance a group of Satyrs start back affrighted at his appearance.¹¹ There are two instances

of his encounter with Herakles, who endeavoured to stay his progress with his bow.¹

Selene, the Moon, appears in many of the scenes already described under Helios, as on the Blacas krater. She is depicted under two types, either on horseback² or driving a chariot like Helios,³ both as a single figure and in other scenes; and she is sometimes characterised by the lunar disc or crescent. Besides the scenes already referred to, she appears on horseback at the birth of Dionysos⁴ and at the pursuit of Medea by Jason.⁵ The magic arts used by Thessalian witches to draw down the moon from heaven are also the subject of a vase-painting,⁶ where two women essay to perform this feat by means of a rope, addressing her, "O Lady Moon!"

Stars are occasionally represented with an astronomical reference, as on the Blacas krater, where they appear in the form of youths, or grouped with Helios, Selene, and Eos.⁷ Phosphoros, the Morning Star, may be identified in this connection, represented as a youth running⁸; but in other cases they are not personified, as on a vase which represents the moon and stars with the constellation Pegasos.⁹

Hemera, the Day, we have already once noted; but in art she is hardly to be distinguished from Eos (Dawn). Nor can Nyx (Night) be identified with certainty on vases.¹⁰ Eos is not an uncommon figure, especially on R.F. vases, and she also plays a part in certain myths. As a single figure she appears rising from the sea in, or driving, a four-horse chariot like Helios,¹¹

¹¹ R.F.: B.M. E 449; E 776 (? Nyx; see above); Helbig, 132 = Reinaich, ii. 46. Late: Millin-Reinaich, ii. 37 (with Hermes; vase by Lasimos in Louvre).
her steeds in one case being named Phlegethon and Lampon. She is also represented flying with two bydriae, from which she pours out dew upon the earth. She is frequently seen pursuing or carrying Kephalos or Tithonos, and is present at the apotheosis of Alkmna. At the combat of her son Memnon with Achilles she and the other mother, Thetis, are generally present. She also pleads with Zeus for her son's safety, and bears away his body after the fatal issue of the fight.

Next we have to deal with the Winds, as personified by the figures of Boreas, Zephyros, etc. As single figures they seldom appear, though we have possible instances of Boreas, with the unusual type of a serpent's tail, or simply as a winged male figure. A wind-god is seen in an episode from the Gigantomachia opposing the chariot of Zeus, and another in an assemblage of deities round Apollo Kitharoidos. Zephyros is seen pursuing Hyakinthos, and he and Boreas together bear the body of a warrior to the tomb in the same manner as Hypnos and Thanatos. But the most important subject connected with Boreas is his pursuit of the Athenian maiden Oreithyia, a frequent scene on the later R.F. vases, some being very fine examples. Erechtheus, Kekrops, and the

14 B.M. E 480, E 512; J.H.S. xviii. pl. 6; Berlin 2165 = Reina, i. 352; Munich 374 = Reina, i. 240 = Baumgarten, i. p. 352, fig. 373; Reina, i. 305; Helbig, 101 = Reina, ii. 78 = Wiener Vorr. ii. 9; Rayet and Collignon, p. 299 (in Louvre).
Nymphs Aglauros, Herse, and Pandrosos, are usually present, and the latter in one case announce the news to Kekrops or Erechtheus.\footnote{Berlin 2165 = Reinach, i. 352.} Boreas is also depicted in the act of punishing Phineus by blinding him, and attacked by the latter's friend Parebios.\footnote{Reinach, i. 346; cf. Serv. ad Aen. iii. 209; Ann. dell' Inst. 1882, p. 90ff.; Roscher, iii. p. 1566.}

On some early B.F. vases we find winged beings which may be styled Boreades, in conjunction with Harpies, apparently representing the influences of good and evil winds respectively.\footnote{B.M. B 4, B 104: see Studniczka, Kyrene, p. 26, and J.H.S. xiii. p. 109 ff.} Zetes and Kalais, the sons of Boreas, will be treated of in the story of the Argonautika.\footnote{See below, pp. 115, 116.} The Aurae or breezes have been identified on a well-known vase in the British Museum,\footnote{B.M. E 804 = J.H.S. xiii. p. 135.} and on an Apulian vase in the same collection is a head undoubtedly intended for Aura.\footnote{B.M. F 277.} The Hyades or rain-goddesses in two instances extinguish the flames of a funeral pyre at the bidding of Zeus, at the apotheosis of Alkmene\footnote{B.M. F 149.} and of Herakles\footnote{VOL. II.}; in one of the latter instances they are named Arethusa and Premnusia. They also receive the infant Dionysos.\footnote{Munich 384 = Reinach, i. 130; Reinach, i. 481.} Echo belongs perhaps rather to the Dionysiac cycle, appearing as the beloved of Pan.\footnote{De Witte, Coll. à l'Hôtel Lambert, pl. 11: cf. Reinach, i. 1.}

II. We may next consider the personifications of cities and countries, which are, indeed, in some cases more than merely symbolical figures, being actual goddesses with a definite cult, such as the Nymph Kyrene, who often appears on works of art.\footnote{B.M. E 228 (see note in Cat.); F 381.} On the great Naples vase representing Dareios in a council of war, personifications of Hellas and Asia are placed among the spectator-deities,\footnote{See especially Studniczka, Kyrene, and on the subject generally, J.H.S. ix. p. 47 ff.} and the former seems also to be indicated on a similar vase with a battle of Greeks and Persians.\footnote{Naples 3253 = Reinach, i. 194.} On one of the late vases with the subject of Pelops and Oinomaos, a personification of the locality Olympia appears to be similarly

\footnote{Naples 3256 = Reinach, i. 98.}
present, just as on the Hieron kytyle the personification of Eleusis is included among the Eleusinian and other deities at the sending forth of Triptolemos. The city of Thebes is personified in several instances, especially as a spectator of Kadmos slaying the dragon; also on a “Megarian” bowl with reliefs in the British Museum, the subjects on which are taken from the Phoenissa of Euripides. Nemea, the scene of Herakles’ victory over the lion, and of the death of Archermos, is similarly personified as a Nymph in the representations of both subjects, and the town of Krommyon as a Nymph protests against the slaying of the sow by Theseus. The Nymph Sparta occurs once, dismounting from her horse. Two cups of the early B.F. class usually known (from their subjects) as Cyrenaic, bear representations of the Nymph Kyrene (see above)—in one case with Apollo, in the other holding a branch of silphium (the local product) and surrounded by Boreads and Harpies (see above).

Among the Greek islands, Aegina and Salamis were supposed to have derived their names from Nymphs beloved of Zeus and Poseidon, who are represented pursuing these quasi-personified figures; we may also regard Europa as coming under that category. Zeus also pursues Taygeta, who is connected with the mountain in Laconia. On one vase we find the names of the islands Delos, Euboea, and Lemnos, given, presumably in pure fancy, to two Maenads and a Satyr in a Dionysiac scene where all the figures are named. A more genuine instance is that of the Nymph Krete on the Talos vase, indicating the locality.

Turning to other geographical features, we have Mount

Olympos transformed into a lyre-playing companion of Satyrs; or, again, river-gods such as Acheloës, who as a combination of man and bull, or with a fish-body like Triton, wrestles with Herakles. The river Nile appears once, but not personified—only as an indication of landscape. In connection with the city of Thebes we find personifications of the local river Ismenos and the local fountain-Nymphs Dirke and Krenaia.

III. Natural products, such as Oinos (Wine) and Opora (Harvest), are only found personified among the Dionysiac conceptions with which we have already dealt (p. 65); these two names we may add those of Hedyoinos (Sweet Wine), Kissos (Ivy), Kalyke (Bud), and Rodo (Rose), the three latter coming more under the heading of pet-names than of strict personifications.

IV. Our next class includes certain groups of personages (all feminine) which for the most part hold their own throughout all periods of art and literature, and are, so to speak, more crystallised into definite mythological personages, associated with the gods and human beings of the legendary ages. These are the Muses, the Charites or Graces, the Horae or Seasons, the Moirae or Fates, and the Erinnyes or Furies.

The Muses do not appear so frequently in vase-paintings as in sculpture, and mostly on later vases. Two fine R.F. examples of the whole nine (with their appropriate attributes) call for mention; other vases give a more limited number, or even single figures; but it must be remembered that in

4 Naples 3226 = Millingen, Anc. Uted. Mon. i. pl. 27 (Ismenos and Krenaia); cf. Millin-Reinach, ii. 7. The nymph Dirke is, according to Robert, represented in the figure rising from the ground to receive the child Dionysos at his birth on the vase Petersburg 1792 = Reinach i. 1 (otherwise Gaia); see his Arch. Märchen, p. 185.
5 Él. Cér. ii. 86; Munich 805 = Reinach, i. 391 (see ibid. p. 277) = Wiener Varl. iv. 4.
6 François vase (at Peleus and Thetis' nuptials); B.M. E 805; Berlin 2391; 2401 (Klio and Terpsichore); cf. Bull. de Cord. Hell. 1895, p. 102 (in Louvre; three figures named Ourania, Kalliope, and Melpomene).
such cases identification is difficult, as characterisation by means of a lyre or scenic mask does not necessarily connote the presence of a Muse. On one vase Terpsichore is seen with two figures inscribed as Mousaios and Melousa; but these may be no more than fancy names for an ordinary group of musicians. Five of them are seen in a group with Apollo, Thamyris, and Sappho, and elsewhere they accompany Apollo.

The Graces can nowhere be identified on Greek vases, though they form a well-known type in sculpture; but there is an Etruscan klyix in the British Museum (probably copied from a Greek original), which appears to represent them as an interior group. The Horae or Seasons appear (without distinctive names) on the François vase at the nuptials of Peleus and Thetis, and on the Sosias cup in an Olympian assemblage (three in each case); also two of them at the sending forth of Triptolemos. The three Moirae (Fates) appear on the François vase (as above), and once also at the birth of Athena; the Furies have already been discussed.

V. The personifications having reference to physical conditions (as distinguished from ethical ideas) are comparatively few in number. They include Hebe (Youth), who by virtue of her divine attributes has already been discussed in another section (p. 77); Hygieia (Health), who is also a fully developed goddess, but only once occurs on a vase, except among the somewhat vague personifications surrounding Aphrodite (see pp. 43, 76); and three others, regarded as of masculine sex. These are Geras (Old Age), Hypnos (Sleep), and Thanatos (Death). Geras is seen in combat with Herakles; Thanatos has already been discussed (p. 71). Hypnos as a winged youth hovers over Alkyoneus, whom Herakles overcame while

9 B.M. E 290.
asleep; causes Ariadne to sleep while Theseus escapes; and with Thanatos carries the body of Memnon, or an ordinary mortal, to the tomb.

VI. Social advantages as apart from ethical qualities are perhaps difficult to determine exactly; but we may fairly rank under this heading such ideas as are suggested by Chrysos (Gold) and Ploutos (Wealth); Eirene (Peace); Nike (Victory); and the numerous attendant gods of Aphrodite and Dionysos, such as Eunomia, Eudaimonia, and others already named (pp. 43, 65). Chrysos and Ploutos as boys accompany Nike in her chariot; Eirene's appearance on vases is doubtful, but she may appear in one instance carrying the infant Ploutos. The birth of Ploutos seems to be represented in one instance.

But by far the most important personage in this class is Nike (Victory), whose appearance as a winged female figure is so often attested by inscriptions on R.F. vases that she can generally be identified with certainty. She is especially popular as a single figure on the Nolan amphorae and lekythi of the "severe" and "strong" periods, some of which are conspicuously beautiful examples. Altogether her appearances rival those of Eros in number, though on the Italian vases they are far fewer. Whether Nike ever occurs on B.F. vases is a very doubtful point, and has been denied by many scholars, but some figures are not easy to explain in any other way. On other works of art she does not appear before 480 B.C., unless

6 Munich 291 = Reinach, ii. 47 (more probably Iris).

* See e.g. B.M. E 287, E 574 (Plate XXXVI.), E 643; Oxford 312-314.
* Studniczka, Siegessgöttin (1898), and in Roscher's Lexikon, iii. p. 318: see also Sikes, Nike of Archermos (Cambridge, 1890), and J.H.S. xiii. p. 111 ff. Studniczka regards the following as certain B.F. instances: B.M. B 1, B 166, B 125, B 334; Jahrbuch, 1889, pls. 5-6, figs. 2, 2a; Jahn, Entführung d. Europa, pl. 5. The instances on late careless B.F. vases, such as B 356, B 357, B 552 in B.M. are not to the point, as these belong to the fifth century.
the "Nike" of Archermos is to be so identified; it seems probable that she was an offshoot from Athena, whom we know to have been worshipped under the name of Nike, as in her temple on the Athenian Acropolis.

She is frequently associated with the gods, either in scenes from mythology or in groups apart from action; usually she pours libations to them, or crowns them in reference to some achievement. Thus we find her with Zeus, with Hera, with Athena, with Poseidon and Dionysos, with Apollo (especially at his victory over Marsyas), with Artemis Elaphbolos, and with Aphrodite. She frequently crowns or pours libations to Herakles, or attends him at his apotheosis; on the later vases she takes Athena's place in conveying him in a chariot to Olympos.

Among the numerous mythological events in which Nike plays a more or less symbolical part may be mentioned the Gigantomachia, in which she drives Zeus' chariot, the birth of Athena, the sending of Triptolemos, the Judgment of Paris, the birth of Dionysos and that of Erichthonios, and the punishment of Ixion. Among Trojan scenes she appears with Achilles arming, at his (supposed) fight with Telephos and possibly also at that with Memnon, and at the carrying off of the Palladion. She is also seen with Herakles in the

NIKE

Garden of the Hesperides, with the Dioskuri, with Perseus and Bellerophon, with Orestes at Delphi; crowning Hellas as the victor over the Persians; and in many scenes with Dionysos.

More numerous and characteristic, however, are the scenes in which she appears as a single figure, or associated with mortals, usually victorious warriors or athletes. As a single figure she most commonly pours a libation over an altar, or flies towards the altar bearing a torch, incense-burner, lyre, tripod, sash, or other attribute; in one case (unless Iris is intended) a jug and caduceus. Especially characterised as the goddess of Victory, she often holds a palm-branch. She frequently takes part in religious and sacrificial ceremonies, such as the decoration or dedication of a choragic tripod, or burns incense, or herself sacrifices a ram or bull. The last-named subject is, however, commoner on gems and a certain class of terracotta reliefs. On one vase she gives drink to a bull; or, again, she rides on a sacrificial bull; or places a hydra on a fountain or altar. She pursues a hare, doe, or bird, or offers a bird to a youth. On the later Panathenaic amphorae and elsewhere she plays on a lyre. On her costume and attributes generally see Roscher, iii. p. 330.

holds the ἀκροστόλιον or stern-ornament of a ship; and sometimes she erects a trophy.

She appears in a chariot drawn by female Centaurs, or accompanied by Chrysos and Ploutos (see above), and she also conducts a victorious warrior in this manner. In other instances she pours a libation to a warrior, who is sometimes inscribed with a fanciful name; or, again, as anticipating his victory, she brings him his helmet. She is, however, more frequently seen in athletic scenes, crowning a victorious athlete, rider, or charioteer, or superintending the games in the palaestra, torch-races, or the taking of an oath by an athlete. In

musical contests she performs the same functions, crowning or pouring libations to a successful performer. She crowns a successful potter in his workshop, and also a poet (?). A being of similar character, who may perhaps be recognized in the figure of a winged youth on some B.F. and early R.F. vases, is Agon, the personification of athletic contests.

On the later R.F. vases the figure of Nike is often duplicated, probably more to produce a balanced composition than for any other reason.

VII. The next class of personifications is that of abstract ethical ideas. Even on the earlier vases there are found a considerable number of these, such as Eris (Strife); but on the later, unlimited play is given to the tendency of the age (seen also in sculpture and painting) to invest every abstract idea with a personality, apart from any idea of deification or mythological import.

Among these, by far the most numerous examples are, of course, those relating to the passion of Love. We have already traced the development of the type and conception of Eros in vase-paintings, and in the same place we have had occasion to speak of the associated ideas which became personified as subsidiary conceptions to that of Love, such as Peitho (Persuasion), Pothos (Yearning), and Himeros (Charm), Phthonos (Envy or Amor invidiosus), and Talas (Unfortunate or Unrequited Love). Of a similar type are the feminine conceptions associated with Aphrodite—Eudaimonia (Happiness), Euthymia (Cheerfulness), and the like.

Among other abstract ideas are those of Arete (Virtue) and Hedone (Pleasure), which have been suggested as represented on a R.F. vase in Vienna, Dike (Justice) is seen

1 B.M. E 460, 469; Reinach, i, 49, 378, ii, 274.

7 See p. 43.
8 Jahreshefte, 1899, p. 16 = Reinach, i, 279; but more probably the scene refers to Orestes and Pylades in Tauris.
overcoming Adikia (Injustice)\(^1\); Apate (Deceit) on the vase with Dareios in council beguiles the goddess Asia with bad advice,\(^2\) and also leads Tereus astray\(^3\); Phobos (Fear) drives the chariot of Ares when he assists Kyknos against Herakles\(^4\); he is specially associated with the god of war, the idea being that of inducing panic among enemies; and in many cases his head appears, like that of the Gorgon, as a device on shields.\(^5\) In one instance he appears as a lion-headed monster.\(^6\) Artemis, in the capacity of Aidos (Shame), hinders Tityos from carrying off Leto.\(^7\) Eris (Strife) appears on B.F. vases as a winged female figure running, in scenes of combat, chariot-races, etc., or as a single figure.\(^8\) But the identification is not always certain; in some combat scenes it is possible that Ate or a Ker is meant, and in those of an agonistic character we may see Agon, the personification of athletics (see above, p. 89).\(^9\)

VIII. The metaphysical ideas next to be discussed are almost exclusively punitive agencies, either connected with scenes in the under-world (Ananke, Poinae, and the Furies), or bringing down penalties and disasters on the heads of wrong-doers, such as the personifications of madness which occur in many of the tragic subjects on Apulian vases.

In the first group we reckon Ananke (Necessity) and the Poinae (Punishments), who appear with the Furies in a scene from the under-world,\(^10\) Ate or Ker (Destiny), a winged figure seen at the death of Hector\(^11\) and at the madness of Lykourgos\(^12\);

and Nemesis (Vengeance) in the scene between Atreus and Thystes, with reference to its fate-fraught character. In less tragic circumstances the latter is present in a bridal scene, with attributes of a flower and an apple. The Moirae or Fates have already been mentioned (p. 83), as has Themis or Divine Ordinance (p. 74).

The second group includes Lyssa (Frenzy), who drives Aktaeon, Hippolytos, and Lykourgos to madness or destruction; Mania (Madness), who similarly drives Herakles to slay his children; and Oistros (lit. a Gad-fly), who performs similar functions when Medea is about to slay hers.

IX. Personifications relating to social enjoyments, such as games, the drama, or banquets, are closely analogous to many of those described under headings III. and VI., and occur in the same connection. Thus in Dionysiac scenes we find Choro (Dance), Molpe (Song), Dithyrambos, Hedymeles (Sweet Song), Komos (Revelry), Komodia and Tragoedia (Comedy and Tragedy), and Pannychis and Kraipale, typifying all-night revels and their consequences.

X. Finally, there are what M. Pottier has described as personifications of individualities, under which heading fall many conceptions which do not find a place in any of the classes already discussed. Among these are many of the names given to Maenads and Satyrs (p. 65), which are intermediate between personal names and embodiments of abstract or physical ideas, some inclining more to one side, some to the other. Of these it is only necessary to mention as illustrative of the present subject the Mainas and the Nymphe found as names of individuals on several vases, and the Oinopion or "Wine-drinker" on vases by Exekias.

2 Reinach, i. 173.
3 Ibid. i. 229 (in Boston); B. M. F 279; B. M. F 271 and Naples 3237 = Baumstei, ii. p. 834, fig. 918 : cf. Reinach, i. 331, t. The name of Typhlosion (Blindness) has also been suggested for the figure on the Naples vase.
5 Munich 810 = Reinach, i. 363.
6 See above, p. 65, for instances.
7 B. M. E 492; Naples 2419; Karlsruhe 208.
8 Berlin 2471.
9 B. M. B 210: see p. 58, note 19.
To the same class belong the names given to Nymphs of various kinds, such as the Nereids (see p. 26) or the Hesperides. The former are named on one vase¹ as Asterope, Chrysothemis, Hygieia, and Lipara; on another² as Aiopis, Antheia, Donakis, Kalypso, Mermesa, Nelisa, and Tara.

Of more general signification, and sometimes perhaps to be regarded as descriptive titles rather than names, are such as Archenautes (Ship-captain),³ Komarchos (Master of Revels),⁴ or Paidagogos (Tutor).⁵ On the other hand, Neanias, Komos, Paian (given to boys at play),⁶ and Eutychia (on the tomb of a woman)⁷ may be merely fanciful personal names.

CHAPTER XIV

HEROIC LEGENDS

Kastor and Polydeukes—Herakles and his twelve labours—Other contests—
Relations with deities—Apotheosis—Theseus and his labours—Later
scenes of his life—Perseus—Pelops and Bellerophon—Jason and the
Argonauts—Theban legends—The Trojan cycle—Peleus and Thetis—
The Judgment of Paris—Stories of Telephos and Tellos—Scenes from
the Iliad—The death of Achilles and the Fall of Troy—The Odyssey—
The Oresteia—Attic and other legends—Orpheus and the Amazons—
Monsters—Historical and literary subjects.

In treating of the subject of heroic legends, we propose to
deal first with the more prominent heroes, such as Kastor and
Polydeukes, Herakles, Theseus, and Perseus, and with the tales
of Thebes and Troy; next with the series of myths connected
specially with Attica or other localities; then with semi-mythical
personages, such as Orpheus and Thamyris, which lead us
on to the next division of the subject—scenes connected with
Greek history.

Kastor and Polydeukes do not play a very extensive part
on vases; and as they are not further characterised than by
the petasos and two spears, which are the ordinary equipment
of young horsemen, they are not always to be identified with
certainty, except in mythological scenes. Among these they
appear in the Gigantomachia,1 or in company with Herakles
are initiated into the lesser mysteries at Agra2; they are also
seen at the apotheosis of Herakles.3 They are present when

1 Athens 1259 = Reinach, i. 506 ; Mon.
2 B.M. F 68.
3 Reinaich, ii. 186.
HEROIC LEGENDS

Leda discovers the egg laid by Nemesis,¹ and on two B.F. vases appear with Leda and Tyndareus in a family group;² they are also seen in company with Hermes,³ with Paris and Helen,⁴ with Danaos taking refuge in Attica,⁵ in a scene from the Mérope of Euripides,⁶ and at the slaying of the Sphinx by Oedipus.⁷ They take part in the hunt of the Calydonian boar,⁸ and in many scenes from the Argonautika, such as the death of Talos,⁹ the punishment of Amykos,¹⁰ and others of doubtful meaning.¹¹ There is more than one representation of their carrying off the Leukippidae,¹² the best being the beautiful Meidias vase in the British Museum (Plate XLI.), where all the figures are named.¹³ They appear as hunters,¹⁴ as deified beings present at a Theoxenia (lectisternium), or feast of the gods,¹⁵ and are crowned by Nike (with stars over their heads).¹⁶

HERAKLES

Of all the heroic legends the most numerous and the most important are those of the Herakleid. They appear on vases of all periods, though in the largest proportion on the black-figured varieties, and include every event in his life, from his birth to his deified life in Olympos. Of the visit of Zeus to his mother Alkména we have already spoken, as also of her apotheosis.¹⁷ As an infant we see Herakles engaged in strangling

¹ Peters burg 2188 = Reinach, i. 8; Re inach, i. 279 (= Baumeister, p. 635, fig. 706) and 380. In Ant. Denkm. i. 59 (now at Boston) and in Berlin 2430 they do not appear in this connection.

¹⁷ See p. 19.
the serpents sent by Hera, while his brother Iphikles recoils in terror; later on Hera appears to be reconciled to his existence, for she is actually seen suckling him at her breast. Next he is carried off by Hermes to Cheiron the Centaur for his education, and we see him undergoing instruction on the lyre from Linos, or on his way, accompanied by an old woman carrying his lyre. By the time when his series of labours begins he is usually represented as a full-grown bearded man, especially on the archaic vases; but he appears in a few instances as a quite youthful beardless figure.

Of all the achievements of Herakles the most famous are the Twelve Labours, to which he was subjected by Hera at the hands of Eurystheus. We find them all represented on vases, with the exception of the cleansing of the Augean stables, which may be presumed to have offered too many difficulties to the painter; it only occurs once in the whole history of Greek art, on a metope at Olympia. The horses of Diomede only occur once, the Keryneian stag thrice, and the Stymphalian birds five times; but the rest may be described as common. In all these scenes Herakles is usually accompanied by Athena; also, but less frequently, by Iolaos and Hermes.

I. The Nemean Lion.

Of this subject we find two "normal" types on B.F. vases, with one or two abnormal versions; on R.F. vases the treatment is less stereotyped.

B.F. (1) Standing type:—Herakles plunges sword into lion's neck (both upright): B.M. B 160, B 232, B 621 (Plate XXX.).
H. strangles lion: Berlin 1720 = Wiener Vorl. 1888, 6, 3 (Exekias); Wiener Vorl. 1889, 6, 3 (Charitaios).
(2) Crouching type:—Herakles stoops and strangles lion: B.M. B 159, B 199, B 318 (Fig. 125); Petersburg 68 = Wiener Vorl. 1889, 4, 6 (Taleides).

1 B.M. F 479; Reinach, i. 229; Gaz. Arch. 1875, pl. 14 (in Louvre).
2 B.M. F 107.
3 Munich 611 and 291 = Reinach, ii. 419, ii. 47.
5 B.M. Cat. of Vases, ii. p. 145. He is represented as attacking Linos, who had found fault with his playing.
6 Reinach, i. 326 (Iphikles here with Linos).
7 See B.M. Cat. of Vases, ii. p. 13.
(3) Abnormal:—Lion on its back; Herakles slays it with club: Reinach, ii. 52. Herakles pursues lion: Louvre F 108 = Wiener Vorl. 1890-91, pl. 1, 5 (Nikosthenes).

R.F. (1) Herakles with lion over shoulder about to hurl it on Eurytheus (type borrowed from Erymanthian Boar, see below): B.M. B 193 = Plate XXXII. (Andokides).

(2) Crouching type: Munich 415 = Reinach, i. 150 = Baumeister, i. p. 656, fig. 723; B.M. E 168; Röm. Mitth. v. (1890), pl. 12 = Wiener Vorl. 1890-91, 7, 2 (Nikosthenes, in Boston). See also B.M. E 104 (abnormal).

We may also note here a curious B.F. vase, on which Herakles is seen in the forests of Nemea preparing the lion’s skin for his own wear.¹

II. The Cretan Bull.

Type: Herakles seizes the bull from the front and ties its legs with a cord.

B.F. B.M. B 309; Berlin 1886, 1898; Helbig, 31; Reinach, ii. 55, 5 = Baumeister, i. p. 660, fig. 727.

Late. Berlin 3145 = Millingen-Reinach, 11; Athens 1931.

See also a very remarkable vase in Forman Sale Cat. No. 305 (now at Boston), where the same subject appears each side, one B.F., the other R.F. (by Andokides).²

¹ Reinach, ii. 70.
² Furtwaengler, however, thinks the subject is Herakles sacrificing a bull (Gr. Vasenmalerei, p. 16; see below, p. 106).
III. The Erymanthian Boar (see Klein, Euphronios, p. 87).

(1) The capture:
B.M. B 462; Louvre F 236; Berlin 1981, 2034; Naples 2705 and S.A. 150; Athens 858, 860 (all B.F.).

(2) The bringing back of the boar (Eurystheus absent; Athena usually receives the hero):
B.M. B 447, 492; Cambridge 57; Munich 694; Athens 1097 (all B.F.).

![Fig. 126. Herakles bringing the boar to Eurystheus (British Museum).](image)

(3) Herakles hurls the boar upon Eurystheus, who hides himself in a large; sunk jar (πίθος).
B.F. B.M. B 161 (Fig. 126); Reinach, ii. 55, 1; Helbig, 37; Louvre F 59, 202.
R.F. B.M. E 44 (Euphronios) = Furtwaengler and Reichhold, pl. 23; Louvre G 17 = Wiener Vorl. 1890, pl. 10.

IV. The Keryneian Stag.

B.F. B.M. B 169, B 231.
R.F. Reinach, i. 233.

A dispute between Apollo and Herakles over a stag (Rein. ii. 56, 3; see p. 34) may perhaps be referred to this subject, as the myth is not otherwise known, but it is more usually Artemis who endeavours to thwart Herakles' capture.

VOL. II.
V. The Stymphalian Birds.

Found only on four B.F. vases (B.M. B163; Louvre F387; Arch. Anzeiger, 1892, p. 172; and Munich 1111 = Reinach, ii. 58) and one late example (Reinach, ii. 297). Herakles shoots the birds with bow and arrow.

VI. The Lernaean Hydra.

This subject, occurring only on archaic vases, has no very fixed type; the Hydra has seven or nine heads, and the body of a serpent or of a cuttle-fish. Iolaos sometimes assists Herakles, and in two cases the crab sent by Hera is also visible.

B.F. Early: Reinach, i. 389; Jahrbuch, 1898, pl. 12; Reinach, i. 118 (6) = Louvre E851.
Later: Reinach, i. 118 (1) = Berlin 1854 (crab); ibid. 118 (3); 118 (5) = Louvre F386 = Millin-Reinach, ii. 75 (Athena slays crab); Reinach, ii. 53 = Baumeister, i. p. 657, fig. 724; Berlin 1801 = Wiener Vorl. 1889, 7, 3: see also Athens 792 = Heydemann, Gr. Vasenb. pl. 4, 1, where two successive scenes are given.

R.F. Reinach, ii. 76. Hydra has cuttle-fish body and ten or eleven heads.

VII. The Horses of Diomedes.

Naples 2506; Reinach, ii. 297 (?).

VIII. The Augean Stables.

Not found on vases.

IX. The Combat with Geryon and Capture of his Cattle.

A very favourite subject on B.F. and early vases, including some of the finest specimens. Geryon is at first winged and only three-headed, then triple-bodied, represented as three armed warriors united,¹ one or two of whom generally fall wounded. Herakles attacks with bow.

Chalcidian: B.M. B155; Bibli. Nat. 202 = Reinach, ii. 58 and 253 = Plate XXII.

¹ Cf. Paus. v. 19, 1: τρεῖς ἄνδρες ἄλληλοι προςεχομένοις
LABOURS OF HERAKLES

Late B.F. B.M. B 156, B 194; Louvre F 53 = Reinach, ii. 59 = Baumeister, i. p. 662, fig. 729 (Exekias); J.H.S. xviii. p. 299, and Bibl. Nat. 223 (abnormal types).

R.F. Munich 337 (Plate XXXVIII.) = Furtwaengler and Reichhold, 22 (Euphronios); Noel des Vergus, Étrurie, pl. 38.

Late. Berlin 3258; Naples 1924 = Millingen-Reinach, 27.

The driving off of the cattle by Herakles is also represented:

B.M. E 104; Reinach, ii. 58, 5; and see Klein, Euphronios, p. 61.

X. The Girdle of Hippolyta.

B.F. B.M. B 533.

Late. Naples 3241 = Reinach, i. 384.

Besides the scenes in which Herakles is evidently capturing the girdle, there are many vases on which he is seen in combat with Hippolyte and other Amazons, such as Andromache or Alkaia, assisted himself by Iolaos or Telamon.

B.F. B.M. B 154, B 426; Louvre E 875; Cambridge 44; Bourguignon Sale Cat. 18 (Exekias); Berlin 3988 = Coll. Sabouroff, i. pl. 49.

R.F. B.M. E 45; Reinach, i. 166; Bibl. Nat. 535 = Reinach, ii. 265; Bologna 322; Reinach, i. 353 = Wiener Vorl. vii. 4, 1 (Duris).

Late. Jatta 423 = Reinach, i. 206.

XI. Fetching Kerberos from Hades.

The various types and methods of representing this subject have been collected in J.H.S. xviii. p. 296; as typical examples may be given:

Early B.F. Louvre E 701 = Reînach, i. 153; Reinach, i. 389, ii. 32.

Late B.F. J.H.S. xviii. p. 295 (in B.M.) ; Reinach, ii. 69.

R.F. Jahrbuch viii. (1893), pl. 2 (in Berlin) and p. 160 (in Boston).

Late. On several of the "under-world" vases, see p. 68, Nos. 1-4, 11.

XII. Fetching the Golden Apples from the Garden of the Hesperides.

There are two versions of this myth. In one, which seems to be the earlier, Atlas fetches the apples, while Herakles supports the universe for him (see above, p. 75). The vases
representing Herakles in the Garden surrounded by the Nymphs (for whom see p. 92) are almost all of the later period:

R.F. B.M. E 224 = Furtwaengler-Reichhold, 8-9 (Plate XLI).
Late. B.M. F 148; Naples 2873 = Millin-Reinach, i. 3 = Wiener Vorl. viii. 12, 3 (Assteas); and Naples 3255 = Reinach, i. 236 = Baumeister, i. p. 686, fig. 745.
Parody. Athens 1894 = Reinach, i. 506 (?)..

Besides the somewhat insignificant part that he plays in the Gigantomachia,\(^1\) Herakles had several independent combats of his own with gigantic monsters and such-like beings. Of these the most popular subjects are Antaios and Alkyoneus. The legend of Herakles’ wrestling with the former is familiar from Pindar\(^2\); on the vases Antaios is not characterised as a giant in size or otherwise, but his mother Gaia is generally present.\(^3\)

Alkyoneus, on the other hand, is represented as a being of gigantic size, lying asleep in a cave\(^4\); a small winged figure which sometimes hovers over him has been interpreted by some as Hypnos (Sleep), but might also be a Κηρθαυάτωο, or harbinger of death.\(^5\) Herakles generally attacks him with club or bow and arrow, but on one vase is depicted gouging out his eye\(^6\); on another he is assisted by Telamon with a stone.\(^7\) Another giant with whom we find the hero contending is Cacus, whose oxen he carried off. This is a purely Roman myth, and belongs rather to the legends of the Roman Hercules, but curiously enough it finds a place on one Greek

The only R.F. examples published are Munich 401 (= Furtwaengler and Reichhold, pl. 32) and 605 (= Ber. d. sächs. Gesellsch. 1853, pl. 7, fig. 1).
\(^5\) See above, p. 72.
\(^6\) Bibl. Nat. 322.
vasé of Sicilian origin, which represents Cacus in a hut with the oxen and Herakles playing a lyre in triumph.1

One of the commonest subjects connected with Herakles is his combat with Kyknos, the son of Ares, described at length in the Hesiodic *Scutum Herculis*. It is mostly found on B.F. vases, the usual “type” showing the two combatants supported by Athena and Ares respectively in their chariots, while Zeus appears in the midst to interrupt them.2 One late R.F. vase seems to show the preparations for the combat, in the presence of an Amazon, a Fury, and other personages3; another vase, the subsequent attack made on Athena by Ares.4

We find him in combat with Acheloös, the river-god, represented as a bull with the face of a bearded man,5 or occasionally, by confusion with a sea-deity, with the body and tail of a fish.6 This latter form is assumed by Triton, with whom also the hero contends,7 though the myth is unknown in literature. Of similar import is his combat with Nereus, the old man of the sea (“Ἀλχος Τεφευ”), who appears in human form as an aged man8; the “type” employed on B.F. vases is similar to that of Peleus wrestling with Thetis (see below, p. 120), with similar indications of the sea-god’s transformation into animals. In one case an air of humour is imparted to the scene, and Herakles is represented smashing the furniture in Nereus’ house.9

Another important group of subjects is concerned with Herakles’ adventures with the Centaurs, which fall under several headings. Allusion has already been made to his early

9 Reina, i. 339 (R.F.).
education by Cheiron, and again we see him paying a visit of a peaceful nature to the aged Pholos, who entertains him by opening a jar of wine.¹ The smell therefrom attracted the other Centaurs and led to a combat, which we see vividly depicted on many early B.F. vases, on which it was a favourite subject, as also on later ones.² We also find him in combat with particular Centaurs, from whom he rescues a woman carried off by them. Thus we see Hippolyta delivered from Eurytion,³ and Deianeira from Nessos ⁴ or Dexamenos ⁵ (the latter appears on later vases only, and there seems to be no distinction between them in the myth).

Other adventures in which he engages include the freeing of Prometheus from the vulture, which he slays with his bow ⁶; the bringing back of Alkestis from Hades ⁷; the seizure of the Kerkopes, a pair of brigands, whom he carries off head downwards over his shoulders ⁸; and his capture by Busiris in Egypt,⁹ with his escape after slaying the king's negro attendants.¹⁰ Among rarer myths may be mentioned the destruction of the vines of Syleus ¹¹; a possible representation of his contest in drawing water with Lepreos ¹²; and his combat with Erginos, the king of Orchomenos, and the capture of his heralds.¹³ A vase in Athens, on which he is

depicted dragging two Satyrs in a leash,\(^1\) depicts an unknown myth; as do those which represent him contending with Geras, a personification of Old Age,\(^2\) and beating a winged Ker with his club.\(^3\) In company with Athena he attacks an unknown man,\(^4\) and he is also seen leading a Sphinx.\(^5\)

Next we turn to the relations between the hero and the Olympian or other deities, which often take the form of disputes or combats. Of these the most famous and important is his capture of the Delphic tripod, for which he fights with Apollo, generally in the presence of Athena and Artemis\(^6\); in one instance Herakles is seen in Athena’s chariot, carrying the tripod off with him\(^7\); other vases represent the final reconciliation with Apollo.\(^8\) There is a curious representation of a combat between Herakles and Hera (depicted as the Roman Juno Sospita, wearing a goatskin on her head), with Athena and Poseidom assisting on either side.\(^9\) Another rare and interesting subject is that of his attack on Helios, whom he interrupts at sunrise to prevent his journey after Geryon’s cattle from becoming known. Herakles is shown waiting for the chariot of the sun-god as it rises from the waves, and preparing to discharge his arrows.\(^10\) A later stage of the story is illustrated by a fine R.F. vase, where he voyages over the sea in the golden bowl given him by Helios.\(^11\) Lastly, he defends Hera and Iris against the attacks of a troop of Seileni.\(^12\) In other scenes where he is associated with the gods, it is in his divine capacity after his apotheosis.

His relations with women are not so frequently depicted but we have at least one representation of his visit to

Omphale; or, again, of his entertainment by Eurytos, the carrying off of his daughter Iole, and the subsequent fight with Eurytos. His rescue of Deianeira from the Centaur has already been alluded to, and there may also be a reference to his carrying her off from her father Oineus. Hesione is not found with him on vases, but he is seen carrying off Auge; he is also associated with a Nymph, who may be Nemea. On one vase he pursues, with amorous intention, a woman, who may possibly be intended for Athena.

A remarkable vase-painting by Assteas of Paestum depicts Herakles in a fit of madness destroying his children by hurling them on a fire, on which he has already thrown the household furniture; his mother and others look on, expressing various emotions. In more peaceful mood he is seen grouped with his wife Deianeira and their son Hyllos, or with Oineus, his father-in-law.

We now proceed to note a few subjects which do not admit of more exact classification. Herakles is initiated into the lesser mysteries at Agra, together with Kastor and Polydeukes, and is conducted by Hermes to the revels of the Scythian Agathyrsi (cf. p. 179). He is also sometimes seen carrying Hades on his back, the latter bearing a large cornucopia; but the signification of this subject is unknown. He accompanies the Argonauts on their wanderings, and appears as a single figure shooting from a bow. He is often represented per-

HERAKLES

forming an act of sacrifice, either as a single figure\(^1\) or in groups, sacrificing a ram or other animal.\(^2\) Some of these scenes, where he sacrifices to the xoanon of Chryse,\(^3\) a local Lemnian goddess, must refer to the story of Philoktetes, with which he was connected. Or, again, conversely, we see a statue of Herakles made the subject of offerings from others.\(^4\) A scene from the story of Antigone (see below, p. 119) is represented as taking place before a shrine, in which stands the deified hero interceding with Kreon for her life.\(^5\) He also appears as protecting god of Attica,\(^6\) and also of the palaestra, with reference to his traditional founding of the Olympian games.\(^7\) Finally, there is a series of subjects which (as in the case with most of the preceding section) may be concerned with Herakles either before or after his apotheosis.

Among these are the numerous vases (especially B.F.) where he is represented as being greeted by Athena or conversing with her,\(^8\) or receiving a libation from her.\(^9\) These may either refer to his receiving visits of encouragement from her in the intervals between his labours, or to his reception by her in Olympos (see below). Many vases represent him banqueting, usually in company with Dionysos and other deities.\(^10\) With Hermes and Iolaos he takes part in a procession accompanied by music\(^11\); and he is also represented overcome with wine and forming a subject for mockery,\(^12\) while

Satyrs steal his weapons\(^1\) (this subject being probably taken from a Satyric drama). Or he is represented bathing at a fountain\(^2\); and in one case fishing with Hermes and Poseidon.\(^3\) He also takes part in the Gigantomachia,\(^4\) and is present at the birth of Athena,\(^5\) in both cases by a curious anticipation of his deified character. Exceedingly common are his appearances with a lyre, as Kitharoidos.\(^6\)

The last scenes of Herakles' earthly life are his last sacrifice on Mount Kenaion,\(^7\) the wearing of the poisoned robe which led to his death,\(^8\) and the subsequent burning of his body on the funeral pyre. The last scene is occasionally combined with his apotheosis; the Hyades quench the flames among which his body is consuming, while the deified hero ascends in the chariot of Athena or Nike to Olympos.\(^9\)

The vases relating exclusively to his apotheosis fall into two main classes, which admit of more than one sub-division: (1) his ascent into heaven in the chariot of Athena or Nike; (2) his reception in Olympos. The ascent in the chariot of Athena is almost confined to B.F. vases; on those of the R.F. period it rarely occurs; and on the Italian vases her place is usually taken by Nike, who is also represented crowning him with a wreath. On the B.F. vases the "type" is almost invariable (see Plate XXIX.): Herakles mounts the four-horse chariot in which the goddess stands ready; on the farther side of it stand various deities, the commonest being Apollo, Dionysos, and Hebe, with Hermes at the horses' heads; more rarely Zeus, Hera, and Artemis are seen.\(^10\) In one or two cases Iolaos acts as charioteer, Athena standing at the

side; or, again, Hebe performs the same office. On the late red-figured vases the, attendant deities are almost limited to Hermes and Eros; the chariot is here usually represented as on its way.

The first stage of the hero's introduction into Olympos is his introduction to Zeus by Athena, a scene common on both B.F. and R.F. vases (Fig. 127). The attendant deities vary very greatly: Hermes, Apollo, Hebe, and Artemis are most often seen; also Hera, Poseidon, Ares, and Dionysos. Besides these there are numerous scenes in which he is grouped with various deities, usually Athena and Hermes, but also Poseidon, Ares, Dionysos, and Hebe, apparently in the enjoyment of his new

life among the welcoming gods; and to this group may be added the scenes in which he is crowned by Nike. The completion of his bliss is the marriage with Hebe, found on two or three fine R.F. vases, with a numerous company of attendant deities.

The adventures of Theseus, the peculiarly Attic hero, are portrayed on vases of all dates; they are rare on the later kinds, but are most popular on the R.F. vases of the "strong" and "fine" periods, as would naturally be expected at a time when his cult was coming into special prominence in Athens (see Vol. I., p. 418). Of his seven labours the only one commonly found on the B.F. vases is the combat with the Minotaur, but some of the finest R.F. kyliles give a complete series. They are given in the order of his progress from his birthplace Troezen through the Isthmus to Athens. It should be noted that the Cretan legends, which alone are common on the early vases, are clearly older than the more purely Attic.

The first subject to be mentioned in connection with the story of Theseus is that of his father Aigeus consulting the oracle of Themis. His finding of Aigeus' sword and sandals beneath the stone (cf. Plate LXII.) is not depicted on vases, but we have a possible representation of his recognition by Aigeus, and an unintelligible scene where he pursues or attacks his mother Aithra, apparently wielding the newly found sword.

There are only two R.F. kyliles which give the complete series of adventures, including that in Crete; the Duris kylix in the British Museum (Vol. I., frontisp.) omits two (the bull and Prokrustes), and others give a varying number of scenes, omitting sometimes one, sometimes another. The adventure

1 B.F.: Louvre F 30 = Rev. Arch. xiii. (1889), pl. 4 (Amasis); F 116-117 = Reinach, i. 297 = Wiener Vorb. 1890-91, pl. 4, figs. 1-2 (Nikosthenes); Bibl. Nat. 254; Berlin 1961 = Reinach, ii. 43. R.F.: Berlin 2626; Reinach, ii. 76, 186.

with Periphetes appears to be confined to literature. We give
the list as follows, with the vases on which they may be seen:

(1) The pine-bender Sinis.

B.F.: Athens 879. R.F.: Reinach, i. 313 (= Naples R.C. 180)
and ii. 280.

(2) The sow of Krommyon, sometimes accompanied by a
Nymph or old woman, the personification of the locality.

Reinach, i. 459; Noel des Vergers, Étrurie, pl. 14.

(3) The brigand Skiron (in Megara); this scene is usually
to be identified by the foot-pan and the tortoise.

Reinach, i. 119.

(4) The wrestling with Kerkyon (at Eleusis).

Reinach, i. 324.

(5) Prokrustes and his bed (near Athens).

1889, pl. 1; Millingen-Reinach, 9-10.

(6) The Marathonian bull.

Inghirami, Vasi Pitt. 54; Millin-Reinach, i. 43; Noel des
Vergers, Étrurie, pl. 35 (in Brussels).

(7) The slaying of the Minotaur.

A very early representation (about 610 B.C.) on the Polledrara
hydria in the British Museum (J.H.S. xiv. pl. 7: see
Chapter XVIII.).

B.F.: B.M. B 148, B 205; Munich 333 = Reinach, ii. 119=
Wiener Vorl. 1889, 2, 2, and 1155 = Wiener Vorl. iii. 7, 2;
Berlin 1608 = Wiener Vorl. iii. 7, 1; Millin-Reinach, ii. 61
(Taleides).

R.F.: B.M. E 441; Helbig, 80 = Reinach, ii. 81 = Baumeister,
iii. p. 1790, fig. 1874.

1 See on the subject generally Museo Ital. iii. p. 235.
The complete set of seven is to be found on the following:

B.M. E 84, where the scenes are duplicated on the exterior and interior of the kylix; here the Minotaur forms the central scene of the interior.

*Ant. Denkm.* ii. 1 (kylix by Aeson).

The following are more or less complete:

B.M. E 48 = Frontispiece, Vol. I. (by Duris; five scenes).

Louvre G 104 (Euphronios).

Reinach, i. 528-32.

After the labours on his journey comes the purification of Theseus on reaching Athens.\(^1\) To this time may perhaps be referred a scene in which he receives a palm-branch from Athena.\(^2\) There is a subject which cannot be placed in literary tradition, but probably comes in point of time immediately before or after the labours; this is the visit to Poseidon and Amphitritie under the sea, whither he is borne by Triton. It occurs on the beautiful Euphronios kylix in the Louvre (G 104) and elsewhere.\(^3\)

Next in point of time we have to deal with the story of Theseus' voyage to Crete and his marriage with and desertion of Ariadne. It begins with a scene in which he bids farewell to Aigeus\(^4\); then on his arrival in Crete he slays the Minotaur, as already described. We next see the meeting with Ariadne,\(^5\) followed by the nuptial ceremonies; the latter scene, together with the subsequent arrival at Delos, and a dance of boys and maidens liberated by Theseus, is vividly depicted on the François vase. His desertion of the sleeping Ariadne in Naxos and the appearance of Dionysos as her consoler form

\(^2\) *Wiener Vorl.* E. 12, 2.

\(^3\) See *J.H.S.* xviii. pl. 14, and pp. 277-79 for three other instances; the last, however, is susceptible of other interpretations.

\(^4\) Bologna 273 = Baumeister, iii. p. 1999, fig. 2149. The B.M. vase E 264 (see p. 108, note 5) may have the same meaning, in which case the woman holding the club is a sort of "short-hand" allusion to the adventure awaiting him. See also Reinach, ii. 81 (Theseus receiving libation from Aithra).

\(^5\) B.M. E 41 = Reinach, i. 532 (Chachrylion).
the subjects of two very beautiful R.F. vases; but the return to Athens and the death of Aigeus are not depicted.

The reign of Theseus at Athens is signalised by his combats with the Amazons and Centaurs. In the former story he carries off their leader Hippolyta as his queen, assisted by his friend Peirithoós; and in another version it is Antiope whom he overcomes, or the subject is treated in a more general fashion. This scene is supposed to take place in Attica; but the story of the Centaurs belongs to Thessaly, the home of Peirithoós. The Centaurs are represented interrupting a banquet, throwing everything into confusion, and carrying off Laodameia and other female victims. It occurs on the Francois vase, and is treated in a vivid pictorial fashion on several vases of a later period. The episode of the death of Kaineus (see p. 145) belongs to this group of subjects. To the same period belongs a vase representing the rape of a girl named Korone by Theseus and his friend. In the story as told by Plutarch (Thes. 31) it was Helene whom Theseus carried off; curiously enough, a figure thus inscribed is also present on this vase, as well as Antiope (see above). The rape (as described by Plutarch) was followed by their descent into Hades to seize Persephone. For this they were doomed to punishment, to sit for ever with hands bound behind them; but in one version Theseus is allowed to depart after a time, as is seen on one of the Apulian under-world vases. A vase signed by Xenotimos represents Peirithoós

9 Berlin 3143 = Reinach, i. 373; may also represent a rape by Theseus.
10 Jatta 1094 = Reinach, i. 356; see also Reinach, i. 168, 455; and above, p. 68.
11 Munich 849 = Reinach, i. 258.
seated in a chair holding two spears\(^1\); but its mythological significance is open to question.

Closely linked with the story of Theseus is that of the love of Phaidra for Hippolytus and the death of the latter, confined to late Italian vases; but Phaidra has not been certainly identified in any case.\(^2\) There is, however, an undoubted representation of the appearance of the bull which overthrew Hippolytus' chariot.\(^3\)

Next in importance as a hero of Greek legend comes Perseus, born from the golden shower in which Zeus visited Danae (see p. 19). We find representations of the scene so touchingly sung of by Simonides, the placing of Danae and her child in the wooden chest and sending them adrift\(^4\); and next we find Perseus as a full-grown youth, about to set forth on his mission of slaying the Gorgon, and receiving from the Naiads the cap, sandals, and wallet, which were to aid him in his quest.\(^5\) On later vases he receives from Athena the sickle (\textit{harpe}) with which he slays the monster.\(^6\) On his way he seizes the eye and tooth of the Graiae, a subject rarely depicted in art.\(^7\) The actual slaying of the Gorgon\(^8\) is not so often represented as the subsequent flight of Perseus, generally accompanied by Athena and Hermes\(^9\); in one or two instances we see Perseus approaching his victim unobserved.\(^10\) Other vases depict the headless corpse of Medusa, from which springs the young Chrysaor or Pegasos, and the other two Gorgons, Stheno and Euryale, either pursuing Perseus

or remaining with the corpse; in one instance they appeal to Poseidon for help.

We next see Perseus arriving at the court of Kepheus to deliver Andromeda; she is generally represented chained to a column in the palace itself. On other vases he is depicted in the act of slaying the monster, but this is a somewhat rare subject. Finally, we have the return to Seriphos and the petrifaction of the king Polydektès by showing him the Gorgon's head. Perseus is also represented showing the head to Satyrs, or placing it in the wallet (κιθαρις), or in combat with Maenads; or, again, he is accompanied by Athena, who holds the Gorgon's head while he looks at the reflection. Lastly, on some small R.F. vases, a bust of Perseus is depicted wearing his winged cap.

The story of Pelops is chiefly connected with Olympia, and his visit to Oinomaos; but the subjects are almost exclusively confined to the later Apulian vases. On one B.F. (Cyrenaic) kylix Pelops is depicted with the winged horses given him by Poseidon, but this is exceptional. The Olympia scenes include five episodes: (1) the arrival of Pelops at Olympia; (2) the sacrifice or compact with Oinomaos; (3) the race; (4) the fight; (5) the death of Pelops.

(4) the death of Mytilos; (5) the carrying off of Hippodameia. Pelops also occurs with Mytilos and Hippodameia in the under-world.

The adventures of Bellerophon are not so popular as those of other heroes, especially in the R.F. period. The story told in the sixth Iliad appears in several scenes, beginning with Bellerophon's taking leave of Proitos; next we see him delivering the letter with its σήματα λυγρά to lobates, the king of Lycia, and then, mounted on Pegasus, slaying the Chimaera. Subsequent events represented on vases are the death of the perfidious Sthenoebia, who falls from the back of Pegasus, and the marriage of Bellerophon with Philonoë.

Nor need the story of Meleager detain us long. Scenes from his life are practically confined to the Calydonian boar-hunt, a subject popular at all periods, especially on early vases. Kastor and Polydeukes, Peleus, and other heroes, together with Atalante, are represented as taking part, as well as Meleager. There is also a vase on which Meleager is represented with the boar's hide, accompanied by Atalante, Peitho, and Eros. Other scenes where a boar-hunt is represented, but no names given, or only names of a fanciful kind, may or may not be identified in this way. There is one vase which appears to represent the death of Meleager.

The next of the Greek heroes with whom we have to deal is Jason, with whom we must include the whole cycle of subjects relating to the Argonautika—such as the stories of Helle, Phineus, and Talos. The legend of the golden fleece which gave rise to the famous quest of Jason is first illustrated by scenes representing Helle or Phrixos in flight on the ram,\(^1\) or the former grouped with her mother Nephele and her brother Phrixos,\(^2\) who accompanied her on her flight. The pursuit of Phrixos and the ram by Ino is also represented.\(^3\) Lastly, there is a vase which may represent the setting out of Jason.\(^4\)

In the earlier history of the Argonautic expedition the most interesting subject found on the vases is the story of Phineus, who had been blinded for impiety by Boreas,\(^5\) and was subsequently deprived of his food by the Harpies until he was delivered by the sons of Boreas, Zetes, and Kalais.\(^6\) Another event is the chastisement of Amykos by Kastor and Polydeukes,\(^7\) and a fine vase of “Polygnotan” style in the Louvre represents a group of Argonauts apparently without any special signification.\(^8\) In all these scenes Kastor and Polydeuces and the Boreades are present together with Jason. There is also a scene which has been interpreted as belonging to the Argonautika: Herakles is represented sacrificing to a statue of Chryse on the island of Lemnos.\(^9\)

Then we have the arrival of Jason and his companions in Kolchis,\(^10\) and the subsequent feats performed by the hero—his slaying the dragon\(^11\) (in one version he enters into its

mouth), his contest with the bull, and finally the capture of the fleece, which he is also represented as bringing to Pelias on his return. The only important event relating to the homeward journey is the death of Talos.

Among the events of his later life are the boiling of the ram by Medea, and the subsequent destruction of the aged Pelias; the renewal of Jason's own youth; the death of his wife Glauke by Medea's agency; and the latter's slaughter of her children, with her pursuit by Jason. Medea also appears in another connection at Theseus' leave-taking of his father Aigeus, and among the Athenian tribal heroes on the vase by Meidias. Though not necessarily connected with Jason, the funeral games held after the death of Pelias must also find mention here. Scenes therefrom are represented on more than one vase—such as the chariot-race conducted by Kastor and others in the presence of three judges (Pheres, Akastos, and Argeos), and the wrestling of Peleus and Hippalkimos. On another Zetes is victorious over Kalais in the foot-race.

THE THEBAN LEGEND

The "tale of Thebes" falls into various episodes, more or less connected, especially those which relate to the story

of Oedipus and his line.\(^1\) Conspicuous as founder of the
city is the Phoenician *Kadmos*, whose encounter with the
dragon is depicted on vases of various periods. On some
he receives from Athena the stone with which he is to
slay the monster\(^2\); on others he is seen approaching the
fountain of Ares, where he was to meet it\(^3\); and, lastly,
we have the actual slaying of the dragon,\(^4\) sometimes in the
presence of Harmonia and various deities and personified
figures, including Thebes. After the slaying of the dragon
Kadmos sacrifices to Athena Onka.\(^5\) The completion of
the story is seen in his marriage with Harmonia.\(^6\) A rarer
subject is the punishment of Dirke by her brothers Amphion
and Zethos, who tied her to a wild bull\(^7\); while a later
episode of the story is the pursuit of her sister Antiope by
her lover Phokos.\(^8\)

The story of the Oidipodia is introduced by the subject
of Laios (the father) carrying off the young Chrysippos.\(^9\) Then
we have the exposure of the infant Oedipus and his discovery
by the shepherd Euphorbos.\(^10\) Of later events in the life of
Oedipus, the only one that attained to any popularity is the
slaying of the Sphinx. The actual deed only occurs once,\(^11\)
and the usual “type” is that of Oedipus (usually a young
man) standing before the Sphinx, which is seated on a rock

---

\(^1\) The only literary source for these
stories (before Roman times) is in the
tragic poets. But subjects from the
*Septem* of Aeschylus are not found on
vases; and it is not until the Hellenistic
period that any real references to the
Sophoclean and Euripidean plays occur.
On some of the Megarian bowls (Vol. I.
p. 500) the subjects adhere very closely
to the text.

or column. It is not always to be identified with certainty. In one instance Oedipus is represented, with Teiresias; in another with persons named Sikon and Kalliope—a subject hitherto unexplained. We need only make passing reference here to a vase supposed to represent the tomb of Oedipus, inscribed with a couplet of verses, at which stand two youths.

Before continuing the story of the house of Oedipus, we must digress to that of Amphiaraoos, the warrior-seer, whose departure from his wife Eriphyle to the Theban War is a favourite subject on vases. It becomes, in fact, a "type" adopted in ordinary scenes. We also find on the reverse of one of the vases with this subject the departure of another warrior, perhaps intended for the hero's son Alkmaion, or for Adrastos. On an early vase Amphiaraoos is seen bringing home Eriphyle in his chariot. The names of his horses, Thoas and Dion, are given. A curious subject is that of the hero in the bosom of his family, with his wife Eriphyle suckling her son Alkmaion, and a maiden spinning. His death is represented on one B.F. vase; on another his slaying of Eriphyle. Another event is the death of the child Archemosos, caused by a serpent. A fine late vase in Naples depicts the prothesis or laying out of his body by his mother Eurydice and others. The subsequent fight of Tydeus and Lykourgos, interrupted

by Adrastos, also occurs,⁴ and the reception of the fugitive Tydeus by Adrastos,⁵ Tydeus appears once more as the slayer of Ismene;⁶ but according to another version she and her sister Antigone are attacked by Laodamas when the Epigoni return to Thebes many years later.⁷ We can only point to one possible representation of the combat of Eteokles and Polyneikes on vases,⁸ though it is common enough, e.g. in Etruscan art; but there is at least one representation of Antigone being brought before Kreon after the burial of her brother,⁹ which also forms a burlesque subject on the comic stage.¹⁰

**THE TROJAN CYCLE**

We now come to the story of the Trojan War, linked with which are the events which led up to it and those which immediately followed upon it—such as the Judgment of Paris on the one hand, and the stories of Odysseus and Orestes on the other. These events are so numerous that they require careful classification. They may be divided into three main sections: (1) Ante-Homerica, including the events that led to the war and those that took place during the first nine years of it; (2) Homerica, or the events of the *Iliad*; (3) Post-Homerica, or the stories of the death of Achilles, the fall of Troy, the *Odyssey* and other Νοστοί, and the Oresteia. The literary authorities for these events, on the lines of which our classification follows, are discussed elsewhere (p. 4 ff.).

In spite of the warning of Horace that in writing of the story of Troy it is not necessary to begin *ab ovo*, it is impossible here to avoid reference to the earliest event which bears at all on the subject—namely, the birth of Helen from the egg, which was the result of Zeus' *amour* with Nemesis. The

subject is referred to on several vases, the moment chosen being that when the egg is found by Leda.\(^1\) Her husband Tyndareus and her other offspring, Klytaemnestra and the Twin Brethren, are usually present. There is one undoubted instance of the nuptials of Helen and Menelaos.\(^2\)

The first event, however, which can be regarded as having a direct effect on the outbreak of the war is the marriage of Peleus and Thetis, at which the apple of discord was flung by Eris among the goddesses, and which brought about the birth of the hero of the war, Achilles. In ancient art, especially on vases,\(^3\) Peleus is depicted forcibly capturing Thetis from the company of her sister Nereids, while she tries to elude him by assuming various shapes, all conventionally indicated in the vase-paintings. Some vases represent the approach of Peleus and his pursuit of Thetis,\(^4\) the majority the actual struggle (Fig. 128),\(^5\) and one or two the announcement of the issue to Nereus and the company of Nereids (who are named).\(^6\)

The next stage is the introduction of Thetis to the Centaur Cheiron by Peleus.\(^7\) Then we have the celebration of their nuptials, with the assembling of the gods, as described by Catullus, and vividly, if quaintly, depicted on the François vase,\(^8\) followed in due course by Peleus bringing the young Achilles to be educated by Cheiron,\(^9\) and his subsequent

sojourn in Skyros. There is one possible representation of the seething of Achilles in the caldron to secure his immortality.

The next event is the Judgment of Paris, perhaps of all the scenes from the story of the Trojan War the most popular with the vase-painters of all periods. The story of the forsaken

FIG. 128. PELEUS SEIZING THETIS (BRITISH MUSEUM).

Oenone, in the telling of which Tennyson has familiarised us with the scene of the Judgment, did not appeal to the unromantic Greeks in the same way. We only find one vase on which she is possibly represented. Curiously enough,

the vase-paintings seldom show the central act of the story—
the award of the golden apple. In fact, in the earlier examples
Paris is omitted altogether, and we only see the three goddesses
led in procession by Hermes. One vase, again, represents
the preparations of the goddesses for the trial, Athena washing
at a fountain and Aphrodite performing her toilet with the
assistance of Eros. The rest may be classified as follows
(the order adopted showing a rough chronological development
of the type):

(1) Hermes leads the three goddesses, Athena alone being characterised;

(2) Procession-type preserved, but Paris is present, standing. Type
    modified on R.F. vases.

(3) Procession-type; Paris seated; landscape introduced (see Fig. 129).

JUDGMENT OF PARIS

(4) Procession-type abandoned; goddesses picturesquely grouped, with attendant figures. Only on R.F. and later vases. In one instance two stages seem to be represented: first, the goddesses grouped for the Judgment, accompanied by Apollo, Helios, and Selene; secondly, the victorious Aphrodite crowned by Eros.

Parodied renderings of the subject also occur.

The reward of Paris for his judgment was, as we know, "the fairest wife in Greece." Accordingly we next find him arrived at Sparta and carrying off the fair Helen as his bride. The vases (all of the R.F. and late periods) depict him on his arrival at Menelaos' palace introduced to Helen, or else we see Helen at her toilet making preparations for her new consort; next, Paris leads away Helen or carries her off in his chariot, and finally introduces her to his father Priam on his return home.

The war having now broken out, we are introduced to the two chief heroes on the Greek side, Achilles and Ajax, as they bid farewell to their family and friends and set out in full equipment. Achilles, accompanied by Patroklos, Menoithos, and other heroes, bids farewell to his parents Peleus and Thetis; he also pays a farewell visit to his grandfather Nereus, who presents him with a crown and receives a valedictory libation from a Nereid. Again, we see Achilles and Patroklos taking
leaves of Nestor, accompanied by Antilochos. Ajax is represented taking leave of Lykos, and also of his father Telamon; but as in one of the latter cases the names are wrongly applied on the vase, it may only represent an idealized departure of an ordinary warrior. There is also a vase which represents Nestor arming (putting on a greave) in presence of Euaichme.

We next find the warriors gathered in Aulis, waiting for the favouring breeze, and whiling away the time (as Euripides describes) in the game of πευκατολ or draughts, which is played by Ajax and Achilles (names usually given) seated at a raised board in full armour, with the statue of Athena behind them. There is another variety of the type, in which the presence of Athena seems to have more meaning. Here the two heroes cast lots with dice before the statue, and there may be some reference to the dispute of Ajax and Odysseus for the arms of Achilles, which was settled by Athena. The story of the sacrifice of Iphigeneia, though popular with poets and painters, for some reason never found its way on to the vases until the influence of great pictures and plays was beginning to make itself felt; and then only appears in one instance, where the transformation into a deer is indicated. The only other incident of the voyage which concerns us is the halt at Lemnos and the sacrifice to the local goddess Chryseis, where Philoctetes is bitten by the serpent and has to be left behind on account of his wound. This island was also the scene of the carrying off by Achilles of Chryseis, the daughter of

9 Reinach, i. 358 = Millingen-Reinach, 50; ibid. i. 145 = Baumeister, iii. p. 1326, fig. 1479; Milani, Mito di Filotette, frontispiece.
OPENING SCENES OF TROJAN WAR

Chryses, the priest of the local goddess, of which there is one possible representation.¹

Two doubtful references to opening scenes of the war are to be found in a supposed consultation of Zeus with Themis among the Olympian deities,² and a representation of the Greeks formally demanding back Helen,³ a demand which of course was not granted. The story of Telephos also belongs to an early stage, and three incidents therefrom are found. In one case he is represented as wounded by the spear of Achilles⁴; again, entering the Greek camp disguised as a beggar, in order to apply to Agamemnon for aid⁵; and, lastly, he is seen seizing the infant Orestes, whom he threatens to destroy if his request is not granted.⁶ A R.F. kylix in Boston represents in the interior Odysseus persuading Achilles to heal Telephos' wound; on the exterior the wounded hero comes, not to Agamemnon's tent, but to his palace at Mycenae.⁷

At a much later stage of the war comes the incident of Troilos, a subject which attained to great popularity, especially with the B.F. vase-painters. It falls into five distinct scenes: (1) the departure of Troilos, with his two horses⁸; (2) the ambuscade of Achilles behind the fountain to which Polyxena comes to draw water⁹; (3) the flight of Troilos and Polyxena, and pursuit by Achilles¹⁰; (4) the death of Troilos¹¹; and (5) the fight over his body.¹² Of these, the ambuscade and the pursuit are the most commonly represented.

² Peters burg 1793 = Reinach, i. 3: for a more probable interpretation (birth of Dionysos) see p. 19.
³ Dubois-Maisonrneuve, Introd. pl. 63; Engelmann, Arch. Stud. zu den Trag. p. 17; and see Urlich, Beiträge, pl. 4.
⁵ Overbeck, Her. Bildw. 13, 9.
⁶ B.M. E 382; Naples 2293 and R.C. 141 = Baumeister, iii. p. 1725, fig. 1807.
⁸ B.M. B 153.
⁹ B.M. B 324, 542; Forman Sale Cat. 282 (= Reinach, i. 285, 1) and 308 (both in B.M.); Athens 620 = Reinach, i. 394 = Wiener Vorl. 1888, i, 1 (Timonidas); B.M. F 493 (caricature).
¹⁰ Louvre E 703 = Reinach, ii. 92 (early Ionic); B.M. B 307; François vase; Berlin 1685; Helbig, 130 = Mus. Greg. ii. 22, 1; B.M. E 10, E 13, and Forman Sale Cat. 339.
¹¹ Reinach, ii. 114-15 = Baumeister, iii. p. 1901, fig. 2000 (Euphorionios); Reinach, i. 285, 3; Louvre G 18 = Reinach, i. 203, 3; Louvre E 703 = Reinach, ii. 92; B.M. B 326.
¹² Munich 124 = Reinach, ii. 113.
A few incidents which are not to be traced in literature probably belong to the Ante-Homeric period. They are (1) Achilles bandaging the wounded Patroklos, on the well-known Sosias cup; (2) the wounded Achilles tended by Patroklos and Briseis; (3) a combat of Hector and Achilles attended by Sarpedon and Phoinix (in one case Phoinix interrupts); (4) a general combat of Greeks and Trojans.

It will be most convenient to deal with the various scenes which can be traced to the Homeric poems (or to co-ordinate traditions) in tabular form, noting where possible the actual passages which they appear to illustrate. But it must be borne in mind that the vase-painter was never an illustrator; he rather looked to literature for suggestions, which he worked out on his own lines, and consequently coincidences with or divergencies from the Homeric text must not be too closely insisted upon.

Possibly to be identified in such scenes as on B.M. B 327, 397, and E 13; but very doubtful: see below, p. 133, and Robert, Bild u. Lied, p. 213.

320 ff. Agamemnon and Briseis.

Reinach, i. 148 = Baumeister, i. p. 721, fig. 776 (Hieron in Louvre); and see B.M. E 76. Achilles and Briseis are found grouped together on two R.F. vases, but without any particular allusion: see B.M. E 258 and Helbig, 84 = J.H.S. i. pl. 6 = Reinach, ii. 91.

430 ff. Chryses propitiating Apollo.

Book II. 50 ff. Agamemnon in council.

B.M. B 149.

212 ff. Thersites insulting Agamemnon.

B.M. E 196.

1 Berlin 2278 = Ant. Denkm. i. 10; and see Overbeck, Her. Bildw. p. 297.
2 Reinach, ii. 198.
3 Ibid. i. 306 = Wiener Vorl. iii. 1 (the names may be fanciful); ibid. i. 77 (cf. Overbeck, Her. Bildw. p. 333).
4 Louvre E 609 = Reinach, i. 395 = Wiener Vorl. 1888, 1, 3 (Chares pyxis).
HOMERIC SUBJECTS

Book III. 259 ff. Priam setting out in his chariot.

Jahrbuch, iv. (1889), pl. 10.

B.M. E 20; Duris kylix in Louvre (Wiener Vorl. vi. 7 = Engelmann-Anderson, vi. 23).

Book V. 95-296. Combat of Diomedes and Pandaros (a reminiscence of).

Berlin 764 = Ant. Denkm. i. pl. 7, fig. 15; and see Hermes, 1901, p. 388; actually here Diomedes and Aeneas fight over the body of Pandaros.

312 ff. Combat of Diomedes and Aeneas, the latter protected by Aphrodite.

B.M. E 73; Tyszkiewicz Coll. pl. 18 (very fine R.F. vase, now in Boston); Reinach, i. 120 = ii. 97 (B.F.).

Stackelberg, pl. 11, 1.

258 ff. (1) Hector arming.

Munich 378 = Reinach, ii. 94 = Furtwaengler and Reichhold, pl. 14.

(2) Hector bidding farewell to Priam and Hecuba.

Helbig, 134 = Reinach, ii. 94 = Engelmann-Anderson, iii. 38.

(3) Hector bidding farewell to Andromache and Astyanax.¹

J.H.S. ix. pl. 3 = B M. E 282; Reinach, ii. 255 = Bibl. Nat. 207.

(4) Departure of Hector.

B.M. B 76, B 235 (?); Louvre E 638 (= Reinach, i. 243), E 642; Reinach, ii. 160; Jahrbuch, iv. (1889), p. 260.

321 ff. Hector conducting Paris to battle.

Bibl. Nat. 207 = Reinach, ii. 255.

¹ Like others of the Homeric scenes on B.F. vases, this type is sometimes used for an ordinary warrior taking leave of his family, and unless names are given it is difficult to distinguish.
HEROIC LEGENDS

Book VII. 162 ff. Combat of Ajax and Hector.

Munich 53; Helbig, 6 = Reinach, i. 104 (see under xiv. 402 ff.); Baumeister, i. pl. 13, figs. 779-80; B.M. E 438 (Smikros); and see Duris kylix in Louvre (Wiener Vort. vi. 7 = Engelmann-Anderson, vii. 42).

Book VIII. 89 ff. Combat of Hector and Diomedes.

Reinach, ii. 96.

261 ff. Teukros and Ajax son of Telamon.

Robert, in Hermes, 1901, p. 390, mentions a fragment of a Corinthian pinax in Berlin with these two figures, which may either belong to the above passage, or to xii. 370 ff., or to xv. 415 ff.

397 ff. Iris interrupting Athena (see pp. 39, 77).

Reinach, ii. 296.

Book IX. Achilles lying sick (apparently a contaminatio or confusion of ix. 168 ff. and xviii. 35 ff.).¹

Jahrbuch, vii. (1892), pl. 1.

173 ff. Embassy of Odysseus and Phoinix to Achilles (R.F. vases only).

B.M. E 56 = Wiener Vort. C. 3, 3; Berlin 2176 (= Reinach, i. 282), 2326 (= Reinach, i. 431 = Roscher, iii. 658); Millin-Reinach, i. 14; Reinach, i. 148 = Wiener Vort. C. 6 (Hieron) and 149.

Book X. 330-461. Episode of Dolon; his capture by Odysseus.

Oxford 226; Munich 583 = Jahrbuch, v. (1890), p. 143; Bibl. Nat. 526 = Reinach, i. 89 = Wiener Vort. v. 5 (Euphronios); Reinach, i. 334 = Petersburg 879; B.M. F 157 = Fig. 130. Dolon as single figure: Reinach, i. 306 = Wiener Vort. iii. 1.

469-525. Rhesos and his horses.

B.M. B 234-35; Naples 2910 = Baumeister, i. p. 728, fig. 782 (Odysseus and Diomedes with the horses); Wiener Vort. C. 3, 2.

¹ Robert, in Hermes, 1901, p. 391, connects this scene with Book xix. 320 ff.
SUBJECTS FROM THE "ILIAD" 129

566 ff. The horses of Rhesos brought to the tent of Diomedes.

Munich 583 = Jahrbuch, v. (1890), p. 146 (a slave waters the horses; another brings drink to Diomedes).

Book XI. The fight at the ships.

Munich 890 = Reinach, ii. 99 = Baumeister, i. p. 729, fig. 783.

Book XIV. Combat of Ajax and Aeneas (?l. 402 ff.).

Reinach, i. 306 = Wiener Vorl. iii. 1; id. i. 104 = Helbig, No. 6 (?see above, under vii. 162 ff.).

FIG. 130. CAPTURE OF DOLOM (LUCANIAN KRATER IN BRITISH MUSEUM).

Book XVI. 666 ff. Sarpedon carried off by Hypnos and Thanatos.

See Louvre F 388; but this scene is hardly to be distinguished from those with Memnon (see below, p. 132).

Book XVII. 60 ff. Combat of Menelaos and Euphorbos, and fight over his body.

B.M. A 749 = Baumeister, i. p. 730, fig. 784 1; and see E 20.

1 The text is not exactly followed here. Menelaos kills Euphorbos in the Iliad, but does not fight over his body with Hector as he does on the vase. Possibly there is a confusion with the Patroklos episode below.
123 ff. Combat over body of Patroklos.

Exekias kylix (Munich 339 = Reinach, ii. 36); Reinach, ii. 95; Millin-Reinach, i. 49; Berlin 2264 (Oltos and Euxitheos) = Wiener Vorl. D. 2, i = Engelmann-Anderson, xiv. 76.

Book XVIII. 367 ff. (1) Thetis in the smithy of Hephaistos.

Berlin 2294 = Overbeck, Her. Bildw. 18, 6.

(2) Hephaistos polishing Achilles' shield.

Book XIX. 1-18. Thetis and the Nereids bringing the armour to Achilles.

(a) Riding on sea-monsters over the waves (all late vases).

B.M. F 69; Jatta 1496 = Reinach, i. 112; Roscher, iii. 221-24; and see Heydemann, Nereiden mit Waffen.

(b) Presenting the weapons to Achilles.

B.M. E 363; Millin-Reinach, i. 14.

364 ff. Achilles arming.

Athens 671 = Wiener Vorl. ii. 6; Overbeck, Her. Bildw. xviii. 4, 7; vase by Amasis at Boston (Report for 1901, No. 5).

B.M. F 173.

Book XXII. 188 ff. Achilles pursuing Hector round the walls of Troy.

Reinach, ii. 102 (now in Boston: see Museum Report for 1898, No. 42).

209 ff. Zeus weighing the heroes' souls in his scales.¹

B.M. B 639; Bibl. Nat. 385 = Reinach, i. 89; Millin-Reinach, i. 19 = Baumeister, ii. p. 921, fig. 994.

¹ The "Psychostasia" is also referred to the combat of Achilles and Memnon (p. 132).
306 ff. Death of Hector.

437 ff. Andromache suckling Astyanax (*compare only*).

B.M. E 569.

Book XXIII. 157 ff. Funeral games for Patroklos.

François vase (chariot-race, etc.).

175 ff. Sacrifice of Trojan captives on the pyre of Patroklos.

Naples 3254 = Reinach, i. 187.

Book XXIV. 16 ff. Achilles dragging Hector’s body past the tomb of Patroklos.

B.M. B 543 and *Forman Sale Cat.* 306 = Reinach, ii. 100 (now in B.M.); Berlin 1867 = Reinach, ii. 99; Naples 2746.

141 ff. Achilles offering his hair to the river Spercheios.

B.M. E 555 (?).

448 ff. Priam begging Achilles for the body of Hector; the Achaeans princes deliberating over the ransom.

Munich 404 (= Overbeck, *Hr. Bildw.* pl. 20, 3), and 890 (= Reinach, ii. 99); Petersburg 422 = Reinach, i. 138 = Baumeister, i. p. 739, fig. 792; Reinach, i. 172 = Vienna 328; Athens 889 = *Ath. Mitth.* 1898, pl. 4 (B.F., but poor).

580 ff. Hector’s body carried out to prepare for burial.

Petersburg 422 (as above).

Among the events of the war between the death of Hector and the final fall of Troy, those which relate to the final exploits of Achilles are most prominent, and especially the

1 See, for a revised drawing of this vase, Hill, *Illustrations of School Classics*, p. 105.
encounters with Memnon, and with Penthesileia, his death and the events arising out of it. The story of Achilles' fight with Penthesileia, and the death of the Amazon queen, is less frequently depicted, but there are some very fine examples remaining. 1 Other representations of Amazons arming, setting out, or in combat may be placed here, but except where Penthesileia is specially indicated it is better to regard them as having no definite reference to the Trojan story. 2 A remarkable painting on an Apulian amphora depicts the slaying of Thersites by Achilles in the presence of Phoinix and Diomedes. Thersites had insulted Achilles after his slaying of Penthesileia. 3

The story of Memnon is related on the vases in several scenes, beginning with his equipment and departure for the fray. 4 Next we see the great fight of Achilles and Memnon over the body of Antilochos, 5 at which the respective mothers of the heroes, Thetis and Eos, are usually present as spectators. 6 The result of the fight was fatal to Memnon, whose body we see carried off by Thanatos and Hypnos, 7 or by Eos herself, 8 for burial in his native land. Eos is also represented mourning over him. 9 The Psychostasia, or weighing of souls by Zeus (see p. 130), has also been referred to this event. The body of Antilochos is finally rescued and carried off by Nestor. 10

Lastly, we find a few possible representations of the death of Achilles, 11 and others, more certainly to be identified, of the

10 Reinach, ii. 106.
11 B.M. E 808 (?).
battle raging round his body, in which Diomedes is wounded; also of Ajax carrying the body off out of the battle, and the subsequent mourning of the Nereids over it. A representation of the ghost of a warrior, winged and fully armed, flying over a ship, is to be regarded as that of Achilles, though to what event it alludes is not clear. The dispute over the hero's armour and the suicide of the disappointed Ajax are introduced by a scene representing the fetching of Neoptolemos, his son, from Skyros, where he bids farewell to Lykomedes and Deidameia; of the quarrel between Ajax and Odysseus there are also several representations. It was decided finally by Athena, who is represented presiding over the Greek chiefs as they vote; or, according to another version, they cast lots before her statue. The armour is then awarded to Neoptolemos, who, according to an oracle, was indispensable for the capture of Troy. Ajax goes mad with disappointment, and finally commits suicide by falling on his sword; the episode of his slaying the sheep is not, however, represented.

The Ἰλίου Πέρας, or sack of Troy, which is so vividly represented on many of the vases of advanced and late style, may be said to begin with the episode of the seizure of the Palladion by Odysseus and Diomed. It is rapidly followed by the construction of the wooden horse and its entry into

the city. There is, however, only one certain representation of the death of Laokoön to be traced, and none of the traitorous Sinon.

Several vases, especially of the later epoch, collect the chief episodes in a frieze or in a series of groups, including the rape of Kassandra by Ajax, son of Oileus, the death of Priam and Astyanax, the recapture of Helen by Menelaos, and the flight of Aeneas; other scenes represented are the leading back of Aithra by Akamas and Demophon, and the sacrifice of Polyxena and subsequent blinding of Polymestor by Hecuba.

I. General.

(h) Ajax stabbing a captive (?).
Reinaeh, i. 88.

Among the various adventures described by the Cyclic poets
in the Νομοτέλη, few seem to have found their way into the
vase-paintings except the fate of Agamemnon, the interview
of Menelaos with Proteus (told in the Οδύσσεια), and, of course,
the adventures of Odysseus.

The house of Atreus and its story will be dealt with later
under the heading of the Ορέστεια: we turn now to the Οδύσσεια,
scenes from which are surprisingly few in Greek art, and appear
to have attracted the painter less than the more stirring events
of the Ηλιάδ. The following, however, have been identified:

Book II. 94 ff. Penelope at her loom.
Reinaeh, i. 191.
HEROIC LEGENDS

Book III. 12 ff. Arrival of Telemachos at Nestor’s house in Pylos.

Berlin 3289 = Roscher, iii. 298 = Engelmann-Anderson, iii. 13.

Book IV. 349 ff. The story of Menelaos’ interview with Proteus.

Book V. 228 ff. Odysseus navigating the sea on a raft.

Oxford 262, Cat. pl. 26 (burlesque). See also B.M. E 156 (Odysseus and Leukothea).

Book VI. 126 ff. Nausikaa washing clothes.

Munich 420 = Reinach, ii. 116 = Roscher, s.v.

Alkinoës and Nausikaa (parody).

Reinach, i. 153.

Book IX. 345 ff. Odysseus offering wine to Polyphemos.

371 ff. Odysseus putting out the eye of Polyphemos.

Plate XVI. = Helbig, i. p. 435, No. 641 (Aristonooës); Bibl. Nat. 190 = Reinach, i. 64; B.M. B 154; Louvre F 342 = Gaz. Arch. 1887, pl. 1; Berlin 2123; Arch. Anzeiger, 1895, p. 35; Jahrbuch, 1891, pl. 6: see Bolte, Monum. ad Odys. pert. p. 2.

420 ff. Odysseus escaping under the ram.

B.M. B 407, 592, 687; Karlsruhe 167 = J.H.S. iv. p. 249; Louvre A 482; Reinach, i. 64: see also Ath. Mitth. 1897, pl. 8 (a very early instance); generally, J.H.S. iv. p. 248 ff., and Rev. Arch. xxxi. (1897), p. 28 ff.

Book X. 210 ff. Odysseus and Kirke (see J.H.S. xiii. p. 82).

(a) Arrival of Odysseus.

Reinach, i. 142 = Roscher, ii. 1195.

(b) Transformations of comrades.

Reinach i. 396; Berlin 2342 = ibid. i. 418; Boston Mus. Report, 1899, pp. 59, 61 (both early B.F.).

(c) Odysseus and Kirke.

J.H.S. xiii. pls. 2 (Athens 956), 4 (in B.M.), p. 81 (Oxford 262); and see Reinach, i. 142.
SUBJECTS FROM THE "ODYSSEY"  

Book XI. 23 ff. Odysseus sacrificing before his visit to Hades.

Bibl. Nat. 422 = Reinach, i. 126 = Baumeister, ii. p. 1040, fig. 1254.

Book XII. 164—200. Odysseus passing the Sirens.

Athens 958 = J.H.S. xiii. pl. 1; B.M. E 440; and see J.H.S. vi. pl. 49, p. 20 (= Louvre F 123); Corinthian aryballos in Boston (Sirena Helbigiana, p. 31).

Scenes from the last twelve books are even rarer:

Book XVIII. 35 ff. Odysseus and Iros.

Reinach, ii. 357.

Book XIX. 385 ff. Odysseus recognised by Eurykleia.

Reinach, i. 191.

394 ff. The story of Autolykos.

In connection herewith see Munich 805 = Reinach, i. 277 for a possible representation of the betrothal of Laertes and Antikleia (Hermes, 1898, p. 641; Robert, Homer. Becher, p. 90 ff.; Hyginus, Fab. 201).

Book XXI. 393—XXII. 5 ff. The slaying of the suitors.

Berlin 2588 = Reinach, i. 217.

The scenes from the Oresteia cover roughly the same ground as the great trilogy of Aeschylus, together with the Iphigeneia in Tauris and the Andromache of Euripides. We have first the murder of Agamemnon by Klytaemnestra with her axe.¹ Next, Elektra making her offerings at the tomb of Agamemnon, sometimes accompanied by her sister Chrysothemis.² It must be borne in mind that the "type" of this scene does not differ in any respect from ordinary scenes of "offering at a stele," and therefore, where the names are not given or are obviously modern additions, this interpretation is at best a doubtful one.

¹ Berlin 2301 = Reinach, i. 381; Petersberg 812 = Reinach, i. 381 = Millingen-Reinach, i. 58 (doubtful).
² Reinach, ii. 16; Naples 2858 = Overbeck, Her. Bildw. pl. 28, 5; ibid. 1755 = Baumeister, iii. p. 1848, fig. 1939; ibid. 1761 = Millingen-Reinach, 16.
HEROIC LEGENDS

The same applies to the next series of vases, on which Orestes meets Elektra at the tomb; but there seems to be one undoubted instance of Orestes and Pylades with the urn containing the supposed ashes of the former (cf. Soph. Electra, 1098 ff.). The next group to be dealt with shows us Orestes slaying Aegisthos, while Klytaemnestra is held back by Talthybios; and, finally, the death of Klytaemnestra herself.

Orestes is then pursued by the Furies, and seeks refuge at Delphi, where he is purified by Apollo at the Omphalos; and he is also seen at Athens, where he afterwards sought the protection of Athena. Other vases, nearly all of late date, and therefore under the influence of the Euripidean tragedy, represent Orestes accompanied by Pylades, arrived at the temple of the Tauric Artemis, where Iphigeneia presents Pylades with the letter. Lastly, we have the death of Neoptolemos at the hand of Orestes at Delphi.

ATTIC LEGENDS

It will now be necessary to deal with sundry isolated subjects, which do not admit of being grouped together round the name of any one great hero or any particular legend. There are, however, a certain number which may perhaps be regarded as having a special connection with Athens, and with these we will begin. Some of the specially Athenian myths have

1 B.M. D 33, F 57.
3 Vienna 333 = Reinach, i. 169; Berlin 2184 = Reinach, ii. 296 = Baumeister, ii. p. 1113, fig. 1310; Reinach, i. 143; Roscher, iii. 969 (in Berlin).

5 B.M. E 446.
6 Petersburg 349 = Reinach, i. 19; ibid. ii. 9, 316; Naples 1984 = Baumeister, ii. p. 1116, fig. 1313.
7 B.M. F 166; Reinach, i. 132 (in Louvre); Millin-Reinach, ii. 68; Naples 1984; Helbig, 117 = Reinach, i. 390; Arch. Anzeiger, 1890, p. 90 (Berlin); and cf. B.M. B 641 (possibly Orestes and Pylades at omphalos?).
8 Petersburg 2189 (according to Roscher, iii. p. 993); but see Reinach, i. 5, and above under Kadmos.
9 Reinach, i. 105 = Naples 3223; ibid. 133 = Baumeister, i. p. 757, fig. 808; ibid. i. 158 = Petersburg 420; Naples S.A. 24; and see B.M. F 155, and Reinach, i. 279.
10 Reinach, i. 321 = Baumeister, ii. p. 1009, fig. 1215 (Jatta Coll.).
11 See generally on Athenian cults, as illustrated by vase-paintings, Harrison, Mythol. and Mon. of Athens, Introd. p. xxi ff.
ATTIC LEGENDS

already been discussed in other connections, notably the story of Theseus (p. 108), the dispute of Athena and Poseidon (p. 24), the sending of Triptolemos (p. 27), and the rape of Kephalos by Eos¹ and of Oreithyia by Boreas (p. 80). There remain then the following:

(1) The birth of Erichthonios, who is represented as received by Athena from Gaia emerging out of the earth, in the presence of Kekrops and his daughters. It only occurs on the later R.F. vases; the type closely resembles that of the birth of Dionysos (p. 19).

'B.M. E 372; Berlin 2537 = Reinach, i. 208 = *Wiener Vorl.* B. 12 ;
Munich 345 = Reinach, i. 66 ; and Reinach, i. 113 = *Wiener Vorl.* iii. 2. Also a scene from the childhood of Erichthonios:
B.M. E 788.

(2) The reception of Dionysos in Attica (by Ikarios or Amphiktion).
B 149, B 153, and E 166 in the British Museum appear to refer to this, but not certainly. See above, p. 56.

(3) The story of Tereus and his daughters, Prokne and Philomela.²

(a) Tereus meeting Apate (Deceit); Prokne and Philomela in chariots.
Naples 3233 = Reinach, i. 240.
(b) Prokne and the dumb Philomela:
Reinach, i. 308 (in Louvre).
(c) Aedonaia slaying Itys.
*J.H.S.* viii. p. 440 (= Munich 799 a).

(4) The three sons of Pandion, Lykos, Nisos, and Pallas,³ with Orneus the son of Erechtheus.
Reinach, i. 510 = Roscher, ii. 2187.

¹ On one of these vases the scene (in the interior of a cup) is watched by a group of Athenians at the foot of a hill, round the outside of the cup (Reinach, i. 107 = Hartwig, *Meistersch.* pl. 39-40).
³ Cf. Strabo, ix. § 392, and see for Lykos in another connection p. 124 above. In the vase here given they witness the exploits of their kinsman Theseus (on the obverse).
(5) The death of Prokris by the agency of Kephalos.
B.M. E 477 (with Siren as soul of Prokris or death-deity).
(6) Kreousa defended by Apollo from the attack of Ion.
(7) Danaos taking refuge in Attica (?).
Reinach, i. 244 = Wiener Vorl. iii. 4, 2 (in Louvre).
(8) Echelos carrying off Basile.¹
Arch. Anzeiger, 1895, p. 39 : see p. 27.
(9) The story of Diomos, the eponymous deme-hero (?).
(10) Kodros, the last king of Athens.
Bologna 273 = Baumeister, iii. p. 1998, fig. 2148 = Jahrbuch, 1898, pl. 4.

The Kodros cup (completely published in Wiener Vorl. i. 4) is decorated with groups of figures intended to illustrate the legendary history of the great Attic families, in accordance with the genealogising tendencies of the period (about 450 B.C.). The outer scenes represent Theseus taking leave of Aigeus, and Ajax taking leave of Lykos; and Aigeus and Ajax (Aias) are eponymous heroes of two Attic tribes. On the Meidias vase in the British Museum² we see a group of Athenian tribal heroes, such as Akamas, Antiochos, Demophon, and Hippothon, together with Medea, who is also connected with Athens in the Theseus scene of the Kodros cup.

Other isolated myths which occasionally appear on vases, but defy more exact classification, may be briefly recorded here:

(1) Admetos and Alkestis.
Bibl. Nat. 918 = Reinach, i. 395 = Dennis, Etruria², ii. frontispiece.
See also p. 69.
(2) Agamedes and Trophonios as prisoners fed by Augias.
Louvre E 632 = Reinach, i. 349 (see Paus. ix. 37, 5; Ann. dell'Inst. 1885, p. 130).

² E 224 = Plate XLI. = Furtwaengler and Reichhold, pls. 8-9.
MISCELLANEOUS LEGENDS

(3) Agrios seized by Oineus and bound on the altar.
   p. 125.

(4) Atalante offering a cup to her antagonist Hippomenes.
   R.F. kotyle in B.M.

(5) Atreus and Thyestes (the latter as suppliant in the
    former's palace?).

(6) Daidalos and Ikaros, flight of.

(7) Glaukos in the tomb brought to life by the seer Polyeidios.
   B.M. D 5 = Plate XL.: see Apollod. iii. 3, 1.

(8) Kanake's suicide.
   Reinach, i. 448.

(9) Laios, Keleos, Kerberos, and Aigolios stung by bees when
    stealing the honey on which the infant Zeus was fed.

(10) Lykourgos destroying his children in a frenzy.
    B.M. F 271 ; Naples 3219 = Reinach, i. 125, and 3237 = Baumeister,
    ii. pp. 834-35. See also Reinach, i. 333 : Lykourgos slaying
    Thoas ; and p. 56.

(11) Melampus healing the daughters of Proitos from their
    madness at the altar of Artemis Lusia, in the presence of
    Dionysos.
   Naples 1760 = Millingen-Reinach, 52 = Wiener Vorl. B. 4, 3.

(12) Merope (a scene from the tragedy of that name).
    Munich 810 = Reinach, i. 363 : see Vogel, Scenen Eur. Trag.
    p. 118.

(13) Pandareos with the golden dog of Zeus, which he stole.
    Louvre A 478 = Hermes 1898, p. 638; Bull. de Corr. Hell. 1898,
    p. 586.
(14) Peleus wrestling with Atalante.
Munich 125 (= Reinach, ii. 120 = Furtwaengler and Reichhold, pl. 31), and 584 = Reinach, ii. 88; Bibl. Nat. 818 = Gaz. Arch. 1880, pl. 14; Micali, Mon. Ined. pl. 41.

(15) Peleus hunting a stag.

FIG. 131. PENTHEUS SLAIN BY MAENADS (BRITISH MUSEUM).

(16) Pentheus torn to pieces by his mother Agave and the frenzied Maenads.
B.M. E 775 = Fig. 131; Munich 807 = Baumeister, ii. p. 1204, fig. 1396; Jatta 1617 = Müller-Wieseler, Denkmäler, ii. 37, 436; Jahrbuch, 1892, pl. 5 (and see p. 154); Gaz. Arch. 1879, pls. 4-5 (?).

(17) Phaon with Chryse and Philomele.
Furtwaengler and Reichhold, pl. 59 (vase in Palermo, formerly interpreted as Dionysos and Ariadne: see text, p. 296, for the correct interpretation).
MISCELLANEOUS LEGENDS

(18) Phineus invoking the gods.
   B.M. E 291 = Wiener Vortl. C. 8, 1. For other Phineus scenes, see pp. 81, 115.

(19) The madness of Salmoneus.

(20) Thoas placed in the chest by Hypsipyle.
   Berlin 2300 = Reinach, i. 273; see Ap. Rhod. i. 622, and Hartwig, Meistersch. p. 374.

(21) Akter and Astyoche (uncertain reference).
   Jahrbuch, 1902, pl. 2 (in Boston): see ibid. p. 68, II. ii. 513 and 658; Schol. in Pind. Ol. vii. 42.

(22) The foundation of Boiae in Laconia by the appearance of a hare.
   Reinach, ii. 333 = Inghirami, Vasi Fitt. 120 (this is exceedingly doubtful).

(23) Two boys delivered to a Nymph (unknown myth).
   Wiener Vortl. E. 12, 3.

The story of Orpheus often finds a place on vases of the R.F. period, but is chiefly confined to two episodes, his playing the lyre among a group of Thracians (the men recognisable by their costume, see p. 179), and his pursuit by the Thracian women; and subsequent death at their hands. In one scene his head after his death is made use of as an oracle. He is often present in under-world scenes (see p. 68), but not always in connection with the fetching back of Eurydice.

1 Furtwaengler (50th Winckelmanns-Jubiläums- festprogr. p. 163) refers the Orpheus scenes to the Aeschylean tetralogy of the Lykourgeia.
2 B.M. E 390; Naples 1978, 2289, 3143 (see Reinach, i. 176); Reinach, i. 403 = Roscher, iii. p. 1181; Roscher, iii. p. 1179 (in Berlin).
3 Munich 383; Reinach, i. 63; ii. 80.
4 B.M. E 301; Naples 3114; Reinach, i. 186, 327 (= Roscher, iii. p. 1184–86); Roscher, iii. p. 1184; see also J.H.S. ix. p. 143.
5 Reina, i. 493 = Roscher, iii. p. 1178.
6 She occurs on B.M. F 270, Petersburg 498, and Karlsruhe 256.
Thamyris, a quasi-legendary figure, appears contending with the Muses for pre-eminence with the lyre; on one fine R.F. vase he is accompanied by Sappho, who, though strictly an historical personage, appears among the Muses in quasi-mythical guise; he also plays the lyre among Amazons. Other semi-historical persons enveloped in a cloud of fable are: Taras, the founder of Tarentum; Midas, who is generally represented with asses' ears, and is depicted judging the Seilenos who was caught in his rose-garden and is led before him with hands tied; and Minos, who appears at the slaying of the Minotaur by Theseus, and in the under-world as one of the judges of souls.

Nor must we omit to mention the Amazons, who play such a large part on Greek vases; besides their connection with various legendary events, they are often employed purely as decorative figures. Mention has already been made of their combats with Herakles and Theseus, and of the part played by their queen Penthesileia in the Trojan War; and we also find them in such scenes as the Judgment of Paris and Herakles' fight with Kyknos. They also contend with Gryphons; and many battle scenes in which they are opposed to Greek warriors may also be here alluded to as not admitting of more definite identification. They are further represented arming and preparing for the fray, or setting out on horseback, or defending

a besieged city; and as decorative figures we see them charging, stringing bows and discharging arrows, blowing a trumpet, running by the side of a horse or checking a restive animal, or fastening a shoe; or in peaceful converse with a Greek warrior, or else without any distinguishing action. Nearly all these subjects belong to the R.F. and later periods.

We may conclude this section with an account of the monstrous semi-human, semi-bestial creatures, which play a large part in the decoration of Greek vases, and appear in connection with many legends. Such are the Centaurs, half man, half horse; the Gorgons, winged women with snaky locks; the Harpies, also found on early vases in the form of winged women; and mythical creatures like Pegasos, the Chimaera, or the Minotaur.

The Centaurs, who probably symbolise mountain torrents or other forces of nature, appear (mostly on early vases) in combat with Herakles, either in troops or in single combat, as in the stories of Nessos, Dexamenos, and Eurytion; or, again, in the scenes so often celebrated in the sculptured friezes and metopes of Greek temples, where they contend with Theseus and Peirithoös, or with the Thessalian Lapiths. Among the latter a common episode is the death of Kaineus, whom the Centaurs buried in the earth, showering rocks upon him. In a more peaceful aspect appear the aged Centaurs, Pholos and Cheiron, especially in the stories of Herakles and Achilles, both of whom

are brought to the latter for their youthful education. As the friend of Peleus Cheiron often assists at his capture of Thetis. Centaurs, especially Pholos, are sometimes represented returning from the chase, or as single decorative figures; in one case they fight with cocks. Nike in one or two instances is drawn in her chariot by male or female Centaurs; and, finally, representations of youthful Centaurs are found, though usually they are middle-aged.

The Gorgons appear almost exclusively in connection with the Perseus legend, but are besides frequently found as decorative figures, especially on B.F. vases, in the running attitude characteristic of archaic art, in one case between two Sphinxes. Besides these, the head or mask of the Gorgon Medusa, familiar at all periods as a decorative motive of Greek art—first with an ugly and grotesque face, afterwards refined and beautiful—is often found by itself on Greek vases, especially as an interior central ornament of B.F. kylikes.

Harpies, conventionally associated through the medium of the Roman poets with the human-headed bird-form which really denotes the Siren, are found invariably on vases in the form of winged women. They are, as has been elsewhere noted (p. 81), associated with the Boreades as symbolical of evil and good influences of winds, and probably should be regarded as personifications of the southern breezes (the malevolent influence of which is seen in the sirocco). Traditionally they were supposed to guard the Garden of the Hesperides in Africa, whence the hot baleful winds come. The story of

Phineus is probably to be explained on these lines. A Harpy appears at the recovery of Zeus' golden dog from Pandareos.

That the human-headed bird represents a Siren in Greek art is amply attested by the representations of Odysseus' adventure with the vocal enchantresses. Their appearance on the so-called Harpy monument of Xanthos, however, shows them in another aspect, that of death-deities—not necessarily of a violent and rapacious character, as on a vase in Berlin, but gentle and kindly. So, again, a Siren is represented in connection with a tomb; and in a scene representing a banquet in Elysium they are depicted crowning the dead. On some vases we find a Siren playing a flute or a lyre (probably merely fanciful subjects); or, again, two Sirens kissing each other. As mere decorative motives their appearances are countless, and many early vases are modelled in the form of Sirens; sometimes they have human arms; in one case a bird's wings and a fish-tail; or, again, more anomalously, bearded masculine heads. More rarely they are seen flying.

The Sphinx is familiar in the first place as the monster, half woman, half dog, which vexed the city of Thebes till slain by Oedipus; this story is often alluded to on vases, but many groups of a man and a Sphinx have probably no special meaning. The Sphinx has sometimes a sepulchral reference,

and is grouped with other figures, such as Atlas¹ or a Seilenos² (the latter probably a scene from a Satyric drama). Like the Siren, she is exceedingly common as a decorative figure,³ especially in the friezes of animals and monsters so dear to the early vase-painters. Her invariable form is that of a winged lion or dog with a woman's bust.

The Gryphon, a kind of dragon composed of an eagle's head and lion's body and legs (occasionally a bird's), is almost exclusively decorative⁴; but on the later vases we find the fabulous combat of the Oriental Arimaspi with the Gryphons who guarded the mountain of gold in the Far East (cf. Plate XLII.)⁵; or, again, they contend with the Amazons⁶ with Scythians,⁷ or with ordinary Greek warriors.⁸ In one instance an Arimaspi woman is seen shooting at a Gryphon of curious type.⁹ Further, they draw the chariots of deities, such as Persephone,¹⁰ and Dionysos¹¹; and we have already seen Apollo coming on a Gryphon from the Hyperborean regions.¹²

Pegasos, the winged steed of Bellerophon, and the monster Chimaera which he slew, also appear as decorative figures¹³; and the former draws the chariots of Apollo and of a woman,¹⁴ and also appears as a constellation with the moon and stars.¹⁵ A human-headed monster attacked by a hero seems to have been suggested by the Chimaera on a companion vase.¹⁶ The Minotaur is generally seen in connection with Theseus, but also appears as a single or decorative figure,¹⁷ and one vase appears to represent the youthful monster in his mother's lap.¹⁸ Other monsters found occasionally on vases are Skylla, who

appears, not in connection with the story of Odysseus, but with those of Perseus and Andromeda,¹ and Phrixus and Helle,² or as a single figure³; and Lamia, a vampire or ogress in the form of a hideous old woman, who is seen undergoing torture from Satyrs,⁴ and in another unexplained scene.⁵ Another type of monster, the serpent-footed giant Typhon, has already been mentioned.⁶ Yet another and a unique type is that of the Nymphs with serpent bodies which protect vines from the attacks of goats.⁷

Lastly, another creation of fancy, though not strictly mythological, is the ἰππαλεκτρύων or "cock-horse," a bird with horse's head, which appears on some B.F. vases ridden by a youth.⁸ This may also be a convenient place for mentioning the common decorative subject of Pygmies fighting with cranes.⁹

### Historical Subjects

The number of vases on which undoubted historical subjects have been discovered is very limited, though the old systems of interpretation exerted much ingenuity in eliciting an historical meaning from many scenes of daily life, with or without names inscribed over the figures. In the instances given below, the names are given in most cases, obviating all doubts. It is worth noting that the subjects chosen are not as a rule those that would most obviously suggest themselves. They fall into two classes, one relating to historical events and persons, the other to literary celebrities:

I. (1) The weighing of silphium by Arkesilas, one of the descendants of Battos, who ruled at Kyrene—probably the second of the name (B.C. 580—550). This

Helbig, 154 = Jahn, Arch. Beitr. pl. 12, fig. 2.
(3) Anakreon.

(4) Kydias of Hermione (a lyric poet: cf. Schol. in Ar. Nub. 967) and Nikarchos (a contemporary flute-player) are to be seen, according to Jahn (op. cit.

![Image of Alkaios and Sappho](image-url)

From Baumeister.

FIG. 133. ALKAIOS AND SAPPHO (VASE IN MUNICH).

p. 740) on a psykter in the British Museum (E 767), on which these names are inscribed over two revellers; but the identification is exceedingly doubtful. See also Munich 1096 = Jahn, op. cit. pl. 4, fig. 1.

III. Mention should also here be made of the names of historical renown which often appear on R.F. vases with the word καλὸς (see Vol. I. p. 403, and below, p. 267), such as Alkibiades,
Glaukon, Hipparchos, Kleiniias, Leagros, Megakles, and Miltiades. The question is dealt with elsewhere, and it has been shown that only in one or two cases—e.g. Leagros, Glaukon, and Kleiniias (the father of Alkibiades)—can an identification with the historical personages be certainly maintained; it is, however, of sufficient interest for reference in this chapter, because the inscribed names may in some cases possibly refer to the figures depicted on the vases.¹

¹ Cf. Naples 2609 (Hipparchos); B.M. E 46, Athens 1162, and Louvre G 103 (Leagros); Athens 1020 = Jahrbuch, ii. p. 163 (Glaukon); B.M. E 300 and Oxford 309 (Kleiniias); Reinach, i. 513, 6 (Megakles).
CHAPTER XV

SUBJECTS FROM ORDINARY LIFE

It is hardly possible to give within brief limits all the illustrations that the vases afford, either directly or indirectly, of the religious and secular life of the Greeks. It is, however, feasible to classify these subjects under several headings, and to give a list of the most typical and popular in each case. Thus we have:

1. Religious ceremonies and sacrifices.
2. Funeral scenes and offerings at tombs.
3. Subjects connected with the drama.
4. Athletic contests, games and sport, and musical scenes.
5. Trades and occupations.
6. Scenes from daily life of women and children.
7. Military and naval subjects.
8. Oriental and barbarian figures.
9. Miscellaneous subjects and compositions of no particular import.
10. Animals (mostly only decorative).

I. RELIGIOUS SUBJECTS

These mostly appear in the form of sacrifices, either before a simple altar, or before the statue of some deity, a cult-image,
RELIGIOUS CEREMONIES

or terminal figure. Thus we have representations of the offering of a bull to Athena, sacrifices to a primitive image of Dionysos or to a terminal figure of Hermes, or a sacrifice or libation to Persephone, Apollo, or other deities. A procession of six maidens carrying chairs and a boy with game is probably in honour of Artemis; and in another scene we have the Dioskuri coming to the Theoxenia or feast prepared in their honour. Many other examples may be found under the heading of the various Olympian deities. In other instances we see the preparations for a sacrifice, or a procession of figures with victims and sacrificial implements; the victims are either rams, bulls, goats, or pigs. Other scenes of sacrifice represent the roasting of a piece of meat held on a spit over a blazing altar; or two men stand over a large krater on a stand, accompanied by a flute-player. In many cases the sacrifice is doubtless intended to celebrate a dramatic, agonistic, or other victory.

Among other religious scenes we have the dedication of a tripod, religious festival dances, praying figures, men or women burning incense over an altar or incense-burner; or scenes of libation, a Metragyrtes or mendicant priest

praying before devotees, and a priest examining the entrails of a ram. An ephebos is initiated and purified by the Αίδος κόιδίου; oaths are taken over a tomb, or omens from birds on a tumulus; and here perhaps may be mentioned a man making a gesture against the evil eye. There is also a scene illustrative of the Πειθομομα, an Athenian feast; and a possible representation of the feast of Adonis, and the "gardens" or pots of flowers exhibited on that occasion. Lastly, there are scenes relating to votive offerings, such as a figure of a child on a column offered to Athena, a youth carrying a votive tablet, and others in which similar votive tablets occur. The number of scenes which can be shown to relate to Athenian festivals, or bear on Greek religious belief and ritual, might be greatly expanded and multiplied, but at present little has been done in this direction.

2. Funerary Scenes

Closely connected with these religious subjects are those which played so large a part in the life of the Greeks, and found such a strong reflection in their decorative art—namely, those which relate to the burial and cult of the dead. The relation of Greek vases to the tomb has been discussed elsewhere (Vol. I. p. 141 ff.), and it is sufficient here to repeat that there are only three or four classes of vases which yield undoubted

12 Miss Harrison's comprehensive Prolegomena to Greek Religion (Cambridge Press, 1903) appeared too recently for the writer to be able to make detailed use of it in this section. It must, of course, be borne in mind that many of the interpretations in that work are only conjectural.
evidence that they were expressly made for funeral purposes, each belonging to a different period of the art.

In the earliest period we have the great Dipylon vases (Vol. I. p. 285), many of which represent funeral processions and rows of mourning women; these were made for standing outside the tomb. In the B.F. period there are the prothesis-amphorae, made likewise for placing first round the bier and then on the tomb, as plainly shown in one instance; and in the R.F. period the Athenian white lekythi are decorated almost exclusively with sepulchral scenes. Among the vases of the decadence a whole series of Lucanian and Campanian hydriae and Apulian kraters and amphorae, as well as some late Athenian vases, the Apulian examples being usually of enormous size, equally betray the special purpose for which they were made.

On the B.F. vases the commonest subject is the prothesis or conclamatio, where the body is exposed on the bier and the mourners stand round in attitudes of grief, a subject also occasionally found on the lekythi. Elsewhere we have the carrying of the bier to the tomb, accompanied by warriors, and the depositio or placing of the body therein. On the vases of this period the tomb invariably assumes the form of a mound (χώμα or tumulus), as it appears in some mythical scenes already described. On the lekythi, on the other hand, the tomb is in the form of a tall plain stele, on a stepped base, crowned with an ornament of acanthus-leaves or a palmette, and wreathed with coloured sashes, while vases and baskets of flowers are sometimes placed on the steps. On the vases of

Southern Italy it is developed either into a tall column with altar-like base,¹ or into a large shrine or heroon, with columns in front and gabled roof, within which stands the figure of the deceased,² or sometimes an acanthus-plant ³ or several vases.⁴

The subjects on the white lekythi and later vases almost invariably take the form of mourners,⁵ or men and women making offerings to the dead, or placing sashes, wreaths, and vases on the tomb.⁶ Or, again, we may note interesting parallels with the Athenian sepulchral reliefs of the fourth century, which are mostly contemporaneous with the vases.⁷ Thus we have "farewell scenes" between a man and woman,⁸ or between two women⁹; or the equestrian figure of a warrior, as on the famous stele of Dexileos,¹⁰ or a warrior charging with his spear ¹¹; or, again, a hare-hunt at a tomb, perhaps with reference to the occupations of the deceased.¹² Sometimes the tomb of a warrior is indicated by his armour.¹³ The interior of a tomb is occasionally shown, with a dead boy in it,¹⁴ or a series of vases,¹⁵ or as in the story of Polycleitos.¹⁶ In one instance a group of figures is placed on the top of the tomb.¹⁷ Mythological figures are sometimes introduced, as Charon ferrying the dead in his bark,¹⁸ or Hermes Psychopompos ¹⁹; or the type of Thanatos and Hypnos (or that of Boreas and Zephyros) with Memnon is borrowed for that of a warrior, a youth, or a woman whom they place in the tomb.²⁰ Occasionally we see the

Scenes from Funeral Lekythi (British Museum).

1. Prothesis; 2. Cult of Tomb.
soul of the deceased as a small flitting winged figure. On the Italian vases the figure of the deceased usually appears inside the herōn, painted white, as if to indicate a sculptured marble figure: a warrior with armour, or a youth with his horse or dog, or pouring a libation from a kantharos. These heroa are always surrounded by figures of women bearing baskets of offerings, unguent-vases, and wreaths, and by youths as mourners.

Apart from the under-world scenes already described, the future life is not illustrated by the vases, except in a curious scene on a B.F. Cyrenaic cup, representing a banquet of the blessed, attended by Sirens. There is also one single representation of the subject so common on later Greek reliefs—the sepulchral banquet.

3. The Drama

The relation of vase-paintings to the drama has already been discussed in Chapter XI., in which it has been shown how the tragedies of Euripides and the farces of Rhinthon influenced the artists of Southern Italy. It may, however, be worth while to recapitulate here the actual representations of actors or of scenes taking place on a stage, together with some account of the numerous burlesques of mythical subjects.

On one curious B.F. vase (probably late and imitative) we see a rude representation of a tragic and a comic chorus, and occasionally on vases of this period we find figures of actors dressed up as birds, or otherwise in comic fashion. More important in this connection are the fifth-century vases found on the site of the Cabeiric temple at Thebes, several of which have parodies of well-known subjects, such as Odysseus

6 See p. 68.
8 Anzeiger, 1890, p. 89 (Berlin); but see p. 76, under Asklepios.
9 B.M. B 80: see for other parodies of processions or sacrifices Athens 1132, 1136, 1138.
10 B.M. B 509; Berlin 1830 = J.H.S. ii. pl. 14, and 1697 (as horses).
and Kirke, or Peleus bringing the young Achilles to Cheiron. It seems probable that these scenes are actual reproductions of burlesque performances connected with the worship of the Kabeiri.

We look in vain for representations of scenes from Aristophanes and the Old Comedy, though there are one or two vases which recall (if nothing more) episodes in the *Acharnians* and *Frogs*. But for the rest, these comic scenes are almost confined to the vases of Southern Italy, especially those made at Paestum, with their presentations of the *φάντασματα* or fourth-century farces. A fairly exhaustive list of these was made some years ago by Heydemann, and probably requires little emendation as yet; we repeat below a number of the more interesting subjects, and others may be collected from the foregoing pages in which myths are burlesqued (the Judgment of Paris, the apotheosis of Herakles, Oedipus and the Sphinx, etc.).

3. Herakles at Delphi; Apollo takes refuge on the roof of the temple: Reinach, i. 153, 2 = Rayet and Collignon, p. 318.
4. Combat of Hephaistos (Daidalos) and Ares (Enyalios): B.M. F 269.
6. Herakles seizing Auge: Fig. 105, Vol. I. p. 474 = Reinach, i. 123 = Heydemann, p. 279.

Other scenes represent single figures, such as Herakles, or Taras on the dolphin; or subjects from farces of daily life, such as

1. *J.H.S.* xiii. pl. 4, and p. 81; B.M. B 77 = Fig. 98: see generally *J.H.S.* xiii. p. 77 ff. and Vol. I. p. 391.
3. B.M. F 99; Berlin 3046 = Baumeister, ii. p. 821, fig. 904 (see *Jahrbuch*, i. p. 283).
5. See for instance pp. 107, 118, 123.
as an actor with a table of cakes\(^1\) or the drunken return from a revel.\(^2\) Many scenes, again, have some reference to the Satyric drama, as on the fine vase in Naples, where Dionysos and other figures attend the preparations for a performance of that kind\(^3\); or such scenes as that of Hera and Iris attacked by Seileni,\(^4\)

![Scene from a Farce (British Museum, F 189)](image)

FIG. 134. SCENE FROM A FARCE (BRITISH MUSEUM, F 189).

or those relating to adventures of Herakles and Perseus with Satyrs.\(^5\) Other subjects have no particular significance, such as an actor attired as a Seilenos playing on the flute, or dancing,

VOL. II.
or with a Sphinx,\(^1\) groups of actors\(^2\) (in one case dressing\(^3\)), a comic actor among Satyrs and Maenads,\(^4\) and single figures.\(^5\) Some, which are apparently mythological, defy explanation.\(^6\)

The influence of Tragedy on vase-paintings is an indirect one, and entirely confined to the vases of Southern Italy on the one hand, and to the plays of Euripides on the other. The subject has been discussed at length elsewhere in this work,\(^7\) and it is unnecessary here to give a list of the subjects on South Italian vases which can be traced to the influence of Euripides. It has also been pointed out that this influence made itself felt, not only in the actual choice of subjects, but generally in their treatment and arrangement, in the quasi-architectural setting of many scenes, and in the elaborate costumes of the figures.

4. **Athletics and Sport**

From the theatre we naturally turn to the palaestra and gymnasium, which played so important a part in the public and private life of the Greeks, and, like the former, may be said to be vested with a religious significance, as exemplified in the Olympic and other great games. Hardly any class of subject is found so frequently and consistently on the vases. The series of Panathenaic amphorae alone supply instances of every form of athletic exercise in which the Greeks indulged.\(^8\) Many vases, especially the R.F. kylikes, represent groups of athletes in the palaestra engaged in various exercises, such as boxing, wrestling, running, and leaping\(^9\); in other cases we have

single groups of boxers or wrestlers, or of the \textit{παγκράτιον}, a somewhat brutal combination of the two. A boxer is sometimes seen putting on his caestus. The \textit{πένταθλον}, which played so important a part in the national games, is not infrequently found, though often only three or four out of the five contests appear.

**FIG. 135. ATHLETES ENGAGED IN THE PENTATHLON (BRITISH MUSEUM, B 134).**

Here, again, we also find single figures of diskos-throwers or javelin-throwers, representations of the long-jump, and men marking the ground with a pick-axe or poles. An athlete is

seen binding round his javelin the cord or ἀγκόλη by which it was thrown, and the pick-axe afore-mentioned also appears in such a way as to indicate its general use by athletes—viz. for digging up the ground over which jumps were made, by way of exercising the limbs. A variation of the javelin contest was one in which the competitors were mounted, and aimed at a shield set up as a target as they rode past. Other important contests are the foot-race; the horse-race, generally taken part in by boys (κέλντες); the chariot-race; the torch-race (λαμπαδηδρομία); and the race of armed warriors (ὀπλιτοδρομία). In the latter contest various types may be distinguished: the arming for the race; the start; the race itself, with runners turning at the end of the stadium; the finish; and a variation in which the runner carried his armour. On the earlier vases this race is run in full armour; on the later, only with helmets and shields. Frequently the victorious athlete, horseman, or hoplite is seen proclaimed as winner, and receiving his prize; also receiving a crown from Nike.
ATHLETIC SUBJECTS

Among more miscellaneous scenes may be mentioned athletes anointing themselves\(^1\) and using the strigil\(^2\); the κωρυκομαγία or quintain\(^3\); an athlete expiring\(^4\); a girl-runner wounded in the foot\(^5\); men rolling discs\(^6\); acrobats\(^7\) and female tumblers performing contortions over swords, or lifting objects with their feet.\(^8\) To the list of palaestra scenes may be added those where Nike or another deity appears as patron of the palaestra watching the athletes,\(^9\) and scenes of ephebi washing or bathing in preparation for or after their contests.\(^10\) The athletes are often accompanied by trainers, who use a forked stick to direct their movements.\(^11\) On the later R.F. and the Italian vases it is a regular thing to find on the reverse a roughly painted group of two or three athletes or ephebi, usually wrapped in himation and conversing together\(^12\); in such cases the palaestra is indicated by a pair of jumping-weights or a ball suspended.

Subjects coming under the heading of what we call **Sport** are not so common, and are practically limited to hunting scenes. They include hare-hunts,\(^13\) stag-hunts,\(^14\) wolf-hunts and fox-hunts,\(^15\)

lion-hunts; and boar-hunts; in the latter on early B.F. vases the figures often have fancy names, with a reference in some cases to the hunt of the Calydonian boar, which created the type. Some, especially B.F. vases, depict the departure of a hunter or the chase; or his return loaded with game; or we see a party of hunters resting (all with fancy names). A group of youths capturing and taming a bull may also be mentioned here, and horse-taming is similarly depicted. We see horses being unharnessed, groomed, and watered, or exercised, and a man with a backing horse; and we may also perhaps include among these subjects scenes representing riding-lessons, a school for ephebi, or a boy learning to mount a horse. A favourite subject for the interiors of R.F. cups is that of a young Athenian on horseback, often in Oriental or Thracian costume (see p. 179). On the B.F. vases a horseman or a chariot is sometimes depicted in front view, a notable exception to the preference of the time, and sometimes a three-horse chariot takes the place of the quadriga. Among miscellaneous chariot-scenes may be mentioned a goddess (?) and a hero mounting chariots, a girl in a chariot drawn by hinds; and people travelling in a country cart.

Among the various Games popular with Greek youths the

favourite is, perhaps, that of ball, which was often played by
men mounted on each other's shoulders in two parties, this being
known as ἔφεδροσμύνος; a rougher variant, in which the ball was
omitted and victory was probably gained by overthrowing
the opponent pair, was known as ἐγκοτίκη. Women and children
also play at ball, as does Eros. Equally popular was cock-
fighting; and we also see a group of boys shooting with
bow and arrows at a popinjay or figure of a bird. Of indoor
amusements the favourite is the κότταφος, a popular relaxation
after a banquet, often seen on kylikes and other R.F. vases.
Other games, more suitable to younger boys, are top-spinning
and bowling a hoop; others, again, in which boys and girls join,
or even occasionally. Eros and Satyrs, are the games of morra
(micare digitus, or "How many fingers do I hold up?"); its variant,
the Ὧμυλλα, played with knucklebones; swinging and
see-sawing; and flying a kite. A game of similar character
to the morra is played by a winged girl, who places her hands
over the eyes of a boy in a chair. The so-called magic wheel,
which was twirled on a string, is almost exclusively used by
Eros on the vases of Southern Italy. Children with their toys,
such as go-carts, vases of various shapes, etc., are often depicted
on the smaller R.F. vases of the fine style, some of which were

perhaps actually made for playthings\(^1\); and we often see them accompanied by pet dogs, tortoises, and other animals.\(^2\) Similarly there are representations of birds and beasts kept in cages,\(^3\) and of grown-up people playing with pets: a youth and girl with a mouse or jerboa,\(^4\) or a man with a Maltese dog.\(^5\)

Equal in importance in the eyes of the Greeks was the other great division of their education, μουσική; the wider sense in which they used the word, the culture of the mind as opposed to that of the body (γυμναστική), admits of including under this heading school scenes as well as musical performances. Among the former is the well-known kylix of Duris in Berlin (Plate XXXIX.),\(^6\) where a teacher is seen unrolling a manuscript on which appears an epic hexameter (see Chapter XVII.); a pupil is about to write on tablets; and others undergo instruction on the flute and lyre. Elsewhere we see a youth writing on a tablet,\(^7\) or on his way to school;\(^8\) a man reading from a roll;\(^9\) and a vivid representation of a schoolmaster giving a writing lesson.\(^10\)

Lessons in music,\(^11\) singing,\(^12\) and dancing\(^13\) are by no means infrequently represented, especially on R.F. vases; we have already seen the young Herakles and Iphikles receiving instruction of this kind,\(^14\) and on the vases both boys and girls take part in the lessons. Dancing scenes include dances of maidens (very common on early B.F. vases), or single figures of dancers;\(^15\)

a girl dancing to the flute or with castanets, a young woman to the music of a girl; a woman dancing the Pyrrhic dance in the attire of a warrior, and a sacred Lydian dancer with her wicker head-dress. The grotesque dancers on some early B.F. vases appear to be performing the kordax.

Groups of musicians with no particular signification are often found, generally playing the lyre and flute, or single figures, such as a lyre-player in female costume, or in the distinctive ορθοστάτων of the musician. Other scenes relate to agonistic and musical competitions, which often formed part of the great games; thus we have on some Panathenaic vases and elsewhere contests for victory with the lyre or flute. Sometimes the victorious musician appears receiving the prize or a crown from Nike; he usually stands on a bema or raised platform. On one vase a poet recites an epic to the sound of the flute; the opening words appear proceeding from his mouth. On another a man is seen tuning his lyre. Singing was a common recreation of banqueters or revellers, especially as seen on R.F. vases.

5. Trades and Occupations

The trades and occupations represented on vases are very varied, ranging from mining to shoemaking. The representations

of miners in caves which appear on some of the early Corinthian pinakes⁴ most probably refer to the digging out of the clay for the potteries rather than to mining for metals. This seems the more probable when it is taken into consideration that potters’ workshops and furnaces are so frequently depicted in the same series.² Besides these we find later instances of potters turning

From Baumeister.

FIG. 136. AGRICULTURAL SCENES (CUP BY NIKOSTHENES IN BERLIN).

vases on the wheel,² painting them, or finishing them off,⁴ as already described in a previous chapter: one vase represents the

³ B.M. B 432; Munich 731 = Fig. 67, Vol. I. p. 213; Gaz. Arch. 1880, p. 106.
interior of a potter's workshop with vases in various stages; another, a man painting the design with a sort of quill. Young men and girls are depicted negotiating the purchase of completed vases in the shop. Another of the Corinthian pinakes represents the exportation of vases in a ship. Metal-work is represented by a well-known R.F. kylix in Berlin, showing a bronze foundry, with statues in various stages of completion; there are also representations of a smithy, in some of which writers have seen an allusion to Hephaistos and the Kyklopes (see p. 37). A man is depicted finishing off a bronze helmet, or carrying a completed terminal figure; and of similar import is the subject of Athena modelling a horse.

Agriculture is represented by vases in Berlin and the Louvre with scenes of men ploughing with oxen (Fig. 136) or hoeing, sowers, and mules carrying sacks of grain; and certain vase-paintings have been interpreted as referring to the digging of a well. A man is seen cutting down a tree, and another birds'-nesting. Shepherds with flocks of sheep and goats are seen on two early Boeotian vases, and also fishermen, and men crushing grapes in a wine-press. The various stages of oil-making include the gathering of the olives from a tree, the pressing in an oil-press, and lastly the merchant measuring out and selling his oil.

A butcher is represented cutting up meat, and also the preparing and cutting up of a tunny-fish, and the baking of bread; on a B.F. vase two men weigh goods in a balance; and the export of the silphium (?) on the Arkesilas vase may also be mentioned here. Lastly, we have a shoemaker in his shop, a carpenter working with an adze, and a boy going to market with two baskets carried on a pole.

6. DAILY LIFE OF WOMEN

Scenes from the daily life of women form our next heading, and we include therewith those relating to marriage or preparations for nuptials, which play so important a part in woman's life. The "type" of a marriage procession on B.F. vases is, as we have seen (p. 16, and Vol. I. p. 378), liable to be confused with the subject of the marriage of Zeus and Hera; the bride and bridegroom appear in a four-horse chariot, accompanied by persons who, if not deities, at any rate bear similar attributes, such as the caduceus of Hermes or the torches of Artemis (as pronuba). In scenes of simpler character the wedding party walk in procession or drive in a cart. On later vases the bride is generally led by the hand by her husband, accompanied as before in appropriate fashion. We also find scenes representing the bridal pair on their marital couch (lectus genialis), and the return of the bride after the ceremonies. Other scenes may possibly represent a betrothal, a bridal toilet, or a nuptial

sacrifice, and, finally, the arrival of the bridal pair at their house, with a servant preparing the marriage-bed.

More common, especially on R.F. vases of the fine style, are scenes taken from the life of the women's apartments (γυναικοκωνία), such as women at their toilet, spinning wool, or bleaching linen, or embroidering. Under the heading of toilet scenes are included single figures of women arranging their hair, painting their faces, fastening on their girdles or shoes, or putting clothes in a wardrobe. They also play with cats or dogs or pet birds, and there is a subject identified as a "consolation" scene. Again, we see women bathing both in private and public baths, or even swimming; but in some of these scenes the bath merely forms part of the toilet. Many of these toilet scenes may perhaps be idealised and regarded as groups of Aphrodite, the Graces, etc.

A favourite subject, but almost confined to the B.F. hydriae, is that of maidens with pitchers on their heads fetching water from a fountain, which is usually in the form of a building with columns and lion's-head spouts of water; the maidens, five or

six in number, carry the empty hydriae flat on their heads, the full ones upright. Women are sometimes seen in gardens or orchards, gathering fruit or (on late R.F. vases) frankincense. Other miscellaneous scenes which cannot be classified are: a woman in bed, woman with foot-pan, at a meal, reading from a scroll, burning incense, spinning a top, balancing a stick, riding in a mule-car; two or more women wrapped in one large cloak; and an accouchement scene. Those in which children appear include a nurse and child; a child learning to walk; a mother, and a child in a high chair; and a woman beating a child with a slipper; subjects of children playing with toys, etc., have already been discussed (p. 167). Finally, there are the scenes in which women appear as jugglers or performing dances in armour, of which mention has been made; these were probably amusements associated with banquets (see p. 182; also *ibid.* for banquets in which women, *i.e.* courtisans, take part).

A very common decoration of vases, especially the inferior ones of Apulia, is that of a woman's head, either as the main subject or in some subsidiary part of the decoration; these, however, are so common that they hardly call for detailed description.

7. Military and Naval Subjects

Subjects of a military character on vases are chiefly confined to three—the arming of warriors, their setting out in chariots, on horseback, or on foot, and combats of two or more figures. In all these cases we are confronted with the often-recurring difficulty as to when such subjects have a mythological significance. Especially on B.F. vases, familiar types—such as the departure of Hector or the combat of Achilles and Memnon, to be identified in other cases by inscriptions—occur again and again in the same form, only diversified by the varying number of bystanders, which is generally regulated by the space at the painter’s disposal. Even when names are added they are often of a fanciful kind; and thus, for instance, we find combats between Homeric heroes which have no counterpart in literary record.

In the scenes of warriors arming we may note certain motives as recurring with more or less frequency—such as that of a warrior putting on his greaves, helmet, or cuirass (Fig. 137), or lacing up his helmet. Kindred subjects are that of a warrior taking his shield out of his case, or an archer drawing an arrow from his quiver, testing an arrow, or stringing his bow.

12 See note 10; also Festschrift für O. Benndorf, p. 66.
We may also note the rarer occurrence of such scenes as the harnessing of a chariot (Frontispiece)¹ or the equipping of a war-horse.² In the departure scenes the usual type on B.F. vases is that of a four-horse chariot to the right, which the warrior is mounting or has mounted; a woman sometimes give him drink, and an old man stands at the horses' heads. This "type" is used for the departure of Amphiarao (cf. Berlin 1655), Hector, or other heroes.³ It is sometimes varied by placing the quadriga to the front.⁴ Or, again, the warrior is seen on horseback, accompanied by his groom,⁵ or a company on foot set out in marching array.⁶ On later vases the more

usual version is that of a warrior receiving a libation or "stirrup-cup" from a woman before his departure, but the same scenes might be interpreted as referring to his successful return. Unmistakable instances of the return are those scenes where he receives a crown, or is brought back as a corpse by his comrades. There are scenes representing warriors taking oaths or omens at a tomb, or omens by the inspection of the liver of a victim, all before departure for battle; and single figures are countless, especially inside R.F. kylikes.

Among the various scenes incident to warfare may be mentioned an ambuscade, a wounded warrior dragged out of battle, a warrior protecting himself from darts, the capture of a prisoner, warriors carrying dead bodies, or human heads as trophies of victory. Besides single figures of warriors, heralds, trumpeters, slingers, and archers often appear; or representations of the armour of a warrior; or of the Δοκυμασία or parade of Athenian knights. Of a somewhat burlesque character is a scene depicting warriors riding on ostriches and dolphins.

Naval scenes are very rare, but we find occasional early

representations of sea-fights,¹ as on the Dipylon vases, the vessels on which appear to be biremes.³ On the B.F. and R.F. vases we find war-galleys³ or merchant-vessels,¹ usually in places suitable for a row of ships—such as the outer edge of a kylīx⁶ or the broad rim of a deinos or large bowl.⁸ These are specially common on vases of "mixed" technique. The subject of "keel-hauling," the punishment administered to refractory sailors, must also find a place here.⁷

8. ORIENTALS AND BARBARIANS

Oriental figures which can neither be classified as mythological, historical, or genre subjects sometimes appear on vases. We have already made mention of such quasi-mythological subjects as combats of Gryphons with Arimaspi or other figures in Oriental attire.⁸ Phrygian warriors, too, may be seen in some Trojan scenes—such as the sack of Troy or the flight of Aeneas⁹—but their presence in scenes of departure or combat does not necessarily make the subject mythological.¹⁰ It is not always easy to identify the nationality of these barbarians, and the names usually given to them—Persian, Phrygian, or Scythian—must in many cases be regarded as somewhat conventional, except where details of costume are unmistakable.¹¹

Archers in Oriental costumes, wearing peaked caps with long lappets, and close-fitting costume of jerkin and trousers (ἀναξύπαθες), stippled over to indicate skin, are seen shooting

arrows, on foot or on horseback, or accompanying the chariots of Greek warriors, or taking part in general combats; as also warriors blowing trumpets. Persian warriors in combat with Greeks appear on R.F. vases of the strong period, and may have some reference to the historical events of the time. It is even suggested that one is copied from the famous painting by Mikon of the battle of Marathon. One vase represents a sort of triumphal procession, perhaps of a Persian king, riding on a camel; and others depict Persians riding. Those of undoubted historical signification have already been mentioned. Scythians appear as mounted or unmounted archers, a Scythian horseman is attacked by a lion, a Scythian pursues two courtesans, and there is a curious scene depicting the revels of the Scythian Agathyris. Thracians, in the typical local costume of (a thick cloak) and (a fox-skin cap), appear by themselves or with Orpheus and Boreas; Thracian horsemen are represented setting out; and after the conquests of Miltiades the local costume appears to have become fashionable among the Athenian youth, as they are depicted wearing it on some contemporary vases. The Thracian custom of tattooing is suggested in some of the Orpheus scenes.

Figures of negroes are not very common on vases, though many of fifth-century date and later are modelled in the form of negroes' heads; but there is a small class of B.F. alabastra on which they are represented in the traditional barbarian

costume of trousers, etc., and are armed with the Oriental battle-axe. ¹ In one case a negro accompanies a camel. ² Ethiopians are seen conveying the body of Memnon or an ordinary warrior to his grave, ³ and one vase represents an Ethiopian with a jug. ⁴ A pair of Egyptian combatants can be identified on a fragmentary vase from Daphnae (Defenneh). ⁵ Lastly, many of the vases of Southern Italy, especially those of Campania, represent combats or leave-takings of native Osco-Samnite warriors, in their typical costume of triangular cuirass, gaily plumed helmet, and scanty tunic. ⁶

9. Banquets and Revels

A group of subjects which play an important part on vases of all periods, especially the height of the R.F. style, but which do not exactly fall under any of the headings so far enumerated, is that of scenes connected with banquets and revels, especially of Athenian ephebi. In the ordinary “type” of banquets at all periods (as in other branches of art) the participants recline on couches on their left elbows, the right arm being free to use, and that hand often holding a drinking-cup or other appropriate attribute. ⁷ In this fashion the gods—such as Dionysos, Hermes, or Herakles after his apotheosis—in indulge in the pleasures of the banquet and the wine-cup. ⁸ There are scenes which represent the preparations for a banquet, ⁹ or young men on their way thither ¹⁰; and in those depicting the feast itself a table is often placed before the couch, on which viands of various kinds are seen ¹¹; or

to throwing the remaining drops of liquid at the little figure on the top of the kottabos-stand, the hitting of which caused part of the apparatus to fall with a ringing noise. The latest Athenian and many Apulian vases the stand is often represented as well, not only in position for the game, but borne along by revellers. It is also carried by Seileni, Maenads, or Eros, and used by Dionysos at his banquets.

Other amusements take the form of music and dancing. The banqueters themselves play the lyre or flute, or listen to male and female performers on those instruments, or a young girl dances for their amusement. The women jugglers, tumblers, and acrobatic sword-dancers who often appear on late vases no doubt often contributed to the entertainment of the "gilded youth" of their day. Sometimes a banqueter is represented reclining on his couch and singing, the words in one or two cases being inscribed as proceeding out of his mouth. Not only men but women are represented banqueting, as on the psykter by Euphranios at Petersburg, which has a group of courtisans. This character also appears on the R.F. vases at the men's banquets.

The κόμος or revel is equally popular with the banquet. It usually takes the form of a procession of young and elderly men in various unrestrained attitudes, dancing, singing,
playing the lyre, flute, or other instruments,¹ carrying drinking-cups and other vessels,² or balancing them in sportive manner.³ Frequently these κόμοι scenes are of a Dionysiac character, the god himself, Seileni, Satyrs, and Maenads taking part,⁴ and sometimes human beings are mingled with them. On a vase of the series connected with the comic stage (Fig. 134, p. 161) a father is seen dragging a drunken youth home from a banquet; but these scenes of rioting are not always necessarily conceived as taking place before or after social festivities. On a red-figured cup at Petersburg the subject of the return from the feast of the Brauronian Dionysos is depicted in most realistic fashion, the revellers indulging in all sorts of buffoonery and fantastic actions, which suggest an Athenian counterpart of modern Bank Holiday amusements⁵!

To turn to a subject of a quieter character, what may be termed "love scenes" are not uncommon on vases, especially of the later period. On the Apulian vases indeed such subjects are innumerable. The usual type, occasionally found on earlier vases,⁶ is that of a youth and a seated girl exchanging presents, such as mirrors, wreaths, baskets of fruit or jewel-boxes, Eros being frequently present.⁷ Scenes of this kind were originally interpreted somewhat fantastically, as having some reference to the Eleusinian or other mysteries,⁸ an idea which no one would now seriously hold. Similar scenes which have no particular import, such as groups of women, often with Eros, occur on many R.F. vases of the later fine style, especially the pyxides and lekythi.⁹ They are all clearly fanciful, and belong to an age when tastes resembled those of the eighteenth century in their artificiality. There are also some instances,

especially on the R.F. vases, where the sentiment is more definitely expressed, and couples are seen embracing or caressing one another in amorous fashion. It is not necessary to make more than passing allusion to the many vases on which this harmless sentiment is replaced by coarseness and open indecency of treatment, some of which, however, belong to the very finest stage of red-figure painting.

Finally, we may mention here a few subjects of a genre character which seem to defy classification, and yet are sufficiently definite to require separate mention. Such are the scenes so common on the interiors of R.F. kylkes, which represent ephebi in all kinds of attitudes, or carrying all sorts of objects, the great aim of the artist being to find the most suitable design to fill in the circular space. Thus we have such subjects as a youth putting on a greave or sandals, carrying a wine-amphora or a lyre, playing with castanets, or pursuing a hare; reclining at a banquet; armed with a club or a large stone; a man leading a leopard, and a man who seems from his gestures to be treading unaware on a snake; and others of an athletic or military character, of which mention has already been made. There are also many subjects which appear to have a meaning, yet are not mythological, and cannot be satisfactorily explained; such instances it would, however, hardly be profitable to describe in detail.

10. ANIMALS

The last class of subjects with which this section has to deal is that of animals, as considered apart from human beings,
or objects of what modern painters term "still life." In the historical chapters of this work it has been shown what a large part the animal world played in the decoration of vases down to the sixth century B.C., and also which were the animals most frequently selected for the friezes and other decorations of early vases. Most noteworthy in this respect are the Mycenaean vases (Vol. I. p. 273), with their representations of cuttle-fish (Plate XV.), the nautilus or argonaut,\(^1\) and other marine subjects. But to these early vases in the present case no further allusion need be made; as subjects they have not as a rule sufficient interest. On the Attic vases of the B.F. and R.F. periods animals rarely form a principal subject on vases, though they still sometimes appear in small friezes on the less important parts of the vase; it may, therefore, be of interest to note a few typical instances in which this feature retains its prominence. Sometimes we have subjects with action: as, for instance, one in which a panther tears a stag, and is attacked by an archer and an armed warrior \(^2\); or a lion attacks a panther, a bull, or a deer.\(^3\) Again, the interior of a B.F. kylix is sometimes filled with an animal subject, such as a wounded stag,\(^4\) or a deer scratching itself or grazing,\(^5\) or other animals\(^6\); and in a similar position on one R.F. kylix we have an ass with its pack.\(^7\) Other animal subjects worth mentioning are a sea-serpent,\(^8\) goats browsing on vines,\(^9\) a fox caught in a trap,\(^10\) cats and mice,\(^11\) the appearance of the swallow.\(^12\)

There is a class of ware made in Southern Italy which takes the form of flat plates or dishes, decorated with representations of fish and molluscs, such as the pike or mullet, the cuttle-fish and various shell-fish; these were clearly used for eating fish off, and they have in the centre a hollow to receive the sauce.¹ Friezes of fish are not infrequently found on the vases of Apulia. Animals, especially birds, sometimes appear in friezes on the early Ionic vases, such as geese, quails, or guinea-fowl²; cocks and hens confronted are more common, especially in the B.F. period,³ and one late Italian vase has an amusing group of a cock and goose greeting one another with the words, "Ah, the goose!" "Oh, the cock!"⁴

Lastly, of subjects from still life, distinct from their appearance in figure subjects, we find the armour of a warrior,⁵ a washing-basin,⁶ a flute-case,⁷ a lyre,⁸ a table with bread upon it,⁹ and a collection of objects for the toilet.¹⁰

CHAPTER XVI

DETAILS OF TYPES, ARRANGEMENT, AND ORNAMENTATION

It may be profitable to supplement the foregoing account with a few general considerations, such as the attributes, emblems, and costume by which the different figures may be distinguished, the general treatment of the subjects at different periods, and the use of ornamental motives in the various stages of Greek vase-painting.

§ 1. DISTINCTIONS OF TYPES

In the earlier vase-paintings deities are often not only indistinguishable from one another, but even from kings and other mortal personages, attributes and subtle distinctions of costume being ignored; and in the period of decline a similar tendency may be noted, due in this case not so much to confusion of ideas as to a general carelessness of execution and indifference to the meaning of the subject. In the former vases it was, doubtless, largely the result of conventionality and limitation in the free expression of forms; but it is a peculiarity not confined to painting, and may be observed not only in the minor arts, in terracotta and bronze figurines, but even in sculpture of a more exalted kind—as, for instance, in
the female statues from the Athenian Acropolis. Thus, all
the deities are draped, and their costume differs in no respect
from that worn by mortals; all alike wear the chiton, hima-
tion, or chlamys, and ornamentation of the drapery with
embroidered patterns is no mark of distinction. It is only as
the art advances in the B.F. period that the necessity for
differentiation makes itself felt, and each deity becomes indi-
vidualised by some peculiarity of costume or special attribute
which makes it possible to recognise them without difficulty.
To give a brief survey of these characteristic marks will be
the object of the following pages.¹

Among the Olympian deities, Zeus is generally bearded,
and fully draped in long chiton and mantle; on R.F. vases
he wears a laurel-wreath. He fights the giants from his
chariot, but otherwise is standing, or seated on a throne, which
is often carved and ornamented with figures.² He usually
holds a thunderbolt, or a sceptre, surmounted by an eagle or
otherwise ornamented; in one or two cases the termination
is in the form of a lotos-bud, curiously conventionalised.³
Hera is distinguished by the stephane or broad diadem,
often ornamented, and covered with the bridal veil, the edge
of which she draws forward with one hand in the attitude
considered typical of brides. Her sceptre is sometimes sur-
mounted by her emblem—the cuckoo.

Poseidon, on the Corinthian and Attic B.F. vases—on which
he is but a rare figure—is often hardly to be distinguished
from Zeus, the approximation of the types extending even to
their emblems. Where he holds in addition a dolphin or
tunny-fish, there is, of course, no doubt as to his presence;
nor, again, in the Gigantomachia, where he wields a rock (see
p. 13, and Fig. 112); but his trident, which subsequently becomes
the unmistakable evidence of his identity, often assumes (as on
the Corinthian pinakes) the form of a sceptre ending in a
difficulty by the reader.

¹ To give detailed references through-
out may be considered superfluous, the
order of subjects followed being that of
the preceding chapters, to which refer-
ence may in all cases be made without

tations of Zeus, Figs. 111, 113, 114;
Plate LI.

TYPES OF DEITIES

lotos-bud, which is typical of Zeus, and, indeed, of Olympian deities generally. The other sea-deities are, however, of a more clearly defined type. The essential feature of Triton is the fish-tail in which his body terminates. Nereus, on the other hand, is represented as an old man, bald and grey-bearded. In this form he contends with Herakles (see p. 101), and it may be that the differentiation was necessary to avoid confusion with the Triton type. As attributes he often holds a dolphin or tunny-fish, and a trident or sceptre. The winged deity with a long sinuous fish-tail seen on early Corinthian vases is probably Palaemon (see p. 26); but in one case this deity is feminine. Amphitrite, as the feminine consort of Poseidon, holds a sceptre or tunny-fish, and Thetis and the Nereids appear in ordinary female form. The former, however, in her struggles with Peleus, is accompanied by lions, serpents, and other animals, which indicate the transformations she was supposed to assume. Skylla appears as described in Homer, with fish-tail and the fore-parts of dogs issuing from her waist, which is encircled by a fringe of scales or feathers.

Demeter and Persephone are not always distinguishable from one another, both having the same attributes—a torch or ears of corn (cf. Plate LI.). Their identification depends rather on the nature of their respective actions in the scenes where they appear. Triptolemos is always seen in his winged two-wheeled car (sometimes drawn by serpents), and usually holds ears of corn or a libation-bowl; on B.F. vases he is bearded. The other Eleusinian deities, on the late R.F. vases where they occur, are marked by the large torches which they hold.

Apollo on the B.F. vases almost invariably occurs in his character of Kitharoidos, the lyre which he holds being of the form known as kithara (on later vases it is a chelys); he is therefore, like all musicians, fully draped in long chiton, and his hair falls in curls on his shoulders, or is gathered in a κρούβιλος. Unlike most gods, he is at all times youthful and beardless. He is also represented holding a laurel-branch,

---

4 An exception is El. Cfr. i. pl. 62, where he is bearded (on a B.F. vase).
shooting an arrow from his bow, or riding on a swan or Gryphon, or accompanied by a hind or other animal. His sister Artemis is draped in long chiton and mantle, and often wears a high cap on B.F. vases; it is not until the later R.F. period that she appears in hunting costume, with knotted-up hair, short chiton, and high laced-up hunting-boots or endromides; sometimes also a fawn-skin. She is usually distinguished by her bow and arrows, and is accompanied by a hound, deer, goat, or other animal.\(^1\)

Hephaistos is usually bearded,\(^2\) and often appears in the workman’s dress of the exomis or short chiton covering one shoulder, and high conical cap; his craft is further symbolised by a hammer or tongs, or by the axe with which he brings Athena forth from the head of Zeus. In the Gigantomachia he uses his tongs with savage violence against an unfortunate opponent (see p. 14). Ares is the typical Greek fully-armed warrior, bearded, with helmet, short chiton, cuirass, and greaves, sword, spear, and shield; but is not otherwise to be distinguished. Hermes, as the messenger of the gods, appears in appropriate costume of chlamys and petasos (the Greek travelling-hat), and carrying the caduceus or herald’s staff; he usually wears high boots, and on the earlier vases a short chiton in addition. He is occasionally winged, but it is more usual to find the wings attached to his petasos or boots. On B.F. vases he is always bearded, but not after the sixth century. Hestia, who but rarely occurs on vases, forms a pair to Hermes in assemblies of the gods, but is not distinguished further than by the Olympian lotos-sceptre.

Athena on the earlier B.F. vases is not always distinguished from an ordinary woman; later, the helmet, spear, shield, and aegis become inseparable adjuncts of her costume, the shield being always circular in form. The spear, which is sometimes her only characteristic, is usually brandished or crouched in her right hand, and sometimes she holds her helmet in her hand (see Plate XXXVI. and p. 40). Her costume consists of a long girt chiton, over which the peplos

\(^1\)See for these two, Fig. 116.

\(^2\) Exceptions are B.M. D 4; Et. Ctr. i. pls. 46 A, 47, 63.
or small mantle is thrown, and the aegis round her chest. The latter is covered with scales and has a fringe of rearing serpents; and sometimes, on later vases, the Gorgon’s head in the centre of the front. On the Panathenaic amphorae she is always represented in the Promachos attitude, at first to left, but later to right, brandishing her spear. At either side of her are columns surmounted by an owl, a cock, or other emblems. On the later specimens her figure is greatly elongated, and her drapery is often elaborately embroidered with patterns in purple and white. Her statue when represented is usually a mere reproduction of the living type; but on some later vases there seems to be a reminiscence of the Parthenos or other statues (see p. 40).

Aphrodite is less individualised than any other deity, at any rate on the earlier vases, on which she is invariably draped in the ordinary manner. She sometimes carries a lotos-headed sceptre (as in Judgment of Paris scenes). Occasionally she is represented armed. On the later vases the influence of fourth-century sculpture becomes apparent in the treatment of this, as of other deities. She now first appears nude (when bathing or washing), scantily clad or half draped, and in transparent Coan draperies, through which the outlines of her form are visible. She has no characteristic attribute, but is frequently represented with a dove or other bird. The types of Eros have already been fully discussed (p. 45); briefly it may be said that on the Attic R.F. vases he is a full-grown nude youth with wings; on those of Southern Italy the type is more boyish, though never the child or putto of the Hellenistic Age, and in Apulia the androgynous type, with hair arranged in feminine fashion and jewellery profusely adorning his person—earrings, necklace, chains, and anklets—is invariable.

Dionysos is distinguished primarily by the ivy-wreath which crowns his head; he generally wears a long chiton and mantle, but on the latest vases is frequently nude. On all B.F. vases, and often on those of the R.F. period, he is bearded, and it is only on those of Southern Italy that he appears as a somewhat effeminate youth, half draped like Apollo, with rounded and graceful limbs. His attributes are
the rhyton or keras (only on B.F. vases), the kantharos, a form of drinking-cup specially associated with him, a vine-branch, and the thyrsos; he is accompanied by panthers and other animals, or swings the limbs of a kid (χυμαροφόνος). Usually he maintains a calm and unmoved attitude amid the wild revelries of his followers. Ariadne is undistinguished except by her association with him. Pan, who only occurs on later vases, is almost invariably represented as a beardless youthful figure, with goat’s horns, but human legs; when, however, he has goat’s legs or feet, he is usually called Aegipan, and in this aspect he assumes a somewhat dwarfish and more bestial aspect.\(^1\)

Satyrs are either elderly and bearded, or youthful; in all cases with pointed ears and horses’ tails, and undraped except for the fawn-skins which they frequently wear. They carry a thyrsos, drinking-cups, or musical instruments, according to the circumstances in which they are depicted. In Ionic art (Vol. I. p. 353 ff.) the Satyrs invariably have horses’ feet as well as tails, and are usually of repulsive appearance. The Seileni are really aged Satyrs, depicted as bald or white-haired, but not otherwise differentiated, except in the case of Papposilemos, who is covered with shaggy skin.\(^2\) The Maenads are often represented (especially on B.F. vases) as ordinary draped women, or only with the addition of a fawn-skin or panther-skin over their chiton; they carry the thyrsos, or frequently on later vases a large tambourine (tymanon).

Of the personages associated with the under-world, Hades is usually an elderly bearded deity of the Zeus type. He carries a sceptre, often with ornamented top, and sometimes from his Chthonian association with Dionysos holds a kantharos, vine-branch, or cornucopia. Kerberos has three heads only on two Caeretan hydriae and the Apulian under-world vases; his usual number is two, but once or twice he has only one.\(^3\) Hekate has torches for her customary attribute, and the Furies, who only occur on South Italian vases, wear short chitons with various Satyr-types, see Loescheke in Ath. Mitt. 1894, p. 521 ff.

\(^1\) Cf. for the two together on a vase, B.M. E 228.
\(^2\) For an attempted distinction of the
\(^3\) See J.H.S. xviii. p. 296.
cross-belts and have rough hair, in which and round their arms serpents are intertwined. Charon the ferryman is represented as an elderly man in short chiton and conical cap (cf. Fig. 122), but the grim Etruscan Charun is a repulsive and savage hook-nosed demon, wielding a hammer. Thanatos and Hypnos, the two Death-deities, are both winged men, but only the former is bearded (cf. Fig. 123); there is usually nothing forbidding in his appearance. The question of the representation of ghosts or souls (eisōlai) has been fully discussed (p. 72); most commonly they are diminutive winged figures, and in other cases they appear as in ordinary life, but possibly they sometimes appear in the form of birds.

Gaia is represented half rising out of the earth, a beautiful but not young woman, with long hair (Fig. 112); or, as Pandora, her head alone is seen (see p. 73). Kybele occasionally appears, with her attendant lion, and an even rarer figure is Asklepios, with his serpent. The Eileithyiae, who attend at the birth of Athena, are ordinary women, distinguished by the appropriate gestures of their hands (Fig. 113). Iris, the female messenger of the gods, appears winged, with short chiton to allow of rapid movement, and carrying the caduceus or herald’s staff; Hebe, on the other hand, is an ordinary woman. Nike is usually to be distinguished from Iris by her long flowing draperies, even when in flight; the various attributes usually associated with her have already been dealt with in detail (p. 87).

Among personifications, Helios is a youthful figure in a chariot, usually with rays round his head (as on Plate LIII.); in one or two cases his head is surmounted by a white disc; Selene appears on horseback, and is sometimes indicated by a crescent moon; where Helios is accompanied by a goddess in a chariot, it is probable that Nyx (Night) is intended (see p. 79). The Stars are represented as nude youths. The Auroae or breezes appear as girls floating through the air; the Hyades or rain-Nymphs are identified by their water-pitchers. A group of winged gods and goddesses is formed by Eos, Agon (the

1 Cf. the Greek heroes on B.F. vases (B.M. B 240, B 543).

2 See B.M. E 477 and Weicker, Selenvogel, passim.

3 See also Roscher, iii. p. 330.
masculine counterpart of Nike), Eris, Lyssa (Frenzy), and the various wind-gods, such as Boreas and Zephyros. These are found at all periods, but the types vary. Eris, who is only found on B.F. vases, resembles the Gorgons (see below), a somewhat grotesque figure with wings, rough hair, and short girt chiton; Lyssa only occurs on Apulian vases, and is akin in type to the Furies—in two instances her figure is enclosed in a circle of rays of light, perhaps to express the blinding effect of her action, and she holds a goad. Oistros, a kindred figure, rides in a chariot drawn by serpents, and carries torches. The type of Agon is assimilated to that of Eros on R.F. vases; on those of earlier date (if this is the correct interpretation) he wears a short girt chiton and holds a wreath. The Wind-gods on B.F. vases wear the petasos and high boots, and short girt chiton; Zephyros is represented as a youth; and Boreas, who only occurs on R.F. vases, wears Thracian costume; he is bearded, and his hair is often rough and shaggy. But these winged deities cannot always be identified with certainty. Among other personifications, Geras is a somewhat ugly old man; the Muses are distinguished by their various musical instruments; and Cities and Countries are occasionally individualised. For instance, Thebes, on a vase by Assteas, wears a turreted crown; Sparta appears as a Nymph on horseback; and, generally speaking, their presence is usually indicated not only by inscriptions, but by their relation to the scene depicted. River-gods, such as Acheloös, appear as human-headed bulls, with horns, but the last-named on a stamnos by Pamphaios (E 437 in B.M.) has a fish-tail.

Kastor and Polydeukes usually appear on horseback and in hunting costume, with petasos, chlamys, and spears; on later vases they sometimes wear the pileus, a conical cap which often appears as their emblem on coins. Herakles on earlier vases is always bearded, and wears the lion's skin fastened round his waist with a belt, the forepaws knotted round his throat.

1 Only on B.M. F 271 and Naples 3237; elsewhere un winged.
2 See p. 91.
3 See J.H.S. ix. p. 47 ff.
4 Note that the vase painters are careful never to represent him wearing the skin when contending with the lion.
the head covers his head like a cap, leaving his face only exposed, and under it he wears a short girt chiton; he is armed with his club, or bow and quiver, and sometimes with a sword. On R.F. vases he is often nude, or only wears the skin in chlamys fashion. On the earlier vases he is often less characterised, and the same applies to the later R.F. vases, on which he is frequently beardless; in many cases he is only to be identified by his club. *Theseus* always appears as a youth, and on the R.F. cups usually wears a short loose chiton of crinkly material (cf. Vol. I., Frontisp.); his arms are a sword, or sometimes a club. *Perseus* wears the winged petasos or cap of darkness and high boots (the shoes of swiftness), sometimes winged; he carries the wallet or κιβως, and sometimes the ἀπρή or curved sword with which he slew Medusa. *Pelops* on the Apulian vases is usually characterised as an Oriental, with richly embroidered costume and a tiara or embroidered cap. The Homeric heroes are only to be identified by inscriptions, or by the actions in which they take part, but *Paris* is usually in Oriental costume; in Judgment scenes he holds a lyre, but when he takes part in combats he is attired as an archer, with bow and quiver, Phrygian cap, jerkin, and trousers. *Kekrops*, the mythical king of Athens, usually ends in a serpent's tail, to denote his autochthonous origin; *Midas* has ass's ears; *Orpheus* is recognised by his lyre, and sometimes wears, as a musician, feminine costume (see below, p. 197).¹

Of other mythological types the *Amazons* are, of course, always armed, frequently in the Oriental fashion, with Phrygian cap or *kidaris* and trousers; their weapons are the crescent-shaped shield or *pelta*, and a peculiar type of battle-axe, the *sagaris*. The *Giants* on B.F. vases are ordinary armed warriors, not even of exceptional size, but in later times they often end in serpents, as on the Pergamene frieze. *Typhon* appears in this form on a Chalcidian vase.² *Geryon* is represented in the manner described by Pausanias (vi. 19, 1), as "three men joined together," with distinctive arms and legs; on Chalcidian vases he has four wings, and is only triple from the waist upwards. The *Centaur* on the more archaic vases, as on those

¹ E.g. Reinach, ii. 80. ² Munich 125.
of Ionia, appear as men with the body and hind legs of a horse attached behind; by the middle of the sixth century they appear in the familiar form of a human bust conjoined with a horse's body. The Gorgons are always rendered in grotesque fashion, with grinning faces and dishevelled hair intertwined with serpents; they wear short girt chitons and high winged boots, and have four wings, the upper pair recurved; usually on B.F. vases they appear in what is known as "the archaic running attitude," or, as the Germans more expressively phrase it, "Knielaufschem," the figures being represented as if kneeling on one knee. The same grotesque type of face, with the protruding tongue and teeth, appertains to the Medusa's head or Gorgoneion, which is at all periods such a favourite decorative motive on vases, either as the interior design of a B.F. kylix, or as a medallion in relief on late vases. The more beautiful type of Medusa head is a creation of later date than most of the painted vases, but in the medallions on Italian vases much of the grotesqueness has disappeared.

Much confusion at one time existed between the conceptions of the Harpy and the Siren, both names being indiscriminately applied to the female-headed bird so common on vases of all periods. But there is ample evidence for the representation of the Harpy more in the style of the Gorgons, as a purely feminine type, with the short chiton suited for rapid movement, high boots, and wings, and often in the conventional running attitude. In this form they appear in one instance as feminine counterparts of the male Boreades. The Siren types vary at different times, the earlier Sirens frequently having human arms. The Sphinx is always a woman-headed winged four-footed beast; sometimes on Corinthian and Ionic vases she wears a high head-dress. The Gryphon is a winged lion with eagle's beak, and often with erect ears; the winged Pegasos and the bull-headed Minotaur require no description.

Turning now to personages concerned in events of every-day

TYPES OF PERSONS IN ORDINARY LIFE 197

life, we find great variety of costume and equipment, especially at different periods and under different circumstances. The vases, in fact, may be said to supply the most instructive locus classicus for Greek dress and ornament, as well as for minor details—such as weapons, implements, and furniture—of which they provide contemporary illustrations.

Kings are usually distinguished by dignified flowing robes, by the wearing of a wreath or head-dress, or by the sceptre which they hold.\(^1\) Oriental potentates wear the costume of their country, with lofty ornamented tiaras, or the Persian kidaris or kyrbasia—a peaked cap decorated with fringes and lappets. Their dress is often very elaborate on the later vases. Actors and musicians both wear appropriate costumes. The former, who hardly occur except on the Italian vases, wear the dress of the Old Comedy, with grotesque mask, padded stomach, loose jerkin, and trousers.\(^2\) Tragic actors are seldom represented; but it has already been pointed out\(^3\) that in the setting of the mythological scenes on the vases of Southern Italy there is an unmistakable reflection of the tragic stage, especially in the elaborate and somewhat exaggerated details of costume. Musicians invariably wear a long chiton, over which on R.F. vases they sometimes wear a short loose garment called the ὄρθοστάδιον, embroidered with patterns.\(^4\) There are also a few instances of male performers (recognisable by their beards) in distinctively feminine costume.\(^5\)

Athletes are invariably nude when performing their exercises, except in the case of the armed foot-race (see p. 164); in the torch-race they seem to have worn high crowns; on the reverse of late R.F. vases they appear inactive, wrapped in mantles and conversing in groups. Hunters wear a distinctive costume of petasos and chlamys, and usually carry two spears. Boys on horseback are usually represented nude, and on Ionic vases have their hair tied in a tuft behind.\(^6\)

Charioteers are always attired in a long girt chiton reaching to the feet, which on Attic B.F. vases is painted white. They usually hold a goad in the right hand, the reins in the left. Heralds wear the attributes of Hermes—the petasos, caduceus, and high boots, with a chlamys or short girt chiton. Warriors on the early and B.F. vases are equipped in a fashion which tallies to some extent with the descriptions of Homer.¹ Their armour usually consists of a crested Corinthian helmet, a metal cuirass, under which is a short chiton, and greaves, to which are sometimes added the thigh-coverings known as parameridia. Some peculiarities may also be noted—such as the hooked projection on the front of helmets on the Ionic vases of Daphnae and the Clazomenae sarcophagi,² the linen cuirasses (indicated by white paint) sometimes worn on Attic B.F. vases,³ or the heavy helmets with large cheek-pieces seen on the Caeretan hydriæ (Plate XXVI.). The R.F. vases often represent the fully armed Athenian hoplite equipped in the same fashion as the B.F.; but in these, and more especially in the Italian vases, there is a tendency to omit much of the defensive armour. Cuirasses on R.F. vases are often decorated with patterns of scales or panelling.⁴ Helmets on Italian vases often assume a local character, with conical crowns and two or three lofty plumes.⁵

Of offensive armour, the full equipment consists of sword, spear, and shield. The two former call for no comment, but the shields, which are of two forms, the circular Argive or the indented oval Bocotian, present one feature of great interest—the devices with which they are adorned.⁶ Investigations have failed to discern in these any symbolical or heraldic significance; they are not appropriated to particular personages, and all that can be noted about them is that they usually seem to suggest rapid movement. Thus we find an eagle or other flying bird, wheels, balls, chariots, a bent

⁶ On this subject generally see T. Ely in Archaeologia, li. p. 477 ff.
leg, a serpent, Pegasos, and so on. The passage in the *Septem* of Aeschylus (387 ff.), in which the shield-devices of the combatants are described, is of course familiar, and similar allusions are not wanting in Greek writers. They are universal on B.F. vases, being painted in white on black ground, and are often found on the earlier R.F. vases in black on red; but they seem to disappear at an early stage of the R.F. period. Sometimes they consist only of letters of the alphabet, as on a Panathenaic amphora, where Athena's shield has the letters A to Θ; on a B.F. vase in the British Museum are the letters ΑΩΕ. Other peculiar subjects are a winged boar, two rams butting, a figure of Artemis, a white-bordered square, and a ladder. Some of those on R.F. vases are somewhat elaborate—a Seilenos, a fox eating grapes, an armed runner, or a warrior blowing a trumpet. A variation is when the device takes the form of an object in relief—a Satyr-mask, Gorgoneion, mask of Phobos (Panic), or a Gryphon, or a rearing serpent; or when a shield is surrounded by a fringe of serpents. Shields frequently have a piece of fringed and embroidered stuff suspended from them, which seems to have served as a protection to the legs.

Archers are depicted in Oriental costume, wearing peaked caps with long lappets and a close-fitting dress of leather, consisting of jerkin and trousers, usually embroidered with various patterns. The different barbarian types which appear on vases—Persians, Scythians, Arimaspi, and Thracians—are more or less individualised, especially on the R.F. vases. Such subjects, indeed, were not really popular until the Persian wars.

The details of Oriental costume have already been noted. Thracians on R.F. vases wear a long loose cloak known as the seira and a cap of foxskin (alopeke) with long flaps, which dress is also worn by Boreas (see above). In the first half of the fifth century Oriental costumes seem to have had a period of popularity among the fashionable young men of Athens, especially the knights; and they are often depicted riding in the seira or striped and embroidered dresses of outlandish style (see pp. 166, 179). Egyptians are often realistically rendered, with shaven heads, as are negroes and Aethiopians. The latter, like all barbarians on vases, usually wear trousers. On the vases of Southern Italy details of local (Osco-Samnite or Messapian) costumes often appear (see p. 180, and Vol. I. p. 483), especially in the case of helmets and breastplates worn by warriors on Campanian vases.

On the earlier vases, down to the end of the B.F. period, there is frequently no distinction between the dress of men and women, and to this fact may have been due the practice of painting the latter white to differentiate them. Both wear the long Doric chiton, with a mantle or himation thrown over it; but men often wear the smaller chlamys over the shoulders in place of the himation. Women, again, on the earlier B.F. vases, often appear without the himation, and wear a long chiton tightly girt at the waist, with a short apoptygma or fold falling over the breast. On R.F. vases the Doric chiton is sometimes worn by women, open down one side (known as the χιτών σχιστός). Men in the "strong" R.F. period wear a short loose chiton of fine crinkly linen. Generally in the R.F. period there is greater freedom of costume and variety of material and arrangement. The Ionic chiton is introduced about 500 B.C., but its vogue does not seem to have lasted long at Athens. In place of the apoptygma women sometimes wear a loose over-garment, known as the diplois. On the earliest vases men are often nude, with the exception of a loin-cloth or pair of tight-fitting "bathing-drawers." Women are practically never nude on vases, except when occupied in bathing or washing, or in the case of hetairae and jugglers.

1 Cf. B.M. B 106, and the Busiris vases (p. 102).
The draperies, especially the chitons, are often richly embroidered with patterns, represented by incising and purple and white colours on the B.F. vases, by black paint on the R.F. On the former the women's chiton is often covered with a sort of diaper pattern of squares, filled in with circles and stars, or the dresses (both of men and women) are covered with groups of dots and flowers in white and purple. In the late fine R.F. period and on the vases of Lucania and Apulia the patterns become exceedingly rich and varied: chequers, wave-pattern, palmettes, stars, egg-pattern, maeander, and all kinds of borders are introduced. A further extension of the principle is seen in the introduction of borders of figures, the most notable instances of which are on the François vase and the Hieron kotyle. On the former the technique is remarkable as a kind of anticipation of red figures on black. Aristotle speaks of a garment made for Alkimenes of Sybaris on which deities were represented between borders decorated with Oriental figures, the subjects being the sacred animals of the Medes and Persians. We may also cite the remarkable statue of Demeter found at Lykosura in Arcadia, the drapery of which is decorated with inlaid borders of figures, and the mantle of Jason described by Apollonius Rhodius.

The hair of women on B.F. vases, and frequently also that of men, usually falls loose or in tight curls on the shoulders, with a fringe over the forehead. On the early R.F. vases men often wear their hair looped up behind in the fashion known as the κροὺζωλος, which, as we know from Thucydides, went out about 480 B.C. Women, on the other hand, have theirs knotted up and confined under a cap. On later R.F. vases and on those of Apulia their hair is usually gathered up in the ὀπισθοσφηνδών, or in a broad coif or fillets, and arranged in bunches of curls in front and behind. On late R.F. vases a radiated diadem, painted white, is often seen. Men are

6 Jahrbuch, 1896, p. 248 ff.
seldom represented with long hair after 480 B.C., but they usually wear a wreath or plain fillet. Head-coverings are rarely worn by ordinary persons, with the exception of the traveller's and huntsman's πέτασος; but Oriental personages usually wear a high cap of some kind (see above, under Barbarians). Jewellery—such as necklaces, earrings, armlets, or anklets—is comparatively rare on B.F. vases, but becomes more and more common, until it reaches profusion on those of Apulia. Bracelets and anklets are often in the form of serpents. Various forms of sandals or shoes are seen on later vases, but on the black-figured the only kind of footgear is the high boot or ενδρόμης, with a curved tag in front.

The extent to which physiognomical expressions are rendered on vases varies at different periods; but it is not true, as has sometimes been thought, that the artists altogether ignored such expressions in their figures; it was only in the earlier phases that this was the case, and even during the fifth century the advance was timid and slow, much more so than in sculpture. As a rule, in the same vase all the faces are alike, and no physiognomical distinction can be drawn between gods and heroes, or even between men and women, except (on the Attic vases) in the treatment of the eye. On the B.F. vases the ordinary type of face has a long nose, with a tendency to turn up, a pointed chin, deep rounded jaw, and large eyes, while the limbs are sinewy, angular, and tapering. Beards of some length are invariable for grown or elderly men; otherwise distinctions of age are hardly observed until the R.F. period. And as in sculpture of the archaic period all figures have the same conventional smile, so on the B.F. vases gods, heroes, and mortals alike all pursue the actions in which they are engaged with the same unvarying expression. The contrast of violent action and calm unmoved physiognomy is often quaint, and almost grotesque.

Indications of expression or sentiment are, in fact, rather implicit than explicit. They are given in a sort of shorthand fashion, just as Polygnotos in his great paintings, by some

---

1 See on this subject throughout Mon. Greci, 1895-97, p. 7 ff.
subtle touch—by a change of attitude or the action of a hand—indicated the emotion he wished to convey. In the different treatment of the male and female eye there is, no doubt, an attempt to give to the man a more lively expression by means of the round pupil, while the oval form of the woman’s eye gives her a softer and less intense look. The neglect of this principle on Ionian vases, where the male eye is oval, seems to be a reflection of the effeminate tendencies of the Ionian races. At an early date we may observe a special treatment of the eye to represent it as closed, in the case of a blind or dying person. Thus the Phineus of the Würzburg cup has merely an angular mark in place of an eye, representing the fall of the upper eyelid over the lower, or the eye is represented as a vacant space without pupil. The mouth is sometimes open to express pain or anger, as in the Nessos of the Proto-Attic vase, or the quarrelling heroes on a vase in the Louvre (F 340). It is also used to express the agony of a dying or injured person, as on a vase with the outraged Polyphemus, with which we may compare the dying warrior of the Aegina pediment. But all these are rather exceptions than the rule on B.F. vases.

After the time of Polygnotos the influence of painting makes itself felt, and we may recall that he perfected the advances of Kimon in this respect. Not only did the vase-painters learn from him how to dispose figures en face or in three-quarter view, but they also learned how to mark different expressions. It has also been observed that the influence of tragedy must have been strong at this time. The krater from Orvieto in the Louvre (Vol. I. p. 442) is a good instance of the progress made in the fifth century in this direction. On one side of the vase (see Fig. 103, *ibid.*) we have a dying Niobid and a youth with face to the front and eyes closing; on the other, in the Argonautic scene, a warrior holding his knees, with lower lip

---

1 Cf. a funerary plaque in the Louvre, where the male mourners, no doubt intentionally, have the oval form of eye; also Louvre F 256 (figure of Aeneas).
2 For other instances M. Girard (*Mon. Grèc, loc. cit.*) refers to Louvre E 753; 754; E 643, 808; *Jahrbuch*, 1893, pl. 1; see also B.M. E 440 (R.F. period).
3 *Ant. Denkm.* i. pl. 57.
4 *Anzeiger*, 1895, p. 35, fig. 9; cf. Louvre E 612 *bis*; and *Ant. Denkm.* ii. 24, 15.
fallen, giving him a melancholy expression, and Herakles with a face of sadness, marked by wrinkles. Other figures show exactly in what direction they are looking (compare Kimon's figures "looking down or upwards"). In the later developments of the Apulian vases, with their scenes drawn from tragic themes and represented in such dramatic fashion, there is plenty of ability to represent emotion, and in several cases it is accurately expressed, as in some of the scenes from the sack of Troy. But in other cases, as on the Assteas vase in Madrid (Fig. 107), much of the old quaintness and grotesqueness is apparent.

It is also necessary to treat of the methods adopted by the artist for indicating locality or landscape in his pictures, a thing which is often done in the briefest and most cursory manner. The germs of this principle are perhaps to be observed (as noted elsewhere, Vol. I. p. 312) in the floral ground-ornaments of the Corinthian and other early vases. In the more developed vase-paintings a sort of shorthand system is customary, a system which in some degree probably prevailed on the Greek stage, as on that of the Elizabethan drama. Thus a temple or a house is represented by a column, or two columns supporting a pediment, a wood or grove by a single tree, water by two dolphins swimming in the lower part of the design, and so on. A notable exception is in the palace depicted on the François vase, in which Thetis awaits the arrival of the bridegroom Peleus. So much of the building is given in detail that it is even possible to attempt a restoration. On the same vase the walls of Troy are depicted, with a double door studded with nails. In the Hydrophoria scenes (p. 173) considerable attention is paid to the architectural details of the well-house, which was probably in the form of a small temple, perhaps circular, surrounded by a colonnade. The water issues from spouts in the form of lions' heads, and statues are often depicted in different parts of the building. The François vase also gives an illustration of a well-house,

with portico supported by columns. The architecture is almost invariably Doric. In outdoor scenes rocks occasionally appear, but only where they are necessary to the subject, as in the ambuscade of Achilles for Troilos. The branches of trees which frequently cover all the vacant spaces of the design on later B.F. vases, especially in Dionysiac scenes, may be mainly intended for decorative effect.

In the R.F. period more and more attention is paid to landscape and architectural detail as the style develops, but there is still a strong tendency to adhere to the shorthand system—a tendency which increases rather than disappears, especially on the white-ground vases. The artist's object was always to make his figures stand out, as far as possible, clear against the background, and he therefore deliberately avoided anything likely to interfere with the desired effect. Landscape proper, with indications of ground-lines, rocks, and trees, was only introduced when the Polygnotan influence became strong, and the Orvieto krater in the Louvre may be once more cited as a good and early instance of a new development. Scenes in architectural settings are rare, but an exception may be noted in the case of some of the late R.F. vases with scenes in women's apartments, where careful attention is paid to the details of the door-ways, even to the locks and key-holes.¹ For the rest, it usually sufficed to indicate the palaestra by a strigil or oil-flask suspended, or a pair of jumping-weights; musical gatherings by a lyre or a flute in a case; banqueting-rooms by cups and other vases hung up, or by rows of boots. Similarly, women's apartments are represented by a window, door, or column, or by sashes, hoods, mirrors, wreaths, and wool-baskets scattered about.²

In the vases of Southern Italy this principle is carried almost to excess. Not only is the old idea of rosettes and flowers scattered about the scene revived, but the whole surface of the design is often covered with miscellaneous objects, such as balls, sashes, and mirrors. On the Apulian vases the use of a double line of white dots to indicate the ground is invari-

¹ E.g. B.M. E 773, 774, 779, 780.

able, and loose stones are scattered about where it is intended to be rocky. Flowers grow about in rich profusion. In the mythological scenes an elaborate architectural background is frequent, and altars, tripods, and columns serve the same end; the heroa or shrines and other forms of tomb in the sepulchral scenes have already been described. In athletic scenes, especially on the reverse of the kraters, a ball, a stylus and tablets, or a pair of jumping-weights are suspended in the air to indicate the palaestra; and on Lucanian vases subjects of a military nature are suggested by a suspended shield only partly visible. The "courting-scenes" on Apulian vases usually have a representation of a window in a corner of the design.

§ 2. ARRANGEMENT OF SUBJECTS

The next point to be considered is the method of arrangement and composition of the figures in general on Greek vases. As regards the Mycenaean, Geometrical, and other early wares, they may be left out of consideration,—firstly, because their ornamentation is mainly composed of decorative motives or single figures of animals; secondly, because even where compositions of figure subjects are found, as on the great Dipylon vases, the method of arrangement is still tentative and without system. The figures are arranged in haphazard groups and bands, and all the remaining spaces are filled in with ornament.

The first attempt at an organised method of decoration is seen in the vases of Corinth and Ionia, and is exemplified principally in the arrangement of the friezes of animals. Roughly speaking, there are two main tendencies, one characteristic of each line of development—the procession and the heraldic group. Both are essentially Oriental (i.e. Assyrian) in origin, the prototype of the latter being the familiar motive of the two animals and the sacred tree, which is so frequently found on Mycenaean gems, and is best exemplified in the famous Lion Gate of Mycenae. Yet this typically Mycenaean and Oriental motive was not the one adopted by its natural inheritors, the Ionians, and it is in

1 See on this motive and other heraldic groups, Jahrbuch, 1904, p. 27 ff.
ARRANGEMENT OF SUBJECTS

Dorian Corinth that we find its reflection on the painted vases. On one Corinthian vase⁴ it actually occurs in the form of a conventional palmette and lotos-pattern (representing the tree), on either side of which two lions are confronted in true Mycenaean fashion. Later, it becomes a common device on the necks of vases, the ornament taking the form of a decorative combination of palmettes (see below, p. 226). Even when on Corinthian vases a whole frieze of animals is found, there is always a central "heraldic" group of two, towards which the whole seems to lead up, or else the frieze is broken up into several isolated heraldic groups. But on the Ionic vases, as on those of Rhodes and Naukratis, we have over and over again regular processions of animals all facing the same way, or, as at Daphnae, solemn dances of women, similarly placed and joining hand-in-hand (see Plate XXV.).

In the developed B.F. vases the same principles are observed to some extent, especially where friezes of animals are introduced; but there is much greater freedom of treatment within the limits of the field available. Generally speaking, however, all designs on B.F. vases may be regarded as following one of the three methods of architectural composition—the frieze, the pediment, or the metope. The frieze style, which is seen on the shoulders of hydriae, the exteriors of kylikes, and sometimes on the bodies of amphorae, oinochoae, or lekythi, implies a series of figures, all turned in the same direction, but without any central point for the action, as in processions of warriors, dances of Satyrs and Maenads, and so on. In the pediment style of composition the essential feature is a centre-point, in which the interest of the subject is concentrated, as in such scenes as the Birth of Athena or Theseus killing the Minotaur. The central group is then flanked by figures immediately interested in the action (Eileithyia and Hephaistos, or Ariadne, in the instances quoted; Athena and Iolaos at the labours of Herakles); and the ends of the pediment, so to speak, are

¹ B 18 in B.M.: cf. also the fragment from Naukratis, B 103.⁵
² This principle in its most developed form may be observed on the Chalcidian and Tyrrhenian amphorae: see Vol. I. p. 321 ff.
³ B.M. B 147.
⁴ Ibid. B 313.
occupied by groups of bystanders, often nameless and uncharacterised, who are in fact only included to fill up the space required.

The metope style, which only admits of three, or at most four, figures, was found convenient for all the vases with subjects on panels, where space was restricted, and also on the kylikes of the "minor artist" class, on which a limited use of figures was preferred, and on those of later date where the space was mainly taken up by the large eyes. But in all these cases—friezes, pediments, or metopes—one thing was held to be essential: the correspondence of the two halves of the design (except in friezes), producing perfect symmetry in the composition.

Lastly, there are a limited number of cases where a single figure was found sufficient, as in the interior of kylikes, on the circular pinakes, and sometimes on the vases where the large eyes take up most of the space.

Subordinate designs, bordering the main design of an amphora above or below, or decorating the cover, are usually in the form of animals or chariot-races, in the frieze style of composition. Similar friezes are sometimes also found (in the old B.F. method) on R.F. vases, and even on the kraters of Southern Italy.

The earlier R.F. vases preserve the principles of the preceding period; and, in regard to the kylikes, the system of decoration has been discussed in detail elsewhere (Vol. I. p. 427). In all of them we see particular attention paid to arrangement, and the variations in the principles of composition form one of our guides in determining the development of the style. In the amphorae and hydriae of the transition from the severe to the strong period the number of figures employed in one scene was diminished, while they became larger in their proportions and were treated with more care; the usual number on the Nolan amphora is one or two each side. On the smaller vases, such as the oinochoë, the number of the figures never exceeds three. Sometimes the hydriae have an elongated composition on the shoulder, containing a frieze of several figures; but usually the design runs into both shoulder and body. Designs in framed

---

1 B.M. B 589-91.
2 E.g. B.M. B 264, B 428, etc.
3 Cf. B.M. E 164 ff.
panels are rare, except on the earlier amphorae and hydriæ, and on the column-handed kraters. The latter are unique in preserving the older methods of decoration right through the R.F. period down to the fourth-century specimens from Southern Italy.

The influence of Polygnotos and his contemporaries brought about, as we have seen, a great change in the arrangement of the compositions, by the introduction of landscape and perspective, and the depicting of figures at different levels. This new development was subsequently exemplified in the large vases of Kertch and Apulia, but in the late fine period at Athens small vases with single friezes or simple subjects were the rule. In the pyxides and other vases with frieze subjects the figures are often crowded together and of dwarfish proportions (Plate XLII. fig. 3). A return to the old system of several friezes is seen where the figures are arranged in two or more rows divided by bands of ornaments, as in the Medias hydria, or the early Apulian and some of the Lucanian vases.¹

The earlier vases of Southern Italy, especially those of Lucania, preserve in some measure the spirit of the best R.F. vases, in the arrangement of the figures, and at all times the composition is one of the best features of these vases; but in the later examples the purely decorative element obtrudes itself; single figures of little more than ornamental character abound, and the old preference for mere ornament asserts itself, the patterns encroaching all over the scenes.

§ 3. Ornamental Patterns

Although by far subordinate to the subjects in point of artistic or archaeological interest, the ornamental patterns which are employed on the vases are by no means without their value in both respects.² They are, indeed, intimately interwoven with

¹ See Winter, Jüngere Attische Vasen, p. 69; Röm. Mitth. 1897, p. 102; also Plate XLV.
² This subject has hitherto received little or no general scientific treatment from archaeologists. Riegl's Stilfragen (1893) contains an interesting study of vegetable ornament on Greek vases; but the plates of Brunn and Lau's Gr. Vasen, though intended to illustrate the system of ornamentation, are not very instructive.
the subjects themselves, which they frame in, relieve, or embellish. Numerous vases are decorated with ornaments only, even in the advanced stages of the art; and this is, of course, an extremely common occurrence in the earlier fabrics, such as the Geometrical and Rhodian. Others, again, are only ornamented in the simplest fashion, with plain bands of red left to show through the black varnish round the body or foot. That the artist took a pride even in this form of ornamentation is shown by the fact that some potters, such as Nikosthenes and the "minor artists," have left their names on vases only decorated with simple patterns.

From the very beginning of Greek vase-painting there may be observed an endeavour to dispose the ornamental patterns in accordance with some system; and even though in some cases, as in the Cypriote Geometrical vases, there is an offence against the canons of art, yet at all periods the prevailing effect is one of symmetry and taste. It may be thought that in some respects there is a poverty in the variety of ornaments employed—as compared, for instance, with mediaeval art; but it should be remembered that—as their architecture shows—the Greek principle was to achieve the highest results within a limited sphere. Their system was conventional, but its conventions are forgotten in the artistic effect that it produces.

It is on the earliest vases that the greatest variety and richness of ornament occurs; as the art is developed the ornamentation becomes more and more subsidiary, until on the vases of the finest R.F. period it has almost disappeared. But in the later phases it again comes to the fore, tending more and more to obscure and finally to supersede the subjects. To set forth as briefly as possible the growth and development of Greek ornament, both as a whole and in the case of individual motives, will be the object of the succeeding summary. It will be found advisable to treat the subject in a twofold aspect,—firstly, dealing with individual forms and their development; and, secondly, in their relation to the decoration of the vases and their subjects, as exemplified in the different periods and fabrics.

Various theories have been propounded as to the origin of the ornaments found on Greek vases. Some have seen in the
patterns architectural adaptations, suggested by the ornamentation of the different members of a temple, such as the maeander, egg-and-tongue pattern, or the astragalus, just as the disposition of the subject is often a reminiscence of the frieze or metopes. But this is no real explanation. In the first place, the patterns are found on vases at a period when they were hardly as yet used in architecture; and, secondly, their use on vases and in architecture must undoubtedly be traced to a common source. Others, again, have regarded them as conventional symbols, the kymation or wave-pattern representing water, a flower or rosette the ground on which the figures stand, and so on. Or, again, it has been thought that they were originally derived from textile patterns, being produced mechanically by the ways in which the threads ran in the loom, whence they were applied with deliberate artistic intention to the surface of a vase.

It is, in fact, impossible to put forward any one theory which will account for the whole system of decorative ornament. As has been pointed out in our introductory chapter, many of these patterns are not only spontaneous, but universal in their origin among primitive peoples; every nation has begun with its circles, triangles, spirals, or chevrons. We are also, in regard to the Greeks, met with the remarkable fact that in its earliest form their painted pottery presents a very elaborate and highly developed system of ornamentation—purely geometrical, it is true, yet none the less of an advanced character. It is a composite system, formed partly from Mycenaean and pre-Mycenaean local elements, and partly from the decorative ideas introduced by the Darians from Central Europe; subsequently the range of Greek vase-ornament was yet further enlarged by the introduction of vegetable patterns, the palmette, the lotos-flower, and the rosette, which are due to the growth of Oriental influences, both from Egypt and from Assyria.

In order to deal with the various ornaments and patterns in detail, it may be found convenient to divide them under three heads—rectilinear, curvilinear, and vegetable or floral. Of the first class the most consistently popular is the typically Greek pattern known as the maeander, key, or fret pattern. It first
appears with the Geometrical style, in which it plays an important part, often covering a large proportion of the surface of a vase, arranged in broad friezes. Three varieties are found—a simple battlement pattern (Fig. 139), and the slightly more elaborate forms, Fig. 140, and the pattern given in Vol. I. p. 283, Fig. 83. In the Boeotian Geometrical, Phaleron, and Proto-Corinthian fabrics it is seldom found, or only in a debased form, as \[\ldots\]; but one or two forms occur in the "Rhodian" and "Samian" fabrics of Ionia; one of these is given in Fig. 141, and another consists of squares of the same alternating with crosses or stars in panels.

We meet with a most interesting development of the latter variety in the vases of the so-called Pontic class and on the Clazomenae sarcophagi, where an elaborate maeander pattern, usually in two rows, is interspersed with stars or rosettes (Fig. 142). It thus becomes almost a distinguishing characteristic of the later Ionian fabrics.

In the Attic B.F. vases there is a return to simplicity. Here we find it for the most part in the form Fig. 140 above, and its usual position is below the designs on the red-bodied amphorae; but it is sometimes found on other vases, as above the panels on the bodies of hydriae or oinochoae. In the R.F. period its
development is most important for determining the succession of the kyllikes, on which it almost becomes a date-mark, so regular is its evolution. This has, however, been already dealt with in the chapter on the history of the style (Vol. I. p. 416). After the severe period it is of frequent appearance on all forms of vases, the kylix, amphora, krater, and pelike in particular; the usual arrangement is a group of three to five maeanders, either of the simple Fig. 140 type, or of a more complicated form (Fig. 143), divided by rectangular panels or squares composed of chequers, or of crosses (diagonal and vertical) with dots or strokes between the arms. A curious variety of the maeander is used by Duris; it consists of a double intersecting maeander interspersed with squares (Fig. 144).

The invariable place for this ornament is below the design on the large vases, and it is usually continued the whole way round (except on the earlier Nolan amphorae); it is also found on the R.F. and white lekythi along the top of the design. It is always painted in black on the clay ground.

A similar form of maeander prevails on the vases of Southern Italy (except in Campania); it is found on the krater, amphora, lebes, kotyle, etc., and is almost invariable. But there is one unique variety which is occasionally found on the great Apulian kraters, as on F 278 in the British Museum; the type is that of the pattern in Fig. 144, but the maeander is represented in perspective, being painted in

---

1 For the various types of these patterns see Vol. I. p. 416, Fig. 102.
2 This is also found on a B.F. vase in the British Museum (B 330); see Hartwig, Meistersch., p. 220; also B.M. E 84; Thiersch, Holti Vasen, pl. 5; Arch. Zeit. 1873, pl. 9.
3 The Pamphaios hydria in the British Museum (B 300) has bits of red-on-black maeander down the sides of the design on the shoulder.
white on the black, the shaded edges left in the colour of the clay.

Of patterns akin to the maeander, the so-called swastika or hook-armed cross, $\mathfrak{S}$, occurs in panels on the Geometrical vases, but subsequently it is only found as a ground-ornament in the field, as frequently at Naukratis, in Rhodes, and elsewhere. It is, strictly speaking, to be regarded as a fragmentary piece of maeander, without any of the symbolical meaning which it bears in the art of northern nations, with whom it was the emblem of the Scandinavian god Thor. Another pattern, $\mathfrak{S} \mathfrak{S} \mathfrak{S} \mathfrak{S}$, or $\mathfrak{S} \mathfrak{S} \mathfrak{S} \mathfrak{S} \mathfrak{S} \mathfrak{S}$, which may be called a variety of the maeander, is frequently found as a continuous border on early vases, such as the Phaleron and Proto-Corinthian wares, and occasionally in the B.F. period.

Next there is the chevron, zigzag, or herring-bone pattern, consisting of systems of V-shaped patterns, arranged in two ways, either $\mathfrak{S} \mathfrak{S}$ or $\mathfrak{S} \mathfrak{S} \mathfrak{S} \mathfrak{S}$; these patterns are practically only found on the earlier fabrics of Greece and Cyprus, or on the native wares of Apulia. On the incised vases of the early Bronze Age found at Hissarlik and in Cyprus this is the prevailing motive, the lines of zigzag being either single, or arranged in groups of four or five parallel:

![Diagram of chevron pattern]

On the Geometrical vases such patterns are of very frequent occurrence, and panels or bands of chevrons arranged vertically, $\mathfrak{S} \mathfrak{S}$ or $\mathfrak{S} \mathfrak{S} \mathfrak{S} \mathfrak{S}$, occur in many instances (Fig. 83). These groups of chevrons or zigzags are also a distinguishing mark of the Boeotian Geometrical fabrics (cf. Fig. 85); they occur to a lesser extent on the Melian, Proto-Corinthian, and Early Corinthian vases, and even in the Chalcidian fabrics. They are either employed as ground-ornaments to fill in spaces, or as panels forming part of the subsidiary decoration. A variation, or rather development, of the chevron, sometimes
employed as a ground-ornament on early Ionic vases, is composed of a cross, \[\begin{array}{c} 1 \\ \end{array} \], with sets of chevrons between the arms.

Diagonally or directly intersecting lines form another universal element of early decoration, varying from a simple arrangement of cross lines \[\begin{array}{c} 1 \\ \end{array} \] to an elaborate diaper-pattern, and in such forms found even in later times. Beginning with the simple intersecting lines, or bands filled in with hatching, of the primitive incised vases, further developed in the white slip ware of Cyprus (Vol. I. p. 243), we next come to their use on the vases of the Geometrical period, both in Greece and in Cyprus. The variety of these patterns is so great that they can hardly be described in any detail; the usual method of treatment is in a band or panel of lozenges, squares, or triangles, filled in with a reticular pattern formed by the short intersecting lines. Sometimes dots are inserted in the spaces to enrich the general effect. Some very good examples of these patterns are to be seen in the Geometrical vases of Apulia (p. 327). In the B.F. period plain bands or panels of intersecting lines are not infrequent; sometimes small amphorae or lekythi are decorated entirely in

![FIG. 145. NET-PATTERN.](image-url)

this fashion.\(^1\) A variation of the motive is the border of network which often surrounds the panels on hydriae or oinochoae, in which the points of intersection are ornamented with studs, resembling the knots of a net (Fig. 145). It is also frequently found on the later Corinthian vases. *Chequer-patterns* are often used with great effect, at all periods from the Geometrical vases

\(^1\) See examples from Cyprus and Rhodes in Cases 24, 25, 28, Second Vase Room, B.M.
down to the fourth century, their usual position being on the neck of a vase (Fig. 146).¹

The *circle* as an ornament occurs comparatively rarely, but there are two exceptions. In the Geometrical vases we find

![Chequer-Pattern](image)

a use both of concentric circles and of rows of single circles joined by straight lines forming tangents, a motive which is obviously derived from the Mycenaean spirals (Fig. 147). Secondly, in the Graeco-Phoenician pottery of Cyprus, especially in its later phases and in the smaller vases, such as the jugs and lekythi, the decoration is practically confined to systems of concentric circles, of a character quite peculiar to this fabric.²

The chief feature of these systems is that the ordinary principles of vase-decoration are entirely ignored, and the circles,

![Prototype Geometrical Tangent-Circles](image)

arranged in series of five or six, forming a band about three-quarters of an inch in width, are placed not only at right angles to the axis of the vase, but parallel to it. The illustrations in Plate XIII. and Fig. 75 (Vol. I. p. 251) will give a better idea of the arrangement than any description; it is clear that the circles were easily produced by applying a fine brush to the

¹ *E.g.* B.M. B 205, 474, 476, 620, D 15, E 151, F 178.
² It appears, however, to be of Mycenaean origin: cf. the B.M. vases A 253, 323, 324, and *Excavations in Cyprus*, p. 6, fig. 6, from Ialysos and Cyprus, decorated in this fashion with vertical concentric circles.
vase while turning on the wheel, first in its natural position and then on its side. Artistically, of course, the principle is a wrong one, and this is most glaringly conspicuous in the barrel-shaped lekythi, in which the axis of the vase is regarded as horizontal rather than vertical. Groups of small concentric circles are also arranged vertically or otherwise on the bodies and necks of vases.

The *spiral*, which forms such a conspicuous element in Mycenaean decorative art, appears again prominently in a class

![Diagram of spirals under handles](image)

which, as we have seen (Vol. I. p. 302), owes much to that source—the Melian amphorae. Systems of spirals are arranged to fill the spaces at the sides of the design,¹ especially in combination with floral ornaments and reticulated lozenges; and the same feature may also be observed in the Proto-Attic vases. It occurs similarly, combined with a flower, on the Samian or Fikellura vases (Vol. I. p. 337). In later times the spiral passes from the sphere of inorganic to that of organic ornament, being combined in various ways with vegetable patterns, and merging

¹ Riegl, p. 155.
in the tendril or volute. But it occasionally reverts to its old form, notably in the red-bodied amphorae of Exekias, who, in place of the usual palmette-and-lotos ornament under the handles, contrives an elaborate system of large spirals to fill the space between the designs (Fig. 148). A variation of this is the figure-of-eight ornament, sometimes continuous, 

which is found on vases of the Proto-Attic class, such as the Burgon lebes in the British Museum (Fig. 87).

The wave-pattern or kymation moulding, shown in Fig. 149, is one which constantly occurs in Greek architectural decoration, but on the vases at any rate seems to be found only at a late period. On the Campanian vases it is the regular border below the design; it is also found on those of Lucania and Apulia. The crescent is only found on early Ionic vases, including those which have been attributed to a Samian origin (Vol. I. p. 336 ff.), and some of the Daphnae and Naukratis fragments,

which probably borrowed it from Samos; it is arranged in bands alternating in colour, black or purple and white. Another typically Ionic ornament is the scale-pattern, which occurs on many of the so-called Rhodian vases, and also on those from Daphnae (Fig. 150). In the former it is produced by means of

1 E.g. B.M. B 209, B 210.
incising on the black varnish, the alternate scales being often coloured purple; but in the latter it is painted in outline. Curiously enough, it also occurs in the incised form on an early group of Corinthian vases (Plate XIX. fig. 3). Like other patterns, it can be traced to a Mycenaean origin, being very

![Diagram of Guilloche or Plait-Band (Ionic)](image1)

common in that style. Subsequently it occurs but rarely, but is sometimes employed on the neck or shoulder of a vase.\(^1\)

It differs from most other patterns in that it does not lend itself to the panel or frieze, but covers a surface of indefinite extent. It is also known as the "imbricated" pattern, from its likeness to overlapping tiles (*imbrices*).

The *guilloche* or plait-band (Fig. 151) is characteristic of early fabrics, such as those of Naukratis and Samos, the Clazomenae sarcophagi (Plate XXVII.), and the small Proto-Corinthian lekythi, but is not often found in later times.\(^2\) It is typically Ionic, and seems to be derived from Mycenae (cf. A 209 in B.M.).

![Diagram of Tongue-Pattern (B.F. Period)](image2)

Lastly, there is the so-called *tongue-pattern*, which is exclusively used as an upper border to designs. On its first appearance in the Geometrical vases it is rectilinear in form, and formed of alternating bars; but from the beginning of

\(^1\) *E.g.* B.M. E 564.

\(^2\) For its use on a B.F. kylix see B.M. B 382 (probably Ionic work).
the sixth century onwards it assumes a curvilinear form, all
the tongues pointing downwards, broader, and close together,
as in Fig. 152. In the Daphnae vases and the later Corinthian
wares it is treated in polychrome fashion, black, purple, and
white alternately. On the lip and shoulders of Caeretan
hydriae it appears in an exaggerated form, painted red, with
black edges, as on Plate XXVI. In the Attic B.F. vases
it forms the invariable upper border of the designs, below the
necks of the amphorae and hydriae, and is also used as a
border to the interior designs of the kylizes; here, too, purple
is often applied to the alternate tongues. Occasionally the
rectilinear form reappears. In the R.F. period it changes its
character again, and the tongues become short and semi-oval
in form, with black centre and narrow outlined edge; in
this form it is usually described as an egg-

t pattern (Fig. 153). It
is found in the smaller
hydriae, and in many
other shapes above or
below the designs; also round the lip of the vase. The
same form and arrangement obtain in the South Italian vases,
especially in Apulia and Lucania, except that a dot is often
placed between each pair of tongues. In some cases it approxi-
mates closely to the egg-and-dart, as on F 179 in the British
Museum. Both tongue and egg-patterns are often ranged round
the base of the handles. The egg-and-tongue, with its variants,
is a typically Ionic architectural pattern; hence its non-appearance in Attic vases before the fifth century. In later Roman
pottery (Chap. XXIII.) it becomes very common. The variety
known as the Lesbian kymation is found in a few late instances.¹

Having surveyed the various types of inorganic patterns,
whether rectilinear or curvilinear, we now come to the con-
sideration of those which are not only derived from vegetable
ornament, but still preserve, in greater or less degree, a
naturalistic character. To begin with the simple leaf-ornament,

¹ Munich 810, 849 = Brunn-Lau, Gr. Vases, pls. 35-6: cf. B.M. F 278.
which is of too conventional a type to associate with any particular plant, this occurs most frequently in the form of of a calyx, placed round the lower part of the body, immediately above the foot, so that the leaves radiate from the foot, pointing upwards.\textsuperscript{1} This ornament begins at a very early period, and is found in most fabrics, continuing down to the latest stages. It is, however, specially associated with the B.F. period, in which it is invariable on the large vases with a more or less marked stem, the amphorae, hydriæ, and kraters. On the smaller ones, however, it does not occur. In the "affected" B.F. amphoræ (Vol. I. p. 388) the calyx is double, with two tiers of rays.\textsuperscript{2}

An arrangement of four leaves saltire-wise in a panel sometimes occurs on the Geometrical vases, a remarkable instance of vegetable ornament in this style (cf. Vol. I. p. 282); an analogous pattern is also found on many early Corinthian aryballi (Vol. I. p. 314; B.M. A 1086 ff.), the leaves not being united at the base, and usually interspersed with reticulated or other motives.

Another form of leaf-pattern is of rare occurrence, and is found now and then on Attic vases; in this small leaves are joined together in a sort of ribbon or chain-pattern\textsuperscript{3} (Fig. 154). The peculiarity of this ornament is that even in the B.F. period it is red-figured in technique, being left in the colour of the clay with a background of black.

The ivy-leaf was not adopted as a decorative pattern before the middle of the sixth century; it seems to be Ionic in origin.\textsuperscript{4} Single large leaves occur on the necks of B.F. lekythi, on late Ionic B.F. vases, and to a considerable extent on the imitations made in Etruria.\textsuperscript{5} These are usually treated in a very naturalistic manner. Double rows of smaller leaves, forming a straight wreath, constantly occur as borders to the

\textsuperscript{1} Examples may be seen in Plates XXIII., XXVIII.-XXXIII.
\textsuperscript{2} B.M. B 148-49, 151, 153; \textit{J. H. S.} xix. p. 163.
\textsuperscript{3} E.g. B.M. B 212, B 593, B 677, B 679; see also \textit{Zeitschrift}, 1899, p. 161.
\textsuperscript{5} E.g. B.M. B 63 (Plate LVIII).
panels on B.F. hydriae, kraters, and oinochoae (Fig. 155); and similar ivy-wreaths are found along the flat edges of the flange-shaped handles on the larger panel-amphorae, as well as on the volute-handles of kraters. These patterns preserve their vogue in the R.F. amphorae of the earlier period, and in the kraters of Lucania, and it should be noted that they are always painted in the B.F. method (black leaves on red ground) except in the vases of Apulia and Paestum. But as a rule on the South Italian vases the ivy-leaf is treated in a naturalistic manner, with tendrils and berries, occupying a large panel on the necks of the column-handled kraters, or forming a border on the lip of the vase (Fig. 156). The vine as an ornament is very rare, but there is a good instance on a late phiale in the British Museum (F 503), where it is treated in a very naturalistic manner, forming the sole decoration of the interior; it is also of frequent occurrence on the vases from the Kabeirion at Thebes (Vol. I. p. 391). The pomegranate occurs only on the Cyrenaic cups (Fig. 93), where it forms a continuous frieze of buds round the exterior, united by

1 E.g. B.M. B 364.  
2 As on the Python krater, B.M. F 149.
interlacing lines. The acanthus is only introduced quite late (except where it appears as an ornament on the top of a stèle), and is found on the necks of kraters and other large Apulian vases, forming a rich and luxuriant mass of foliage, often with a flower in the centre, on which rests a female head. Myrtle or olive-wreaths occur at all times, especially on the flat rim of the mouth of a vase; the myrtle seems to be a typically Ionic motive, and is found at Daphnae, Samos, Rhodes, and on the Caeretan hydriæ.¹ In the Rhodian vases it is either roughly painted in black on red, or else in red and white on a black ground. It was also adopted at Athens—e.g. by Nikosthenes. Laurel-wreaths form the regular decoration of the neck in the bell-shaped kraters and wide-bellied amphorae of

![Laurel-Wreath (South Italian Vases)](image)

the late R.F. period and the decadence (Fig. 157). These wreath-patterns on the late vases, it should be noted, are either treated in R.F. technique or painted in opaque white on the black varnish. They are often drawn with great care and accuracy.

The history of the development of the palmette (or honeysuckle), the lotos-flower and bud, and of continuous foliated patterns in general, has been skilfully treated by Riegl.² To write a complete account of this class of ornamentation would be impossible within the limits of the present work; only a few main features can be noted, to show the form the patterns assume at different periods, so universal is their appearance on vases of all shapes and dates. The lotos-flower or bud is, of course, a motive of purely Oriental origin, which found

¹ See Jahrbuch, 1895, p. 44, note 15. ² Stilfragen, passim, especially p. 48 ff. and p. 178.
its way into Greece probably through the medium of Phoenicia; the palmette, on the other hand, is purely Greek, although it may possibly be derived from a Mycenaean prototype, the *Vallisneria spiralis* plant, which is so frequently found on Mycenaean vases (Fig. 158). They are found not only as single motives, isolated or repeated, but also combined together, or forming part of elaborate systems of floral ornament, with stems and tendrils often conventionalised, which link them together, either in continuous bands or in groups occupying a limited space, on the neck or under the handle.

In the Graeco-Phoenician pottery of Cyprus the lotos-flower often appears in a purely Egyptian form (Fig. 159, from C 165 in B.M.), but it is more often combined with and almost merged in some elaborate system of patterns too complicated to describe or define by any name. But in Greek vase-paintings, in which it first makes its appearance in the seventh century, it is always more or less conventional. It is thus found on the Melian amphorae in combination with systems of spirals; though on the shoulder of the example given by Riegl there occurs a band of lotos-flowers alternately upright and inverted, linked together by scrolls, where the form is almost

---

2 For the Egyptian types of lotos-flower and bud see Riegl, p. 48 ff.
3 Riegl, p. 155; see also an early Boeotian example in the B.M. (A 564 = Riegl, p. 173).
that of Egyptian art, except that the cup of the flower is rounder, the petals shorter and blunter. It is obviously as yet in the transitional stage. Next we meet with it in the vases

![FIG. 160. LOTOS-FLOWERS AND BUDS (RHODIAN).](image)

of Ionia, especially in those of the so-called Rhodian and earlier Naukratite styles, which have friezes of lotos-flowers alternating with closed buds or with palmettes, connected by tendrils (Fig. 160). A similar pattern, on an exceptionally large scale and treated in polychrome (white and purple), surrounds the lower portion of the body on several of the later Caeretan hydriae (cf. Plate XXVI.). But in most of the fabrics of the sixth century the bud seems to have been preferred to the open flower of the ornament.¹ Rows of lotos-buds linked by tendrils, upright or inverted, are found on the Cyrenaic cups, on the vases of the Chalcidian type, and on the later Ionic fabrics, such as the Rhodian kylikes in the British Museum (B.379-81). Sometimes, too, a single bud appears in the design

![FIG. 161. PALMETTE- AND LOTOS-PATTERN (EARLY B.F.).](image)

¹ Thiersch, *Tyrren. Amphoren*, p. 70, points out that the form of lotos-flower with two large points is Peloponnesian (Corinthian, etc.) and Ionic; the form found in Attic, Boeotian, and Proto-Corinthian fabrics has three principal points.

VOL. II.

15
itself, overhanging the scene or rising from the ground. On the so-called Pontic vases the buds are isolated, and placed alternately upright and pendent. In the Corinthian and early Attic fabrics the lotos-flower is found, combined in various ways with palmettes and tendrils, as a neck-ornament, or above a panel, or under the handles, and also as a centre in heraldic compositions (Fig. 161); but subsequently the buds resume their sway, and are found bordering the panels of black-bodied amphorae (as in Fig. 162), forming a lower border to the designs on the red-bodied, and also on the shoulder of lekythi. These motives linger on in the earlier R.F. amphorae and hydriae, and in the column-handed kraters; rows of buds of a degenerate elongated form, on the lip, neck, or shoulder, are continued well into the period of the South Italian fabrics.

The palmette or honeysuckle ornament is not usually found as an independent ornament before the middle of the sixth century. Its development in this direction really belongs to the R.F. period. But in combination it is found, as we have seen, in Corinthian and Attic B.F. vases, and also in Chalcidian. Before the Athenian unification of styles it usually appears linked with lotos-flowers in a sort of double chain, each pattern being alternately upright and reversed, as in Fig. 163; in this form it is usually found on the neck, or as an upper border to the design. This

---

1 See generally Riegl, p. 155 ff.
type of ornament is favoured in the Proto-Attic, Corinthian, and Corinthish-Attic vases, and the earlier panel-amphorae; the palmette is here regarded as the foliage of the lotos-flower, which at first always predominates. Subsequently the palmette gains the upper hand, as on the necks of the red amphorae (see Fig. 165), and the lotos-flower is gradually ousted altogether. It, however, returns occasionally on R.F. hydriae and amphorae.\(^1\) Another variety, which may be described as a metope-like treatment, compared with the frieze-like treatment above, consists of an interlacing arrangement filling the space of a square, with two palmettes and two lotos-flowers respectively opposed, or a symmetrical arrangement of palmettes and lotos-flowers, connected by tendrils, as in Fig. 164. This is found under the handle, or on the neck, or in the middle of a frieze of the Corinthian "heraldic" type.\(^2\) On the red-bodied B.F. amphorae the universal neck-ornament is a band of large palmettes vertically opposed, linked by a continuous chain

\(^1\) E.g. B.M. E 169.

\(^2\) The varieties of this pattern should be carefully distinguished. Corinthian vases have a composition of lotos-flowers only; Chalcidian, palmettes only (cf. Vienna 219; B.M. B 34). In the "Tyrrenian" amphorae, and subsequently in Attic red-bodied amphorae, the two principles are seen to be united, and palmettes alternate with lotos-flowers. See also Fig. 161.
passing between them and separated by elongated lotos-flowers (Fig. 165); this is also found on the Panathenaic vases and the earlier R.F. amphorae. Towards the end of the sixth century, however, there is a tendency to drop these composite ornaments, and attention is devoted to the palmette alone. The method of its application to the kylikes as a handle-ornament, linked thereto by a scroll, has already been treated in detail (Vol. I. p. 413); it first appears on the Cyrenaic cups, and is usually employed by the "minor artists" of the B.F. period. The chief feature of the new advance is that the palmette is no longer a stiff upright design with straight unenclosed petals, the

form to which it adheres down to the end of the sixth century; but now assumes a more flexible and graceful form, being encircled and linked to its fellows by means of slender scrolls or tendrils, which thus form a series of elliptical or oval forms
capable of great variety of arrangement and position (Fig. 166). This framed palmette is first found in the Fikellura or Samian ware. It occurs in the form of a frieze, with linking scrolls, on the later B.F. hydriae. The number of leaves or petals of which the palmette is composed is usually limited to seven. Another important and very effective improvement is achieved by placing opposed pairs of palmettes no longer vertically, but obliquely, forming an upper or lower border to the design (Fig. 167). These are frequently found on the krater and hydria, and appear constantly on the vases of Apulia and Lucania, especially on the lip. Great attention is paid to the effective grouping of the framed palmettes in the spaces under the handles, the object aimed at being more and more naturalism rather than symmetry.  

**Fig. 167. Oblique Palmettes (Late R.F.).**

In the later R.F. period, on the other hand, there is a certain reaction in the direction of conventional ornament, combined with exaggeration and lack of refinement. The palmette under the handle returns to the old erect unframed type, and increases enormously in size, so that one or at most two vertically opposed suffice to fill the space. In this form it appears on the bell-shaped kraters and hydriae of Southern Italy, and especially those of Campania, surrounded by elaborate scrolls and tendrils. In the latter fabric the palmette, which has become almost gross and ugly, is usually flanked by two large convolvulus or other flowers rising from the ground, and drawn

1 Cf. also an elegant oinochoë with white ground in the British Museum (B 631). On a similar jug at Munich (334 = Brunn-Lau, Gr. Vasen, pl. 22) the palmettes are enclosed in heart-shaped borders. For other vases which, like these, have palmettes for their sole decoration, see British Museum, Second Vase Room, Case 28, and Laborde, *Vases de Lamberg*, ii. pl. 41.

in profile (Fig. 168). In the Apulian and Lucanian vases there is no rule as to the number of the palmettes, and sometimes the effect is exceedingly rich and elaborate. Speaking generally, there is no ornament which prevails so universally and in such varied forms and systems on Greek vases, but to give an exhaustive account of all its uses would be far beyond the limits of this work.

There remains only to be discussed the rosette, which, in spite of its often purely formal character, may be reckoned as in its origin a floral motive, even if it is not obvious that it is derived from any particular plant. It may be said to have two distinct forms, the star and the disc,\(^1\) the former consisting of an indefinite number of radiating arms or leaves, the latter of a simple disc surrounded by a row of dots. In both forms it is found at all periods, not so much as a formal pattern in bands or groups, but as a decorative adjunct to surfaces within or without the field of the design, especially as a ground ornament on Ionic, Corinthian, and other early fabrics, or as an embellishment of the draperies worn by the figures on the vases.

In the Mycenaean period it is found usually in the dotted disc form, as a ground ornament, but the star form is by no

\(^1\) They are distinguished by German writers as "Blattrosette" and "Punktrosette."
means rare. In later Cypriote pottery the star-shaped rosette sometimes occurs in a band of ornament, left in the colour of the clay on a black background; but the other type is more common in conjunction with the concentric circles. In Hellenic pottery the rosette at first appears exclusively as a ground-ornament, and this function it fulfils both in Corinthian and early Ionic pottery to a large extent, as well as in some of the smaller groups. In the Rhodian and Naucratite wares it assumes very varied forms (e.g. Fig. 169, from the Euphorbos pinax), intermingled with hook-armed crosses and bits of maeander; in the early Corinthian wares it takes the shape of an approximately circular flower of six petals, which covers every available vacant space over the area of the design; these are often rendered with great carelessness, the artist’s only object being apparently to insert a patch of colour where it would fill in a space. Subsequently the rosettes become both more symmetrical and at the same time fewer in number, and by the beginning of the Attic B.F. style have altogether disappeared. Occasionally they are employed for a band of ornament on the lip, neck, or handles of a B.F. vase. Lost sight of for a period of some two hundred years, the rosette springs again to life in the vases of Apulia, resuming its old functions as a ground-ornament, and also being employed in bands on the neck or elsewhere. It usually appears in the form of a star-shaped flower of six or eight petals, in red edged with white on the black ground (Fig. 170).

It may also be found convenient to treat the ornamentation out that the rosette, although Assyrian in origin, is not here used in a strictly Assyrian fashion.

1 Cf. Furtwaengler and Loeschcke, Myken. Vasen, pls. 4, 25, 28, 37, 38; J.H.S. xxiii. pl. 5 (Crete).
2 E.g. C 244 in B.M., and Fig. 76 (Vol. I. p. 254).
3 See Riegl, cf. cit. p. 197. He points the Proto-Attic vase, Ant. Denkm. i. 57.
of Greek vases from a different point of view, in order to give an outline of the decorative system adopted in each of the principal styles, and as considered appropriate to the various forms.

In the vases of the prehistoric period, from the primitive incised wares down to the end of the Mycenaean style, there is an entire absence of anything like rule or formalism. The principle observed in the very early classes, such as the Cypriote relief and white slip wares (Vol. I. p. 241 ff.), is the imitation of other substances, of metal or leather. The object of the artist was to cover the surface of the vase as far as possible with decorative designs; and if, as was generally the case, his artistic capacity restricted him to linear or simple vegetable patterns, the utmost he could achieve was to adapt these to the whole of the space at his disposal—i.e. the whole body of the vase. Mycenaean vases, however, are usually only decorated on the upper part, as far as the middle of the body, which was encircled with one or more plain bands of black. Thus there remained a sort of panel between the handles, of varying extent.

In the Geometrical period, however, a great change takes place, which from the artistic point of view is a reaction in the direction of formalism, but nevertheless forms the basis of the decorative systems of later times. Here we see for the first time a regular partition of the surface of the vase by means of bands and panels of ornaments, without indeed any restriction of particular patterns to any part of the vase, but yet a deliberate endeavour to establish a decorative system. With the increase of animal and human subjects the ornament becomes more subsidiary, merely a framework to the design, but even in the succeeding Proto-Attic and Melian classes it plays a very important part. In the Melian vases the system is Geometrical, but the ornamentation is curvilinear and Mycenaean. The ground-ornaments, however, are derived from the former source as well (hook-cross and zigzags in conjunction with rosettes). In both these classes the space under the handles is selected for the display of a grouping of ornamental motives, such as

---

1 See what has already been said on this subject in Vol. I. Chapter VII. p. 282: cf. also Perrot, Hist. de l'Art, vii. p. 165.
spirals or palmettes, or the two combined in a series of heart-shaped motives or panel-compositions; similar patterns cover the neck and the lower part of the body. The ornamentation of Phaleron and Proto-Corinthian vases is an echo of the Geometrical system. The ground-ornaments are the hook-cross, rosettes of dots, and bits of maeander; the bands of pattern consist of zigzags, chequers, double rows of dots, and toothed patterns. The early Ionic vase-painters treat the subsidiary ornamentation as they do their principal subjects, adopting the frieze principle in most cases; the only exception is in the Rhodian pinakes, where it is usually confined to simple patterns round the rim, with a sort of fan-pattern in the exergue below the central design. The ground-ornaments are really the chief feature of Rhodian ornamentation, as in Corinthian vases. The decoration of the Fikellura or Samian ware is very characteristic, and demands separate mention. The patterns are highly developed, and suggest a late date—as, for instance, the scroll, the ivy-leaf, and the framed palmette. In later Ionic vases the ornamentation is not very prominent, except in the Caeretan hydriae, in which the broad bands of palmette-and-lotos ornament, and the exaggerated tongue-pattern on the lip and shoulder, occupy a proportion of the surface unusual at this period. Besides the typical ground-ornaments (rosette and hook-crosses) of the earlier vases, the favourite Ionian patterns are the maeander, the guilloche, and wreaths of ivy and myrtle. At Corinth, as we have seen, for a long time ornament is confined to the ground-filling rosettes, with some simple motives, such as zigzag lines or tongue-pattern, on the mouth and shoulder, or bordering the design; even in the later examples, when the rosettes have disappeared, it is practically confined to the interlacing palmette-and-lotos pattern on the neck, above the design, or inserted in the subordinate friezes of animals. The same principle applies in the Corintho-Attic and Chalcidian fabrics.

1 Cf. a similar pattern on the Daphnae situlae (B.M. B 105-6).
3 See on the ornamentation of the former Thiersch, Tyrhen. Amphoren, p. 69 ff.; on the latter Riegl, p. 187.
In Athenian B.F. vases we at last find a stereotyped system of ornament for each kind of vase, from which there is little or no variation. Generally the system is as follows:—On the panel-amphorae, an interlaced palmette-and-lotos pattern or a row of inverted lotos-buds above the panel, and a calyx of leaves round the foot, those with flanged handles having also ornaments thereon, ivy-leaves or rosettes. On the red-bodied, a chain of double palmettes round the neck, tongue-pattern on the shoulder, a grouping of palmettes, tendrils, and lotos-flowers under the handle, and a row of three or four narrow bands of ornament below the design (lotos-buds upright or inverted, maeander, zigzags), terminating with the calyx round the foot. The Panathenaic amphorae have the same neck-ornament as the red-bodied, with tongues above the panel, and thick rays round the foot; the fourth-century examples have palmettes on the neck, with elongated tongue-pattern immediately below. On the hydriae, tongue-pattern above the shoulder-design, borders to the panels (maeander above, ivy or network down the sides, lotos-buds or framed palmettes below), and calyx round the foot. On the oinochoae, panel-borders like those of the hydriae, but on the olpae (Vol. I. p. 178) only two or three rows of chequer, maeander, etc., on the neck above; on the lekythi, lotos-buds, ivy-leaves, and palmettes on the shoulder, and a double row of dots above the design. The kylix-ornament is practically limited to the handle-palmettes of the "minor artist" class, and a circle of straight-edged rays, alternately black and outlined, round the stem on the later varieties (together with the large eyes).

In the R.F. period the same system of appropriate patterns for each form of vase is in the main adhered to, but with greater freedom; there is also a wide difference between the earlier amphorae and hydriae, which cling to the old panel-system with its ornamental borders, and the vases of the fine period, in which there is an absence of all restraint on the one hand, and a tendency to dispense with ornament almost entirely on the other (as in the Nolan amphorae). On the kylix, the ornament is throughout confined to the palmettes under the handles and the maeander encircling the interior design, which have been
LATER SYSTEMS OF ORNAMENT

dealt with already (Vol. I. p. 413 ff.). The earlier amphorae and hydriae, as we have seen, have panels with borders as in the B.F. period, usually in the older technique; those of the fine style (including the wide-bellied amphorae) have a short non-continuous border, such as egg-pattern or maeander, above and below the figures, with similar patterns on the lip and round the bases of the handles. The stamnos has egg-patterns round the lip and handles, tongue-pattern round the shoulder, and a system of palmettes between the designs. The red lekythi have egg-pattern or palmettes on the shoulder, and maeander-pattern (with crosses) above or below the design; the white have black rays on red ground or black and red palmettes on white on the shoulder, and maeander above the designs. The bellkrater and wide-bellied amphora of the late R.F. period, as also those of Southern Italy, have a band of oblique palmettes or a laurel-wreath round the top, maeander with crosses below the design, palmettes grouped under the handles, and egg-pattern round their bases. The column-handled krater, on the other hand, adheres throughout to the B.F. system of ornamentation, with ivy-wreaths and elongated lotos-buds on the rim, similar lotos-buds on the neck, panels bordered with tongue-pattern and debased ivy-wreaths, and the calyx round the foot. The wide-bellied lekythi have palmettes or egg-pattern above the design, and maeander below.

In the vases of Southern Italy there is, as a rule, no system observed in the ornamentation; in the large vases of Lucania and Apulia it is used with great profusion and variety, chiefly in bands on the neck. In the smaller Apulian vases and in those of Campania it is often confined to a wave-pattern below the designs; the Campanian hydriae usually have in addition a wreath of myrtle or laurel round the shoulder. Generally speaking, the large vases, such as the bell-krater, the hydria, and the wide-bellied amphora, continue the principles adopted in the R.F. period. The systems of palmette-patterns under the handles have already been discussed, and for other details the reader is also referred to what has already been said in discussing the individual patterns.
CHAPTER XVII

INSCRIPTIONS ON GREEK VASES

The practice of inscribing works of art with the names of persons and objects represented was one of some antiquity in Greece. The earliest instance of which we have historical record is the chest of Kypselos, which dated from the beginning of the sixth century B.C., and concerning which Pausanias¹ tells us that "the majority of the figures on the chest have inscriptions written in the archaic characters; and some of them read straight, but other letters have the appearance called by the Greeks 'backwards-and-forwards' (βουστροφηδών), which is like this: at the end of the verse the second line turns round again like a runner half through his course. And any way the inscriptions on the chest are written in a tortuous and hardly decipherable fashion." There is, however, no mention of inscribed vases until a much later date; Athenaeus speaks of a cup with the name of Zeus Soter upon it, also of γραμματικά ἐκπώματα, or cups with letters on them.²

Inscriptions on Greek vases are found in comparatively early times, even prior to the date to which the chest of Kypselos is attributed. This question will receive more attention subse-

¹ v. 17, 6. ² xi. 466 D-E.
quently; meanwhile, we may point out some of the ways in which they have proved important in the study of archaeology. In the first place, they were originally among the principal, perhaps the strongest, arguments in the hands of Winckelmann, Sir W. Hamilton, and the other upholders of the true origin of Greek vases against Gori and the other "Etruscans" (see Vol. I. p. 19). They are, in fact, if such were required, an incontestable proof of Greek manufacture. Secondly, in more modern times, they have been of inestimable value in enabling scholars to classify the early vases according to their different fabrics. The alphabets of the different cities and states being established by inscriptions obtained from trustworthy sources or found in situ, it was an easy matter to apply this knowledge to the vases. In Chapters VII.-VIII. numerous instances have been given of the value of this evidence (see also below, p. 247 ff.), perhaps the best being that of the Chalcidian class, for which the inscriptions have been a more important criterion even than style. Thirdly, the inscriptions are sometimes of considerable philological value. Those on Attic vases may fairly be said to represent the vernacular of the day; and thus we learn that the Greeks of the Peisistratid age spoke of Ὄλυμπεύς, not Ὀδυσσεύς, and of Θήσιος, not Θησεύς; that they used such forms as νίξ for νίος,¹ and πιέε for πίε (see below, p. 255). Traces of foreign influence in the inscriptions, as in the frequently occurring Doric forms, imply that many of the vase-painters were foreigners, probably of the metic class. We shall also see that one class of inscriptions gives some interesting information on the subject of the names and prices of vases in antiquity.

The whole subject has been treated exhaustively—especially from a philological point of view—in a valuable treatise by P. Kretschmer,² to which we shall have occasion to make constant reference in the following pages. He classifies them under two main headings: (a) inscriptions incised with a sharp tool in the hard clay; (b) inscriptions painted with the brush after the final baking. They are also found in very rare

¹ Hence the oblique cases νίξ, νίκ, etc., of classical usage.
² Die griechischen Vaseinschriften, Gütersloh, 1894.
instances impressed in the soft clay and varnished over.\(^1\) In later times inscriptions in relief are actually found, sometimes painted with thick white pigment, sometimes gilded.\(^2\) On the so-called Megarian bowls and on the Arretine and other wares of the Roman period they are stamped from the moulds. Lastly, there are the stamps imprinted on the handles of wine-amphorae, which have been discussed in Chapter IV.

The **incised inscriptions** are of three kinds: (1) those executed by the maker of the vase; (2) those scratched under the foot; (3) those incised by the owner. As these represent a much smaller class than the painted ones, they shall be dealt with first.

(1) Inscriptions incised by the maker before the final baking. These are found on the handles and feet, round the edge of a design, or interspersed therewith like the painted inscriptions. Generally they represent the signature of the potter, as in the case of the early Boeotian vase signed by Gamedes,\(^3\) the vases of the fifth-century artist Hieron,\(^4\) and those of Assteas, Python, and Lasimos in Southern Italy.\(^5\) On the vases of the latter class explanatory inscriptions seldom occur, but when they do (as on the vases of Assteas) they are always incised. Of their palaeographical peculiarities we will speak later. On a vase in the South Kensington Museum\(^6\) the words \(\text{βραχάς καλός}\) are incised and painted red, and on the pottery found on the site of the Kabeirion at Thebes the same process is often adopted, except that the paint used is white.\(^7\)

(2) Of inscriptions scratched under the foot a considerable number remain, especially on B.F. vases. They are often difficult to decipher, being in the form of monograms, and frequently appear to be meaningless. In many cases they may have been private marks of the potter or his workmen; others, again, are evidently private memoranda made by the workman, relating to the number of forms of vases in his

INCISED INSCRIPTIONS

239

batch, or by the merchant respecting the price to be paid. Commonly they take the form of names of vases,\(^1\) such as ΗΝΔΠΙ for υδρία (hydria), ΛΗΚ or ΛΗΚΥ for λήκυθος (lekythos), ΣΚΥ for σκύφος (skyphos),\(^2\) and so on. Many of the inscriptions give the words in full, with numbers and prices, and we may obtain from them some curious information.

Among the more elaborate examples given by Schöne in his valuable monograph is one from a krater in the Louvre:\(^3\):

\[\text{ΚΡΑΤΕΡΕΣ : ΓΙ} \quad \text{kpatieres e}\]
\[\text{TIME : ԾԾԾ ՕԶԾԾԵԾ : ԲԱԶԾ} \quad \text{τιμή τέσσαρες δξίδες ὀκτώ} \]
\[\text{ΒΑԶԵԱ : ΔԾԾ} \quad \text{βαθέα εἰκόσι (at 1 dr. 1 ob.).} \]

That is, six kraters, value four drachmae; eight oxides; twenty batheca (an unknown form), one drachma one obol. The batheca were probably deep cups or ladles; the oxides (lit. vinegar-cups) were small vessels, probably answering to our wine-glasses.

Another instance given by Schöne:\(^4\) is:

\[\text{ΛΗΚΥΘΙΑ Δ} \quad \text{ληκύθια δέκα} \]
\[\text{ՕԻՕՕՕAI} \quad \text{օնոխօատ ոն} \]

or ten lekythi and two oinochoae.

Another good example is on a krater in the British Museum (Ε 504):

\[\text{ΚΡΑΤΕΡΕ ΓΙ : ԾԾԾ} \quad \text{kpatere(s) e τέσσαρες} \]
\[\text{ΠԵԼԼԱՆԻԱ : ΔԾԾ} \quad \text{πελλίνια δώδεκα τρεῖς} \]
\[\text{ՕԶԾԾԵԾ : ΔԾ} \quad \text{δξίδες εἰκόσι τρεῖς} \]
\[\text{ՕԵՅԲԱՖԱ : ΔԾԾ} \quad \text{δξύβαφα εἰκόσι (at 1 dr. 1 ob.)} \]

i.e. six kraters at four drachmae, twelve cups at three obols, twenty oxides at three obols, twenty oxybapha at one drachma one obol.

---

\(^1\) For the explanation of these names see Chapter IV.

\(^2\) B.M. E 497; Schöne in Comm. Phil. in hon. Monumeni, p. 658, Nos. 29-32.

\(^3\) Op. cit. p. 651, No. 5. In this and the other examples it will be understood that Δ denotes 10 (δέκα), Γ 5 (πέντε), and so on; Ի being the sign for a drachma.

\(^5\) A diminutive of πέλα, a large deep cup or bowl (see Vol. I. p. 186).
Another in Vienna:

ΚΡΑΤΕΡΕΣ : ΠΙ : ΤΙΜΗ : ΠΡΟΧρατήρες εξ τιμή τάσσας (4 dr.)
ΒΑΘΕΑ : ΔΔ : ΤΙΜΗ : Η βαθεα εικόσι τιμη η | (1 dr. 1 ob.)
ΟΞΙΔΕΣ : Δ οξίδησ δέκα

is to the same effect as the two preceding. On a hydria at Petersburg we find:

ΥΔΡΙΑΡΧΟΙ Α'

οῦ(μίω) τρ(ε)ξ(σ) δραχ(μιώ) π(έντε) ο(βόλου) ενός . . .

or three hydriae worth five drachmae one obol. The last example that need be mentioned is from a vase at Berlin:

Α. ΛΥΔΙΑ ΜΕΣΩ : I : Ε : ΛΕΠΑΣΤΙΔΕΣ : Κ : Ε

οῦ(λ) Λύδια με(κ) ιων εν λεπαστίδες κ'.

Here the letters probably stand for numerals of the ordinary kind, denoting the numbers of the batch (ι' = 15, κ' = 27).

The form of the letters in all these cases is that of the fifth century. In the case of the second, third, and fourth examples given, it will be noted that the shape of the vase itself corresponds with the first item. Jahn and Letronne originally held the view that these marks were made by the potter on the feet of the vases before they were attached to their respective bodies. Schöne, in the light of the examples already quoted, makes the ingenious suggestion that each list represents a different "set" of so many vases of different forms, and used for different purposes, sold together in a batch, like a modern "dinner-set" or "toilet-set" of china. Thus we have in our fourth example a set of six mixing-bowls at four drachmae (35.) apiece, ten wine-glasses at (probably) three obols or $4\frac{1}{2}$ d. apiece, and twenty cups or ladles at about $10\frac{1}{2}$ d. apiece.

Some of the shorter inscriptions also throw light on the prices at which different vases were sold. For instance, ΛΗΚΩ:ΛΔ:ΑΗ would denote thirty-four lekythi for thirty-seven obols, or roughly $1\frac{1}{2}$ d. apiece; ΛΗΚΩ:1Γ:ΙΑ, thirteen lekythi

1 Schöne, op. cit. p. 650, No. 3.
2 Ibid. No. 7 = Cat. 1206.
3 Cat. 2188; Schöne's No. 8. The meaning of Λύδια μείζων is uncertain.
for eleven obols, at a slightly lower price.\(^1\) Aristophanes\(^2\) tells us that one obol would purchase quite a fine lekythos, just as elsewhere\(^3\) he mentions three drachmae as the cost of a κάδος or cask. This latter statement is borne out by the inscription on a vase, \(\Gamma \cdot \kappa A \Delta \Lambda \cdot \Delta \Pi\), or five κάδια value twelve drachmae, \(i.e.\) at about \(2\frac{1}{2}\) dr. apiece.\(^4\) An inscription quoted below shows that the owner of a cup valued it at one drachma. Other examples of the same kind are collected by Schöne. The cup from Cerigo in the British Museum, on which is incised ΒΕΜΙΚΟΤΛΙΟΝ (ἡμικοτύλιον)\(^5\) does not strictly come into this category, but may be mentioned as having an inscription of the same class.

(3) Inscriptions incised by the owner, and subsequently to the completion of the vase. These usually take the form of the word ἘΙΜΙ (ΕΜΙ), with the owner's name in the genitive, as ΙΔΑΜΕΝΗΟΣ ΗΜΙ ("I am Idamenes'"), or ΑΓΤΟΥΟΙΔΑ ΗΜΙ ("I am Astyochidas'"), on two B.F. cups from Rhodes.\(^6\) Sometimes this appears in an extended and metrical form, as on another B.F. kylix from the same site:

ΦΙΛΤΩΕΗΜΙΤΑΞΚΑΛΑΣΑΚΥΛΙ+ΕΑΓΟΙΚΛΑ
Φιλτώς ἤμι τὰς καλὰς α κύλις α τωκλα
"I am the painted cup of the fair Philto."\(^7\)

Another metrical inscription runs:

Κυφισοφώτος ἡ κύλις' έιν δέ τις κατάζη δραχμήν ἀποτείεις' δώρον δἐν ταρά Ξενο.....
"I am the cup of Kephisophon; if any one breaks me, let him pay a drachma; the gift of Xeno(krates)."\(^8\)

A yet more remarkable example is on an early lekythos from Cumae in the British Museum,\(^9\) which, in the manner favoured

\(^1\) B.M. B 310; Munich 693. See Jahn in \textit{Ber. d. Sächs. Geisslich.} 1854, p. 37.

by modern schoolboys, invokes an imprecation on the head of a thief:

"I am Tataie's oil-flask, and he shall be struck blind who steals me."

"Tatai's is my oil-flask, and he that steals it will be blind who steals me."

Others, again, record the gift of the vase, as: "Epainetos gave me to Charopos"; 
"Lo, this Thoudemos gives to thee." A boat-shaped vase (kymbion) in the British Museum has incised on it the exhortation ΠΡΟΠΙΝΕ ΜΗ ΚΑΘΕΣ, "Drink, do not lay me down." The owner's name is found in the nominative on a vase from Carthage at Naples: ΧΑΡΜΙΝΟΣ ΘΕΟΦΑ- 
ΜΙΔΑ ΚΩΙΟΣ, "Charminos, son of Theophamidas, a Coan"; similarly in the genitive with the omission of ειμι: ΑΡΙΣΤΑΡΧΟ 
ΑΡΙΣΤΟΝΟΣ, 'Αριστάρχον 'Αριστωνος; ΑΛΕΞΙΔΑΜΙΝ 
'Αλεξιδαμου.

Under the same heading comes the class of votive or dedicatory inscriptions, found in such large numbers on the pottery of certain temple-sites, such as that of Aphrodite at Naukratis, and that of the Kabeiri at Thebes. The usual formula at Naukratis is ο δεινα ἀνέθηκε τῇ 'Αφροδίτῃ (or τῷ 
'Αφόλλωνι); but sometimes we find the formula 'Αφόλλωνοι 
ειμι, where the god as the recipient of the gift is regarded as the owner.

One of the most interesting, and certainly the most ancient,

---

of all incised inscriptions on Greek vases is that engraved on a jug of "Dipylon" ware found at Athens in 1880.¹ It runs:

![Inscribed Image]

FIG. 172.

ὄς νῦν ὁ ῥοχηστῶν πάντων ἀταλώτατα παίζει, τοῦ τόδε ... "He who now sports most delicately of all the dancers," etc. Though probably not contemporary with this eighth-century vase, it is still of great antiquity, and the earliest Athenian inscription known.

In studying these graffiti, it must always be borne in mind that they lend themselves easily to forgery, and that many are open to grave suspicion. Instances of these doubtful inscriptions are the Kleomenes vase in the Louvre² and a late vase signed by Statios in the British Museum (F 594).

The painted inscriptions are practically limited to a period extending over two centuries, from the time at which the primitive methods of painting were slowly emerging into the black-figured style, down to the finest stage of red-figure vases. Rare at first, they rapidly spring into popularity, being constantly found on the sixth-century fabrics; but throughout the red-figure period they gradually become rarer and rarer, until they drop out almost entirely. In the vases of the Decadence they have for the most part fallen into disuse; at any rate, they are comparatively scarce. Some of the latest inscriptions are in the Oscan and Latin languages, showing the increasing influence of the Romans over Southern Italy, and especially Campania. The inscriptions always follow the laws of palaeography of the region and period to which they belong.

Generally speaking, it may be said that they have some reference to the design painted on the vase; at least, the majority

are explanatory of the subject represented. Sometimes not only is every figure accompanied by its name, but even animals and inanimate objects, instances of which are given below. On the François vase there are no less than 115 such inscriptions. In almost all cases we can be certain that they are original, and contemporaneous with the vase itself.

The explanatory inscriptions are generally small in size, the letters averaging one-eighth of an inch in height. On B.F. vases they are painted in black; on R.F. vases of the “severe” style, in purple on the black ground, or in black on the red portions; on later R.F. vases, in white. There is no rule for their position, or indeed for their presence; but, as a general rule, it may be said that they are oftener found on the finer and larger vases, and that they are placed in close juxtaposition to the figures to which they refer. The direction in which they are written may be either from left to right or right to left (as generally on Corinthian or Chalcidian vases); on the Panathenaic amphorae are the only known examples of ΚΩΝΓΕΩV inscriptions, in which the letters are placed vertically in relation to each other. They are occasionally found on the objects depicted, as on stelae or lavers (see pp. 260, 272), on shields, or even on the figures themselves. Signatures of artists are occasionally found on the handle or foot of a vase.

Kretschmer (p. 5) illustrates the practice of employing inscriptions on vases from the art of the Semitic nations. He instances clay vases from Cyprus with painted Phoenician inscriptions, for which the same pigment is used as for the decoration of the vases themselves. But none of these are likely to be earlier than the first Greek inscriptions, and it is more than probable that the Cypriote Phoenicians borrowed the practice from the Greeks. In order, therefore, to obtain information as to the date of these painted inscriptions, we are entirely dependent upon internal evidence.

1 B. M. B 134: Urlich, Beiträge, pl. 14.
2 Berlin 2314.
3 Examples in the B. M. are E 12 and E 457 (Pamphaios), E 61 (Hieron), E 65 (Brygos), E 258 (Eusitheos); and cf. Fig. 125.
4 Perrot, Hist. de l'Art, iii. p. 670. They have been found at Larnaka, Paphos, Dali, and Amathus.
The importance of these inscriptions may, perhaps, be best realised when it is pointed out that they are one of the chief guides to the age of the vases, and have contributed more than any other feature to the establishment of a scientific classification of the earlier fabrics, as will be fully indicated in the succeeding account.

The Greek alphabet, as is well known, is derived from the Phoenician, and this is attested not only by tradition, but by the known existing forms of the latter, the signs being twenty-two in number. The invention of the two double letters, and of the long η and ω, which are purely Greek, was attributed by popular tradition to various personages without any authority. With the question of the introduction of writing into Greece this is not the place to deal. Recent discoveries, especially in Crete, have greatly modified all preconceived notions on the subject, and for the present we are only immediately concerned with the earliest use of the Greek alphabet, as we know it.

This can be traced as far back as the seventh century B.C. on various grounds, and in all probability the traditional view which placed its introduction into Greece at about 660 B.C. is fairly correct. The earliest inscriptions on the vases are certainly not later, perhaps earlier than this (see below, p. 254). At Abou-Simbel in Egypt, Greek inscriptions have been found in which the name of Psammetichos occurs, and this king is generally supposed to be the second of that name (594–589). In Thera and other Aegean islands, and on the coast of Asia Minor, inscriptions are known which, for various reasons, have been placed even earlier than this, and the vase with Arkesilaos, the inscriptions on which are discussed below, is hardly later, as it can be shown to date between 580 and 550 B.C.

Before proceeding to discuss the early inscriptions, it may be as well to note, for the benefit of those to whom Greek Epigraphy is an unfamiliar subject, the chief peculiarities of the earlier alphabets. They fall into two principal groups, the Eastern and Western, each of which has many subdivisions. Certain forms, such as \( \varphi \) for \( \chi \), are characteristic of one or

2 On the subject generally see Roberts,
the other division; but the distinction is not so clearly marked on the vases, on which many alphabets, such as the Ionic and Island varieties, are scarcely represented. The vase-inscriptions fall mainly under three heads: Corinthian and Athenian in the Eastern group, Chalcidian in the Western. During the fifth century (or even earlier) there is a rapid tendency to unification in the Greek alphabet, which is chiefly brought about by the growing supremacy of Athens. This acted in two ways: firstly, by the fact that Attic became the literary and therefore the paramount language in Greece; secondly, by the fact of her artistic pre-eminence, which crushed out the other local fabrics. Finally, by the time of the archonship of Eukleides in 403 B.C., the alphabet, if not the language, had become entirely unified, and the Ionic forms universally adopted for public and official purposes. For private use they had, of course, long been known at Athens; but the official enactment of that year only set the seal to a long recognised practice. Throughout the fifth century the old Attic and the Ionic forms are found side by side on R.F. vases.¹

In the later archaic period the coins come in as an important source of evidence.² None of the inscribed ones appear to be earlier than the sixth century, the oldest being perhaps the electrum stater usually attributed to Halikarnassos, with the name of Phanes (?). The only characteristic letter (the alphabet belonging to the Ionic group) is the sign ☩ in place of Η to denote ητα, which has not been found on any vase with the Ionic alphabet, and therefore betokens a very early date. Next comes an Attic stater of about 560 B.C., with the legend (Α)ΟΕ, which may be fitly compared with the oldest Panathenaic amphora,³ on which the dotted Ο is also found. The earliest coins of Haliartos in Bocotia have the curious form ☩ for the spiritus asper or Η, dating apparently before 550 B.C.; the succession can thence be traced through Η, ☩, and ☩ down to about 480 B.C., when it is dropped entirely. At Himera in Sicily ☩ occurs in the fifth century for the spiritus asper, and is followed by the Η

¹ See the table given by Kretschmer, p. 105.
³ B.M. B 130.
form, which in the West is employed down to about 400 B.C. On the early coins of Poseidonia (Paestum) the M form of Σ is found (550—480 B.C.), being also characteristic of Corinthian vases of the sixth century; it also lingers on in Crete, but in Sicily and elsewhere the S form of Attic and other alphabets is more usual, until replaced in the fifth century by Σ. Of the specially Ionic letters, Η (= eta) is found generally at an early date, as at Teos (540—400 B.C.), and also Ω. At Corinth the kappa Κ for Κ is in use from the earliest times down to the days of the Achaean League, and does not therefore afford evidence of date by itself, but only of a local peculiarity, being equally universal on vases. The digamma is only found on coins of Elis and Crete, whereas it often occurs on early Greek vases.¹

It may also be of interest to note that the IP form for the rough breathing occurs on the helmet of Hiero in the British Museum,² which can be dated 480—470 B.C., and that the use of Η for eta and of the four-lined Σ at Athens previous to the archonship of Eukleides can be deduced from the well-known fragment of Euripides³ in which the letters forming the name ΘΗΣΕΥΣ are carefully described.

In the following pages illustrations of the points above noted will be fully detailed where occurring on the vases. The annexed scheme of alphabets used on vases (Fig. 173) will serve to give a general idea of the variations of form in different fabrics.

The painted inscriptions on vases first appear, as already noted, about the beginning of the seventh century B.C. The earlier fabrics—Mycenaean, Cretan, and Cycladic—generally belong to an epoch when writing, if not unknown, was at any rate little practised⁴; nor have any inscriptions been found on the Dipylon or Geometrical vases, except the incised one which we have already discussed. The oldest known painted inscriptions are found on a Proto-Corinthian lekythos (see p. 254), the Euphorbos pinax from Kameiros (B.M. A 749), Argolis, Cyprus, and elsewhere, with characters incised on the handles, of contemporaneous execution, and forming parallels to the Cretan script and the later Cypriote syllabary.

¹ See for other details of coin-inscriptions Hill, op. cit.
² Cat. of Bronzes, No. 250.
³ No. 385 (Didot).
⁴ It should be borne in mind that Mycenaean vases have been found in
and the krater signed by Aristonoös, which is perhaps of Ionic origin, strongly influenced by Mycenaean art.

**Fig. 173.**

With the great impulse given to vase-painting at the beginning of the sixth century by the development of the art in Corinth,
Chalkis, and Athens (especially in Corinth), the number of inscribed vases rapidly increases. Among the earliest examples are those remarkable painted pinakes found at Corinth (Vol. I. p. 316), nearly all of which have dedicatory inscriptions, while in most cases the names are given of the deities, Poseidon and Amphitrite, to whom they were dedicated, and whose figures appear on them. They may be dated 600—550 B.C. The custom of inscribing names on works of art is illustrated by other products of this period, as we have already noted in the case of the chest of Kypselos; and they occur on the early bronze reliefs from Olympia, the Samothrace relief in the Louvre, the archaic reliefs at Delphi, and the newly found painted metopes at Thermon, as well as later on the paintings of Polygnotos.

On the Euphorbos pinax already mentioned appear the names of Menelaos (ΜΕΛΑΟΣ ΑΜ), Hector (ΗΟΤΗ ΑΜ), and Euphorbos (ΕΟΡΣΟΜ). Although found in Rhodes, it is proved to be of Argive origin by the characteristic form of the Α in Menelaos. Although its date cannot be exactly ascertained, it is probably about 620—600 B.C. It is a vase important in more than one respect, as it may be said to foreshadow the beginnings of the black-figure style.

The vase of Aristonooös was found at Cervetri, and bears the artist's signature,

\[ ΗΕΙΟΠΕΙΩΟΝΟΝΟΤΙΑ \]

in an alphabet from which, unfortunately, all characteristic letters are wanting, so that its origin is uncertain. It is, however, as we have said, probably a seventh-century product of an Ionian fabric, on the coast of Asia Minor. The Ω has been taken by several scholars to denote Φ, as in the Phrygian alphabet, but Kretschmer (p. 11) prefers to read it as Θ (Ω = Θ).

---

4. *See also Vol. I.* p. 335.
6. Vol. I. p. 297 and Plate XVI.; for the latest interpretation of the name, as here adopted, see *Class. Review*, 1900, p. 264.
We have, however, already seen that it is most probably a superfluous letter.

Early in the sixth century must be placed another remarkable vase, the Arkesilaos cup of Cyrenaean fabric. The inscribed names on this vase are as remarkable as its subject; there are nine in all, two only fragmentary. The only proper name is that of Arkesilas (Ἀρκεσίλαος), who was king of Kyrene 580-550 B.C.; the others seem to be titles, such as ἸΟΘΟΡΤΟΣ, Ἰασήσιος or Δ'σερτος, "Keeper of the burdens"; ἸΑΙΟΜΑΥΟΣ, Σλωφόμαχος, a word having some reference to silphium, the subject of the vase; ὉΝΗΜΑΚΟΣ, "Guardian"; ἸΡΜΟΦΟΡΟΣ, and ὘ΥΘΟ, ὥπεγοσ. One word, ἹΟΜΒΑ, οτέματος, refers to an inanimate object (a balance). The dialect is Doric, Kyrene having been colonised by that race.

Next we have to deal with a very important class of inscriptions—those found on Corinthian vases. They are too numerous to be dealt with in detail; Kretschmer mentions nearly fifty inscribed vases, exclusive of the pinakes. Wilisch attributes the earliest to the latter half of the seventh century, the latest to the middle of the sixth century; but they certainly do not become common before the sixth. They include several artists' signatures—viz. Chares, Milonidas, and Timonidas (Vol. I. p. 315). One of the most famous of the inscribed vases is the Dodwell pyxis at Munich, representing a boar-hunt. The figures are inscribed with fanciful names, such as ΑΔΜΒΜΝΟΝ (Agamemnon), ΔΟΣΜΑΧΟΜ (Dorimachos, or "spearman"), ΠΑΚΟΝ (Pakon), and so on. A krater in the British Museum (Plate XXI.) represents a similar scene, also with fancy names, such as Polydas and Antiphatas. Another famous vase is the Amphiaraoos krater in Berlin, representing the setting out of Amphiaraoos and the funeral games of Pelias; no less than twenty names are inscribed. Of these, ΣΑΤΟΝ (Baton) and ΕΠΝΕΡΓΟΜΟΜ (Hippalk(i)mos) illustrate other palaeo-

2 Collected by Blass, Dialektinschr. iii. 3120 ff., and Wilisch, Altkorinthische Thonindustrie, p. 156.
3 Roberts (Gk. Epigraphy, i. p. 134)

distinguishes three periods in the Corinthian alphabet from 700 to 400 B.C., but the vases seem to belong almost entirely to the first, down to 550 B.C.

4 Vol. I. p. 316, Fig. 90.
5 Cat. 1655: see Vol. I. p. 319.
graphical peculiarities. Other good examples are the vase by Chares, another in the British Museum with the name of the owner (ἈΞΙΒΟΣ ΒΜΕ, Αἰνέτα εμί), and that by Timonidas representing Achilles lying in wait for Troilos. A study of the pinakes in Berlin is also instructive in this respect. One is signed by Timonidas, another by Milonidas, while others bear interesting inscriptions, such as Fig. 174:

![Fig. 174](image)

The majority have only the names of Poseidon and Amphitrite, or (ὁ δείκτης) ἀνέθηκεν.

In view of the palaeographical importance of these inscriptions, it may be worth while to dwell briefly on their peculiarities. The dialect is of course Doric, and consequently the names often differ widely from the forms to which we are accustomed; and this is increased by divergencies of spelling, which produce many anomalous results. For instance, ἂΜΑΝΩΠΑ (Κεσάνδρα) appears for Kassandra on a vase in the Louvre. AE is used for Al, as in ΑΒΘΟΝ (Ἀέθων = Αἴθων) on the Chares

1 Louvre E 600 = Reinach, i. 395.
2 B.M. A 1080 = Reinach, i. 306.
3 Athens 620 = Reinach, i. 394.
5 Ibid. 20, 63.
6 E 638 = Mon. dell‘ Inst. 1855, pl. 20. It has been suggested that the name is originally a corruption of Αλεξάνδρα = Xandra = Κσανδρα = Κεσαντρα (Kretschmer, p. 28).
pyxis, and in ΓΒΡΑΞΟΞΒΝ (Περαιοθεν for Πε(λ)ραιοθεν) on the pinax already quoted. A nasal is dropped before a consonant, as in the names of Amphiaraos (ΑΦΞΑΡΒΟΜ) and Amphitrite (ΑΦΞΤΡΙΤΑ). The digamma lingers as a medial (more rarely as initial) in many words, such as Ραχος, Δαμοκάνασσα, Ποτειδάρου, and Αιδαρίου; its written form is Χ or Χ. The use of Θ for the rough breathing is invariable.¹

One or two vases have been recognised as of Sicyonian fabric by the use in inscriptions of the unique Χ for Ε, peculiar to that place (Vol. I. p. 321). The only certain example, however, is a krater in Berlin (Cat. 1147), with the names of Achilles (ΜΥΧΙΛΑ) and Memnon (ΜΧΜΝΟΝ). It may also be noted that an Athenian sixth-century vase, signed by Exekias, has a Sicyonian inscription incised upon it by its owner²:

ΧΠΑΙΝΧΤΟΜΜΧΔΟΚΧΝ+ΑΡΟΓΟΤ
Ἐπαλνεὶς μὲ ἔδωκεν Χαρότα.

Boeotian vases never attained to the importance of the Corinthian fabrics, though, on the other hand, the manufacture lasted longer; but there are several instances of early signed vases from this district. Two, of which one is in the British Museum, are by Gamedes, the others by Theozotos, Gryton, Iphitadas, Mnasalikes, and Menaidas.³ They are recognised as Boeotian by the use of typical letters, as well as by origin, style, and dialect; such are the Χ for Α, Υ for Χ, and so on. There is also a fifth-century vase with the Boeotian alphabet.⁴ The Kabeirion vases have inscriptions in the local alphabet, with a few exceptions, which are Ionic.⁵

A unique vase, from the epigraphical point of view, is E 732 in the Louvre, found at Cervetri, to which allusion has been made elsewhere (Vol. I. p. 357, and see Fig. 111). It bears eleven names (of gods and giants) in an alphabet which has

¹ The general peculiarities of the Corinthian alphabet are not touched on here, as examples have been given of all characteristic letters. See Roberts, Gr. Epigraphy, i. p. 134.
² Kretschmer, p. 51; Roehl, I.G.A. p. 14, No. 22.
⁴ Ath. Mitth. 1892, pl. 6, p. 101.
⁵ Ath. Mitth. 1890, p. 411.
been recognised as Ionian, and is according to Kretschmer most probably that of the island of Keos. The great uncertainty as to the Ε sounds presented by this vase finds parallels in the stone inscriptions found on that island, while in the use of Β for ζ (the older form of that letter), the four-stroke Σ, and Ω with a central dot, this attribution finds further support. The only other islands that would fit the conditions are Naxos and Amorgos. As instances of the confused use of Ε, we have ΤΗΛΩ for Ζεῦς, but ΠΟΛΒΩΤΕ for Πολυβωτης, while again 'Εφιάλτης appears as ΗΙΠΑΝΤΕΣ! But this confusion does not occur in Naxos or Amorgos.

Other vases are undoubtedly of Ionic origin, but their actual home is uncertain; they are usually assigned to the coast of Asia Minor. For some reason, however, it is very rare for these vases to bear inscriptions; in all the numerous instances now collected, only some half-dozen with inscriptions can be found. One of these is the well-known Würzburg kylix with Phineus and the Harpies (see Vol. I. p. 357); another is a vase from Vulci, published by Gerhard, which has since disappeared. On both of these we find the characteristic Ionic letters Ω for ο, Η for η, Χ for χ, Λ for λ, and Σ with four strokes. Both vases are of the sixth century, and other details attest their Ionic origin.

We now come to a very important but somewhat puzzling class of inscriptions, those in the Chalcidian alphabet. The number of these is hardly more than a dozen, but such as they are they have enabled archaeologists to establish a Chalcidian school of painting by comparisons with other uninscribed vases. In all cases the inscriptions relate exclusively to the figures in the designs. Among the characteristic Chalcidian letters are the ρ for Κ, as in ΡΩΤΥΡ ΚΑΛΟΤΙΟΣ; the curved ζ for Ο, as in ΖΟΩΤ ΦΑΥΡΟΣ (Ταφυρός); Λ for Λ and Ψ for Χ, as in ΛΨΙΛΛΕΞ (Αχιλλάξ); Φ for Ε, as in ΦΩΦΙΛΑ (Σάμβος); and the abnormal form of the digamma Ε, as in ΔΨΑΔ (Δάχις).

ψ is represented by ΦΕ in one instance (ΜΠΟΕΟΕ = Μ<π>όψος).

Kretschmer has compiled a list of twelve vases with inscriptions in this alphabet, to which one or two may be added, but for a fuller treatment of the questions involved in studying this group the reader is referred to Chapter VII. This, however, may be a more suitable place for a few remarks relating to the inscriptions alone.

In one or two instances the dialect alone is peculiarly Chalcidian, as the characteristic letters happen to be wanting. In some instances, as Kretschmer points out, the Aeolic fondness for the vowel υ is to be traced, as in ιυνιονιονι, Κύκνως for Κύκνος, which finds parallels in the Chalcidian colony of Cumae, and probably influenced the Latin language through that means. Hence, too, the preference for the Q sound of the Ψ as in English and other languages when υ is preceded by a guttural. On the British Museum Geryon vase (B 155) there is a curious mixture of dialect in the forms Γαρύννης, Νηθονς.

It must be borne in mind, in speaking of the Chalcidian alphabet, that it really extended over a wide area, including not only Chalkis in Euboea, but Chalkidike in Northern Greece, and the colonies on the coast of Italy, such as Cumae, and this may partly account for the mixed character of the dialect on some of these Chalcidian vases. But although an attempt has been made to connect them with Cumae, it cannot be said at present that any certainty has been attained as to the place of their manufacture.

Though not belonging to the Chalcidian group, there is a vase which must be mentioned here, on account of its inscription, which is partly in the alphabet of the Chalcidian colonies. The vase is of the "Proto-Corinthian" class (see Vol. I. p. 308), and dates about 700—650 B.C.; it bears the name of the maker, Pyrrhos:

οανίατανασιάπανοβνη
Πυρ(ρ)ος μ' ἐποίησεν 'Αγασίλέου,

and is therefore one of the oldest existing signatures.

Athenian Vases

Under this heading are included all remaining vase-inscriptions, except a few from Italy. Their value to us, as Kretschmer points out, is not to be measured only by the mythological information they provide, or by the list of Athenian craftsmen and popular favourites which can be drawn up from them, but it is also largely philological. In other words, they illustrate for us the vernacular of Athens in the sixth and fifth centuries, just as the Egyptian papyri have thrown light on the Hellenistic vernacular of the second. In countless small details the language of the vase-painters varies from the official language of state documents and the literary standard of Thucydides, Sophocles, and even Aristophanes. The reason is, of course, a simple one—namely, that the vase-artists occupied a subordinate position in the Athenian state; they were mere craftsmen, of little education, and in all probability their spelling was purely phonetic. Hence we constantly find such forms as πιει for πιε, νιός for νιός, or Θησεύ for Θησεύ (see above, p. 237); and even the rich potter Hyperbolos is ridiculed by the comic poet Plato for saying ὀλίον (sc. ὀλιγον) for ὀλίγον, and δητώμην for δητώμην.

Another interesting point is that many of the artists who have signed their vases were obviously not Athenians by birth. Thus we find such names as Phintias, Amasis, Brygos, Cholkos, Sikanos, Thrax, and even such signatures as ὁ Λυδός (or ὁ Σκύδης) ἔγραψεν. It is, then, evident that many of them were μέτοικοι or resident aliens, and consequently occupied but a humble rank in the social order of the city. One name, indeed, that of Epiktetos, is actually a slave's name (Ἐπίκτητος = "acquired").

We need not, then, be surprised at meeting with many un-Attic forms or spellings in the vase-inscriptions, which sometimes give a clue to the origin of the artist, and of which it may

1 As is often the case with English seventeenth-century inscriptions.
3 Notizie degli Scavi, 1903, p. 34.
be interesting to give some specimens. Kretschmer notes that these variations are always Doric, never Ionic.

The commonest Doricism on Attic vases is the use of Α for Η, of which there are many instances, such as ΔΑΙΑΝΕΙΡΑ, Δαιάνειρα for Δημάνειρα; ΗΙΜΕΡΟΠΑ for Ιμερόπη (B.M. E.440); ΟΙΔΙΓΟΔΑΣ for the Attic Οίδιπος. Such forms as Ολυσσεύς and Φερρέφασσα are also clearly un-Attic. On the other hand, the names Menelaos and Iolaos always appear in their Attic form Μενελέως, Ἰολέως. The above instances are all from proper names; but there are other remarkable instances, such as the use of καλά for καλή in ΠΑΝΤΟΞΕΝΑ καλα ΚΟΡΙΝΘΩΝ. On one of his signed vases Exekias uses the un-Attic form ΤΕΣΑΡΑ, Τέσ(σ)αρα, but, as Kretschmer notes, he also uses Τόλαος for Ἰολέως, and was probably not an Athenian. On a B.F. amphora in Rome (see below, p. 263) occurs the form ταρδέβακεν.

Perhaps the most remarkable use of non-Attic Greek on a vase is in the case of the artist Brygos, who, as we have already pointed out, was of foreign origin. On a kylix in his style (B.M. E.69) we find the forms Διπίλος, Νικοπίλη, Πίλαος, and Πιλιππος. These were at one time referred to a Macedonian origin, but Kretschmer points out that that people used Β, not Π, for Φ. He aptly quotes the Scythian in the Thesmophoriazusae, with his πιλησει, πανεται, and κεπαλή, as giving a likely clue to the home of this dropping of the aspire.

The painted inscriptions on the Attic vases may be divided into three classes: (1) those relating to the whole vase and its purpose, such as artists' signatures; (2) those relating to the designs on the vase, i.e. explanatory inscriptions, and those found on Panathenaic amphorae; (3) those which stand in no direct relation to the vase, such as the so-called "love-names"

5 Ar. Thesm. 1084-1225.
6 Kretschmer also hints that it seems to indicate the pronunciation of Φ by the Athenians as FH in "hap-hazard," not as F.
or "pet-names," and interjections such as "hail," "drink deep," etc. The incised inscriptions have already been discussed.

The artists' signatures first call for consideration. In relation to their works they are fully discussed elsewhere (Chapters IX., X.), but the present may be regarded as a convenient opportunity for some general outline of the style and palaeography of these inscriptions.

Klein in his _Meistersignaturen_ (2nd edn.) reckons a total of ninety-five signatures, a number which has probably been largely increased since he wrote in 1887. These names he finds distributed over some 424 vases, one name, that of Nikosthenes, occurring on no fewer than seventy-seven; he divides them into four classes, as follows: (1) masters in the B.F. method; (2) masters combining the two methods; (3) masters in the R.F. method (including S. Italy vases); (4) masters whose names appear on vases without subjects. These four classes are not mutually exclusive, as names in (1) and (3) appear again in (2) and (4).

The form which the signature takes is usually (1)—

ο δείνα ἐποίησεν (of the potter);

or (2)—

ο δείνα ἔγραψεν (of the painter);

or (3), the two combined, either under one name, as—

Ἐξηκεὶας ἔγραψε κατοίησε μὲ;

or (4), with separate names, as on the François vase—

\[\text{Εἰρήνη Ἐπιμήκως Κλίτης μ' ἔγραψεν 'Εργοτιμός μ' ἐποίησεν.}\]

Fig. 175.

The form (3) may possibly indicate the priority of the artist, but it is more probable that it was adopted as forming an
iambic trimeter. When ἐποίησεν only occurs on a painted vase, it is generally to be assumed that the potter is also the painter.

The older artists avoided, as a rule, the imperfect ἔγραψε or ἐποίησε, but its use came into fashion for a short time among the early R.F. artists, such as Andokides, Chelis, and Psiax, who use ἐποίησε (Vol. I. p. 430); it was again adopted by the Paestum and Apulian schools, as a modest affectation that their work was as yet unfinished.¹ But the majority preferred the more decided aorist, indicating completeness. The word μὲ or ἐμὲ is usually added by the earlier artists, as in the instance already quoted from Exekias. Generally speaking, ἔγραψεν rarely occurs on B.F. vases, ἐποίησεν being the rule. A rare form of inscription is the formula ἔγραψεν τῷ δεῖνα, as in the doubtful signature of Statios²; and even more unique is the use of the word κεραμεύειν by the early Attic potter Oikopheles,³ as a synonym for ποιεῖν. Other peculiarities of signature are to be seen on the works of Lykinos (Ἠργάσατο), Paseas (Πασέου τῶν γραμμάτων), and Therinos (Θερίνου ποίημα).⁴

The potter sometimes added the name of his father, either as being that of a well-known man, or to distinguish himself from others of the same name. Thus Timonidas of Corinth signs ΤΕΜΟΝ ἝΛΛΑΤΙΚΑ, Τιμονίδας ἔγραψε Βία (sc. son of Bias); Tleson, Τιλίσσον ὧ Νειρχοῦ; Eucheiros, ὁ Ὀργοτίμου νίς (the son of Ergotimos); Euthymides, ὍΠΟΛΙΟΥ, ὧ Πολίου. The latter in one instance not only gives his patronymic, but challenges comparison with his great rival Euphronios, in the following terms: Ὑς Ὄννειτος ἐν Θερινοῖς, ὡς αὐτοῦ εὐφρόνος, ἰ.e. "Euphronios never made anything like this."⁵ Other peculiarities are: the omission of the verb, as was sometimes done by R.F. artists (e.g. Psiax); or, on the contrary, the simple ἐποίησεν, without a name, sometimes

¹ There are also isolated instances of ἔγραψε: Timonidas of Corinth, Pheidippus, Euthymides, and Aristophanes. See Klein, Meisters. p. 13.
² B.M. F 594.
³ Gardner, Ashmolean Vases, No. 189, pl. 26: Κεραμεύειν μὲν Οἰκοφέλην. We are reminded of the jest about Chairestratos made by the comic poet Phrynichos, who speaks of "Chairestratos soberly pottering (κεραμεύειν) at home" (Athen. xi. 474 B).
⁴ See list at end of chapter, and Klein, op. cit. pp. 49, 213, 214.
found on R.F. kylikes of the Epictetan school\(^1\); or the addition by the artist of his tribe or nationality. Among the latter we have Kleomenes, Teisias, and Xenophantos, who style themselves Ἀθηναῖος, and Nikias, who not only gives his father's name, but also his deme in Attica:

\[\text{Nikiaς } \varepsilon[\rho]\text{μοκλέους } \text{Ἀναφλύστιος } \epsilonτοίχευ.\]

Two other artists call themselves ὁ Λυδός (the Lydian) and ὁ Σκύθης (the Scythian). Smikros signs one of his vases in the Louvre\(^2\) ΔΟΚΕΙΣΜΙΚΡΩΕΙΝΑΙ, "It seems to be Smikros' work." There are also frequent vagaries of spelling, as in Φυτίας for Φυτίας, Πάνθαυς or Πάνθαους for Πάμφαους, and Ἰέπων for Ἰέρων. Sakonides once spells his name Ζακωνίδης, and Nikosthenes once uses the kappa Φ for Κ. Fuller information in regard to this subject may be found in Klein's admirable work; there is also much of interest relating to the R.F. cup-painters in Hartwig's exhaustive treatise. A complete list of all known artists' names is given at the end of this chapter.

We now come to the inscriptions which have relation to the subjects depicted on the vases. These are seldom of a general kind, having reference to the whole composition; but on a Panathenaic amphora in Naples a boxing scene is entitled ΠΑΝΚΡΑΤΙΟΝ, "general maul,"\(^3\) and on another in Munich over a foot-race is written, ΣΤΑΔΙΟ ΑΝΔΡΟΝ Νίκη, σταδίου ἀνδρῶν νίκη,\(^4\) while a B.F. lekythos in the same collection with Dionysos and dancing Maenads is inscribed ΔΙΟΝΥΣΙΑ(Κ)Α.\(^5\) On a vase with a Homeric subject is ΠΑΤΡΟΚΛΙΑ, and on one with a scene from Theban

legend ΚΡΕΟΝΤΕΙΑ.¹ Localities are sometimes hinted at by the use of such words as ΚΡΕΕ (κρήνη) on the François vase, where Polyxena goes to the fountain, or by the ΚΑΛΙΡΚΡΕΕ Καλλιρρόη κρήνη on the British Museum hydria (B 331) with girls drawing water at the fountain of Kallirrhoë. More often names are given to inanimate objects like the βάκος (seat) and υδρία (pitcher) on the François vase, σταθμός on the Arkesilas cup, the βωμός (altar) on a vase in Munich (Cat. 124), λύρα (lyre) on a cup in Munich (333), and θρόνος (throne) on an amphora in the Louvre.² On a washing-basin on a R.F. vase published by Tischbein appears the word ΔΗΜΟΪΑ, i.e. "public baths."³ The word τέρμων sometimes appears on a stele on later vases.⁴ Animals are also occasionally named, such as the ζή on the Munich vase already quoted (333).⁵

But the greater majority of these inscriptions refer to the names of persons, deities, and mythological figures, the name being usually in the nominative, but occasionally in the genitive, with εἰδως or εἰκὼν understood.⁶ Sometimes generic names or nicknames are given to ordinary figures in genre scenes, as Αρχεναύτης, "the ship's captain"; Κόμαρχος, "leader of the revels"; or, again, Πληξεπός for a horseman, Τόξαμις and Κιμμέριος for a Scythian bowman.⁷ Names of real contemporary persons are occasionally introduced, as on a hydria by Phintias, on which his comrade Euthymides and the "minor artist" Tlenpolemos are represented, with names inscribed⁸; and on a stamnos by Smikros at Brussels the artist introduces himself and the potter Phædiades at a banquet.⁹ Although proper names usually stand alone, they are sometimes accompanied by some interjection, as οδί Μενεσθεύς, "Here is Menestheus,"¹⁰ Σφιγξ ἦδε χαίρε, "This is the Sphinx; hail!"¹¹ or in the form of a phrase, as Ἑμεῖς εἰμί Κυλλήνιος.¹² So also

we find ἸΛΙΟΣ ΓΕΡΩΝ "Διὸς γέρων, “the old man of the sea,” for Nereus¹; ἹΕΣΤΟΡ ΓΥΛΙΟΣ “Nestor of Pylos”²; ΔΙΟΣ ΟΟΣ Διὸς φῶς, for Dionysos³; ΔΙΟΣ ΠΑΙΣ, “the son of Zeus,” for Herakles⁴; ταῦρος φορβάς, “the grazing bull,” for the metamorphosed Zeus (a doubtful instance).⁵

Besides the names of figures and objects, words and exclamations are sometimes represented as proceeding from the mouths of the figures themselves, in the same manner as on the labels affixed to the figures of saints in the Middle Ages. They vary in length and purport, but in some cases they appear to be extracts from poems or songs, or expressions familiar at the time, but now unintelligible or lost in the wreck of Hellenic literature. They are found on both B.F. and R.F. vases, but more commonly on the former, and generally read according to the direction of the figure, as if issuing from the mouth.

Thus a boy pouring wine out of an amphora cries, ἜΝΧΕ ἩΔ. . ΟΙΝΟΝ, ἐ(γ)χει ἕδ[υν] οἶνον, “Pour in sweet wine”⁶; over the first of three runners in a race appears νικᾶς, Πολυμένων, “Polymenon, you win”; again, Amphiaraoς is exhorted to mount his chariot with the word ἀνάβα,⁷ or one personage says to another, χαίρε or πίνε καὶ σύ.⁸ Sometimes the words are evidently those of a song, as on a R.F. kylix at Athens, where a man lying on a couch sings an elegy of Theognis beginning δὲ παιδῶν καλλιστε, “Fairest of boys!”⁹ Another sings ΜΑΜΕΚΑΙΠΟΤΕΟ, which has been recognised as an inaccurate version of an Aeolic line, καὶ ποιήσω καὶ μάρμαι.¹⁰ On a red-figured vase in the British Museum (Ε 270) a man accompanied by a flute-player has an inscription proceeding from his open mouth, which runs, ΗΩΔΕΠΟΤΕΝΤΥΡΙΝΟΙ, δεί τοτ’ ἐν Τύριμβη; evidently the beginning of a song, “Here once in Tiryns . . .” On a stamnos in the British Museum (Ε 439)

the letters NON appear before the mouth of a Seilenos, and evidently represent notes of music.\(^1\)

On a psykter by Euphronios\(^2\) a courtesan playing at kottabos casts the drops out of a cup with the words
\[ \text{ΘΙΑΣΟ?ΎΔΑΣΩΔΩΔΙΩΝΙΣΙ}, \ \text{τιν τάνδε κατάσσω, Δέαγρ(ε),} \]
"To thee, Leagros, I dash these drops." Another kylix (Munich 371) represents a surfeited drinker on a couch, saying, \(ού \ δίναμ' \ ού, \) "I can no more!"

To turn to another class of these expressions, we have a Panathenaic amphora in the British Museum (B 144), on which a herald proclaims a victor in the horse-race as follows:
\[ \Delta \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \nu \n
πάτερ, αἰθεὶς πλοῦσιος γεν[ομέ]ν, "O Father Zeus, may I be rich!" while on the other he sits over a full vessel, and cries to the purchaser, ΕΔΕΜΕΝΕΔΕ Γ'ΛΕΟΙ ΓΑΡΒΕΒΑΚΕΝ, ἢδη μὲν, ἢδη πλεοitung) παρθέβακεν, "Already, already it has gone far beyond my needs."¹

To conclude with a few miscellaneous and unique inscriptions, we have firstly, on a vase in the British Museum (Ε 298), a tripod, on the base of which are the words 'Ἀκαμαυτίς ἐνίκα φυλή, showing that it is intended for a monument in honour of a choragic victory, with the name of the victorious tribe. On a sepulchral stele on a B.F. funeral amphora at Athens² are the words (now nearly obliterated) ἀνδρός ἀποθεμένῳ ἔνω ῥάκος κα[κός] έν[ε]βάθει κείμαι[τι, "Here lie I, a vile rag of a dead man." Similarly, on a sepulchral plaque at Athens are the words, ἘHMATODEΣΤΙΝ ἈΡΕΙΟΥ, "This is the grave of Areios."³ In a representation of Sappho reading from her poems, she holds an open roll, on which are visible the words Θεοὶ, ἡρίων ἐπίων ἁρχομαι ἀλλ[ων] . . . ἔπεα πτερόευτα⁴; and in the well-known school-scene on the Duris vase in Berlin⁵ a teacher holds a roll, on which are the words (in Aelio dialect, and combined from the openings of two distinct hymns):

MOISAMOI
ΑΔΙΣΚΑΜΑΝΛΡΟΝ
ΕΒΡΝΑΡΤΟΜΑΙ
ΑΕΙΝΑΕ

Μωσά μοι
ἀδισκαμανλρον
ἐβρναρτομαι
ἀειναε

A small fragment of a red-figure kylix (?) of fine style, found at Naukratis in 1899 (and now in the Ashmolean Museum at Oxford),⁶ has a similar scene of a dictation lesson. A seated figure unrolls an inscribed scroll, on which is the boustedhedon legend, στησίχορον ὑμον ἁγοισαι, while another figure, of

⁵ Plate XXXIX.
⁶ On the form of the Δ see below, p. 268.
which the right hand alone remains, is writing on a tablet (Fig. 177).

In a very puzzling scene on a R.F. vase of fine style, generally supposed to have some reference to the Argonautic expedition, one figure holds up an object inscribed with the name ξιγήθος. This object has generally been interpreted as a tessera hospitialis, or "letter of introduction," as we should say.

Lastly, there is the class of Panathenaic vases with their inscriptions. They fall into two groups: (1) the words ΤΩΝ ΑΘΕΗΕΝ ΑΘΛΟΝ, to which ΕΜ! is sometimes added, "(I am) from the games at Athens"; (2) the names of archons, which only occur on the fourth-century examples. They form a unique instance of inscriptions which give direct information as to the date of a vase, and range from 367 to 313 B.C. (see Vol. I. p. 390).

Sometimes vases (especially in the B.F. period) are covered with meaningless collocations of letters, either separate or in the form of words. Some ingenious explanations of these have been propounded, but none are very satisfactory. They are often found on the class known as "Corintho-Attic" or "Tyrrhenian amphorae," and it is just possible that in this case they are attempts by an Athenian workman to copy the unfamiliar Corinthian alphabet.

The third class of inscriptions on Attic vases is composed of those which have no direct relation to the vase.

---

1 Reinach, i. 277: see on the subject, Hermes, 1898, p. 640; Notizie degli Scavi, 1895, 86 ff.; and above, pp. 115, 137.

itself. They include invocations to deities such as were used in making libations, e.g. Διός Σωτήρος, "To Zeus the Saviour"; or, again, the exhortations so frequently found on B.F. kylikes of the "Minor Artists'" school, of which the commonest is χαίρε καὶ πίει εὖ, "Hail, and drink deep!" or χαίρε καὶ πίει τίμιε, "Hail, and drink this!" On a number of R.F. kylikes appears the word προσαγορεύω, "I salute you."

But the most numerous and important inscriptions of this class are those conveniently named by German archaeologists "Lieblingsnamen," or "Lieblingsinschriften," for which we have no satisfactory equivalent in English, though "pet-name" and "love-name" have been suggested, and latterly "καλός-name." The latter title has been adopted from the fact that the usual form which these inscriptions take is that of a proper name in the nominative case, generally masculine, with the word καλός attached. Sometimes, but not so frequently, the name is feminine, with καλὴ; the superlative form καλλιστος is also found. In other cases ὁ or ἡ παῖς appears in place of the proper name, or the word δοκεῖ is added, and sometimes also ναι or ναιχί, emphasising the statement. The most remarkable instance is a B.F. jug at Munich, round the shoulder of which is the inscription καλὸς Νικόλα Δωρόθεος καλὸς καμοι δοκεῖ, ναι· χάτερος παῖς καλὸς, Μέμων καμοι καλὸς φιλὸς. It is not quite certain how far the word καλὸς should be interpreted in a physical sense as "handsome" or "fair," or in an ethical sense as "good" or "noble"; but having regard to the manners and customs of fifth-century Athens, it is more likely that the physical meaning of the word is to be inferred.

These inscriptions are often found on B.F. vases, but far more frequently in the succeeding period, and generally in

7 Cat. 334 = Reinach, i. 79. The vase is probably by Charinos.
8 Cf. the story of Pericles and Sophocles told by Cicero, De Offic. i. 40, 144.
more or less direct connection with artists' signatures, from which fact interesting results have been obtained. Special attention has been drawn to them of late years, from the fact that many of the names are those borne by historical personages, such as Miltiades, Megakles, Glaukon, and so on, and attempts have been made to connect them with those characters (see Vol. I. p. 403).

Klein, the chief writer on this subject, has collected in the second edition of his valuable work no less than 558 instances of these καλός-inscriptions,¹ as against 424 signatures of artists; and there are besides these the numerous instances in which no proper name is given.

The chief question which calls for consideration in regard to these inscriptions is their purport, and the reason why they occur exclusively on vases, and of these exclusively on Attic vases covering a period of not more than one hundred years. The custom was not, of course, an unfamiliar one at Athens, as two references in Aristophanes indicate. In the Acharnians ² he describes the Thracian Sitalkes as being such a "lover" of the Athenians that he wrote on the walls, "The Athenians are fair"; and, again, the slave Xanthias, in the Wasp, speaking of his master's litigious proclivities, says that if ever he saw Δήμος καλός written on a door he promptly wrote by the side κημός καλός.³ But the most interesting and apposite instance recorded is that of Pheidias, who scratched on the finger of his statue of the Olympian Zeus, Παντάρχης καλός.⁴ Generally speaking, the word was no doubt intended to refer to the personal beauty of boys (as indicated by the use of β παιδ), or at any rate of young athletes, and was applied to popular favourites of the day,⁵ whose occupations in the gymnasium, at the banquet, and elsewhere were matters of every-day talk.

These names may have been placed on the vases with the

¹ Vase mit Lieblingsinschriften, 2nd edn., 1898. Of these, 528 are masculine names, and only 30 feminine.
² 143 ff. There is, of course, a play here on the word ἐρωτάω.
³ 97 ff. Demos is here a proper name; κημός means the ballot-box, in which the juries recorded their votes.
⁵ Such as the Laches καλός on Berlin 2314, a name which recalls the Platonic dialogue with that title.
view of attracting the public to purchase them, or may even have been the subject of special orders from customers. Some light seems to be thrown on the matter by a cup signed by the painter Phintias,¹ which represents a young man, purse in hand, making purchases of vases in a potter’s workshop. This vase has the inscription Χαιρίας καλός, but whether it is intended as a representation of Chairias or his admirer it is impossible to say. The names, however, are not always those of every-day life. They may have relation to the figures on the vase, as Ηέκτωρ καλός.²

We have already noted that historical names frequently occur in this series, and it is obvious that if they can be identified with the actual historical owners of such names much valuable information in regard to the chronology of Greek vases will be gained. The question has already been discussed in a previous chapter (Vol. I. p. 403), and the principles there laid down need not be repeated. It is sufficient to say that so far only two or three names have been identified with those of historical personages, though more results may yet be obtained. Of these one is Stesileos, occurring on two vases in Berlin, and identified with a strategist who fell at Marathon in 490.³ On two lekythi (one late B.F., the other R.F.) the name of Glaukon son of Leagros ⁴ appears, and these two names have also been identified with Athenian strategi, Leagros having fallen in battle against the Edones in 467, while Glaukon commanded at Kerkyra in 433—432 B.C. It may be roughly inferred that Leagros was a boy (παιδί) about 510 B.C., and his son Glaukon about 470 B.C., which gives an approximate date (within ten years or so) for these two groups of vases. It is, however, obvious that much at present only rests on hypothesis.

It is curious to note that nearly all these names have an aristocratic sound: thus we have Alciades, Alkmaeon, Hipparchos, and Megakles, besides those already quoted. Miltiades καλός occurs on a R.F. plate at Oxford,⁵ but there

¹ Hartwig, Meistersch. pl. 17, 1.
² Reinach, ii. 94.
³ Hartwig in Milanges d’Arch. 1894, p. 10 note. 
⁴ The name of Leagros occurs on many vases by Euphronios and other artists: see Klein, Lieblingsinschr.² p. 70ff.
⁵ Klein, Lieblingsinschr.² p. 87 = Ashmolean Vases, No. 310.
seems hardly sufficient evidence for referring it to the youth of the conqueror of Marathon (cf. Vol. I. p. 403). The table at the end of this chapter may be found useful as giving a conspectus of the principal names and their relation to the artists.

It is now necessary to discuss some of the principal peculiarities of the Attic vase-inscriptions, in regard to palaeography, orthography, and grammar. The variety in the forms and uses of the letters is somewhat surprising at first sight, but it must be remembered that non-Attic influences were always strong, as has indeed already been pointed out.

The minor artist Xenokles uses a sort of cursive handwriting for his signature. The sign for the aspirate occurs first as Ξ, afterwards as Η, and is sometimes introduced without apparent reason, as in ΗΛΕΙΟΛΑ for ΕΙΛΕΙΟΛΑ, and ΗΑΦΡΟΔΙΤΗ for ΑΦΡΟΔΙΤΗ. The digamma is unknown on Attic vases, but the François vase and the allied “Tyrrenian” group give some interesting examples of the use of ϒ for Κ. Thus we find ΟΟΡΑ+ $ for ΚΟΡΑζ, ΕΤΕΟΠΟΛΟΣ for ΕΤΕΟΚΛΟΣ, +ΑΡΙΟΛΟ for ΧΑΡΙΚΛΩ. On the Corintho-Attic vase in Berlin (1704) are two curious instances of dittography, due no doubt to Corinthian influence, ΚΥΛΛΗΝΟΣ being written ΚΟΥΕΝΙΟΣ (ΚΟΥΕΛΛΗΝΟΣ) and ΖΕΙΩ as ΔΕΙΩ, where the Corinthian and Attic forms of Κ and Ε stand side by side. So on a vase in the Louvre (Ε 852) we have ΣΔΕΙΩ = ΖΔΕΙΩ.

1 See for this section, Kretschmer, p. 94 ff.
2 See Kretschmer, p. 98.
ATTIC ORTHOGRAPHY

As a result no doubt of the unsettled state of the alphabet in the fifth century, a confusion in the use of η and η, and ο and ω respectively, often arises, and we find 'Ἀλκιμάχος κάλως for Ἀλκιμάχος καλός, ΚΥΜΟΔΩΚΕ for Κυμοδόκη, ΟΗΤΙΣ for Θέτις, and similar forms. The diphthong ei is sometimes rendered by Eι, sometimes by E, as in ΚΑΛΕΔΩΚΕΣ for καλῆ δοκεῖς; αι and ει are also rendered by E, as in the name ΑΛΚΜΕΟΝ for Αλκμαιόν and ΠΕΝΘΕΣΙΛΕΑ for Πενθεσίλεα, or αι by A, as in ΑΟΕΝΑΑ for 'Αθηναία. In a few words, such as +ΙΠΟΝ (Χείρων) and ΣΙΛΕΝΟΣ (Σείληνος), the diphthong ei is represented by its other member i. On the other hand, we find ΕΙΟΛΕΟΣ for Ιολέως (B.M. B 301). The general vagueness of the Attic craftsmen's orthography is well illustrated by Kretschmer in the word 'Οδυσσεύς, which is not only invariably spelled with a Α, reminding us of the Latin form Ulysses, but occurs in the following different forms:—ΟΛΥΤΕVS, ΟΛΥΤΕV, ΟΛΥΤΕΛΕVS, ΟΛΥΤΕΛΕVS, ΟΛΥΤΕS, ΟΛΥΣΕVS, and ΟΛΥΣΕΕΙΕVS, this order being roughly chronological. The ordinary δ-form is, however, found.

A tendency to assimilation of aspirated consonants, always avoided in literary Greek, is seen in such forms as ΘΑΛΟΒΙΟΣ for Θαλβίος, ΠΑΛΡΙΩΝ for Καρυλίων, and ΦΑΝΦΑΙΟΣ for Φάμφαιος. The reverse tendency is curiously illustrated in ΚΡΙΟΙΑΙΟΣ for Χαριταίος. Unassimilated forms occur, as in the case of ΑΝ+ΙΠΟΞ for "Αγχίππος. Another peculiarity is the omission of nasals before consonants, as in ΑΤΑΛΑΤΕ for 'Αταλάντη, ΤΥΤΑΡΕΟΣ for Τυτάρεως, ΙΑΦΝ η for Νηύφαι, ΛΑΓΟΝ for Λάδ(μ)πων, and ΕΚΕΛΑΔΟΣ for 'Ε(γ)έλαδος. There is also a tendency to avoid double consonants, as in ΜΕΣΙΛΑ for Μυσίλλα, ΑΡΙΑΝΕ for Αριάνη, ΚΛΥΤΑΙΜΕΣΤΡΑ for Κλυταιμνηστρα, ΠΕΡΟΦΑΤΑ for Περσέφαττα; this is especially common in the case of double Λ or double Σ, as in ΟΛΥΤΕVS and ΜΕΣΙΛΑ just quoted. On the other hand, on later vases consonants are often doubled

1 But see p. 271 for the probable explanation of this use of ω.
2 Kretschmer, p. 146.

4 Louvre F 53 = Reimach, ii. 59 (Exekias).
5 Berlin 2291.
6 Munich 340 = C.I.G. 7433
without reason, as in Κάστωρ for Κάστωρ, 1 ΤΡΙΠΠΟΛΕΜΟΣ for Τριππόλεμος, ΜΕΜΜΗΝΩΝ for Μέμμηνον, this being commonest with Σ and Π, Ξ and Ψ, originally absent from the Attic alphabet, are represented usually by ς and ός, exceptionally by κς and Πς, as in ΑΡΟΠΙΣ, ΚΣΕΝΟΚΛΕΣ 2; also occasionally by metathesis, as ΕΛΡΑΦΕΝ, ΣΑΝΟΟΣ, ΠΙΣΤΟΣ+ΕΝΟΣ. 3 Attic contractions, such as ΑΤΕΡΟΣ for καὶ ἄτερος and ΚΑΜΟΙ for καὶ ἔμοι, are also found. 4

Among peculiarities of inflection (some of which may of course be mere misspellings) may be mentioned ΗΒΙΘΣ = νιᾶς for νιᾶς, ΠΑΒΣ for παῖς, ΩΕΒΣ for θησιός, and ΠΕΒΣ for Περσισ; also the open form -εις for -ης, as in ΗΕΠΑΚΛΕΣ, +ΣΕΝΟΚΛΕΣ, and the form πίει for πίε; to some of these allusion has already been made.

From this mass of detail it is possible to deduce certain chronological results, 5 which are not without their value for the dating of the various Athenian fabrics. Excluding the doubtful Dipylon vase, the inscriptions extend from the seventh century 6 down to the time of Xenophon and the late Panathenaic amphorae, a period of over three hundred years.

In the François vase we meet with the closed Η for the aspirate, the Φ and Κ together, and the two forms Ξ and Ω of Θ; as the Ξ form dropped out of private use earlier than out of official documents, and is found in the latter down to 520 B.C., we can date the François vase about the middle of the sixth century (not later, as the closed Ω shows); the same date will also apply to the earliest Panathenaic amphora (B.M. B 130), and the cup of Oikopheles. The fact that Eucheiros, a "minor artist," calls himself the son of Ergotimos, who made the François vase, permits us to place him some thirty years later, about 520 B.C., and this point may be regarded as the zenith of the B.F. period. In the later B.F. vases

1 B.M. E 224; Karlsruhe 209: cf. Berlin 2184 (ΟΡΕΣΣΗΣΕΣ) and 1906 (ΤΡΙΤΟΝΝΟΣ).
2 Kretschmer, p. 179.

6 The two Proto-Attic inscribed vases (Berlin 1682 and Art. Denkm. i. 57: see Vol. 1. p. 293).
the Η and Ω for Ε and Ο begin to make their appearance\(^1\); but the conservative Panathenaic amphorae, like the coins, adhere to the original spelling right down to the end.

The existence of the R.F. style for some time previous to 480 B.C. has now been established by the discoveries on the Athenian Acropolis. This is also borne out by the appearance on vases by Euthymides of the ☊ form for Ω, and the complete absence in the earlier vases of the Η and Ω forms, which are not found among the Acropolis fragments. The hydria of Meidias (B.M. B 224), which marks the zenith of the "fine" period, has a purely Ionic alphabet. The Ionic forms seem to have come in with the "fine" R.F. style after 480 B.C., and for some time we find a mixed alphabet on the vases.\(^2\) It is also interesting to note the appearance in some cases of the Thasian alphabet, with its use of Ω for Ο (as in 'Αλκιμάχος καλός, B.M. E 318), which has been traced to the influence of Polygnotos.\(^3\)

We conclude our account of inscriptions on Greek vases with a brief survey of those found on the vases of Southern Italy\(^4\); it will be seen that they are neither numerous nor specially interesting.

The inscriptions are for the most part in the Doric dialect and Ionic alphabet, with the addition of the Doric sign ʰ for the aspirate. Generally speaking, these Doric forms are found on the Apulian vases, whereas on the products of Paestum they are mainly Ionic, with admixtures of Doric. Attic forms also occur. It seems probable that the Doric tendencies of the Apulian inscriptions are due to the influence of the great Laconian colony of Tarentum (although the vases were not made there), while Paestum was influenced, on the other hand, by the neighbouring Ionic colonies, such as Cumae.

The latter, being for the most part of earlier date, will first occupy our attention. They include two artists' signatures, which appear in the form ΑΣΣΕΣΕ ΣΕ ΕΡΑΦΕ and ΥΟΝ

\(^1\) Berlin 2008; Röm. Mitth. 1886, p. 21.
\(^2\) See the table given by Kretschmer, p. 105.

\(^4\) See Kretschmer, p. 211 ff.
ΕΓΡΑΦΕ. We have already remarked on the use of the imperfect tense (p. 258); there are five vases by Assteas and one by Python, on all of which the figures also have their names inscribed. The Ionic forms appear in ΜΕΓΑΡΗ, Μεγάρη, ΑΛΚΜΗΝΗ, Άλκμήνη, and so on; on the other hand, Python uses the Doric form ΑΩΣ, Άως = Ηώς, and Assteas the Doric Ἲ in ἸΕΣΣΕΡΗΑΣ = 'Ε<σ>σπεριάς. Ionic forms are also found on a few Apulian vases, as for instance Berlin 3257 (from Ceglie), which has ΕΞΥΘΥΜΙ and ΕΥΝΟΜΙ for Εύθυμια and Εύνομια, or Naples 2296 with ΝΗΣΑΙ for Νήσαια.

Some of the inscribed Apulian vases are not without interest, as for instance that in the Louvre, which bears the signature of Lasimos: ΛΑΣΙΜΟΣ ΕΓΡΑΨΕ, Δάσιμος ἔγραψε. He was probably not a Greek, but of Messapian origin. On the great Dareios vase in Naples (No. 3253) several names are inscribed, such as ΕΛΛΑΣ, ΑΣΙΑ, ΔΑΡΕΙΟΣ, and the general title of the scene, ΓΕΡΣΑΙ. On a well-known burlesque scene in the British Museum (F 269) the characters are inscribed ΗΡΑ ("Ηρα"); ΔΑΙΔΑΛΟΣ (Δαιδάλος = Hephaistos), and ΕΛΕΥΘΕΡΟΣ ("Ευ<?>οίλης = Ares); and on the fine amfora F 331, representing Pelops at Olympia, are numerous incised inscriptions: ΠΕΛΟΨ, Πέλος; ΟΙΝΟΜΑΟΣ, Οἰνόμας; ΠΡΩΔΑΜΕΙΑ, 'Ιπποδάμεια, etc. On the altar is painted ΔΙΟΣ, Διός, sc. "the altar of Zeus."

A curious inscription is that on a krater in Naples (No. 2872), which represents Eros and a woman playing at ball; the latter leans on a stele on which is inscribed ΗΦΑΜΟΪΤΑΝΘΕΠΙΑΝ which was interpreted by Cavedoni, probably correctly, as ἤς άν μοι τάν σφ(α)ίραν, "You might send me the ball." The + is an error for Η, the 1 for Η. This inscription, be it noted, is painted, contrary to the general rule in these vases, as they are generally incised; but an exception seems to be made in favour of inscriptions on stelae and similar objects, which are not uncommon, though many are open to suspicion. In the

1 For the proof that Assteas and Python worked at Paestum, see Vol. I. p. 479.
2 The name is perhaps a by-form of Dasimos (see Vol. I. p. 478). The correspondence of D and Ι is not uncommon, as in δακρύς = lacrīma.
INSCRIPTIONS ON SOUTH ITALIAN VASES 273

British Museum there are several examples, but by far the most curious is on an amphora in Naples (No. 2868), where a stele is inscribed:

\[ \text{ΝΩΤΙΚΟΛΟΛΑΧΗΝΤΕΚΑΙΑΣΦΟΔΟΛΟΝΠΟΛΥΡΙΖΟΝ} \\
\text{ΚΟΛΠΙΝΙΟΙΔΙΟΝΟΔΑΝΑΛΙΟΙΟΝΕΞΩ} \\
\text{νωτὶ [μὲν] μολὼκειν τὲ καὶ ἀντφόδολον πολυριζόν} \\
\text{κόλπῳ δὲ Οἰδιπῶδαν Λαῖος(ν) νόον ξώ} \\
\]

"On my back I bear mallow and many-rooted asphodel, but in my bosom Oedipus, Laios' son." 2

A curious and unique inscription is found engraved on a kotyle from Chiusi: ὁ ὅτος τὸν δάμον ἐφα ποινρόν, "This fellow said that the people were a depraved lot." 3 The η of ποινρόν was first written Ε, and then corrected into Α, the Doric form. It may be supposed that the inscription is due to a workman who did not approve of the democracy under which he lived.

On an amphora from Gnatia (Fasano), with a goose and a cock, in white on the black ground, is the quaint dialogue:

\[ \text{ΑΝΗΧΛΑΙ, ΟΤΟΝΕΛΕΤΡΥΓΩΝΑ} \\
\text{αἱ τὸν χώρα, ὃ τὸν ἐλετρυγώνα, or, "What, the goose?" "Oh, the cock!"} \]

Etruscan inscriptions do not come within the scope of this chapter, but an Oscan inscription should be mentioned here, which is incised on a vase in the British Museum (F 233), over an actor: ΑἴΤΝΑΙ = Sautia, the Oscan form of Εανθίας, which was a common name for the slave of comedy.

PART IV

ITALIAN POTTERY

CHAPTER XVIII

ETRUSCAN AND SOUTH ITALIAN POTTERY

In the succeeding section of this work we propose, by a natural transition, to deal with Italian pottery, that is, Etruscan and Roman, as distinct from Greek. The subject naturally falls under three heads—the first two dealing with the pottery of the period previous to the Roman domination of Italy, and therefore contemporaneous with the Greek pottery; the third with Roman pottery from the second century B.C. onwards, and of necessity including also remains of similar pottery from Gaul, Britain, and other countries over which that civilisation extended.

In the present chapter the first two branches of the subject—namely, Etruscan pottery, and the local fabrics of Southern Italy—will be discussed; the period of time which they cover is, as has been said, coincident with that covered by the history of Greek pottery, extending from the Bronze Age down to the end of the third century B.C.
§ 1. ETRUSCAN POTTERY

BIBLIOGRAPHY

(1) EARLY ITALIAN CIVILISATION

As regards Etruria, it will be seen that the art of the people was largely imitative, being derived mainly from Greece, but in some measure also from the East. Few remains of their productions have reached the present day, with the exception of large numbers of vases, bronzes, and jewellery; these, however, afford a very clear notion of the characteristics of Etruscan art. It is hardly possible to treat the subject of working in clay in Etruria with such fulness as can be done in the case of Greece and Rome, owing to the greater dearth of literature; but in our previous chapter (III.) on this subject much has already been said with reference to what is known on this head. In regard to the pottery, careful scientific excavations, such as those undertaken by M. Gsell at Vulci (Vol. I. p. 77), have done much to increase our knowledge of all periods, and to place chronological certainty within the reach of the inquirer.

In dealing with the history of art in Italy, we are naturally first met with two questions: (1) Who were the earliest inhabitants of the country, particularly in the region afterwards known as Etruria, in which the first signs of artistic development appear? (2) At what period and from what quarter did the Etruscans occupy this region, or are they aboriginal? It will therefore be necessary to devote a few preliminary paragraphs to these much-debated questions,1 in order to gain a better understanding of the subsequent history.

1 See especially Pottier, Louvre Cat. ii. p. 285 ff., and Gsell, Fouilles de Vulci, p. 315 ff.
The question of the origin of the Etruscans, to take the second first, is as old as Herodotos. As is well known, the Father of History held to the view that they originally came from Lydia, a view which found general support in antiquity, and is referred to by Horace, and many other writers. His fellow-townsmen Dionysios was, however, of the opinion that they were autochthonous. However much of truth there may be in either of these theories, the fact remains that with certain modifications each of the two alternatives has found supporters even down to the present day, though to Niebuhr first is due the suggestion that the immigration of the Etruscans was by land and not by sea, and that they came from Central Europe by way of the Rhaetian Alps. He has been followed by most writers since—above all by Mommsen, who was the first to point out the absurdity of identifying the Lydian Ῥυρήνωι or Ῥυρήνδοι with the Italian Tusci or Etrusci. It follows from this that the whole of the civilisation of Northern and Central Italy is due to this race, which would obviously have left its impress on each district as it passed through it; and, secondly, that it was this same race that was afterwards known by the name of Etruscan.

The chief objection to the theory of an autochthonous origin is that, as we shall presently see, a break in the civilisation of Northern Italy which can be traced about the beginning of the ninth century B.C. is of such a marked and rapid character that it cannot be regarded as due to any cause but the irruption of a new race. Moreover, there is probably, as M. Pottier points out, more truth in the words of Herodotos than appears at first sight. It is true that there are no grounds for accepting the Lydian theory absolutely; but apart from this, it is to be noted that Herodotos nowhere states that the Tyrhenians landed on the west coast of Italy—_i.e._ in Etruria. What he does say is that, "after having visited (or coasted along) many nations, they arrived at the Umbrians, where they founded cities and inhabit them to this day; and instead of Lydians, their name was changed to that of

---

3 i. 30.
ETRUSCAN AND SOUTH ITALIAN POTTERY

Tyrrhenians." Additional evidence is given by Hellanikos, who explicitly states that they landed at the mouth of the Po; and as the Umbrians probably occupied a larger territory in prehistoric than in classical times, we may fairly place here the city of Tyrsenia or Tyrrhenia, which Herodotos gives as the name of their first new home. Thus the Umbrians will represent the early aborigines whose civilisation, known as the Terramare, we shall presently describe, and it was this civilisation, transformed and developed, which was carried by the invaders over the Apennines into the region now to be known as Etruria. It will be noted that this theory at least satisfactorily combines the land and sea migrations of the Etruscans into Etruria, though it does not profess to dogmatise as to the region whence they first started. The idea that they first landed on the west coast is entirely due to Roman ideas, fostered by poets like Virgil; and though it is in one passage accepted by Dionysios of Halicarnassos, he expressly contradicts himself in another.

The two chief characteristics of this new Etrusco-Umbrian civilisation are the development of geometrical decoration and the predominance of a metallurgical element, both of which are obviously derived from Eastern sources, whether Hellenic or Oriental. It will suffice here to point out that the "Tyrrhenians" during their previous voyages (see above) might well have come in contact with the other civilisations of the Eastern Mediterranean, such as Cyprus, Asia Minor, Mycenae, and the Greek islands, and that their natural acquisitiveness and capacity for imitation, which we shall find illustrated throughout their history, enabled them to pick up and use artistic ideas from all these quarters. Even their earliest art yields many points of comparison with that of the Eastern Mediterranean.

The earliest civilisation of which traces have survived in Italy is, as we have already seen, that of the Terramare, so called

---

1 *Frag. Hist. Græc.* ed. Didot, i. p. 45: ἐκι Συρνῆς ποταμῷ (the name of one of the mouths). He calls them here Pelasgians.

3 Cf. i. 27 with vii. 3.
from the remains discovered in that district, covering the basin of the Eridanus or Po, but chiefly between Piacenza and Bologna. We have further seen that the aboriginal people to whom these remains belong are probably to be identified with the Umbrians, but it is perhaps safer to style them Italiotes. They were lake-dwellers, living in wooden houses built on piles in the water or in the marshy lagoons of the district which they inhabited, and their civilisation was of the rudest description.

We find among their remains, besides rude objects in bronze and other substances, pottery of the very simplest kinds, hand-made and roughly baked. This is not found in tombs, but mingled with the débris of the dwellings. The shapes comprise cups and pots, and there are few attempts at decoration beyond rows of knobs or bosses. A crescent-shaped or lunulated handle is attached to many of the vases, serving as a support for the thumb; but this is a feature also found in other parts of Italy and in Sicily. Iron, glass, and silver are quite unknown, and gold only represented by a doubtful specimen; on the other hand, along with the finds of bronze, which include weapons, tools, and objects of toilet, are survivals of the Neolithic Age in the shape of axes, spear-heads, and tools of stone. In several of the settlements actual moulds for bronze-casting were found.

The Neolithic remains are sufficient to indicate the early date of this civilisation, and it is probably contemporary in point of development (if not of date) with the earliest remains from Hissarlik and Cyprus. It may thus be traced back as far as 1500 B.C. at least, and seems to extend down to about the end of the tenth century B.C. The analogous pottery found at Thapsus in Sicily is mixed with Mycenaean vases, and may therefore be more precisely dated; but it is altogether more advanced than that of the Terramare. The influence of the latter no doubt spread gradually downwards during these thousand years through Central and Southern Italy.1

1 See Heibig, Die Italiker in der Foëbae, for a full account of this period; also Von Duhn in J.H.S. xvi. p. 128, whose ethnographical views seem to differ in many details from those of other writers previously cited.
(2) THE VILLANUOVA PERIOD (TOMBS A POZZO)

The next stage in the development of civilisation in Italy, probably separated from the preceding by a period of transition, is what is known as the Villanuova period, from a site of that name at Bologna. It begins with the ninth century B.C., and lasts for some two hundred years; its traces are much more widely spread than those of the Terramare people, being found not only to the north of the Apennines, but all over Etruria. It is interesting to note that the chief finds have been made in what afterwards became the principal centres of Etruscan civilisation, such as Bologna, Corneto, Vetulonia, etc. In almost every respect it shows a marked development on the preceding stage. Iron is already known, and the working of bronze better understood, the processes of hammering plates (σφυρήλατον) and working in repoussé being introduced to supplement that of casting.¹

We now for the first time meet with tombs, the characteristic form of which is that of a well or pit, ending in a small circular chamber, in which the remains are deposited. Italian archaeologists have given to these tombs the name of a pozzo. The method of burial practised was almost exclusively that of incineration, but it appears certain that the inhabitants of Etruria never showed a special preference either for one method or the other, and the alternative method of inhumation already appears at Corneto before the next stage is reached with the eighth century.

It has been sometimes objected that the introduction of inhumation must connote the first arrival of the Etruscan people in these regions, on the ground that they did not practise incineration; but this idea rests on no sound basis. The introduction of the new system, which never entirely ousted incineration, can easily be explained as due to external influences; not indeed to the Phoenicians (although it was a universal Oriental custom), for their influence in Italy has been much exaggerated; but rather to the Greeks, who colonised Cumae in the middle of the eighth century, from which time

¹ See Brit. Mus. Cat. of Bronzes, p. xlv.
onwards Hellenic influence gradually becomes more and more apparent.

We have seen, then, that the Villanuova civilisation may be fairly regarded as Etruscan. It was not, however, by any means confined to Etruria, for it is spread all over the country to the north of the Apennines, and two of its most important centres were at Bologna and Este. The whole of this region shows traces of having been for a long time under the early Etruscan domination. It is, in fact, in close dependence on the Terramare civilisation which here preceded it, the difference, as we have indicated, being brought about by commerce and foreign influences.

The *pozzo* tombs usually contain a large cinerary urn or *ossuarium*, in which the ashes were placed after being burnt (Fig. 178). These urns are fashioned by hand from a badly levigated volcanic clay, generally known as *impasto Italico*. It is to be distinguished from the later *buccherò nero* (see p. 301) by its quality, and by the fact that vases of the latter clay are always wheel-made. The clay is irregularly baked over an open fire, and the colour of the surface varies from red-brown to greyish black. It is covered with a polished slip, and there is no doubt that it was the intention of the potter to give the vases a metallic appearance as well as form.

As regards their shape, they are of a peculiar but uniform type, with a small handle at the widest part, and cover in the form of an inverted bowl or saucer with handle (Fig. 179: see also Fig. 178). The ornamentation consists of geometrical ornaments incised or stamped in bands round the neck and body—such as maeanders, chevrons, stars, and dots—the incisions being made while the clay was moist. In rare cases

1 See *Ann. dell' Inst.* 1884, p. 111.
2 *Notizie degli Scavi*, 1881, pl. 5, Nos. 15, 16.
we meet with painted ornaments in white applied directly to the surface. Besides the urns, which often almost fill the chamber, accessory objects in the form of common pottery, fibulae, and other bronze objects, spindle-whorls and amber objects, are found in the tombs.

The common pottery does not in its character exhibit much advance on that of the Terramare. The difference, indeed, consists not so much in development of technique as in a greater variety of decoration. It has points of resemblance with the far earlier pottery of Hissarlik and the early Bronze Age tombs of Cyprus (see Chapter VI.), and there are not wanting evidences of commercial intercourse with and importation from the Eastern Mediterranean. But two salient features of the Italian wares are the employment of handles and the unique form of the hut-urn (see below).

The clay is mostly of the same kind as that of the urns, and the smoked and irregularly fired surface shows that furnaces were not yet in use, but that an open fire sufficed for the purpose. The technique is exceedingly primitive, and the forms are simple but heavy. In the latter respect the striking difference in the inherent artistic capacity of the Greeks and Italians is already apparent. The latter never at any time displayed that unfailing eye for form which distinguishes the
Greeks in all their products. The shapes include saucers like the urn-covers, bowls with a flat vertical or high-looped handle, flasks with long beak-like necks like the early Cypriote vases, bowls with small feet, jars with one or two handles, aski, and kerni, or groups of vases united on one stem.

Many of these are quite plain, but the majority are decorated with geometrical patterns, like the ossuaria or urns already described. Some of the patterns show quite a mechanical regularity, as if produced from a stamp. These take the form of circular sinkings and other patterns formed by circles, an early instance of a motive which afterwards became common in Etruria. There are even some instances of designs in colour, a sort of cream pigment being used. A peculiarity of this class is the fondness for protuberances in the form of horns on the handles (ansae lunulatae), which are also found in the Terramare, as already mentioned; or knobs round the body of the vase, in order to hold cords for suspension, which afterwards served a merely decorative purpose, like the bosses on cups described by Homer. Sometimes are to be seen rude attempts at modelling horses or heads of oxen, or at giving the whole vase the form of a bird, as is seen in some of the aski.

The absence of accessory vases in Villanuova tombs, as is sometimes the case at Vulci, seems to show either very great antiquity or else a long survival of an older type. On the whole, however, a chronological classification is hardly possible. Generally speaking, the pit-tombs were still in use throughout Etruria at the end of the eighth century, and no tombs of the next stage can be dated earlier than 700 B.C. The line of demarcation for the latter end of the period is therefore the seventh century, coincident with the first undoubtedly Greek importations found in the tombs.

The real interest of the Villanuova period is, however, centred in remains which do not come within our province—namely, the objects in bronze which have been found in such enormous

1 H. xi. 633; Od. iv. 615, vi. 232. See Dumont-Pottier, i. p. 152.
2 On the ornamentation of the Villanuova period general reference may be made to Böhlau's Zur Ornamentik der Villanovaperiode (1893).
3 Gsell, Fouilles de Vulci, p. 254.
numbers at Bologna, Vetulonia, and elsewhere. They fall into line with the earliest remains on Hellenic sites—such as Olympia, Rhodes, and Crete—and a connection can often be traced, as in the fibulae, with the Hallstatt civilisation. On the other hand, they are entirely free from any Oriental influence.

Sometimes the cinerary urns in the tombs of this period take the form of huts (tuguria), though these are more often found in the neighbourhood of Rome, as at Alba Longa. They represent, in fact, the civilisation of the Italiote people on their first arrival in Latium, which they probably colonised by moving southward through Umbria and Picenum, leaving Tuscany to the Etruscans. One of the best examples of these hut-urns is that from the Hamilton collection in the British Museum (Plate LVII. fig. 4), which still contains ashes. The ashes were inserted through a little door, which was secured by a cord passing through two rings at its side and tied round the vase. The ornamentation suggests the rude carpentry which was applied to the construction of the dwellings of this primitive people, the cover or roof being vaulted, with raised ridges intended to represent the beams of a house or cottage. These urns have no glaze on their surface, but a polish was produced by friction. They are occasionally painted with patterns in white, inlaid in grooves. On the Museum—example are fragments of maeander. They are usually found inside large vases, which protected them from falling earth and other accidents. The fact that they were found under beds of lava originally led to an exaggerated opinion of their antiquity, but in any case the nature of their contents confirms their very primitive use.

An interesting account of the early settlements in the southern extremity of Etruria is given by Von Duhn, as the result of exploration by local archaeologists on the sites of

1 See Brit. Mus. Cat. of Bronzes, p. xlv, and references there given.
2 The objects found at Hallstatt date from about the tenth to ninth centuries B.C., and are sometimes "sub-Mycenaean" in character.
3 See on the subject of hut-urns the bibliographies given in Gsell, Fouilles de Vulci, p. 258; Bonner Studien, p. 24 (Von Duhn); and J.H.S. xvi. p. 127 (id.).
4 J.H.S. xvi. p. 125.
Falerii (Civita Castellana) and Narce. The most interesting feature of these results is the gradual migration of the peoples from the hill-tops to the valleys as they became more civilised. Thus many modern cities, such as Florence, are direct descendants of the early hill-settlements of primitive Italy. In Etruria it was usually the reclaiming of the marshes for cultivation that enabled the population to settle in the lower and more accessible situations.

The Faliscan region well illustrates this principle, as does Narce. In the earliest graves on the hill-tops cremation is the rule, and the urns are of the Villanuova type. Nothing of later date than the eighth century is found, and no importations. The hut-dwellings at Narce seem to have been of the hut-urn type. The common pottery is of the primitive hand-made greyish black clay; but after the eighth century the position of the settlement was shifted lower down, and in these later tombs a remarkable series of red-glazed wares is found (see below, p. 301), and Greek and Oriental importations soon make their appearance. Narce soon fell under Etruscan sway, but Falerii retained its individuality for some time longer.

(3) THIRD PERIOD: TOMBS A FOSSA; FIRST GREEK INFLUENCES

The next stage in the development of Etruscan civilisation is marked by a change in the form of the tomb. The pit is now replaced by a trench; in other words, the vertical form is exchanged for a horizontal one. Concurrently with this change the practice of inhumation becomes fairly general. This period may be regarded as extending from the eighth century B.C. to the beginning of the sixth, and is marked by the first signs of importations from Greece in the shape of Geometric pottery and bronzes. In general character it is not strongly marked off from the preceding. The great advance is in the development of art in the objects found in the tombs. Not only do we witness the first beginnings of what is destined to become the typical species of Etruscan pottery—namely, the bucchero nero—but towards the end of

1 See also for Narce Mon. Antichi, iv. pt. 1, p. 105 ff.
the period the Greek influence, as evidenced by finds of wheel-made vases with Geometrical decoration, or even of the so-called Proto-Corinthian type, becomes widely felt. It was no doubt largely due to the foundation of colonies in the south of Italy, such as Cumae. Altogether it is a most important period for the history of Etruscan pottery. Of Oriental influence there are at present hardly any signs, and all wheel-made vases found in these tombs are probably of Greek origin, as it does not appear that the wheel was in regular use before the middle of the sixth century.¹

It is now necessary to turn our attention to the local hand-made varieties. And, in the first place, it is worthy of note that pottery of the Villanuova type actually survives the transition from the pit-tombs to the trenches, as is seen at Corneto, Vetulonia, and elsewhere. Probably it indicates the pottery in common use, the imported objects being only regarded as de luxe; or else, as Prof. Helbig suggests,² the former types were preserved for religious reasons connected with burial rites, as was often the case in Roman religion.

In the earlier types of pottery from the fossa tombs, such as are common at Vulci, the hand-made pottery of impasto Italico still continues, preserving the same shapes and the same simple linear decoration; but it is better baked, and the surface is somewhat better polished. Red wares are also found, and yellow wares with Geometrical ornaments painted in red, which are evidently local imitations of the Greek Geometrical fabrics (see below).

Later, while the technique remains unaltered, a difference is seen in the forms, which become lighter, more varied, and more symmetrical. Such shapes as the stamnos, kantharos, and trefoil-mouthed oinochoë now for the first time appear. The methods of ornamentation are also modified; new varieties of incised patterns are seen, and the bodies of the vases are sometimes fluted or ribbed; while such motives as friezes of

¹ M. Pottier states that a primitive kind of wheel was used for making the impasto in the eighth century, and Helbig and Martha are certainly wrong in stating that it was not introduced till the sixth (see Louvre Cat. ii. p. 294).
² Bull. dell' Inst. 1885, p. 118.
ducks, which are also found on the contemporary bronzes,\(^1\) now first find a place. M. Gsell, describing in detail the various fabrics found in the Vulci tombs of this period,\(^2\) speaks of pottery of a grey clay baked to red, perhaps in a furnace, forming urns and jars of a considerable size. He thinks that some primitive kind of wheel (see above) must have been used to produce these. In some of the *impasto* wares there is a decided advance in technique, the clay being better levigated and the walls of the vases thinner. Some black wares seem to have been *fumigated* like the later *bucchero*. Generally speaking, both incineration and inhumation are still practised.

The ornaments are incised, stamped, or painted, and the decoration almost exclusively linear, the stamped patterns being usually in the form of stars. This pottery is, in fact, merely a continuation of that of the pit-tombs, except that the imitation of metal-work is much more strongly in evidence.

Yet another variety preserves the methods and forms of the Villanuova class, but introduces a new kind of clay, altogether black, as distinguished from the earlier reds and browns. A remarkable specimen of this early black ware found at Orvieto has incised upon it the subject of Bellerophon and the Chimaera, the style being, as we should expect, childish to the verge of the ludicrous.\(^3\) Later, the black wares acquire a very fair glazed surface, and are ornamented with incised linear patterns of zigzags, chevrons, etc.; these are mostly small vases. It is in these two particularly that we see the forerunners of the highly developed *bucchero* ware.

Besides these local fabrics, there are found Greek imported wares with Geometrical decoration of pale yellow clay, with ornaments in brown turning to red; the commonest form is the oinochoe, and the patterns include circles, zigzags, wavy lines, embattled patterns, etc. These are all wheel-made, and are, in fact, the same types as are found in the Dipylon cemetery at Athens and in Boeotia (Chapter VII.); the earliest instances belong to the end of the eighth century, in some late pit-tombs

---

3 *Notizie degli Scavi, 1884, p. 186 = 338: cf. for the style a vase from Tamassos, Cyprus, in the British Museum (Rev. Arch. ix. 1887, p. 77).
ETRUSCAN AND SOUTH ITALIAN POTTERY

at Caere, in which also "Propto-Corinthian" pottery was found. They coincide with the great impetus given to Greek colonisation in Sicily and Southern Italy, and probably came by that way into Etruria. It should be borne in mind that these vases were imported not for their own merit, but for the value of their contents. It has already been mentioned that local imitations of them are found in the trench-tombs.

To the seventh century belong also two classes of pottery which are more or less connected, and are chiefly associated with Caere.¹ The first class consists of a series of vases of red ware, mostly large jars and πιθοί, ornamented with designs in relief, the lower part of the body being usually ribbed. The designs take the form of bands of figures stamped round the upper part of the vase, either in groups on the principle of the metope or in extended frizes. In the former case the design was produced from a single stamp for each group; in the latter, it was rolled out from a cylinder resembling those in use in Assyria for sealing documents. Besides the jars, plates of this ware are not uncommon; they may have formed either covers like those of the Villanuova ossuaria, or stands for the jars, in order to hold drippings of liquid, etc. The use of the πιθοί in tombs is not quite clear, though they were doubtless in daily use for holding grain or liquids.²

The subjects are always of an Orientalising character, similar to those found on Greek vases under Oriental influence, and comprising animals, monsters, hunting scenes, combats, and banquets. The origin of these vases is doubtful; they may be either indigenous or imported, as similar examples have been found in Rhodes, Boeotia, Sicily, and elsewhere; but they are rare outside Etruria. The suggestion of a Sicilian origin³ has found some favour, but it is more likely that they are native productions after Greek models (see Vol. I. p. 496); some are undoubtedly of local make,⁴ and they were probably made at Caere or in the neighbourhood. Their prototypes go back

¹ See generally Pottier, Louvre Cat. ii. p. 363 ff.
³ Abeken, Mittelital. p. 362 ff.; but see Arch. Zeit. 1881, p. 41.
⁴ E.g. Ann. dell' Inst. 1884, pl. C.
almost to the Mycenaean period, but were hardly imported before 700 B.C., after which time the local imitations begin, being one more instance of the invariable rule that all Etruscan pottery is more or less imitative. Similar vases in metal were manufactured on the coast of Asia Minor, and the ἄναθήματα of the Lydian kings at Delphi\(^1\) were probably examples of this class.\(^2\)

The second class shows some affinities to the other in regard to the shape and the nature of the clay; but the important difference is that the vases are decorated with painted subjects instead of reliefs. The subjects are painted in white outline on a brick-red glazed ground, the process being as follows: The clay, which resembles the impasto Italico, is first hardened by baking, and then a mixture of wax and resin and iron oxide is applied to it, and a lustre given to the surface by polishing. The pigment, a mixture of chalk and lime, is then laid on. The process can hardly be said to be Greek, and yet the subjects are purely Greek, being borrowed in part from the Greek Geometrical vases, such as sea-fights, and in part from later (Ionian) sources\(^3\); we

---

\(^1\) Hdt. i. 14, 25; Paus. x. 16.
\(^2\) For Greek examples of early vases with reliefs see Vol. i. p. 497, and Plate XLVII.
\(^3\) See for specimens *Gaz. Arch.* 1881, pl. 28, 29, 32-3; Pottier, *Vases du Louvre*, pl. 33-4.
actually find representations of the Birth of Athena and the Hunt of the Calydonian Boar (Fig. 180). The shapes of the vases again are certainly local, as are the animal forms, which resemble those incised on the bucchero wares. The drawing is usually crude in the extreme. It is interesting to note that on the vase from which Fig. 180 is taken the potter has painted in white an Etruscan inscription (not shown in the cut). Another vase of the same class was found in the Polledrara tomb (see Plate LVI. and p. 300 below). The method of painting in opaque pigment on a red or black ground is, it would seem, an Ionian characteristic, being found at Naukratis in the seventh century (Vol. I. p. 347), and also, as we shall see on other quasi-Ionic fabrics in Etruria.

Generally speaking, the tombs a fossa are not later than the middle of the seventh century; evidence of this is given by the absence of bucchero proper and of Corinthian fabrics. There are, however, traces of their lingering on even down into the sixth century, as at Vulci, where Helbig mentions a tomb found in 1884 containing Corinthian vases of that date. At Corneto the latest belong to the end of the seventh century.

(4) FOURTH PERIOD: CHAMBER TOMBS; ORIENTAL INFLUENCE

Our fourth period, which in many respects shows a close continuity with that of the tombs a fossa, is nevertheless clearly defined by two circumstances: firstly, the adoption of a new type of tomb, doubtless developed out of the fossa, which takes the form of a large chamber, and is therefore known as a camera; secondly, the influence of Oriental art, concurrently with an increased influx of imports from Greece. The period covers about a century of time, from 650 to 550 B.C., and includes several of the largest and most important tombs that have been found in Etruria, which will demand more or less detailed treatment. In none, however, were any great finds of pottery made; but one of these tombs, the Grotta d'Iside or Polledrara tomb at Vulci, contained several specimens of exceptional interest.

1 Louvre D 151.
2 Bull. dell' Inst. 1884, p. 163.
PERIOD OF CHAMBER-TOMBS

The simplest form of chamber-tomb consists of a narrow corridor or ἰπομόσιος leading into a larger chamber; next, the ἰπομόσιος opens into a square or rectangular vestibule, round which various side-chambers are attached; finally, the tomb assumes the form of a vast subterranean edifice composed of several wings, and used for more than one corpse—in fact, a "family vault."

While on the one hand the ceramic types of the Villanuova period still linger on, as in the retention of ossuaria for the receipt of ashes, on the other the painted Greek vases and the local bucchero wares increase more and more, and altogether there is a great advance in the direction of variety and richness. This period saw not only the general introduction of the wheel into Etruria, but also the introduction of the alphabet of Western Greece, through Cumae. A vase of bucchero ware found at Vetulonia bears an Etruscan inscription, which can hardly be much later than 700 B.C.,¹ and we have already seen an instance on a vase from Caere.

In the earlier chamber-tombs no bucchero is found, and the pottery is of the same types as in the trench-tombs; but with the enlarged arrangement of the tomb come the Corinthian vases of Orientalising style, to be followed later by the Ionian and later Corinthian fabrics, and finally by the Athenian wares. The vestibule disappears after the sixth century, and all later tombs have the simple ἰπομόσιος. The typical contents of a chamber-tomb are, as regards local pottery, in the earlier tombs impasto Italico wares, in the later bucchero. The former is hand-made, the shapes similar to those found in the trench-tombs—i.e. pots incised with zigzags, circles, and other patterns, or painted in white. The latest varieties are wheel-made, of bucchero forms. The latter wares, which are much more numerous, are evolved from the impasto: (1) by the use of the wheel; (2) by the introduction of the furnace; (3) by extensive imitation of Greek ceramic and metal forms. The earliest bucchero vases at Vulci and Corneto synchronise with Corinthian pottery of the middle style, about 630—600 B.C., and they last down to the end of the fifth century.

¹ Röm. Mitth. 1886, p. 135.
The appearance of the alphabet seems to point to a marked incursion of Greek influence in the early part of the seventh century. The story of the arrival of Demaratos of Corinth, about 665 B.C., with the three artists whom he brought in his train, Diopos, Eucheir, and Euugrammos, is no doubt an echo of this. The progress of Hellenism was, however, momentarily arrested by the growing power of Carthage, which may partly account for the temporary Orientalising of Etruscan civilisation. It is certainly to the Carthaginian influence in Italy that the Phoenician objects found in the seventh century tombs, such as the silver bowls of Praeneste, are due. Oriental influence is also seen in the large tombs at Vulci, Caere, and Vetulonia, but it is hardly so strong as was at one time supposed; and of late years scholars have generally recognised that Ionian art and commerce played a much larger part throughout in the civilisation of Etruria; and, further, that Oriental art found its way mainly through these channels. At all events there was throughout the seventh and sixth centuries a keen struggle for supremacy in the Western Mediterranean, in which the Etruscans, the Phoenicians of Carthage, and the Ionian and Continental Greeks alike shared; and hence the diverse influences at work in Etruria.

But it was not long before Greece, with its rising colonies of Cumae, Sybaris, and Syracuse, made its predominance to be felt in the Western Mediterranean, and this was consummated by the final victory of Hiero over the combined fleets of Carthage and Etruria off Cumae in 474 B.C. A monument of this exists to the present day in the bronze helmet dedicated by that king at Olympia, now in the British Museum.

We may further define as the second great period of Greek importations, that extending over the sixth and fifth centuries, a period which saw the development not only of the local bucchero fabrics, but also of the Greek black- and red-figured vases, which, heralded by the Corinthian wares, now pour in a continuous stream into Etruria. To this same period belong the paintings of the Etruscan tombs.

1 See Pliny, H.N. xxxv. 152. The names are doubtless descriptive.
2 Cf. B.M. Cat. of Bronzes, p. xlvii, and references there given.
GREEK AND ORIENTAL INFLUENCES

The earliest influences from Greece came, as has been hinted, through colonies like Chalcidian Cumae, which were the chief agents in the Hellenisation of Etruria; but at Cervetri, at any rate, the prevailing influence was Corinthian, as testified by the remarkable series of Corinthian and quasi-Corinthian vases in the Campana collection at the Louvre. Later in the sixth century came the connection with Athens, the chief results of which are to be seen in the contents of the tombs of Vulci (Vol. I. p. 76). It extends from the time of the Peisistratidae (540—520 B.C.) down to about 450 B.C., being probably brought to an end by the Peloponnesian War and the destruction of the Athenian maritime supremacy; but isolated instances of importations occur down to the time of Alexander the Great, in the Panathenaic amphorae of which dated examples of 336 B.C. have been found at Cervetri (Vol. I. p. 390).

In sketching this outline of Hellenic influence in Etruria we have overstepped the limits of chronological sequence, and must retrace our steps in order to deal first with the local products of the period from 650 B.C. onwards, and secondly with the effects of the Greek civilisation on the same.

Polledrara ware.—The Grotta d’Iside or Polledrara tomb at Vulci has been dated, on the authority of a scarab of Psammetichos I. (656—611 B.C.) which it contained, towards the closing years of the seventh century. This dating has been generally accepted, and there seems no reason to doubt it, although the evidence of an isolated scarab is not always as trustworthy as appears at first sight. Besides local bronze work and objects of Egyptian or quasi-Egyptian character, it contained one vase of unique character which calls for special consideration.¹

This is a hydria of somewhat peculiar, if not unique form, with a very wide body and rudimentary foot. In some details, especially in the treatment of the handles, it exhibits obvious

¹ Nearly all the contents of this tomb are now in the British Museum (Etruscan Saloon, Cases 126-35): see Micali, Mon. Ined. pls. 4-8; Dennis, Etruria², i. p. 457 ff.; C. Smith in J.H.S. xiv. p. 206.
evidence of imitation of metal-work. Although at first sight resembling buccero ware, the clay is seen on examination to be of a different type, not being grey but reddish brown in fracture, while the lustrous black surface is produced by a thin coating or slip. It is decorated with designs in three colours, red, blue, and a yellowish white, which were laid on the black and then fired. The red is best preserved, the blue fairly so, but the white has almost entirely disappeared. The designs are arranged in three friezes, of which the lower consists only of isolated bits of key-pattern. On the two upper rows are scenes from the story of Theseus and Ariadne, together with Centaurs, Sphinxes, and other accessory figures. On the upper row Theseus slays the Minotaur; on the lower, Theseus and Ariadne are seen, firstly in a chariot, secondly leading a dance of four other figures, the hero playing a lyre, while Ariadne holds the clve. The colouring scheme is most elaborate, and cannot be detailed here; an occasional use of incised lines may also be noted.

A small two-handled cup or kylix, of a type often found at Naukratis decorated with eyes, was also found in this tomb, and appears to belong to the same class. The clay is similar to that of the hydria, as is the decoration, which however, owing to the flaking off of the black slip, has largely disappeared. Although in its technique it resembles the hydria, the subjects and motives are probably derived from Naukratis. Only a few other examples of this "Polledrara" ware are known: an oinochoe in Berlin, two vases in the Louvre, and a vase found at Cervetri, unpublished. From the contents of the tomb in which the last-named was found, it may fairly be dated early in the sixth century.

Mr. Cecil Smith regards the Polledrara hydria as the result of an Italian attempt to imitate the new buccero technique which was at this time being perfected (see below), the form of the

vase being borrowed from an Ionic source. Ionic influence (see above, p. 296) is visible in more than one respect in this vase, as also in the reliefs decorating the bronze bust from the same tomb. Other details, such as the imitation of metal-work, are rather to be referred to a Corinthian source; and it is worthy of note that two Corinthian vases were among the contents of the tomb.

The striving after a gaudy effect by the use of polychrome decoration, and especially the employment of blue, a colour otherwise unknown in vase-painting before the end of the fifth century, finds a parallel in the sixth century poros-sculptures from the Athenian Acropolis, in which even more violent effects of colour are attained, as in the bright blue beard of the Triton. But in this case there seems little doubt that the idea is borrowed from Egypt, with its fondness for brightly decorated mummy-cases and bright blue images of faience and porcelain. Other details which betray an Egyptian origin are the lions' masks, the all-pervading lotos-flower, and the seated dog or jackal. The connecting link is no doubt the great trading centre of Naukratis, through whose agency the Egyptian scarabs, porcelain objects, and ostrich eggs found in this tomb also came to Etruria.

As a parallel to the Polledrara finds should here be cited the painted terracotta panels from Caere now in the British Museum and Louvre, which are certainly local products, and give a realistic representation of the Etruscan people. They are described below (p. 319). These again, both in subject and style, lead to a comparison with the large Etruscan terracotta sarcophagi, of which the most remarkable is that in the British Museum. Here, as in the Polledrara bronze bust, the rude native attempts at sculpture in the round are combined with reliefs which successfully reflect the style of Ionic art. Lastly, we note another parallel in the paintings of animals on the walls of a tomb at Veii.

---

1 The hydria is a form of essentially Ionic origin, the earliest examples being found in the "Caeretan" and Daphnae fabrics (see Chapter VIII.).

2 Cat. of Terracottas, B 630=Fig. 183.

3 Micali, Mon. Ined., pl. 58; Dennis, Etruria, i. p. 34 ff.
Mr. Cecil Smith sums up: "The Polledrara ware was probably local Italian, made at Caere under the combined influence of Ionian and Naukratite imports, acting on an artistic basis principally derived from Corinth." Developed pari passu with the red impasto ware (of which a painted example was found in the Vulci tomb), it gradually gave way to the bucchero ware with which we deal in our next section. It only remains to note that similar ware has been found in Rhodes, where also later wares of a genuine bucchero type, unpainted, have come to light; and these appear to be instances of a counter-importation from Etruria to Asia Minor.

The only other piece of pottery from the Polledrara tomb which calls for special comment is one to which reference has just been made, a large pithos of the primitive impasto red ware, made on the wheel (Plate LV.). It falls into line with the painted and stamped fabrics from Caere already described (p. 292 ff.), and is, like the hydria, painted in polychrome, but the colours are much faded. The subjects are a frieze of animals and a ship.

Three other tombs which rival the Polledrara in size and importance are the Regulini-Galassi tomb at Caere, the Tomba del Duce at Vetulonia, and the Bernardini tomb at Praeneste. Although the finds of pottery herein were small, they are yet of great interest for the history of Etruscan art in general, especially as they afford evidence for approximate dating. In the two former Etruscan inscriptions were found. The Caere and Praeneste tombs are probably the earliest, about 650 B.C., and the Del Duce and Polledrara tombs are not later than the end of the seventh century.

In the Regulini-Galassi tomb the pottery takes the form of large caldrons of red glazed ware, which mark a transitional stage between the impasto and bucchero. They are characterised by the large Gryphons' heads projecting in relief round the

sides, to which are attached chains. Sometimes they are supported on high open-work stands. In 1892 the British Museum acquired a series of these and similar vases (Plate LVI.), including some plain specimens of *bucchero* ware from early tombs at Civita Castellana (Falerii: see Vol. I. p. 75).

**Bucchero ware.**—This may be called the national pottery of Etruria. Its technique is not at present perfectly known, and analysis does not show certainly whether the black paste is natural or artificial. Modern experiments have been made which seem to indicate that this result may be obtained by fumigating or smoking the clay in a closed chamber after the baking, which process blackens the clay throughout. But M. Pottier\(^2\) thinks that the black surface was obtained not by fumigation of the vase, but by applying a slip of pounded charcoal already smoked, which at a moderate temperature would permeate the clay. The surface was then covered with wax and resin, and polished, like the Polledrara hydria. A combination of analyses of the paste made by Brongniart\(^3\) gives the following result:

The oldest *bucchero* vases go back to the tombs *a fossa* of the end of the seventh century. They are small and hand-made, ornamented, if at all, with geometric patterns, incised. The engraving was done by a sort of toothed wheel or a sharp tool; more rarely, hollowed out in grooves. Obviously the process is an imitation of metal engraving. Oriental influence soon appears, first of all in the chalice-shaped cups found at Cervetri, the surface of which is covered with figures of lions.

---

2 *Louvre Cat.*, ii, pp. 294, 315.  
deer, etc., in Oriental style. Both form and decoration are derived from metallic prototypes. The projecting Gryphons' heads mentioned above are also typical of this class.

In tombs of 560—500 B.C., along with Corinthian vases, a different type occurs, the vases being wheel-made, of light and elegant forms—cups, chalices, pyxides, amphorae, and jugs. The ornament is in the form of reliefs, either stamped from a cylinder on a narrow band, as in the red ware from Caere (see p. 292), or composed of a series of medallions separately modelled or made from moulds and stuck on. This, again, is an imitation of metal. Examples of these types are given in Plate LVII. figs. 1-3, 5.

The subjects are not very varied. They range from animals such as stags and lions, or monsters such as Sphinxes and Centaurs, to winged deities, suppliants with offerings before deities, and other mythological figures—Chimaera, the Asiatic Artemis, or the Minotaur. Egyptian masks are also common. Episodes of hunts or banquets occur, and also groups of figures in meaningless juxtaposition. Some vases have only curvilinear patterns, such as palmettes, all of a vegetable rather than a geometrical type. In this group the general tendency is rather Hellenic than Oriental, especially towards Ionian art. This is only a temporary phase, and is practically confined to Cervetri, Veii, and Corneto—i.e. the maritime region in which the Corinthian vases are found.

At Chiusi an extraordinary development is manifested, which gradually obtained a monopoly. The city was far from the sea and Hellenic influences, and retained Oriental traditions. After the end of the sixth century all the varieties of bucchero were fused into one type, which lasted down to the end of the fourth century. The shapes include amphorae, trefoil-mouthed oinochoae, various forms of cups, bowls with raised handles and ladles (kyathi), table-utensils, basins imitating metal forms, braziers, and vases in the form of birds or fishes. They are

ETRUSCAN BLACK WARE: HUFT-URN AND CUOCHERO
(BRITISH MUSEUM)
ornamented with reliefs from top to bottom, the subjects being much the same as in the last group. The tops or covers are often in the form of female or cows' heads, or surmounted by birds (cf. Plate LVII. fig. 5). The figures and ornaments are stamped in from moulds and fixed by some adhesive medium, incised designs being inserted to fill up the spaces. These reliefs are never found earlier than the period of Attic importations.

The subjects are derived as before from Greek, Egyptian, and Assyrian sources, the Oriental types being so much combined that they must evidently have come through the Phoenicians. Among the Greek subjects we find Theseus and the Minotaur, Perseus and the Gorgons, Pegasos and the Chimaera, warriors, etc. The animals and the four-winged figures are Assyrian in type, while Egypt supplies such types as Ptah, Anubis, and other animal-headed deities, and the female heads on the so-called Canopic jars.

There are here no signs of inventive genius. The technique is purely native, but all is founded on foreign models. The shapes are those of Ionia and the coast of Asia or of Athens. On the other hand, the development of the technique from the Villanuova pottery is certainly apparent. The Greeks, indeed, tried to imitate it at times, and bucchero ware is found at Rhodes and Naukratis. We may fairly lay down that Etruscan invention is limited to the perfecting of the technique and the combination of the borrowed elements and art-forms. Many of the flat reliefs seem to be copied from ivories, and the rounded reliefs are certainly from bronze repoussé work; in some cases we find traces of gilding, silvering, and colour, which have been intended to reproduce the appearance of metal. Again, in many respects the bucchero vases are merely the counterparts of works in bronze, as in the case of the braziers and the bowl with Caryatid supports given in Plate LVII. fig. 2. In short, they reproduce for us what is wanting in our knowledge of early Greek metal ware.

1 See Pottier, Louvre Cat. ii. p. 324 ff.
There seem to be some references to this early black ware in the Roman poets, for Juvenal mentions it as being in use in the time of Numa: "Who dared then," he says, "to ridicule the ladle (simpvium) and black saucer of Numa?" Persius styles it Tuscan fictile, and Martial imagines Porsena to have been quite content with his dinner-service of Etruscan earthenware.

A peculiarly Etruscan type of vase which deserves some separate attention is that known as the Canopic jar, resembling the so-called κάνοπτοι in which the Egyptians placed the bowels of their mummies. These Etruscan canopi are rude representations of the human figure, the heads, which are often attired in Egyptian fashion, forming the covers. The eyes are sometimes inlaid, and the female heads have large movable earrings and other adornments. In the tombs it was customary to place these vases on round chairs of wood, bronze, or terracotta. An example may be seen in the Etruscan Room of the British Museum, where the chair is plated with bronze, covered with archaic designs in repoussé relief, and another is shown in Fig. 181. Similar chairs were discovered in the Tomba delle Sedie at Cervetri; but the Canopic jars are almost confined to Chiusi. The type finds a parallel in the so-called "owl-vases" from the second city at Hissarlik (Vol. I. p. 258), in which the same combination of the vase-form with the human figure is to be observed. The lower portion of the jar was intended to receive the ashes of the dead, like the ossuaria, this method of placing the mortal remains of a person within a representation of himself being peculiarly Egyptian.

Signor Milani has traced the origin of the Canopic jars to the funeral masks placed over the faces of the dead, which are sometimes found in the earliest Etruscan tombs. This practice

CANOPIC JARS

may have been derived from Mycenae, where Schliemann found gold masks in the shaft-tombs of the Agora; but in Etruria the examples are all in bronze, except a few of terracotta. A gradual transition can be observed from the mask, at first placed on the corpse and then attached to the urn containing its ashes, to the head fashioned in the round and assimilated with the cover; while in later times a further transition may be observed from the vase with human head to the complete human figure.

From Mus. di ant. class.

FIG. 181. CANOPIC JAR IN CHAIR PLATED WITH BRONZE.

Finally, its place was taken by the reclining effigies on the covers of the sarcophagi (p. 320). The earliest jars are found in the pozzo tombs of the eighth century, the evolution of the head modelled in the round being accomplished by the seventh century, and the archaic types last down to about 550 B.C., when the severe perfected style comes in, to be succeeded by the free style of the fifth century, after which time the Canopic jars cease to be manufactured.

1 H 148 in the British Museum is a curious terracotta example, covered with incised designs: see Benndorf, Gerichts- heime und Sepulcralmahen, pl. 11, p. 42.
The types are both male and female throughout, the latter being usually distinguished by wearing earrings and necklaces. Towards the end of the series the handles are gradually converted into rudimentary arms, and finally into fully developed human arms, sometimes holding attributes. They are probably placed on chairs as emblems of the power and authority which the deceased enjoyed during his life. In the Berlin Museum¹ there is a remarkable example of the sixth century in which the jar is placed on a chair of the same clay, covered with graffito ornamental designs and figures of animals. The jars are always made of a plain red unglazed clay, and are uncoloured. In the British Museum² there are two seated female figures on detached square bases, wearing bright red chitons and large circular earrings, which seem to represent the period of transition from the jar to the sarcophagus, the style in which they are modelled being that of the fifth century. Some of the later examples have strongly individualised features, and seem to be genuine portraits; it is possible that they are actually from moulds taken from the faces of the dead.

(5) PERIOD OF GREEK INFLUENCE; PAINTED POTTERY

Although the Etruscans executed such admirable works in bronze, exercised with such skill the art of engraving gems, and produced such refined specimens of filigree-work in gold, they never attained to high excellence in their pottery. The vases already described belong to plastic rather than pictorial art, and are mostly imitations of work in metal. Down to the end of the sixth century B.C. their attempts at painting vases have been, as we have seen, limited practically to two fabrics, the Polledrara ware and the Caere jars with paintings in a similar technique. These methods have, however, nothing in common with Greek vase-paintings of the ordinary kind on a glazed surface, a method which was never popularised in Etruria.

The total failure of the Etruscans in vase-painting finds a

¹ Cat. 3976-77. ² Cat. of Terracottas, D 219-220.
curious parallel in their sculpture; all their best work is to be sought in their engraving or figures in low relief, as in the mirrors and *cistae*. Yet the same mirrors and *cistae* show clearly that it was from no lack of ability in drawing that they failed; wherefore it is the less easy to understand, not only the absence of all originality in their painted vases, but also the rarity of instances of their imitative tendencies in this respect.

Apparently the red-figured vases which were imported into Etruria in such large numbers in the fifth century served as prototypes, not for their paintings, but for the engraved mirrors to which we have alluded. It may have been that they shrank from the task so successfully achieved by Greek painters of suitably decorating the curved surfaces of a vase, and preferred the flat even surfaces supplied by the circular mirrors and the sides of the *cistae*. Moreover, the interior designs of the kylikes, perfected by Epiktetos, Euphronios, and their contemporaries, served as obvious models for disposing a design in a circular space; and they had in the subjects of the vases a mythological repertory ready to hand.

It now remains to be seen to what extent they actually were influenced in their pottery by the imported Greek vases.

For considerably over a century painted pottery, at all times rare in Etruria, is practically unrepresented in the tombs except by Greek importations, Corinthian, Ionic, and Attic; the only local attempts in this direction are the Polledrara and Cervetri vases. As we have seen, early Corinthian vases appear in the *fossa* tombs, and later Corinthian in the chamber tombs, in which, towards the middle of the sixth century, the Attic B.F. fabrics begin to make their appearance. The latest developments of the Corinthian wares are, indeed, almost unrepresented, but their place is taken by what appear to be local imitations of the Corinthian vases, a large series of which was found at Cervetri, and now forms part of the Campana collection in the Louvre. These are, however, for the most part certainly Greek, being presumably made by the Greek settlers in that town—at any rate, an Etruscan origin cannot be proved for them.\(^1\)

\(^1\) See Vol. I. p. 321.
We have also seen that the Ionian fabrics exercised a great influence on Etruscan art, and this leads us to another series of vases found at Cervetri, the Caeretan hydriae discussed in Chapter VIII. Some years ago it was noticed by the late F. Dümmler\(^1\) that there were in many museums examples of a class of vases which stood in close relation to the Caeretan hydriae, yet were obviously a different fabric. Having collected and examined these vases, he was able to demonstrate satisfactorily that they were direct imitations by the Etruscans of the Caeretan hydriae,\(^2\) thereby proving at the same time that the latter were imported from other sources (\textit{sc.} Ionia), and not, as had hitherto been supposed, themselves of Italian origin. It is not unlikely that the Ionic influence in Etruria is due to the Phocaean migration of 544 B.C.; on reaching Italy the Ionian fugitives would naturally hand on their art-traditions there.

These Etruscan vases are not exclusively hydriae, some being amphorae, others kyathoi; but they all bear the unmistakable stamp of Etruscan art in the drawing of the figures and other small details, such as the treatment of the incised lines. It will further be noticed that the drawing is in most cases quite free from archaism, figures being often drawn in full face or correct profile; and this consequently proves that they belong to a considerably later date than the fabrics which they imitate, although the figures are always in black on a red ground. The style in some cases is not unlike that of the later Panathenaic amphorae of the fourth century, and may also be compared with some of the bronze cistae from Palestrina. Accessory pigments are rare, and the incised lines are sketchy and careless; great prominence is given to the bands of ornament bordering the designs, this being a feature borrowed from the Caeretan hydriae. On a large amphora in the British Museum (B 64) the characteristic Caeretan band of lotos-flowers and palmettes is exactly reproduced, though in black instead of polychrome.\(^3\) Other typical ornaments are the maeander and chevrons; ivy-leaves and sprigs shooting up from the ground;

\(^2\) They also show the influence of the \textit{“Pontic”} class (Vol. I, p. 359).

\(^3\) It may be compared with B 59 in the same case (Plate XXVI.).
PAINTED VASES OF ETRURIA

lotos-buds, and wreaths of all kinds. The subjects are limited in range, and thoroughly Etruscan in feeling; Pegasii and beardless Centaurs with human forelegs, Bacchic subjects, and genre scenes, such as athletic contests, combats, or funeral ceremonies (Plate LVIII.), almost complete the list. The turned-up shoes and the pointed *tutuli* worn by the women, as well as the physiognomy of the figures, with their receding foreheads, are all characteristically Etruscan, though the two former details are borrowed from Ionia.¹ The shapes of the vases are heavy and inartistic, and the effect altogether unpleasing. A list of the principal examples is here appended.²

When at last the imitative instincts of the Etruscans did in course of time impel them to turn their fancy to copying the red-figured vases, we find the same characteristics reproduced. The number of such imitations is not large, but they are unmistakable, not only from the style, but from the pale yellow clay, dull black glaze, and bizarre character of the ornamentation. Nevertheless, in some cases fairly good results are obtained, as in the B.M. kylix F 478, which in its interior design at all events is an obvious attempt to imitate the work of the great Athenian kylix-painters. The artist seems to have learned his art from the school of Hieron and Brygos, but his Etruscan instincts are revealed in the over-elaboration and stiff mannerisms of the drawing. The Museum also possesses a very fine krater from Falerii (F 479), which appears to be an example of a local school,³ imitating the red-figured vases of the "fine" period and large style. But these comparatively successful imitations are exceptional.

The other red-figured Etruscan vases are far inferior, and are executed in a style which none can fail to recognise. It is dry and lifeless in the extreme, the drawing helpless, and

2 B.M. B61-74; Louvre E 754-81 (some of these do not show distinctive Etruscan features, although made in Italy); Naples 2522, 2717, 2757; Würzburg 81-2; Micali, *Mon. Incid.* 36. i, 37, 1, and 43, 3; *id. Storia*, 82, 3; Dubois-Maisonneuve, *Introductory* 34; Inghirami, *Mus. Chiusi*, 72; Gsell, *Fouilles de Vulci*, pl. 18-9; *Anzeiger*, 1893, p. 87. According to Endt, *loc. cit.*, about 200 examples are known. B 63 in the B.M. is reproduced in Plate LVIII.
3 Another is given in *Mon. dell' Inst.* x. pl. 51.
the whole effect repulsive and disagreeable, as is so often the case with Etruscan art. These vases are not earlier than the third century B.C., and may be later. In them we observe, besides Greek mythological subjects, the introduction of local deities such as Charun and Ker. The British Museum possesses some ten examples of this class, in addition to the two already described. The most interesting is a krater (F 480=Plate LVIII.), with, on one side, the death of Aktaeon, designated by his Etruscan name Ataiun; on the other, Ajax, designated Aifas, throwing himself upon his sword, after the award of the armour of Achilles.

Another vase of this class has for its subject the farewell of Admetos and Alkestis, with Etruscan inscriptions accompanying the figures, and a speech issuing from the mouth of one of them. Behind Admetos is one of the demons of the Etruscan hell, probably intended for Hades or Thanatos, wearing a short tunic and holding in each hand a snake. Behind Alkestis is Charun with his mallet. On another vase found at Vulci Ajax is represented slaying a Trojan prisoner in the presence of Charun; and on the reverse the latter appears again with Pentesileia and two other women. On a third Leda is represented showing Tyndareus the egg from which Helen and Klytaemnestra were destined to be born; it is inscribed Elinai, the Etruscan form of Helen.

The latest specimens of these fabrics, which have been found at Orvieto and Orbetello, positively degenerate into barbarism; the figures are carelessly and roughly painted, and white is extensively used as an accessory, as in the later Apulian and Campanian vases. The subjects are usually borrowed from the infernal regions, and the gruesome figure of Charun is common.

Inscriptions on Etruscan vases are rare as compared with Greek, and in many cases have only been scratched in after the vase was made. There are also instances of imported Greek vases on which Etruscan inscriptions have been incised in this manner,

as in the case of a vase in the form of a lion in the British Museum (A.II.37, from Veii), on which is incised ἨΕΛΘΩΡΠ
ΘΑΘΙΣΝΑΣ, selthur hathisnas. The earliest known are incised
on plain pots of black ware, and several of these take the
form of what are known as abecedaria, or alphabets. Strictly
speaking, some of these alphabets are of Hellenic origin, and
do not give the forms of the Etruscan letters as they are known
to us; but as the latter are derived from the Greek (western
group), probably through Cumae (see above, p. 295) these
inscriptions would naturally represent their original forms in
Etruria.

In 1882 an amphora was discovered at Formello near Veii,¹
on which this Greek alphabet is written twice from left to right,
together with a retrograde Etruscan inscription, and a "sylla-
bary" or spelling exercise. The alphabet is as follows: α, β, γ,
δ, ε, ζ, Κ, θ, ι, κ, λ, µ, ν, η, Ο, Π, Μ, Ω, ρ, σ, τ, ι, ω, ψ, ζ. This
is the most complete abecedarium extant, containing twenty-six
letters and illustrating the archaic Greek forms of the twenty-two
Phoenician letters in their Semitic order. The four additional
ones are υ, + (= ξ), Φ, and Ψ (= χ). The character η is the
representative of samech, and is not found in Greek inscriptions;
Μ is shin or san (cf. p. 247).

The Caere alphabet, on a vase now in the Museo Gregoriano,
is also combined with an Etruscan syllabary, consisting of
such forms as βι, βα, βυ, βε, γι, γα, γυ, γε, etc.;² the alphabet
resembles that from Formello, except for the omission of the
Ω, and the ι, which represents san. A third alphabet of
the same type, extending as far as α, was found at Colle
near Siena.³ On another small black jar also found at Caere,
and now in the Museo Gregoriano,⁴ is incised an Etruscan
inscription in two lines, in which also the letters are certainly
early Greek rather than Etruscan; these two from Caere must
be of the same date as the Regulini-Galassi tomb, about
650—600 B.C.

² Dennis, i. p. 273; Deecke, Etr.
The two following, however, are genuine Etruscan *abecelearia*: one from the foot of a cup found at Bomarzo, in which the alphabet runs (retrograde): $a$, $\gamma$, $e$, $f$, $\zeta$, $\eta$, $\theta$, $i$, $l$, $\mu$, $n$, $\pi$, $\Lambda$, $\rho$, $s$, $\tau$, $v$, $\phi$, $\chi$, $\phi$.

![Etruscan alphabet, from a vase](image)

the other in the museum at Grosseto, in which the letters are practically the same, but with the addition of $\kappa$ and $\gamma$. In the first named the form $\zeta$ for $Z$ should be noted, and in both occur the *san* and two forms of $\phi$, which in Etruscan generally appears as $\&$. Among other instances of early Etruscan inscriptions are that on the Louvre vase from Caere, with white paintings on red ground (D151: see p. 294), which dates from the seventh century; and on objects from the Regulini-Galassi and Del Duce tombs (pp. 295, 300). They are, however, very rare on the pottery of the next two centuries, with the exception of those incised on the plain pottery, which bear no essential relation to the vase itself. These, as has been noted, are also found on imported Greek wares, one of the best instances being the kylix of Oltos and Euxitheos, at Corneto, on the foot of which is an inscription of thirty-eight letters not divided into words. Occasionally also painted inscriptions are found.

When, however, we come to the imitation Greek vases of the third and second centuries, we find a curious reversion to the old Greek practice of inscribing the names of the figures and even sentences on the paintings themselves. Some of these have already been mentioned. The best example is afforded by the krater with Admetos and Alkestis, on which the names of the two principals are given as $\Delta \iota \mu \kappa \tau \alpha \alpha$, *Atmite*, and $\iota \tau \sigma \iota \iota \alpha$, *Alesci*; while by the side of the figure of Charun is a long inscription *ECH : EASCE : HUC : APDAM : 8AEPODCE*. On the vase with Ajax and Penthesileia the names are given as

§ 2. ETRUSCAN TERRACOTTA WORK

It remains to say a few words on the other uses of clay among the Etruscans. This subject has indeed been discussed to some extent in Chapter III., regarding the use of clay in general in classical times. But there are some features of work in terracotta which are peculiar to this people. For their extensive use of this material we are quite prepared by the evidence of the pottery found in their tombs, which shows that they understood the processes of manufacture perfectly, even if they failed in their attempts at decoration. As we shall see, they employed it constantly, not only for finer works of art, but for ordinary and more utilitarian purposes. This we know not only from the existing remains, but from many passages of ancient writers, who speak of the Etruscan preference for clay and their skill in its use.

Pliny, in particular, speaks of the art of modelling in clay as "brought to perfection in Italy, and especially in Etruria." \(^2\) He attributes its introduction to the three craftsmen whom Demaratos brought with him from Corinth in the seventh century B.C.—Eucheir, Eugrammos, and Diapos—whom he styles fictores.\(^3\) This story of its origin need not, of course, be implicitly believed; nor, on the other hand, need the statement of Tatian,\(^4\) who, followed in modern times by Campana and other Italian writers, claimed for Italy a priority over Greece in the art of making terracotta figures. For their statues the Etruscans certainly seem to have preferred clay to any other material. Although few of these have descended to us, there are many passages in Roman literature which imply their excellence, and it is chiefly from these that our knowledge of Etruscan statues in terracotta is derived. The Romans, unable

\(^4\) Orat. ad Gracc. 1.
themselves to execute such works, were obliged to employ Etruscan artists for the decoration of their temples, as in the notable instance of that of Jupiter on the Capitol. A certain Volca of Veii was employed by Tarquinius Priscus, about 509 B.C., to make the statue of the god, which was of colossal proportions, and was painted vermilion, the colour being solemnly renewed from time to time. The same artist made the famous chariot on the pediment of the temple, which, instead of contracting in the furnace, swelled to such an extent that the roof had to be taken off. This circumstance was held to prognosticate the future greatness of Rome. Volca also made a figure of Hercules in the Forum Boarium, and we read that Numa consecrated a statue of Janus; but the material in the latter case is not actually specified as terracotta.

Pliny goes on to say that such statues existed in many places even in his day. He also speaks of numerous temples in Rome and other towns with remarkable sculptured pediments and cornices; the existing remains of some of these will presently be discussed. There is no doubt that the use of terracotta for the external decoration of temples was even more general in Etruria than in Greece; and, whereas in Greece it ceased in the fifth century, in Etruria it lasted down to Roman times. The use of bricks in Etruria seems to have belonged entirely to the time when it had lost its independence, under Roman dominion. For instance, the brick walls of Arretium, which are highly spoken of by Pliny and Vitruvius, do not belong to the Etruscan, but to the later city; and although Gell alleged that he saw tufa walls with a substructure of tiling at Veii, Dennis sought for these in vain; even a pier of a bridge resting on tiles which he found there proved to be later work. For buildings and for tombs the principal material seems to have been tufa, but the tiles of the roofs were probably of terracotta, as were sometimes those used for covering tombs.

5 Etruria, i. p. 12.
Etruscan temples were also largely built of wood, with a covering of terracotta slabs, as the evidence of recent excavations shows. This method of decoration, which, as we saw in a previous chapter (Vol. I. p. 100), was largely practised in Italy and Sicily, and even spread thence to Greece, as at Olympia, is not alluded to by Vitruvius in his description of Etruscan temples (iv. 7), although he speaks of the wooden construction of the roofs; but he alludes to antepagmenta fixed on the front of the temples, which may refer to the terracotta slabs. 1 Earlier restorations made after his descriptions are imperfect in this respect, only regarding construction and not decorative effect. 2 It is at any rate clear that the roof had a pediment on the front only, the other three sides projecting over and forming eaves, round which hung the pendent slabs (see below); they were not required in front because of the portico. Araeostyle temples, the same writer tells us, had wooden architraves and pediments, ornamented with sculpture in terracotta. The cinerary urns often supply evidence as to the construction of the roofs, with their exact imitation of tiles.

We have now remains of at least four temples built in this method, or, rather, of their terracotta decoration: from Cervetri in Berlin, from Civita Lavinia in the British Museum (Plates II.-III.), from Alatri (1882), and from Falerii or Civita Castellana (1886). 3 Other remains of architectural terracotta work come from Orvieto, 4 Pitigliano, 5 and Luni (see below), and from Conca or Satricum, 6 the latter being chiefly antefixal ornaments of the ordinary Italian types. The Cervetri remains consist of roof-tiles, antefixal ornaments with figures in relief in front, and friezes with chariots and warriors. 7 Portions of a similar frieze from the same site are in the British Museum, 8 as are also three antefixes in the same style as one in Berlin

from Cervetri (Plate LIX.). They belong to the fifth century, and illustrate a later development from the ordinary archaic type—idealised female heads or heads of Satyrs with rich polychrome decoration. Another example in Berlin appears to represent Juno Sospita. The friezes are a good example of the Italo-Ionic style of the end of the sixth century, the points of comparison with the Chalcidian and other B.F. vases being particularly noteworthy.

But for information on the form of the Etruscan temple these are too fragmentary to be of any use. The remains from Alatri, Civita Castellana, and Civita Lavinia are much more illuminating. The last-named, of which some description has already been given (Vol. I. p. 101), are partly archaic, partly of the fourth century, the two former wholly of the later date; but allowing for differences of style, the general arrangement was in all cases practically the same. The front of the temple was in the form of a pediment supported on columns, with ornamental raking cornices, and akroteria in the form of figures or groups. Along the sides and back ran gutters, with lion-head spouts at intervals, faced by upright cornices, with pendent plates of terracotta, or “barge-boards” hanging free and ornamented with patterns in relief. These were for protection against weather, like the edgings to the roofs of Swiss chalets and modern railway stations. The practice was quite un-Greek, and peculiar to Etruria. The antefixal ornaments were continued along the sides above the cornice. The architraves were also ornamented with terracotta slabs, on which were palmette patterns; and thus the whole formed a rich and continuous system of terracotta plating which completely covered the woodwork of the architraves and roof. All the slabs were ornamented with coloured patterns in relief, or simply painted on a white slip, such as maeanders, tongue, scale-pattern, lotos-flowers, or various forms of the palmette.

The existing remains of Etruscan monumental sculpture in

1 Cat. of Terracottas, B.621-23; cf. Arch. Zeit. 1871, pl. 1. B.621 is illustrated in Plate LIX.

3 See Furtwaengler, Meisterwerke, p. 250.
clay are, as has been indicated, not large. Some of the architectural antefixes are almost important enough to be included under this head, especially those in the form of figures or groups modelled almost in the round. These belong mostly to the fifth century B.C., and the finest example is the group in the Berlin Museum from the Cervetri find already mentioned, representing Eos carrying off Kephalaos; it is in the style of about 480 B.C. A smaller but still very effective example is the antefix from Civita Lavinia in the British Museum, representing a Satyr and Maenad awaiting the advent of Dionysos (Plate II.). With these must be reckoned the sculptured friezes from Cervetri in the British and Berlin Museums, and the reliefs on the British Museum sarcophagus from the same site. In all these the same prevalence of Ionic Greek influence may be observed, which is characteristic of so much Etruscan work of the late archaic period, both in terracotta and bronze, as in the reliefs of the Polledrara bust. This influence, which is due to the strong Hellenic element in the civilisation of Caere and the Campanian cities, we have also seen at work in the vase-paintings of the period.

One of the earliest instances, and perhaps the most remarkable, of Etruscan clay modelling in the round, for its size and execution, is the group on the top of the famous sarcophagus in the British Museum (Fig. 183). The figures, a man and woman reclining on a couch, are life-size, of somewhat slender proportions, with smiling features, the drapery of the woman stiff and formal. Sir Charles Newton has described the style as "archaic, the treatment throughout very naturalistic, in which a curious striving after truth in anatomical details gives animation to the group, in spite of the extreme ungainliness of form and ungraceful composition." The same difficulties that beset the

4 B.M. Cat. of Bronzes, No. 434, and p. xlvii.
5 See p. 308, and Furtwaengler, Meisterwerke, p. 250.
6 For full description of this sarcophagus see Cat. of Terracottas, B 630; Murray, Terracotta Sarcophagi, pls. 9-11, p. 21. It is interesting to note that the figures must be contemporaneous with the Capitoline statues made by Volca.
sculptor of the Polledrara bust, in working in the round instead of relief, are visible here; and the contrast with the Hellenic style of the reliefs round the lower part is very marked. There are similar sarcophagi in the Louvre, and in the Museo Papa Giulio at Rome.¹ M. Martha notes in regard to the figures on the former that the faces are remarkable for individuality and precision of type, but the limbs are stiff and rude. This is not an infrequent feature of early Greek art.² Signor Savignoni claims these three monuments as purely Ionic Greek work, but repudiates much of the British Museum sarcophagus as un-antique.

Of later sculpture in terracotta the instances are comparatively few, by far the best being the pedimental sculptures from Luni in Northern Tuscany, discovered in 1842, and now at

¹ Mon. dell' Inst. vi. pl. 59; Mon. Antichi, viii. pl. 13, p. 521 ff. (Savignoni). The latter was found in the same group of tombs as the painted slabs in the Louvre described below.
Florence. Their date is about 200 B.C., and they include figures of the Olympian deities, Muses, and a group of Apollo and Artemis slaying the Niobides. A few remains of similar figures were found at Orvieto.

It may be convenient to speak here of a small group of monuments in terracotta which illustrate in an interesting manner the achievements of Etruscan painting in the archaic period. This is a series of terracotta slabs, which were inserted into the walls of small tombs at Cervetri to receive the painted decoration which the Etruscans considered such an important feature of their sepulchral arrangements. Two sets have been found, one of which is in the Louvre, the other in the British Museum; both are of similar character, and belong to the beginning of the sixth century, but the style varies in some degree. Fig. 184 gives one of the slabs in the Louvre.

1 Mus. Ital. di Ant. Class. i. p. 89 ff. pl. 3-7.
2 Dennis, Etruria, ii. p. 48.
3 Martha, L'Art Etrusque, pl. 4 =

The surface of the slabs was covered with the usual white slip or λείχωμα of early Greek paintings,\(^1\) on which the designs were sketched with a point and filled in with red and black outlines or washes. The white ground was left for the flesh of women and for white drapery, the flesh of the men being coloured red. Of the two the Louvre slabs seem the more advanced, and more directly under Ionic influence, while the others are more provincial in character. The Caeretan hydriae seem to have left some traces on the former, and in the latter it is interesting to note the use of borders of white dots for the drapery, such as we see on the Daphnae vases (Vol. I. p. 352).

These paintings may also be compared with those in the Grotta Campana at Veii (Vol. I. p. 39), which, in spirit at any rate, if not in date, are the oldest examples of Etruscan painting, while still under Oriental influence. But not being works in terracotta, they do not strictly concern us here.

Although the more important sarcophagi of the Etruscans were made of alabaster, tufa, and peperino, a considerable number, principally of small size, were of terracotta. All of these belong to a late stage of Etruscan art. Some few were large enough to receive a body laid at full length. Two large sarcophagi, from a tomb at Vulci, now in the British Museum, may be taken as typical.\(^2\) The lower part, which held the body, is shaped like a rectangular bin or trough, about three feet high and as many wide. On the covers are recumbent Etruscan women, modelled at full length. One has both its cover and chest divided into two portions, probably because it was found that masses of too large a size failed in the baking. The edges at the point of division are turned up, like flange tiles. These have on their fronts in one case dolphins, in the other branches of trees, incised with a tool in outline. Other sarcophagi of the same dimensions are imitations of the larger ones of stone. Many of the smaller sort, which held the ashes of the dead, are of the same shape, the body being a small rectangular chest, while the cover presents a figure of the deceased in a

---

\(^2\) Cat. of Terracottas, D 799, 800.
reclining posture. They generally have in front a composition in relief, freely modelled in the later style of Etruscan art, the subject being often of funeral import: such as the last farewell to the dead; combats of heroes (Plate LIX.), especially that of Eteokles and Polyneikes; a battle in which an unarmed hero is fighting with a ploughshare; the parting of Admetos and Alkestis in the presence of Death and Charun; and the slaying of the dragon by Kadmos at the fountain of Ares. Some few have a painted roof. All these were painted in tempera upon a white ground, in bright and vivid tones, producing a gaudy effect. The inscriptions were also traced in paint, and rarely incised. A good and elaborate example of the colouring of terracotta occurs in the recumbent figure on a small sarcophagus in the British Museum (Plate LIX.).

Here the flesh is red, the eyes black, the hair red, the wreath green, and the drapery of the figure is white, with purple and crimson borders; the phiale which the figure holds is yellow (to imitate gilding), and the cushions on which he reclines are red and blue. This system of colouring is maintained to an even greater degree in the relief on the front of the sarcophagus, the subject of which is a combat of five warriors. The background is coloured indigo, and every detail is rendered in colour, except the nude parts, which are covered with a white slip throughout. The pigments employed are red, yellow, black, green, and purple, and the inscription above is painted in brown on white, all the colours being marvellously fresh and well preserved; but the general effect is gaudy, fantastic, and scarcely appropriate. It may also be said in regard to the whole series that the subjects are monotonous and unpleasing, and the compositions crowded to excess.

By far the finest example of these terracotta sarcophagi is one found at Cervetri not many years ago, now in the British Museum (Plate LX.). It is known from the inscription in front

to be the last resting-place of a lady named Seianti Thanunia, whose effigy, life-size, adorns the top—a most realistic specimen of Etruscan portrait-sculpture, and in splendid preservation. Within the lower part her skeleton is still preserved, together with a series of silver utensils. A very similar specimen, that of Larthia Seianti, is in the Museum at Florence,¹ and from the coins found therewith the date of these two may be fixed at about 150 B.C. The figure of the lady was cast in two halves, the joint being below the hips; she is represented as a middle-aged matron, her head veiled in a mantle which she draws aside with her right hand. In her left she holds a mirror in an open case; she wears a sphendone in her hair, and much jewellery. On the right arm are bracelets, and on the left hand six rings, the bezels of which are painted purple to imitate sard-stones; in her ears are pendants painted to imitate amber set in gold. The nude parts are painted flesh-colour, and colouring is freely employed throughout, the cushions being painted in stripes. The dimensions of the sarcophagus itself are 6 ft. by 2 ft. by 1 ft. 4 in.; it has no reliefs on the front, but is ornamented with pilasters, triglyphs, and quatrefoils.

For antefixal ornaments, masks, and the decoration of the smaller sarcophagi and other products of ordinary industry, the clay seems to have been invariably made in the form of a mould; but for the larger sarcophagi and the Canopic figures a rough clay model was made by hand and itself baked. Probably both processes were employed concurrently—large statues, for instance, being made in several pieces; in these it will generally be noted that the head and torso are modelled more carefully than the limbs.

M. Martha² explains the invariable colouring of Etruscan terracottas on the supposition that the Etruscans did not profess to make figures in this material, but looked down on it as a common substance, to be concealed wherever possible. However this may be, the polychromy was not only a necessary artifice, but an admirable means of imparting life and realism to the figures. In the archaic period there is much less variety, yellow, red, brown, and black being the only colours employed

¹ Mon. dell’ Inst. xi. pl. 1. ² L’Art Étrusque, p. 300.
as a rule. The dark red pigment usually applied for flesh-colour on the sarcophagi may suggest the minium with which the statue of Jupiter Capitolinus was smeared. In later work the tints are lighter and much more varied, as we have seen, and this is especially noticeable on the figures from the Luni pediments, in which rose, yellow, green, and blue are employed with the same delicate nuances that we see in the Tanagra figures.

§ 3. SOUTHERN ITALY

In dealing with the indigenous non-Hellenic people of Southern Italy and their pottery, we are almost more at a disadvantage than in regard to the Etruscans. The peoples are almost unknown to us, and are vaguely characterised as "Iapygian," "Messapian," "Oscan," and so on; but this does not really carry us much further. Moreover, this part of Italy has never been scientifically or thoroughly excavated, like Etruria, and even where finds have been made they are small and poor; nothing of very remote date appears to have come to light, and very few early Greek importations. Hence there has been until quite recently no attempt made at a scientific study of the pottery, or even to distinguish local from imported wares; in Heydemann's catalogue of the Naples vases it is practically ignored. Recently, however, Herr Max Mayer, and Signor Patroni, whose laudable investigations of the Graeco-Italian vases have already received attention (Chapter XI.), have turned their attention to the study of the less promising indigenous fabrics.

The region with which the present section deals is that comprised by the three districts of Apulia, Lucania, and Campania. The barbarian races by which it was occupied in classical times were known by various names, used with some vagueness; but roughly we may divide them into two groups: the Iapygians or Messapians and the Peucetians, occupying the south-east portion of the peninsula from modern Bari to the end of the "heel"; see also Pottier, Louvre Cat. ii. p. 371. A line drawn across from Taranto to Fasano roughly divides the two districts, the Peucetians being on the north, the Messapians on the south.
ETRUSCAN AND SOUTH ITALIAN POTTERY

and the Osco-Samnites, who occupied Campania and the mountainous district of Samnium on its north-eastern border. In Lucania the district of Sala Consilina has yielded local pottery.\(^1\) The Osco-Samnites appear to have been more amenable to the influence of Greek civilisation than the others, owing to the existence in their midst of such centres of culture as Cumae, Capua, and Poseidonia (Paestum); hence we find that the pottery of that region shows a much more Hellenic character than that of Apulia, and is more like that of Etruria in its attempts to imitate the Greek imported fabrics (see Vol. I. p. 484).

Greek painted vases are found in Southern Italy as early as the seventh century B.C., though even in \textit{"Aegean"} times they had penetrated as far as Sicily, and even Marseilles (see Vol. I. pp. 69, 86).\(^2\) At Cumae in particular, and also at Nola, \textit{"Proto-Corinthian"} and Corinthian wares have been found; during the sixth century Ionic and Attic B.F. wares make their appearance, but never in large quantities, as in Etruria. They, however, gave rise to a class of imitative fabrics found chiefly in Campania: small amphorae and other forms rudely painted with black silhouettes, dating from the fifth century. At Tarentum the finds of vases have been mainly Greek, but even these are comparatively rare. The principal examples of local wares are to be seen in the museums of Bari, Lecce, Taranto, and Naples; the British Museum, Louvre, and Berlin only possess isolated specimens.\(^3\) The general scarcity of imports is due, Signor Patroni thinks, to the restricted intercourse between the colonies on the coast and the interior districts peopled by hostile local tribes. After the fifth century, when large numbers of Greek artists were established in the towns of Southern Italy, the circumstances became different, and we have already made in Chapter XI. a general survey of the various fabrics produced from that time in the various centres down to the total decay of the art.

All Italiote pottery, before this direct influence of Hellenism

\(^1\) \textit{Notizie degli Scavi}, 1897, p. 167.
\(^2\) For Marseilles see also Déchelette, \textit{Vases Céramiques de la Gaule rom.} i. p. 7.
\(^3\) See also Reinach, ii. 242-43, for those in the Imperial Museum at Vienna.
made itself felt, may be called "archaic"; but it must at the same
time be borne in mind that these archaic types still went on
during the time of Greek influence. They formed, in fact, a
"domestic" style, as opposed to the "high-art" style of the
Graeco-Italian wares, just as the early Geometrical pottery of
Athens is thought to have been in relation to the Mycenaean
vases (see Vol. I. p. 279). They must not, however, be regarded—
as has been done by some writers—as deliberate archaistic
revivals of older fabrics. It is true that they bear a remarkable
resemblance in many cases to Aegean, Cypriote, and Geometrical
wares; but this likeness is due to other causes, being the result
of development, not of direct imitation. A learned Italian, on
first seeing some of the local pottery excavated in Apulia, ex-
claimed, "This is the Mycenaean style of Italy." Chronologically
and ethnographically he was wrong, but artistically he was right;
and as Signor Patrioni has pointed out, parallels to nearly all the
ornamental motives of local Apulian fabrics may be traced in
Mycenaean pottery.

There is also a favourite shape, that of a large double-
mouthed askos, examples of which may be seen in the British
Museum (F 508 = Fig. 185, and F 509), which is obviously
derived directly from the Mycenaean "false-necked amphora"
(see Vol. I. p. 271). It is not a Hellenic type, although it is
the forerunner of a form of askos found among the painted
vases of Apulia. 1 Another favourite form, which Signor Patrioni
calls the orcio appulo, a jar with three vertical handles round the
nearly spherical body, and wide-spreading mouth, may similarly
be derived from the Mycenaean three-handled pýxis (Vol. I. p. 272).
Other forms, again, are parallel with those of Cyprus, as is in
some cases the system of geometrical decoration, a figure or
pattern in a panel with borders of geometrical ornament.

The writers above-mentioned distinguish two main classes
of the local pottery of Apulia (including the south-eastern
extremity or "heel" of Italy). The central portion of this
district was inhabited by a tribe known as the Peucetii, and
the extremity by Messapians, or, as they are also styled,
lapygians. The vases, which appear to be the product of the

latter race, are found in various places—such as Brindisi, Ægnazia or Fasano, Lecce, Nardo, Ostuni, Otranto, Putignano, Rugge, Taranto, and Uzento—and they may best be studied in the museum at Bari. The pottery of the Peucetii, which Signor Patroni calls Apulian, covers the region round Bari, including Putignano on the south, Bitonto and Ruvo on the north, where the local civilisation seems to have been modified by the influence of such centres as Canosa.

The typical form of Messapian pottery is a krater with high angular handles, at the highest and lowest points of which are pairs of discs (rotelle), a spherical body, and neck sloping
inwards, without lip. The form is one which, as we have seen in Chapter XI., was adopted by the Greek vase-painters in Lucania at a later date.\(^1\) Mayer states that this form is only found in the "heel" of Italy, but Patroni seems to imply that it is typical of Central Apulia.\(^2\) It is painted in two colours—purple-red and dark brown or black; but the former colour is not found in the earlier examples. The decoration includes simple geometrical or vegetable patterns, such as wreaths, panels of lozenge-pattern, zigzags, and an ornament composed of two triangles point to point $\bigtriangleup$, which Mayer calls the "hourglass" ornament. The more developed examples have figures in panels, ranging from rows of ducks to human figures. Among these are a man gathering fruit from a tree and two stags confronted. Lenormant published two very interesting specimens in the Louvre, one of which has two cocks confronted, the other a man swimming accompanied by a dolphin.\(^3\)

The latter, with others of the same class, styled by Lenormant "Iapygian," appear to be imitations of B.F. amphorae\(^4\); but if they are imitations they must be almost contemporaneous with their prototypes, and cannot be later than the fifth century. The man with the dolphin recalls the story of Taras and the coin-types of Tarentum; but Lenormant pointed out that a similar legend was current relating to Iapys, the eponymous hero of Iapygia,\(^5\) and he may therefore be intended. Some of these vases have painted inscriptions, one of which runs, ΙΑΡ; but they are apparently nothing more than names, partly Hellenised.

Among other shapes are a kind of askos with simple decoration, a jug or pitcher with discs attached to the handles, also with simple patterns, and a unique variety of the krater with four flat-topped column-handles. Signor Patroni\(^6\) calls attention to another class of Messapian vases from which the geometrical decorative element is absent, the ornament being arranged in bands of equal width, and varying between linear and natural

---

\(^5\) *Serv. ad Virg. Aen.* iii. 332.  
\(^6\) *Ceramica Antica,* p. 19 ff.
forms. A characteristic motive is a sort of chain-pattern. The wave and rows of pomegranate-buds also occur, and animals, such as dogs and dolphins; also human heads and figures. The shapes are either the double-necked askos, as given in Fig. 185, with an arched handle between the mouths, or a kind of double situla, formed of two jars on a cylindrical stand with a vertical handle between.

As Mayer has pointed out, there cannot here be any question of a very ancient class of vases, but rather of one of eclectic character. The Geometrical tendency appears chiefly in the north of the district, where the influence of Peucetia (see below) was felt. The vegetable ornaments, he suggests, have affinities with those of "Rhodian" vases. The date can hardly be earlier than the fifth century.

The fabrics of Central or Peucetian Apulia centre, as has been noted, round Bari. They are all of a strongly Geometrical type, but the system of ornamentation is freer and more varied than in the Messapian class. They are easily recognisable by their forms and characteristic designs, painted only in brown or black. Here, again, the typical form is a krater, in which the handles are either arched in vertical fashion or else form flat bands. It has a shallow, spreading lip. The patterns are arranged in panels and bands, and are often executed with great care. Fig. 186 gives an example from Sala Consilina in Lucania. The favourite motives are chequers, zigzags, the "hour-glass," hook-armed crosses, and lozenges filled with reticulated pattern, neatly arranged in

1 Cf. Röm. Mitth. 1897, pl. 10, p. 222.  
2 Notizie degli Scavi, 1897, p. 168.
friezes or saltire-wise. Round the lower part of the vase is often found what may be described as a comb-pattern, and on some vases is a curious rudimentary form of the maeander, arranged in triangles or diagonal crosses. Among the other shapes are a small askos with ring-handle on the back, a sort of high stand like a fruit-dish, large cups and bowls, and the *oreio* already mentioned. One of the finest examples is a krater from Ruvo in the Jatta collection, with twisted handles and a very elaborate system of ornamentation, chiefly diaper and maeander patterns.

Like the Messapian, the Peucetian or Apulian pottery seems to have flourished during the fifth century; but there are some vases which seem to form connecting-links with their Hellenic prototypes, and probably belong to the sixth century. In any case, both fabrics must be regarded as much earlier than previously supposed; they are certainly not late archaic work, and time must be allowed for their disappearance when the Hellenic fabrics of Apulia begin. In placing the majority of the products between 600 and 450 B.C., we shall probably not be far from the truth, although M. Pottier would throw the origin of the fabrics as far back as the eighth century.

CHAPTER XIX

TERRACOTTA IN ROMAN ARCHITECTURE AND SCULPTURE

The uses of clay among the Romans were, as may be supposed, much the same as among the Greeks and Etruscans, in architecture, in sculpture, and for household implements. The main differences are that in some cases—as in architecture—its use was more extensive at Rome, in others less; and that generally the products of this material in Roman workshops are inferior to those of the Greeks. But the technical processes are in the main identical with those employed by the Greeks, and consequently much that has been said in Chap. III. of this work need not be here repeated.

I. ARCHITECTURE

1. BRICKS AND TILES

The Romans divided the manufacture of objects in clay into two classes: *opus figlinum* or fine ware, made from *argilla* or *creta figuraris*; and *opus doliare*, for tiles and common earthenware.\(^1\) We begin, then, as in the chapter on the Greek uses of clay, with the latter division, including the use of this material in Roman architecture, and primarily in the making

---

\(^1\) Pliny, *H.N.* xxi. 47; Columella, *Re Rust.* iii. 11, 9.
of bricks and tiles. It must be borne in mind, however, that the structural use of bricks of clay, such as we employ at the present day, was unknown to the Romans; they only used what we should call tiles, and even these were only employed structurally, as a facing to walls and vaults of concrete; no walls were ever built of solid brick, and even in those of seven inches thickness the bricks are built on a core of concrete. Nor were the bricks allowed to appear on the outer face of the building, at least before the second century of the Empire; they were always faced with a coating of marble or stucco.

Nevertheless, the general use of bricks or tiles was most extensive, and they were employed as tiles for roofing houses, as bricks for walls and vaults, and even for columns, as slabs for pavements, for furnaces and for covering graves, and in tube form for conveying water or hot air; they are found in temples, theatres, and baths, and are used for cisterns and fountains, and in aqueducts and military fortifications. They were called lateres, because, says Isidorus, "they were broad, and made by placing round them four boards."¹ The kilns were called laterariae, and the makers laterarii; to make bricks was lateres ducere, fingere,² or (with reference to the baking only) coquere. The word later seems to be employed indiscriminately for sun-dried (crudi) and baked bricks (coctiles),³ without the qualifying epithet, but testa is also used when burnt brick is intended.⁴ The sun-dried bricks were the earlier and simpler form, used for building walls and cemented together with clay or mud.⁵ Vitruvius in his account of brick-making (ii. 3) only refers to this kind, and apparently never mentions baked bricks except in passing allusions. He describes three kinds, to which he says the Greeks gave the respective names of genus Lydium, pentadoron, and tetradoron (see Vol. I. p. 95). The two latter are exclusively Greek, but the first-named, ¹½ by

1 foot in dimensions, answers to the Roman tegula sesquipedalis.\(^1\) A frequent arrangement, he says, was to employ half-bricks in alternate courses with the ordinary sizes, which served to bind the walls together and present an effective as well as a stable appearance. This information is repeated by Pliny, copying almost word for word.\(^2\)

Among the Romans two dimensions were in general use, as may be inferred from the frequent mention in inscriptions or elsewhere of the sesquipedales and of bipedales,\(^3\) or two-foot bricks, as we shall have occasion to show later. Being very flat and thin in proportion to their size, these bricks rather resemble tiles, as has been already noted; they are generally square, or at least rectangular. But there were also tegulae bessales or bricks measuring two-thirds of a foot square, \(i.e.\) about 8 inches, and triangular bricks, equilateral in form, with a length varying from 4 to 14 inches. The latter are the kind used in all existing Roman walls of concrete with brick facings. The thickness varies from 1\(\frac{1}{4}\) to 2 inches. They are not always made with mechanical accuracy, the edges being rounded and the sides not always parallel. In military works they were often used alternately with flint and stone (see below, p. 337), as we see them in England, at Colchester, Dover, Verulam, and many other places.\(^4\) At Verulam the tiles are arranged in three horizontal layers at intervals of about 4 feet, with flint and mortar between. They were also used for turning the arches of doorways, and for this purpose tegulae bipedales were cut into pieces, so as only to tail a few inches into the concrete which they cover. Complete squares were introduced at intervals to improve the bonding.\(^5\)

The pillars of the floors of hypocausts were formed of tegulae bessales, and sometimes also of two semicircular bricks joined so as to form a circle, varying from 6 to 15 inches in diameter.\(^6\) Occasionally the upper bricks diminished in size,

\(^6\) Marquardt, Privatalterthümer, p. 618.
in order to give greater solidity to the structure. The bricks or tiles forming the upper floors were from 18 to 20 inches square; in some cases, as at Cirencester,\(^1\) these were flanged tiles (see below).

The general size of Roman bricks was, in the case of the *sesquipedales*, 1 1/2 by 1 Roman foot; but variations are found, such as 1 1/4 by 1 4 inches. For the *bipedales* Palladius recommends 2 feet by 1 foot by 4 inches. The great building at Trier known as the Palace of Constantine is built of burnt bricks, 15 inches square by 1 1/4 inch thick.\(^2\) Prof. Middleton notes tiles in Rome of 12, 14, and 18 inches square,\(^3\) and Marquardt\(^4\) states that bricks found in France measure 15 by 8 to 10 inches; others (the *bessales*) 8 by 8 by 3 inches. A complete circular brick, measuring 7 1/2 inches across by 3 1/4 inches thick, and impressed with the stamp of the eleventh legion, was found at Dolae near Gardun, and is now in the museum at Spalato.\(^5\)

Vitruvius\(^6\) gives elaborate instructions about the preparation of the clay for sun-dried bricks, and counsels in the first place a careful choice of earth, avoiding that which was sandy or stony or full of loose flints, which made the bricks too heavy, and so liable to split and fall out when affected by rain; it also prevented the straw from binding properly. Clay which was either whitish or decidedly red (from a prevalence of ochre) was preferred, and that combined with coarse sand (*sahulo masculus*) made light tiles, easily set. The process of manufacture was a very simple one. The clay was first carefully cleaned of foreign bodies, and then moistened with water and kneaded with straw. It was then moulded by hand or in a mould or frame of four boards, and perhaps also pressed with the foot.\(^7\) The bricks were then dried in the sun and turned as required, the usual process also adopted in the modern

---

5. ii. 3, 4.
7. This may be the origin of the foot-shaped stamp so common in Roman lamps and vases (see Blümner, *Technologie*, ii. p. 18).
brickfield. Some bricks actually bear the marks of the feet of animals and birds which had passed over them while the clay was soft, and there is one in the Shrewsbury Museum with the imprint of a goat's feet. Others at York and Wiesbaden show the nails of a boy's shoes.\(^1\) These impressions of feet (where human) may also be referred to the practice of using the feet to knead the bricks.

The bricks were then ready for use, but were kept for two years before being employed, otherwise they were liable to contract, which caused the stucco to break off and the walls to collapse. At Utica, Vitruvius tells us, they had to be kept five years, and then could only be used if passed by a magistrate. Altogether, much care was taken in their preparation, and it was generally considered that spring and autumn were the most favourable times for making them, probably because they dried more slowly and were less liable to crack during the operation. In summer the hot sun baked the outer surface too fast, and this appeared dry while the interior was still moist, so that when the inside dried the outside contracted and split.\(^2\) It was also, of course, advisable to avoid seasons of rain and frost. But the bricks could not be properly tested until they had undergone some exposure to the weather, and for this reason Vitruvius recommends the employment of old roof-tiles where possible in building walls.\(^3\)

For baked bricks the processes must have been much the same, with, of course, the addition of the baking in the furnace. Existing Roman bricks are nearly always of well-tempered clay and well baked; but the clay exhibits a great variety of colour—red, yellow, and brown. The paste is remarkably hard, breaking with an almost vitreous fracture, and sometimes shows fragments of red brick (pozzolana) ground up with it to bind it together, and prevent warping. This may be seen in the Flavian Palace on the Palatine, and in an archway in the Aurelian Wall near the Porta Latina. As an instance of

\(^3\) Blümmer, ii. p. 20, points out that there are very few instances of this, and perhaps Vitruvius' idea was not practical.\[3\]
varieties of brick found in the same building, Nero's Aurea Domus may be cited.\(^1\) The durability of Roman tiles is ascribed to their careful preparation and seasoning, which give them a much longer life than modern tiles; hence they were frequently used up again in early mediaeval buildings and in Romanesque churches in England, as at St. Albans, St. Mary-in-Castro, Dover, and St. Botolph's and Holy Trinity, Colchester.\(^2\)

During the period of the Republic private houses and public buildings alike were built of unburnt brick in Rome, as we learn from the words of Dio Cassius,\(^3\) Varro,\(^4\) and Cicero\(^5\); Varro speaks of *domus latericiae*, and Cicero of "the brick (*latere*) and concrete of which the city is constructed."\(^6\) After the Republican period this material was still employed outside Rome with burnt-brick cornices,\(^6\) but even this was exceptional. Pliny mentions walls of sun-dried bricks at Arretium and Mevania.\(^7\) Henceforth, then, burnt brick was employed more and more as Rome grew more populous.\(^8\) In Vitruvius' time (the beginning of our era) the materials used for building were stone for substructures, burnt brick (*structura testacea*) for the outer walls, concrete for the party-walls, and wood for the roofs and floors. He explains the cessation of the use of unburnt brick as due to the legal regulations of his time, which prohibited party-walls of more than 1\(\frac{1}{2}\) foot in thickness, and unburnt bricks could only support one story above them in that size.\(^9\)

Baths, either public or private, walls and military fortifications, were built of bricks, the latter being thus better able to resist attacks than if they were of stone. Temples, palaces, amphitheatres, the magnificent aqueducts and the cisterns with which they communicated, were also usually of this material. Of these, numerous remains exist in Rome and other places, such as Cumae and Pozzuoli. The aqueduct made by Nero

from the Anio to Mons Caelius is of brick, that of Trajan partly so; the aqua Alexandrina of Severus Alexander (A.D. 229) and that existing at Metz are wholly of brick, and so are the castella or reservoirs made by Agrippa when he constructed the Julian conduit over the Marcian and Tepulan. It is true that Augustus boasted that he had found Rome of brick and left it marble; but it must be remembered, firstly, that Suetonius uses the term latericiam, which may denote unburnt brick; secondly, that the phrase is probably to be limited to public buildings and monuments, in which there was an increased use of marble for pillars and roofs. For walls brick and concrete continued to be used, as in private buildings, with a covering of stucco in place of marble incrustation.

In the first century of the Empire brick-making was brought to perfection, and its use became universal for private and public buildings alike; the mortar of the period is also of remarkable excellence. The Romans introduced brick-making wherever they went; and even their legions when on foreign service used it for military purposes. But of pure brick architecture, as we see it, for instance, in the Byzantine churches of Northern Italy, there was no question until comparatively late times. It was always covered over with marble or stucco until the second century of the Empire. Examples of sepulchral buildings wholly in brick, of the time of Hadrian, may be seen in the tomb before the Porta San Sebastiano at Rome, known as the temple of Deus Rediculus. This has Corinthian pilasters with a rich entablature, red bricks being used for architectural members, yellow for the walls; the capitals are formed of layers of bricks. Of Hadrian’s time are also the guard-house of the seventh cohort of Vigiles across the Tiber, of which a small part remains, and the amphitheatrum castrense on the walls of Aurelian.

One of the most remarkable instances of Roman brick

1 See Daremberg and Saglio, s.v. Aquaeductus; Middleton, Remains of Ancient Rome, ii. p. 323.
2 Suet. Aug. 28.
3 Bormann, Die Keramik in der Baukunst (Durm’s Handbuch d. Architektur), p. 51.
construction is the Pile Cinq-Mars, as it is called, a tower still standing on the right bank of the Loire, near Tours. It is about 95 feet high and 13 feet square, expanding at the base, being built of tiles to a depth of 3 feet each side, with a body of concrete; the tiles are set in mortar composed of chalk, sand, and pounded tiles. On one side there are eleven rectangular panels with tile-work of various patterns, like those on the flue-tiles (see p. 348), and as also seen on the Roman wall at Cologne; the patterns include squares, triangles, and rosettes. The history and purpose of this building are quite unknown.¹

At Pompeii bricks are used only for corners of buildings or doorposts, and sometimes for columns, as in the Basilica and the house of the Labyrinth.² There are also late examples of brick columns with capitals in tiers of bricks as in the tomb mentioned above. Brick walls are not found, but bricks occur as facing for rubble-work. These are less than an inch thick, triangular in form, with the hypotenuse (about 6 inches long) showing in the face of the wall. Sometimes fragments of roof-tiles are used (cf. p. 334). The earlier bricks contain sea-sand, and have a granular surface; the later are smooth and even in appearance. Later, what is known as opus mixtum (see below) is used, as in the entrance of the Herculaneum gate; this implies courses of stone and brick alternating,³ which, as we have seen, was common in military works, as in the Roman walls in Britain. In this country, owing to the absence of good material for concrete, the use of stones or brick throughout for building was general from the first; hence, too, the bricks are always flat and rectangular in form (bipedales).⁴

The arrangement of triangular bricks (made by dividing a medium-sized brick into four before baking), laid flat in regular horizontal courses, is characteristic of the earliest examples of Roman methods. It is found in the Rostra (44 B.C.) and in the Regia (35 B.C.), the earliest existing

¹ Roach-Smith, Collect. Antiq. iv. p. 11, pl. 5-6.

³ See Mau-Kelsey, Pompeii, p. 36.
⁴ Mau-Kelsey, Pompeii, p. 38.
⁵ Archaeologia, lli. p. 664.
examples. The back wall of the Rostra is of concrete faced with triangular bricks 1 1/2 inch thick, the sides 10 inches long. The same arrangement may be seen in the Pantheon, in the Thermae of Diocletian, and in some of the aqueducts (see below). The brickwork in the Pantheon was formerly thought to belong to the building of Agrippa in 27 B.C., but has been now shown to belong to the second century. At Ostia, in the temple of Honos and Virtus, the walls are built of triangular bricks or with red and yellow bricks with moulded cornices.

About the year 80 B.C. the method known as opus reticulatum was introduced, in which the bricks presented square faces (about 4 inches each way), and were arranged diagonally to form a network pattern (Fig. 187). At Pompeii the opus reticulatum dates from the time of Augustus; it is laid on concrete, and the bricks are small four-sided pyramids with bases 3 to 4 inches square. This method lasted down to about A.D. 130 in Italy. It should, however, be noted that it was commoner in stone than in brick, the latter material not having come into general use for building at the time when it was employed. But even when tufa was used for the reticulated work, bricks or tiles were used for quoins at the angles, and for bonding courses through the walls, as well as for arches and vaults (Fig. 188). This combination of opus reticulatum and brickwork is well illustrated in the palace of Caligula. In the case of vaults,

1 Middleton, Remains of Ancient Rome, i. pp. 254, 301; id. in Archaeologia, xlix. p. 426.
4 See Blümner, Technologie, iii. p. 146, where a good illustration is given.
5 Archaeologia, ii. pl. 2, fig. 4; Middleton, op. cit. i. p. 55, fig. 6.
indeed, the use of brick seems to have been general, as in the baths of Caracalla, and many other buildings (cf. Fig. 189). Vitruvius\(^1\) advises the use of *tegulae bipedales* to protect the wooden joists over the vaults from being rotted by the steam from the hot bathrooms; they were to be placed over the whole under-surface of the concrete vault, supported on iron girders, which were suspended from the concrete by iron clamps or pins. Over the whole was laid a coating of cement (*opus tectorium*) in which pounded pottery was the chief constituent, and this was stuccoed.\(^2\)

The *opus mixtum* (the term is not classical) prevailed regularly under the later Empire, from the fourth to the sixth century; the earliest example which can be dated is the circus of Maxentius. It is also used in work of the time of Theodoric.\(^3\) The method of construction is shown in Fig. 190.

\(^1\) v. 10, 2.

\(^2\) See also on this subject Anderson and Spiers, *Architecture of Greece and Rome*, p. 137 ff.; Middleton, *op. cit.* i. p. 66, ii. p. 120, fig. 64.

\(^3\) See Middleton, *op. cit.* i. p. 62; *Archaeologia*, li. pl. 2, fig. 5.
The reason for the limited use of brick in Rome may have been the scarcity of wood for fuel for the kilns. But in any case the pointed backs of the bricks made a good bonding with concrete, and presented a large surface with a comparatively small amount of clay. The secret of the wonderful durability of Roman buildings is that each wall was one solid coherent mass, owing to the excellence of the concrete. In the Pantheon the concrete of the dome is nearly 20 feet thick, the brick facing only about 5 inches. The character of the brick facing often indicates the date of a wall, the bricks in early work being thick and the joints thin; later, the reverse is the case. But caution must be exercised in dating on this principle, owing to the great variety of methods employed during the same reign, and even in the same building.  

The word for a tile, *tegula*, is derived from *tegere*, to cover, or, as Isidorus says, they are so called *quod aedēs tegant*²; the

curved roof-tiles were known as *imbrices* because they received rain-showers (*imbres*). The maker of roof-tiles was known as *tegularius*¹ or *figulus ab imbricibus*.² *Tegulae* or flat roof-tiles were usually made with vertical flanges (2½ inches high) down the sides, and these flanges, which fitted into one another longitudinally, when placed side by side served to hold the covering-tiles placed over them. There were also roof-tiles known as *tegulae deliciares*³ and *colliciares*, which formed the arrangement underneath the surface of the roof by means of which the water was collected from the *tegulae* and carried off in the front through spouts in the form of lions' heads.⁴

Besides the various rectangular forms we find triangular tiles used, either equilateral or right-angled; semicircular or curved tiles, used for circular walls, ovens, tombs, and cornices, or other parts of buildings; cylindrical tiles (*tubuli fictiles*),⁵ which were used for drains and conduits; and, finally, the rectangular hollow flue-tiles, employed for hot air in hypocausts.⁶ Another form was the *tegula mammata*, a plain square tile with four knobs or breast-like projections (*mammæae*), which was often used in party-walls with the object of keeping out damp.⁷ The tiles were inserted by the points of the projections into the concrete, thus leaving a space between in which the warm air could circulate freely.

Existing examples of tiles are composed of a compact dense clay, less fine than that of the bricks, and of a pale salmon or light straw colour when baked. They were probably made in moulds—but these may only have been a couple of boards placed together—and after being dried in the sun were baked in kilns. The flanged tiles were, of course, produced by turning up the edges before drying. Besides the arrangement described above, it is probable that roofs were sometimes tiled in the manner prevalent in the present day, with flat or curved tiles

³ There are tiles in existence marked *DOL. DELIC. I. C. (opus) deliares deliciares* (Marquardt, *Privatalterthümer*, p. 619).
⁴ The arrangement is well illustrated on pl. 6 of Campana’s *Ant. opere in plastica* (from Ostia).
⁵ Vitr. v. 9, 7; viii. 7, 1.
⁷ See Vitr. vii. 4, 2; Nissen, *Pompeian Studien*, p. 65 ff.
overlapping like scales; and for this purpose the tiles seem to have been pierced with holes at one corner, and so attached to one another. The same method obtained in the Roman villas in Britain, except that Stonesfield slate was used in place of tiles. An inscription found at Niederbrunnen in Germany speaks of *attelgia tegulicia*, or huts roofed with tiles, erected in honour of Mercury.¹

Tiles with turned-up edges or flanged tiles were principally employed, as has been indicated, for roofing; but some were also placed in walls where required, especially where a space was required for the passage of air.² They were also employed for the floors of bath-rooms, in which case they were laid on the *pilaæ* of the hypocaust in an inverted position, and the cement flooring was laid upon them. The flanges are generally about 2½ inches higher than the lower surface of the tile; they are bevelled on the inner side in order to diminish the diameter of the *imbræs*, but have no holes for nailing to the rafters. The ends of the sides were cut away in order that the lower edge of one tile might rest on the upper edge of the one adjoining. Those found in France are said to be distinguished by the sand and stones found in their composition.³ There are flange tiles of red and yellow clay from the Roman Thermae at Saintes in the Museum of Sèvres, and others from ancient potteries at Millac de Nontron, as well as tiles of red clay from Palmyra.⁴ In the military *castra* in England flange tiles of a red or yellow colour have been found, the latter with fragments of red tiles mixed in the clay. They are also often found in the ruins of villas. A flange tile from Boxmoor, Herts, now in the British Museum, measures 15½ by 12 inches, the flange being 2¼ inches high; and it will be seen that these dimensions correspond roughly with the *tegulae bipedales*. Flanged tiles with holes in them appear to have been used at Pompeii for lighting passages, the flanges serving to keep out rain.⁵

The *imbrices* or covering-tiles which held the flat tiles together,

² Caumont, Cours, ii. p. 182.
³ Ibid. p. 184.
⁴ Brongniart and Rioceaux, Mus. de Sèvres, i. p. 18.
thus rendering the roof compact, were quite plain, with the exception of the end ones over the gutters. These were in the form of antefixal ornaments like the Greek examples (Vol. I. p. 98), an upright semi-oval termination ornamented with a relief or painted pattern, with an arched support at the back. Many examples exist at Pompeii (see below), Ostia, and elsewhere; but artistically they are far inferior to the Greek examples, and of simpler design. Most of them have a simple palmette or acanthus pattern in low relief, but on or below this an ideal head or the head of a deity is sometimes added, such as Zeus Ammon, Medusa, a Bacchic head, or a mask, or even a figure of Victory. Of the last-named there is a good specimen in the British Museum (D 690 = Fig. 191); she carries a trophy from the battle of Actium, and stands on a globe from which spring two Capricorns (the symbol of Augustus).

No better example of the various uses of ornamental tiles in architecture can be selected than the remains found at Pompeii, which are exceedingly numerous. Terracotta seems to have been used here especially for such parts of the decoration as were exposed to wet, as well-mouths, gutters, and antefixal tiles. A characteristic feature of the decoration of Pompeian houses was the

---

1 Campana, Ant. opere in plastica, pl. 6.
2 For references to ornamental terracotta antefixes in Latin literature see below, p. 371; and cf. Livy, xxvi. 23, xxxiv. 4.
3 See for an account of these Von Rohden, Terracotten von Pompeii, p. 5; also Mau-Kelsey, Pompeii, p. 251.
trough-like gutter which surrounded and formed an ornamental cornice to the *compluvium* or open skylight of the *atrium* and peristyle, through and from which the rain-water was collected in the *impluvium* or tank sunk in the ground below. These were adorned with spouts in the form of animals’ heads or foreparts, usually lions and dogs, with borders of palmettes between; the gutter behind was virtually a long tank of square section.

Antefixes and gutter-cornices, where they occur, must always be regarded as serving ornamental rather than necessary purposes. All early work in terracotta at Pompeii is of coarse clay, but good execution; later, the reverse is the case. The only public building in which many remains of terracotta tiles and cornices have been preserved is the temple of Isis; but the Basilica may also have had terracotta decoration. Many fragments also remain from private houses, some actually *in situ*, having been neglected by early explorers as unimportant. In the house of Sallust a kymation cornice from one of the garden courts has scenic masks forming the spouts; this is not earlier than the rebuilding of the house A.D. 63. There is also much terracotta work in the house of the Faun. Comic masks were used both as spouts and as antefixes, the exaggerated mouth of the mask serving admirably for the former purpose. These date from the reigns of Nero and Vespasian, and all seem to be from the same fabric, although there is considerable variety in the types; the use of masks for these purposes is not earlier than Nero’s reign (cf. the house of Sallust, above). Besides the ornaments above mentioned the patterns on the cornices include palmettes and floral scrolls, dolphins and Gryphons.

The roof-tiles were of the usual kinds, flat oblong *tegulae* with flanges, measuring 24 by 19 by 20 inches, with semicylindrical *imbrices*. They were laid in lines parallel to the long ridges of the roofs, so that the water converged into the

5 Mau-Kelsey, *Pompeii*, p. 36.
gutter-tiles at the angles, whence it fell into the impluvium. These gutters, however, were not confined to the angles of the openings, but were sometimes ranged along the whole length of the sides, as we have seen; those at the angles only seem to be earlier in date. They are not found on the exteriors of buildings. The front of the gutter was usually in the form of a vertical kymation moulding, but was sometimes simply chamfered. Antefixal ornaments terminating the covering or ridge-tiles are not invariable, but are found at different periods. The earliest examples are in the form of palmettes, but the later exhibit a great variety: comic masks, a head in low relief on a palmette, or a head surmounted by a palmette. Of the latter class thirty-eight were found in 1861. In the Augustan period ideal heads of gods and demi-gods are sometimes found.

Von Rohden, in summing up (p. 14), is of the opinion that terracotta roof-decoration at Pompeii was comparatively rare. In the whole record of excavations only twenty-three water-spouts are mentioned, though it is probable that many were never registered. In scarcely more than twelve private houses have as many pieces been found as would suffice for the whole of the atrium and peristyle roofs, and nearly all of these are of late date. The discovery of isolated pieces in a house seems to show that they were used up again in the restorations after the earthquake of A.D. 63.

There are also some good examples of roof-tiles among those which have been found at Ostia, both in baths and private houses; some of the latter came from a house of which the brickwork bore inscriptions with the names of consuls of Hadrian's reign. The arrangement of the roof-tiles is that described on p. 341; the antefixal ornaments are usually in the form of palmettes or acanthus leaves, with maeander below; but heads of deities, such as Venus and Neptune, or of Medusa, and tragic masks were also found. Two exceptional examples had groups in relief of Neptune drawn over the sea by hippocamps, and of

the statue of Cybele in the ship drawn by the Vestal Virgin Claudia.

Tiles of the size known as *bipedales* are also used for lining the walls of rooms. They are found in Roman villas in Britain, and are ornamented on one side with various incised patterns, made with a tool in the wet clay. On some found at Ridgewell in Essex the decoration consists of lozenges, rosettes, and other ornaments, like those on the Pile Cinq-Mars already described; they are often found covered with the stucco with which the walls were plastered. At Pompeii, Orvieto, and elsewhere the stucco-painted walls were constructed with *tegulae mammatae* placed edgewise, and connected with the main walls by leaden cramps, the brick lining being thus detached from the walls by a narrow interval which served as an air-cavity. This was a frequent proceeding, and was also contrived with flanged tiles; it corresponds with the system prescribed by Vitruvius for keeping damp from the painted walls of rooms. It was also largely employed in baths and bathrooms, the object being both to keep the walls dry and to allow hot air to circulate from the hypocausts and warm the rooms. In the cold climate of Britain the Romans found this a universal necessity, and instances may be observed in many of their villas; but, as far as can be observed, the general method of warming was by an extensive system of pipes under the floors rather than up the walls. These tiles are pierced with holes, by means of which they were attached to the walls by plugs or nails of lead. In the *castrum* at Jublains a chamber is yet partly standing with one of its sides coated with tiles of this kind.

More commonly, however, a peculiar kind of tile was used for warming the hot rooms (*sudationes*) of baths, and in villas when required. They were hollow parallelopipeds, known as *tubi,*

---

4 vii. 4, 2.
with a hole in the side for the escape of the air which traversed them, the usual dimensions being about 16 by 6 by 5 inches.\(^1\) Seneca speaks of pipes inserted in walls, which allowed the warmth to circulate and warm both the upper and lower stories equally;\(^2\) and the younger Pliny mentions the air-holes (fenestrae) in the pipes which warmed his bedroom, by means of which the temperature could be regulated at pleasure.\(^3\)

\(^4\) So also in the Roman villa at Woodchester (Wright, * Celt, Roman, and Saxon*, p. 198).
sides with wavy or diagonal lines, as in the flat tiles described above, and as is often done in modern building. The whole system of heating, which may be seen in the baths of Caracalla, is very instructive (Fig. 192): the walls were of concrete with brick facing, through which a system of flues of socket-jointed tiles passes upwards from the hypocaust below, effectually warming every part.¹

The hollow tiles often assume a more ornamental appearance (as in Fig. 193), the patterns scratched on them taking the form of lozenges and diapers, chevrons, chequers, and rosettes, as may be seen in a Roman villa at Hartlip in Kent, where other tiles are simply scored with squares.² This villa is remarkable for the extensive use of tiles throughout; even the staircases are constructed with them. Others found in Essex and Surrey have dogs, stags, and initial letters among foliage; one found in London had among the wavy lines of pattern the letters PX TX³; and another, from Plaxtol in Kent, the local maker's name, CABRIABANTI.⁴ These hollow tiles, which are generally of the same clay as the roof-tiles, were also occasionally used as pillars of hypocausts,⁵ but for this purpose columns of tegulae bessales were more usual, as Vitruvius implies.⁶ Many examples may be seen in the Roman villas of Britain, as at Cirencester, Chedworth, Lympne, and Wroxeter. In a villa found at Carisbrooke, Isle of Wight, the whole bath was constructed of tiles, the floor supported by pilae of the same.⁷ At

⁶ vii. 4. 2.
Bath the hollow tiles are actually used as *vousoirs* for arches and vaults.  

Through these chimneys—for this is what they practically were—the hot air circulated and gave an imperfect warmth to the rooms, the heat radiating from the walls or penetrating through the air-holes. The pipes standing close to one another virtually made up the wall; but the exact method by which the warming was accomplished, without great inconvenience to the occupiers of the rooms, is not quite clear. It is not difficult to imagine that the tiles would have warmed rooms merely by the introduction of hot air circulating through them, even though covered with stucco. On the other hand, the apertures for admitting the air into the rooms, if of any size, must also have admitted smoke from the hypocausts, and interfered with the ventilation. It may be that they were not made for this purpose at all, but only for fastening the pipes together or to the walls. Another difficulty is the method in which the flues made their exit into the open air. It has been suggested, partly on the analogy of a mosaic found in Algeria, that they ended above in an arrangement like a chimney-stack. There is, moreover, a terracotta roof-tile in the Museo delle Terme at Rome with a circular pipe, 8 inches in diameter, projecting from its upper surface.

Terracotta pipes, or *tubuli*, of cylindrical form, were sometimes employed by the Romans for conveying or distributing water, but the more usual material for this purpose, especially for drinking-water, was lead; the latter were called *fistulae*. The Venafrum inscription, an edict of the Emperor relating to the water-supply of the town, mentions *canales, fistulae*, and *tubi*. Vitruvius calls the *canales structiles*, implying that they were of masonry. Pliny speaks of *tubi fictiles* used for conduits from fountains, and Vitruvius recommends the use of terracotta pipes (*tubuli fictiles*) in aqueducts. Examples of clay

---

piping are preserved in the Museo delle Terme at Rome. At Marzabotto, near Bologna, terracotta pipes were used for carrying off the water from the roof of a house, by means of a straight tube through the wall fitting into another which curved upwards inside. These date from the fifth century B.C. Other examples have been found in Rome and Italy, and specimens found on the Rhine were 21\frac{1}{2} inches long, of which 3\frac{1}{4} inch was inserted into the adjoining pipe, and 3\frac{1}{2} to 4\frac{1}{4} inches in diameter. Terracotta was also used for cisterns, as at Taormina, and for aqueducts; but Lanciani has pointed out that its use in these ways was confined to irrigating purposes. The Campagna of Rome was formerly extensively drained with these tiles, and owed to that circumstance much of its ancient healthfulness.

Of the use of tiles in pavements there is frequent mention in Roman writers. For this purpose complete tiles were seldom used, at any rate in Italy; but in Britain it was not at all uncommon, as in the villa at Hartlip already mentioned. On the other hand, hypocausts were regularly paved with tiles, as in the Baths of Caracalla (Fig. 192 above), and in an example found at Cirencester, where the tiles are flanged. But in another form tiles played a considerable part in Roman methods of paving. Pliny and other writers speak of pavimentum testaceum or opus signinum as the usual pavement for rooms, especially those liable to damp, such as kitchens and outbuildings, or for baths and cisterns. This was made of a layer of fragments of tiles stamped and pounded into a firm solid mass, combined with mortar. It corresponds to the nucleus ex testis tunsis of Vitruvius, which (to a depth of six inches) was laid on the rudus or coarser concrete. On this was laid the flooring, consisting either of tiles or marble slabs,
or more generally of mosaic. The Baths of Caracalla again afford a good illustration of the process. In the mosaics too fragments of clay were often used, especially for producing red or black colour. Vitruvius and other writers allude to this practice, and the former also speaks of testacea spicata, a kind of false mosaic made with small bricks about 4 inches by 1 inch, set on edge to form a herring-bone pattern. In the Guildhall Museum is part of a tesselated pavement of concrete, faced with small bricks about an inch square.

One of the most interesting uses of tiles by the Romans is in connection with their tombs. Not only are they used in the construction of the more magnificent edifices (cf. p. 336), but they were also often employed (as in Greece) for the humbler graves. For the latter, three, or sometimes six, tegulae bipedales were set up in the form of a prism, one forming the floor, the other two the gabled covering which protected the body from the superincumbent earth. Within this were laid the ollae or sepulchral urns which held the ashes of the dead, and other vases. A tomb found at Litlington in Cambridgeshire was covered with a large flanged tile, which protected the pottery buried underneath; and at Eastlow Hill in Suffolk a tomb was found roofed with twelve rows of flanged tiles, each side in rows of four. In some of the tombs of Greece belonging to the Roman period semi-cylindrical tiles were used for this purpose. In the provinces the tiles often have impressed upon them in large letters the names of the legions which garrisoned the various cities. The tiles of Roman tombs at York are inscribed with the names of the sixth and ninth legions which were quartered there: as LEG VI VICT P F, legio sexta victrix pia fidelis; LEG IX HISP (or VICT), legio nona Hispaina (or victrix). At Caerleon (Isca Silurum) the bricks bear the name of the second or Augustan legion: LEG II AVG. The stations of the twentieth legion may also be traced at Chester in this manner; the tiles

are inscribed LEG·XX·V·V.1. They were placed at the foot of
the tomb-like tombs, in order to indicate who was buried
beneath, the inscriptions being written across the breadth of the
tile. They are of very different dates, some of those in Britain
being apparently as late as the introduction of Christianity.

The extent to which bricks and tiles were used in Roman
buildings under the Empire may be gauged by the number of
those with inscriptions which remain; a whole section of the
Latin Corpus (see below) is devoted to those found in Rome
alone, numbering some two thousand. Many of them have been
removed to the museums from the principal edifices, such as the
Pantheon, the Coliseum, the Circus Maximus, the Baths of Titus
and Caracalla, the Basilica of Constantine, and the Praetorian
Camp. Other inscriptions have been found on tiles removed
from such buildings and used to repair the roofs of churches
in Rome. Such places as Bologna, Cortona, Tibur, and Ostia
have also produced numerous inscribed tiles of this class. The
use of such stamps was to guarantee the quality of the clay.
To the topographer, as will be seen, these stamps are often of
great value; and had the custom of placing on them the names
of the buildings for which they were intended been less rare,
they might often have afforded valuable evidence as to doubtful
sites. Besides their topographical value, the tiles also help to
settle the succession of consuls, and throw great light on the
economy of the Roman farms and the possessions of the great
landed proprietors. The uninterrupted series, extending from
the times of the Caesars to the age of Septimius Severus, of
names of proprietors, potters, and estates, tells much of the
internal condition of Italy, and of one of the sources of revenue
to the Roman nobility.2

The stamps found on bricks and tiles are of four kinds—
rectangular, semicircular, circular, and crescent-shaped. The
inscriptions are in raised letters in all cases, but instances are

1 C. I. L. vii. 1225.
2 The inscribed tiles found in Rome
have been collected and published by
Dressel in vol. xv. (part i, Nos. 1-2155)
of the Corpus Inscrip. Lat. Others are
published in the other volumes under the
heading "Instrumentum Domesticum."
In the succeeding pages Dressel's account
has been mainly followed.
also known of incised inscriptions, written without frames across the tile. After the time of Diocletian the only forms found are square, circular, and octagonal; the square stamps always have straight inscriptions. On the circular stamps the inscriptions are placed in a circle, in one or two lines, and the beginning is determined by a small cut-out circle at the edge of the stamp, thus \( \mathcal{O} \), known as the orbiculus; apart from this its object is uncertain. In later stamps the inscription often reads backwards, or certain letters are reversed. The letters were cut straight in a mould and lie in the plane of the surface, being of rectangular section, not wedge-shaped, as in inscriptions on marble. During the Republican period and the first century of the Empire a plain "block" type is used; then the letters become smaller and more elegant, with bars at the ends of the hastae, as \( E, M, \) etc. Finally they show a tendency about A.D. 200 to become broader and shorter: \( E, M, S. \) At and after the time of Diocletian the forms become very varied. Punctuation in the best period takes the form of a \( \mathcal{D} \); afterwards the mark becomes vague in form. Ligatured letters are rarely found after the time of Diocletian, but are common in the best period; sometimes more than two are combined.\(^1\) The stamps with which the letters were made were usually of wood or bronze, but have not been preserved.

In the centre of the stamp it was customary to place an emblem or device of some kind, perhaps in view of a law which obliged brick and tile makers to affix distinctive marks or emblems on their bricks; but the devices are not peculiar to individual workshops, and some potteries, such as the Terentian (see below), used several. They may be compared with the countermarks or small adjuncts on the coins of the Republic, and the seals and stamps on the wine-amphorae of Thasos (Vol. I. p. 158). Figures of gods, such as Mars, Cupid, and Victory, animals, and even groups of figures, occur, and after the third century Christian emblems are often found. It is most probable that they were merely ornamental and without significance, except in certain

cases of canting or punning allusions. Thus M. Rutilius Lupus has a wolf; Flavius Aper a boar; Aquilia an eagle; C. Julius Stephanus a wreath; and Aelius Asclepiades a serpent, with reference to the god Asklepios.¹

The most complete stamps have the date of the emperor or the consulship, the name of the estates (praedia) which supplied the clay, that of the pottery where it was baked (figlinae or officina), and that of the potter who prepared it; sometimes even of the slave who moulded the tile, and even its very dimensions. Two typical examples may be given from the British Museum collection,² of which the first (Fig. 194) is said to have been found in the Catacombs at Rome.

It has in the centre of the stamp a figure of Victory, round which is the inscription in two lines, beginning with the outer band:

OPVS DOL(iare) DE FIGVL(inis) PUBLINIANIS
(ex) PREDIS AEMILIAES SEVERAES

"Pottery³ from the Publinian works, (the clay) from the estate of Aemilia Severa."

The other has no device, but the last word of the inscription is in the centre:

IMP ANTONINO II E(t) BALBINO COS
D P Q S P D O ARABI SER(vi)

"The Emperor Antoninus for the second time and Balbinus consuls; from the estates (de praedia) of Q. Servilius Pudens, pottery (doliare opus) from the hand of the slave Arabus."

¹ C.I.L. xv. 19-29; 209, 1145; 709; 1212; 398.
² Cat. of Terracottas, E 148-49.
³ Opus doliare is the invariable word for bricks or tiles in Roman inscriptions, figinum being confined to pottery of the finer kind (cf. p. 330).
The earlier stamps exhibit more method and precision; the later betray comparative carelessness. In the latter the name of the emperor sometimes occurs alone, and unusual expressions are introduced. Contractions are invariably at all periods, and even the consuls are sometimes only mentioned by initials; but by comparison of examples it is possible to place them in the right order. Those found in Rome cover the period from the reign of Trajan to that of Theodoric (A.D. 500), but in other parts of Italy they are found dating as early as 50 B.C. We are told that Theodoric, when he repaired the walls of Rome, made a present of twenty-five thousand tiles for the purpose, and on the tiles bearing his name he is styled "The good and glorious king," with the additional exclamation, "Happy is Rome!"  

The estates on which the clay for the tiles was produced are called possessiones; privata (private property); rationes (shares); insulae (blocks); or more generally, praedia. The latter word, indeed, is almost invariably used down to the third century, the others being more characteristic of the time of Diocletian. The praedia not only provided the clay, but in some cases also contained the potteries. On some tiles fundus, which means a country farm, is found. The proprietors of these estates were imperial personages, persons of consular dignity or equestrian rank, and sometimes imperial freedmen. Many tiles give merely the name of the imperial estates, without mentioning the reigning emperor; in the later ones, as in the Basilica of Constantine, it is usual to find the expression OFF. AVGG ET CAES NN, Officina Augustorum (duorum) et Caesarum (duorum) nostrorum. Several names of the Antonines occur; also Annius Verus and his wife Domitia Lucilla, the parents of M. Aurelius. Septimius Severus owned many praedia which supplied bricks for his palace on the Palatine. The Empress Plotina was evidently a large landed proprietor, and we also find the names of Aelius Caesar (Hadrian's adopted heir), M. Aurelius, Faustina II., and Julia Procula. Among the names

1 Cassiodorus, Variar. i. 25; cf. ii. 23. 1627, etc.
2 C. I. L. xv. 1668-70.

4 Middleton, Remains of Ancient Rome,
of inferior proprietors, unknown to fame, occur Q. Servilius Pudens, T. Statilius Severus, and L. Aemilius Julianus, priest of the sun and moon. Such names as Q. Agathyrsus, Rutilius Successus, and Sulpicius Servundus seem to denote imperial freedmen; the first-named styles himself AVG. LIB.

A remarkable fact in connection with these inscriptions is the prevalence of feminine names, the quantity of tiles on which these are found being enormous. The causes are various,—partly the renunciation by emperors of their private fortunes in favour of their female relations; partly the proscriptions which, from the failure of male heirs, caused estates to devolve upon women; partly the gradual extinction of great families. The important position held by freedmen under the Empire is well known to the student of Roman history.

The potteries of the tile-makers were of two kinds—figlinae and officinae; but the former seems to be a wider and inclusive term—that is to say, that one figlina included several officinae or workshops. In the inscriptions, ex figlinis is usually followed by the name of the owner, ex officinis by the name of the potter (officinatar). The former expression is by far the commoner, and the latter (of or OFFIC) is more usually found on lamps and vases, although after the third century it is invariable on the tiles. The figlinae are always mentioned in a subordinate manner to the praedia, when both are mentioned, as is usually the case. The potteries were mostly outside the city, even at some distance. Localities are not often mentioned, but we have the Salarian potteries on the Via Salaria, and also mention of the Via Nomentana, and such expressions as Ad Aureliam, Ad Mercurium felicem, or Ad viam triumphalem. Stamps found in the walls along the Appian and Latin ways show that potteries existed in the direction of the Alban and Tuscanian hills, and in other parts of Latium, as at Praeneste and Ostia. On the north side they extended as far as Narnia and Oriculum on the Tiber. They are also found in Etruria and Campania. Tiles from

5 Ibid. 389.
Latium were exported to Liguria, the Adriatic, Sardinia, Africa, Gaul, and Spain. Usually a descriptive epithet is associated with the word *figlinae*, either of a geographical or personal character. Examples of the former are Macedonianæ, Rhodianæ, and Oceanæ. The latter give either the name of an emperor, as Neronianæ, Domitianæ; or a Gentile or family name, as Favorianæ, Furianæ, Publinianæ, Terentianæ, or Voconianæ. One of the names which occurs most frequently is that of L. Brutidius Augustalis, a freedman; others are stamped EX FIGLINIS PRIMIGENI SERVI DNI NOSTRI IMP—"From the potteries of Primigenius, slave of our lord the Emperor." Imperial slaves owned many potteries, and others were owned by the emperors or other wealthy proprietors, and administered by freedmen or slaves. The officinae served to distinguish the functions of the different *figlinae*. Thus the establishment of M. Publicius Januarius, a freedman, is styled *doliariae officinae*; or they are distinguished by separate names, as Claudianæ, Domitianæ, and so on. The tiles from the potteries of Asinius Pollio bear the name of C. Cosconius as maker, as do those of Julia Procula's potteries, being further distinguished as *d oliares, bipedales*, and *sesquipedales*. It would appear that the potteries of private proprietors were under the direction of freedmen, while those of the imperial estates were chiefly managed by slaves, from whose labours large revenues were obtained.

There were many private potteries in Gaul and Germany. In the neighbourhood of Saarbrück many tiles have been found with the maker's name, L. Valerius Labeius. Others with private names have been found at Trier, one with the stamp of the *colonia*. Several potters with Gaulish names are known, and probably FIDENATIS on a tile at Zulpich, SECVDANVS *f(igulus or f(ecit) and PACATVS F* from Seligenstadt, refer to craftsmen of that nationality. Often the master's name only

1 B.M. Cat. of Terracottas, E 130.  
2 E.g. Wilmanns, Exempla Inscri. Lat. 2793 a.  
occurs, of which possible instances are BELLIANVS on a tile from Caerwent, and PRIMV(s) on another from Colchester. In the British Museum are tiles with the initials T·P·F·A, T·P·F·C, T·P·F·P, from Rodmarton in Gloucestershire. Tiles found in the provinces also have the maker’s name simply, without indications of date or the owner of the pottery, as on those from Seligenstadt already cited. The makers must in all cases have been of inferior condition, as implied in the example already quoted of the slave Arabus (p. 354); and other names—Daedalus, Peculiaris, Primigenius, Zosimus—belong to the same rank of life. Yet the occurrence of a single name for a private individual is everywhere very common. On the other hand, imperial slaves usually have two names given, and freedmen three.

On the tiles of the freedmen of the Gens Domitia (dating about the reign of Hadrian) is frequently stamped the formula VALEAT QVI FECIT, “May he who made it prosper,” with the name of the representative of the family in the genitive. On other tiles we find such expressions as VTAMVR FELICES, “May we use it and be happy”; FORTVNA COLENDA, “Fortune is to be worshipped” (a second-century tile); and on others of post-Diocletian date, VRBIS ROMAE, “The city of Rome”; SECVLO CONSTANTINIANO, “The age of Constantine”; FELIX ROMA (on the tiles of Theodoric), “Happy is Rome.” Even on sepulchral tiles of late Imperial times are stamped such aspirations as, VTI FELIX VIVAS, “May you live happily.”

Again, memoranda are found incised on the tiles, as on one at Hooldorn in Holland, KAL·IVNIS·QVARTVS LATERCLOS N(umerov) CCXIII, “Quartus (made) 214 tiles on the first of June”; and on another, found in Hesse in 1838, STRATVRA TERTIA LATERCVLI CAPITVLAES NVM·LEG·XXII, “In the third layer large tiles of the number of the twenty-second

legion. A tile found in Hungary had scratched upon it two metrical lines in cursive writing:

Senem severum semper esse condece
Bene debet esse povero (sc. puero) qui discit bene,"
and on others names such as Tertius, Kandidus, Verna, were incised. Idle boys in the brickfields often seem to have scratched the alphabet or other words in the soft clay, and complete Roman alphabets are found at Hooldorn and Stein on the Anger; the letters I K L M on one at Winchester;

two lines of the *Aeneid* are written in excellent cursive characters of the first century after Christ.¹

The Roman tiles, if rightly used, are found very useful for judging the dates of buildings. For instance, a study of those in the Pantheon showed that the walls were neither the original ones nor those built by Agrippa in 27 B.C., but were restored in the second century or supplied then with new brickwork. On the other hand, the stamps from the Flavian amphitheatre and Thermae Antoninianae confirm the dates of those buildings. Those tiles which bear the name M. Aurelius Antoninus as consul² seem to be the Emperor Caracalla’s. In the time of Diocletian the dates cannot be definitely ascertained, but before his time the shape of the stamp is a good criterion. Rectangular stamps are found in the best period, and in the first century B.C. only one line of inscription is usual. Two lines denote the period 50—100 A.D. or later; semicircular or lunate forms came into use under Claudius, and lasted to the end of the first century; perfect circles belong to the same period. The type with the cut-out *orbiculus* came in about Nero’s reign, and the size of the *orbiculus* gradually diminishes down to that of Severus, while the inscriptions gradually increase in length.³

A considerable number of the Roman tiles are inscribed with the names of the consuls of the current year in which they were made, presenting a long and interesting series, from the consulship of L. Licinius Sura and C. Sosius Senecio (A.D. 107) to that of Severus Alexander (A.D. 222). Many of these consulships do not, however, appear to have been recorded in the regular *fasti consulares* or official lists, and they were probably *suffecti*, whose names were not recorded after their temporary elevation. It seems likely that the occurrence of consuls’ names implies that such tiles were destined for public buildings, and were so marked to prevent their being stolen with impunity. They are fewer in number than those which have merely the names of *praedia* or potteries, but are yet sufficiently numerous to be an invaluable

² *E.g.* B.M. E 149: see p. 354.
³ See Dressel in *C.I.L.* xv. p. 10.
aid in tracing the succession for upwards of sixty years. Inscriptions of this class are only found on opus doliare, and chiefly in Italy. Their appearance is probably due to some law passed by the Senate about the reign of Trajan to regulate the potteries. As an example may be given a tile from Hooldorn in the Netherlands, inscribed SVB · DIDIO · IVLIANO · COSS¹; the date is A.D. 179, the name being that of the future emperor (COSS is a mistake for COS).

The following examples are taken from Dr. Dressel's scheme of the chronological order of the stamps,² and show the style of inscription characteristic of the different periods:

I. First century after Christ.

1. (a) With name of master only (either of praedia or figlinae):
   Asini Pollionis.
(b) With name of officinat or potter:
   C. Cosconi.

2. (a) Master and potter (often a slave):
   Felicis Domiti Afri.
(b) Master and conductor (lessee of the pottery), or potter:
   Tegula C. Cosconi, figuli Asini Pollionis.

3. (a) Master, potter, and name of pottery:
   Amoeni duorum Domitiorum Lucani et Tulli, ex figlinis Caninianis.
(b) Master, lessee or potter, name of pottery:
   T. Grei Iauari ex figlinis Caninianis duorum Domitiorum.

II. Second century to third century.

1. (a) Ex praedis L. Memni Rufi.
   (b) Opus doliare L. Bruttidi Augustalis.
   L. Lurius Martialis fecit.

² C.I.L. xv. p. 5ff. For epigraphical and grammatical peculiarities see ibid. p. 7. On p. 204 is given a list of emperors whose names are found on the tiles, from Trajan to Septimius Severus.
2. (a) Ex figlinis (vel praedis) Domitiae Lucillae, opus doliare Terti Domitiae Lucillae (vel ab Tertio servo).

(b) C. Comini Proculi ex praedis Domitiae Lucillae.
Ex figlinis Q. Asini Marcelli doliare opus fecit C. Nunnidius Fortunatus.
Opus doliare ex praedis domini n(ostr)i ex conductione Publiciae Quintiae.

3. (a) Ex figlinis (vel praedis) Caepionianis Plotiae Isauriae, fornace Pecularis servi.

(b) Opus doliare ex praedis duorum Augustorum nostrorum, figlinis Domitianis minoribus, Fulvi Primitivi.

During the greater part of the third century chronological indications are absent, but about the time of Diocletian the practice of signatures is revived. The inscriptions, however, differ now from the earlier ones, not only in the forms of the letters and of the stamp, but also in style; they are less regular in form, and present several peculiarities. The expressions *opus doliare* and *ex figlinis* are now no longer found, and in place of the latter *officina* is invariable. Many of the *officinæ* are the same as in the former period, but new ones, such as the Britannica, Claudia, Gemella, and Jobia, occur, the latter with the cognomen Diocletiana. *Officina* is sometimes used twice over, for the pottery and for the workshop. In place of *praedia* we have such expressions as *statio, rationes, or possessiones*. Formulae are introduced in an abbreviated form which give the method of administration or character of the estates: as R · S · P, ratio summae patrimonii or privatae; S · P · C, stationis patrimonii Caesaris; S · R for summae rei or stationis Romanae; S · P for summae privatae or stationis patrimonii; S · R · F for sacrae rationis fisci; or simply S for stationis or summarum. 1

Apparently several *stationes* might be united in one *officina*, or several *officinæ* in one *administratio*; the number of the *statio* is given in some instances. The name of the *statio* may be

1 See for these abbreviations and expressions C.I.L. xv. p. 387.
replaced by that of the potter; or merely the administratio is
given, as off · privata. Besides the names of master, lessee,
and potter, that of the negotiator is sometimes mentioned. We
also find the portus or depot in which the tegulae were stored
for distribution, as portu licini,¹ or the name of the building
for which they were destined, as portvs avgvsti,² castris
praetori(s) avg(usti) n(ostrī), horreis postvmianis.³ Some
tiles dug up in Lambeth Hill, London, on the site of the
Post Office, now in the British and Guildhall Museums,⁴ were
impressed with the letters p · p · br · lon or pr · br · lon
(Fig. 196), which have been interpreted
as publicani provinciae Britanniae
Londinenses.⁵

Tiles made for military purposes
are exceedingly common in the later
period, and the stamps probably had
a double use. In the first place, they
show that they were made by the
soldiers, from which we learn that in
the legions, as in a modern army,
there were many men acquainted
with handicrafts. Secondly, they
prevented theft or removal of the tiles,
and served as a "broad arrow" to
denote public property. They are not, of course, found in
Rome, where there was no necessity for the legions to make
bricks or tiles; here the camp seems to have been supplied by
private individuals.

Of special interest are the inscriptions stamped on tiles which
relate to the military divisions stationed throughout the pro-
vinces of the vast empire. These are found in soldiers' graves (see
above, p. 351), as well as in their camps and quarters; they
contain the names and titles of the legions, and mark the
extent of Roman conquest. Thus the route of the thirty

¹ B. M. E 152.

⁴ Cat. p. 73, Nos. 60-3.
⁵ C. I. L. vii. 1335; Roach-Smith,
Collect. Antiqu. i. p. 143; see also
legions through Germany has been traced; and in Britain an examination and comparison of such tiles shows the distribution of military force and the migrations of different legions from one quarter to another. The stamps are in the form of long labels (tesserae), circles, or crescents, occasionally surrounded by a wreath, or else in the shape of a foot, an ivy-leaf, or a vase; the letters are in relief, sharply impressed, as if from a metal die. The names and titles of the legions are given either in initials or in contractions, as LEG·II·P(arthicae), and so on (see above, p. 351); sometimes the potter’s name is added, with FIGVLUVS or FECIT.\footnote{1}

The tiles of the first legion have been found at Mainz and Nimeguen; those of the second, or Parthian, at Darmstadt, Ems, Hooldorn, Caerleon, and the Lake of Nemi\footnote{2}; of the third, in Scotland; of the fourth, at Mainz; of the fifth, in Scotland, and at Baden, Cleves, Xanten, and Nimeguen; of the sixth, at Nimeguen, Neuss, Aix-la-Chapelle, Darmstadt, and Windisch; the seventh, at Aix-la-Chapelle and Xanten; the eighth, at Mainz, Baden, and elsewhere; the ninth, at Baden and York; the tenth, at Nimeguen, Hooldorn, Vienna, and Jerusalem; the twentieth, at Chester\footnote{3}; and so on down to the thirtieth.\footnote{4} At Bonn tiles have been found of the Legio Cisrhenana on the left bank of the Rhine, and of the Legio Transrhenana on the right bank. Cohorts have also left their names on tiles: the second Asturian at Aesica on the Roman Wall\footnote{5}; the fourth (Breucorum), at Huddersfield\footnote{6}; the fourth Vindelician, at Frankfurt, Mainz, and Wiesbaden\footnote{7}; the Ulpian Pannonian at Buda-Pesth.\footnote{8} The vexillationes, whose main body was at Nimeguen, are similarly recorded; a British vexillatio was attached to the army at Hooldorn\footnote{9} and Nismes, for Dacia, Pannonia, and the East; for Germany, Steiner, op. cit. passim, and Bonner Jahrbücher, index to vols. 1-60.

\footnote{1}{Numerous examples of these legionary stamps will be found in Steiner’s Codex Inscr. Rom. Danubii et Rheni (1851); they will presumably be republished in the forthcoming part of vol. xiii. of the Latin Corpus.}
\footnote{2}{C.I.I. xiv. 4990, 2.}

and another to that of Lower Germany, as instanced by tiles inscribed • VEX • EX • G • INF (vexillatio exercitus Germaniae inferioris), found at Utrecht and Nimeguen in the Netherlands, and at Xanten in Germany. Tiles of the British fleet, CL(assis) BR(itannica), have been found at Boulogne, Lympne, and Dover.

2. TERRACOTTA MURAL RELIEFS

Terracotta mural decoration was largely employed by the Romans for the interior and exterior of their buildings, in the form of slabs, ornamented with reliefs, which were placed round the impluvium or on the walls. Sometimes they seem to have formed a sort of hanging “curtain” round the lower edge of the cornice, as the open-work patterns along the edges seem to imply, a method of decoration which we have already met with at Civita Lavinia (Vol. I. p. 101), where also the hanging slabs are bordered with patterns in outline or open-work. But, as also at Civita Lavinia, these slabs seem to have been frequently used as antepagmenta, being pierced with holes, which imply that they were nailed against the walls. In the Casa dei Cecillii at Tusculum there is evidence that they were used as wall-friezes, and those found at Pompeii (where they are very rare) also have holes for fastening to walls. It may be to the first-named variety that Festus refers when he speaks of antefixa of fictile work which are affixed to the walls underneath the gutters. There is also a reference to them in Cicero, who, in writing to Atticus, says, “I entrust to you the bas-reliefs (typos) which I shall insert in the cornice of my little atrium.”

The slabs are usually about 18 inches long by 9 or more high, and 1 to 2 inches thick; they have nearly all been found at Rome, but specimens are also known from Civita Lavinia, Cervetri, Nemi, Pompeii, and Atri in Picenum. The

British Museum possesses a very fine series, numbering, with fragments, one hundred and sixty, nearly all of which were collected by Mr. Charles Towneley at Rome; and there is an equally fine collection in the Louvre, which came from Signor Campana, who devoted a large work to the illustration of them. The other good examples, some of which were found in the Baths of Caracalla, are in the various collections at Rome.

The reliefs were evidently cast in moulds, as many subjects are repeated over and over again, or at least with only slight differences; moreover, the relief is low, with sharp and definite outlines, such as a mould would produce. Among the British Museum examples a group of Eros, a Satyr, and a Maenad is repeated in three cases (D 520–522), with no variations except in the colouring; another of Dionysos and Satyr three times (D 528–530), with only one small variation. It is evident that in the latter, as in some other cases, the relief had been retouched before baking. Reliefs entirely modelled are of much rarer occurrence, but exhibit considerable artistic feeling and freedom, as in an instance in the British Museum (D 651), which represents the sleeping Endymion; the hair is so fine and deeply cut that it could not possibly have been produced from a mould. The moulds may have been made of various materials—wood, stone, metal, or gypsum, as well as terracotta. Circular holes are left in the slabs for the plugs—usually of lead—by which they were attached to the woodwork or masonry. The clay varies in quality and appearance, being often coarser than that of Greek reliefs, and mixed with coarse sand in order to make it stronger and more durable; in tone it varies from a pale buff to dark reddish-brown. Traces of colouring are often found on the slabs, and the background in some cases (as B.M. D 577, 623) was coloured a bright blue; the figures, or more often details such as hair, etc., were usually painted red, yellow,

---

1 *Cat.* 501-660. It has been stated, but on what authority is unknown, that they were found in a well near the Porta Latina, together with a series of statues discussed below (p. 373).

2 A collective publication of these reliefs is being prepared by the German Archaeological Institute.

3 See Helbig’s *Führer*, ii. pp. 272, 408 ff.

purple, or white. These colours are not fired, as in the earlier terracotta reliefs, but painted in tempera, and their use is entirely conventional. The slabs are ornamented above and below with bands or cornices in the form of egg-and-tongue mouldings, or a system of palmettes and intersecting arches; these are sometimes in low relief on a band, sometimes partly in outline or open-work.

The figures are mostly in low relief, being usually grouped with large flat surfaces between, in the manner of Hellenistic art; in some cases the design is composed in such a way that the whole surface (except the principal figures) is occupied by patterns of scroll-work or foliage, more or less conventional. The compositions are either in the form of narrow friezes, usually with rows of busts or figures of Cupids, or square metope-like groups with two or three figures on a large scale. For the narrower slabs the busts were preferred, owing to the scope they gave for high relief, which better suited the distance from the eye; but this rule is not invariably. The style is, in general, bold and vigorous, and, though essentially architectural, not devoid of dignity and beauty; but it is somewhat conventional, and at times even archaistic.¹ Those found at Pompeii are usually of remarkably good style, especially the Nereid frieze,² with its rich colouring. These are earlier than the earthquake of A.D. 63, and probably belong to the Augustan period, to which also the majority may be assigned. On one or two names of potters are found, such as Annia Arescusa(na) and M. Antonius Epaphras in the British Museum.³

The subjects on these reliefs cover a very wide field, almost as wide as those on the painted vases, and quite as wide as those on the Roman lamps. In many cases they are doubtless copies of well-known works of art, and may even go back to prototypes of the fifth century, as in the case of a figure of a girl in the British Museum (D 648), or one of Eros, conceived as a full-grown youth, in the Campana collection.⁴ Others, again, present points of comparison with the Hellenistic reliefs, as is

¹ See B.M. Cat. of Terracottas, p. xvii.
² Von Rohden, Terracotten von Pompeii, pl. 20: see also pls. 21, 23.
⁴ Ant. opere in plastica, pl. 14.
the case with that representing the visit of Dionysos to a mortal (B.M. D 531). Lastly, we find in the reliefs, as also on the Arretine vases (below, p. 492), a series of types closely related to the New Attic reliefs, in which it was sought to revive an older style; among the types borrowed from these originals are Maenads in frenzy or dancing in various attitudes, and the figures of the four Seasons. Among those which reflect the character of their time rather than the spirit of Greek art, we have representations of Egyptian landscapes, or Egyptian deities and emblems; scenes from the circus or gladiatorial arena; and quasi-historical subjects, such as triumphs over barbarian enemies. Of mythological subjects, the most popular are Dionysiac scenes or groups; next to these, Apollo, Aphrodite, Eros, and Victory. Heroic legend is represented by the labours of Theseus, Herakles, Perseus, and Jason, and occasional scenes from the Iliad and Odyssey. Lastly, there are a certain number which are purely decorative, with a single figure of Eros or Victory (treated in archaistic fashion), or an ideal head surrounded by elaborate and graceful scrolls or acanthus foliage; others, again, have conventional groups of two priestesses or canephori, with a candelabrum or a foliated pattern between (Plate LXII.), a mask between two Cupids, and so on. Even the figures in some cases tail off into conventional patterns.

To mention a few of the more interesting subjects in detail, it may suffice to quote examples from the two best-known collections—those of the British Museum and Louvre. Beginning with the Olympian deities, we have the infant Zeus in the cave on Mount Ida, protected by the Curetes, who dance above him, wielding swords and shields (Plate LXI.); in one instance he is in his nurse's arms. On a narrow frieze the busts of Zeus, Ares, Hera, and Athena are represented; Apollo receives a libation from Victory; or a warrior consults his oracle, indicated by a bird in a cage; Aphrodite is seen riding on a sea-horse.

or on a goose. Eros or Cupid appears in various attitudes and combinations of figures: flying, embracing Psyche, or being embraced by a Satyr; accompanying Aphrodite, Triton, and the Nereids; a pair on either side of a mask of Triton or Medusa; or a group of three struggling under the weight of a heavy garland of fruit and flowers. Busts or masks of Demeter, Zeus Ammon, and Triton are also found; a group of Aphrodite and Peitho; and the three Eleusinian deities, Demeter, Persephone, and Iacchos.

The Dionysiac scenes are very frequent, though often of little interest, and mere groups without definite action. The best known is the reception of Dionysos in the house of a mortal, a subject formerly interpreted as his reception by Ikarios at Athens (cf. p. 139); this type is remarkable for its rich and elaborate composition, probably derived from a Hellenistic original. A very effective composition is that of a dancing Satyr and Maenad swinging the infant Dionysos in a λίχνου (vannus) or winnowing-van, which serves as his cradle (Plate LXII.). Among other scenes may be mentioned Dionysos giving drink to a panther; two Satyrs standing on tiptoe to peep into a laver; Satyrs gathering or pressing grapes (of which many replicas exist), or working an oil-press; Ampelos (the personified vine) between two Satyrs; Bacchic processions, sacrifices, or ceremonies; and friezes of Bacchic masks and masks of Pan.

Among other deities Victory is by far the most common. She is usually represented slaying a bull for sacrifice, a subject of which there are two principal varieties, according as she turns to right or left. The motive is a well-known one, and found in fifth- and fourth-century art, from the balustrade of the Nike temple at Athens onwards. She is also depicted flying with a wreath, or as a conventional archaistic figure between tendrils and scrolls. Of the figures of the Seasons we have already

9 B.M. D 553-60.
11 B.M. D 566-68; Campana, pls. 86 ff.
spoken; they are characterised by the attributes they carry, as a kid for Spring, corn for Summer, fruit for Autumn, and a hare and boar for Winter. Masks of Medusa, Sirens, and Sphinxes (both male and female) are found in compositions of a decorative character.

Of heroic legends, the rape of the Leukippidae by Castor and Pollux is repeated more than once; Herakles is seen contending with the Nemean lion, the hydra, and the Cretan bull, and with Apollo for the Delphic tripod; Theseus raises the rock which discloses his father's weapons (Plate LXI.), contends with the Marathonian bull, or overcomes a Centaur; Jason builds the Argo, superintended by Athena, and, assisted by Medea, obtains the golden fleece; Perseus rescues Andromeda, and brings the Medusa's head to Athena; Actaeon is slain by his hounds. The Homeric scenes include Paris carrying off Helen from Sparta (or, as some interpret it, Pelops with Hippodameia); Nestor healing the wounded Machaon with a potion; Priam bringing offerings to Achilles; Penelope mourning for the absent Odysseus; Odysseus recognised by Eurykleia; and Orestes on the Delphic omphalos. There are also numerous semi-mythical scenes, such as combats between Amazons and Gryphons, between Amazons and Greeks, or between Arimaspi and Gryphons.

With the exception of the Roman subjects from the circus and arena, the remaining subjects are purely decorative, and of little interest; the former, some of which have reference to the conquest of Dacia, admit of the dating of the reliefs in the reign of Trajan. Others depict gladiators contending with lions; chariots racing in the circus, which is indicated by the obelisks and other adornments of the spina; or colonnades adorned with statues of boxers and victorious athletes. Some of the Egyptian subjects are interesting for their local colouring,

with their representations of the Nile, on which pygmies ply a boat, among hippopotami, crocodiles, and lotos-flowers, and ibises; but these compositions are more curious than artistically effective.

II. SCULPTURE

I. ROMAN STATUES AND STATUETTEs

In the earlier ages of Rome the laws and institutions, based without doubt on the sentiments of the people, were unfavourable to art. Numa was said to have prohibited the representation of the deity in human form, and the statues of great men were not allowed to exceed three Roman feet. To women the privilege of having statues was not conceded until much later. Pliny constantly compares the luxury of his own day with the simplicity of early times, to the disadvantage of the former, dwelling fondly on the times when men could be content with plain terracotta images, and it was not necessary or possible to make a display of silver and gold.

Most of the ancient statues of the Romans were of terracotta, a fact to which constant allusion is made by their writers. Juvenal speaks of "a factile Jove, not spoiled by gold," and Propertius speaks of the early days of the golden temples, when their gods were only of clay. Similarly Pliny expresses his surprise that, since statuary in Italy goes back to such a remote period, statues of clay should even in his day still be preferred in the temples. Vitruvius alludes to the favourite Tuscan fashion of ornamenting pediments with signa fictilia, examples of which, he says, may be seen in the temple of Ceres in the Circus Maximus (see below), and the temple of Hercules at Pompeii. Cicero speaks of a statue of Summanus on the pediment of the Capitoline temple "which at that time was of terracotta," and Livy tells how in 211 B.C. a figure of Victory

on the apex of the pediment of the temple of Concord was struck
by lightning and fell, but was caught on the antefixal ornaments,
also figures of Victory, and there stuck fast. Though not stated
to be of terracotta, these figures would hardly be of any other
material at that period. Other allusions may be found in Ovid
and Seneca. ¹

In the early days of the Republic art was clearly at a very
low ebb,—in fact, Roman art can hardly be said to have existed—
and everything was either borrowed from the Etruscans or im-
ported from Greece. Hence the statues of terracotta which
adorned their temples are spoken of as signa Tuscanica. The
most celebrated works in ancient Rome were made by artists
of Veii or the Volscian Fregellae, such as the famous quadriga
on the pediment of the temple of Jupiter Capitolinus, and the
statue of the god himself, described elsewhere (p. 314), which
were made by Veientine artists in the time of Tarquinius Priscus.
Numa, ever attentive to Roman arts and institutions, is said to
have founded a corporation or guild of potters. ² In 493 B.C.
Gorgasos and Damophilos, natives of Himera in Sicily, orna-
mented with terracotta reliefs and figures the temple of Ceres
at Rome (now Santa Maria in Cosmedin). ³ Their work, which
is alluded to by Vitruvius in the passage referred to above, was
probably Greek rather than Etruscan in style, as we have seen
to be the case generally with the archaic terracotta relief-work
of Italy (p. 317). In the reign of Augustus the temple was
restored, and so great was the esteem in which the works of
these old masters were held that they were taken out of the
walls and framed in wood.

Coming down to later times, Possis, "who made fruit and
bunches of grapes," and Arkesilaos are cited by Pliny, ⁴ on the
authority of Varro, as modellers in clay. The latter made for
Julius Caesar a statue of Venus, which, although unfinished, was
highly prized. Pliny also mentions a terracotta figure of Felicitas
made by order of Lucullus. ⁵ It seems probable that the extensive

⁵ Ibid. 156.
use of terracotta was mainly due to the absence of white marble in Italy, none being discovered till imperial times. The siege of Corinth, which unfolded to the eyes of the Romans an entirely new school of art in the quantities of Greek masterpieces carried by Mummius to Rome, as also the conquest of Magna Graecia and other parts of Greece, caused the old fashion of sculpture in terracotta to fall into contempt and neglect. Henceforth the temples of the gods and houses of the nobility became enriched and beautified with the spoils of Greek art in all materials. Even at an earlier period (195 B.C.) Cato in vain protested against the invading flood of luxury, and especially against the new taste in sculpture. "Hateful, believe me," says he, "are the statues brought from Syracuse into this city. Already do I hear too many who praise and admire the ornaments of Corinth and Athens, and deride the terracotta antefixes of the Roman gods. For my part I prefer these propitious gods, and hope they will continue to be so, if we allow them to remain in their places."  

Yet up to the close of the Republic, and even later, great works continued to be executed in terracotta, and were much esteemed. The statue made for Lucullus is an instance, and existing statues in this material, which we shall shortly discuss, are probably of early Imperial date.

Few statues of any size in this material have escaped the ravages of time, but there are some specimens to be seen in our museums. In the Vatican is a figure of Mercury about life-size, and in the British Museum a colossal torso, to which the head and limbs had been mortised separately. A head of a youth from a large statue, found on the Esquiline, was exhibited in 1888 at the Burlington Fine Arts Club. A series of female figures, including a seated Athena, ranging from two to four feet in height, was found in a well near the Porta Latina at Rome in 1767. They were purchased by the sculptor Nollekens, who restored them and sold them to Mr. Towneley,

from whom they were acquired for the British Museum. They are made of the same clay as the mural reliefs already described, and are supposed to have decorated a garden. Some of them have been identified, on somewhat slight authority, as the Muses Ourania, Calliope, and Thaleia; there are also two terminal busts of the bearded Indian Bacchus, which show some traces of conventional archaism in their style. Other large figures have been found at Nemi and Ardea in Latium, the latter being now in the Louvre.

At Pompeii in 1766 three pieces of colossal sculpture in terracotta were found in the temple of Aesculapius, representing a male and female deity and a bust of Minerva with her shield. The two former used to be identified as Aesculapius and Hygieia, but it is more probable that they are Jupiter and Juno, making, with the bust, the triad of Capitoline deities, a subject found on lamps at Pompeii. The execution is careful, and they seem to date from the latter half of the first century B.C. They formed the cult-statues of the temple. Other statues appear to have been employed for adorning gardens, or for niches in private houses, among which are a portrait of a seated physician of great originality, a nude boy, and two actors. A figure of Eros appears to have been attached to a wall as an ornament; a fragment of a colossal Minerva found in a niche near the Porta Marina is an excellent example of sculpture of the first century B.C. Figures were also employed as architectural members, such as the Atlantes supporting the entablature in the tepidarium of the Thermæ in the Forum, dating from the Augustan period; the former seem to be copied from originals in tufa. Of later date is a Caryatid figure, probably of the Neronian epoch. These sculptures are all of great importance for the history of art at the end of the first century B.C., and as showing the continued popularity of terracotta; the fashion, however,
EXISTING TERRACOTTA STATUDES 375

did not outlive the reign of Nero, and all those in Pompeii must be anterior to the earthquake of A.D. 63.

Sculptors sometimes made preliminary models in clay of the statues which they intended to execute in bronze and marble. This was not a common practice with the Greeks, and the first sculptor who made use of it, according to Pliny,¹ was Lysistratos, the brother of Lysippos. But at Rome in the time of Augustus it became much more frequent; Pasiteles is said by Pliny ² never to have made a statue except in this manner. These models, known as proplasmata, were much sought after, as exhibiting the artist’s style and powers of conception in the most free and unfettered manner, and those of Arkesilaos, another artist of the period, fetched a high price.³

**Terracotta statuettes**, similar in proportions and subjects to those of Greece, are found in houses and tombs of the Roman period, and also as votive objects on sacred sites. They were known to the Romans as sigilla, and were employed as toys and presents, or placed in the lararia or domestic shrines; the same subjects are found applied to all these uses. Thus in the lararia were placed not only figures of deities, such as Venus, Mercury, or Bacchus, but masks, busts of children, and so on.⁴ Sometimes they served to decorate the walls, as in the house of Julia Felix at Pompeii, where in the wall surrounding the garden were eighteen niches, containing alternately marble terms and terracotta figures, one of the latter representing a woman feeding a prisoner with her own milk.⁵ In the Via Holconia forty-three terracotta figures from a workshop were found, showing that there was a local manufacture at Pompeii; the types were the same as in the houses.⁶

It is noteworthy that the terracottas, of which some two hundred have been found, were nearly all from the lower parts of the city and the inferior houses, or in the domestic quarters of

⁶ Ibid. pl. 42, pp. 25, 53.
the large houses. This implies that the richer Romans preferred bronze statuettes for their shrines and household decoration. Comparatively few were found in tombs.

A few notices relating to terracotta figures are found in Roman authors. Martial speaks of a statuette of Hercules, which he calls sigillum; he also alludes to a caricature of a man which was so repulsive that Prometheus could only have made it when intoxicated at the Saturnalia, and to a grotesque mask of a Batavian. In another epigram he refers to the imitation of a well-known statue of a boy in terracotta. Persius speaks of clay dolls (pupae) dedicated by a maiden to Venus, and Achilles Tatius of clay figures of Marsyas made by coroplasthi. Elagabalus, by way of a jest, used to place viands made of earthenware before his parasitical guests, and force them to enjoy a Barmecide feast.

There is also an interesting passage in the Satires of Macrobius relating to the festival of the Sigillaria, at which large numbers of terracotta masks and figures were in demand. This festival took place on the twelfth to the tenth days before the Kalends of January, forming the fifth to seventh days of the Saturnalia, and corresponding to the 21st to 23rd of December. Ausonius says that the festival was so named from the sigilla or figurines, and Macrobius more explicitly states that it was added to the Saturnalia to extend the religious festival and time of public relaxation. Subsequently he diverges into an excursus on the origin of the feast, more curious than convincing. Epicadus is quoted by him as referring it to the story of Hercules on his return from slaying Geryon, when he threw into the river from the Pons Sublicius images of men which represented his lost travelling-companions, in order that they might be carried by the sea to their native shores. His own view is that they

represent expiatory offerings (piacula) to Saturn, each man offering an oscillum or mask on his own behalf in the chapel of that god. Hence, he says, sigilla were made by the potter and put on sale at the Saturnalia. Elsewhere he states that clay oscilla were given to children as playthings at this season even before they had learned to walk. The festival was indulged in by all classes of society, who vied in making presents of statuettes and figures to one another; and we are told that Hadrian exchanged gifts with others, and even sent them to those who did not expect to receive them. Similarly, Caracalla, when a child, gave to his tutors and clients, as a mark of condescension, those which he had received from his parents.

From the use of this word sigilla (a diminutive of signum), for terracotta figures, the makers came to be known as sigillarii, or figuli sigillatores, and a street in which they lived was known as the Via Sigillaria. There was also a market for the sale of sigilla for the feast near the Pantheon. Although the names of makers are constantly found on Roman lamps and pottery, as well as the tiles, they are very seldom found on statuettes, with the exception mentioned below of those found in Gaul. But the name of Q. Velius Primus, in a sort of mixture of Greek and Latin, is found in raised letters on a mask of a Satyr in the British Museum (D 177 = Fig. 197), and other names are occasionally found on the moulds. The social condition of the Roman potter seems to have been much lower than that of the Greek, who was often a person of respectable position; but this may be partly due to the fact that his clientèle was drawn mainly from the poorer classes. He was generally a slave, sometimes a barbarian, and even the masters of the potteries were only

freedmen. As we saw in the case of the tile-makers, the potters often worked on the estates of wealthy or influential people, from which their clay was obtained. More details of Roman potters will be found in the sections dealing with tiles and lamps.

On the technical aspect of Roman terracotta figures little need be said. The processes were practically the same as those described in Chapter III. when dealing with the Greek terracottas. Large figures were made from models (*proplasmata*) and built up in several pieces on a wooden framework, known as *crux* or *stipes*. A reference to this method may be traced in a fable of Phaedrus, which describes Prometheus as having made human figures in clay in separate pieces, and, on returning from a supper with Bacchus, joined them together wrongly, so that the sexes became confused. The smaller figures were all made from moulds, by means of which they could be repeated with but slight alterations. Few statuettes seem to have been made after the second century of the Empire.

The range of subjects in Roman terracottas is much the same as in the Greek figures of the Hellenistic period. At Pompeii *genre* figures predominate, including such types as gladiators, athletes in the circus, slaves carrying bundles, and personages in Roman costume. A favourite type at Pompeii is a mask of a youth in a Phrygian cap. There is a decided preference shown for portraits and grotesques. Von Rohden, in dealing with the question of the extent to which these figures represent Greek or purely Roman types, considers that although the influence of the former is still strong, yet they are marked by such wide differences that they must be ranked in the latter category. He dates them in the time of Vespasian, in which the decadence which had begun with the later Hellenistic age is in the Roman fabrics still more strongly accentuated. The style is negligent, the proportions faulty, and the art of colouring

---

1 Tert. *Apol.* 12 and *ad Nat.* i. 12; the Greek word is *kàr̓aftos*; see *Vol. I.* p. 111.
practically lost. They are only redeemed from insignificance by the taste for portraiture and the interest which attaches to the reproduction of motives borrowed from contemporary life.

The Pompeii figures may serve as typical Roman terracottas, but they are also found elsewhere in Italy, as well as in other parts of the Roman Empire; nearly all, however, are of inferior merit and execution. At Praeneste in 1878, on the site of the temple of Fortuna Primigenia, were found genre figures and votive objects,\(^1\) and similar *ex votos* have come to light at Gabii.\(^2\) At Nemi figures have been found which are obviously of Roman date, some of considerable size.\(^3\) From time to time finds have been made in Rome, and there is a pretty little head in the British Museum found in the Tiber (D 383), which, however, may be of Greek workmanship. The industry also extended from Rome to the provinces, and even in Britain terracotta figures are sometimes found, as at Richborough\(^4\); at Caistor, by Norwich, a terracotta head of Diana, of fairly good style, is recorded.\(^5\) There are also in the Guildhall Museum some terracottas in the coarse red clay which characterises most of the British examples: a Venus on a swan; a female head with turreted crown, of archaistic style, from Finsbury; and a large figure of Proserpina holding a fruit, of very fair style, from Liverpool Street.\(^6\) A figure of a boy on horseback is or was in the Museum of Practical Geology.\(^7\)

2. GAULISH TERRACOTTAS

In Gaul there appear to have been very extensive manufactures of terracottas, but not anterior to the conquest by Julius Caesar in 58 B.C. These statuettes were made for the Roman colonists, who introduced the types of their own religious conceptions, but the makers were local craftsmen. Potteries have been unearthed at Moulins on the banks of

---

5. *Victoria County Hist. of Norfolk*, p. 291.
the Allier, and in Auvergne and other parts of France, and even in Germany, where one was discovered at Heiligenberg in Alsace, and others on the Rhine (see below, p. 384). The finds on the Allier, made in 1857, give a practically complete survey of the subjects; they are all now collected in the museums of Moulins and St. Germain, and were fully published at the time in a work by M. Tudot. The figures found here are not from tombs, but were unearthed from the sites of the potteries and from ruins of buildings; they are all made in a peculiar white clay, whereas the figures of the Gironde district are grey or black, and those of the Rhine Valley reddish, like those of Britain. The technique resembles that of the Roman figures; there is no vent-hole, and they usually stand on a conical base; the modelling is very heavy, and the latest specimens are absolutely barbaric.

Until recently the subject of Gaulish terracottas had been greatly neglected; Tudot's plates were useful, but his text unsatisfactory and devoid of method, there being no proper description of the plates. M. Pottier has given a good summary of his work, and M. Héron de Villefosse has also dealt with some aspects of the subject. But they had not been treated as a whole and in relation to the subject of ancient terracottas in general until 1891, when an important memoir by M. Blanchet appeared, in which a complete survey of the Gaulish terracottas was given. This must of necessity form the basis of the present account.

In dealing with the technical character of the terracottas found in Gaul, M. Blanchet points out that the white clay of which many are made (e.g. those from the Allier valley) is not universal; some are made of red or grey clay, which has turned white in the baking, apparently by a process analogous to that used by the Chinese for porcelain, others are actually covered with a white engobe like the Greek terracottas. This appears

---

to have been done with a view to subsequent colouring, which in nearly all cases has quite disappeared; but statuettes with remains of colouring, made of purely red clay, have recently been found in the neighbourhood of the Moselle and in Germany. M. Blanchet quotes an example in the Museum at Angers, with the name of the maker, P. FABI. NICIAE, which is coated with a lead glaze like the enameled wares described in Chapter III. He considers that the moulds from which they were made were often of bronze, and that bronze models were used as copies; but that they were also of terracotta is clear from the numerous examples given by Tudot. A terracotta mould for a figure of Venus Anadyomene, found at Clermont-Ferrand, is in the British Museum, and another from Moulins is for the back of the head of a similar figure, with hair elaborately coiled. From the numerous moulds which have been found it may be seen that the figures were cast in two pieces, longitudinally, the arms being added afterwards, together with the circular plinth. The mould in the British Museum may be cited as an example of one for the back part of a figure; probably only the upper part was modelled.

Potters' names are exceedingly common, not only on the figures, but also on the moulds, and form two distinct classes, those on the exterior of the moulds, and those on the figures or interior of the moulds (which are obviously the same thing). The distinction is that the former were merely for the identification of the moulds, while the latter indicated the creator of the type and made him known to the world, a feature which, as will be noted in Chapter XXIII. (p. 511), reappears in the pottery of Westerndorf in Germany. Tudot gives an example of a mould with the name ATILANO on the exterior and IOPPILLO on the inside. Many of the names are identical with those of the makers of vases, but the types and subjects are quite distinct from those on the Gaulish terra sigillata.

3 See the lists given by Tudot (p. 64) and Blanchet (p. 83).
4 Pl. 3: other examples in pls. 4-14.
Those on the exterior of the moulds are usually in a scrawling cursive type, whereas the other class are in capital letters\(^1\); the cursive characters resemble those in use at Pompeji, but are not necessarily contemporary; they are, however, not later than the second century. The influence of this cursive character seems to have extended to the other class; for instance, in the inscription given in Fig. 198 below, not only are the G and S of cursive form, but E appears in the form II. Otherwise the letters are in the ordinary Roman alphabet (with the exception of A, which is sometimes \(\Lambda\)); the forms E and II seem to have been used indifferently in Gaul at all periods. The “signature” sometimes combines the two names, as in the form

\[
\text{AVOT FORM SACRILLOS CARATRI, which has been taken to mean Sacrillos fecit forma Caratri, “made by Sacrillos from Caratrius’ mould.”}
\]

Among the Roman names which occur are Attilianus, Lucanus, Pistillus, Priscus, Taurus, and Tiberius; among the Gaulish, Abudinus, Belinus, Camulenus, and Tritoguno.

A large majority of the existing statuettes were, as we have seen, made in the valley of the Allier; these show more conspicuously than any others, the influence of transplanted Graeco-Roman art. Curiously enough none have been found at Lezoux, one of the chief pottery-centres of Gaul, although there is abundant evidence that the vases and statuettes were made in the same workshops (see above).\(^3\) M. Blanchet considers that there was a large and important manufacture in Western France, which may have been inspired by the Allier workshops, but mainly exhibits native characteristics; he also notes the scarcity of these figures in Southern Gaul (Narbonensis), which may perhaps be explained by the preference there shown for bronze statuettes and vases with medallions (p. 530).\(^4\) Other centres were Cesson, Meaux (where Atilianus and Sacrillos can be located), Bourbon-Lancy in Saône-et-Loire, and St. Rémy-en-Rollat (see p. 516), where vases also were made of the local

4 Ob. cit. lx. p. 204.
white clay. M. Déchelette has been able to assign to the last-named pottery a date between A.D. 15 and 50. Another fabric was in the neighbourhood of Liège, and in Germany there were centres at Salzburg, and at Cologne, where the maker

Vindex can be dated in the reign of Postumus (A.D. 260—270).\(^1\) An important maker, Pistillus, had a pottery at Autun; his statuettes are found all over Gaul,\(^2\) and the name appears on

\(^2\) Rev. Arch. xv. (1890), p. 423 (from Dijon); for a list, see Blanchet, op. cit. li. p. 96.
vases and coins, and also in an inscription. 1 Julius Allusa had a workshop at Bordeaux. In West and North-West France statuettes are found with the name of Rextugenos; they are all of peculiar and original character, with highly-ornamented backgrounds to the figures, and easily distinguished. The specimen given in Fig. 198, representing Venus Genetrix, was found at Caudebec-les-Elbeuf in Normandy (Seine-Inférieure); it bears the inscription RIXTVGIINISOSSVLLIASAVVOT, Rextugenos Sullias auvot (sc. fecit). 2

An interesting find of terracotta figures was made at Colchester in 1866, 3 consisting of thirteen figures presenting exact analogies to the Gallo-Roman terracottas of the second period both in type and style. One very poor specimen represents Hercules with club and lion-skin; another a bull, and a third a bust of a boy (perhaps a portrait of Nero or Britannicus); four are recumbent figures. The rest are more or less grotesque, including caricatured seated figures holding books or rolls, and a buffoon. With them were found vases in the form of animals of yellow-glazed ware. Figures of suckling goddesses (see below) have been found in Britain, and similar finds of Gallo-Roman types in white clay in London, among them a Venus holding a tress of her hair. 4 Votive offerings of parts of the body and figures of the goddess Fecunditas were found near the source of the Seine, in a temple of Dea Sequana, the local river-deity. 5 Other finds have been made in Touraine, Anjou, La Vendée, Brittany, and Normandy, brought by commerce from the Allier potteries; and in Germany at Hedderachheim and on the Rhine. Part of a group of some size in purely Graeco-Roman style from the Department of Marne is now in the British Museum (Morel Collection).

Tudot originally classified the Gaulish terracottas chronologically in three periods according to style, and in this he has been followed by M. Pottier. But M. Blanchet 6 has pointed

1 Orelli, Inscr. Lat. 2776.
2 Blanchet, op. cit. plate, fig. 1; Rev. Arch. xi. (1888), p. 155, pl. 6.
out that the former's method was altogether unscientific, that he trusted too much to the evidence of coin-finds, and that he was altogether wrong in conceiving the possibility of any being anterior to the Roman conquest. On the whole the chronological data are exceedingly vague, and can only be accepted in isolated instances, as in the case of the finds at St. Rémy-en-Rollat (A.D. 15—50) or Cologne (A.D. 260—270), or where a resemblance in the coiffure of the feminine figures to those of Roman ladies can be traced. Some figures may probably be dated about A.D. 100 on the latter ground, the head-dress recalling those of Domitia and Julia the daughter of Titus. But it can only be laid down with certainty that the manufacture of statuettes was introduced into Gaul with the terra sigillata or ornamented red pottery at the beginning of the Imperial period. Where there is a question of decadent or barbaric style, as is undoubtedly often the case, it does not necessarily imply a late date, but only that the inferior work is due to the incapacity of some local artist, and figures of varying style must frequently be contemporaneous.1

In dealing with the types of Gaulish terracottas, their origin and signification, M. Blanchet divides the subjects into three classes, of which the first is not only the largest but the most interesting: divinities, subjects from daily life, and animals. The deities are not those we should expect from Caesar's statement2 that Mercury, Apollo, Mars, Jupiter, and Minerva represent the scale of popularity in Gaul, for they are mainly variants of one type, that of Venus. Many of these Venus figures reproduce types familiar in Greek and Graeco-Roman art, such as the Anadyomene, and the Cnidian or Pudica type; but in the majority she is frankly recognised as a Nature-goddess (Aphrodite Pandemos or Venus Genetrix), and hence we find numerous examples in which the old Oriental conception of the nude Aphrodite-Astarte with pronounced sexual characteristics, so common in the primitive terracottas of Chaldaea, Phoenicia, and Cyprus,3 once more reappears, as in Fig. 198. Of almost equal frequency is the seated type of the

1 See Blanchet, p. 120 ff. 2 Cf. Heuzey, Figurines ant. du Louvre, pls. 2-4.

VOL. II.
Mother-Goddess or Κούρστρόφος, suckling a child\(^1\); this is not peculiar to Gaul, but is found in the terracottas of Southern Italy.\(^2\) We may compare also the Fecunditas types on Roman coins.\(^3\) Blanchet thinks that the goddess Rumina may be here intended, but prefers to adopt the general term of Mother-Goddess.

Among other mythological types the Ephesian Artemis, Pallas, Mercury, Epona (Fig. 199), and Abundantia occur; and among genre subjects the most interesting type is that of the Spinario, or boy extracting a thorn from his foot, familiar in Greek sculpture. Slaves, caricatures, and busts of ladies (see above) or children wearing the bulla, vases in the form of heads, and busts affixed to plates, also come under the latter category. Many of these are exceedingly rude and barbaric; children are transformed into coarse grotesques, and animals look (says M. Pottier) as if they had come out of a Noah's ark.

The artistic origin of the Gaulish types has been discussed by M. Blanchet,\(^4\) who points out that although the modern tendency is to restrict the rôle played by Alexandrine art of the Hellenistic period in influencing that of Rome,\(^5\) yet its effect on Gaul cannot be altogether ignored. That Egyptian cults found their way into Gaul is well known,\(^6\) and in the terracottas such types as Isis and Horus appear, while comparisons may frequently be made with the late terracottas found in the Fayûm and at Naukratis. But there was also a stream of influence from Southern Italy, especially

GAULISH TERRACOTTAS

Campania, whence, as we have seen, the Mother-Goddess types were largely derived.

As regards the uses for which these terracottas were made, much that has been said on that head in Chapter III. will apply equally to Gaul. They have been found not only in tombs, but in wells and rivers, and on the sites of sanctuaries; but they do not seem to have had any special funerary significance. The majority were probably used for various domestic purposes in the houses, the figures of animals, for instance, as toys, and were then buried with their owners. Those found in wells or rivers may be regarded as votive offerings, as it is well known that the Gauls were fond of throwing votive figures into rivers or springs.

3. MISCELLANEOUS USES OF TERRACOTTA

It is impossible to enumerate all the purposes to which the Romans applied terracotta, but a few peculiar uses deserve special notice. The excavations at Pompeii have yielded several examples of its application to the decoration of a puteal, the circular structure which protected the mouth of a well; the core is of tufa or other hard material, and round this are laid curved slabs of terracotta decorated with reliefs. They are all of comparatively early date; one has triglyphs and bulls' heads in relief, and is stuccoed over. Instances are also found at Pompeii of its use for table-legs, in the form of figures of kneeling Atlantes, like those supporting the entablature in the Thermae (p. 374), but sculptured in the round. Small altars, or stands for holding lamps or for burning incense, supposed to have formed part of the furniture of the domestic shrines, have also been found in this material. Varro tells us that the dolia or large jars made by potters were used as cages for dormice which were being fattened for the palates of Roman epicures; and Columella gives instructions for the use of clay tiles in making beehives. Porphry implies that it was customary to hive bees in kraters

or amphorae of clay.\textsuperscript{1} Tickets (tesserae) for admission to the circus or amphitheatre were also occasionally made of clay, and on them were stamped letters or numbers referring to the position of the seat, or representations of the animals exhibited. Two from Catania in the British Museum\textsuperscript{2} have an elephant on the obverse and the letter \textit{A} on the reverse, showing that they were for admission to a spectacle in which those beasts were shown. There are also possible instances of \textit{tesserae frumentariae}, or tickets for the supply of cheap corn in time of necessity.\textsuperscript{3} Moulds of terracotta for making counters, with masks or figures of Fortune and Isis, have also been found; there is an example in the British Museum from Arezzo (E 46).\textsuperscript{4}

Herr Graeven, in a very interesting article,\textsuperscript{5} has recently collected all the known examples (numbering some fifty) of money-boxes in terracotta used by the Romans. There is no mention of such objects in Latin literature, but it is probable that they were known as \textit{loculi}, and were made in imitation of the metal \textit{θησαυρός} used for keeping money in temples. Of this there is a clear instance in a specimen recently found at Priene in Asia Minor,\textsuperscript{6} in the form of a small shrine with a slit in the top. Graeven states that there is evidence of their having been placed on a cornice which ran round the walls of the rooms in the houses. This box has an additional hole at the back for extracting the money, but the Roman specimens have only one opening. An example of a clay treasure-box from Western Europe is one in the form of a chest, 12\frac{1}{2} inches high, with a bust of Apollo on the top, found at Vichy, and now in the Museum at Moulins.\textsuperscript{7} It may have been placed in a \textit{saeculum} or chapel for the offerings of those who visited the medicinal springs.

Of the Roman money-boxes proper four main types may

\textsuperscript{1} \textit{Antr. Nymph.}, 3, 14 ff. (Teubner).

be distinguished. The first, of which examples have been found at Pompeii, is in the form of a small chest or coffer (arca), and may have been known by the name *arcula*. The second type is that of a money-box in the form of a vase. The custom of hoarding money in jars (*ollae*, p. 470) was universal in Roman times, as we know from the *Aulularia* of Plautus, the plot of which turns on this practice, and from the numerous finds of coins in jars in our own day. None of these have any ornamentation; they have been found in Germany, and there is a small specimen in the British Museum from Lincoln, of spherical form with a knob at the top. Aubrey records the finding of a similar one in North Wiltshire. These appear to be of very late date.

The next two types are of much greater interest, not only from their ornamentation, but from their form and the inscriptions which they bear. In the one the box takes a flat circular form, closely resembling the body of a lamp (the shape is that of Fig. 207), with a design similarly placed in a medallion. One actually has a figure of Victory with a shield, which reproduces the type of the New Year lamps described on page 413 (B.M. No. 309), and has a similar inscription. It may be supposed that these boxes were carried round on New Year’s Day to solicit contributions, just as is done (says Herr Graeiven) by boys in Rome at the present time. Others have figures of Fortune and Hermes in a shrine, the latter deity being of course specially associated with money-making. These two examples have their respective makers’ names on the back, C IVN BIT and PALLADI, names which are also found on Roman lamps, another detail which shows the close connection between these two classes of objects.

The last type to be described is shaped like a bee-hive, or, as in Fig. 200, like a circular temple, forms which were found convenient for the then favourite design of a deity in a

shrines. Among the examples quoted by Graeven¹ is one of the latter shape with Fortune (Fig. 200), now in the Bibliothèque Nationale. Of the beehive form three may be mentioned as presenting interesting features. One with Hermes in a shrine has the maker's name, PAS AVGV, which also occurs on lamps²; another, found on the Aventine, and now at Gotha,³ has on the front the figure of a victorious charioteer, on the reverse a slit for the coins, and the maker's name, AEL MAX. D'Agincourt suggested that this type of box was carried about by victors in the games to receive donations. Lastly, there is one recorded to have been found in the Baths of Titus in 1812, but now lost, which contained coins of Trajan, and was inscribed FISCI IVDAICI CALUMNIA SVBLATA. The evidence points to the dating of these two classes in the first century of the Empire, or slightly later.

Terracotta moulds for false or debased coins of the Imperial period have frequently been discovered in different parts of the Empire.⁴ None, indeed, have come to light in Italy, but they occur in Egypt, Tunis, France, on the Rhine, in Switzerland, Lower Austria, and Britain. They were first noted by A. le Pois in 1579 at Fourvières, where moulds were found of coins of Septimius Severus and his successors. In 1697 and 1706 more of the same period, of local clay, were found at Lingwell Gate, near Wakefield,⁵ in 1704 at Lyons, and in 1764 at Augst, near Basle. In 1829 and 1830 further finds were made at Wakefield, and again in 1869 at Duston, Northants.⁶ Numbers

have been noted from time to time in the museums of France and the Rhenish provinces, the most interesting find being that made in 1829-30 at Damery, near Épernay, in the Department of Marne. In 1859 a find of 130 moulds contained in a jug was made at Bernard; they appear to have been hastily placed there and left by forgers. At Bordeaux in 1884 finds were made in the ruins of a pottery, and others more recently at Autun and La Coulouche. In 1899 thirty-four moulds were found at Susa in Tunis. The British Museum has a collection of moulds of denarii from Egypt, mostly found at Crocodilopolis (Arsinoë) in the Fayûm; they are of a deep brick-red local clay, but a great number are burnt black.

Nearly all these moulds fall between the reigns of Septimius Severus and Diocletian, but some of those at Bernard go back as far as Trajan, and there are isolated instances of coins of Domitian at one end, of Constantius II. and Julia Mamaea at the other. Caracalla and Elagabalus are frequently represented, and those in the British Museum include Albinus, Crispus, Constantine, Galerius, Licinius, and Macrinus. The Damery find included thirty-nine moulds, comprising types of the coins of Caracalla, the elder Philip, and Postumus; 2,000 pieces of base silver coin, chiefly of Postumus; 3,900 bronzes of Constans I. and Constantius, all evidently made together; chisels and remains of other tools, and groups of moulds still containing the metal, and also lumps of metal which had overflowed from the moulds.

The way in which these moulds were used is as follows. The complete mould was composed of two shallow round boxes with hollow impressions respectively of the obverse and reverse, obtained by impressing the designs from genuine coins into the soft clay. The depth of the hollow was so calculated that when the two were placed together the space represented the required thickness. To cast the coins, a number of these moulds were placed one on the other, and luted with clay to prevent the liquid metal from escaping between the two pieces of each mould; down the side of the column formed by the pile of moulds a hollow cutting was made, at the base of which holes were pierced corresponding to the cavities where the metal was
to enter. The metal was then poured into the hollow, and ran in through the holes as required.\footnote{See Darenberg and Saglio, ii. s.v. Forma, for an account of the process.} Sometimes the columns were joined in groups of three \( \text{図} \), for which a single column served; of this there is an example at Damery, where each \textit{rouleau} contained a dozen moulds (thirteen discs). In the Cabinet des Médailles at Paris there is an example of one of these \textit{rouleaux} of moulds, found at Lyons in 1704 (Fig. 201),\footnote{Darenberg and Saglio, \textit{loc. cit.}, fig. 3187.} with the basin in which they were placed for the casting. At Susa the moulds were fitted slantwise into a bronze tube.

It is not absolutely certain whether these moulds were all used for fraudulent purposes by forgers; the find at Damery, for instance, was made on the site of Bibea, an important station on the road from Rheims to Beauvais, which would be too prominent a place for forgers to have selected. It is much more likely that in such a case they were used to make coins of inferior alloy, perhaps in some instances for the issues of usurpers who, being at a considerable distance from the capital, were unable to fill their military chests except with hastily cast coins. The distant parts of the Empire in which these moulds are found lend some colour to this theory. It will also be remembered that they mostly date from the time when a debased coinage was current throughout the Empire, beginning with the reign of Septimius Severus; this was put an end to by Diocletian in 297. We may therefore suppose that they represent, so to speak, officially recognised forgeries, emanating from a kind of local mint for producing coins hastily for provincial use. Hence the rapid spread of base money in the third century, which was not only forced upon the State, but was also readily taken advantage of by forgers.
CHAPTER XX

ROMAN LAMPS

Introduction of lamps at Rome—Sites where found—Principal parts of lamps—Purposes for which used—Superstitious and other uses—Chronological account of forms—Technical processes—Subjects—Deities—Mythological and literary subjects—Genre subjects and animals—Inscriptions on lamps—Names of potters and their distribution—Centres of manufacture.

BIBLIOGRAPHY

LAMPS (lucernae) were often made of terracotta, and these are in many ways of special interest. Originally they appear to have been called lychmus, from the Greek λύχμος, and this word is used by Ennius, Lucilius, Lucretius, and Virgil. Varro says that the word lucerna, from lux, was invented when the want of a Latin word was felt, and that previously candelae or torches had been alone in use, there being no oil known in Italy suitable for this purpose. Even in Greece lamps were comparatively rare all through the best period (cf. Vol. I. p. 106). The oldest lamps found in Rome date from the third century B.C., and are thought to be of Campanian fabric; they were found on the Esquiline, and are of quite different character.

1 See Macrobius, Sat. vi., 4, 18. Lucilius uses this word and lucerna in the same line.

2 L.L. v. 119.

393
from the ordinary Roman types. It would appear, therefore, that originally the Romans borrowed lamps from Southern Italy. By the time of the Empire their use had become general, and they are found everywhere. The increase in their manufacture was mainly due to growing taste in house decoration, and also to use in funeral ceremonies and for public purposes, such as illumination. Of the latter use in imperial times there is plenty of evidence (see below, p. 396).

The sites on which Roman lamps have been found are far too numerous to discuss in detail, as they embrace every part of the Roman Empire. In Rome and the neighbourhood they are especially plentiful, as is implied by the fact that a large portion of the fifteenth volume of the Latin Corpus Inscriptionum is devoted to those with potters' stamps alone. They are found in all parts of Italy, in Gaul, Germany, Britain, Spain, North Africa, Sicily, Greece, Egypt, Cyprus, and Asia Minor. The question of centres of manufacture is discussed elsewhere (p. 427) in connection with the potters' stamps; but it may be noted that those found on Greek soil are often of a distinct character from those of Western Europe, and the stamps on them form a distinct group, being usually in Greek letters (cf. Vol. I. p. 108). Of provincial sites, Knidos, Ephesus, Carthage, and some of the German towns have proved particularly rich in this respect. Large numbers have been found in London, mostly of the later types, some perhaps of local fabric, and those in the Romano-British collection of the British Museum are nearly all from that city or from Colchester. Not the least remarkable fact of their wide distribution is the occurrence in the most widely separated regions of the same potter's stamps and the same subjects, implying in the former case extensive export from one centre, in the latter systematic commercial intercourse between the potters of different districts.

The principal parts of a Roman lamp are: (1) the reservoir or body, which contained the oil (infundibulum); (2) the flat circular top, known as the discus, sometimes with an ornamented rim

1 Ann. dell' Inst. 1880, p. 265 ff.; see below, p. 399.
(margo); (3) the nozzle, with a hole for the insertion of the wick (rostrum,\textsuperscript{1} nasus, myxus\textsuperscript{2}); the wick was called ellychnium); (4) the handle (ansa, manubrium), which was not indispensable. In the discus was a filling-hole for pouring in the oil, sometimes protected by a cover or stopper, and sometimes a second smaller hole, the purpose of which has been disputed (see p. 406). The number of nozzles was not limited, though there is usually only one; a lamp with two is known as bilychnis\textsuperscript{3}; one with several, as polymyxs. Martial in one of his epigrams says: “Though I illuminate whole banquets with my flame, and have so many nozzles (myxos), I am known as a single lamp.”\textsuperscript{4} The wicks were made of a plant known as verbascum (Greek, \(\phi\lambda\rho\omicron\omicron\omicron\)) or thrallis,\textsuperscript{5} but tow, papyrus, and sulphur were also employed\textsuperscript{6}; the oil was a vegetable oil of some kind. Sometimes the lamps were provided with a sort of snuffers or tweezers for extracting and trimming the wick,\textsuperscript{7} as described in a passage in the Moretum (10 ff.), which speaks of drawing out the wick of a dying lamp with a needle:

Admovet his pronam submissa fronte lucernam,  
Et producit acu stuppas humore carentes  
Excitat et crebris languentem flatibus ignem.

The purposes for which lamps were used by the Romans were various, but fall under three main heads: (1) for purposes of illumination in private houses, in public buildings, or on occasions of rejoicing; (2) as offerings in temples; (3) as funerary furniture.

In small houses they were placed either in niches in the walls or on brackets, or were suspended by chains, or even in some cases hung by the handle from a nail. An Etruscan terracotta lamp bears evidence of having been suspended in the last-named manner,\textsuperscript{8} but there is no doubt that this was

more usual with lamps of bronze, there being few in terracotta which would have admitted of such a use. Sometimes the lamps were made resting on a kind of support, as is the case with two in the British Museum, and others found in Africa.\(^1\) On the support a figure of a deity was usually modelled in relief.\(^2\) Combinations of a lamp and altar are not uncommon, especially at Rome and Naples.\(^3\) There are numerous examples from Pompeii and Herculaneum illustrating their use in private life, although lamps of clay are confined to the poorer houses or to domestic service. For their use in the bedchamber at night evidence is afforded by Martial and other writers.\(^4\) A rough classification of the existing terracotta lamps might be made by dividing them into—(1) those with knobs for hanging, (2) those with handles for carrying, (3) those without handles for placing on tables or brackets.

Many passages in Latin writers afford evidence for the use of lamps in processions or for illuminations at times of public rejoicings, such as triumphs. They were thus used by Cleopatra, at the triumph of Julius Caesar, at the return of Nero, and so on.\(^5\) Caligula had theatrical representations performed by lamp-light at night, and Domitian arranged hunts and gladiatorial combats \textit{ad lycnuchos}.\(^6\) Severus Alexander lighted up the baths with oil-lamps,\(^7\) and Tertullian speaks of assisting in political triumphs by defrauding the day with the light of lamps.\(^8\) Juvenal also speaks of their use in illuminations.\(^9\) Many lamps, especially those with subjects relating to the circus or games, are inscribed with the word \textit{saecvla} (\textit{ares}), and it is possible that they were used in connection with the Ludi Saeculares, at which illuminations took place. But lamps with this inscription are not exclusively ornamented with such subjects.\(^10\)

USES OF LAMPS

Lamps were used for burning in temples, and were also the subject of votive offerings to the gods, in Greece as well as in Italy. One found at Oenoanda in Lycia was offered "to the most high God"; and those which Sir Charles Newton found in such large numbers at Knidos (Vol. I. p. 108) were also votive offerings in the temenos of Demeter. Votive lamps are recorded from Selinus, and at Carthage numbers were found round the altar of Saturnus Balcaranensis. To their use in the worship of Isis, as referred to by Apuleius, we allude below.

Nearly all lamps have been found in tombs, the custom of placing them there being one of Asiatic, not of Greek, origin; it became quite general under the Roman dominion. Christian lamps are found in the catacombs, but not in cemeteries, showing that the practice came to be regarded as pagan. At Avisford in Sussex they were found placed in open bowls with handles, on brackets along the side of a tomb. The Roman lamps found in tombs were placed there, like the Greek vases and the later glass, for the use of the dead, sometimes, though not necessarily, with the idea of their burning perpetually. An inscription on a sepulchral cippus in the British Museum directs the heirs of the deceased to place a lighted lamp in his tomb on the Kalends, Nones, and Ides of each month, and similarly L. Granius Pudens of the seventh cohort requests that his family should place oil in a lamp on his birthday. Another inscription in an elegiac couplet says: "Whosoever places a lighted lamp in this tomb, may golden earth cover his ashes." A fourth inscription directs the daily offering of a lamp at the public expense to the manes of a deceased person. In the story of the matron of Ephesus, told by Petronius, a servant-maid is described as replenishing the lamp in a tomb as often as was required. Two lamps in the Athens Museum

have the subject of a bear, and over it the inscription ΦΟΒΟΣ, "Fear"; being found in tombs, they must have been placed there with some significance, and as, on the evidence of a Cilician inscription, Phobos was regarded as a guardian of tombs who frightened off robbers and other evilly-disposed persons, it may be that the terrible bear was placed on the lamp as a symbol of this protector of the dead.¹

Other superstitious uses of lamps, not connected with the tomb, were not uncommon. Omens were drawn from the way in which the flame burned,² and Chrysostom describes a method of naming children by giving names to lamps, which were then lighted, and the name of the child was taken from that last extinguished.³

There are also a few other exceptional uses of lamps, as for instance when they were given as strenae, or New Year's presents. Such lamps usually have a figure of Victory holding a shield, on which are the words AMNVM NOVVM FAVSTVM FELICEM, "A happy and prosperous New Year!"⁴ In the field are heads of Janus, or cakes, wreaths, and other objects also probably intended for presents. These all appear to date from the beginning of the first century after Christ.⁵ A lamp of the same class in the Guildhall Museum has on the shield FIIICTII, Felic(i)ũ(as).⁶ It is interesting to note that the New Year lamps are found in tombs⁷; they may, of course, have been preserved and buried as mementoes; but at the same time, it is not essential that the subject on a lamp should have any relation to its purpose, as we have seen in the case of those inscribed Saeculares.⁸ The Helioserapis lamp (see p. 403) and those with Phobos as a bear may, indeed, be instances to the contrary, but on the whole it would seem that the same rule would apply as in the case of the terracottas (see Vol. I. p. 122).

⁷ Cf. C.I.L. ix. 6081, 1.
⁸ See also the lamps from the altar of Saturnus Balearicensis (Daremburg and Saglio, iii. p. 1339).
The earliest Roman lamps are of rude shape, undecorated, with a long projecting nozzle and circular reservoir; they are not always provided with handles, but are often covered with black glaze, like the Greek examples. Lamps of this type are found on the Esquiline, in North Africa, as at Carthage, and in Sicily.¹ One of the Esquiline examples, dating from the second century, has the engraved inscription VEVCADIA (Fig. 202).² Like the Greek lamps, these are made on the wheel (προσημάτων), not, as later ones, in a mould. Names in graffito seem to imply a reference to the person in whose tomb the lamp was found, and such formulae as AVE, NOLI ME TANGERE, NII ATTIGAS NON SVM TVA M · SVM, PONE FVR (“Drop it, thief!”), which occur on the Esquiline lamps, also clearly refer to funeral usage.³

In the first century B.C. the lamps, still mostly of black ware, and devoid of subjects, are distinguished by the straight-ended, concave-sided nozzle \( \text{\(\mathcal{M}\)} \), with a shallow groove leading to the centre, small grooved ring-handle, and sometimes a lateral projection like a fin, from which some varieties are known as “delphiniform” (Fig. 203).⁴ These are often found in North Africa, but are also imported into Italy, and some have Greek stamps. The top is sometimes covered with globules, or with patterns of vine and ivy, and in the later examples figure-subjects are introduced.⁵ The earlier ones have large single letters or monograms underneath

for potters' marks; the later, the name of the potter or superintendent of the pottery.

We now come to the Roman lamps of the Imperial period, of which such large numbers exist in museums all over Europe and the basin of the Mediterranean. They have not as yet been very systematically studied and classified; but so far as the subject has been treated at all, those who have investigated the development of the forms are fairly unanimous in their general conclusions. The last writer on the subject, Herr Fink, of Munich, has advanced a step further, and by comparison of forms with potters' signatures has arrived at some interesting results, which we need not hesitate to accept in the main. He adopted as the basis of his classification the form of the nozzle in each case, for the obvious reason that it is more essential to the character of a lamp than the handle; if the latter is removed, the form is in no way affected, as it would be by the absence of the nozzle.

Following, then, on the lines of Fink and the other writers, we may establish—apart from abnormal forms and lamps modelled in the shape of figures—four main classes, which are sufficient to include practically all the lamps with which we have to deal. They may be summarised as follows:

(1) Lamps with rounded nozzle or nozzles, flanked on each side by a kind of double volute, as in Fig. 204 and B.M. 167-352. The usual number of nozzles is one, but two are not infrequently found. These belong to the first century B.C., and, being convenient forms for a decorated top, are ornamented with all kinds of subjects; the handle when present is often ornamented as in the cut.

---

2 On the evidence yielded by the potters' signatures see also below, p. 428.

3 See the examples given on Plates LXIV.-LXV.
FORMS OF ROMAN LAMPS

(2) Lamps of the same type as the last, except that the nozzle ends in an obtuse-angled termination, as Fig. 205 and B.M. 94-166. It is a form not adapted for more than one nozzle, and usually has no handle.¹

(3) A small but distinct class, almost devoid of figured decoration (Fig. 206 and B.M. 379-392), but usually with a potter's name underneath; the form is elegant, and probably copied from bronze.² The chief feature is the sunk centre, in which is usually placed a Bacchic or comic mask; round it runs a raised rim, through which a shallow groove passes to the somewhat elongated nozzle. This dates from the first century of the Empire or earlier, some being found with coins of Augustus, others at Pompeii; these lamps are of red clay, unglazed, and have no handle. On the sides are projecting knobs, either concealing the joins of the moulds (see p. 405), or for the attachment of chains. The names of the makers, Strobilus, Communis, Fortis, etc., are in good raised letters, impressed in the mould (see Fig. 210). They are found in all parts, but rarely south of Rome; most of them are from Gallia Cispadana,³ and they may have been made at Mutina.

(4) In this class (Fig. 207 and B.M. 393-567) the nozzle is small, and hardly projects beyond the rim of the lamp; it is semicircular or heart-shaped in form, and sometimes has an incised line or circles at the base. Fig. 208 represents a late development with the heart-shaped nozzle, in which the type given in Fig. 204. Cf. C.I.L. xvi. pl. 3.

¹ I am inclined to agree with Dr. Dressel in placing this type earlier than Fink’s Class I. It seems to be intermediate in form between the delphiniform and other types with blunt nozzles, and

² Cf. C.I.L. xvi. pl. 2, No. 5 = Fig. 206, and Dressel, ad loc., p. 783.
³ Cf. C.I.L. v. 8114.

VOL. II.

FIG. 206. LAMP WITH SMALL PLAIN NOZZLE; SECOND CENTURY AFTER CHRIST.
design is always surrounded by a wreath or ornamental pattern. Many of these lamps, especially those found in Greece (see Vol. I. p. 108), have no handle; there is also a somewhat late variety, described on the same page, which is confined to Greece and marked by potters' signatures in Greek letters (B.M. 604-629). These lamps date from the time of Trajan onwards; the signatures are usually abbreviated, and are stamped hollow, or sometimes scratched in the wet clay; raised letters are rare. The subjects are very varied.

Some of the larger lamps in the first class, especially those with more than one nozzle, have a flat vertical projection attached to the top of the handle, triangular in form or crescent-shaped (as in Fig. 204), and this is often ornamented with figures in relief, either whole subjects or busts of deities, or such simple motives as a pair of dolphins, a leaf, or a palmette. The figure-subjects are often quasi-Egyptian, such as Harpocrates and Safekh on a British Museum example (No. 337 = Plate LXIII. fig. 3), or a lectisternium of Sarapis, Isis, Helios, and Selene. In a few cases this projection is replaced by a bust or even a seated figure of Sarapis enthroned in a niche. But in most cases the handle, when present, is of a simple form, either a ring with shallow parallel grooves or a solid projecting piece through which a hole is pierced.

Lamps of terracotta often assume, like those in bronze, a more ornamental form, being modelled partly or wholly in the form of figures, heads, animals, and so on. In some cases the upper part or discus only is modelled, assuming the form of a mask—Satyr, theatrical, or grotesque. Among the entire figures which form lamps occur Artemis, Eros, Victory slaying a bull, and various animals; more common are heads of Zeus.

6 In the Louvre.
Roman Lamps of Various Forms (First Cent. B.C.)
(British Museum).
Ammon, Pan, Seilenos, negroes, and animals such as oxen, birds, snails, frogs, or tortoises. A favourite shape is a lamp in the form of a foot or a pair of feet, shod in sandals or boots, and there are two lamps in the British Museum, one of enamelled ware, in the form of a gladiator's helmet; others form fruit, pine-cones or crescents. In the lamps which are modelled in the form of a head, the chin usually forms the nozzle, and the orifice for filling is on the forehead; in those in the shape of a foot the nozzle is formed by the great toe. Occasionally lamps are found in the form of a ship, recalling that which, according to Apuleius, was used in the worship of Isis: a golden boat or cup (cymbium, see Vol. I. p. 186), which shone with a clear light and sent forth a long flame. An interesting commentary on this use of lamps is formed by a remarkable example in the British Museum (Plate LXIII. fig. 1), which is not only in the shape of a boat, but is decorated with subjects referring to the pseudo-Egyptian cults characteristic of Rome in the late republican and early imperial period. This lamp, which is no less than twenty inches long and has numerous holes for wicks along the sides, was dredged up from the sea at Pozzuoli, where it may originally have been in the temple of Isis and Sarapis. On it is the inscription ΕΥΠΑΟΙΑ, signifying "a prosperous voyage," perhaps as a prayer on behalf of the donor, and underneath are the words ΛΑΒΕ ΜΕ ΤΟΝ ΗΑΙΟΣΕΡΑΠΙΝ, "Receive me, Helioserapis," by which the name of the vessel may be intended.

Most lamps had only one wick, but the light which they
afforded must have been feeble, and consequently the number was often increased. When the number is not large, or when the body is circular (as in Plate LXIII. fig. 4), they project beyond the rim of the lamp, as in Class I. already described, but the lamps which have a large number are usually boat-shaped or rectangular in form (see Plate LXIII.), and the nozzles do not then project, but are ranged along the sides, merely indicated by separate moulding underneath. Occasionally a conglomeration of small lamps was made in a row or group, but even in these cases the illumination given must still have been feeble. The average size of a lamp is from three to four inches in diameter across the body, the length depending on the form of the handle and nozzle, but averaging about an inch over the diameter, and they are mostly about an inch in height. The top of the lamp is almost always circular in form, occasionally oval, and rarely rectangular, and is usually slightly depressed, being thus shaped to enable any overflow of oil to run down through the filling-hole. Many Greek lamps, and Roman lamps from Greek sites, such as Cyprus, are convex above, with a small moulded disc on the raised centre, in which is the hole. These are either devoid of decoration, or only have an ornamental pattern or a frieze of figures on a small scale. Usually the subject is enclosed within a plain moulded rim, but in the later examples (Class IV.) especially it is more contracted in extent, and surrounded with a border of ornament, such as the egg-pattern or a wreath of some kind (see Fig. 208).

Christian lamps, which hardly come within the scope of this work, vary very little in form; they have ovoid instead of circular bodies, a plain rounded nozzle, and a small solid handle, and the design is always encircled by a band of ornamental pattern or symbolical devices.

The clay of which the lamps are made is usually of a red colour, due to the presence of red ochre (rubrica), but it varies both in quality and tone according to localities; those from

1 See for examples in B.M., Nos. 58-66.
3 See Dalton, B. M. Cat. of Early Christian Antiqs. pl. 32, p. 148.
Greek sites, such as Athens and Corfu, are often of a pale buff colour, those from Cyprus a light reddish brown, and so on. Martial refers to the red clay of Cumae, a place where lamps are sometimes found, and those from Naples are usually of a dull brown or yellow colour. Lamps found in France and England are often imported from Italy, and therefore of the ordinary red clay, but those of local manufacture are of a white or yellowish tone.

The earliest undecorated examples are made on the wheel, as are those from the Esquiline and from Carthage, in which the decoration is only incised; but subjects in relief required a different technique. Occasionally they are modelled by hand, but we find that from the first century B.C. onwards they are almost invariably made in moulds, modelled from a pattern lamp, in a harder and finer clay than the pattern. The mould was divided into two parts, adjusted by mortices and tenons, which, in the opinion of some writers, explains the lateral projections visible on certain varieties; the lower part formed the body of the lamp, the upper the decorated discus. The two parts seem to have been marked by corresponding letters to avoid errors, and there are two or three lower lamp-moulds in the British Museum from Ephesos and elsewhere, marked with an A on the under side for this purpose. Other examples of moulds have been found in Greece, Italy, and Africa, and there are also specimens both for the upper and lower half in the Guildhall Museum. They were either of terracotta or plaster.

The clay was impressed into the mould with the fingers,

1 xiv. 114.
2 See on the subject Daremberg and Saglio, iii. p. 1334; Blümner, Technologie, ii. pp. 71, 108.
3 Cat. of Terracottas, E81-83: see Cat. p. 51, Nos. 117-18 (from London Wall).
the figured decoration being applied by means of models or stamps, as with the Arretine ware (see below, p. 439), and the ornamental patterns probably produced with a kind of wheel or running instrument, as in Roman pottery (p. 441). Signatures in relief were taken from the mould, those in hollow letters were impressed in the lamp itself from a stamp before baking. Important potteries must have possessed a large number of moulds; for instance, at Rome alone ninety-one different subjects are found on the lamps of one potter (L. Caecilius Saevus), eighty-four on those of C. Oppius Restitutus, fifty-one on those of Florentius, and there must of course have been many more now lost. It is clear that the same types were used by different potters; the models must, therefore, have been handed about from one to another, each potter merely adding his own name.

The two portions of the mould were joined while the clay was moist, and pared with a tool, and the orifice for filling was then pierced. Glaze, when used, was applied before the baking, for which only a moderate temperature seems to have been required; this process followed as soon as the clay was dry. In some lamps a small hole or slit may be observed, which some have thought to be for the pin with which the wick was extracted, but it is more probable that it was for a piece of wood which held the top and bottom of the mould together until the clay was united; it was usually covered over before the baking, and may have taken the place of the knobs already spoken of which occur in other forms. The lamps were baked in batches, placed closely together or superimposed, and it sometimes happens that a number are found united together which had coalesced firmly in the furnace, as in Sir Charles Newton's excavations at Knidos.

Subjects are first found on lamps in the second century B.C., though these are quite of a simple character. Lamps of this date from North Africa have such designs as an altar and

1 See also p. 395 above.
fruit, a vase, or a caduceus, a head of an ibis, or a nude incised figure of Tanit; others have merely a wreath round the centre, and these apparently belong to the first century B.C. The number of figures is generally small, it being contrary to the principles of ancient art to crowd a work with minute figures and details. The majority of lamps have only one figure, and few beyond those of exceptional size have more than three. As a rule the treatment is careless and the figures very indistinct, but the lamps with Greek signatures (see Vol. I. p. 108) form a notable exception.

It may be imagined that the lamp-maker sought to gratify the taste of his customers by ornamenting his ware with familiar subjects. Purchasers of terracotta lamps were, as has been noted, generally persons of inferior condition, and the subjects on the lamps are in many cases a popularising of well-known myths or even of works of art, such as the Venus types (p. 410) or the Maenads of the "new-Attic" reliefs (p. 411). The types of Victory and Fortune are reflections of statues of the period, and are repeated in many bronze statuettes. There are also, as we shall see, occasional references to literature. In Rome the stage exerted little influence, and subjects are rarely taken from the drama (masks are an exception); but the games of the circus and gladiatorial contests found a ready market, and form a large proportion of the designs. The subjects on the lamps, in fact, represent not so much the great masterpieces of art, as do coins or gems, but, like the Greek vases, the popular art of the day, and may be compared with the illustrations of the popular journals and magazines of our own time. On the whole, they are of great value to us as illustrating Roman life and religion, just as subsequently those on the Christian lamps are of inestimable importance for the light they throw on the early ages of our own religion.

As the number of published lamps and catalogues of collections is so very small, the subjects included in the following list are mostly confined to the collections in the British Museum,
which are quite sufficiently comprehensive for the purpose. A few additional examples are given from the Guildhall, Vienna, and other collections, from the *Antichità di Ercole*, Bartoli's *Lucernae veterum sepulcrales*, the *Musée Alaoui*, and other isolated sources. References to Passeri's work, *Lucernae fictiles Musei Passerii*, have been avoided, as it has been shown by Dr. Dressel that nearly all those published by him are false.

We proceed to note the principal subjects in detail, observing practically the same order that was adopted in describing the subjects on Greek vases. They may be roughly divided into eight classes:

1. Olympian deities.
2. Miscellaneous deities.
3. Heroic legends, etc.
4. Historical and literary subjects.
5. *Genre* subjects.
6. Animals.
7. Inanimate objects.
8. Floral and decorative devices.

The Olympian deities are not often represented, some not at all, except on a lamp in the Kestner collection at Göttingen, which has busts of all the twelve; they are not, however, clearly distinguished by attributes. Zeus is represented with Hera and Athena, the three Capitoline deities of Rome, whom the Etruscans knew as Tinia, Thalna, and Menerfa, the Romans as Jupiter, Juno, and Minerva. He also appears alone, seated on his throne, but more commonly his bust only is represented (Plate LXIV, fig. 4), accompanied by his eagle, which perches on a thunderbolt, sometimes conventionally rendered.

---

1 The numbers given in the following notes are those of the forthcoming Catalogue of Roman lamps in the Department of Greek and Roman Antiquities.
2 See also *C.I.L.* xv. 6195-751 for mention of many interesting subjects.
5 B.M. 511; *Ant. di Ercol., viii.* 1.
6 *Cyprus Mus. Cat.* 1394; B.M. 604 = Plate IV, fig. 1.
The eagle and the thunderbolt also appear alone,\(^1\) or the former with Ganymede.\(^2\) A bearded horned mask may be intended for Dionysos, but is more probably Zeus Ammon.\(^3\) Sarapis is sometimes enthroned, with Cerberus at his side;\(^4\) sometimes only his bust occurs, surmounted by the usual kalathos;\(^5\) Cerberus is also found alone.\(^6\) Hera, except in the instance mentioned, does not occur. A very interesting lamp from Salamis, Cyprus, now in the British Museum, represents the contest of Athena and Poseidon for the possession of Attica;\(^7\) it is doubtless a reminiscence of the Parthenon west pediment, though rough and indistinct in execution. Athena is also seen as a single figure,\(^8\) seated, or standing in the usual Promachos attitude, or before an altar, or pursuing a panther;\(^9\) her head or bust are not uncommon.\(^10\) Apollo is usually represented seated, playing on his lyre, or with the Gryphon at his side;\(^11\) Artemis appears as a huntress, accompanied by her hound, or drawing an arrow from her quiver.\(^12\) A lyre or a crescent appearing alone may be the symbols of these two deities.\(^13\) There are one or two possible instances of Hephaistos and Poseidon,\(^14\) and Demeter may be indicated by a pair of torches;\(^15\) the latter also appears in her chariot, seeking for Persephone.\(^16\) Ares or Mars is found either as a single figure,\(^17\) in a chariot,\(^18\) or playing with Eros, who steals his armour.\(^19\) Hermes appears as a single figure, or accompanied by a sheep, goat, or cock;\(^20\) in one instance he presents a purse to Fortune, who is accompanied by Herakles.\(^21\)

\(^21\) B.M. 174.
bust, along with his attributes of the purse and caduceus; the latter attribute, accompanied by two hands joined, may also have reference to this deity. Aphrodite occurs but rarely; she is either represented accompanied by lions, or riding on a goat, or at the bath or toilet, or in the Cnidian type, all these types being probably reproductions of known works of art. She is also accompanied by Eros, who assists in arming her; this type is known as Venus Victrix, and is seen in a group of Aphrodite and Eros in the Louvre.

More common than all the Olympian deities put together is Eros or Cupid, who appears in all sorts of attitudes and actions, besides those already mentioned. He sits on a chair or reclines on a couch, or is represented in motion, carrying a hare or a bird, a dish of fruit or a branch of vine or palm, a cup, situla, or torch; or plays on the lyre, flutes, or Pan-pipes; or sacrifices a pig, or pours wine into a krater. He rides on a donkey, a dolphin, or a crocodile, or sails in a boat; plays with a chained lion, or is himself tied to a tree. He is represented in the character of Ares, armed with spear and shield; or in that of Dionysos, with cup and thyrsos; or of Herakles, whose club he carries; also, probably in the character of Herakles, he shoots at a serpent. He is also associated with Psyche, and two Erotes sometimes appear together, in one instance in the character of gladiators fighting, in another of boxers. One of the most remarkable lamps in the Museum collection (No. 168)

represents a number of diminutive Erotes playing with the club and cup of Herakles; it is unfortunately fragmentary, but another example in Dresden gives the complete design.\(^1\) One plunges head-foremost into the cup; three others raise the club with difficulty from the ground, one supporting it with his back, and a fifth, hovering in the air, pulls at it with his hands. In front of the last-named are the words ADIVAT
SODALES, “Help, comrades!”

Dionysos is another surprisingly rare figure on the lamps, though his followers, the Satyrs and Maenads, have their full share of representation. He occurs as a single figure of youthful appearance,\(^2\) and also with his panther, to which he offers his kantharos to drink from\(^3\); his mask or head may also be recognised.\(^4\) Pan is occasionally found,\(^5\) in one case in the form known as Aegipan (see p. 60) in company with Echo,\(^6\) in another as a grotesque bust.\(^7\) There is also an instance of Marsyas hung up for his punishment to the branch of a tree.\(^8\) A pastoral deity playing flutes on the handle of a lamp in the B.M. (No. 366) may be either Pan or Marsyas. Satyrs are represented seizing Maenads,\(^9\) dancing, drinking, and playing on the Pan-pipes,\(^10\) or carrying cups and wine-skins,\(^11\) or with a goat\(^12\); both the bearded and beardless types are found, and their masks or busts are also common.\(^13\) The shaggy-haired Papposeilenos is occasionally represented.\(^14\) Maenads are depicted dancing, in frenzied attitudes, or sacrificing kids; the type is often that of the “new-Attic” reliefs, derived originally from Scopas, of the Maenad Χιμαιροφόνος.\(^15\) Their heads and masks also occur.\(^16\)

Among the minor deities we find that Helios and Selene

(Sol and Luna) are often depicted together, or Selene alone, or else their busts together, or separately; in one case there is a simple representation of the solar disc for Helios. A curious subject in the British Museum collection is apparently a combination of the Christian "Good Shepherd" with Helios and the crescent for Selene. Asklepios and Hygieia occur in rare instances, and there is an example of Charon in his boat. Of marine deities and monsters, Triton or Proteus, wearing the pileus or mariner's cap, Scylla, and a Nereid riding on a sea-monster (Plate LXIV. fig. 1) are found. The popularity of exotic religions at Rome is testified to by the occurrence, on the one hand, of Kybele with her lions, and Atys; on the other, of Egyptian deities such as Sarapis, already mentioned, and Harpocrates, who is found either alone, or with Isis, or with Isis and Anubis, or with Safekh (Plate LXIII. fig. 3); Isis and Horus, and busts of Hermanubis and Isis are also found. On the handle of a lamp is a lectisternium with busts of Sarapis and Isis, and of Helios and Selene. The busts of the two Kabeiri also occasionally appear. Among personifications or quasi-personifications we find the three Charites or Graces and a Muse with lyre; others are all typically Roman, such as a bust of Africa on a lamp from Carthage, and such types as Abundantia (or two cornucopiae as her symbol), Vertumnus.

Fortune with her steering-oar and cornucopia, and Victory. Many of these seem to be reflections of bronze statuettes of the "Roman" period. The latter goddess is frequently found, bearing a wreath, a trophy, or a shield, sometimes reclining or in a chariot; or again between two Lares; or two Victories are grouped together. Of special interest are what are known as the New Year lamps, given as strenae on January 1st (see p. 398), on which Victory is represented holding a shield, on which is inscribed an aspiration (see p. 420) for a happy New Year, the head of Janus, cakes, coins (stipes), and other emblems filling in the rest of the design (Plate LXIV. fig. 5).

Occasionally the inscription is varied, and appears as "For the safety of the state" or "Happiness" simply. Two Lares confronted, holding cornucopia, etc., are also found without Victory. Of representations of Phobos (Fear) we have spoken already (see p. 398). There are also representations of terminal deities, as well as unidentified goddesses.

Coming now to the heroes and heroic legends, we find that they play on the whole an inconsiderable part in the list of subjects on lamps. Leda is represented with the swan, and the Dioskuri sometimes appear as busts; also Kastor as a full figure, accompanied by his horse. Of the labours of Herakles we have the Nemean lion, the Erymanthian boar, etc.
hydra, and the slaying of the serpent in the Garden of the Hesperides, as well as the combat with a Centaur and the freeing of Prometheus. He is also represented as single figure, holding the apples of the Hesperides, leading kids, or with a jug or drinking-cup, or his head alone (both bearded and beardless types). Theseus slays the Amazon Andromache; Perseus is represented carrying the Gorgon’s head; Bellerophon is seen fallen from his horse Pegasos, or leading him to drink at Peirene; there are also possible representations of Kadmos and Meleager. Europa is depicted on the bull; Endymion asleep; Aktaeon devoured by his hounds; Telephos suckled by the hind; and Eos pursuing Kephalos. Icarus in his attempted flight is watched by Minos from the walls of Knossos (Plate LXIV. fig. 2). From the Theban legend we have only Oedipus before the Sphinx, a scene from the Phoenissae of Euripides (see p. 415), and Amphion and Zethos seizing the bull for the punishment of Dirke. Nor are scenes from the Trojan cycle much more common; but Achilles and Thetis are represented, and also Achilles dragging the body of Hector round the walls of Troy; there is a curious scene, somewhat grotesquely treated, of Odysseus and Neoptolemos stealing the bow of Philoktetes, who fans his wounded foot; Ajax is seen grieving after his madness; and Aeneas carries off his aged father and his son from Troy. Odysseus appears before Kirke, passing

HEROIC AND LITERARY SUBJECTS

the Sirens,¹ and offering a cup to Polyphemos,² but sometimes also without the Cyclops. Orestes appears at his trial before Athena in the presence of a Fury.³ A Centaur is seen carrying off a woman, and in combat with a Lapith⁴; also with a lion,⁵ carrying an amphora,⁶ or playing flutes.⁷ An Amazon wounded, standing at an altar, and accompanied by a crane, are also among the list of subjects.⁸ A single figure of Pegasus,⁹ and the Gorgoneion or Medusa-head,¹⁰ are not infrequently found. Combats of Pygmies and cranes,¹¹ and a Pygmy on a crocodile,¹² may also perhaps be included under this heading.

The next group of subjects includes those of a historical or literary character. In the British Museum there are two very interesting representations of Diogenes in his tub or pithos (see Vol. I. p. 152), presumably addressing Alexander, as in the well-known story,¹³ but the latter is not represented (Plate LXIV. fig. 6).

Among portraits are busts of Aesop,¹⁴ and various Roman personages, such as Hadrian, Antonia, Trajan, Marcus Aurelius, Septimius Severus, Commodus, Julia Domna,¹⁵ Lucius Verus,¹⁶ and others who cannot be identified.¹⁷ A scene from the Phœnissæ of Euripides occurs on one lamp, with the combat of the two brothers and the death of Jocasta; the name of the play is actually inscribed on the lamp.¹⁸ With reference to Virgil’s first Eclogue we find a representation of the shepherd

Tityrus on a lamp found at Pozzuoli; the shepherd, whose name is given, is seated among his flocks. Several lamps illustrate the well-known fable of Aesop, of the Fox and Crow. The fox, wearing a chlamys, stands on his hind-legs holding up a pair of flutes to the crow, which is perched on the top of a tree. Another subject, which doubtless has reference to some fable, is that of a stork holding in its beak a balance, in which a mouse is weighed against an elephant. The humour of the subject lies in the fact that the mouse is seen to weigh the elephant down. These two are illustrated on Plate LXV. figs. 3, 6. There is also a lamp in the British Museum (Plate LXIII. fig. 2) with a curious subject which may either be a scene from a comedy like those on the South Italian vases, or else a parody of “a visit to Asklepios.”

The subjects taken from ordinary life are eminently characteristic of the social life of Rome under the Empire. An almost inordinate proportion relate to the now popular gladiatorial shows, and many others deal with the events of the circus and arena. Of gladiatorial subjects there are three principal varieties, which occur again and again on lamps of all shapes and periods with little alteration. One class represents a single gladiator in the characteristic armour, with visored helmet, greaves, and arm-guards, sword and shield; the next represents a combat of two (Plate LXV. fig. 5), in which the one is usually worsted and falls at the other’s feet, his shield on the ground beside him. An interesting example in the

British Museum (No. 526) shows a mirmillo or secutor in combat with a retiarius, who fought with net and trident. The third series has representations of gladiatorial armour ranged in a circle: swords, shields, arm-guards, greaves, and helmets.¹

From the circus and games we have such subjects as a naval contest in the amphitheatre; a bull-fight; a bestiarius contending with boars; a man leaping over a bull; and boxers.² A remarkable lamp in the British Museum (No. 164 = Plate LXV, fig. 4) gives a representation of a chariot-race in the circus; we have the colonnade of latticed barriers (carceres) from which the chariots started, the spina down the middle of the course, adorned with shrines and obelisks, and rows of seats full of spectators; four chariots take part in the race. Next there are scenes such as an athlete crowning himself, a victorious charioteer in his quadriga, or a victory in the horse-race.³ Of more miscellaneous character are such subjects as a chariot drawn by four men, a two-horse or four-horse chariot by itself, or a man or boy on horseback.⁴

Military subjects are at all times rare, but a not infrequent subject is a mounted warrior charging with a spear; a soldier is also depicted with a bird, at an altar, taking an oath, and saluting an officer who rides past.⁵ There are also representations of an imperator on his triumphal car, of an eagle and standard, and of a trophy perhaps commemorating a victory over barbarians.⁶ A representation of a ship or galley is not uncommon, but sometimes it is not easy to distinguish these from the type of Odysseus and the Sirens.⁷ Some lamps

have landscapes in the style of Alexandrine reliefs and chased metalwork, as for instance a harbour surrounded by buildings, in which two fishermen pursue their vocation (Plate LXV. fig. 1), or a hunter accompanied by a porter, with a town in the background. Among pastoral scenes we have also, besides the Tityrus already mentioned, shepherds and goatherds with their dogs, tending sheep and goats which nibble the foliage of trees; fishermen, and hunters, as already noted. Another interesting type is that of a juggler or mountebank accompanied by a dog and a cat, which climb ladders, jump through rings, and perform other tricks (Plate LXV. fig. 2). Of a more miscellaneous character are such subjects as a butcher slaughtering animals hung from a tree; a fuller at work; a slave washing a dog, and another washing a statue; slaves carrying casks or fasces; a mule turning a mill. Others, again, do not admit of any exact classification; such are a man and woman embracing; a woman scraping herself after the bath; a youth with a mortar; the sacrifice of a pig; a man riding on a camel or elephant, or driving a camel; a dwarf in a boat or playing on a flute; comic actors, and comic and tragic masks innumerable; and two skeletons dancing.

Animals form a large proportion of the representations on lamps, especially on the late class without handle from Knidos (Vol. I. p. 108), and include Gryphons, elephants, lions, panthers,

boars, bears, wolves, deer, horses, oxen, sheep, goats, dogs, rabbits, eagles, storks, ostriches, peacocks, parrots, cocks and hens, and other birds; dolphins, sea-horses, cuttle-fish and other kinds of fish, scorpions, frogs, shell-fish, and so on. Those mentioned so far are single figures, merely decorative; in others there is more definite action. Such are a lion attacking a bull or crocodile, or seizing a hind or a donkey; two bears dancing; a monkey and vine; a dog on a couch, fighting with a goose, or attacking a stag, hind, or boar; two monkeys in a boat; a hare or rabbit nibbling at a plant; a bird on a twig, sometimes eating fruit; an eagle seizing a hare; an ibis and a serpent; a hen with chickens, cocks fighting, or a cock pursuing a hen; dolphins twisted round a trident or anchor; a crocodile and serpent; a lizard or sea-monster and eel; two serpents, sea-horses, or dolphins with an altar between; and a grasshopper eating grapes.

There are also a large number of lamps, the centre of which is only ornamented with some decorative motive, such as a carchesium (Vol. I. p. 188), situla, or krater, from which spring vine-branches, ivy, or other plants; an oinochoe, flask, or drinking-cup; palm-branches, wreaths of ivy, vine, oak, and myrtle, sprays of flowers; a cornucopia and caduceus, or other emblems of deities, such as two hands joined with a caduceus behind them (see p. 410); scallop-shells; or purely conventional patterns, such as large four-leaved flowers, stars, and rosettes. The latter are mostly found on lamps from Greek sites, especially in Cyprus, and at Tarsus and Knidos. Many lamps

have no decoration on the *discus*, but only comic masks round the edge, or a border of foliage.

The Christian lamps are as a rule easily to be distinguished from the pagan by their form, as well as by their subjects. These subjects are mainly taken from the Old Testament, from the life of our Lord, and from the sphere of symbolism; the Good Shepherd, the seven-branched candlestick, the cross or *labarum*, and the sacred monogram, are all favourites.¹

A considerable number of Roman lamps have inscriptions, either impressed in relief or hollow letters from a stamp, or engraved with a pointed instrument; the stamps were probably of bronze. Potters' signatures and trade-marks are always underneath the lamp, and those found on the top usually relate in some way to the subject. Sometimes, as in lamps from Pozzuoli and Naples,² the inscriptions are in relief on the surface, in small tablets. They may, however, be classified under four headings:—

(1) Inscriptions referring to the circumstances under which or for which the lamp was made, as, for instance, with reference to national events or public games, or for religious dedications.

(2) Inscriptions descriptive of the subjects.

(3) Acclamations or formulae addressed by the potter to the public.

(4) Signatures of potters or trade-marks; this class is by far the most numerous.

To the first class belong some of the formulae to which allusion has already been made (pp. 396, 398), such as those on the New Year lamps: *ANNVM NOVVM FAVSTVM FELICEM MIHI HIC* (or TIBI, or to some person whose name is given); occasionally this is varied by formulae such as *FILICITH* (for *FELICITAS*?); "Happiness (to you)!"³ *OB CIVES SERV(atos)*, "For the preservation of the state"⁴; *G · P · R · F*, *Genio populi Romani feliciter*⁵;

⁴ See B.M. 189 and *C. I. L.* xv. 6211-18; these all date from the time of Augustus; cf. his coins and those of his successors.

⁵ *C. I. L.* xv. 6195.
EX·S·C, "By the decree of the senate"; FIDES PVBLICA, "The public trust," and the SAECVLI, SAECVLO, SAECVLAES group of inscriptions, which may in a few cases refer to the Ludi Saeculares, but more probably are of similar import to the SAEC(nium) AV(reum) DOM(ini), "The golden age of our lord," on a lamp from Antium. The last-named formula, it should be noted, is found both above and below the lamps. LVCE(ria) PV(licia) LICA probably refers to the use of the lamp in some public illuminations (see p. 396). A lamp in the Trier Museum has the names of the consuls for the year 235 (Severus and Quintianus). Among names of deities for whose sanctuaries the lamps were intended are Venus (SACRVM VENERI, with a figure of the goddess), and the Ephesian Artemis (APTEMIC EΦECSIΩN).

Among the inscriptions relating to the subjects on the lamps are several which have already been mentioned, such as DIOGENES and TITVRVS, and also GA(ny)MEDES over a figure of the same. On a lamp representing the flight of Aeneas from Troy are the names AEN(eas), ANCH(ises), ASC(nius), and the exclamation REX PIE, alluding to the former. On another, which represents the fight of Eteokles and Polynikes and the death of Jocasta, subjects taken from the Phoenissae of Euripides, occur not only the letters PVL for Polynikes, but also PHO(e)nISS(ac), leaving no doubt as to the source whence the scenes are taken. Another in the form of Eros or a Genius with the club and lion-skin of Herakles, lying asleep, has on it the curious inscription AIA STLACIA TVRA DORMIT, STERNIT SIR..., the import of which is not quite clear. Similar inscriptions often occur in scenes from the circus or amphitheatre, giving the names of gladiators, as Afer, Helenus, Popillius, or Sabinus, or of charioteers in the

circus-races, as C. Annius Lacerta and the horse Corax, which won him a race for the white faction at the Secular Games; another lamp has the name of a horse or his driver, INCITATVS, and a third the exhortation VIC(i)LA PRASINE, which may allude to a driver of the green faction. Over the figure of a warrior on a lamp from Carthage is PLVS FECISSES SI PLVS LICERET, “You would have done more if you had had the chance.” In other cases there seems to be a revival of the old Greek fashion of apostrophising the figures as Kalos—e.g. AQUILIO CALOS, AXOLMVS (c)ALOS. There are also inscriptions put into the mouths of figures, as in the subject of Cupids with the club of Herakles, one of whom cries ADIV(v)ATE SODALES, “Help, comrades!” or the funerary Genius weeping over an urn and saying, LVGEO, “I mourn.”

To the third class belong such expressions as HAVE, “Hail!”; VIVAS OR VALEAS, “Long life!”; VTERE, “Use this”; AVE ET VALE, “Greeting and farewell,” on a lamp from Cologne; and on another from the same site, HAVE MACENA VILLIS HAVE LASCIBA VALE, which seems to have a somewhat coarse significance. Others allude to the future purchaser, as EME ME, “Buy me”; QVI FECERIT VIVAT ET Q(uit) EMERIT, “May the potter and purchaser flourish”; EMITE LVCEMNAS AB ASSE COLATAS, “Buy lamps for an as”; BONO QVI EME(rit), “May it be for his good who shall buy it.”

The latter class are chiefly found in North Africa. Mention has already been made of the inscriptions on the Esquiline lamps, such as PONE FVR; these are not found on lamps of imperial times, and appear to be peculiar to the early fabrics. Μη δαπτου has been found on a lamp at Athens. On a lamp

from Spain is inscribed G·IVLIVS·ARTEMIDOR...LVCERNAS·II·D·D, “C. Julius Artemidorus makes a present of two lamps.”

A very curious inscription is found written in ink on a lamp at Rome, to this effect: “Helenus delivers his name to the nether world; he carrieth down with him coins, a New Year’s gift, and his lamp; let no one deliver him except us who have made them.”

Potters’ signatures are almost invariably to be found on the under side of the lamp, where they are arranged on the diameter at right angles to the axis of the lamp; sometimes they are placed in a panel or tablet, or within the outline of a foot. In rare instances they are found on the handle, or on the top. Greek lamps which are not of Roman origin are never signed, nor are those of Christian origin; the oldest signatures are to be found on the Esquiline lamps, but they rarely appear before imperial times, when they become fairly general. Among these earlier instances are Praeae(nts) and Fl(a)bia (Flavia), the latter found at Carthage. More frequently, lamps of this kind have a single letter or monogram by way of stamp; a “delphinoform” lamp in the Musée Alaoui has a monogram of A and Π. A single letter sometimes occurs above or below the inscription, which may be regarded as a sort of trade-mark indicating the potter (figulus), the full name being that of the officinator or master; on a lamp in the British Museum from Knidos (No. 132) the name Romane(n)sis is accompanied by the letter X; on another, Fortis by the letter N. On the lamps signed by L·Hos·Cri, a Gaulish potter, are found the letters G, I, L, M, P, S, T, V, X, Z, and other signs. These trade-marks are not confined to letters; Fortis uses a wreath and palm-branch, as in Fig. 210; L. Caecilius Saevus a palm-branch or a foot-shaped

6 E.g. A, B, C, II, I, R: C.I.L. x. 8053, 209-14; xii. 5682, 131; xv. 6266, 6334, 6342.  
7 C.I.L. xii. 5682, 57.
stamp; L. Fabricius Masculus the letters H and X, a wheel, or a star.\(^1\) Other lamps have no name underneath, but some simple pattern, such as five circles in \textit{quinquev} form, or the favourite device of the foot-shaped stamp (cf. p. 333). These varieties of marks were probably intended to distinguish different series in the products of a single pottery.

The signatures are usually abbreviated, the full form being \textit{ex officina (officinato}ris), the name being consequently in the genitive. On a lamp from Rome is \textit{ex officina Aiacis}, \textit{ex officina Aiacis}.\(^2\) Sometimes, but rarely under the Empire, the nominative is used: \textit{A. B. fecit}, or more commonly \textit{A. B. f.}. Thus we have \textit{AVGENDI, ATIMETI, C. IVLI NICEPHORI, or ASPRENAS, FELIX, TROPHIMVS}. But where a single name occurs it is rarely full enough to show the case. On a lamp at Dresden the potter Diomedes calls himself \textit{LVCERNARIVS}.\(^3\) From the second century down to the time of Augustus the name may be either in the nominative or genitive, either the \textit{praenomen} and \textit{nomen}, or the \textit{nomen} or \textit{cognomen} only; these signatures were all incised while the clay was moist. In the period represented by the third class (see p. 401) nearly all the signatures are \textit{cognomina} simply, as \textit{ATIMETI, COMMVSIS, FORTIS, STROBILI}, all in the genitive. In the fourth class, or lamps of the second century, the nominative is very rare; the names are usually abbreviated, and one (\textit{cognomen}), two (\textit{nomen} and \textit{cognomen}),

\(^1\) See Fink in \textit{Münchener Sitzungsberichte}, 1900, p. 690, for examples.  
\(^2\) \textit{C.I.L. xv. 6282.}  
\(^3\) \textit{Anzeiger}, 1889, p. 170 = \textit{C.I.L. xv. 6263.}
or three may be found. Potteries were, as we have seen, often owned by women, hence female names are not uncommon. Abbreviations of a particular name vary considerably; for instance, L. Caecilius Saevus appears as L. CAEC. SAE, L. CAE. SAE, L. CA. SAE (see below, p. 428); L. Fabricius Masculus as L. FABRIC. MASC, L. FABRIC. MAS, L. FABR. MASC, FABRIC. MAS, and so on.\(^1\) Or the praenomen may vary, and for C. Oppi. RES we find L. OPPI. RES; or, again, the cognomen, as in the case of C. Junius, where it may be Alexis, Bitus, or Draco,\(^2\) or of L. Munatius, found with Adjectus, Restitutus, Successus, Threptus, and Philemo.\(^3\) The variations in the names may denote potteries in connection, or successive holders of one business. In one instance the name of a workman PVLCHER occurs with that of Fabricius Masculus, in another that of PRIMVS with C. Oppius Restitutus.\(^4\) Greek names, where they occur, seem to imply that the potters were freedmen, as in the case of Dionysius, Phoetaspus, and others.

The following list gives the names most frequently found, with the localities in which they occur:—

Annius Serapiodorus (ANN. SER): Rome, Ostia.

C. Attilius Vestalis (C. ATIL. VEST): Rome, Italy, Gaul, Britain.

Atimetus: Italy, Gallia Narbonensis, Pannonia.

L. Caecilius Saevus (L. CAE. SAE): Rome, Southern Italy, Sicily, Sardinia, Gallia Narbonensis, Britain.

Clodius Heliodorus (CLO. HEL): Italy, Africa, Spain, Gaul.

Communis: Rome, Pompeii, Gallia Cisalpina, Pannonia.

Crescens: Gaul, Pannonia.

L. Fabricius Masculus (L. FABR. MASC): Rome, Gallia Cisalpina, Africa.

Florentius (FLORENT): Rome, Italy, Sicily, Tunis, Gaul, Germany, Britain.

Fortis: Rome, Italy, Sicily, Dalmatia, Germany, Gaul, Britain.

Gabinia: Italy, Sardinia, Africa, Gaul.

L. Hospidius Crispus (L. HOS. CRI): Gaul.

\(^1\) C.I.L. xv. 6350, 6433.

\(^2\) Ibid. 6501-03.

\(^3\) Ibid. 6560-65.

\(^4\) Ibid. 6434, 6593.

\(^5\) See Daremberg and Saglio, s.v.

Lucerna, p. 1331; also the lists given by Fink in Sitzungsb. d. Münch. Akad. 1900, pp. 689, 692 ff., and the various volumes of the Corpus under Instrumentum Domesticum, especially vol. xv.
C. Julius Nicephorus (C. IVLI NICEP): Italy, Gaul.
C. Junius Bito: Italy, Sicily, Gaul.
L. Mar. Mi.: Rome, Campania, Sicily, Spain, Gallia Cisalpina.
L. Munatius (with various cognomina): Rome, Africa.
N. Naevius Luc. (N. NAEV. LVC): Italy, Sardinia, Spain, Gaul.
Passenus Augurinus (PAS. AVG): Italy, Gaul.
Phoetaspus: Italy, Gaul, Pannonia.
Strobilus: Rome, Italy, Africa, Pannonia, Dalmatia, Gaul, Britain.
Vibianus: Gaul, Pannonia.
C. Viciri Agathopus (C. VICIRI AGAT): Italy, Sardinia, Gallia Cisalpina.

It will be noted that nearly all are found at Rome, but that the others fall into geographical groups; the same name is seldom found both in the north and south of the Empire. Thus Fortis is not found in Africa, Oppius Restitutus only rarely in Gaul. Certain names are entirely localised, as Annius Serapiodorus at Rome and Ostia, L. Hos. Cri. and Marcellus in Gaul, Q. Mem. Kar. and Pudens in Sardinia. The name of Vindex, a maker of terracotta figures at Cologne (see above, p. 383), is found on lamps at Trier and Nimeguen.¹

The distribution of the Fortis lamps in particular is remarkable. They have been found in several places in Gallia Cisalpina, such as Aquileia;² at Lyons, Aix, Orange, and elsewhere in France;³ at Nimeguen in Holland;⁴ at Trier, Cologne, Mainz, and Louisendorf in Germany;⁵ in London;⁶ in Spain;⁷ and over the region of Dacia, Pannonia, and Dalmatia,⁸ as well as in

Rome and Italy. The most natural conclusion to be drawn from these results is that the majority of the lamps seem to have been made in Italy, and it has been thought probable that there were three principal centres of fabric whence exportation went on in different directions—Rome and its environs, Campania for the lamps found in Southern Italy, Africa, and the Mediterranean, and Gallia Cisalpina for those found in Central Europe. It has also been suggested that the last-named fabric centred in Mutina (Modena) and that this was the place where the lamps of Class III. (see p. 401) were chiefly made. Outside Italy there may well have been manufactures in North Africa, where lamps are so plentiful, and in Gallia Narbonensis, to which region some signatures are peculiar. Evidence of a lamp-manufacturer in Africa seems to be afforded by the mention of praedia Pullae-norum in an inscription from Tunis, the lamps of Pullaenus occurring in Sardinia and Africa. Local fabrics of very poor lamps were doubtless numerous.

A certain number of Roman lamps have Greek signatures, not differing in character but only in alphabet from the Latin inscriptions. The most curious instance is that of KEACEI ΠΟΜΕΕΕΙ for Celsi Pompeii, which is found on lamps in Southern Italy; Πομπαλίου is also found at Naples, and even 'Αβασκάντου and Πρέιμου, which are usually associated with lamps made in Greece (see Vol. I. p. 108), occur on some found in Italy. In Sicily we find the signatures of Apollonians of Tyre (ΑΠΟΛΛΟΦΑΝ ΤΥΡΙΟ) at Himera and Proklis Agyrios (ΠΡΟΚΛ ΑΓΥΡΙ) at Gela and Catania; 'Ρύγλου for Regulus occurs at Tarentum. Greek names are often found in Cyprus, and conversely a large number of lamps found at Knidos by Sir Charles Newton bore the signature ROMANE(n)ΞΙΣ, in Latin letters with the S reversed,
apparently suggesting that the lamps were made by a Roman abroad.\(^1\) Greek signatures are even found in Gaul and Germany.\(^2\)

Mention must also be made here of the recent researches of Herr Fink\(^3\) with the object of ascertaining the chronological succession and general distribution of the signatures on lamps of the Imperial period. Starting with the four main classes of forms which have already been laid down as the basis\(^4\) (the distinction resting mainly on the various forms of the nozzle), he has obtained, by comparison chiefly of the lamps in the British Museum, Berlin, and Munich collections, the following interesting results.

Certain stamps appear to be peculiar, or almost peculiar, to each class: thus, in Class I. only, we find P. Cessius Felix and L. Munatius Successus; in Class II. only, L. Fabricius Masculus; in Class III. only, Atimetus, Fortis, Phoetaspus, and other single cognomina; in Class IV., which contains by far the larger number of stamps, Clodius Helvidius, C. Junius Bitus,\(^5\) L. Munatius Threptus, and C. Cornelius Ursus. The lamps of the Gaulish potter L. Hospidius Crispus are all of one peculiar form, a transition between Fink's I. and IV.\(^6\) Cross-instances are very rare, but C. Junius Draco is found in Classes I. and IV., C. Oppius Restitutus in Classes II. and IV., Florentius and Celsus Pompeius in Classes III. and IV. It is also interesting to note that there are lamps in Class IV. with the Christian monogram and the figure of the Good Shepherd. In Class I., generally speaking, signatures are very rare; in Class III. they are almost invariable, but the total number of lamps is relatively small. Another curious result is that certain signatures, such as L. Caecilius Saecus, Bassus, Cerialis, Sextus Egnatius Aprilis, and Romanensis, are not confined to one type of lamp, but in these cases it is to be noted that each type has a variation of signature: thus, in Class I., L. CAEC. SAE; in II., L. CAE. SAE.

\(^1\) See *C.I.L.* iii. Suppl. 1, 7310, and Vol. I. p. 168. He also occurs in Africa (*C.I.L.* viii. 10478, 37) and elsewhere.

\(^2\) *Inscr. Graec.* xiv. 2574.

\(^3\) *Münchener Sitzungsberichte*, 1900, p. 685 ff. On p. 692 a table of signatures on the British Museum lamps is given.

\(^4\) See above, p. 400.

\(^5\) The names of this and other potters in Class IV. also occur on terracotta money-boxes (see above, p. 389).

\(^6\) See *C.I.L.* xv. pt. 2, pl. 3, No. 15.
in III., L·CA·SAE; while in IV., L·CAE·SAE occurs no less than 140 times.

His conclusions are that one workshop did not necessarily set itself to produce only one form, but that the differences in form are merely due to changes of fashion. In Class I. Greek technical instincts are still strong as regards form and choice of subjects, but in ornament the taste of Southern Italy prevails; the subjects are mainly mythological. In Class II. the typically Roman motives appear: gladiators, combats, and hunting-scenes; this form, according to Fink, is more developed than Class I. Evidence which has been obtained from Regensburg shows that Class III. belongs to the time from Augustus to Hadrian, and, as we have seen, it is chiefly confined to the north of the Apennines. Where provincial potteries can be traced, as at Westerndorf and at Westheim in Bavaria, the lamps are usually of this form, but it was doubtless imitated in Italy. Form IV. is essentially Italian, but is also found in Central Europe, and is evidently of late date.
CHAPTER XXI

ROMAN POTTERY: TECHNICAL PROCESSES, SHAPES, AND USES

I. INTRODUCTORY

Roman vases are far inferior in nearly all respects to Greek; the shapes are less artistic, and the decoration, though not without merits of its own, bears the same relation to that of Greek vases that all Roman art does to Greek art. Strictly speaking, a comparison of the two is not possible, as in the one case we are dealing with painted vases, in the other with ornamentation in relief. But from the point of view of style they may still be regarded as commensurable. Roman vases, in a word, require only the skill of the potter for their completion, and the processes employed are largely mechanical, whereas Greek vases called in the aid of a higher branch of industry, and one which gave scope for great artistic achievements—namely, that of painting.

It may perhaps be advisable to attempt some definition of the subject, and lay down as far as possible historical and geographical limits within which Roman pottery as a distinct phase of ancient art may be said to be comprised. The line which distinguishes it from Greek pottery is, however, one of artistic evolution rather than of chronology, one of political circumstances rather than of geographical demarcation. In
other words, it will be found that during a certain period the ceramic art had reached the same stage of evolution throughout all the Mediterranean countries; in Greece and Asia Minor, in the Crimea and in North Africa, in Southern Italy and in Etruria, a point of development had been reached at which the same kind of pottery, of very similar artistic merit, was being made in all parts alike. In Greece and other regions which had up to the end of the fourth century, or even later, been famous for their painted pottery, this art had lost its popularity and was dying or dead; in other parts, as in Etruria, it had never obtained a very firm foothold, and the local traditions of relief-ware imitating metal were revived. Not the least remarkable feature of the art of the Hellenistic Age is the great impetus given to working in metal, as has already been indicated in a previous chapter (Vol. I. p. 498). The toreutic products of Alexandria and of the famous chasers of Asia Minor, whose names Pliny records, became renowned throughout the Greek world, and the old passion for painted pottery was entirely ousted by the new passion for chased vases of metal.

But in spite of increased habits of luxury, it is obvious that the replacing of earthenware by metal could never have become universal. For ordinary household purposes pottery was still essential, and besides that, there were many to whom services of plate and gold or silver vessels for use or ornament were a luxury unattainable. Hence it was natural that there should follow a general tendency to imitate in the humbler material what was beyond reach in the more precious, and the practice arose, not only of adorning vessels of clay with reliefs in imitation of the chased vases, but even of covering them with some preparation to give them the appearance of metal. Instances of these tendencies have been given in Chapter XI., and no better example could be adduced than that of the silver phialae of Èze and their terracotta replicas in the British Museum (Vol. I. p. 502).

In the same chapter we saw that Southern Italy, in particular, was the home of the relief and moulded wares in the Hellenistic

1 H.N. xxxiii. 154 ff.: see below, p. 489.
period. This was a time when there were close artistic relations between that region and Etruria, and we have already seen that this method of decoration had long been familiar in the latter district (see p. 292 ff.). Hence it is not surprising that we find springing up in the Etruscan region of Italy an important centre of pottery manufacture which proved itself to be the heir of more than one line of artistic traditions. The era of Roman pottery is generally assumed to begin with the establishment at Arretium, within the area of Roman domination, of a great manufactory in the hands of Roman masters and workmen. Evidence points to the second century B.C. as the time when Arretium sprang into importance as a pottery-centre; and thenceforward for many years its fabrics filled the markets and set the fashion to the rest of the Roman world.

The lower limit of the subject is, from lack of evidence, not much easier to define; but after the second century of the Empire, pottery, like other branches of working in clay, sank very much into the background, and the spread of Christianity after the time of Diocletian practically gave the death-blow to all Pagan art. M. Déchelette, in his account of the important potteries at Lezoux in Gaul, brings forward evidence to show that they practically came to an end about the time of Gallienus (A.D. 260—268)¹; but it is probable that the manufacture of degenerate sigillata wares went on for about a century longer in Germany at any rate, if not in Gaul. Much of the pottery found in Germany and Britain is of an exceedingly debased and barbaric character.

In discussing the geographical distribution of Roman pottery we are met first with the difficulty, which has already been hinted at, of defining where Greek ends and Roman begins. But we must have regard to the fact that in most if not all Greek lands pottery, painted or moulded, was in a moribund condition, whereas in Italy the latter branch was rejuvenescent. It seems, therefore, more satisfactory on the whole to exclude the Eastern Mediterranean entirely from the present survey, and to consider that with the concluding words of Chapter XI.

¹ Vases ornés de la Gaule Romaine, i. p. 190 ff.
the history of pottery in that part of the ancient world came to an end. That is to say, that all later fabrics found in Greece or Asia Minor, even though they are sometimes of Roman date, belong to the lingering traces of a purely Hellenic development, and have no bearing on our present investigation.

The latter must therefore be limited to the countries of Western Europe, embracing—besides Italy—France, Germany, Britain, and Spain. The pottery found in these regions during the period of the Roman Empire is homogeneous in character, though greatly varying in merit, and so far as it can be traced to the victorious occupiers of those countries rather than to purely native workmanship, represents what we may call Roman pottery, as opposed to Greek or Graeco-Roman on the one hand and Celtic or Gaulish on the other.

2. TECHNICAL PROCESSES

Roman pottery, regarded from its purely technical aspect, is in some ways better known to us than Greek, chiefly owing to the extensive discoveries of kilns, furnaces, and potters' apparatus, such as moulds and tools, in various parts of Western Europe. On the other hand, its classification is a much more difficult matter, although it has for so long been the subject of study, for reasons which will subsequently appear. This is perhaps partly due to the overwhelming interest which the discoveries of recent years have evoked in the study of Greek vases; and partly, of course, to the artistic superiority and more varied interest of the latter; but the mass of material now collected in the Museums of Italy and Central Europe is gradually impelling Continental scholars to bring to bear on Roman pottery the scientific methods now universally pursued in other directions. Of their work we shall speak more in detail in another chapter; for the present we must confine ourselves to the technical aspect of the subject.

The Romans, who used metal vases to a far greater extent than the Greeks—at least under the late Republic and Empire—did not hold the art of pottery in very high estimation, and their
vases, like their tiles and lamps, were produced by slaves and freedmen, whereas at Athens the potter usually held at least the position of a resident alien. These were content to produce useful, but not as a rule fine or beautiful, vases, for the most part only adapted to the necessities of life. There was, so far as we know, no manufacture of vases set apart for religious purposes, either for funerary use or as votive offerings, and for the adornment of the house metal had the preference. It is not, therefore, surprising that we should find them making use of a less fine and compact paste for the greater proportion of their vases. With the exception of the fine red wares with reliefs, which are now generally known to archaeologists as terra sigillata, and which answered in public estimation to our porcelain, they made only common earthenware, and this was generally left unglazed.

All kinds of clays are used, varying with the different regions in which the pottery was made, and ranging in hue from black to grey, drab, yellow, brown, and red. In quality, too, the clay varies to a considerable extent, some being of a coarse, pebbly character. The red clay of the Allier district in France, where most of the Gaulish pottery was manufactured, is of a ferruginous nature; its natural colour is modified by baking, though it never becomes white. The pottery of St. Rémy-en-Rollat in that neighbourhood is made of the same white clay as the terracotta figures (p. 382). In Italy, as a rule, careful attention seems to have been paid to the preparing and mixing of the clay, and in the glazed red wares it is uniformly good. In fact, the remarkable similarity in technique and appearance of this ware throughout the Roman Empire has led to the view that there can only have been one centre from which it was exported. Against this, however, must be urged the undeniably provincial and almost barbarous character of the decoration on much of the pottery found in Central and Northern Europe; and therefore, without denying that exportation went on, as it undoubtedly did, we should prefer

1 The term is applied to clay suited to receive stamps (sigilla) or impressions.
to suppose that this red glaze was produced in some special artificial manner, such as by using red ochre or iron oxide (see below), the knowledge of which became common property. As Semper said forty years ago¹: “Not only did barbarians, Gauls, Britons, and Germans, learn to know and use Roman technique, but also Egypt, Asia, and the Greeks, already immortalised by their own pottery, dropped their local processes, and voluntarily adopted Roman forms and technique.” Clay and glaze, form and technical method, are in all parts the same; it is only the decoration that varies and reflects the spirit and taste of the locality.

Formerly it was thought that the red glaze was obtained in the baking, after careful polishing of the surface, and that special means were adopted to this end. In the kilns of Castor (see below) Artis thought that he detected contrivances for this purpose; but it is now generally agreed that the glaze is artificial, not natural. In ordinary wares and in the lamps a red glaze is produced by a mere polishing of the surface, and this varies in tone and lustre with the proportion of oxide of iron in the paste, and the degree of heat employed in the baking. But in the terra sigillata the red glaze reaches a high and uniform state of perfection. This seems to have been produced by a kind of varnish, the elements of which are not absolutely certain; but it would appear that the substance added to produce the effect was of an essentially alkaloid nature. This has been deduced by Dragendorff² from a series of analyses made from fragments of different wares, both without and with the glaze; in the latter case the alkaloid constituents show a marked increase in quantity, whereas the proportion of the iron oxide and other elements remain constant. These investigations were made by Dr. Lilienthal, of Dorpat, on five fragments: (1) from a vase of the Republican period found at Corneto; (2) from a bowl of fine terra sigillata of the first century after Christ; (3) from a deep cup of the same style; (4) from late provincial ware of the second or third century; (5) from a degenerate fabric with rough clay and inferior glaze, the results being as follows:—

¹ Der Stil, ii. p. 148. ² Bonner Jahrbücher, xcvi. p. 20.

It must be borne in mind that, although the final effect is due to the alkaloids, the red colour of the vases is produced by the iron oxide which was inherent in the composition of the clay, none being added with the varnish, as the quantities show. All the fragments also showed traces of manganese and sulphuric acid. Previously analyses had been given by Brongniart and Blümner,³ with results approximately similar,

---

¹ In the case of fragment No. 3 the clay and lime could not be differentiated.
² In the case of fragments 2 and 5 no definite general result was obtained.
³ Brongniart, *Traité*, i. p. 421; Blümner, *Technologie*, ii. p. 91. See also *Handbook to Collection of Pottery in the Museum of Practical Geology*, 1893, p. 65, for an analysis made on a fragment of glazed red ware by Dr. Percy:
but not so definite. Fabroni had thought that the iron oxide was combined with a vitreous paste, and Keller, by practical experiments, essayed to show that borax was employed to provide the required appearance, and further maintained that the furnace at Castor already alluded to was used for dissolving that substance. He was not far from the truth, but the results obtained by Dragendorff seem to militate against his conclusions.

In any case the glaze is very perfect, of so bright a red as to resemble coral, and serving, as Blümner says, to enhance the ground colour where a modern glaze would only conceal its imperfect tone. It is so fine and so carefully laid on that it does not interfere with any outlines or details, in this again evincing its superiority to modern glaze. It seems to have been applied not with the brush, but by dipping the vase into the liquid. Black glaze, such as occurs on the earlier Italian fabrics (p. 481), was produced from an alkaline silicate.

The ordinary unglazed wares were classified by Brongniart under four heads: (1) pale yellow; (2) red (dark red to reddish brown; first century of Empire); (3) grey or ash-coloured (down to the end of the Western Empire); (4) black (mainly provincial). This distribution was in its general lines adopted by subsequent writers, such as Buckman and Birch, but was felt to be inadequate, and some slight modifications were adopted. For practical purposes, however, it will be found to work fairly well as a convenient method of grouping the commoner wares. None of them as a rule have any decoration. They will be considered in fuller detail in a subsequent chapter.

In the manufacture of vases the Romans used the same processes as the Greeks. They were made on the wheel (rota figuraris or orbis), to which allusion is not infrequently

1 Storia degli ant. vasi eterini, p. 65.
2 Ueber die rothe Topferware, p. 16.
3 Brongniart, Traité, i. p. 423; Déchelette, ii. p. 339.

made by the Latin poets, as in the well-known line of Horace ¹:

> Amphora cepit
> Institui; currente rota cur urceus exit?

And, again, in the phrase *totus, teres, atque rotundus* ² he is doubtless referring to a vase just turned off the wheel. Tibullus speaks of "slippery clay fashioned on the wheel of Cumae" ³; and there are also allusions in Plautus and other writers. ⁴ The simile has also been drawn upon by English poets. ⁵ Specimens of potters' wheels have been found at Arezzo and at Nancy; these are made of terracotta, pierced in the centre for the axis of the pivot, and furnished at the circumference with small cylinders of lead, to give purchase for the hand and steadiness to the whirling wheel. ⁶ Another from Lezoux, now in the Museum at Roanne, is figured by M. Déchelette. ⁷ Most of the common wares were made by this process, except the *dolia*, or large casks, which were built up on a frame like the Greek pithos (Vol. I. p. 152).

But for the ornamented vases with reliefs an additional process was necessary in order to produce the raised ornament, and they were in nearly all cases produced from moulds, like the lamps or terracotta figures and reliefs. ⁸ The vases were still fashioned on the wheel, but this was done in the mould from which the reliefs were obtained. Occasionally the reliefs were modelled by hand or with the aid of tools, or even produced with a brush full of thick slip (*en barbotine*), but moulding was the general rule. This method entailed three distinct stages, of which the first alone required artistic capacity; the other two were purely mechanical, requiring only a certain technical dexterity. The first was that of making the stamps from which the designs were impressed; the second, the

making of the moulds; the third, impressing the clay in the mould.

The stamps were made of clay, gypsum, wood, or metal, and had a handle at the back for holding while pressing them into the mould; they were used not only for figures and ornamental designs, but also for the potter's signature (see below). Only clay examples, however, have been preserved, but some of these are admirable specimens. Frequently the subjects on the Arretine vases were taken, like those on lamps and mural reliefs, from existing works of art, especially from the "new Attic" reliefs to which allusion has already been made (p. 368), and the stamps are directly copied from these sources. An instance of this is a stamp from Arezzo in the British Museum, with a beautiful figure of Spring (Plate LXVI. fig. 2), which finds its counterpart on a complete vase from Capua (Fig. 219), and also on a mural relief (B.M. D 583). Another good example in the same collection represents a slave bending over a vessel on a fire, and shielding his face from the heat with one hand. From the same site are two others representing respectively a boar and a lion. A fourth stamp found at Arezzo, with a tragic mask, is given in Fig. 211.¹ The stamps must have been articles of commerce, and handed down from one potter to another, as the subjects are found repeated in different places; the majority were probably made at Arezzo and other important places in Italy.

Among examples from the provinces may be mentioned one in the British Museum (Romano-British collection), with the figure of a youth, inscribed OFFI(cina) LIBERTI; it is of fine terracotta, and was found at Mainz. A stamp with the figure of Paris or Atys is in the museum of the Philosophical Society at York.² Other stamps in the form of a hare and a lion in the Sèvres Museum are inscribed with the name of Cerialis, a well-known German potter, whose name also occurs on a mould for a large bowl with a frieze of combatants in the British Museum, and in the former museum are six others, including one of a wolf, with the name of a Gaulish potter,
Cobnertus. Von Hefner mentions one found at Rheinzabern with a figure of a gladiator at each end, inscribed P:ATTI-CLINI O(officina), and others from Westerndorf with a lion and a horse. Dies for stamping the potters' names have been found at Lezoux in Auvergne, and in Luxemburg, with the names of Auster (AVSTRI OF) and Cobnertus, and Roach-Smith possessed one with the latter name; in the Sévres Museum is also a stamp for making rows of pattern (see below), and at Rheinzabern one for an egg-and-tongue moulding was found. Specimens of these stamps are given in Fig. 211.

The moulds were made of a somewhat lighter clay than that of the vases, but it was essential that the material should be sufficiently porous to absorb the moisture of the pressed-in clay of the vase; sometimes holes for the water to escape through are visible. They were made on the wheel, and had a ridge on the exterior for convenience in handling; they were made whole, not in halves, but sometimes the vase was first made plain, and the figures were then attached from separate moulds, or rather made separately, as in the case of the "Megarian" bowls (Vol. I. p. 499). Vases have been found in the Rhone valley in all are known (op. cit. i. p. 337).

1 Brongniart and Riocreux, Mus. de Sévres, pp. 16, 128. For Cerialis see p. 536 and C.I.L. xiii. 10010, 544; for Cobnertus, ibid. 592, and Déchelette, i. p. 179.
ornamented with large appliqué medallions, and the separate moulds for these also exist; they seem to have been made at Vienne. The figures and ornaments were impressed into the moulds from the stamps while the paste was still soft, leaving hollow impressions to receive the clay of the vases. Similarly, continuous patterns, such as rows of beads or dots, were traced in the mould with a roller or wheel-like instrument on which the pattern was cut in relief. Any defects or careless arrangement in the completed vase would of course be due to a careless insertion of the stamps in the mould.

There are large numbers of moulds for Roman and provincial vases in existence, and the British Museum has a fine though fragmentary series from Arezzo, intended for some of the finest specimens of the local ware; of these more will be said in the following chapter. Many of these moulds have been found on sites of potteries in Gaul, especially in the Auvergne and Bourbonnais districts, and are collected in the Moulins, Roanne, St. Germain, and other museums. Lezoux was an important centre in this respect, and here also were found moulds for patterns and ornaments. In the British Museum (Romano-British collection) there is part of a mould for a shallow bowl, found at Rheinzabern, with stamped designs of a lion, boar, and hare pursuing one another; it is similar to the mould with Cerialis' name already described. These matrices are usually of fine bright red clay, unglazed; they are very porous, rapidly absorbing moisture, and easily allowing the potter to withdraw the vessel from the mould. The importance of the discovery of moulds can hardly be overrated for the evidence they afford as to the site of potteries and centres of fabrics; it is obvious that where they are found, and only in such places, the vases must have been made; and that the discovery of a potter's name on any mould establishes his workshop at the place where it was found.

2 Blümmer, Technol. ii. p. 112.
4 Gaz. Arch. 1881-82, p. 17; Bron-gniart, Traité, pl. 30, figs. 2-4: see also Déchelette, i. p. 141 ff., and below, p. 525 ff.
Various tools for working the moulds, or touching up details or damaged parts of bronze and ivory, have been found on the sites of ancient potteries, as at Arezzo, but their use cannot be accurately determined.

The method of decoration known as *en barbotine*, which is a sort of cross between painting and relief, was achieved by the laying on of a semi-liquid clay slip with a brush, a spatula, or a small tube. The pattern was probably first lightly indicated, and the viscous paste was then laid on in thick lines or masses, producing a sort of low relief. The process was, as a rule, only employed for simple ornamentation, such as leaves, sprays, and garlands; but on the provincial black wares it finds a freer scope. On vases found in Britain and the adjoining parts of the Continent (p. 544) figures of animals are rendered in this manner, and on another class peculiar to Germany (p. 537) inscriptions are painted in a thick white slip. The colour of the slip did not necessarily correspond to the clay of the vase, and was, in fact, usually white. These vases are, however, technically poor, and the reliefs heavy and irregular. The process has been aptly compared to the sugar ornamentation on cakes.

Painted decoration is almost unknown in Roman pottery, and is, in fact, confined to the *pocoolum* series described in Chapter XI. It occurs in a rough and primitive form on some of the provincial fabrics, such as the Castor and Rhenish vases (see pp. 537, 544), but its place is really taken by the *barbotine* method.

Engraved or incised decoration is exceedingly rare, and practically confined to provincial wares, which sometimes have incisions or undulations made over the surface with the fingernail in the moist clay. In the north of England, as at York, pottery is commonly found with wreaths and fan-patterns cut in *intaglio* in the clay while moist. Others have patterns of four leaves cut in the soft clay, or continuous.  

---

2 Blümner, ii. p. 111; Daremberg and Saglio, ii. *art. Figlinum*, p. 1130.

ornaments round the vase made with the toothed roller-like instrument of which we have already spoken. Some of this ornamentation may be in imitation of contemporary glass vases. M. Déchelette has traced this fabric to Lezoux, and the specimens found in Britain are doubtless imported. A Gaulish example from the Morel Collection in the British Museum is given on Plate LXIX. fig. 4.

The feet and rims of the vases were made separately, and attached after their removal from the wheel, as were also the handles when required; but the rarity of handles in Roman pottery is remarkable. It is perhaps due to the difficulty of packing them safely for export. The next process was the preparation of the glaze, for those vases to which it was applied, followed by the baking.

3. ROMAN POTTERY-FURNACES

The remains of pottery-kilns and furnaces discovered in various parts of Europe have furnished a considerable amount of valuable information on the system employed in baking the vases. On this particular point, indeed, we know far more in regard to Roman pottery than to Greek, although, as we have seen in Chapter V., the painted vases themselves sometimes yield information on the appearance and arrangement of the furnaces. But remains of actual furnaces have been found in many places in Western Europe, notably in Germany, France, and Britain, in a more or less complete state, as also in Italy, at Pompeii, Modena, and Marzabotto. A complete list of those known in 1863 has been given by Von Hefner, supplemented by Blanchet's lists of furnaces found in France (1898 and 1902). In Gaul the best examples are at Lezoux, near Clermont, at Châtelet in Haute-Marne, and at Belle-Vue,

5 Brongniart, i. p. 439.
near Agen, in the Department of Lot-et-Garonne. The latter was circular in form, below the level of the soil. In Germany important remains have been found at Heiligenberg in Baden, Hedernheim near Frankfort, Rheinzabern near Karlsruhe, and Westerndorf. All these in general arrangement differ little from those in use at the present day; the Hedernheim furnace (Fig. 212) was found in the most perfect preservation, but was subsequently destroyed, not, however, before satisfactory plans and drawings had been made. In Britain by far the most important discoveries have been made at Castor, Chesterton, and Wansford in Northants, where the remains extend for some distance along the Nene valley. They were first explored by Artis in 1821—27, who published a magnificent series of plates in illustration, entitled Durobrivae; these he supplemented by a full description in the Journal of the British Archaeological Association. Castor and Chesterton (the latter in Hunts) are both on the site of Roman towns, and were the centres of a special local ware, described in a succeeding chapter. The potteries, being so numerous, are probably not all of the same age.

In 1677 four Roman kilns were discovered in digging under St. Paul's Cathedral for the foundation of Sir C. Wren's

4 See Haverfield in Victoria County Hist. of Northants, i. pp. 167, 207 ff.
building, at a depth of 26 feet. They were made of loam, which had been converted into brick by the action of the fires, and were full of coarse pots and dishes; they measured 5 feet each way. A drawing made at the time is preserved among the Sloane MSS. in the British Museum. In the kilns was found pottery of the kind typical of London and the neighbourhood. In 1898 two kilns, one of large size, with pottery bearing the name CASTVS FECIT, were found near Radlett in Herts, and another was excavated in 1895 by Mr. C. H. Read at Shoeburyness. In Norfolk a kiln of somewhat curious form was found in the Roman settlement of Caistor by Norwich; the shape is that of a shallow concave depression with partitions, and it contained vases placed ready for baking. Another found between Buxton and Brampton was recorded by Sir Thomas Browne, and a third at Weybourne. In the South of England kilns have been found in the New Forest, where there was a manufacture of local pottery; in Alice Holt Forest near Petersfield, Hants; at Shepton Mallet in Somerset; and a potter's workshop at Milton Abbas, Dorset. The British Museum contains a model of a kiln unearthed at Worcester about forty years ago, on the site of the modern porcelain works. Finally, discoveries of kilns and pottery were made in 1819 at Colchester, and again in 1878, when five kilns, all of different forms, with local pottery, came to light.

To describe all these different types of furnaces in detail would of course be impossible, but much may be learnt from the very full, though now somewhat antiquated, descriptions of the Castor kilns given by Artis. It will be found more
satisfactory to describe the generally-prevailing arrangements, noting the more important variations where they occur. It may further be laid down that the system was practically the same for terracotta figures and tiles as for pottery, and that in many cases both were made in the same furnace. But this was not invariably the case, and at Rheinzabern, for instance, the kilns for tiles were quadrangular, those for pottery circular.

The kilns were constructed partly of burnt, partly of unburnt brick, the interior, floor, and outside of the roofs being covered with a strong layer of cement. They consisted of two main portions, the fire-chamber with its adjuncts, and the vaulted chamber above, in which the objects to be baked are placed. The fire-chamber was usually circular, with a projection in front, the praefurnium,\(^\text{1}\) which had either a vaulted roof, as at Castor and Heiligenberg, or a gabled roof formed of pairs of tiles, as at Rheinzabern. Through this the fuel was introduced, consisting chiefly, as charcoal remains show, of pine-wood. The fire-chamber was either divided up, as at Castor, by walls radiating from a central pillar which supported the roof, or by rows of pillars in a line with the entrance, as at Rheinzabern and Heiligenberg. Holes were bored in the roof to allow the heat to penetrate through, but the arrangement varies; at Heiligenberg each division of the furnace was vaulted, making grooves along which the holes were bored. The oven where the pots were placed has been destroyed in most cases, but we know that it consisted of a floor, a wall with entrances, and a vaulted dome. The pots were ranged partly on the floor, partly on terracotta stands over the holes, as at Rheinzabern and Heiligenberg\(^\text{2}\); at Lezoux there are remains of holes in the walls for iron bars to support them. Special arrangements seem to have been made for baking the finer wares, in order to ensure the proper spread of heat, and to guard against their being blackened or otherwise injured. In the Romano-British Room of the British Museum is a lump of bowls of red ware from Lezoux, fused together in the baking and cast aside.\(^\text{3}\)

KILNS AT CASTOR AND IN GERMANY

One of the kilns at Castor (Fig. 213) is described by Artis as a circular hole 3 to 4 feet deep and 4 feet in diameter, walled round to a height of 2 feet; the praefurnium was about a foot in length. In the centre of the circular hole was an oval pedestal (with one end pointing to the furnace-mouth), on which and on the side wall the floor was supported, being formed of perforated angular bricks meeting in the centre. The vaulted dome was composed of bricks moulded for the purpose, and the sides of the kiln of curved bricks set edgeways in a thick slip of the same material. Brongniart compares the Castor kiln with that at Heiligenberg, near Strasbourg, and others in the Rhine valley in which "Samian" ware was made.

Another kiln found in 1844 Artis describes as having been "used for firing the common blue or slate-coloured pottery, and had been built on part of the site of one of the same kind, and within a yard and a half of one that had been constructed for firing pottery of a different description. The older exhausted kiln . . . presented the appearance of very early work; the bricks had evidently been modelled with the hand, and not moulded, and the workmanship was altogether inferior to that of the others, which were also in a very mutilated state; but the character of the work, the bricks, the mouths of the furnaces, and the oval pedestals which supported the floors of the kilns, were still apparent."

Artis was also of opinion that "the blue and slate-coloured vessels found here in such abundance were coloured by suffocating the fire of the kiln, at a time when its contents had

---

1 See Haverfield in *Vict. County Hist. of Northants*, i. p. 207.
2 *Traité*, i. p. 426.
acquired a degree of heat sufficient to ensure uniformity of colour." Hence he denominated kilns in which this ware was baked, "smother kilns." He further notes that the bricks of this kiln "were made of clay mixed with rye in the chaff, which being consumed by the fire [i.e. in the baking of the bricks] left cavities in the room of the grains, which might have been intended to modify expansion and contraction, as well as to assist the gradual distribution of the colouring vapour. The mouth of the furnace and top of the kiln were no doubt stopped; thus every part of the kiln was penetrated with the colouring exhalation." From experiments made on the local clays he proved to his own satisfaction that the colour could not have been produced by any metallic oxide, inherent or applied from without; and this view was supported by the appearance of the clay wrappers of the dome of the kiln. But in view of recent researches, such as those of Blümner, it is doubtful whether Artis' theories can now be upheld. As Mr. Haverfield has pointed out,¹ the dark colour may be due to the chemical action of the carbonaceous vapour of the smothered kiln rather than to any "colouring exhalation."

The process of packing the kiln in order to secure uniform heat in firing is thus described by the same writer: "The kilns were first carefully loose-packed with the articles to be fired, up to the height of the side walls. The circumference of the bulk was then gradually diminished, and finished in the shape of a dome. As this arrangement progressed, an attendant seems to have followed the packer, and thinly covered a layer of pots with coarse hay or grass. He then took some thin clay, the size of his hand, and laid it flat on the grass upon the vessels; he then placed more grass on the edge of the clay just laid on, and then more clay, and so on until he had completed the circle. By this time the packer would have raised another tier of pots, the plasterer following as before, hanging the grass over the top edge of the last layer of plaster, until he had reached the top, in which a small aperture was left, and the clay nipt round the edge; another coating would be laid on as before described. Gravel or loam was then thrown up against the side.

¹ *Vit. County Hist. of Northants*, i. p. 209.
wall where the clay wrappers were commenced, probably to secure the bricks and the clay coating. In consequence of the care taken to place grass between the edges of the wrappers, they could be unpacked in the same-sized pieces as when laid on in a plastic state, and thus the danger in breaking the coat to obtain the contents of the kiln could be obviated."

In the course of his excavations Artis discovered a singular furnace, "of which I have never before or since met with an example. Over it had been placed two circular earthen fire vessels (or cauldrons); that next above the furnace was a third less than the other, which would hold about eight gallons. The fire passed partly under both of them, the smoke escaping by a smoothly-plastered flue, from seven to eight inches wide. The vessels were suspended by the rims fitting into a circular groove or rabbit, formed for the purpose." He was strongly of opinion that this furnace was used for producing glazed wares by means of iron oxide. Whether this is so or not, it is interesting to note that in the British Museum and Museum of Geology there are cakes of vitreous matter from Castor, probably used as a glaze, and consisting of silicates of soda and lime.  

The kiln found at Caistor, in Norfolk, was apparently used for baking the grey Roman ware, and differed in form from those described, which were for the black, being only calculated for a slight degree of baking. It was a regular oval, measuring 6 feet 4 inches in breadth. The furnace holes were filled in below with burnt earth of a red colour, and in the upper part with peat; the exterior was formed of strong blue clay of 6 inches in thickness, and the interior lined with peat; the kiln was intersected by partitions of blue clay. Some of the vases were inverted and filled with a core of white sand.

The furnaces at Heiligenberg and Rheinzabern present the following further peculiarities. The former, which were evidently used for the baking of red wares, had a flue in the

1 See Haverfield, _op. cit._ p. 210, fig. 31.

form of a long channel with arched vault, the mouth being over 8 feet from the space where the flames and heat were concentrated under the oven (Fig. 214). Numerous pipes of terracotta, of varying diameter, diverged from the upper part or floor of the oven, to distribute the heat; in the outer wall of the oven was a series of smaller ones, and twelve or fifteen of larger size opened under the floor of the oven to distribute the heat and flame round the pots (Fig. 215). The mouths of the pipes were sometimes stopped with baked clay stoppers to moderate the heat. The upper part or dome of the kiln is never found entire, having been generally destroyed here, as elsewhere, by the superincumbent earth. Walls of strong masonry separated and protected the space between the mouth of the flue and the walls of the oven, and the floor of the latter was made of terracotta tiles.

At Rheinzabern, where excavations were made in 1858, fifteen furnaces were found, some round and others square,
KILNS AT HEILIGENBERG

but all constructed on the same plan. The floor of the oven was over 3 feet below the top of the walls, and was covered with tiling, the walls being formed of rough slabs of clay, about 28 by 16 inches in size. The floors of the ovens were in some cases supported by bricks covered with a coating of clay. Stands of baked clay in the shape of flattened cylinders supported the pots in the oven, and these rested on pads of a peculiar form, roughly modelled in clay.\(^1\) In all, seventy-seven pottery-kilns and thirty-six tile-kilns were discovered on this site.\(^2\)

The following list, though by no means claiming to be exhaustive, gives the names of the chief potteries where actual furnaces have been discovered.

4. Pottery in Latin Literature; Shapes and Uses

Vessels of earthenware were extensively used by the Roman people in the earlier days of the Republic for all purposes of domestic life, and later writers often contrast their use with that of the costly vases of precious metal then customary. "Gold," says Persius, "has driven away the vases of Numa and the brass vessels of Saturn, the urns of the Vestals and Etruscan earthenware"; and Juvenal speaks of those who laughed at "Numa's black dish and bowl, and fragile saucers from the Vatican hill." Even under the Empire fdictile vessels continued to be used by the poorer classes, and the use of the finer red glazed wares must have been even more general. But Juvenal, satirising the luxury of Domitian's time, says that it is considered a reproach to dine off earthenware. In Republican times it was the proud boast of a Curius to prefer his earthenware service to Samnite gold, and in 167 B.C. the consul Q. Aelius Tubero was found by the Aetolian ambassador dining off earthenware; Seneca also tells how he, at his entertainment given in the temple of Jupiter, placed fdictile vessels before his guests. But when Masinissa entertained the Romans in 148 B.C. the first course was served on silver, the second in golden baskets, which Ptolemy Euergetes describes respectively as the Roman and Italian fashions. Athenaeus says that up to Macedonian times dinners were served in fdictile vessels, but that subsequently the Romans became more luxurious, and Cleopatra spent five minae a day on gold and silver wares. Subsequently earthenware was replaced by glass as well as metal, especially for unguent bottles and drinking-cups, of which large numbers are found in Roman tombs, where they virtually take the place of pottery.

1 Cf. Tibull. i. 1, 38:
   "Nec e puris sperrere fictiliibus
   Fictilia antiquus primum sibi fecit
   agrestis
   Pocula de facili compositaque luto."

8 Ἀπολλ. Athen. vi. 229 b. He uses the curious expression, ἱκραμος ἁργυρος, which, as in the use of the word ἱκραμος for marble tiles (Vol. I. p. 100), implies the antiquity of the use of fdictile ware. See the next note.
9 vi. 229 C, where the use of ἱκραμος or dinner-service is discussed.
Vases of immense size were sometimes made under the Empire, and stories are told of the absurdities perpetrated by some of the Emperors in this respect. Juvenal, in describing the turbot prepared for Domitian, says no dish could be found of sufficient size to cook it in, and Vitellius had a dish made which from its huge dimensions acquired the name of "the shield of Minerva." Elsewhere it is scoffed at as a "swamp of dishes" (patinarum paludes). Pliny speaks of terracotta vases which sold for even more than precious crystal or myrrhine ware, and were therefore presumably of great size.

The principal use of earthenware was for the transport and storage of wine, oil, corn, figs, honey, and other commodities, answering to the casks of the present day. Martial speaks of a jar (testa) reddened with the blood of tunnies exported from Antipolis (Antibes). Of the shapes used for this purpose and their names we shall speak presently in detail. Vases were also used in religious rites, but metal was probably more general; Plautus describes a miser who sacrificed to the Lares in earthenware (vasis Samis) because he was afraid that they might steal silver vessels. They were also used for various operations in agriculture, medicine, and household economy; but above all for the domestic purposes of the table. Some of the peculiar uses have already been referred to (p. 387), and another that may be mentioned is the use of jars as bell-glasses for rearing vine-sprouts.

Although the custom of burying vases with the dead was not so general among the Romans as among the Greeks, they were yet frequently used in graves in the form of cinerary urns, in the shape of a covered jar (olla or obrendarium) of coarse ware and globular in form (p. 550). Vases containing ashes have often been found in England, as at Bartlow and Litlington in Cambridgeshire. At the latter place a tomb contained a sort of colander perforated with holes which formed the letters

INDIVLClVII. Similar finds are recorded from Arnaise in France. Pliny states that many persons expressed their desire to be buried in coffins of terracotta. Roman sarcophagi of terracotta have been found at Saguntum in Spain, but for these stone and lead were the ordinary materials. The cinerary urns were often formed from large dolia or amphorae, the neck being broken off so as to produce a globular vessel. Examples have been found in England at Chesterford, Essex, at Southfleet in Kent, and in the Bedford Purlieus near Kingscliffe, Northants (now at Woburn Abbey); another is in the Cathedral Library at Lincoln. Roach-Smith also mentions specimens found in Lothbury, London, and in Kent, the latter being now in the Maidstone Museum.

Vitruvius, in his chapter on Echea, or vases distributed around the ancient theatres for acoustic purposes, mentions that they were often made of earthenware for economical reasons; but they were usually of bronze. Seneca, too, alludes to this practice when he speaks of the voice of a singer falling upon a jar (dolium). It is certain that the Greeks and Romans often made use of earthenware jars in architecture, but it is probable that this was more often done with the object of diminishing weight than for acoustic reasons, or, as some have thought, for want of better material. The dolium, amphora, and olla seem to have been the forms most usually employed. There are various examples in walls and substructures of the Augustan period, and they are also found in vaults, where their purpose is undoubtedly to lighten the weight. In the circus of Maxentius a number of large amphorae were found embedded in the vaulting and upper part of the walls, arranged neck downwards and with their axis inclined obliquely to the wall. All are now broken, but they illustrate the ingenious method

in which the upper parts of the arches supporting the rows of seats were lightened. In the dome of the tomb of St. Helena, outside the Porta Labicana, rings of pots are embedded for the same purpose, whence the building is usually known as Torre Pignattara (from *pignatte*, pots). An oven found at Pompeii had a vaulted top formed of *ollae* fitted into one another, each about a foot in height, of ordinary red ware; the span of the arch was 5 feet 6 inches, and the object here was to ensure extreme dryness as well as lightness. A similar arrangement occurs in the Stabian Thermae at Pompeii, and also in the church of San Stefano alla Rotonda at Rome, and the dome of San Vitale at Ravenna, built by Justinian in the sixth century, is similarly constructed, with an elaborate system of tubes and jars. The practice seems to have been continued during the Middle Ages, and an example occurs in England, at Fountains Abbey, where the purpose was acoustic.

We now proceed to describe in detail the principal shapes of Roman vases, so far as they can be identified from literary or epigraphical evidence or from other sources, on the same lines as in our previous chapter on the shapes of Greek pottery. Some of these shapes, it will be seen, they had in common with the Greeks, such as the amphora, the krater, and the phiale or patera, and in several instances (such as the cyathus and the scyphus) the Greek name is preserved.

Beginning with vases used for storage, whether for liquids, as for wine and oil, or for solids, as for corn or fruit, which were chiefly kept in cellars, we take first the *dolum*, a gigantic cask corresponding to the Greek πίθος (Vol. I. p. 152), which from its general usage gave rise to the generic term *opus doliare*, for common work in clay. It was large enough to contain a man, as we know from the story of Diogenes illustrated on the Roman lamp already given (Plate LXIV. fig. 6); the vessel thereon depicted may serve to give an

---

1 Middleton, *loc. cit.*
3 Nissen, *ibid.*
idea of its appearance. Columella speaks of dolia sesqui-
uclearia, i.e. holding one-and-a-half culei or thirty amphorae.
They were buried in the earth of the cellars, and have been
found thus in Italy at Anzi, in France at Apt, Vaucluse,
and near Clermont, and at Tunis. They were used for
wine, oil, corn, and salted meat, and Juvenal tells us that
dolia were used for new wine, being lined with wax, pitch,
or gypsum. In 1858 a large number were found at Sarno in
Campania, some being stamped with the makers’ names,
as ONESIMVS FECIT, VITALIS F, L. TITI. T. F. PAP, and
M. LVCCEI. QVARTIONIS. On one was incised L. XXXIV, or
thirty-four lagenae (see p. 446). One of the prodigies which
was supposed to predict the future fortune of the Emperor
Antoninus Pius was the discovery above ground of some dolia
which had been sunk in the earth in Etruria. An old name
for the dolium was calpar, and another smaller variety was
the seria, containing only seven amphorae. A diminutive form
of the latter, seriola, is described as a wine-vessel invented
in Syria.

Dolia were made in separate pieces, the base and other parts
being secured by leaden cramps, and they were also hooped
with lead, as we learn from Cato. Pliny speaks of repairing
•casks by fitting on handles, scraping the hoops, and stopping
up cracks. They are made both of white and red clay, baked in
a slow furnace, great care being required to moderate the heat
aright. Their makers were known as doliarii. Part of a large
dolium bound with leaden hoops was found near Modena, at
Palzano; also at Spilamberto, one with the name of T. Gavelius
and the numerals XXX, XIII, another of the capacity of 36
amphorae. On the mouth of one found in the Villa Peretta
at Rome was the name of L. Calpurnius Eros, on another

the name of T. Cocceius Fortunatus.\footnote{Marini, No. 4.} Two good examples of \textit{dolia} were at one time preserved in the gardens of the Villa Albani, about 4 feet in diameter and as many in height, and of a coarse gritty pale red clay. This kind of vase was often used for sepulchral purposes, bodies having being found actually buried in them (see above, p. 457).

Next in size and importance to the \textit{dolium} is the \textit{amphora}, resembling in form the Greek wine-jar\footnote{See Fig. 22, Vol. I. p. 154.}; it usually has a long cylindrical body with pointed base, a long narrow neck, and two straight handles. Hölter\footnote{\textit{Formen der röm. Thongef.} p. 16, pls. 1-8.} notes several varieties: the Canopic, the wide-bellied, the cylindrical, the globular, and the spheroidal, the former of which is a typical early form in the provinces.\footnote{Cf. Koenen, \textit{Gefässkunde}, pls. 10-12.} It was often without neck or handle, and was seldom ornamented, not being used for artistic purposes like its Greek prototype, but only for strictly utilitarian ends, that is, for the storage and transport of wine. It is usually of coarse red earthenware, made on the wheel, with a clay stopper to close the mouth, and the name of the maker in a rectangular label on the handle, like the \textit{diota} or wine-amphora of the Greeks. It was in fact often known as a diota, as in a familiar line of Horace\footnote{Cf. Jahn, \textit{Wandgem. d. Villa Pomp.} pl. 5, p. 42.}:

\begin{quote}
Deprome quadrimum Sabina,  
O Thaliarche, merum diota.
\end{quote}

The amphora was pitched internally to preserve the wine\footnote{Od. i. 9, 7.}; the pointed base was of course adapted for fixing it in the ground in the cellar, but when brought up it was placed in a tripod-stand of metal or wood (\textit{incitega}).\footnote{Pliny, \textit{H.N.} xiv. 135.} In Cicero's time the regulation size was equivalent to a quadrantal or two \textit{urnae}.\footnote{Cf. Jahn, \textit{Wandgem. d. Villa Pomp.} pl. 5, p. 42.} The use of this vase was very varied and extensive among the Romans; it was employed not only in cellars and granaries, but also at the table and for many other purposes of ordinary life, even where nowadays vessels of wood or iron would be preferred.

\end{footnotes}
D'Agincourt mentions the discovery at Rome, near the Porta del Popolo, of a row of amphorae in a cellar in 1789, and at Pompeii a hundred were found in the house of Arrius Diomedes, a hundred and fifty in that of the Faun; a hundred and twenty were found in a cellar near the baths of Titus, and many more at Milan in 1809, and at Turin. Numbers have been found in London, varying in capacity from four to twelve gallons, and others at Colchester and Mount Bures in Essex. But they are so universal all over the Roman Empire that to enlarge the list would be tedious. Many, however, evoke a special interest by reason of their stamps and inscriptions, and a few typical examples may profitably be given.

The inscriptions vary in form and character; some amphorae give the name of the maker in the genitive, officina being understood; others the consuls for the year in which they were filled; others, again, the name of the wine or other phrases descriptive of their contents; and others complimentary inscriptions to their owners. Among names of makers both single, double, and triple names are found, and among the former are many of a Gaulish or barbarian character, such as Bellucus, Dicetus, and Vacasatus, son of Brariatus; the last-named from Nimeguen, the first-named from London. Among the triple names, showing that the potters were Roman citizens or freedmen, are M. Aemilius Rusticus from Caerleon, and C. Antonius Quintus, also found in Britain. Sometimes the name is in the nominative with f for fœcit, or with the genitive of for officina occurs. The stamps are in the form of oblong rectangular labels on the handle or neck, the letters in relief. One of the most curious stamps was on an amphora found in the Pontine marshes near Rome, a square one with a caduceus and other symbols arranged in twelve compart-

ments; the inscription runs M·PETRON·VETERAN·LEO·SER·FECIT, "Leo, the slave of M. Petronius Veteranus, made it."1

The names of Vespasian and Titus as consuls are found on an amphora from Pompeii: VESPASIANO III ET FILIO CS, the year being A.D. 742; that of M. Aurelius (but not necessarily as consul) occurs on an amphora found at Newington in Kent3; and on one in the British Museum from Leptis in Africa is L·CASSIO·C·MARIO·COS, the date being A.D. 107.4 On the neck of a fourth amphora, found at Pompeii, was FVNDAN·CN·LENTVL·M·ASINIO·COSS, "wine of Fundi in the consulship of Cn. Lentulus and M. Asinius (Agrippa)," of the year A.D. 26.5

The character or origin of the wine or other commodity stored in the amphorae is given by such inscriptions as BARCAE, KOR·OPT ("best Corcyrean"),6 RVBR·VET·V·P CII ("old red wine, 102 lbs. weight"), all from Pompeii, painted in red and black.7 MES·AM·XVIII, also on an amphora from Pompeii, appears to mean "eighteen amphorae [not measures] of Mesogitan wine" (from Mesogis in Lydia8); or, again, we find at Pompeii SVRR·XXI, "twenty-one amphorae of wine of Surrentum."9; TOSCOLA(n)ON (ex) OFFICINA SCAV(ri), "Tuscan wine from the manufactory of Scaurus."10 On the other hand, LIQVAMEN OPTIMVM ("best pickle"), or such expressions as SCOMBRI ("mackerel"), GARVS ("brine"), etc., imply that the vessel has been used for conveying pickled fish.11

Among expressions of a complimentary nature are: FABRILES MARCELLAE N·AD FELICITATEM, "the workmen of our Marcella to wish her joy"12; (pr)OMO(s) FAMELIAI DONO(m) VOTUM DEDIT, or DONO V(NAM DAT), "Promus gave (an urn) as a gift and vow to his family" (from Ardea in Latium).13

12 Doni, p. lxxxvi. Found on the Aventine, now in the Museo Kircheriano.
The list may be concluded with the inscription on an amphora found in the garden of the Villa Farnese, among the ruins of the Aurea Domus of Nero, which held eight *congii*; on its neck was traced in ill-formed letters: *I(quaminis) FL(os) EXCEL(lens) L. Pvrelli GEMELLI M( . . . ),* “Finest brand of liquor, belonging to L. Purellus Gemellus.” An amphora was found at Pompeii with the name of Septimius or Stertinius Menodotus in Greek letters. There are occasional references in the classics to the practice of placing such stamps on vases, as when Plautus makes the slave say, with reference to the drinking that went on in his master’s house, “There you may see epistles written with letters in clay, sealed with pitch; the names are there in letters a foot and a half long.” Or, again, another slave, fearing to be caught with a jar in his possession, reflects, “This jar is lettered; it proclaims its ownership.” Juvenal speaks of wine whose country and brand had been obliterated by old age through long hanging in the smoke.

Another vase used much in the same way as the amphora, and particularly for keeping wine, was the *cadus*, the shape of which is not exactly known. It held about twelve *congii*, or seventy-two *sextharii* (pints), and is frequently mentioned by Horace and Martial. The former in the *Odes* refers to his jar of Alban wine nine years old, and in another passage to one stored in Sulpicius’ cellars; the latter speaks of *cadu Vaticani*, which may mean made of clay from the Vatican hill or containing Vatican wine; elsewhere he speaks of taking yellow honey from the ruddy jar (implying an earthenware vessel), and of the red jar which pours out home-made wine. We also learn from him that the *cadus* was hung in the chimney to give the wine a mellow flavour. From other passages we learn that the *cadus* was used for

oil,\(^1\) fruit,\(^2\) and money,\(^3\) and also as a measure equivalent to one-and-a-half amphorae or three urnae.\(^4\) The *orca* is described by Isidorus as a kind of amphora, of which the *urces* (see below) was a diminutive.\(^5\)

The Romans were presumably, like the Greeks, in the habit of mixing their wine with water, but we only find the *crater* mentioned rarely; and that in a poetical manner.\(^6\) Moreover it was probably made in metal as a rule, and the rare instances of the *crater* which occur in the Arretine ware are obvious imitations of metal prototypes; there is a fine example in the British Museum from Capua (see Fig. 219). Ovid, however, speaks of the *rubens crater,*\(^7\) implying terracotta, as in the case of the *rubens cadus* of Martial mentioned above. The *vinarium,*\(^8\) the *acratophorum* (for holding unmixed wine),\(^9\) and the *oenophorum* were probably of the same character, but the latter was portable, as we know from Horace’s jeer at the man who took his cooking-stove and wine-jar (œnophorum) with him everywhere.\(^10\)

The *urna*, the equivalent of the Greek *hydria*, was similarly used for carrying water, and also for casting lots, or as a voting-urn;\(^11\) in the latter sense Cicero actually uses the word *hydria*.\(^12\) Its size was half that of the amphora. Both the *urna* and the *hydria* are found in connection with funerary usages, and appear to have held the ashes of the dead.\(^13\) The *sita*, or bucket, with its diminutive *sitella*, was also used for water and for lots,\(^14\) but was principally of metal. Isidorus says it is

the Greek κάδος (Vol. I. p. 165).\footnote{Etym. xx. 6.} The \textit{cupa} and the \textit{cumera} seem to have been of wood rather than earthenware\footnote{Cf. Caes. Bell. Civ. ii. 11; Lucan, iv. 420.}; the former was a kind of tub, the latter was used for keeping grain, and also by brides for conveying their effects to their new home.\footnote{Paul. \textit{ex Fest. ed. Müller, p. 63, 12.}} Another large vessel for holding liquids was the \textit{sinus}, or \textit{sinum}, used\footnote{Plaut. \textit{Curc.} i. 1, 75; \textit{Rud.} v. 2, 32; and see Virg. \textit{Aen.} vii. 33; Varro, \textit{L.L.} v. 123.} both for water and milk.\footnote{Plaut. \textit{Stich.} ii. 2, 28; Cato, \textit{Agricult.} 11; Varro, \textit{Re Rust.} i. 22; cf. Juv. v. 47 for \textit{nasus}, applied to a cup.\footnote{Ad Fam. vii. 29: cf. also Plaut. \textit{Aulul.} iv. 2, 15; Pers. iii. 22.}} The \textit{nasiterna}, so called from its long spout or \textit{nasus}, had three handles, and was used as a watering-pot.\footnote{Plaut. \textit{Amph.} i. 1, 273; Cato, \textit{Agricult.} 81; Varro, \textit{ap. Nom.} 546, 23.} The \textit{fidelia} appears to have been a kind of large pail or bucket; Cicero in one of his letters\footnote{Plaut. \textit{Bacch.} ii. 5, 522; Cic. \textit{ad Att.} ii. 3, 3; \textit{av.} 209.} cites the proverb, \textit{de eadem fidelia duos parietes dealbare}, which answers to our "killing two birds with one stone." It implies that it would be used for holding paint or whitewash.

Of smaller vases for holding liquids, such as jugs, bottles, and flasks, the principal were the \textit{urceus} (with its diminutive \textit{urceolus}), the \textit{amphulla}, and the \textit{lagera} or \textit{lagona}. The \textit{hirnea} is also mentioned as a jug which was filled from the jar or \textit{cadus}.\footnote{Varro, \textit{R.R.} i. 22; Treb. \textit{Poll. Vit. Claud.} 17; Plaut. \textit{Merc.} v. 2, 86; \textit{id. Pers.} i. 3, 43; Cic. \textit{Fin.} iv. 12, 30.} The \textit{urceus} seems to be a small jug, the equivalent of the Greek \textit{olwoχόν}, having one handle; it was also used as a measure.\footnote{Hor. \textit{A.P.} 97: cf. the \textit{λυκεύθω} episode in the \textit{Frogs} (Vol. I. p. 196); also the word \textit{amphullarii}.} The \textit{amphulla} was used both as a wine-flask and an oil-flask, corresponding thus to the Greek \textit{λήκυθος}, as is seen in its metaphorical use.\footnote{Plin. \textit{Ep.} iv. 30, 6; Mart. xiv. 110.} It was used for bringing the wine to table, like a decanter,\footnote{Florida, ii. 9, 2: cf. the terracotta vessels with reliefs in the British Museum, D 204-\textit{f}; also Mus. Greg. i. pl. 10; Micali, \textit{Mon. Incd.} pl. 52.} and is described by Apuleius\footnote{Isidorus derives the word from \textit{amphulla}, in reference to its round form (\textit{Etym. xx. 5}).} as lenticular in form, being therefore like a flat round-bodied flask with two handles.

An interesting example of an \textit{amphulla} of this kind, of red ware with a coarse reddish-brown glaze was found some years
ago near the Hôtel Dieu, Paris. It bore two inscriptions round the body, one on either side, with letters in relief; on one side was OSPITA REPLE LAGONA CERVAEA, "Mine host, fill the flask with beer"; on the other, COPO CNODI TV ABES EST REPLETA, "Innkeeper, (?), be off, it is full." Similar vases have been found in Hainault and at Trier, and are said to be still made in Spain. Another of the same kind, but with only one handle, recently acquired by the British Museum from the Morel collection, has on it the word AMPULLA painted in white (Fig. 216). The lagena (Greek, ἡρυφος) was a jug or bottle with narrow neck, wide mouth, and handle, and was used as a sign by wine-sellers. It was sealed up until required for use, and being proverbially brittle, was protected, like a modern Italian wine-flask, by wicker-work. It was also used as a travelling-flask, and carried by hunters and fishermen; the younger Pliny exhorts Tacitus, when he goes hunting, to take not only a "sandwich-box and brandy-flask" (panarium ac lagunculam), but also a note-book to jot down ideas. The Roman barmaid carried a lagena at her side when serving in the tavern, and it was used as a wine-jug at the table. A jar found at Saintes in France has engraved on it MARTIALI SOL(ī)DAM LAGONAM, "A whole flask to Martialis," and

THE AMPULLA AND LAGENA

467
gives a clue to the form associated with this word (see Fig. 217).

The words in use for a ladle are cyathus, corresponding to the Greek κυαθός (Vol. I. p. 179), in measure equivalent to one-twelfth of the sextarius or pint, and simpulum or simpuvium. The latter were chiefly associated with sacrifices, and will be dealt with later (p. 471); the cyathus was regularly used at the table for measuring out the wine into the drinking-cups. We learn from Martial that in drinking a toast it was customary to use the number of cyathoi that corresponded to the letters in the name of the recipient, as in the epigram

Laevia sex cyathis, septem Justina bibatur,
Quinque Lycas, Lyde quattuor, Ida tribus.  

Of drinking-cups the Romans had almost as large a variety as the Greeks, the majority of the ornamented vases preserved to this day being apparently for this purpose; the number of names recorded in literature is, however, much less, as many of those given in the long list on pp. 181-183 of Vol. I. are mere nick-names for ordinary forms. The generic name for a drinking-cup was pocus, the Greek ποτήριον, just as vas was the generic name for a larger vessel; it occurs constantly in the poets, who, indeed, use it somewhat loosely, and has already been met with in the series of small bowls with Latin inscriptions described in Chapter XI. (p. 490). Many forms of drinking-cups used by the Romans were only made in metal, such as the cantharus, carchesium, and scyphus (see Vol. I. pp. 184, 187). All these were forms borrowed from the Greeks, as were the calix (kylix), the cotula (chiefly used as

a measure = half-a-pint), and the scaphium and cymbium, which were boat-shaped vessels. The ciborium (a rare word, but used by Horace) was supposed to be made in the form of the leaves or pods of the colocasia, or Egyptian bean. Its later ecclesiastical use is well known. Other names of which we hear are the batioca, the gaulus, the scutella (see below), and the amystis, or cup drained at one draught (see Vol. I. p. 181). Like the Greek kylix, the calix appears to have been of all these the one most commonly in use, and is constantly referred to by poets and prose writers. Those of terracotta could often be purchased at a very low price, and formed, it is evident, the ordinary drinking-cups of the Roman citizen; they were also frequently of glass. Juvenal speaks of "plebeian cups purchased for a few asses"; and Martial describes a man buying two calices for an as and taking them home with him. We have no exact information as to its form, but it must have been something like the Greek kylix, only probably without handles; it was also used for solid food such as herbs. Seneca speaks of calices Tiburtinae, which seem from the context to have been of earthenware. Varieties of the calix are probably represented by the typical Gaulish forms illustrated in Chapter XXIII., Figs. 221-223.

Of dishes and other utensils employed for food at the table, the largest were the lanx and the patina. The former is described by Horace and Juvenal as large enough to hold a whole boar, and was probably of metal; the patina is described as a dish for holding fish, crabs, or lobsters, but that it was not necessarily limited in size is shown by the stories already alluded to of Domitian and Vitellius (p. 456). The latter, when dragged to his death, was insulted by the epithet of patinaris,

or dish-maker. The patina was flat, and made of clay, and is also described as a wide and shallow vessel for cooking. It is contrasted with the lagena in the well-known fable of the fox and the stork. Smaller dishes for sweetmeats and other dainties were the catinum and catillum, and the patella. The discus and paropsis appear to have been, like the lanx, principally of metal; the former was like a shield (whence scutula and scutella); the latter is mentioned by Isidorus, who describes it as quadrangular, and by Martial, together with some obscurely-named dishes:

Sic implet gabatas paropsidesque
Et leves scutulas cavasque lances.

Martial speaks of the patella as a dish for a turbot, and also as a vessel of black ware which was used to hold vegetables; the catinus (a fictile dish) was large enough to hold a good-sized fish, such as a tunny, and the catillus appears to have been a sort of porringer. Sauces were placed in small dishes or cups, known as acetabula (the Greek ἀκτήβαφα), which were evidently of earthenware; the catillus held pepper, and the concha or shell was used for a salt-cellar, also for unguents. The latter was probably a real shell, not of earthenware. Another kind of dish which is only once mentioned, in Horace’s account of Nasidienus’ banquet, was the masonomum, probably a kind of lanx, in metal, which held on that occasion a sort of ragoût of game. His own table, however, he boasts, was adorned only by a cyathus and two cups, an echinus or rinsing-bowl, a guttus, and a patera or libation bowl. The guttus seems to have corresponded to the Greek lekythos or askos, and is the

general name for an oil-flask or cruet. It was either a small, long-necked bottle or a squat flask with a narrow spout, which allowed the oil to pour slowly. Roach-Smith published a relief dedicated by Egnatius, a physician, to the Deae Matres, on which small vases of the first-named form appear, indicating that he consecrated his medicine bottles to these divinities.

Of vessels for cooking, washing, and other common domestic purposes, the *olla* was that in most general use; the word is, in fact, a generic name for a jar or pot (Gk. χύτρα), as in the play of Plautus, the *Aulularia*, the name of which embodies an archaic form of the word, *aula, aulula*. Here it was used for hiding a hoard of gold. It was also, as has been noted, used as a funerary urn, and some inscribed examples of marble *ollae* have been found in tombs. The *pelvis* was more particularly a washing basin, but Juvenal speaks of it as scented with Falernian wine. It is usually identified with the *mortarium*, a large, shallow, open bowl with a spout, frequently found in Britain and Central Europe (see below, p. 550); it is of coarse light-red clay, and often has the potter’s name stamped upon it. That it was used for pounding substances is shown by the fact that it often has small pebbles embedded in the surface of the interior. The *scutra* is mentioned by Cato and Plautus, and appears to have been used only in Republican times; its Imperial successor was the *cacabus*. The *trua* or *trulla* was a saucepan with a flat handle; numerous examples in bronze, silver, and earthenware have been preserved, and some have elaborate designs in relief on the handle.

A number of obscure and archaic names of vases are recorded by the etymologists and other writers, especially in regard to those used for sacrificial purposes and libations. The *capis*
or *capedo* was probably a kind of jug (from *capere*, to contain); Cicero refers to the *capedunculae* which were a legacy from Numa. The *praefericulum* was not, as usually supposed in popular archaeology, a jug, but a shallow basin of bronze without handles, like a *patera*. The *lepasta* or *lepesta* (cf. Greek *λεπάστη*) is recorded as used in Sabine temples, and the *fultae* was used in the cult of Vesta for holding water; the *cuturnium* is also mentioned. The *simpulum* and *simpuvium* represent similar utensils, though the words are distinct; they were small-sized ladles used almost exclusively in religious rites, and sometimes regarded as old-fashioned. With reference to the size, *fluctus in simpulo excitare* became a proverbial expression for "a storm in a teacup." They seem to have been usually of metal, but Pliny speaks of fictile *simpula*; the *simpuvium* is represented on coins and sacrificial reliefs. The *laux* appears to have been used for offerings to Bacchus, and the *guttus*, *cymbium*, and other forms also appear in a sacrificial connection; conversely the *patera*, which is for the most part exclusively a libation bowl, was sometimes used for secular purposes; there is evidence that its use as a drinking vessel is older than its use for libations. The last-named corresponds to the Greek *φύλλον* (Vol. I. p. 191), and is constantly referred to or represented; its essential feature was the hollow knub or *omphalos* in the centre, and it was either made of metal or earthenware. The *patella* was also used for libations or for offering first-fruits to the household gods.

Other obscure words referring to vases of secular use are the

2 *De Nat. Door.* iii. 17, 43.

14 See Isid. *Etym.* xx. 5, who suggests a derivation from *patera*, "quod patentes sunt dispensisque labris."
pollubrum (Greek, πολλούβρον) and malluviun (Greek, χέρνυψ), meaning respectively basins for washing the feet and hands; the aquaminarium for washing vessels; the galebba, a variety of the sinus; the pullarius, a vessel used for warm drinks, for must, for preserving grapes, for coals, for fumigating, and as a cupping-glass; and the obba, which Persius describes as sessilis, i.e. squat and flat-bottomed. The culeus, congius, hemina, and sextarius appear to have been measures only, not vases in general use; the congius was one-eighth of an amphora, or six sextarii, about six English pints.

In the case of the majority of the names discussed in the foregoing pages, any attempt at identification with existing forms is hopeless; we have very few clues in the literature to the shapes of the vases described, and little evidence from themselves, as is often the case with Greek shapes; nor is any Roman writer except Isidorus, whose date is too late to be trustworthy, so explicit as Athenaeus. At present little has been done in the way of collecting the different forms of existing vases, but a valuable treatise on the subject was recently issued by the late O. Hölder, a Würtemberg professor, who collected all the forms found in Germany and Italy, and although he did not attempt to identify them by Latin names, he has done much service in grouping them together, classified as urns, jars, jugs, and so on, in a series of twenty-three plates of outline drawings.

There is, in fact, in Roman pottery no clear line of distinction to be drawn between the various forms of drinking-cups or of jugs or dishes, as is the case with Greek vases; different

8 Die Formen der röm. Thongefäße, diesseits und jenseits der Alpen (Stuttgart, 1897). For the forms peculiar to the ornamented wares, reference should be made to Dragendorff's article in Bonner Jahrb. xcvi. pls. 1-3, and Déechellette, Vases de la Gaule Romaine, passim.
forms again are found in different fabrics, and those typical of ornamented wares are not found in plain pottery, and so on. Nor must it be forgotten that in Roman pottery the ornamented wares are the exception rather than the rule. Where the Greeks used painted vases, the Romans used metal; and apart from the plain pottery, the forms are almost limited to a few varieties of cups, bowls, and dishes. Comparisons with the Greek equivalents illustrated in Chapter IV. may give a probable idea of what the Roman meant when he spoke of an *urceus* or an *olla*, but for the rest the modern investigator can do little beyond attempting to point out what types of vases were peculiar to different periods or fabrics, and in most cases any attempt to give specific names can only be regarded as arbitrary.
CHAPTER XXII

ROMAN POTTERY, HISTORICALLY TREATED; ARRETINE WARE

In the present chapter we propose to discuss the origin and character of the finer Roman pottery, or red glazed ware with designs in relief, which is usually known to modern writers under the convenient designation of terra sigillata, a phrase which has already been explained (p. 434). Not only in clay and glaze but in decoration these wares are characteristically Roman; but the question as to the actual centre or centres of their manufacture still admits of some discussion.

Relying principally upon the testimony of Pliny, Martial, and other ancient writers, archaeologists have been accustomed to classify the red ware with reliefs, on a rough system of distinction according to artistic merit, as Arretine, Samian, and "false Samian." The latter term "Samian" has indeed acquired such popularity that it has passed into the language as a conventional term of almost every-day use; but to the scientific investigator it has long been apparent that in point of accuracy it almost stands on a level with that of "Etruscan vase." That of "false Samian" has usually been applied to a certain class of provincial wares, technically inferior to the "Samian." But though both terms may still retain currency in popular language for the sake of convenience, it must not be supposed that they are impressed with the hall-mark of scientific terminology.

Before however we attempt to distinguish the different fabrics
on the basis of recent researches, it may be as well to investigate the statements of the classical writers and weigh the evidence which they afford on the various kinds of pottery in use in Italy under the Roman Empire.

The most valuable information is found in the pages of Pliny, supplemented by Isidorus of Seville, who, writing in the seventh century, probably gives merely second-hand information. The former\(^1\) says: "The majority of mankind use earthenware vessels. Samian ware is commended even at the present day for dinner services; this reputation is also kept up by Arretium in Italy, and for drinking-cups by Surrentum, Hasta, Pollentia, Saguntum in Spain, and Pergamum in Asia. Tralles is also a centre for pottery, and Mutina in Italy . . . . and exportation from the celebrated potteries goes on all over the world." Isidorus, who largely quotes from Pliny, gives the tradition that Samos was the seat of the original invention of pottery, "whence too came Samian vases."\(^2\) He goes on to say that "Arretine vases are so called from Arretium, a town in Italy where they are made, for they are red." But in regard to "Samian ware" he admits that there is another explanation of the term, namely that it is a corruption of Samnia. Herein he is possibly not far from the truth, for we have already seen that the adjacent region of Campania was in the last few centuries of the Republic famous as a centre for relief-wares, and it is possible that the manufacture of such pottery was carried on in the district, as for instance at Putecoli, long afterwards. We also know that Allisae in Samnium was a seat of this industry,\(^3\) and that a special class of pottery was made at Oriculum and at Mevania in Umbria about 200 B.C. (see below, p. 490).

On the other hand there is no doubt that Samos had a reputation for its pottery for many centuries, as is implied by the tradition which Isidorus quotes and by the words of Pliny: "even at the present day it is commended." In a previous chapter it has been suggested that the so-called Megarian bowls, which undoubtedly are a prototype of the Roman wares, represent the Samian pottery of the Hellenistic period; but whether

\(^1\) *H. N.* xxxv. 160 ff.
\(^2\) *Hor. Sat.* ii. 8, 39.
\(^3\) *Etym.* xx. 4, 3.
this is so or not, the most probable conclusion is that the term "Samian" connotes in the first instance a Greek, not a Roman, fabric; that this Greek ware was imported into Italy; and that it became so popular that the term really came into use for native products, just as now-a-days we are able to speak of "China" which has travelled no further than from Worcester, Sèvres, or Dresden. It may thus have become a generic name for table-ware. Plautus mentions Samian ware more than once (see above, p. 456), usually with reference to its brittleness, as in the Menaechmi, where Menaechmus says, "Knock gently!" to which the parasite Peniculus replies: "I suppose you are afraid the doors are Samian." Again in the Bacchides, with a jesting allusion to Samos as the home of one of the two heroines: "Take care, please, that no one handles her carelessly; you know how easily a Samian vase gets broken." In another passage he speaks of a Samiolum poterium. And Tertullian, speaking of Numa's times, says that only Samian vases were as yet in use.

Pliny also mentions Pergamum and Tralles as centres of fabrics, and speaks of the firmitas or toughness of that of Kos, but of these we know nothing further. It has been pointed out by Dragendorff that there was some manufacture of terra sigillata in Asia Minor under the Empire, probably an imitation of the Italian ware, as the examples known present the same characteristics as the provincial wares of Central Europe, and the forms are also those of the Arretine vases. The same writer has shown that there were also manufactures of terra sigillata in Greece itself, in Egypt, and in Southern Russia, which were of similar character.

To return to Italy and its local fabrics. It is not to be supposed that there was any one principal centre, for different towns excelled in their respective wares, and these were imported from one to the other, and especially into Rome. This city was of

\[1\] i. 2, 65.  
\[2\] ii. 2, 22.  
\[3\] Stich. v. 4, 12; cf. Mart. iii. 81, 3; Lucil. op. Non. p. 398; Tibull. ii. 3, 47; Cic. pro Murena, 36, 75; Cornif. Rhet. ad Herenn. iv. 51.  
\[4\] Apol. 25.  
course originally supplied with earthenware by the Etruscans, whose mantle fell on the town of Arretium, but it cannot be doubted that the manufacture of pottery must have been carried on to some extent in Rome itself after the absorption of the Etruscan people. We read that even in Numa’s time there was a Guild of Potters (see p. 372), but it never appears to have excelled in any of the finer wares, and is ignored by Pliny, though we have evidence from other sources. Thus Martial speaks of cadi Vaticani; and Juvenal of fragile dishes from the Vatican hill. Cato says dolia are best bought in Rome, tiles at Venafrum. And the evidence of a pottery in the third and second centuries B.C. on the Esquiline which is given by the find of lamps described in Chapter XX. is supported by Festus.

Pliny, as we have seen, mentions Arretium, Hasta and Pollentia, Mutina and Surrentum with commendation; he also couples the pottery of Hadria with that of Kos for firmitas. He further implies that Arretium kept up the old pre-eminence of the Samian ware, and this is borne out, not only by what we gather from Martial and other writers, but still more by modern discoveries, of which we shall shortly speak in detail. Of the other potteries less is known, but remains have been found at Hasta and Pollentia (Asti and Pollenza in Piedmont) and the figlinae of Velleia in the same region were also well known in antiquity. At Mutina (Modena) remains of a pottery were found (see Vol. I. p. 71), together with vases of Arrette type, and the potter Fortis, whose name so often occurs on lamps (p. 426), appears to have had his workshop here. His stamps are also found on tiles and on pottery of all kinds, even Arretine. Here, too, were found vases of black ware, of “Graeco-Campanian” style, sometimes with stamps impressed from gems, and unglazed red plates stamped with small palmettes like the Greek black-glazed wares (Vol. I. p. 212). Livy

mentions that in 176 B.C. a great destruction took place here of "all kinds of vases, made more for use than for ornament." In their general results the pottery-finds are instructive as showing the transition from black to red wares, which may also be observed in the vases of Popilius and the early Arretine fabrics (see below).

Campania in general seems to have maintained the traditions of the Calene and Etrusco-Campanian fabrics of the third century (Chapter XI.), and there is evidence of manufacture and export in the first century B.C. Horace's table was supplied with *Campana supellex.* Surrentum ware is mentioned by Martial as well as Pliny, and, as indicated in the preceding chapter (p. 462), supplied amphorae of local wine to Pompeii. The pottery of Cumae, which place was at an earlier date an important centre for painted vases (Vol. I. p. 80), is mentioned by Martial. It would also seem to have supplied clay for the vases made at the neighbouring Puteoli, which had no local clay suitable for the purpose, and is not mentioned by ancient writers. The latter has however yielded large numbers of vases of a type closely resembling the Arretine, and a pottery was discovered in 1874, with moulds. Some of the vases have Arretine stamps, which imply importations during the first century B.C., but names of local potters are also known, chief of whom is Numerius Naevius Hilarus, who employed eleven slaves. Q. Pomponius Serenus and L. Valerius Titus are also found here and elsewhere in Southern Italy and at Nismes. Some fragments of this Puteoli ware from various sources are in the British Museum.

Horace speaks of pottery from Allifae in Samnium, and Pliny mentions the popularity of that made at Rhegium and Cumae; this exhausts the list of sites known to us from ancient

writers. In the provinces the only place which had any fame was Saguntum, alluded to by Pliny and more than once by Martial, who speaks of cups (poeula and cymbia) fashioned from Saguntine clay; also of a synthesis septemaria or nest of seven cups, "polished by the potter's coarse tool, of clay turned on the Spanish wheel." But modern researches on the site have not thrown any light on the character of the local fabric (p. 540); it is only at Tarragona that terra sigillata has been found.

The pottery of Arretium is more than once referred to by Martial, who notes that it compared unfavourably with the splendour of crystal vessels, but at the same time begs his hearer not to regard it altogether with contempt, for Porsena was well served with his Tuscan earthenware:

Arretina nimis ne spernas vasa monemus;
Lautus erat Tuscis Porsena fictilibus.

An epigram in the Latin Anthology (259) says:

Arretine calix, mensis decor ante paternis,
Ante manus medici quam bene sanus eras.

Other allusions are less direct. Coming down to more modern times, we actually find mention of the pottery in a manuscript written by Sig. Ristori of Arezzo in 1282, and by C. Villani in his History of the World, written in the fourteenth century. Subsequently Alessi, who lived in the time of Leo X., described the discovery of red ware about a mile from the city, and Vasari tells us that in 1484 his grandfather found in the neighbourhood three vaults of an ancient furnace. Further allusions are found in the writings of Gori (1734) and Rossi (1796); and in 1841 Fabroni published a history of Arretine ware, in which the above facts are recorded. He tells us

7 Storia degli ant. Vasi fatt. aretini, Arezzo, 1841.
that in 1779 potteries were unearthed at Cincelli or Centum Cellae, which contained, besides various implements, part of a potter's wheel, resembling those in vogue at the present day. It was composed of two circular slabs placed round one pivot at an interval from one another, their diameter not being the same. The wheel actually found was of terracotta, about 11 inches in diameter by 3 inches in thickness, with a groove round the edge. It was bound with a leaden tyre, held in place by six cylinders of the same metal, and appears to have been the upper of the two slabs, the "table" on which the clay was placed.\(^1\)

The Arretine ware must be regarded as the Roman pottery par excellence. The term was used anciently in an extended sense for all vases of a certain technique without regard to the place of manufacture, as a piece of evidence from Spain tends to show. Pottery has been found at Tarragona with the inscription, A
TITI
FiguL Arre, A. Titii figul(i) Arre[tini],\(^2\) which has generally been taken to mean a maker of Arretine ware living on the spot, just as now-a-days Wilton or Brussels carpets may be made at Kidderminster.

The general characteristics of the Arretine ware are: (1) the fine local red clay, carefully worked up and baked very hard to a rich coral-colour, or like sealing-wax; (2) the fine red glaze, composed chiefly of silica, iron oxide, and an alkaline substance, which, as we have seen (p. 437), was perhaps borax; (3) the great variety of forms employed, which show in a marked degree the influence of metal-work; (4) the stamps with potter's names, which are almost invariably found. The duration of this pottery seems to have been from about 150 B.C. to the end of the first century of the Empire, at which time pottery in Italy had reached a very degenerate stage, and the height of its success and popularity was during the first century B.C. Analyses of the vases show that practically the same results as to their composition are obtained from different periods.

During the last century these vases have been found in large numbers at Arezzo, and there is now a considerable quantity of them collected in the public museum of that city, as well

\(^1\) See above, p. 438.  
\(^2\) C.I.L. ii. 4970, 519.
as in private collections and the museums of other countries. The official record of Italian excavations contains an account of finds made in 1883, 1884, 1890, 1894, and 1896 on various sites in the city and immediate neighbourhood,¹ and gives the locality of the different potteries,² as well as the names of their owners. The first potter’s name recorded was that of Calidius Strigo by Alessi; it was found in 1492 in the presence of Giovanni de’ Medici, afterwards Leo X. Others were given by Gori, and fuller lists (up to date) by Fabroni in 1841, Gamurrini in 1859, and Marini in 1884.³ At the present day the most complete information on this head may be found in the recently published volume of the Corpus of Latin inscriptions dealing with Etruria,⁴ in which the results of the most recent excavations are incorporated. A large number have also been found at Rome, the names being identical with those found at Arezzo, and the ware consequently imported.⁵ It must be distinguished from the inferior relief wares either of local fabric (see p. 492) or imported from Gaul, Northern Italy, and elsewhere. Names of Arretine potters are also found in large numbers at Modena, Rimini, and other places in Northern Italy, in France, Spain, and elsewhere.

The stamps range in date from the second century B.C. down to the Christian era, but not beyond the first century of the Empire. The oldest of all, it is interesting to note, are found on black-glazed wares similar in character to those from the Esquiline.⁶ The red-glazed ware probably came in about 100 B.C., and the two methods appear to have been for a time contemporaneous. The initials Q. A. F and C. V which occur on early red Arretine wares⁷ are also found on the Esquiline lamps. Next comes the red ware with quadrangular stamps repeated four or five times on the bottom, followed by single quadrangular stamps and those

⁷ C.I.L. xi. 6700, 12, 739.
of varying form, especially some in the shape of a foot, which are not found in the best period at Arretium, and seem to belong only to the time of the Empire. This form of stamp is very common on lamps and plain pottery, and there are many examples of bronze stamps in this shape extant.¹ Those vases which have stamps on the exterior in the midst of the design represent the middle or Augustan period. The older stamps are more deeply impressed in the surface of the vase than the later. On the whole, the palaeographical evidence of the stamps is very slight, and we can only roughly date them between 100 B.C. and 100 A.D.² Dragendorff has, however, noted that the slaves' names are mostly Greek, a detail which helps to establish a terminus post quem, placing them later than 146 B.C.

The Calidius Strigo of whom we have already spoken was a potter of some importance, employing twenty slaves, of whom the names of Protus and Synistor occur most frequently. But he only seems to have made plain table wares without reliefs, examples of which are found in Rome and elsewhere. A potter named Domitius had a workshop on the same spot, but only employed a few slaves. A more important name is that of Publius Cornelius, first found by Ferdinando Rossi in the eighteenth century at Cincelli, together with remains of his workshop; many additional examples were found in 1883 and 1892. He employed no less than forty slaves, of whom the best known are Antiochus, Faustus, Heraclides, Primus, and Rodo. One vase by the last-named has medallions with the head of Augustus and the inscription, AVGVSTVS, which gives the date of the fabric.³ Previous to the discovery of this in 1893 Gamurrini had supposed that Cornelius was one of the colonists placed at Arezzo by Sulla. Many of his vases are found at Rome, and also in Spain and Southern Italy. The vases with CORNELI in a foot-shaped stamp are probably not his. He appears to have acquired the business of two other potters—C. Tellius and C. Cispius.

¹ Cf. B.M. Cat. of Bronzes, Nos. 3043, 3068, 3100, etc.
² Some may be referred to Sulla's time; see Notizie, 1883, p. 269 ff.; 1890, p. 71 ff.
³ Notizie degli Scavi, 1894, p. 49.
Among all the potters' stamps few are commoner than that of M. Perennius, and his wares certainly take the highest rank for their artistic merit. All his relief designs are copied from the best Greek models, as will be seen later. Few of his vases seem to have been exported to Rome, but they are found in Spain and Southern Gaul. The form of the name on the stamps varies greatly, the commonest being M. PERENNI; M. BEREN., M. PERE., and M. PER. are also found, and even M. PE. with the letters joined in a monogram. He employed seventeen slaves, of whom the best known is Tigranes. His name appears as TIGRAN, TIGRA, or TIGR, and always in conjunction with that of Perennius. These two are found on a vase with Achilles and Diomede fighting against Hector, and on three Arretine moulds in the British Museum, the subjects of which are a dance of Maenads, masks of Maenads and Satyrs, and a banquet scene (Plate LXVI. figs. 4, 6). The name of Tigranes appears alone on a fine vase in the Louvre with the apotheosis of Herakles. Another slave, Cerdo, made a vase with the nine Muses, their names being inscribed over them in Greek. A third slave who produced vases of more than average merit was Bargates, whose name is found on a fine vase in the Boston Museum (Fig. 218), the subject of which is the fall of Phaëthon, who lies shattered in pieces on the ground, with Tethys coming to his rescue. Zeus with his thunderbolt and Artemis with her bow have brought about his downfall. Helios is seen collecting his terrified steeds; and the rest of the design is occupied with the transformation of the Heliades into poplars.

The site of Perennius' principal workshop appears to have been in the city itself, close to the church of Sta. Maria in Gradi; but he may also have had a branch manufactory at Cincelli or Centum Cellae. Signor Pasqui notes that his name occurs alone on the interior of plain bowls and dishes. Next

From Philologen.
to these come the copies of Greek models by Cerdo, Pilades, Pilemo, and Nicephorus, followed by Tigranes, and then by Bargates, who also worked for Tigranes when he became a freedman (the stamps being in the form \text{BARGATE M·TIGR}); lastly occur the names of Crescens and Saturninus.

Three Annii had a pottery near the church of San Francesco, and employed over twenty slaves, with both Greek and Roman names; the most important of the three is C. Annius, who made vases with reliefs, as did Lucius, but Sextus only made plain wares. There are also vases stamped ANNI only; they probably belong to the first century B.C. Aulus Titius is found frequently at Arezzo and Rimini, at Lillebonne in France, and, as we have seen, in Spain; his wares also penetrated to Africa and all parts of Italy. He has no names of slaves coupled with his, and his signature appears in the various forms, \textit{A. Titi, A. Titi figul., A. Titi figul. Arret.} He was succeeded by C. Titius Nepos, who had fifteen slaves, and there is also a L. Titius. C. and L. Tettius occur at Rome, but only the latter at Arezzo\(^1\); the word SAMIA, which occurs on his stamps, is more likely to be a proper name than to have any reference to Samian ware. The name of Rasinius, which is associated with more names of slaves than any except P. Cornelius, is found more often at Rome than at Arezzo\(^2\); it also occurs at Pompeii,\(^3\) and at Neuss in Germany, which facts point to the time of Augustus and A.D. 79 as the limits of date. Of the numerous slaves, some were afterwards employed by C. Memmius. There appear to have been at least two representatives of the name, C. Rasinius in the Augustan period, and L. Rasinius Pisanus in the Flavian. The latter Déchelette has shown to be a degenerate Arretine, making imitations of Gaulish ware.\(^4\) L. and C. Petronius are found at Arezzo, together with remains of their potteries, and C. Gavius, who

\(^2\) \textit{C.I.L.} xv. 5496.
\(^3\) \textit{Ibid.} x. 8055, 36.
\(^4\) See \textit{Bonner Jahrb.} cii. p. 119; Déchelette, \textit{Vases de la Gaule Romaine}, i. p. 116. A potter of the same date and character is \textit{SEX·M·F}, found in Etruria.
belongs to the Republican period, at Cincelli. Numerous other potters who are probably Arretine may be found in Ihm's lists; on the other hand, there are stamps found at Rome and in Etruria which cannot have originated from Arretium. Such are Atenio circitor reficiendum curavit; and Faustus Salinar Seriae; those with OF(ficina), such as OF FELICIS, which are found at Rome, but are probably Gaulish; those with fecit or epooi (ἐποιεῖ), with the exception of Venicius fecit hec, from Arezzo; and Atrane, a name found at Vulci, Chiusi, and many other sites in Etruria, but not at Arezzo.

The name usually given in the signatures on the stamps is that of the maker only; sometimes a slave's name is added, either above or below the maker's, or on a separate stamp. The maker's name usually gives the nomen and praenomen, implying a freedman, and when given in full is seen to be in the genitive; the slave's name is usually in the nominative. Four typical varieties are given by the following stamps from the pottery of P. Cornelius, with the name of the slave Potus:

\[
\begin{array}{cccc}
\text{POTVS} & \text{P - CORN} & \text{POTI} & \text{P - CORN} \\
\text{P - COR} & \text{POTVS} & \text{P - CORN} & \text{POTI}
\end{array}
\]

A difficulty sometimes arises in regard to these two-line stamps when the slave's name occurs below that of the master, on account of the frequent abbreviations; for instance, it is not easy to say whether such stamps as A-VIBI or P-CORNELI denote one name or two, for there are certain instances where the master has three names. It is always possible that the name denotes a slave become a freedman, as A. Vibius Diomedes or P. Cornelius Anthus, and in Dr. Dressel's opinion this is the most probable explanation; but the alternative has much in its favour. There are, moreover, stamps such as

FORMS OF SIGNATURE

P. MESEINI or P. CORNELI which, of course, leave no room for doubt. In later examples the praenomen is often omitted, and occasionally the praenomen and cognomen are found without the gentile name; there are also a few instances of female names. An exceptional form of signature is given by CINNA C. L. TITI(orum) S(ervus); occasionally also, as in the example from Spain already quoted, FIGVL(us) ARRE(tinus), or simply ARRETI(nus), are found. Sometimes, again, two potters seem to have been in partnership, as Sura and Philologus, L. Gellius and L. Sempronius (L. GELLI L SEMP), or two firms, as the Umbricii and Vibieni.

The simple quadrangular form of stamp is by far the commonest, and, next to this, an outline of a foot; less frequent forms, and of later date, are the circular, oval, or lunate, and other varieties of marks, such as wreaths, stars, or branches. Dr. Dressel gives no less than eighty-seven types from Rome, of which thirty-three are rectangular with ornamental edges. The forms of the letters are not always an indication of date, but such forms as Ά, Ά for A, ΙΙ for E, and ΙΙ for F betoken an early date. Ligatured letters abound. The names are often written from right to left, or left to right, with separate letters reversed or inverted; or the words are broken up as MVS for Docimus, ANV for Romanus, and so on. The stamps were probably of wood, but some are taken from seal-rings.

The forms of Arretine vases are all, without exception, borrowed from metal originals, and in their contours display the same tendency. But, as compared with the Hellenistic forms they show great simplicity, and almost, as it were, a return to archaism. The vases are for the most part of small size, and indeed the dimensions of the furnaces at Arezzo seem

to indicate that larger vases could not have been baked in them. They are principally cups, bowls, and dishes, the former of hemispherical or cylindrical form and devoid of handles—a characteristic which usually distinguishes Roman from Greek pottery. Some of the moulds for Arretine ware in the British Museum collection appear to have been used for a deep cup with flat base and spreading lip (Plate LXVI. fig. 5), of a type which finds no parallel in Greek shapes, but the hemispherical bowl on a low foot is the prevailing form.

\[ \text{FIG. 219. ARRETINE KRATER WITH THE FOUR SEASONS (BRITISH MUSEUM).} \]

Other shapes are extremely rare, a notable exception being the beautiful krater in the British Museum with figures of the Seasons (Fig. 219), which, although found at Capua, is certainly Arretine in style and technique. The technical methods employed we have already described in the preceding chapter,\(^1\) and there do not appear to have been any variations peculiar to this fabric. Fabroni (p. 37) states that cinerary urns, tiles, lamps, and reliefs were also made in the potteries at Arretium.

\(^1\) See also Köm. Mittl. 1897, p. 286.
The prototypes of the forms we have seen to be the Hellenistic vases of chased metal, for which Alexandria was the principal centre. But, apart from form, it is doubtful whether the Alexandrine toreutic work exercised much influence on the potters of Arretium. For the decoration and subjects they undoubtedly drew their inspiration chiefly from the New-Attic reliefs and the art of Asia Minor, as has been pointed out by more than one recent writer, who have urged that the influence of Alexandria on Roman art has been greatly over-estimated. Dragendorff points out that all the famous chasers known to us were natives of Asia Minor, and thinks that Rhodes was probably the centre of this art. It must also be borne in mind that the second century was the era of collecting works of art in Greece and Asia Minor and conveying them to Rome, so that the examples which were most prominently before the eyes of Italian artists under the later Republic were just these products of Greece and Asia Minor in the Hellenistic Age. Moreover, the Rhodian and Pergamene schools of art were still living when that of Alexandria was dying out under the later Ptolemies. The mixed style of art of the first century B.C. is essentially Roman, produced under the influence of the Greek works then collected in Rome, and does not extend beyond Italy.

But it is also conceivable that its predecessors in the line of ceramic development contributed to produce the ware of Arretium. It recalls in some respects the different Greek relief-wares discussed in Chapter XI., the Calene phialae of the third century, and the so-called Megarian or Homeric bowls, in which some have seen the real "Samian" ware of the Roman writers, dating from the same period. To these succeeded in Hellenic lands the fabrics of Athens, Southern Russia, and Asia Minor, to which allusion has already been made, and which often present similar characteristics to the

---

1 See Hauser's work on the subject, *Neuattische Reliefs*, passim.
Arretine fabrics. Nor must it be forgotten that the earliest Arretine pottery was covered with a black glaze, which may indeed represent a desire to reproduce the effect of metal, but is much more likely to be a direct heritage from the late Greek pottery, which in this respect carried on the tradition of the painted wares. At all events, two main characteristics of Hellenistic pottery have plainly left their mark on Roman fabrics: the disappearance of painting under the influence of relief decoration imitated from metal, and the cessation of the exclusive use of a black varnish.

The transition seems to be partially effected by a small group of vases which have been styled "Italian Megarian bowls" or "Vases of Popilius," after the potter C. Popilius, whose name occurs on many of them. They form a distinct class, dating apparently from the third century B.C., on the testimony of the inscriptions; the form is that of a hemispherical bowl without handle or foot, with very thin walls, and covered with a slip of varying colour—yellow, brown, or black. These bowls, too, are a close imitation of metal-work, especially in the arrangement of the reliefs. The ornament usually consists of long leaves and scrolls radiating from a rosette on the foot and bordered above by bands of wave- or tongue-pattern, scrolls, or garlands; the ground is filled in with stars, shields, and other devices. In the finer examples a frieze of figures is added, with such motives as Erotes, masks, dolphins, and ox-skulls repeated. The bowl of Popilius published by Hartwig is the only one with a definite subject: a fight between Greeks and Barbarians, which is an undoubted reminiscence of the famous mosaic at Pompeii with Alexander at the Issus. Eleven bowls by Popilius are known, two by L. Appius (see Fig. 220), and one each by L. Atinius and L. Quintius. The first-named potter seems to have lived partly at Oriculum, partly at Mevania in Umbria; both he and Appius also made "Calene" ware. These potters were freedmen, as the use of the two names indicates. Their work does not show the fine glaze of the Calene and Arretine fabrics, but is decorative.

1 Röm. Mitth. 1897, p. 40 (Siebourg); böcher, xcvi. p. 37; Milianges d'Arch. 1898, p. 399 (Hartwig); Bonner fahr. 1889, pl. 7, p. 288.
in its effect; each ornamental motive is produced from a separate stamp, and the potter's marks are put on *en barbotine* (see p. 442).

To sum up with Dragendorff, it is clear that a careful study of Hellenistic pottery is necessary for a correct estimate of the Italian and Roman. As in the case of other arts, it proves that the Romans were merely receptive, at best only developing what they received. This development began with the importation of Greek relief-wares with black varnish, especially from Asia Minor, and their imitation at Cales. Then, as in Greece, so in Italy, the search for new forms, colouring, and decoration began and brought about a degenera-

*Fig. 220. "ITALIAN MEGARIAN" BOWL BY L. APPIUS (BRITISH MUSEUM).*

tion of technique. What the Calene vases are to those of Asia Minor, so are the vases of Popilius to the "Megarian" bowls. Finally, the finds in Southern Russia show that even the technique of the red-glazed ware is not an Arretine invention, but was already known to the Greeks, although first brought to perfection in Italy.

We must now return to the Arretine vases and turn our attention to their subjects and decoration, and their place in artistic development. Dragendorff\(^1\) divides them into two classes, including with them the vases of Puteoli, which bear Arretine stamps, and probably only represent a mere off-shoot of the latter potteries, merely differing in the quality of the design and in the absence of many of the best types. These were mostly discovered in 1874, and it is possible that the krater from Capua (p. 488) may also be reckoned as originating from this source.

His first class includes the vases of M. Perennius, which form such a large proportion of the signed Arretine wares. They are characterised by friezes of figures repeated, or of groups of figures all of the same size, sometimes divided by pillars or terminal figures. Ground-ornaments are rare, and the ground under the figures is not indicated as elsewhere. The subjects include Dionysiac scenes, such as dancing Maenads, sacrifices, drinking-scenes, the vintage, or Dionysos in a chariot; Cupids, Muses, and Seasons; Victory sacrificing a bull; Nereids with the weapons of Achilles; Hieroduli or priestesses dancing, with wicker head-dresses; banqueting, erotic, and hunting-scenes. Examples of the latter classes are given on Plate LXVI. The types of the figures, as in the case of the dancing Maenads, are largely derived from the New-Attic reliefs (see above).

In the second class, to which belong the vases of P. Cornelius and those found at Puteoli, a large use of ornament is the most conspicuous feature. The figures are little more than decorative, or form motives of a sculpturesque character, and are not, as in the first class, isocephalous. Naturalistic motives, such as wreaths, are very frequent. Among the types we have

Moulds and Stamp of Arretine Ware, with Casts from the Former
(British Museum)
figures like those in the Nile-scenes on the terracotta mural reliefs (p. 371) and Centaurs derived from Hellenic prototypes.

Throughout there is a remarkable variety, not only of subjects, but of ornaments and methods of composition, features in which the Greek vase-painters at all periods allowed themselves little freedom. The ornamentation, which usually borders the figures above and below, or still oftener occupies the whole surface available for decoration, includes such motives as conventional wreaths and festoons, scrolls of foliage, and egg-and-tongue pattern; a favourite device is the use of columns with spiral shafts, often surmounted by masks, between the figures. But it is often naturalistic as well as conventional, at least in detail, and only in the general effect is it purely ornamental rather than a reproduction of nature.

In the figures derived from the New-Attic reliefs and similar sources, such as metal reliefs on bases, candelabra, etc., the copyist usually shows a strong tendency to archaism; the attitudes of the figures are graceful, but somewhat affected. They seldom represent any particular action or story, but even human figures are merely decorative. Groups of dancing figures are especially favoured, such as Satyrs and Maenads, or the Hieroduli or dancing priestesses, who wear a curious head-dress of wicker-work (calathus)\(^1\); or we see Genii and Cupids crowning altars and lamp-stands, or playing on musical instruments. Throughout the parallelism with the Roman mural reliefs (p. 367 ff.) is most remarkable, whether in the archaizing style, the decorative treatment of human figures, or in the choice of themes: the dancing Maenads and Satyrs, the Hieroduli, Victory sacrificing a bull, or the figures of Seasons. Of the last-named a fine instance is the beautiful krater from Capua, now in the British Museum (Fig. 219), the figures on which are most delicately modelled. A stamp in the same collection from Arezzo has a figure of Spring, which repeats the type of the Capua vase (Plate LXVI, fig. 2: see p. 439).

A somewhat later development, corresponding to the second class described above, seems to draw its inspiration rather from

\(^1\) Cf. Bonner Jahrb. xcvii. p. 58: also a mould in the B.M. (Plate LXVI, fig. 5), and Brit. Mus. Cat. of Terra-cottas, D 646.
the Hellenistic reliefs of naturalistic style, such as Schreiber has published, dating from the third century B.C.1 The figures are no longer stiff, but free and vigorous, and elaborate compositions are attempted, some being perhaps excerpts from large Hellenistic compositions. Realistic landscapes in the Hellenistic style, with rocks and trees, are largely favoured, and the repertory of subjects includes Dionysiac sacrifices and processions, combats of Centaurs and Lapiths, and hunting-scenes. A fragmentary mould in the British Museum is a good example of the latter, only that here the scene is definitely characterised as Alexander the Great at a lion-hunt (Plate LXVI. figs. 1, 3). The king is just slaying a lion, which stands over a man whom it has felled, and Krateros advances to his assistance with an axe. A wreath which adorns the beast's neck seems to indicate that it was an animal specially kept in the royal park for hunting.2 The mould bears the name of M. Perennius.

Dragendorff, in a valuable and illuminating estimate of the Arretine wares,3 points out that they are an example of the tendency, so constantly occurring in classic art, to imitate one substance in another. He is further of opinion that they largely reproduce contemporary originals which illustrate the eclectic art of the Augustan period, instituting a reaction against Hellenistic art and forming in their simple shapes a contrast to the baroque forms of later Hellenistic pottery. The art of the Augustan Age was followed, as Wickhoff has pointed out,4 by a period of impressionism or illusionist style derived from painting, which is, however, completely absent from Arretine and all other pottery of the Roman period. It may, therefore, be fairly assumed that when the impressionist style came into vogue, the art of the Arretine potter had had its day. All subsequent wares with reliefs are essentially provincial, and the origin of their style is uncertain, but it is at all events not derived from any of the contemporary phases of Roman art.

2 Ibid. cliii, p. 103. On the same article the preceding paragraphs are also largely based.
3 See on the subject, *Bonner Jahrb.* xcvi. p. 73.
4 *Roman Art*, Eng. Trans., p. 18 ff.
The vases of the types which we have been describing are not, as has been hinted already, found exclusively at Arezzo. In Italy they are found in all parts, and the stamps of known Arretine potters occur in large numbers in Rome, as also at Cervetri, Chiusi, Vulci, and elsewhere in Etruria, and at Mutina (Modena). They are also found all over Campania, at Capua, Cumae, Pompeii, and Pozzuoli. North of the Alps they occur but rarely, and almost exclusively in Gallia Narbonensis, but we have seen that they are found in Spain, and instances are also recorded from Sardinia, Africa, Greece, Asia Minor, and Cyprus. From these details two conclusions may be drawn, either that there were various centres scattered over the Empire for the manufacture of what was currently known as "Arretine ware," or that an extensive system of exportation went on from one centre, which would naturally be Arretium. Certainly there is no difference either technically or artistically between the Arezzo vases and some of those found in other places, such as Modena or Capua. Either view has something in its favour, and it is doubtful whether the question is yet ripe for solution.

The Arretine ware, as we have seen, steadily degenerated during the first century of the Empire, and at the close of that period had practically come to an end. The question then arises, What took its place in Italy? For it will be seen in the following pages that in discussing the remaining examples of terra sigillata which Roman potters have left us, we have to deal almost entirely with provincial wares, made in Gaul and Germany, and exported largely even into Central and Southern Italy. Not the least striking feature in the history of Roman pottery is the rapid rise of these provincial fabrics, and the reputation which they so speedily acquired even in the more central and more civilised parts of the empire. Yet the manufacture of pottery in Italy cannot have died out entirely

1 See C.I.L. xiv. p. 702.

4 A fine example has been found at Neuss on the Rhine (Bonner Jahrb. ciii. p. 88).
6 Cyprus Mus. Cat. p. 94, No. 2116, Princeps Titi, from Salamis.
by the end of the first century. The plain and unglazed wares for domestic or other ordinary uses, such as the dolia and wine amphorae, of course continued to be made in Italy as elsewhere, and the list of centres given by Pliny, which we have already discussed, clearly shows that in the Flavian epoch several places still preserved a reputation for the manufacture of pottery. On the other hand, we have no evidence that the pottery made in these centres had any other than utilitarian merit, or that it represents what we know as terra sigillata, and it is certainly remarkable that all the ornamental wares found in Italy are either of the Arretine type or else importations from Gaul, with very few exceptions. Lamps and tiles, as we have seen in previous chapters, continued to be made throughout the second and third centuries, but both were essentially utilitarian in their purposes, and the latter, at any rate, lay no claim to artistic distinction. The growing use of metal vases by all but the poorer classes, was also not without its effect on the disappearance of moulded wares in Italy, and a reference thereto may perhaps be traced in Martial's plea for the Arretine pottery (p. 479).

It therefore seems safest to assume that as in the fourth century B.C. the manufacture of painted vases ceased at Athens, but entered on a new era of development in Southern Italy with the migration of Athenian artists to the Hellenic centres of that region, so in the first century after Christ the manufacture of terra sigillata in Italy—as distinguished from plain pottery and other objects such as lamps—gradually died out, owing to the migration of artists and transference of artistic traditions to the rising centres of a new civilisation in the country bordering on the Rhone and the Rhine. It will be our object in the succeeding pages to collect the evidence for the existence and importance of the potteries in these regions, and to show, in short, that they for some time supplied to the whole Roman world all that its representatives were then capable of in the way of artistic and decorative work in pottery. In the following chapter will also be more conveniently discussed the vases of Ateius, Aco, and other potters which represent the transition from the Arretine to the Gaulish fabrics.
CHAPTER XXIII

ROMAN POTTERY (continued); PROVINCIAL FABRICS

Distribution of Roman pottery in Europe—Transition from Arretine to provincial wares—Terra sigillata—Shapes and centres of fabric—Subjects—Potters' stamps—Vases with barbotine decoration—The fabrics of Gaul—St. Rémy—Graufesenque—"Marbled" vases—Vases with inscriptions (Banassac)—Lezoux—Vases with medallions (Southern Gaul)—Fabrics of Germany—Terra sigillata in Britain—Castor ware—Upchurch and New Forest wares—Plain pottery—Mortaria—Conclusion.

1. General Characteristics

The pottery with which we have now to deal is that which was known to an older generation as "Samian ware," ¹ but may now be more appropriately termed Provincial terra sigillata. In regard to its general characteristics, it is distinguished by a fine close-grained red clay, harder than the Arretine, and presenting when broken an edge of light red. The surface is smooth and lustrous, of a brighter yet darker red colour (i.e. less like coral) than that of Arretine ware, but the tone of the red varies with the degree of heat used. The most important feature is the fine red glaze with which it is coated, similar in composition to—though not identical with—that of the Arretine (see the analysis given on p. 436); it is exceedingly thin and transparent, and laid equally over the whole surface, only slightly augmenting the colour of the clay, which resembles that of coral or sealing-wax. The glaze varies in lustre and quality as well as in colour, but as the analyses show, it is produced on the same

principle at all periods and in all fabrics, Italian and provincial. The ornamentation is invariably of a coarser nature than that of Arretine ware, and though it draws its inspiration therefrom, is divided from it by a considerable interval of artistic degeneration; nor is the missing link always easy to trace. This ware is found all over Central Europe, from the Balkan to the Spanish Peninsula, in the forests of Germany, and on the distant shores of Britain, but in greatest abundance and effectiveness in the valleys of the Loire and Rhine, a fact which in itself directs us to look to these districts for the centres of its manufacture. Wherever found, it is in its main characteristics identical, and readily to be distinguished from the local wares with their simple, or entire absence of, ornamentation. The vases are usually of small dimensions, consisting of various types of bowls, cups, and dishes, of which two or three forms are preferred almost to the exclusion of the rest, and they usually bear the stamp of the potter impressed on the inside or outside. The angular and sharp profiles of the various shapes indicate that in nearly all cases they are derived from metal prototypes.

Although this ware is found all over the Roman world, yet by far the greater proportion of the material at hand comes from the Roman sites of Gaul, Germany, and Britain, and evidence points to two—and only two—districts as the principal centres of its manufacture: the valleys of the Loire and the Rhine and their immediate neighbourhood. Even in Italy the material is exceedingly scanty, and much of the pottery found in Rome or Campania can be proved by the potters' stamps to have been imported from Gaul. In Greece the finds of terra sigillata, though covering a wide area, are few and far between, and we are hardly in a position to state whether these are local fabrics or importations. Dragendorff notes \(^1\) that in the museum at Bonn there are fragments from Athens, Eleusis, Rhamnus, Oropos, Epirus, Eretria, Argos, Delos, and Troy, and others in private possession at the same place from Alexandria. In the museum at DIMITZANA in Arcadia there is a vase with Latin stamps, and another without stamp is preserved at Chanak Kalessi on the Dardanelles. Furtwaengler records a few frag-

\(^1\) *Bonner Jahrbücher*, xcvi. p. 82.
ments from Olympia, one with OCU • SALVE, and fragments have also been found at Pergamon. There are a few cups from Cyprus in the Museum at St. Germain-en-Laye, and others at Nicosia. But it must not be forgotten that, as has already been noted (p. 476), there is evidence of manufacture of red relief wares in Greek lands under the Empire, and much of the above-mentioned material may not be able to lay any claim to a Western origin.

For the potteries of Central and Western Europe there is indeed no literary evidence, for, as we have seen (p. 479), Saguntum is the only provincial place of any reputation in antiquity, although modern excavations have not upheld its claim. All the evidence is necessarily derived from excavations, and from finds of moulds and potteries; but by the careful and scientific researches of Von Hefner, Dragendorff, Déchelette, and other investigators on Gaulish and German sites results have been obtained of incalculable value for establishing the provincial centres which during the first century of the Empire inherited the traditions of Arretium. In the succeeding enquiry, therefore, we shall devote our attention almost entirely to the terra sigillata, of which Gaul, Germany, and Britain have yielded such abundant quantities, and after a general consideration of its history and characteristics, shall discuss in detail the peculiarities of separate fabrics.

In his invaluable treatise on terra sigillata—the first comprehensive attempt at a general scientific discussion of the subject which has been contributed—Dragendorff collected a series of over fifty varieties of forms (almost exclusively cups,

2 Cyprus Mus. Cat. p. 93, and index, s.v. Samian.
3 M. Déchelette’s epoch-making work on Roman pottery in Gaul only appeared after this chapter was in type. To make proper use of it would have necessitated practically re-writing the chapter; but I have remodelled it where absolutely essential, and given frequent references to his work in foot-notes, which it is hoped may suffice in some measure. Moreover for some of the fabrics I have had the advantage of his articles previously published in the Revue Archéol. xxxvii. (1901) and the Revue des Études Anciennes, v. (1903), which he has since incorporated in his book.
4 Terra Sigillata, in Bonner Jahrbücher, xcvi. (1895), p. 18 ff.
bowls, and dishes), which embrace all the examples of Arretine and provincial wares with relief-ornamentation. Of these he considers the first fourteen peculiar to the Arretine ware, but there are other vases found both in Italy and the provinces which in form and colour are not distinguishable from the Arretine, and seem to be undoubted examples of early importations. Such vases are found at Andernach, Neuss, and Xanten on the Lower Rhine,\(^1\) bearing the stamps of Ateius, Bassus, Primus, and Xanthus, who are also frequently found in Southern Italy.\(^2\) With regard to the first-named, however, there is evidence to show that he may have worked in Southern Gaul, and the Italian origin of this pottery is not absolutely certain.\(^3\) At

**FIG. 221. GAULISH BOWL (FORM NO. 29); FIRST CENTURY AFTER CHRIST.**

all events, the finds in Germany to which a date in the first century can be given seem to show the adoption of a new form of dish differing from that characteristic of Arezzo\(^4\); this new form is also common at Pompeii (probably as an importation), and is found on the Limes at Saalburg with the stamp BOLLVS FIC. It is usually quite plain, and seems to have lasted down to the end of the third century. Another variety (No. 18) was found at Andernach with a coin of Antonia Augusta, and at Este in Italy with a stamp SERRAE, which belongs to the time of Augustus. From it a later form (No. 31) was developed.

As a general rule these early provincial forms were unornamented, but the two types of bowl or cup which Dragendorff

4 Cf. Dragendorff's Nos. 15-17 (plates 1-2) with Nos. 1-3 (plate 1).
numbers 29 and 30, and which are reproduced in Figs. 221, 222, become the normal form for the provincial relief-wares of the first century. These are not found in the Arretine ware, but occur all through that century, not only in Gaul, but also, for instance, in the castra on the frontier of Germany. The only Arretine form which seems to have prevailed to any extent in the provinces is the krater (Dragendorff's No. 11 = Fig. 219). Other kinds of deep cups with expanding sides (Dragendorff's Nos. 22-27) are found occasionally in Italy and on various sites in Germany, and can be traced from their first appearance in the first century for about a hundred years. Nos. 24 and 25 are found at Xanten (Castra Vetera) with coins of Julius Caesar and Nero, others in the cemetery of Bibracte near Autun, which is known not to be later than the time of Augustus. The general conclusion seems to be that these wares represent a sort of transitional stage between those of Arretium and the indubitably provincial terra sigillata. Towards the end of the first century they are supplanted, notably at Lezoux and in Germany, by the hemispherical bowl (Dragendorff's No. 37 = Fig. 223), which subsequently becomes the only form employed for the moulded wares.

In pursuing his investigation of the provincial fabrics of the first century, Dragendorff begins by discussing various groups of vases found in Germany which seem to represent a period of transition between the Italian-Roman (and the local native)

4 It was deserted about 5 B.C. See Déchelette, i. p. 93.
5 Bonner Jahrb. xcvi. p. 87.
pottery and the provincial *terra sigillata* proper, which is not usually found before the middle of the century. First we have a kind of light-red ware, formerly known as "false Samian," which lacks the strong lustrous sheen of the genuine *terra sigillata*; the tone Hettner considered to be the result of mere polishing, without any glaze or slip.\(^1\) The forms are heavier and coarser, and are not confined, as in the genuine fabric, to deep cups or shallow bowls, but include a sort of beaker or tumbler-shaped cup,\(^2\) and a slim jar with characteristic incised ornament. They are found in the oldest Roman tombs at Andernach, about A.D. 60.\(^3\) Contemporary with this (from Augustus to Vespasian) was a kind of black ware with incised linear ornament, resembling that described under a subsequent heading (p. 515); it bears the same potters' stamps as the light-red ware, and is interesting for its close relation to the older La Tène pottery, showing its origin to be Celtic or Gaulish, not Roman. The centre of fabric for these wares, which are limited in their distribution to the Rhenish provinces, Normandy and Southern Gaul, seems to have been Trier, which place is as nearly as possible the centre of all the sites on which they have been found; it is further evident that both the red and the black were made in the same pottery. Dragendorff styles these fabrics "Belgic," on the ground that

---

\(^2\) *Bonner Jahrb.* lxxxvi. pl. 5, 21, pl.

they are mostly found in the province of Gallia Belgica. It is conceivable that, as that province became organised in the first century, potters from Southern Gaul settled at Trier. A pottery of that epoch has been found there, with remains of black, grey, and light-red ware, and a piece found at Andernach with the stamp DVRO CVAVO shows evidence of having been made at the former place.¹ The potters' stamps include both Roman and non-Roman names. These wares are very rarely found in Britain.²

We now come to the *terra sigillata* fabrics proper, which extend from about A.D. 30 or even earlier to 250, and exhibit a great difference from the earlier fabrics.³ There is no longer any question of Italian manufacture or of unsuccessful provincial imitations of Italian ware, but of a provincial fabric of excellent technique and real artistic individuality. The material for our purpose is supplied by the Gaulish cemeteries and pottery-sites of the Rhone and Allier valleys, the Cevennes, Normandy, and Belgium, by those of the Rhine valley and Southern Germany, and those of Britain. In Northern Gaul this pottery is found with coins ranging from Caligula to Commodus, and in the forts on the German Limes, such as those on the Taunus range and along the Main, the coins extend from Vespasian to Gallienus (A.D. 260), in whose time occupation ceased on the right bank of the Rhine.

In considering the probable centres of fabric we find a remarkable correspondence in the potters' stamps in the most widely-separated localities, indicating a limited number of centres which had a great reputation. Thus, for instance, in comparing lists of stamps found in London with those from Douai in France Roach-Smith noted that no less than three-fourths of the names occurred in both places.⁴ The same investigator, now many years ago, was acute enough to deduce the conclusion

---

¹ For other typical stamps see Dragen-dorff in *Bonner Jahrb.* xxvi. p. 95 ; *ibid.* lxxxvi. p. 164 ff., lxxxix. p. 51 ff.
² *C.I.L.* vii. 1336, 790 is an isolated example of the black ware found in London.
³ *Bonner Jahrb.* xxvi. p. 103 ff.; Dé-chelette, i. p. 64 ff.
from this and other similar evidence that in Britain there was no local manufacture of *terra sigillata*; and he has been justified by more recent researches, based on a much more extensive command of material. The two chief authorities on this subject at the present day, Dr. Dragendorff and M. Déchelette, are agreed in their main conclusions that the centre of this fabric must be sought in Gaul, and since the appearance of the latter’s treatise on the Gaulish potteries, there seems little doubt that it was in the first century at Graufesenque near Rodez in the Cevennes (Condatomagus), in the succeeding period at Lezoux in Auvergne, where extensive remains of potteries have come to light.

Dr. Dragendorff based his arguments on the following facts:

1. The potters’ names are largely Gaulish.
2. Names are found in other parts which are known to be from a Gaulish centre such as Lezoux.
3. Gallic epigraphical peculiarities, such as ꞌ for O, Ꞑ for D, and OV for U, are found in the inscriptions.
4. Even names of an undoubted Latin type, such as Julios and Priscos, end in the Gallic termination -os.
5. Cursive forms such as ꞑ for A, ꞷ for E, ꞹ for F, and ꞹ for L, are frequently found, as also in Gaulish inscriptions of the second century.

That he was working on the right lines has been now shown by M. Déchelette, who has employed as the basis of his researches the more conclusive evidence of discoveries, especially of finds of moulds and remains of potteries. But of this more will be said subsequently.

On the other hand there were two large potteries in Germany, at Rheinzabern, near Speier, and at Westernndorf, in Southern Bavaria, where ornamented vases were undoubtedly made. They were apparently not largely exported, but many of the stamps also occur on the plain wares from these potteries, implying that the ornamental vases must also have been made by the local men. The pottery of Westernndorf begins about the middle of the second century. Dragendorff notes that of

---

1 *Collect. Antiq.* vi. p. 70; *Ill. Rom.*

2 *See Bonner Jahrb.* xxvi. p. 105.*

*Loc. cit.*
all the Gaulish potters' stamps only forty-one have been found in Italy, and many of these only in Cisalpine Gaul, while others are very rare.

In regard to the forms, the chief fact to be noted is that, new shapes and methods of decoration now appear with the growth of the provincial potteries, unknown in Italy, and the earlier bowls and dishes are not found (for instance) at Rheinzabern.\(^1\) One form of dish (No. 32) is new, but another (No. 31) is clearly developed from the Italian type (No. 18). An essentially Gaulish form of deep bowl or cup is No. 33; another with handles (No. 34) is only found at Banassac. The mortaria with spout and pebbles inserted for grinding (see below, p. 551) now first make their appearance, especially in the Limes forts and in Britain. Many of the forms clearly indicate an imitation of metal. Déchelette notes that of the forms given by Dragendorff (Nos. 15-55) about twenty in all are found in Gaul, including the three used for moulded wares (see below, and p. 501).\(^2\) To these he adds sixteen new forms, which he numbers 56 to 71, and for the vases with barbotine or appliqué decoration six more (72-77) must be included in the list.\(^3\)

The next feature to be considered in these vases is the decoration, which is not confined, as in the Italian wares, to reliefs obtained from moulds, but is also produced by ornaments applied to the surface of the vase, either in the form of separate figures or medallions modelled by hand or made from moulds and then attached, or by the method known as en barbotine (see below, pp. 512, 529). Sometimes the decoration takes the form of impressed or incised patterns (p. 515), but these are more characteristic of the commoner wares. For the present we may limit the discussion to vases in which the decoration is produced at the same time in the mould.\(^4\)

Vases of this type exhibit a remarkable monotony of form, being, as already noted, practically confined to two varieties of the bowl or deep cup, one with curved, the other with straight, sides (Forms 29 and 30 = Figs. 221, 222), at least up to the middle

---

1 See *ibid.* p. 110, pl. 2-3, figs. 31-55, for later provincial forms.
2 See his vol. i. p. 29, with plates 2-5.
3 *Ibid.* ii. pls. 1, 2.
4 See *Bonner Jahrb.* xcvi. p. 126 ff.
of the first century. In the latter half of that century these are supplemented by a third variety (Form 37 = Fig. 223), and at the same time a gradual diminution in the sharpness of the outlines, as in the reliefs themselves, becomes apparent. No direct connection with the Arrentine ware can be traced, either in the forms or in the decoration. The potters' stamps are found at first in the interior, as on the plain wares, but subsequently on the exterior, in the middle of the design.

At first there is a general absence of figure subjects, and the designs are purely ornamental, or else animals, such as birds or hares, are introduced as mere decorative elements. An important distinction from the Italian wares should be noted, viz. that in the latter the wreaths or scrolls which play such an important part in the decoration are composed of single detached leaves or flowers, whereas in the provincial wares the whole wreath is modelled in one continuous system, either formed of undulating motives, as at Graufesenque, or of a straight wreath or band of ornaments, as at Lezoux.1 On the other hand the figure compositions are never continuous until the "free" style comes in at Lezoux with the second century, but are broken up by ornaments into metope-like groups. The typical arrangement is that of a wreath between rows of beads or raised dots, with a triple band of hatched lines or "machine-turned" ornament above, and rays or pear-shaped ornaments below, pointing downwards. Sometimes the wreath is duplicated; or the frieze is broken up into metope-like groups of animals bordered by ornament, as in the first-century bowls found in France and Italy, which Déchelette attributes to the potteries of Condatomagus (Graufesenque in the Cevennes).2 With the introduction of the hemispherical bowls (form 37) comes a new system, in which the upper edge is left plain, followed by a band of egg-and-tongue ornament; then comes the main frieze, and below this a simple wreath. This form and method first appear at Lezoux about A.D. 70, and at Rheinzabern with the beginning of the next century. The final stage is reached when the decoration consists of

---
ORNAMENTATION AND SUBJECTS

figures either arranged in medallions and arcades, or freely in friezes, a system which obtains exclusively at Westerndorf, and on the bulk of the *terra sigillata* found in Britain. Along with these changes in arrangement goes a steady artistic degeneration.

As regards the subjects, it may be generally observed that the conceptions are good, but the execution is poor. In many cases they are obviously imitations of well-known works, and it is curious that no Gaulish subjects occur. The types include representations of gods and heroes, warriors and gladiators, hunters and animals. In general they are of Hellenistic origin, and include all such subjects as are characteristic of the art of the period.¹ At first, however, purely decorative motives hold the field, in imitation of the Arretine ware, and it is not until after the disappearance of the latter that figure decoration is found. We have imitations of sculpture, as in the types of Venus bathing or the Diana *à la biche*, and of the Hellenistic reliefs with genre and idyllic subjects, as in the scenes with fowlers or fishermen.² The "new-Attic" reliefs furnish models for types, as in other branches of Roman art (see pp. 368, 489), and Eros, Herakles, and Dionysiac subjects are universally popular.

Among the mythological types Dragendorff has collected the following³: Zeus, Poseidon, Apollo, Hephaistos, Hermes, Aphrodite, Artemis, and Athena; Dionysos, Herakles, Victory, Fortune, and Cupids; Amazons, Giants, sea-monsters, Gryphons and Sphinxes, Pygmies and cranes; Bellerophon, Aktaeon, the rape of the Leukippidae, and Romulus and Remus suckled by the wolf. The gladiatorial subjects closely follow the types of Roman art, and the favourite theme, a combat of two in which one is worsted, resembles a common type on the lamps (p. 416).⁴ Thus, though the style of art is essentially provincial, the subjects draw their inspiration exclusively from classical sources.⁵

---

¹ See generally Déchelette, i. p. 219.
³ An exhaustive list of types, figures, and ornaments of all kinds, as found in the Graufesenque and Lezoux fabrics, is given by Déchelette in his second volume, p. 5 ff.
⁵ See also the useful list given by Von Hefner in *Oberbayr. Archiv*, xxii. (1863), p. 28 ff., giving the chief types on German wares from Westerndorf and elsewhere.
A series of examples from Britain may be noted as covering in their subjects the ground indicated; they are mostly from Roach-Smith's extensive collection, now in the British Museum. They include a vase with figures in separate compartments: Diana, Minerva, Hercules, Bacchus, a man with a cup, and Satyrs and Nymphs; another with Hercules in the Garden of the Hesperides killing the serpent, Diana, warriors, and panels of ornament; a third with Bacchus and a tiger, Luna, and Genii with torches. Others have Apollo with Diana or pursuing Daphne; Diana and Actaeon; copies of statues of Venus (of the Cnidian or Medici type); the labours of Hercules, Bacchanalian orgies and processions, and such deities as Victory, Fortune, Cupids, and Anubis, as well as Satyrs and Fauns, Gryphons, Sphinxes, and Tritons. On the vase of Divixtus illustrated in Plate LXVIII. fig. 2, the subjects are Venus at her toilet, Diana with a stag, and a Silenus carrying a basket of fruit. The subjects from daily life include hunting scenes of various kinds; dogs pursuing stags, boars, or hares; combats of bestiarii with various animals; musicians, and gladiators. Ornamentation of a purely decorative character includes animals and trees, and representations of fruit, flowers, and foliage, either in scrolls or interspersed with other objects. Roach-Smith also gives a curious example from Hartlip in Kent with two separate friezes of figures and the potter's stamp SABINI M; on the upper band are Leda and the swan and a seated goddess with cornucopia; on the lower, Diana with a deer, under a canopy, and Victory crowning a warrior, the various groups being several times repeated. The style is very rude, and though the subjects are classical, the figures and designs are very barbaric, almost mediaeval in appearance.

The terra sigillata fabrics appear to have lasted on down to the end of the fourth century in the provinces, but are by

---

1 See Cat. of London Antiqs. Nos. 158 ff. pl. 8; Ill. Rom. Lond. p. 89 ff.; Collect. Antiq. passim; also Plate LXVIII.
3 Cf. C.I.L. xiii. 10010, 1682.
4 Hence Roach-Smith was inclined to date the vase as late as the fifth century; but recent researches show that this is impossible. Even in the first century vases of this debased style are found. There were two potters of the name of Sabinus in the first century in Gaul (Déchelette, i. p. 297).
that time not only rare, but exceedingly degenerate. Some found at Andernach can be attributed to the reign of Magnus Maximus (A.D. 388), and in others, apart from the style, the costume of the figures resembles that of the fourth century; the potters' stamps by this time have entirely ceased.

The names of potters which, as we have seen, so frequently occur on the provincial wares are nearly all Gaulish in form or origin, and this, it has been noted, is one of the strongest arguments for the Gaulish origin of the pottery. The stamps are usually quadrangular in form, but sometimes circular or oval, or in the form of a human foot; they are depressed in the surface of the vase, but the letters are in relief. There is considerable variation in the form of the letters, which are often cursive (see p. 504), often ligatured, and frequently single letters or whole words are impressed backwards. The names are either in the nominative, with or without F, FEC, FECIT, or in the genitive with OF, OFFIC, etc., M, or MANV; the Gaulish word AVOT for FECIT is also found. It is rare to find a potter with more than one name, and probably few of the Gaulish potters were Roman citizens; on the other hand, there are few undoubted examples of slaves' names. Some groups of names seem to indicate partnerships, such as VRSVS FELIX, PRIMI PATER(nt), SECVND(i) RVFIN(i); in other cases the name of the father is also given, as TORNOS VOCARI F(ilius), VACASATVS BRARIATI F, but it is not impossible that the formula may mean, "Tornos the slave of Vocarius," or, "Vacasatus the slave of Brariatus made (fecit)." In Aquitania stamps occur with FAM(uli) or NEPOTIS added after the name. Some groups of names are peculiar to certain localities, Amabilis, Belsus, Domitianus, Placidus, etc., being found only in Germany; other potters give a hint of their origin, adding to their names ARVE or AR for Arverns, the district of the Arverni, corre-
sponding to the modern Auvergne. Vases are found at Lezoux with the stamp RVtenvs fecit; here the name may be a deliberate intention of the Rutenian potter, to show that the vase was not made locally. The name Disetus, which is found on the Rhine, occurs in Gallia Belgica in the form Diseto, the variety being due either to differences in date or in the place of fabric. Among peculiarities in the stamps may be mentioned an instance, given among those from Britain, where the potter from ignorance or caprice has impressed the stamp of an oculist, intended for a quack ointment, on the bottom of a cup (found in London, and now in the British Museum). It reads: Q. IVL. SENIS. CR | OCOD. AD. ASPR (crocodes, an ointment made from saffron). In 1902 some interesting graffiti were found on pottery at Graufesenque (cf. those given on p. 239), being apparently notes made by the potters, such as VINAR(ia), ACET(abula), TAR(ichos), and so on, as well as the names of the potters and the quantity of the contents in each case. But it is not possible to ascertain the forms corresponding to the names given in graffito.

Some peculiarities of the potters' stamps may be noted among those from Westerndorf and Rheinzabern, in which certain combinations occur on the same vase. Thus at Westerndorf we find:

| COMITIALIS · FE | CSS · EROT |
| COMITIALIS · F | CSS · ER |
| SEDATVS · F | CSS · MAIANVS · F |
| CSS · MAIANVS | CSS · ER |

at Rheinzabern:

| CERIAL · FE | CONSTANT |
| COMITIALIS · FE | IOVENTI |
| | LATINNI |
| | SECVNDAIANI |

1 C. I. L. xiii. 10010, 1670.
3 Déchelette, i. p. 86, pl. 13; Rev. Arch. iii. (1904), p. 75 ff. The names of vessels include the interesting word hannae, whence our "pan."
5 Bonner Jahrb. xxvi. p. 136.
The names Comitialis and Cerialis are found on stamps interspersed among the designs, and therefore made with the vase in the mould, but those with CSS occur on the rim, and were therefore added subsequently. It will be noted from the above examples that the names like Comitialis—Primitivos is another instance—are common to more than one fabric, but those in the second series are peculiar to one; the latter, therefore, refer to the actual potter (figulus), the former to the designer of the decoration (sigillarius), whose moulds were employed in more than one place. It is an interesting parallel to the ἑρακάου and ἐποίησεν of the Greek vases. This conclusion receives additional confirmation from the discovery of certain types of decoration both at Rheinzaben and Westerndorf, showing that there was a system of exchange between the two potteries.\(^1\) The name CSS is only found at Westerndorf, and it has been supposed that it denotes C. Septimius Secundianus, a name which occurs in the neighbourhood. The name of Comitialis is found on a vase from London in the British Museum, presumably imported from Germany.\(^2\)

Representations of potters are not unknown in Gaulish art; and there are also allusions to them in inscriptions. Some are depicted wearing the tunic only, and thereby proclaiming their servile condition; others wear the cloak also, as for instance one Casatus Caratius, fictiliarius, who is represented on a stele at Metz holding a fluted vase like those made in black ware.\(^3\) On another, L. Aurelius Sabinus is represented, with an amphora, olla, and lagena in the background, and an inscription which runs, L. Aurelius Sabinus doliarius fecit sibi et suis.\(^4\) Several inscriptions found in Germany speak of negotiatores artis cretariae, and may be assumed to refer to what we should call "commercial travellers" or "agents" for the sale of the finer wares. In an inscription found at Wiesbaden Secundus Agricola is mentioned in this capacity,
and in another from Dornburg, Secundinus Silvanus, a native of Britain.\(^1\) M. Messius Fortunatus, whose name actually occurs on pottery, is described in inscriptions as being also *pavimentarius* (road-maker) and *paenularius* (cloak-maker).\(^2\)

Apart from the potters' stamps, some interesting inscriptions have been found on the vases from Rottenburg in Germany. There are examples with the names of the consuls for A.D. 237, Didius Caelius Balbinus and M. Clodius Pupienus Maximus (the first year of their reign).\(^3\) Others have the names of the legions stationed in the *colonia* of Sumlocene or Solicinium, which this site represents, with the dates A.D. 169 (LOCEN . A . V . C . MLVI), 248 (C . STI . A . V . C . CDI), and 303, and the names of the twenty-first and twenty-second legions.\(^4\) Incised inscriptions on Roman pottery are common throughout the provinces, as the pages of the *Corpus* indicate, but are more usually found on the plain wares than on the *terra sigillata*. Among the more interesting examples is a vase in the Louvre, of the first century after Christ, on the neck of which is incised *GENIO TVRNACENSIVM, “To the Genius of Turnacum”* (Tournay)\(^5\); another found at Ickleton in Cambridgeshire\(^6\) had *(ex ho)c AMICI BIBVNT, “Friends are they who drink from this”*; a third from Leicester, VERECVND A LVDIA LVCIVS GLADIATOR, supposed to refer to a love-token or present from a gladiator to his mistress.\(^7\) A vase of black ware from Taplow, Bucks, in the British Museum has a Greek inscription.

We next come to the discussion of the vases decorated in the method known as *en barbotine*.\(^8\) This is exceedingly rare in Italy, and it is probable that the vases there found are im-

\(^8\) For the technique of this process see above, p. 442, and Brongniart, *Traité*, i. p. 425.
portations; the process seems to have been invented in Gaul or Germany, and the only parallel thereto in earlier ceramic art is in the method employed for the gilded vases of the fifth and fourth centuries (see Vol. I. p. 210). At its first appearance it occurs on vases of common grey or black unglazed ware, found at Andernach with coins of Claudius and Nero, but by the end of the first century it is also employed on glazed wares, red or black, and even on the enamelled glazed vases of Gallic or German origin. The ornamentation is at first exceedingly simple, consisting of plain leaves, chains of rings, or raised knobs, as on the examples found in Italy; but it developed rapidly, and the patterns become very varied. Its chief merit is that it is essentially a free, not a mechanical method, and some of the specimens from the Rhine and Britain have really effective compositions of animals and interwoven scrolls. Even human figures find a place; but towards the end of its popularity the ornamentation encroaches upon and finally outst the figure subjects, and degeneration is manifested in artificiality and crowding of detail. In the earlier examples there is a marked preference for a slip presenting a contrast of colour to the clay, and we find white used on red and black ware, brown on buff ware (early German vases in the form of human heads), and so on.

In Gaul, barbotine is limited to subsidiary decorative patterns, and is never used for figures as in Germany and Britain (see below and p. 544); it is very common in the North of France. At Lezoux it was employed in the earlier period of that pottery (A.D. 50—100) for simple leaf-patterns, in the later (A.D. 100—260) to complete the decoration of vases with appliqué reliefs (p. 529).

The black glazed wares decorated en barbotine are characteristic of the second century, and extend down to the fourth. The clay is actually red, with thin walls, but is covered with a black or dark-brown varnish, often with a metallic lustre,

---

1 There is an example of this ware from Cologne in the British Museum (Greek and Roman Department), and others at Turin and Trier. Déchelette (ii. p. 309) states that it is found in the first century B.C.

3 Déchelette, ii. p. 309.

which when too much baked turns to red, and thus presents the appearance of *terra sigillata*. The barbotine is either of the same colour as the clay, the varnish being subsequently added *over it*, or composed of white or yellow slip and applied after the varnish. The decoration usually takes the form of leaves or scrolls, or of simple raised knobs; but figures of dogs, hares, and deer are found, and occasionally men.

On the red or *terra sigillata* wares the barbotine process is not found earlier than the middle of the first century; there is none, for instance, at Andernach. It is practically unknown in Italy, and a few fragments from that country in the Louvre and Dresden Museums are probably importations. Moreover, it is confined to forms which only appear with the development of the provincial potteries. The earliest specimens are found with coins of the Flavian epoch at Trier and Xanten; it occurs also in Germany and Britain, and there are examples at Speier from Rheinzabern, but it does not seem to have been made at Westerndorf. The ornamentation is very limited in its scope, and from a strictly artistic point of view it was not really suited for any but simple patterns of leaves (especially those of the ivy or of lanceolate form) or for running animals. Figures of hunters, gladiators, or *bestiarii* are occasionally found. From the very nature of the process no fine details were possible, and all must be executed in long, thin, and soft lines. Sometimes, however, scrolls in barbotine were combined with figures of men and animals made from moulds, as on the Lezoux ware described below (p. 529). Potters’ stamps are rare, but Dragen-dorff gives examples from Cologne, Bonn, and Speier.\(^1\) It has been pointed out by the same authority that the influence of glass technique is strongly marked, not only in the method, which suggests the imitation of threads and lumps of spun glass, but also in the forms, which frequently occur in the provincial glass ware of the period, then rising into prominence.\(^2\)

Examples of British barbotine ware are given on Plate LXIX.

The other method of decoration to which we have alluded, that of indented ornamentation, is undoubtedly an imitation of glass technique, and the forms (flasks and small cups or bowls

---

1. *Bonner Jahrb.* xcvi. p. 120.
without feet or handles, of ovoid or spherical form) are equally characteristic of that material. The decoration consists of linear patterns and sharply-cut ornaments in the shape of an olive or barley-corn, often combined with naturalistic foliage. This ware may be dated by coins between A.D. 100 and 250; there are no examples with potters’ stamps, but it seems to have been made at Lezoux, Trier, and Westerndorf, and exported to Britain and elsewhere.

What may be described as a variety of this technique, but occurring in the red glazed wares, is a method of decoration in rows of linear incised patterns, usually in small rectangular panels of hatched lines. These belong to the time of the decadence of the ceramic industry, i.e. to the fourth century, and are found chiefly in North and East France and Germany, not in Central or Southern Gaul. There are examples from the Department of Marne in the British Museum (Morel Collection). The patterns are made with wooden stamps, not with the usual running wheel. Déchelette thinks the method originated in Germany with the vases of the La Tène period.

In order to elucidate further the development and characteristics of the provincial Roman pottery, it may be found serviceable to turn our attention to the various sites which are known to have been centres of manufacture, or which have yielded pottery in large quantities, and at the same time to indicate the main points of difference between the fabrics of Gaul, Germany, and Britain.

2. THE FABRICS OF GAUL

The pottery of Gaul presenting the closest relationship, both artistically and chronologically, with that of Italy, it will be most convenient to accord it precedence. Hitherto a general survey of the Gaulish fabrics has hardly been possible, as the materials had not been collected and studied as a whole; and such a task was obviously beyond the capacity of any one

1 See for examples Déchelette, ii. pl. 5; p. 93; Oberbayer. Archiv, 1863, pl. 4, Bonner Jahrb. lxxiv. pl. 2, figs. 2-5; fig. 11; and Plate LXIX. fig. 4.
2 Vol. ii., p. 325.
who had not the advantage of a personal acquaintance with the mass of material now available in all parts of France. But since the indispensable and exhaustive work of M. Déchelette has appeared, it has rendered superfluous all the previous literature on this particular subject. This scholar has earned the gratitude of students by his careful study of the pottery excavated on certain sites in Southern France, by means of which much light has been thrown on the Gaulish fabrics of the first century, at the time when the *sigillata* industry was just taking root in Gaul, and had hardly freed itself from Italian influences. In one section of his work he deals with the finds made in 1895—1900 at Saint-Rémy on the Allier, about four miles from Vichy, in another with those of 1901-02 at Graufesenque, near Rodez, in the Cevennes region, and thirdly with the important fabrics of Lezoux. With these and others of more or less importance we shall deal successively in the following pages.

At Saint-Rémy no traces of actual furnaces were found, but fragments of moulds, etc., showed clearly that it was an important centre, not only for pottery, but also for terracotta figures. As a rule little chronological evidence is to be obtained from finds in France owing to the confused and unstratified condition of the remains, or from absence of scientific records; but in the present case we are fortunate in possessing a series of homogeneous types belonging to the earliest period of *sigillata* ware in Gaul; an entire uniformity of clay, technique, form, and decoration shows that they must all belong to one circumscribed epoch, in spite of the absence of coins or other definite evidence. At the same time it has been possible not only to connect them with finds at Mont Beuvray (Bibracte), near Autun, which can be dated not later than 5 B.C., at Ornavasso, on Lago Maggiore (coins of Augustan epoch), and at Andernach (also Augustan, see pp. 502, 533), but also to obtain a clue to their originals and prototypes.

The forms of the vases fall under five clearly-defined heads:

1. p. 41 ff.
2. i. p. 64 ff.
3. i. p. 138 ff.
SAINT-RÉMY FABRIC

a pocusum, or tumbler-shaped vessel, a scyphus with flat-topped handles, a straight-sided open bowl, flasks with or without handles, and of conical form or pear-shaped (see Fig. 224). All the vases are of white clay, with reliefs, but there are no potters' stamps, and the execution is often imperfect; the secret of the red ware seems as yet unknown, but there is evidence that it was gradually substituted for the white, and the typical bowl with sloping sides and continuous scrolls of foliage (Dragendorff's No. 29 = Fig. 221) introduced here as elsewhere. In the Saint-Rémy fabrics this bowl only has a single row of ornament, a tongue-pattern, scrolls, or arcing round the lower part. The general conclusion reached by M. Déchelette is that down to the end of the first century B.C. two kinds of pottery were introduced into Gaul: the Arretine ware, which occurs at Bibracte with the stamps of Annius, Memmius, and Tettius, and a class of small goblets and flasks of yellowish clay which in many respects resemble the Saint-Rémy type. The latter sometimes bear the name of AcO AcAstvs, a potter who appears to have worked in the region of Savoy or Piedmont, and who was inspired by the Arretine technique and style of signature. His ware also occurs in Lombardy at Ornavasso, and at Klagenfurt in Pannonia, where a fragment was found (Fig. 225) with his name and an inscription which runs: "Life is short, hope is frail; come, (the lights) are kindled; let us drink, comrades, while it is light." He certainly belongs to the Augustan epoch, and may be regarded as the immediate inspirer

1 C.I.L. xiii. 10009, 3; Déchelette, i. p. 31 ff.

2 C.I.L. iii. Suppl. 12013, 3; Déchelette, i. p. 34.
of the Saint-Rémy fabrics. Hence about the beginning of the first century of our era it may be inferred that the potters of Saint-Rémy and district began to "exploit" the Italian technique, but following the Gallo-Italic method of Aco rather than the Arretine. The typical decorative motive by which this pottery may be recognised is a kind of arcading, which from having floriated points gradually tends to assume a purely vegetable form. Some of the vases are only ornamented with rows of raised points, and this feature occurs on others with the potters' names L. Sarius Surus and Buccio Norbanus. Figure decoration is found only on the pear-shaped flasks, in the form of

From Déchelette.

FIG. 225. VASE OF ACO (FIRST CENTURY AFTER CHRIST), WITH INSCRIPTION.

animals (Fig. 224) and bearded heads. To the same period belongs a series of vases manufactured at Vichy and Gannat in the same district.¹

The results obtained from Graufesenque in the Department of Aveyron, have been even more remarkable. This place represents the ancient Condatomagus, in the country occupied by the Ruteni, and appears to have been a great centre of the terra sigillata industry. Although it is not mentioned by Pliny, yet there must have been in his time large exports

¹ Déchelette, i. p. 60.
THE POTTERIES OF GRAUFESSENQUE

southwards from this part of Gaul, even as far as Campania. M. Déchelette has shown that it supplied not only Gaul and Italy, but even Africa, Spain, and Britain, to a greater extent than any other centre—that, in fact, from A.D. 50 to 100 it was the seat of the most important pottery in the whole empire.¹

Remains of pottery were first discovered in 1882 by the Abbé Cérès, including a series of moulds, which made it certain that this was a centre of fabric. These discoveries were largely supplemented by further excavations in 1901-02. Among the moulds are those of certain potters which are only found here, and consequently afford satisfactory evidence that such potters can be localised in this region. The potters were not itinerant, nor were the moulds transferred from one pottery to another; but the important central pottery seems to have attracted a group of smaller ones to collect round it, just as we find Cincelli linked to Arezzo (p. 483), and the moulds could be exchanged from one to another within this limited area.

The local pottery of Gaul, which in the first century B.C. had reached a high level,² was interrupted about the time of Augustus by the invasion of Italian methods, by which it was very rapidly Romanised, and Gaul became a mere tributary of Roman industry. At first two kinds of technique were practised—one with a white or yellow clay, as at Saint-Rémy and Bibracte; the other in the ordinary red ware, which appears to have been employed exclusively at Condatomagus and Lezoux, at first following on the lines of the Arretine ware, but subsequently attempting new developments. Artistically it is inferior to the Arretine, but it is much more varied. Besides the terra sigillata proper, or moulded ware with reliefs, which is by far the most numerous, we find in Gaul several other varieties of technique: appliqué medallions, separately moulded and attached with barbotine, in imitation of the Greek metal ἐμβληματα; barbotine decoration; a class of so-called “marbled” vases; and incised decoration of simple

¹ See also Jullian in Revue des Études Anciennes, i. (1899), p. 152.
² Painted vases with Geometrical decoration were widely exported, even to Bohemia; see Rev. Arch. xxvi. (1895), pls. 5, 6, p. 196 ff.; Gaz. Arch. 1881-2, pls. 3-4, p. 17.
linear patterns made with a tool in the moist clay, but with bold and skilful execution. But practically the wares found at Graufesenque are limited to the moulded class, and the others, which will be described subsequently, only became general in the second century, when the Lezoux potteries came to the front and those of Graufesenque were exhausted.

In the *terra sigillata* wares three forms assume marked prominence, those illustrated in Figs. 221-223; they are found in fairly equal proportions, but the earliest form, which we may call for convenience No. 29, has a slight preponderance. We shall see later that similarly the latest form (No. 37) prevails at Lezoux; this form was introduced about A.D. 70. The intermediate No. 30 is found at both, but more frequently at Graufesenque. The only other found in the moulded wares is a bowl on a high stem, which closely follows the type of the Arretine krater seen in Fig. 219; it is therefore either common to Arretium and Condatumagus, or represents a transition from one fabric to the other. Déchelette quotes an instance with the stamp *VOLVS*, which recalls the Arretine potter Volusenus.

About three-fourths of the vases are ornamented, the decoration falling into two categories: (1) an earlier class with ornament only, occurring on the forms 29 and 30 (see Plate LXVII.); (2) a later with figures, such as animals or gladiators, the forms being Nos. 30 and 37. Of the ornamental motives on form 29, there are five principal types: (a) simple winding scrolls; (b) scrolls combined with figures in medallions; (c) scrolls combined with panels of "arrow-head" pattern; (d) bands of semicircles enclosing volutes which terminate in rosettes; (e) figures in metopes. In this form the decoration is almost always in two friezes, a natural consequence of the shape of the vase; the metopes or geometrical compartments only come in with form 37. In the latter form seven successive types of decoration may be distinguished: (a) a transitional system with metopes, derived from the older form; (β) metopes with wavy borders, a

Gaulish Pottery of First Century after Christ
(Graufesenque Fabric)
(British Museum).
diagonal or cruciform pattern often occupying alternate panels (cf. Plate LXVII. fig. 2); (γ) large medallions, often combined with inverted semicircles (chiefly found at Lezoux: cf. Plate LXVIII. fig. 3); (δ) arcing (rare at Graufesenque); (ε) arcing and semicircles combined; (ζ) large foliage-patterns or vine-leaves, often interspersed with animals; (η) friezes of "free" figures (not found at Graufesenque: cf. Plate LXVIII. fig. 1).

In regard to the figure subjects, mythological types are rare, and generally there is not so much variety as at Lezoux. Déchelette reckons 177 different types in all, of which 112 are peculiar to the fabric, whereas no less than 793 are peculiar to Lezoux. Hence, he points out, the origin of any Gaulish vase may be determined from the nature of the types alone. In artistic execution they are unequal, some being copies of popular themes, others of a naïve and unsophisticated character. Gaulish elements are conspicuously absent. Although the difference from the Arretine style is strongly marked, there is yet the same tendency to display the influence of toretic prototypes, and even of the "new Attic" reliefs and the genre types of the Hellenistic period. But others are original and non-classical in style, and there is no homogeneity. Each pottery doubtless had its favourite subjects—a point which may prove of use in determining the separate fabrics. In any case, figure-subjects only prevailed for a short period at Condatomagus, whereas at Lezoux and in Germany they extend over a considerable period. For Gaul did not become Romanised before the reign of Titus; hence the previous absence of mythological themes. The potter Libertus (see below, p. 527), who worked at Lezoux about A.D. 100, stands out as the foremost potter and modeller in Gaul, who, brought up on classical traditions, influenced the whole pottery of the country.

The question of the chronology of these Rutenian fabrics

---

1 See also op. cit. pl. 9, p. 73.
2 See his vol. i. p. 75 for further details.
3 A figure of Artemis is derived from the type given by Hauser, Neuattische Reliefs, pl. 1, fig. 9, for a genre type, cf. the fishermen figured by Déchelette, Rev. des Études Anciens, v. p. 55 (= Vases de la Gaule, ii. p. 91, type No. 556).
depends more upon the results of comparison with other sites than on the internal evidence of the finds. None of this pottery, for instance, is found at Bibracte, which was deserted about the beginning of our era; but at Andernach vases with Rutenian potters' stamps are found with coins ranging from Augustus to Nero. They are also abundant at Xanten, Neuss, and Vechten in Holland. Evidence may also be obtained from the German Limes, where form 29 disappears about A.D. 30. The exportation of Rutenian wares, therefore, began about the reign of Tiberius. Their wide distribution may be traced by a study of the inscriptions in the thirteenth and other volumes of the Latin Corpus.¹ In Britain they are found in London² and at Silchester. Out of thirty-four ornamented vases from the latter site in the Reading Museum, M. Déchelette attributes exactly half to Condatomagus, representing the first century, and the other half to Lezoux, representing the second.³ In Italy this ware is found at Rome and Pompeii, and of the typical Rutenian subjects some twenty have been noted among the terra sigillata in Roman museums. The potters Bassus, Jucundus, Mommo, and others of Rutenian origin are found at Rome, whereas the only one from the Auvergne district there is Albucius⁴; and the same names occur at Pompeii, especially that of Mommo, whose stamps are characteristic.⁵ The latter group of vases, moreover, supply, as in other cases, important evidence for dating the Rutenian vases; they show, not only that Mommo and the others were in full activity before A.D. 79, but that mythological subjects—not found on the Pompeian examples—were only introduced towards the end of the pottery's activity.

Another well-known potter who appears to have worked at Condatomagus is Vitalis, whose signature in full or in the form of vita is well known there. He is also found as far

¹ The list of names given by Déchelette, i. p. 81, will render it possible to trace Rutenian potters on these sites in C.I.L. xiii. part 3, fasc. 1; see also vols. vii. (Britain), x. (Campania), xv. (Rome), etc., and Déchelette, i. p. 105 ff.
² Examples in British and Guildhall Museums.
⁴ Cf. C.I.L. xv. 5059, 5273, 5355; 4945.
afield as Carthage and on the east coast of Spain. This is additional testimony to the extent and quantity of exportations from this centre, and to its position as the most flourishing manufacture in the Roman empire at the time. This popularity it could never have acquired if the fabrics of Arretium, Mutina, and Puteoli had not now reached their decadence; nor, if those of Auvergne, such as Lezoux, or of the Rhenish provinces had been already in full activity, would the Rutenian wares have penetrated into Central Gaul and Germany. M. Déchelette notes as an interesting fact that in some collections of Roman pottery debased wares with Arretine stamps are to be seen, apparently not later than A.D. 80, and evidently imitations of Rutenian ware; these bear the names of L. Rasinius Pisanus and Sex. M. F., of whom mention was made in the last chapter (p. 485). There is no evidence that this pottery was in existence after A.D. 100, and its rapid disappearance is certainly due to the rise of Lezoux, where, as noted below, Rutenian potters' stamps are not uncommon in the first century.

Déchelette has collected forty-three names of Rutenian potters, which are distributed over two hundred and thirty-two vases or fragments known to him. On form 29 the stamps are only found in the interior of the vases, and hence are not found on the moulds, but both were probably made by the same potters. Vases of the other two forms are often unsigned. Of individuals Mommo occurs sixty-three times, Germanus thirty-eight. The same writer points out that the evidence from Graufesenque would overthrow any theory of itinerant potters, if on no other grounds, from the fact that the moulds of a particular potter are only found on the one spot.

A group of vases which must be mentioned here, though a very small one and not strictly belonging to the terra sigillata, is that of the yellow ware with red marbling. It consists of a small group of bowls and dishes with a dull yellow slip covered

C.I.L. ii. 4970, 559 from Tarraco, and the vase published in Rev. Arch. xxxiii. (1898), p. 100, fig. 11, from Carthage.

Vol. i. p. 113.
Op. cit. i. p. 79.
Bonner Jahrb. xcvi. p. 97 ("Marmorung"): see also Déchelette, i. p. 67.
with veins of a red colour, producing a variegated effect. Eight of these were found at Trier, one with the stamp of Primus, and there are a few others in German museums. In Southern Gaul, as at Arles, they are more common, and others have been found at Lyons and Vichy. The British Museum possesses one from Bordighera and three from Arles, and they are also known in Sardinia and Southern Italy; there are two at Naples from Pompeii with the stamp of Primus. The latter fact gives a terminus ante quem for their date, and it is probable that some place in Southern Gaul was the centre of the fabric. Dragendorff suggested Arles, where stamped examples have been found; but Déchelette points out that all the potters' names are Rutenian, and this is conclusive evidence in favour of Graufesenque; in any case we have here an instance of exportation from Gaul into Italy. It is not certain in what manner the marbling has been produced; it is probably an imitation of glass.

Yet another example of a fabric which was imported from Gaul into Italy is to be seen in the pottery of Banassac, a class of vases with inscriptions of a convivial character, with letters in relief encircling the body. The form is that of the hemispherical bowl No. 37, the appearance of which at Pompeii shows that it was developed before A.D. 79. They are found in large numbers in the south of France, especially at Nismes, Orange, Vienne, Montans (Tarn), as well as Banassac; at the latter place fragments have been found on the site of a pottery, showing that they were made there. The most notable example (Fig. 226) was found at Pompeii, and is now in the Naples Museum; it is inscribed HIBE AMICE DE MEO, "Drink, friend, from my (cup)," the letters being separated by leaves, and is of ordinary red terra sigillata ware. Here, again, it is possible to date the fabric in the first century, not later than the reign of Vespasian. On the local specimens are found such sentiments as Gabalibus feliciter, Remis (felici)ter, Sequanis

1 C.I.L. x. 8056, 283. i. p. 120ff.
3 Mus. 'Borb. vii. pl. 29; C.I.L. x. 8056, 4; Déchelette, i. p. 121.
THE BANASSAC FABRIC

feliciter¹; veni ad me amica; bonus puer; bona puella; the two last-named recalling the seaside mugs of the nineteenth century. The convivial inscriptions we shall meet with again in a later fabric from the region of the Rhine (p. 538). Terra sigillata was also made here and at Montans in the Department of Tarn; the decoration is in the form of metopes, denoting the transitional period (about A.D. 70). No potters' names are found on the inscribed vases.

The pottery of Lezoux, in Auvergne, was first carefully studied by the late M. Plicque,² who excavated there on a large scale in 1879 and succeeding years, and obtained as a result of his researches no less than three thousand different potters' names, as well as the substructures of about a hundred and sixty furnaces, forty of which were in good preservation, comprising sixty-six distinct manufactories. About twenty-three more manufactories were traced along the principal roads and the banks of the Dore and Allier. He also found numerous

¹ Déchelette (i. p. 125) notes in these names a direct proof of exportation; they were carried about by the negotiatores or agents (p. 511) to the different regions named.

² Étude de la Céramique Arverno-romaine (1887). M. Déchelette has embodied most of Plicque's researches in his own account of the potteries (i. p. 138 ff.).
remains of tools, potters' wheels, and other apparatus. In addition, he excavated some two hundred tombs containing quantities of pottery, which seemed to imply a general use of it in funeral ceremonies. The potteries here seem to have been already in full working order in the time of Vespasian, and lasted down to about A.D. 260. The earliest date to be obtained from the evidence of coins is about A.D. 70, but the earliest fabrics seem to go back to the time of Claudius; the date of destruction of the site is indicated by coins of Gallienus and Saloninus found among the burnt ruins.

A large proportion of the vases have potters' stamps, but there is no rule about the signatures. In the vases of form 29 the names are in the interior, denoting the masters of the potteries; in the later forms they are on the exterior, having been placed on the inside of the mould before baking, usually among the ornament. The ordinary formula is OF, M, or F, with the name in the genitive. As to the distribution of Lezoux vases, there was, as noted below, little exportation before A.D. 100, but after that time they prevail over Britain and Germany. Déchelette gives ninety-two examples with potters' stamps in Britain, including twenty-one names. A few specimens have been found in North Italy; Paternus occurs at Turin, Albucius at Rome.

Of the moulded or terra sigillata wares twelve different forms are found, of which as elsewhere three prevail to the exclusion of the others. The krater type (Dragendorff's No. 11) is only found in the earliest period, about A.D. 40—50, and as already noted (p. 520) forms 29 and 30 are not so common as at Graufesenque, while form 37, which practically took the place of 29, occurs in great quantities. Déchelette distinguishes three chronological epochs of development, covering respectively the periods A.D. 40—75, 75—100, and 110—260. In the first period the decoration of form 29 develops in the same manner as at Graufesenque; but with this important variation, that the running scroll is replaced by a straight pattern of vine or oak

1 See Déchelette, i, pp. 155, 194 ff. for lists of names, with types used by each and places where found.
2 See Déchelette, i, pls. 4, 5, Nos. 63—71, and p. 149.
Gaulish Pottery found in Britain; Lezoux Fabric; A.D. 70–250 (Brit. Mus.).
leaves, or bands of rosettes or circles. The colour of the glaze is lighter than at Graufesenque, the reliefs more delicately modelled. The potters of this period, all of whom use form 29, are Atepomarus, Coboturus, Danomarius, Iliomarus, and Petrecus. It will be noted that these are all Gaulish names, whereas those at Graufesenque are all Latin.

To the second period (A.D. 75—110) belong the bowls of form 37 with transitional or metope decoration, or in the "free" style, which is employed by Libertus, an important potter of Trajan's reign. Exportations now first begin, and examples are found on the Limes, but generally speaking they are few in number, and while the Rutenian potteries existed the output must have been limited. After the reign of Trajan, however, large numbers were exported to Britain and Germany. The cruciform ornamentation (p. 521) is found on the forms 30 and 37, and a peculiar type of egg- or astragalus-pattern (borrowed from Arretium) is used by Butrio and Libertus. Figure subjects, introduced by Libertus, now become general, especially animals and hunting-scenes (see for an example Plate LXVIII. fig. 1). The typical potters of the period are Butrio, Libertus, Carantinus, Divixtus (Plate LXVIII. fig. 2), Juluccus, Laxtucissa, and Putrius.

The third period (110—260) is represented almost exclusively by the form 37 with decoration in "free" style or large medallions and wreaths; a few examples of form 30 and the olla (Déchelette's No. 68: cf. p. 529) are found. The chief potters' names are Advocatus, Banuus, Catussa, Cinnamus (Plate LXVIII. fig. 3), Doeccus, Lastuca, Paternus, and Servus. Of these, Paternus belongs to the period of the Antonines, and he and Cinnamus, says M. Déchelette, represent the apogee of the prosperity of Lezoux, and of its export commerce. The period of degeneration is marked by the appearance of barbotine decoration and imitations of metal (see below). It is difficult to say exactly when the potteries came to an end, but there is no evidence that terra sigillata was manufactured after the third century, and Plique is probably right in attributing their destruction to the German invaders in the reign of Gallienus.
The wares characteristic of the earlier period include *dolia* of coarse clay and other plain fabrics, as well as the various types of *terra sigillata*. Among the latter are examples of importations from the Graufesenque and Banassac potteries and other places in the Aveyron district, but the majority are of local manufacture. These include, besides the moulded red wares with figured decoration and potters' stamps, orange-red wares, yellow polished wares (often micaceous), and black ware with barbotine ornamentation, on which potters' stamps are not found. *Lezoux* was also a centre for the enamelled glazed wares which have been described in Chapter III. In the later period the red wares are ornamented with figures from moulds, or with barbotine, or have lion's-head spouts (see below). The marbled vases (p. 523) are also found, and in the third century the vases with *applique* reliefs, with incised or hollowed-out ornamentation, or bronzed in imitation of metal, are the prevailing types.\(^1\)

The salient points of difference between the earlier and later fabrics, says Plique, are these. The clay of the earlier is only baked to a small degree of heat and is not vitreous, but is exceedingly porous. It is also frequently full of micaceous particles. Subsequently it becomes more vitreous but less porous; it is more compact and sonorous, free from mica, and more brilliant and lustrous. In the earlier, the forms are artistic and symmetrical, the ornament sober and elegant, remarkable for its taste and simplicity. The figures are enclosed in medallions, and the ornaments consist of rays or rounded leaves, rows of beads, and guilloche-patterns. In the later, the art degenerates, the ornamentation becoming heavy and overcrowded, and the figures are broken up and badly arranged; the forms of the vases, too, become heavier. The principal decorative pattern is the egg-and-tongue round the rim. In the potters' stamps of the two first periods the letters have frequent ligatures and abbreviations; the names are often in the nominative or with *OFFICINA preceding* the name. Later, the letters are coarser and ligatures are rare; the names are usually in the genitive, *followed by M (manu) or OF (facina).*

---

\(^1\) See Plique's summary in his *Étude de la Céramique Arverno-rom.*, p. 10 ff.
The characteristic \( \mathfrak{U} \) for \( \mathfrak{v} \) found in the middle of the second century should be noted.

Among the subsidiary fabrics of Lezoux the most remarkable is that of the vases with appliqué reliefs.\(^1\) They are formed entirely on the wheel, and the decoration is made separately from moulds (p. 440), and attached with barbotine, either in the form of a medallion or with an irregular outline, varying with the figure. Barbotine in many cases is also employed for foliage patterns filling in the background. The usual form is that of a spherical or ovoid vase (Plate LXIX, fig. 2), which may perhaps be termed an olla,\(^2\) with short neck and no handles. It may be noted in passing that such shapes could not conveniently be moulded, hence the variation of form when we pass from terra sigillata to other methods of decoration. In the third century this combined process largely supplanted the moulded wares at Lezoux. The paste and glaze, however, are identical with the terra sigillata. No potters' signatures have been found on these vases, but they occur all over Gaul, including Belgium and Switzerland, and also in Britain. In the British Museum (Romano-British Room) there are two very fine specimens found at Felixstowe in Suffolk, one of which is that given on Plate LXIX. Roach-Smith mentions others from London, York, and Richborough,\(^3\) and they are also known at Évreux in France. A good but imperfect example from Gaul is in the Morel Collection, now in the British Museum, and has figures of Herakles and Maenads. The modelling in some cases is admirable, especially in the Felixstowe vases, and in the London specimens published by Roach-Smith, with masks and figures of Cupid. These vases represent the latest stage of the ceramic industry of Lezoux.

Another class of vases made at this centre which may be mentioned here includes a series of paterae, oinochoae, and trullae (p. 470) with ornamented handles, all obviously made in imitation of metal.\(^4\) Of the paterae there is a good example

\(^3\) Ill. Rom. Lond. pp. 86, 97, pl. 29; Cat. of London Antiqs. pl. 7, fig. 2; Richborough, p. 74.
\(^4\) Déchelette, ii. p. 316.
in the British Museum from the Towneley Collection, ornamented with athletic contests and cock-fights round the edge. M. Déchelette (ii. p. 319) thinks some of the oinochoae made at Vichy may be imitations of the bronze jugs which are found at Pompeii, but many seem to be of a later date.

During the period A.D. 100—400, and especially in the third century, a class of red wares appears at Lezoux in the form of large bowls with spouts in the shape of lions' heads. These were wrongly identified by Plique with the *acrathoros* (p. 464), but they are clearly mortars (*pelves, mortaria*), in which food was ground or cooked, the spout serving the purpose of straining off liquid. The lions' heads are made from moulds and attached with barbotine. Some of these have potters' names. As a class they must be distinguished from the plain *mortaria* of grey or yellow ware described below (p. 551).

With the South of France it is necessary to connect a series of medallions with reliefs, intended for attachment to vases of *terra sigillata* ware. In one or two cases the vases themselves have been preserved, but usually the medallions alone remain; there are also examples of the moulds in which they were made. Nearly all of these have been found in the valley of the Rhone, at Orange or Vienne, the rest in other parts of France, such as Lezoux, along the Rhine, or at Rome (two examples). They were probably made at Vienne; but there was also a fabric in Germany, examples of which occur at Cologne, Trier, and Xanten. The subjects of the reliefs are very varied, ranging from figures of deities to gladiators or even animals; they frequently bear inscriptions, and their date is the third century after Christ.

As long ago as 1873 Froehner published a series from Orange, with such subjects as Apollo, Venus Victrix, Mars and Ilia, a figure of Lugdunum personified, the freeing of Prometheus and the death of Herakles, Dionysos and Ariadne, a bust of

VASES WITH MEDALLIONS

Hermes, a gladiator, a cock and hens, and a bust of the Emperor Geta, the last-named serving as an indication of date for the whole series. Several were inscribed, that with Venus Victrix having CERA FELICIS, which probably refers to the wax in which the figures were first modelled, though some have thought that it represents the Greek κεραφέλις. Another trio from Orange¹ represent respectively:—(1) a chariot race in the circus, with the inscriptions FELICITER, LOGISMUS (a horse's name), and PRASIN(a) t(actio), “the green party”; (2) Fig. 227, a scene from a play, probably the Cycnus, in which Herakles is saying to Ares, the would-be avenger of his son, “(Invicta) virtus nusquam terreri potest,” the god proclaiming “Adesse ultorem nati me credas mei”; in the background, on a raised stage or θεολογείου, are deities; (3) an actor in female costume. There

¹ Gaz. Arch. 1877, pl. 12, p. 66. The second of these has passed into the British Museum (in the Morel Collection). See Fig. 227, and Déchelette, ii. p. 290.
are also three in the Hermitage Museum at Petersburg, of which two represent Poseidon, the third Hermes.\textsuperscript{1} Caylus also gives a representation of a vase with three such medallions, with busts of Pluto and Persephone, Mars and Ilia, and two gladiators.\textsuperscript{2} Where gladiators with names appear it may be assumed that they are portraits of real people, and Déchelette argues from this that the vases were made specially in connection with gladiatorial (or theatrical) performances.

\textbf{FIG. 228. MEDALLION FROM VASE OF SOUTHERN GAUL: ATALANTA AND HIPPOMEDON.}

An interesting group found at Vienne and Vichy\textsuperscript{3} have subjects taken from the Thirteenth Iliad, such as Deiphobos and the Locrian Ajax, or Hector fighting the Achaeans. Among the remaining examples known the most interesting are three from Orange, one of which represents a festival in honour

of Isis, the other two, the victory of Hippomedon over Atalanta (Fig. 228), with an inscription of three lines:

- Respicit ad malum perrnicibus ignea plantis,
  Quae pro dote parat mortem quicumque fugaci
  Velox in cursu cessasset virgine visa.¹

Reference has already been made to a paper by M. Blanchet, in which he gives a list of the sites in Gaul on which pottery appears to have been made (see p. 443). But in the majority of these cases plain wares must have been the only output. Moulded wares, as Déchelette points out, required skill and resource to produce.² In any case, very few types are found on moulded wares which cannot be also associated with Graufesenque or Lezoux, and any made on other sites must have followed the same methods of decoration.³ The places given in Blanchet’s list cover practically the whole extent of France, though the principal centres of activity were always the Aveyron and Allier districts and the Rhône valley. In the neighbourhood of Lezoux, for instance, vases were made at Clermont-Ferrand, Lubié, St-Bonnet, and Thiers. At Nouâtre, Indre-et-Loire, was an important pottery, not yet fully investigated; and others were at Rozier (Lozère), Auch (Gers), Montauban, Luxueil (Haute-Saône), St-Nicholas near Nancy, and Aoste (Isère), where vases of characteristic originality were made.⁴ But it is not likely that any future investigations will displace Graufesenque and Lezoux as the chief centres for Gaulish terra sigillata.

3. THE FABRICS OF GERMANY

In Germany the oldest and one of the most important sites for pottery is Andernach,⁵ between Bonn and Coblenz, where however, it must be borne in mind, there was no local

¹ See also Gas. Arch. 1880, pl. 30, p. 178 for examples from Nismes; Froehner, Coll. Gréau, 1351, 1352; Rev. Arch. xix. (1892), pl. 11, p. 313; Darenberg and Saglio, iii. art. Forma, figs. 3184, 3185; C.I.L. xii. 5687. All previous literature is now superseded by Déchelette’s work (vol. ii. p. 235 ff.).

⁴ Ibid. The form employed is his No. 69.

manufacture; its importance is mainly as a site yielding valuable chronological evidence. The finds extend from the beginning of the first century down to about A.D. 250, the earlier objects finding parallels in cemeteries at Trier and Regensburg which can be similarly dated. Generally speaking, it has been observed that Roman remains begin on the left bank of the Rhine a century earlier than those in the border forts on the Limes, which cover the period from A.D. 100 to 250.

*Terra sigillata* with reliefs is comparatively rare, though, as we have seen, it was at an early period exported from Gaul, and the pottery consists chiefly of ordinary wares, red, grey, and black, usually of good and careful execution, with thin walls. Much of this common pottery may be assumed to be of local manufacture. The characteristic types of the first century are simple jugs of plain ware without slip for funerary or domestic use; vases with white slip (also found at Regensburg); black ware bowls and dishes, sometimes with potters' stamps; black and grey cinerary urns. These forms include small urns and the usual cups and bowls with straight or sloping sides, replaced after A.D. 100 by spherical-bodied jars with narrow necks. The decoration comprises all the varieties we have included in the foregoing survey: barbotine, incised linear patterns, impressed patterns made with the thumb, and raised ornaments such as plain knobs or leaves worked with the hand. In the third century painted decoration is introduced, as in the black ware drinking-vessels with inscriptions described below (p. 537).

At Xanten (Castra Vetera), lower down the Rhine, large quantities of *terra sigillata* have been found, which can be dated by means of coin-finds from the beginning of the first century down to the third. During this period a steady degeneration in the pottery may be observed, although glass fabrics correspondingly improve; in the time of the Antonines the clay is coarse and often artificially coloured with red lead or other ingredients, producing what was formerly known as "false Samian" ware.¹

An exceptionally interesting centre, and in some respects the most important in Germany, is that at Westerndorf on the Inn, between Augsburg and Salzburg, where the coins range from about A.D. 160 to 330. It was first explored in 1807 and as long ago as 1862 the results were carefully investigated and summarised by Von Heßner in a still valuable treatise.\(^1\) The pottery includes *terra sigillata* of the later types, and plain red, yellow, and grey wares, sometimes covered with a non-lustrous grey or reddish slip, or with black varnish, the latter have very thin walls and are baked very hard. The decoration of the *terra sigillata* comprises all the usual types,\(^2\) the forms being also those prevalent elsewhere, with the addition of a covered jar or *pyxis*, but the figures are confined to the cylindrical or hemispherical bowls (Nos. 30 and 37).\(^3\) The plain wares include cinerary urns, deep bowls or jars, with simple ornament, open bowls with impressed patterns, and mortaria.

Of some peculiarities of the potters' stamps we have already spoken (p. 510); they are found in the form of oblongs or human feet, and more rarely in circles, half-moons, or spirals, the letters being both in relief and incised. Trade marks were sometimes used, the potter Sentis, for instance, using a thorn-twig by way of a play on his name. Names are both in the nominative and genitive, with some abbreviated form in the one case of FECIT, in the other of MANVS or OFFICINA.\(^4\) Local names are clearly to be seen in those of Belatullus, Iassus, and Vologesus.

Another important centre of fabric in Germany is Rheinzabern (Tabernae Rhenanae) near Speier, which probably shared with Westerndorf a monopoly of the moulded wares.\(^5\) The pottery found here is mostly in the Speier Museum; it is almost all of form 37, with its typical decoration, and the fabric does not seem to have been established before the second century. The chief potters' names are Belsus, Cerialis, Connertus, Comitialis, Julius, Juvenis, Mammillanus, Primitivus,

\(^2\) A useful summary is given by Von Heßner, p. 28.
\(^3\) Cf. *ibid*. pl. 4, figs. 1-7.
and Reginus. The British Museum possesses moulds for large bowls with free friezes of animals, one with the stamp of Cerialis; there was little export to Gaul, but a considerable amount to Britain. M. Déchelette notes the similarity of the types to those of Lezoux, and suggests that Rheinzabern is an offshoot from the latter pottery. This site has also produced barbotine wares, which bear a remarkable superficial resemblance to that of Castor (see below, p. 544), and have been wrongly identified therewith; but they are not found at Castor, and in point of fact differ widely in artistic merit, being far superior to the British fabric, as has been pointed out by Mr. Haverfield. The ornamentation is a formal and conventional imitation of classical models, whereas the Castor ware is only classical in its elements, and is otherwise barbaric yet unconventional.

It is possible that Trier, and in fact all places mentioned in a preceding chapter (p. 453) as sites of kilns may be regarded as centres of manufacture, though in only a few cases was anything made beyond the ordinary plain wares. Of the latter a useful summary has been made by Koenen, chiefly from the technical point of view, which it may be worth while to recapitulate. He divides the pottery of the Rhine district (which may be taken as typical) into three main classes: the first transitional from the La Tène period to Roman times; the second, native half-baked cinerary urns; the third, Roman pottery, ousting the other two. The first two classes cover the local hand-made wares of grey, brown, or black clay, which are clearly of native make, and like the similar wares of Britain and Gaul hardly come under the heading of Roman pottery, though subsequently they felt its influence. The Roman pottery proper (which can be well studied in the museums of Bonn, Trier, and elsewhere on the Rhine) is divided by Koenen into three periods: Early, Middle, and Late Empire. Roman wares first appear

1 In the Greek and Roman Department, found at Mainz.
2 Déchelette, ii. p. 319.
3 Archæologia, lvii. p. 104.
4 Victoria County Hist. of Northants, p. 211.
with coins of Augustus, and at this period exercise much influence on the La Tène types, producing a sort of mixed style, usually of greyish or black clay with impressed or incised ornament, subsequently replaced by barbotine. The *terra sigillata* is either of the superior deep red variety with sharp outlines and details, which we have seen to emanate from Gaul, or else plain ware of a light red hue ("false Samian"), without ornament. But as Hölder has pointed out, the settlement of the chronology of German pottery (apart from the *sigillata*) is particularly difficult, because we are dealing with a purely utilitarian fabric, which consequently preserved its forms unaltered through a considerable period; moreover, there must have been many local fabrics and little exportation, which makes comparison difficult.

To the German fabrics belong a group of vases with painted inscriptions found on the Lower Rhine, and less frequently in North and East France. They occur in the second century at the Saalburg, and last down to the fourth; large numbers have also been found at Trier, and other examples at Mesnil and Étaples (Gessoriacum) in France. The usual form is that of a round-bellied cup or jar (Fig. 229), with a more or less high stem and plain moulded mouth. Their ornamentation

---

2 *Formen der röm. Thongefässe*, p. 11.
4 Roach-Smith, *Collect. Antiq*. i. pl. 4, p. 3.
is confined to berries, vine-tendrils, and scrolls, at first naturalistic, afterwards becoming conventionalised; but their chief interest lies in the inscriptions, which, like those of the Banassac type described above (p. 524), are of a convivial character. They are painted in bold well-formed capitals, in the same white pigment which is used for the ornamentation; the following examples will serve as specimens:

**AMAS ME, AMO, AMO TE CONDITE.**

**AVE, AVE COPO, AVETE.**

**BELLVS SVA (deo ?).**

**BIBE, BIBATIS, BIBAMVS PIE, BIBE VIVAS, BIBE VIVAS MVLTIS ANNIS.**

To this list must be added a remarkable vase of the same class found at Mainz in 1888,⁷ with the inscription ACCIPE M(e
st)TIE(n)s ET TRADE SODALIS, “Take me when you are thirsty
and pass me on to your comrade.” Above the inscription are
seven busts of deities, Sol, Luna, Mars, Mercury, Jupiter, Venus,
and Saturn, representing the seven days of the week; both the
design and the inscription, however, are incised, not painted.

4. ROMAN POTTERY IN THE NETHERLANDS, SPAIN, AND
BRITAIN

In Holland and Belgium finds of terra sigillata and potters’
stamps are recorded from various sites, such as Arentsburg,
Rossem, Rousse, near Oudenarde, Voorburg, between Utrecht
and Leyden, and Wyk-by-Dursted, and also at Utrecht.⁸ At
Vechten near Utrecht, the ancient Fictio on the road from
Lugdunum (Leiden) to Noviomagus (Nimeguen) finds were
made in 1868 which confirm the activity of the Rutenian
potters in the first century.⁹ These discoveries included coins
extending from the Republican period down to Trajan, and
terra sigillata of the Graufesenque type, with many names of
potters belonging to that region.

In Spain finds have been made on various sites, and there are numerous examples in the museum at Tarragona; at Murviedro, the site of the ancient Saguntum, which, as we have seen, is mentioned by Pliny and Martial as an important centre, various kinds of Roman ware have come to light, some with potters' stamps, but no evidence remains of potteries or of any local manufacture.

In Britain—at least in England—finds of Roman pottery have been so plentiful and so universal that it is difficult to select typical centres for discussion. It must also be borne in mind that, with the exception of the plain wares and a few other fabrics, such as the Castor ware, we have not to deal with local manufactures. A certain quantity of terra sigillata may have been imported from Germany (e.g. from Westerndorf), but by far the greater proportion is from Gaul, as is shown by the potters' names.

We propose in the first place to review briefly the types of terra sigillata which occur in Britain. The bowls of forms 29 and 30, which are found in Germany in the first century, do not occur on the Roman Wall, and we have already seen that they are not later than Hadrian's time; but they are common in the South of Britain, as at London and Colchester. Roach-Smith and other earlier writers have published specimens of these older forms decorated with figures which have been found in London, Bath, York, Caerleon, and elsewhere. The earliest dateable examples of form 37 have been found with coins of Nerva at Churchover in Warwickshire; this type is indeed common all over Britain, and is one of the few varieties of terra sigillata occurring in the North. It is found at South Shields, along the Roman Wall, and in Scotland at Birrens in Dumfriesshire.

6 Vict. County Hist. of Warwickshire, i. p. 230.
by a variety of the same form, with a moulded ridge breaking the outline in the middle; this would seem to be a type which also occurs in Germany during the second and third centuries. Mr. Haverfield states that this form is found at South Shields and in Yorkshire, and is imitated at Silchester. Of the principal subjects on these we have already given some description (p. 508). Finally, there is the wide shallow type, approximating to the mortar or pelvis, the upper part of which forms externally a flat, vertical band, projecting beyond and forming a tangent with the general curve of the bowl; this is usually ornamented with lions' heads in relief. This variety is not earlier than the second century, and is also found in the third; we have already seen that it was made at Lezoux.

It is important to note that all the places mentioned as yielding bowls of forms 29 and 30 were occupied at least as early as A.D. 85, perhaps as early as A.D. 50. But the style of these bowls may have lasted longer; at all events, the varieties are so numerous as to show a development for which some time is required. There is also a distinct development in the plain band round the upper edge of the bowl, which, at first a mere beading, becomes broader and more vertical by degrees. It may, however, be assumed that, as none are found north of York, it disappeared from Britain, as from Gaul and Germany, before A.D. 100.

The ware formerly known as "false Samian" (Dragendorff's hellroth) appears in several varieties. The light red or orange colour is produced by a kind of slip of pounded pottery laid over the surface. Vases of this type, glazed within and without with a thin reddish-brown and somewhat lustrous glaze, occur in London, and a good specimen was found many years ago at Oundle in Northants, but has since disappeared. It was a fine vase, of light-red clay with red-brown glaze, resembling the Gaulish terra sigillata, and had some claim to artistic merit. The subject was Pan holding up a

4 Roach-Smith, Collect. Antiq. iv. pl. 17, p. 63; Victoria, County Hist. of Northants, p. 219.
mask, and three draped figures, and it bore the stamp of the Gaulish potter Libertus (of ·LIBERTI), who, as we have seen, worked at Lezoux.\(^1\) This ware is often coarse, and ornamented externally with rude white scrolls painted in opaque colour,\(^2\) and there is a variety found at Castor, of red glazed ware with a mettaloid lustre, the clay itself varying from white to yellowish-brown or orange.\(^3\) Both shapes and ornaments resemble those of the Castor black ware (see below), and it seems likely that this is actually a local fabric, the difference in colouring being due to the degree of heat employed in the firing.

The number of potters' names found on these wares in Britain is very large, those in the seventh volume of the Latin Corpus amounting to about 1,500.\(^4\) This list, published in 1873, of course superseded all those previously drawn up by the Hon. R. C. Neville, by Roach-Smith, and by Thomas Wright.\(^5\) Roach-Smith, however, performed a useful service in tabulating the list of names found in London along with those from Douai and other sites in France,\(^6\) which went far to prove the Gaulish origin of the British terra sigillata. It is not, therefore, necessary to discuss the potters' names found in Britain in further detail.\(^7\) Besides the potters' stamps, incised inscriptions sometimes occur on the pottery, giving the owner's name or other items of information (see above, p. 512).

To give a detailed account of all the sites in Britain on which Roman pottery has been found would be a task entailing more labour and occupying more space than the results would justify. Not only do the sites cover almost the whole of the country from the Roman Wall to the Isle of Wight, and from Exeter to Norfolk, but the disinterring of the material from miscellaneous and often unscientific records, or from scattered

\(^7\) General reference may also be made to the archaeological journals of the London and provincial societies, and to the volume of the Gentleman's Magazine Library on Romano-British Remains, also for Norfolk, Northants, Hampshire, and other counties, to the respective volumes of the Victoria County History.
and uncatalogued collections, would be a truly gigantic achievement. It should, however, be achieved; but this will only be by co-operation, each county performing its share of the work, as has been done in a few cases. The Society of Antiquaries has issued archaeological surveys of certain counties,¹ which without entering into details tabulate the sites of Roman remains; and it is to be hoped that forthcoming volumes of the *Victoria County History* will do for other counties what those already published have done for Hampshire, Norfolk, Northants, etc. The most representative collections are those of the British Museum and the Guildhall in London, and of the provincial museums at Colchester, Reading, York, and elsewhere.

We now turn to the consideration of the local products of Romano-British potters. Exclusive of the plain unornamented wares which were made in many places, as the numerous remains of kilns show (cf. p. 454), there are only three distinct fabrics to be mentioned. In all of these the ware is black, with or without a glaze, but the style of ornamentation varies.

By far the most important centre, not only for the quantity of pottery it has yielded and the extent of its furnaces, but also for the artistic merit of its products, is that of Castor, in Northamptonshire. Of the numerous traces of furnaces and workshops discovered here, in the neighbouring villages of Wansford, Sibson, Chesterton, and in the Bedford Purlieus, we have already spoken in a previous chapter (p. 444 ff.); it now only remains to discuss the technical and artistic aspects of the pottery.

Artes has recorded that the pieces of pottery found in or near the kilns show great variety of form and style, including the red imitations of *terra sigillata*, pieces ornamented with "machine-turned" patterns,² and dark-coloured ware with reliefs or ornament in white paint. But the characteristic and commonest Castor ware has a white paste coloured by means of a slip with a dark slate-coloured surface; the usual form is that

¹ Cumberland and Westmoreland, Hereford, Hertford, Kent, and Lancashire.
² See Haverfield, in *Vic. County Hist. of Northants*, p. 208, fig. 29.
of a small jar on a stem with plain cylindrical mouth. Some are merely marked with indentations made by the potter's thumb, or with rude patterns laid on the intervening ridges; but others have designs laid on en barbotine in a slip of the same colour as the vase, and others of rarer occurrence are decorated in white paint with conventional foliated patterns, somewhat resembling the Rhenish wares described on p. 537. Haverfield reproduces a fragment of a vase on which are painted in white and yellow a man's head in peaked cap, and an arm holding an axe. The barbotine variety is the most typical, and is by no means confined to this site. It is often found in Central and Eastern England, and even in the Netherlands. One of the finest specimens was found at Colchester in 1853, containing calcined bones, and ornamented with figures over which inscriptions are incised. The subjects, arranged in friezes, include two stags, a hare, and a dog, interspersed with foliations; two men training a dancing-bear, one of whom holds a whip and is protected by armour; and a combat of two gladiators (murmillo and Thrax) of a type familiar to us from Roman lamps (see p. 416). Over the heads of the men with the bear is inscribed, SECVNDVS MARIO; over the gladiators, MEMN(o)NSAC·VIIIIS and VALENTINV·LEGIONIS·XXX, respectively. The meaning of the inscriptions is not quite clear, but the last one certainly seems to allude to games taking place at the post of the thirtyieth legion—i.e. the Lower Rhine. For this and other reasons Mr. Haverfield is of opinion that the vase may have been made in that district and not at Castor, and it is not, of course, impossible that such ware was not confined to Britain. This would, at any rate, explain its presence in the Netherlands. Mr. Arthur Evans has noted the presence of an unfinished piece of Castor ware in a kiln at Littlemore, near Oxford.

Hunting-scenes are also very popular, especially a huntsman

6 But see above, p. 536, and Déchelette, ii. p. 311.
spear a boar, or a hare or deer chased by stags, as on a fine vase found at Water Newton, Hunts, in 1827. A specimen in the British Museum with a race of four-horse chariots is illustrated on Plate LXIX. Roach-Smith gives a remarkable specimen with a mythological subject, that of Herakles and Hesione; the subject is curiously treated, Hesione being chained down with heavy weights. Another interesting but fragmentary vase from Chesterford in Essex has figures of Jupiter, Mars, Mercury, and Venus, and it may be assumed that the complete subject was that of the seven deities represented by the days of the week. Otherwise the potter is content with animals, such as dolphins or fishes, or mere foliations, ivy-wreaths, engrailed lines, and other ornamental patterns.

In regard to the technique of these wares, Artis notes that the indented patterns were made while the vase was “as pliable as it could be taken from the lathe”; for the barbotine the thumb or a rounded instrument was employed. Figures of animals were executed with a kind of skewer on which the slip was placed, a thicker variety being used for certain parts to heighten the relief, and a more delicate instrument for features and other details. No subsequent retouching was possible. The vases were glazed subsequently to the application of the barbotine; on the other hand, the decoration in white paint was made after glazing. The glaze was, as we have seen in Chapter XXI., p. 448, produced by a deposit of carbon, by the process known as “smothering”; it varies in quality, being either dark without any metallic lustre, or with a metalloid polish resembling that produced with black-lead.

The date of the Castor ware is difficult to ascertain, but it must begin fairly early in the Roman period, on account of its affinities with late Celtic pottery. Déchelette (ii. p. 310) would date the ware towards the end of the third century. As has already been pointed out (p. 536), it is only the elements

1 Artis, Durobrivae, pl. 28; Vict. County Hist. of Northants, p. 211, fig. 34: cf. ibid. p. 190 = fig. 18, p. 192 (from Bedford Parkers).
2 Collect. Antiq, iv, pl. 24.
3 Ibid. iv, p. 91: cf. the vase mentioned on p. 539.
of the decoration that are classical; they are treated in a rude, debased manner, with the free unconventional handling characteristic of barbaric art. "They are not an imitation, but a recasting" according to the traditions of late Celtic or Gaulish art,¹ such as is displayed, for instance, in the ancient British and Gallic coinage. The fantastic animals, the treatment of the scrolls, and the dividing ornaments of beading, etc., between the subjects are essentially unclassical. Potters' stamps on this ware are exceedingly rare, an almost isolated instance being CAMARO-F on a vase found at Lincoln.²

Two other local varieties of black ware peculiar to Britain are those known respectively as Upchurch and New Forest ware. Although no remains of kilns have been found in the former district, the pottery is obviously local, and its manufacture appears to have extended along the banks of the Medway from Rainham to Iwade, over what are now marshes, but was then firm ground. The remains consist of a thin finely-moulded bluish-black fabric, with graceful and varied forms, ornamented with groups of small knobs in bands, squares, circles, wavy, intersecting, or zigzag lines, or a characteristic pattern of concentric semi-circles resting on bands of parallel vertical lines (Plate LXIX. fig. 6). This ware has also been found on the Continent, and may either have been exported or else made in other places besides Upchurch; it is probably of quite late date.³

The clay is soft and easily scratched, and is covered with a polish or lustre produced by friction; the composition is fine, and the walls thin and well turned. It varies in tone from greyish, like that of London clay, to a dull black. The vases are mostly small (cups, bottles, jugs, small jars, and occasional mortaria), and some have ribbed sides; the ornamentation is always either in the form of impressed lines or raised patterns made by applying pieces of clay before the vase was baked.

¹ Haverfield, in *Vic. County Hist. of Northants*, p. 212.
³ See on this ware Roach-Smith, *Collect.*
No potters' stamps have come to light, nor is this ware found with coins or other Roman remains. Rough earthenware was also made in the Medway district, of a red, yellow, or stone colour.

The New Forest ware is found in the north-west part of the Forest, between Fordingbridge and Bramshaw. It is sometimes spoken of as "Crockhill ware," from the local name of the site of the furnaces, of which traces were found in 1852. The pottery consists of two varieties, one of thin, hard, slate-coloured ware, with patterns of leaves or grass painted in white (Plate LXIX. fig. 5); these are small jars, averaging six inches in height, sometimes moulded by the potter's thumb into an undulating circumference. There are points of resemblance with the Castor ware. The other variety consists of a thicker ware, with a dull white-yellowish ground and coarse foliated patterns painted in red or brown, usually platters or dishes. It is a rude and inartistic fabric, of obviously native origin and resembling Celtic rather than, any Roman or Italian pottery. It is found on other sites in Hampshire, such as Bitterne (Clausentum), and even as far north as Oxford. The date is probably the third century of our era. With the kilns there were found heaps of potsherds which had been spoiled in the baking and rejected; they were vitrified so as to resemble stoneware, and when again submitted to the action of fire, cracked and split. The glaze with which the local blue clay had been covered was of a dark-red colour and alkaline nature, but had probably been affected by imperfect firing.

5. Plain Roman Wares

The plain unornamented and unglazed Roman pottery which answered to the modern earthenware has usually been considered by writers on the subject in a different category from the glazed and ornamented wares. Although from the very simplicity of its character it defies scientific classification, yet

1 Haverfield, in Vict. County Hist. of Hants, i. p. 326.
it must be remembered that this common ware was not likely to have been exported very far from the place of its origin, and therefore where any differences can be observed in the nature or appearance of the clay, in peculiarities of form or of technique, it is not impossible to establish the existence of a local fabric. But up to the present little has been done except in isolated instances. Certain local wares have been recognised in Britain, as will be noted below, besides the Castor, Upchurch, and New Forest wares, some of which almost come under this heading; and others, again, in Gaul. Similarly in Germany, attempts have been made by Koenen and other writers to classify the plain pottery whether according to form or on other principles (see above, p. 536).

Many years ago a rough but in some respects convenient classification was made by Brongniart on the basis of the colour of the clay employed, which he distinguished under four heads: (1) pale yellow or white wares; (2) red wares, varying to reddish-brown; (3) grey or ash-coloured wares; (4) black wares. In the first division he included the large, often coarse, vases, such as the dolia and amphorae; under the second head Roman ware of the first century, and under the third that of subsequent date; while the fourth class comprised Gallo-Roman and other provincial wares. A somewhat similar system, in some respects even less chronological, was attempted by Buckman, who distinguished brown ware as a separate fabric. The obvious defect of these systems is that they are neither chronological nor according to fabrics, and that their basis is in many respects a purely accidental one; but at the same time they have proved convenient for discussing plain ware which does not admit of much consideration apart from its forms and the general appearance of its composition. And at all events they enable us to discuss examples of certain shapes under one head, inasmuch as the amphorae and dolia are nearly all of the first class, the mortaria or pelves of the third, cups, dishes, and flasks of the second and fourth, and so on.

The yellow ware is distinguished by its coarse clay, of a

1 *Traité*, i. p. 381.
3 *Roman Art in Cirencester*, p. 77.
greyish-white or yellow colour, varying to dirty white, grey, or red. It is to this division that all the larger vases belong, such as those used for storing wine and other commodities or for funerary purposes, and the innumerable fragments of dolia and amphorae which compose the Monte Testaccio at Rome.\footnote{1 C.I.L. xv. p. 560; Ann. dell' Inst. 1878, p. 119ff.} Some of these vases were made on the wheel, but others were modelled by hand and turned from within. Those used in burial were usually of a globular form, or even dolia with the necks and handles broken off, and contained cinerary urns and glass vessels. We also find lagena, trullae (saucepans), and mortaria made in this ware. Another remarkable variety may be described as a kind of olla; its peculiarity is that it is modelled in the form of a human head, much in the same style as the primitive vases of Troy (Vol. I. p. 258). A vase of this type found at Bootham, near Lincoln, had painted on the foot D(e)O MIRCVRIO, "To the god Mercury," in brown letters.\footnote{2 Proc. Soc. Ant. 2nd Ser. iii. (1867), p. 440 (now in B.M.): cf. Aris, Duro- briacæ, pl. 49.} The clay is light yellow, with a slip of the same colour.

A finer variety of this clay, often of a rosy tint, or white and micaceous, was used for making the smaller vases, which are thin and light, and all turned on the wheel.\footnote{3 Brongniart, i. p. 435.} They are sometimes ornamented with bands, lines, hatching, or leaves, slightly indicated in dull ochre, laid on and fired with the vase. Some specimens are covered with a flat white slip, of a more uniform character than that employed on the Athenian vases. In others the clay is largely mixed with grains of quartz. In Britain little jars of a very white clay have sometimes been found, as well as small bottles and dishes, painted inside with patterns in a dull red or brown. They seem to have formed a kind of finer ware for ornamental purposes, as well as for the table.

The second class, that of the red wares, forms by far the largest division of Roman plain pottery, and comprises most of the kinds used for domestic purposes; it is found in all forms and sizes, all over Europe, often covered with a coating or slip, white, black, or red. This class may be considered
to include all varieties of red and reddish-brown ware, but
as a rule the clay varies in colour from pale rose to deep
coral, and in quality from a coarse gritty composition to a
fine compact and homogeneous paste. It is usually without
a glaze, and sometimes the clay is largely micaceous. To
enumerate all the shapes which illustrate this ware is unneces-
sary, but the Romano-British and Morel Collections in the
British Museum—and in fact any representative collection of
Roman pottery—exhibit all the principal varieties, from the
cinerary urn to the so-called "tear-bottle" or unguent vase.
The principal shapes are also illustrated in the treatises of
Hölder and Koenen.

Among sepulchral vases of this ware were the ollae in which
the ashes of slaves were placed in the columbaria at Rome,
tall jars with moulded rims and flat saucer-shaped covers.¹ In
Roman tombs in Gaul and Britain these ollae are usually
placed inside large dolia or amphorae, to protect them from
the weight of the superincumbent earth.² In Britain they
have been found at Lincoln, on the sites of Roman settle-
ments along the Dover Road, at Colchester, and in other
places, and as many as twenty thousand are recorded as
having been found at Bordeaux.³ After the introduction of
Christianity this practice seems to have been abandoned, but
vases of smaller size continued to be placed round the bones
of the dead.

The grey wares were usually made of fine clay, of which
there were two varieties: a sandy loam like that of which
bricks are made on the borders of the chalk formations in
England, and a heavy stone-coloured paste, sonorous when
struck, which has been compared to the clay of modern
Staffordshire ware. The colour of the first-named is light
and its texture brittle, and it was chiefly used for mortaria,
or for cooking-vessels which were exposed to the heat of the
fire. The mortaria resemble modern milk-pans, being
flat, with overlapping edges and a grooved spout opening

¹ See Daremberg and Saglio, s.v. Olla.
² Cf. Wright, Celtæ, Roman, and Saxoni, p. 359 ff.; Archæologia, xii. pl. 14, p. 108;
³ Brongniart, i. p. 437.
in front. They appear to have been used both for cooking, many bearing traces of the action of fire, and for grinding food or other commodities, the latter purpose probably explaining the presence, in the interior of many examples, of small pebbles, or a hard coating of pounded tile, to counteract the effects of trituration. They are usually of a hard coarse texture, but compact and heavy, and their colour varies from pale red to bright yellow or creamy white.

They are frequently stamped with the name of the potter, placed in a square or rectangular panel on the rim and often arranged in two lines. The names are either single, denoting the work of slaves, as Albinus, Brixsa, Catulus, Sollus, and Marinus, or double and occasionally even triple, for the work of freedmen, as Q. Valerius, Sex. Valerius, Q. Averus Veranius, and so on.\(^1\) The example given in Fig. 230 is from Ribchester in Lancashire, and bears the stamp BORIED(us) F(ecit). A mortarium recently dug up in Bow Lane, London, now in the Guildhall Museum, has the name of Averus Veranius with O : GARR : FAC in smaller type between the words, apparently referring to the place of manufacture.\(^2\) One of the commonest names is that of Ripanus Tiberinus, who gives the name of the place where he worked: RIPANVS : TIBER : F : LVGVDV FACT, Ripanus Tiber(inus) f(ecit); Lugudu(ni) fact(um).\(^3\) The potters' names are usually accompanied by the letters of or F. The mortaria vary from seven to twenty-three inches in diameter, and are found in England, France, Germany, and Switzerland. Of the second or heavier variety a curious vase in the form of a human head was found

---

\(^{1}\) See generally _C.I.L._ vii. 1334.  
\(^{3}\) Roach-Smith, _Ill. Rom. Lond._ p. 89; _C.I.L._ vii. 1334, 43.
at Castor; much of the New Forest ware also comes under the same heading, including the small cups with pinched-in sides, some being covered with a slip of micaceous consistency.

Of black ware many varieties have been found in Gaul and Britain, besides the special local wares which have already been described. Some were employed as funerary urns, but the majority are of small size, and in quality they vary from the extremest coarseness to a fine polished clay, producing an effect almost equal to the Greek or Etruscan black wares. The finest specimens of plain black ware are to be seen in the vases with a highly polished surface, presenting a metallic appearance and an olive hue which almost approximates to that of bronze. Examples of this ware are found in Gaul at Lezoux, in Britain at Castor, and elsewhere.

In the first century after Christ a superior kind of black ware seems to have been made in Northern Gaul and Germany, described by Dragendorff as "Belgic black ware." The clay is bluish-grey, with black polished surface produced like that of the bucchero ware by smoke, not like the black glaze of later Roman ware. A similar variety of grey ware exists, but without glaze or polish. The forms of the vases vary very much from the Roman, including a typical high, slim urn and other more squat forms, closely imitating metal; they bear some relation to those of the La Tène period, and are Celtic or Gaulish rather than German. Such ornamentation as they bear is exclusively linear, and never in relief. There is, however, a Roman form of plate which often occurs, and, generally speaking, the fabric may be described as a continuation of pre-Roman pottery influenced by Italy. It is well represented at Xanten and Andernach, but is not found on the Limes, and is rare in Britain; it does not seem to have been made after the beginning of the Flavian epoch, when it was largely superseded by the ordinary Roman black glazed wares.

A special kind of black ware seems to have been made in the

1 Artis, Durobrivae, pl. 49, fig. 1.
3 Cf. Plique, Céramique Arverne-Romaine, pp. 16, 39.
valley of the Rhone, consisting of pots of a coarse, gritty paste with micaceous particles, breaking with a coarse fracture of a dark red colour. They have been mostly found at Vienne, where they seem to have been made. The bottom of the vase is usually impressed with a circular stamp with the potter’s name in late letters, as L-CASSI-O, F(iri)MINVS-F, SEVVO-F, SIMILIS-F (from Aix). The well-known name of Fortis has also been found on black ware from Aix.

In Britain black ware is, as elsewhere, exceedingly common, and a typical group of the smaller varieties is afforded by a series of five found in a sarcophagus at Binsted in Hampshire, now in the British Museum, consisting of two calices, a jar (olla), an acetabulum, and a kind of candlestick. The Upchurch ware largely belongs to this category, and much of the same kind has been found at Weymouth.

Brown ware of a very coarse style is often found with other Roman remains, consisting of amphorae and other vessels for domestic use. Examples of amphorae and jugs with female heads modelled on the necks have been found at Richborough and elsewhere.

At Wroxeter the excavations yielded two new classes of pottery, one consisting of narrow-necked jugs and mortaria, very beautifully made from a white local clay, which has been identified with that found at Broseley in the neighbourhood, nowadays supplying material for the manufacture of tobacco-pipes. The surface is decorated with red and yellow stripes. The other kind is a variety of red ware which has been styled “Romano-Salopian,” made from clay obtained in the Severn valley, and differing from the common Roman ware. It is, however, exceedingly doubtful whether these types should be classed under the heading Roman.

In conclusion, it may be noted that although all provincial

1 C.I.L. xii. 5685, 195, 362, 831, 845; B. M. Cat. of Terracottas, E 145-47 (wrongly included in that volume among tile-stamps).
3 Roach-Smith, Richborough, p. 74;

5 Wright, Uriconium, p. 251. Examples may be seen in the Shrewsbury Museum.
6 Wright, ibid. p. 252, and Celt, Roman, and Saxon, p. 278.
museums contain more or less complete collections of the ordinary plain fabrics, they are for the most part of strictly local origin, and not in themselves sufficient for general study. But since the acquisition of the Morel Collection by the British Museum the student has ample facilities for investigating there not only the fabrics of Britain, but also those of Gaul, of which an exhaustive series is now incorporated in our national collection.

With this review of the ceramic industries of the Roman Empire, we conclude our survey of the pottery of the classical world. We have followed its rise from the rough, almost shapeless products of the Neolithic and earliest Bronze Age, when the potter's wheel was as yet unknown (on classical soil), and decoration was not attempted, or was confined to the rudest kinds of incised patterns. We have traced the development of painted decoration from monochrome to polychrome, from simple patterns to elaborate pictorial compositions, and so to its gradual decay and disappearance under the luxurious and artificial tendencies of the Hellenistic Age, when men were ever seeking for new artistic departures, and a new system of technique arose which finally substituted various forms of decoration in relief for painting. And lastly, we have seen how this new system established itself firmly in the domain of Roman art, until with the gradual decay of artistic taste and under the encroachments of barbarism, it sank into neglect and oblivion. We observe, too, with a melancholy interest, that while other arts, such as architecture, painting, and metal-work, have left some sort of heritage to the later European civilisations, and like the runners in the Greek torch-race

vital lampada tradunt,

this is not so in the case of pottery. This art had, it would seem, completely worn itself out, and had, in fact, returned to the level of its earliest beginnings. The decorative element disappears, and pottery becomes, as in its earliest days, a mere utilitarian industry, the secrets of its former technical achievements irrevocably lost, its ornamentation reduced to the simplest
and roughest kinds of decoration, and its status among the products of human industry once more limited to the mere supplying of one of the humblest of men's needs.

But this was inevitable, and we must perforce be content; for have we not seen, in the course of its rise and fall, a reflection of the whole history of Greek art, from the humble beginnings in which Pausanias descried the touch of something divine which presaged its future greatness? It is unnecessary to recapitulate the manner in which the successive stages of Greek art are mirrored in the pottery, from the first efforts of the Athenian potter down to the eclecticism of the Arretine ware. Let it suffice to say that the object of this work has been twofold: firstly, to show the many-sided interests of the historical study of ancient pottery; secondly, to point out its value to the student of ancient art and mythology; and that it is the modest hope of the writer that this object has been in some measure fulfilled.
