Republic of India.

### FOREWORD

Some of the most significant writing in English on our music in recent times has come from the pen of Swāmī Prajñānānanda. So it is a pleasure to be asked to launch still another volume from him—perhaps his most scholarly and most searching one to date.

Swāmijī's historical study of our music covers a wide range from the earliest historical traces of our music to the present day. At a time when most "historical" studies degenerate into a mixture of pseudo-legendary and mythology with large doses of sentimentality and platitudes, his scholarly approach is like a breath of fresh air.

He starts with the Nāradīśikṣā and the Nāṭyaśāstra and ends with Rabindra-Sangīt and Rabindranāth Tagore's own theories. And apart from detailed analysis of every text that matters, he explores practically every relevant field—ancient musical instruments, the nature of orchestra and the chorus in ancient India, the Sapta-tantrī-Veenā in the Buddhist Caves, the concept of Rāga, Aryan and non-Aryan theories, the origin and development of Dhruvapada, of the Kheyāl. He examines the close relationship that exists between Music and Dance and has some revealing things to say about acoustics, aesthetics, the psychology and philosophy of music, iconography.

There are, naturally, areas where he is completely at home and areas where he gropes a little. No one person could be the complete master of the entire situation.

Where I feel he is happiest and most authoritative is when he examines early texts and authorities in detail. Swāmijī is one of those rare beings in India who has both the requisite musicianship and the scholarship for such a task. He has the critical and discriminating eye of the scholar who does not miss any relevant point and the artiste's appreciation of the finer aesthetic implication of such points. His commentaries on the early texts are thus like those of a poet and a musician and illuminating in a very special way.

By the very nature of his vocation in life he is also intimately familiar with such epics as the Rāmāyaṇa and Mahābhārata, not to mention the Purāṇas all of which contain material without which our knowledge of those early days of ritual and music-making would be incomplete.

There are two ways of approaching an art like Indian music. There is the cold analytical approach of the research worker like Curt Sachs or Marcel Dubois which has its value. There is also the approach of the scholar who is steeped in tradition for whom everything has a deep significance at various levels. History, as traditionally understood, enables one to place every artistic activity in the perspective of contemporary life and thought. Swāmijī belongs to the latter category, but is not unware of the value of the former.

There is an excellent and comprehensive Bibliography. There are a number of Appendices on topics which are important but do not fall strictly within the scope of the main subject.

Altogether, the present book seems to be one of the most important contributions to the study and understanding of our music and I commend it wholeheartedly to the reader.

Sangeet Nāṭak Akademi, Nārāyaṇa Menon New Delhi. (Dr. V. K. Nārāyaṇa Menon) 16th December, 1964.

# PREFACE

Though I was nurtured in an atmosphere of music and received impetus and inspiration in the culture of music from my family tradition and afterwards learnt classicalmusic from many reputed teachers, including my elder brother, Shri Panch Kari Banerjee of Prasadpur (Hooghly), yet I admit, in all humility, that I received real inspiration in music form my revered Master, Srimat Swami Abhedanandajī Mahārāj, the direct disciple Rāmakrishna Paramahansa Dev and the spiritual brother of Srimat Swami Vivekananda. I came in touch with Swāmī Abhedānanda in 1924, and took initiation in Sannyasa and joined the Ramakrishna Order in 1927. I learnt classical music, specially dbruvapada (dbrupad) from different teachers like Nikunja Bihari Dutt (of Sibput, Howrah), the direct disciple of Sangitaratnakara Aghore Nath Chakravurty (of Harinabhi, 24 Parganas), Sangītanāyaka Gopeśwara Banerjee (of Bishnupur, Bānkurā), Sangītāchārya Harinārāyana Mukhopādhyāya (of Devnāthpura, Varanasi) and others for a pretty long year. I also took training from Jaanendra Prasad Goswami. (of Bishnupur) in dhruvapada and kheyal.

I consider music as a spiritual sādhanā and as a better means to rouse the real aesthetic sense and spirituality in man. My spiritual teacher, Swamī Abhedānanda used to tell me many a time that music is the best medium that leads sincere seekers after truth to Divine knowledge (Brahmajñāna). I try to follow the deep significance of his words, and I believe that practice as well as true knowledge of music lead mankind to the life divine.

I have dealt with various problems of the Naradisiksa and the Natyasastra, the evolution of ancient musical instruments of India, the concept of raga, orchestra and chorus, the classical prabandhas like dhruvapada and kheyal or khyāl, different music-types of Bengal and their evolution, different types of dance, etc. in this book. Besides, I have striven to solve some problems of acoustic science, iconography, aesthetic-cum-psychological as well as philosophical aspects of Indian music. I have also shown that philosophy of music is mainly concerned with the theory of sound i.e. dhuani or sphota, which is the basic and essential part of both Eastern and Western music. I am aware that many of the students and teachers of music are not ordinarily accustomed to take keen interest in the psychological and philosophical aspects of music, and yet it is understood that there are students and teachers, who are really serious and critical in their approach towards the culture of genuine and traditional form of music, and as such I have ventured to deal with this difficult task of discussing briefly the psychology and philosophy of music.

Further I would like to add that though many of the subjects, dealt with in the present book, were discussed before in my previous books, yet I can assure the readers that I have thrown new light upon those subjects and have discussed some new problems which were not handled in my previous works. In the last chapter of the book, I have discussed about the main problems of the prime aim and object of music, and have pointedly shown that the realization of one's Self is the prime object of music, and by means of music it is possible for all to achieve that state which enables them to remove the nescience or ajñāna and to enjoy everlasting peace and blessedness in their mundane life.

In this historical study of music, I have maintained throughout the book that until and unless music is viewed in its historical perspective, it will be futile to solve its various problems. In connection with the ancient musical instruments of India, I have mainly dealt with the evolution of veena, venu and puskara in the chapter IV. It is a fact that not only the musical instruments, but also all the ingredients of music should properly be investigated with historical perspective. Well has it been said by Dr. B. C. Deva that in order to trace the history of any instrument "we have to rely upon the following: (1) References in musical texts; (2) References in the general literature on people; (3) Paintings, sculptures. These (paintings, sculptures) are not always reliable, as the depiction is often stylized and true to life). \* \*; (4) Epigraphic references; (5) Folk-lore and mythology, often scantily dismissed, but yielding fruitful clues on careful study" (Cf. his article on the Mukhavīnā in the Sur-Sringer journal, vol. 2, Octo., 1964, No. 2).

Dr. Deva is of opinion that though venu, the flute, is old as the Vedas, yet the mukhavīnā family, comprising the mukhavīnā, nāgaswara, ottu, shehnāi sundari is definitely of later origin. "Mukhavīnā, a smaller variety of nāgaswara", he says, "is referred to in Telugu poet Pālkurki Somanātha's work, who lived in the 12th-13th century. Nāgaswara is referred to in Telugu poet Skandapurāna, Srīnātha's Kridābhiraman of the 14th century and Ahobala's Sangeet-pārijāta (17th century). \* The shehnāi is usually taken to be an imported instrument from the Middle-East. Its Persian name is said to be surnā, changed to sanāyi in India. The older Mongolian variety, traced to India, is also called suru-nāi. While the author of the Sangeetsāra

mentions an instrument, sunāri very much like a shehnāi, this perhaps the same as sundari, a diminutive shehnāi of Mahārāṣṭra" (Cf. the article, Mukhavīṇā).

In the chapter V, I have tried to prove that orchestra and chorus were in vogue in ancient India even before the beginning of the Christian era. In the 2nd century A.D., Bharata has mentioned and described about the form of Indian orchestra, named kutapa in the Natyaśāstra, and after him, Abhinavagupta and Sārangdeva have made them explicit. I have given genuine evidences of the orchestras which are depicted in different Cave-temples of India. As in ancient India, orchestras, constructed out of different musical instruments, were in practice to accompany dance and music, so they were in practice in different ancient countries like Mesopotamia, Chaldea, Assyria, Greece, Rome, Italy, Persia, Arabia, etc. Dr Farmer has stated in the book, A New Oxford History of Music, vol. I (1957) that the historians, musicologists and archaeologists are of opinion that 3000 years before the Christian era at least, ancient Mesopotamia had numerous musical instruments, and the Mesopotamians were the master of them. In fact, the musical instruments used to play an important role in ancient Mesopotamia. Similarly in Assyria and oldest Sumeria, musical instruments played an important part in their social life, and it is evident from the art remains, preserved in the British Museum.

Dr. Farmer has said that from the time of Ashurnasir-pal III (c 883-859 B.C.), we get ample lithographic materials of music and musical instruments. The British Museum bas-reliefs also illustrate the artistic interests of Ashur-bāni-pal (668-626 B.C). In the book of Daniel (iii), written in the second century B.C. the orchestra of

the Chaldecan King Nebuchudnezzar (604-562 B.C.) has been mentioned, and that orchestra was formed out of the combination of musical instruments like horn ('qarnā), pipe (masrōqītbā), kithara (qīthror), trigonal lower-chested harp (sabbeka) and upper-chested concord harp (psantrīn ṣūnifouyāb). The Mesopotamian court minstrelsy, even in later Archaemenid days, "was usually conceived on a grandiose scale. With the Assyrians the position of the court ministrel was a high one, as his apparel and situation often denote. The singing girls were the later Arabian qaināt, a term used to denote both female musicians and attendants, and the cognate Akkadian word, kināt (female attendants), had probably the other meaning also".

Regarding the musical instruments of Mesopotamia, the historians, musicologists and archaeologists are of opinion that 3000 years before the Christian era at least, ancient Mesopotamia had numerous instruments of music, "not only of a most varied character, but of a very high and advanced degree of construction, as the harps and ketharas of Sumerian days alone eloquently testify". In the chapter VIII of this book, I have dealt with the historical evolution of some regional and foreign melody-types or ragas, and their incorporation into the stock of classical music, so as to enlarge and enrich the domain of Indian music. In chapter IX, I have discussed about historical evolution of the prabandha type of dbruvapada-giti, advancing evidences from ancient Sanskrit treatises. In the same way, the evolution and problem of kheyāl or khyāl type of gīti has been approached with in the light of historical evidences. Though I am aware that there are controversies among some scholars, regarding theory of evolution as well as classical forms of both dhruvapada and kheyāl or khyāl, yet I have dealt with them carefully, citing passages from the dependable Sanskrit treatises. I am indebted to the reputed scholars, like Thākur Jaideva Singh and Paṇḍit S. N. Ratanjankar in this respect. I have quoted freely their rational and historical views, regarding the evolution and genuine types of dbruvapada and khyāl, from their papers, read in the Symposiums of the A.I.R., New Delhi, in 1960 and 1961.

The chapter XIII has been devoted to the study of theory and problem of acoustics of music. There I have set forth the views of different Western scientists and noted musicologists both of the East and the West. Therein I have also endeavoured to prove that the vibrations of soundunits are the cause of evolution of musical tones and tunes as well as their colours. Regarding the number of colourvibrations of tones and tunes, the reputed psychologist, Prof. Woodworth has said: "At the red end of the spectrum, the wave length of the light is 760 millionths. In between are waves of very intermediate length, appearing to the eye as orange, yellow, green and blue, with all their transitional hues. A wave-length of 600 gives yellow, one of 500 gives green, one of 470 gives blue, etc.". Prof. Tain has also supported Prof. Woodworth, while he has said: "An increase of speed and diminution of lengths in the waves are sufficient to determine the vibrations which our sensation of colour undergoes in passing from red to violet. \* \* Helmholtz distinguishes these following successive colours-red, orange, golden, yellow, pure yellow, green, blue of water, cyanic blue, indigo, violet and ultraviolet". Helmoltz's determinations of the vibration-units of C1, C, D, E, F, G, A, B, c, d, e, f, g, a, b, c,2 c,2 c,4 are 1702, 2131, 240, 256, 512, 1024, 2048 per second.

Mr. M.A. Bjerregward has mentioned about the colours of tones of the European music in his book, Great Mother. The vibration-units of Indian musical tones, Sa, Re, Ga, Ma, Pa, Dha, Ni/Sá are 240, 270, 300, 320, 360, 405/. 480. The lengths of the wires of a veenā from the bridge are 1, \frac{8}{3}, \frac{4}{3}, \frac{21}{3}, \frac{8}{15}, \frac{1}{15}, \frac{1}{2} \text{ and their cents have been enumerated as, 204+182+112+204+182+112=1200. It can be mentioned in this connection that some musicologists determine the vibration-units of the Indian tones as, 256, 288, 320, 341\frac{1}{3}, 384, 426, 480 per second. Questionnaires may be raised as to the definite units of vibrations of the tones, but it is a fact that the Indian method of determining the vibration-units of the tones has been adopted from the European system.

The chapter XIV of the book deals with the iconography of Indian music. There it has been shown that the melodic-types (rāgas) have been regarded as the icons or symbols of their presiding deities. Though the conception of the icons is not very ancient, as it evolved in the 16th-17th century A.D., yet Indian seers in the sphere of music are fully aware of the divine forms of the rāgas and rāgiņīs, and they are confident that through the medium of rāgas and rāgiņis, the devout artistes and sincere lovers of music attain the realization of the sura or nāda-Brahman.

In the chapter XV, I have dealt with the main problems of aesthetic-cum-psychology of music. Wherein it has been shown that unless and until the aesthetic and psychological qualities of tones and tunes are realized through the ecstatic vision of the artistes and audiences of music, appreciation of music is not possible. The dictionary meaning of 'aesthetics' is an appreciation of the Beautiful, in accordance with principles of good taste. Profs. Vivas and Krieger have

said: "Aesthetics is the name customarily given to the theoretical and systematic exploration of the questions which arise when men reflect on their interest in the beauty of nature and the products of the fine arts". In fact, the sense of beauty or appreciation of the Beautiful brings with it the idea of aesthetics.

Kant has elaborately discussed about the problem of aesthetics from different angle of vision in his Critique of Judgement. In the 'Critique of Aesthetical Judgement', Kant has discussed fully the analytic of the Beautiful, judgement of taste, the analytic of the Sublime, the Beautiful and the art of agenius, dialectic of analytical judgement and other things. The fundamental principle underlying the procedure of Critique of Judgement is seen to be that of the purposiveness of nature, and nature is everywhere adapted to ends or purpose, and thus constitutes a well-ordered whole. The taste is the faculty of judging of an object and the object of satisfaction is called beautiful. In other words, it can be said that the beautiful is that which, apart from concepts, is represented us the object of a universal satisfaction. But Kant has laid stress, anyhow or other, on the intellectual satisfaction of beauty of art. But the Indian philosophers think it in a different way. They say that intellectual satisfaction only prepares the ground of spiritual satisfaction or feeling of fine arts, and it is not the be-all and end-all of the artiste life. So, until and unless the spiritual satisfaction or spiritual intuition is reached, so long work of art fails to satisfy the real purpose.

In this book, I have discussed briefly about the psychological and aesthetic problems of music mainly from the Indian viewpoint, and have shown that psychological analysis as well as aesthetic appreciation of the divine

emotional sentiments (rasas) of the musical tones (svaras) and tunes (ragas) bring unto the artistes and the art-loving listeners the realization of the Beautiful and the Sublime of Indian music. Now the students of the Kantian philosophy are well-acquainted with an agreement and a disagreement between the two prime principles, the Beautiful and the Sublime, as according to Immanual Kant, the Beautiful implies form and limitation, whereas the Sublime may be found in an object which is formless and unlimited, and for this reason, the Sublime is recognised as great. But, in the Upanisads of India, we find a beautiful epithet of the Brahman, known as satyam-sivamsundaram. There the combined attributes, truth, peace and beauty constitute the staff of the Brahman. But in the strict sense of logic, the attributed Brahman is with form and, therefore, limited. The Advaita Vedanta states that the Brahman with the attributes is determinate Brahman (saguna-Brahman), and so it should be taken that the Upanisadic epithet, satyam-sivam-sundaram first points the determinate Brahman (saguna-Brahman) and then, symultaneously, the indeterminate Brahman (nirguna-Brahman). From the strict Advaita Vedantic standpoint, both the phases of the Brahman are essentially one and the same. So, if a sincere artist gets an intuitive perception of the sublime beauty of his created art, he will realize the Beautiful, and that is the prime achievement of fine arts.

The symbols or symbolic representations are as old as the Vedas and the Upanisads. It has already been said that in the Upanisads, different kinds of symbols have been prescribed for realizing the divinity of the Brahman. In the Pātanjala-daršana, Ŗṣi Patanjali has prescribed the Praṇava as the symbolic representation of the Brahman. Regarding

the attitude towards symbols, St. Kramtisch has said in her Indian Sculpture (1933): "Indian plastic sense is averse to the symbol, which is the substitute for a reality. The un-formed clamours for form, for this is the way which it shows its reality. Symbols are ready-made and block the approach of the unformed towards form. They stand in the way of creation. If in ancient Indian sculpture, of the Indus civilization and in the Mauryan age, animal or plant were represented in lieu of the corresponding divinity, they were meant to tee vahanas, i.e. vehicles of the divinity, and not abstracts or parts of its appearence, such as footprints or hair relics, or of its presence, such as the seat or the walk (cankrama), in the case of the Buddha. \* \* The sacred tree, alone amongst the symbols for the Buddha, has maintained some of these earlier qualities. \* \* Symbols again play a considerable part in later centuries. But then they are additional attributes to figures of devinities, themselves endowed with form. Wheel, flame, lemon, lotus, etc. held in the hands by various devinities, are part of their apparel, and belong to the same category as crown, scarf or armlet. Nor do they then stand for an entire reality, they support only one of its many qualities, objectified and rationalised".

Not only the Hindus, Buddhists and Roman Catholic Christians, but also all the civilized nations of the world, including the Romans, Greeks, Egyptians and Persians used and still use symbols for their choosen deities and gods, and Saviours. The ancient Egyptians used a Tāu-Cross or Crux Ansātā. The Christians use the cross, fish, serpent, rose, dove, lamb, eagle, egg, etc. as the symbols of Christ and Easter (cf. Swāmī Abhedānanda: Necessity of Symbols). J. M. Robertson has said that in

the Mithraic cult, the bull slain by Mithra, the Sun-god, was the symbol of the earth and moon; Mithra slaying the bull was meant the rays of the sun penetrating the earth. Besides, lamb, ram, rose, etc. were used as the symbols of Mithra, the Sun-god. In India, different trees, fruits and animals were used as the symbols of the gods. Harold Bayley has mentioned in the Lost Language of Symbolism (vols. I & II, 1912) different symbols of different gods of different nations. So symbols are the mediums or signs for signifying the real objects behind them, and in music, symbols of birds, beasts have been used to signify seven tones or svaras, and different paintings and pictures have been used to signify the ragas and raginas, which have been regarded as the nayakas and nayikas.

Prof. Percy C. Buck says in his Psychology for Musicians (1945): "For musicians it will be sufficient to realize that we develop from children, who judge by the easy recognition of melody and rhythm, into more sophisticated beings who look for the feeling embodied in the form; from the tune to which our itching feet insist on beating time, to the hidden meaning, behind the quite phrase which once may have seemed so pointless and unexciting. And one of the greatest contributions that Psychology makes to Civilization-which means the education of man in the mass-is by pointing out that all education, in any subject, must aim at grasping the inner meaning instead of confining our attention to the outward appearance". Percy Buck has dealt with different problems like reaction, habit, commonsense of technique, ideas and association, interest, attention, memory, appreciation, will, meaning of education, element of thinking and utility of the knowledge of psychology in the field of music, and we think that these are essential things for the knowledge of the musicians and music-loving listeners.

Though I have not discussed particularly about the aesthetic qualities like emotional sentiments and moods (rasas and bhāvas) of different rāgas and rāgiņīs, as enumerated by the musicologist, Hanuman, yet I have mentioned the basic principles of the asethetic qualities of the tones and tunes of Indian music with their specific characteristic and applicability. As I have already discussed in the Appendix of my book, Rāga-O-Rūpa (Melody and Form), vol. I, the aesthetics of the six rāgas and thirty rāgiņīs, so I have refrained from recapitulating them in this book. Lālā Kānnoo Mal, M.A. has discussed this problem elaborately in his book, Kāma-Kalā, which was published by the Punjab Sanskrit Book Depot, Lahore in 1931. I have followed him in my Rāga-O-Rūpa.

Now take me the privilege of quoting some portions of 'some notes on Hindu erotics' from his book, Kāma-kalā, where he has said: "In no other country has the feeling of Love been so minutely observed, studied, analysised, classified and elaborated into an exalted science as in India. Its whole domain has been assiduously and patiently explored, its innermost recesses have been opened up and ransacked, its most hidden secrets wrung out and displayed to the public gaze. The erotic sentiments has, in India, formed the background of illumination to all its poetical, dramatic and theoretical literature; and it is under its mild, soft and inspiring light that the most exquisite productions of Hindu literature have bloomed into their splendour. All the beauties of fine arts of India are so many,

variegated, and myriad-tint prisms to reflect the soft, subtle and gentle rays of Love's far-off radience behind them".

Regarding the fundamental cause (ālambaṇa-vibbāva) of the erotic sentiment, he has said that it is the most important of all the divisions of this feeling. It is the fundamental basis on which the manifestation of the abiding feeling of love depends. Lālā Kānnoo Mal has said: "This cause consists of a man or a woman, which is as it were, the receptacle of the feeling of love. The classification of men or heroes with reference to this sentiment is four-fold; viz,

Dhīralalita .... light-hearted;
Dhīrapraśānta .... calm and tranquil-minded;
Dhīraudātta .... exalted or noble-hearted, and
Dhīrauddhata .... vehement.

Each of them is four varieties; viz,

Dakṣiṇa ... clever, one who is kind to his sweet heart;

Dhṛṣṭa ... ... deceitful, one shameless towards his previous love;

Satha ... ... wicked. one who hides his unfaithfulness;

Anukūla ... ... One faithful to only a single lady-love".

Similarly Nāyikās or heroines have been classified from different points of view. The classifications are:

- Classification of heroines with reference to their moods and relations with the heroes. The classification from this standpoint is eight or tentold, Prositapatikā, Abhisārikā and others.
- 2. Classification of heroines with reference to their

- positions, such as uttamā (excellent), madhyamā (middling) and adhamā (bad).
- Classification based on the moods of heroines arising from their self-conceit, haughtiness and personal beauty, such as Premagarvitā—one proud of her love; Rūpagarvitā—one proud of her beauty; Māninī—one addicted to affected resentment.
- 4. Classification based on sex physiology, such as Padminī (the Lotus women); Chitrānī (the Variegated woman), and Hastinī (the Elephant woman). They are in descending order of merit".

"The classification of heroes and heroine", he has said, "given in the Hindu works on Dramaturgy and Erotic are considered to be artificial and fanciful by some critics, but this criticism arises more from their lack of intimate knowledge of love psychology than from its minute study. \* \* All great dramatists and poets, irrespective of caste, colour and clime, have portrayed them in their own way...".

In fact, śṛṅgāra is the prime sentiment, and this sentiment is the cause of awakening the attitude of detachment (nirveda) in men. The śṛṅgāra, the prime sentiment is divided into vipralambha and sambhoga. The vipralambha is manifested as delightful enjoyment or sambhoga, pūrvarāga, māna and prema-vicitya. The first quality, sambhoga is again divided into two, primary (mukhya) and secondary (gauṇa) ones. In fact, the primary sentiments are manifested as  $8 \times 8 = 64$  qualities. The Nāyaka and Nāyikās (rāgas and rāgiṇīs) manifest themselves in the māna quality in eight states, and they are known as abbisārikā, vāsakasajjā, utkaṇṭṭḥitā, vipralabdhā, kaṇḍitā, kalabantaritā, proṣitabhatṛkā and svādbīnabhatṛkā. Bhatata has beautifully described eight kinds of primary sentiments

and their different manifestations. Bharata, Kavi Kalidas, Kavi Jayadev as well as most of the Alamkarikas have described śrngararasa as adirasa (prime sentiment), as has been said before. In his Ujjalanilamani, Rupa Goswami has mentioned about different aesthetic manifestations and attitudes of the Nayakas and Nayikas. He has said that the Nayakas (ragas) are divided into dbīralalita, dbīrasanta, dbīroddbata and dbīrodatta. the Nāyakas (or rāgas), the Nāyikās (rāgiņīs) too manifested mainly into two, svakiyā and parakiyā, parakīyā Nāyikās are also divided into two, kanyā and parodhā. Again among suakīyā, parakīyā and kanyā Nāyikās (rāginīs), svakīyā one is divided into three, mugdhā, madhyā and pragalbhā. Further the Alamkārikas have divided madhyā and pragalbhā Nāyikās (rāgiņīs) into dhīrā, adbīrā and dbīrādbīrā. These later Nāyikā rāgiņīs are also divided into different forms.

The ancient musicologist, Hanuman has divided the principal ragas and raginis into  $6+6 \times 5 = 36$ , and they are,

- Bhairava...Madhyamādī, Bhairavī, Bāngālī, Barāṭī, Saindhavī.
- Mālava-kauśika...Todī, Khambāvatī, Gaurī, Guṇaktī, Kakubhā.
- Hindola...Velāvalī, Rāmakrī, Desākhyā, Paṭamañjarī, Lalitā.
- 4. Dīpaka... Kedārī, Kānādā, Deśī, Kāmodī, Nāţikā.
- Srī...Vāsantī (Vasanta), Mādhavī, Mālaśrī, Dhānaśrī, Āsāvarī.
- 6. Megha... Mallārī, Desakarī, Bhupālī, Gurjarī, Tānkī.
  Among these main Nāyakas and Nāyikās (rāgas and rāgiņīs), the six Nāyaka rāgas manifest themselves as dbīralalita, dbīrašānta, dbiroddbata and dbirodātta, and the

thirty Nāyikā rāgiņīs manifest themselves in the states of abbisārikā, vāsakasajjā, utkanṭṭḥitā, vipralabdhā, khaṇḍitā, kalahantaritā, proṣitabhatṛkā and svādhinabhatṛkā. Their permanent sentiments (sthāyī-rasas) like śṛṅgāra, sambhoga-śṛṅgāra, vipralambha-śṛṅgāra, etc. also differ. These sentiments and their states or moods (rasas and bhāvas) are the object of feeling (anubhava), and the Sādhaka-artistes as well as the audiences enjoy celestial peace and delight through them, and in this way, their minds are prepared due to the concentrated attention to the divine feeling which enables them to attain gradually the realization of the Sabda-Brahman, which is in essence the transcending Ātman.

It should be mentioned in this connection that most of the authors of music, both Hindu and Muslim, described the emotional sentiments (rasas) and moods (bhavas), together with the nayaka-nayika-bhavas of the ragas and raginis, in the Muhammedan period. Some of the Persian scholars, administrators and courtiers translated some books on music in Persian language, and some of them compiled or composed the music works independently in Persian. As for example, Fakir Ullah, who lived during the reign of the Emperors, Shah Jahan and Aurangzeb 'Alamgir, translated the Mankutühal in Persian language. It is said that the work, Mankutubal was composed or compiled by the order of Raja Man Singh (1486-1517 (A. D.) of Gwalior, and the book was named after him. Fakir Ullah named the translation (of the Mankutubal) the Ragadarpana. In the fifth chapter of the Ragadarpana, Fakīr Ullāh described the emotional sentiments as well as aesthetic characters of the ragas (nayakas) and raginis (nāyikās), after giving the descriptions of the musical

instruments. From this it is understood that during Rājā Mān and his noted dhruvapada singers, the emotional characters of the rāgas were strictly observed. The Persian book, Rāgadarpaņa was again translated in Hindi by Hariharnivās Dvivedī of Gwālior, and was published by the Vidyāmandir, Murār, Gwālior in 1954, with detailed historical accounts, by the name of Mānsingh Aur Mānakutūhat, and it has recently been translated in Bengali by Shri Rājyeśwar Mitra of Calcutta.

Similarly Mīrzā Khān compiled the Persian work on music, Tuhphātul-hind, probably in the middle of the 17th century A. D., and in the chapters, third and fourth of this book, he described the emotional sentiments (rasas) as well as the aesthetic characters (nāyaka-nayika-bhāvas) of the rāgas and rāginīs. This Persian book has recently been translated in Bengali by Shri Rājyeśwara Mitra and has been published (together with the Bengali translation of the Rāgadarpaṇa) in book form by the Lekhak-Samavāya-Samiti, Calcutta-26, by the name of 'Mughal Bhārater Sangeet-cintā'. Rādhā Mohan Sen of Bengali mentioned also the name of Tuhphātul-hind in his Bengali book on music, Sangeet-taranga (cf. pp. 130-132).

Hākim Mohammad Karam Imām, a Courtier of Wājid-Āli Shāh of Lucknow also touched slightly the aesthetic sentiments of the rāgas and rāgiņis in his Persian book, Ma'adnul Moosique, written in 1856. Some portions of this book, Ma'adnul Moosique have been translated in English by Govind Vidyārthī and were published in the Sangeet Nāţak Bulletins of October, 1956 and April, 1960.

Let me further mention, in this connection, about the informative book, History of Indo-Pak Music (Decca, 1962)

by Dr. Abdul Halim, the Professor and Head of the Dapartment of History in the Decca University. The learned author has efficiently discussed about various historical materials of music, including most of the fragments of the Persian books : (1) Rag-darpan of Faqirullali and (2) Mauj-i-Musiqi of Muhammed La'l Khan Barni. His discussion on the Origin and Evolution of Khiyal in Pāk-India (pp. 66-75) is informative. Dr. Hālim is of opinion: Khiyāl is created with the Perso-Arab Music which the Umayyad and Abdasid Caliphate developed during the early Middle Ages, \* \* My thesis will have proved that Khiyal or ornate music is not really the invention of a master musician. It is the true product of Muslim culture so far as its origin is connected. It is for this very reason that whoever revived this art-form has been designated as its inventor. And it on this very account that many writers on music and practical musicians say that Amir Khusraw of Delhi was its inventor, and others concede this place to Husain Shah Shrqi" (pp. 62. 75). Dr. Hālim has also mentioned about the names of the celebrated musicians of the Muslim Period.

Now, regarding the realization of rasa as the prime aim of the practice of music, it can be said that though the Vaiṣṇava mystics uphold the doctrine "rasa vai saḥ" i.e. 'the emotional sentiment is the ultimate reality,' yet it should be taken that the realization of rasa (parama-rasānubhūti) in music is only the highest footstep towards the achievement of the supreme principle, Ātman and not the Self-realization (ātmānubhūti) in itself, and through the highest footstep of rasānubhūti, the ātmānubhūti is afterwards reached and attained. It is the prime aim of Indian psychology as well as of Indian philosophy to realize the

Atman or nāda-Brahman, the summum bonum of human life. This realization of the Atman or nāda-Brahman can really be said to be an immediate awareness of the Absolute (pratyakṣa brahmānubhūti), and this realization can only free the music artistes and audiences from the chain of delusion or māyā. So it is a fact that the psychological aspect of music can lead the Sādhakas to the sacred temple of realization of the higher Self and thus helps them to make free from the deceitful world or samsāra.

In chapter XVI, I have dwelt with the sublime philosophical ideas of music, which is divine and at the same time essential to the life of the artistes. It is a fact that when the Sadhaka-artistes and the sympathetic listeners realize the real essence of the nadatattva, they dive deep into the mysterious kāmakalā or kundalinī, and come to know at last its secret. The will-to-know or urge for knowledge of the ideal of music stirs the sleeping coiled kundaling or subconscious mind, and, consequently, gives a start for the ascend of the divine basic energy. Then gradually the awakened energy penetrates all the force-centres of the body (of the spinal cord) and finally reaches the thousand-petalled lotus of the sabasrāra, the seat of the all-consciousness Paramaśiva, and then the Sadhaka-artistes and the sincere music-listeners feel divine communion of the fivatman and the Paramatman. They then attain the fruition of the nada-sadhana, which enables them to cut asunder the knots of nescience and realize the transcendent Brahman. And this state can be said to be the ultimate achievement (paramā prāpti) of the practice of music.

In the Sangītaśāstra, it is also mentioned: "śiva-śaktisamāyogāt rāgānām udbhabo bhavet" or "śambhu-śakti-

samjoga ta, pragate satvidhi raga; pañca-pañca mukha te bhaye, chatau sibā-mukha-bhāga," i.e. the rāgas evolved from the communion of Siva and Sakti. This conception is purely a Tantric one. Besides it, there is a Vaisnava conception, and it has been explained in the chapter sixteen of this book. Now, the Tantric interpretations of the above śloka and the doha are that, according to the Tantrasastra, Siva is prāņa (or prāṇaśakti) and Sakti is vāk (or nāda). The melodic forms or ragas are the combinations of tones (svaras), which are no other than the sweet and soothing sound-units. The sound is known as nada, and it appears as letters (varna) and sound (dhvani). The melodic forms or ragas are, in truth, the sounds, having bodies of letters (varnas like sa, ri, ga, ma, pa, dha, ni). So when the prana or pranasakti vibrates ('spandate') by will-power (icchāśakti) of the artistes (Sādhakas), sounds (nādas) originate or emanate, and when those sounds are arranged in different orders or patterns, different kinds of melodic forms or ragas evolve, and they please the minds of all the living beings. To make this idea more explicit, let me quote some lines from the book, Sadbana for Self-realization by Swāmī Pratyagātmānanda Saraswatī and Sir John Woodroffe (1963). It has been said in connection with the mantrasādhanā: "Sabda is Sakti. The Viśvasāra-Tantra (Ch. II) says that Sabda-brahman which is Mantra (Mantramaya) exists in the body of live and is the subtle aspect of the Jīva's vital Sakti. As the Prapancasara-Tantra states, the Brahmānda or Spheroid (universe) is pervaded by Sakti as Dhvani, called Nada, Prana and the like. \* \* Sabda is the Guna of Akasa, but is not produced by it. It manifests in it; and Sabda-svarupa is the Brahman. In the same way, however, as in outer space waves of sound are produced by

movements of air (Vāyu), so in the space within the Jīva's body, waves of sound are produced according to the movements of the vitāl air (Prāṇavāyu) and the process of inhalation and exhalation. The Śabda which first appears in Mulādhāra (See A. Avalon's Serpent Power) is, in fact, the Śakti which gives life to Jīva. The Jīva who inbreathes and outbreathes utters a great Mantra. \* \* Śakti it is who is the Cause of the sweet, indistinct and murmuring Dhvani which sounds like the humming of black bees. This sound is Parā, and then Paśyantī, which becomes subtle as Madbyamā and gross as Vaikharī. Kuṇḍalinī, who is Varṇamayī and Dhvanimayī, is the manifestation in bodies of the Paramātmā".

In the Iapasūtram (English edition, 1961), Swāmī Pratyagātmananda Saraswatī has further said, in connection with Vāk and Prāṇa: "If the creative 'formula' be vāk, then what formulates, is prāṇa. \*\* Prāṇa is abstract and uncreative without vāk; and vāk is empty and dead without prāṇa. They consort and operate conjointly. They are the First Creative 'Pair' of which this universe and all possible universes are 'progeny'.

"In Sanskrit, prāṇa is a masculine word and vāk feminine. \* \* Prāṇa instils the creative élan in the original 'stuff' of existence; vāk evolves this 'stuff' into created form. \* \* So prāṇa consorts with vāk when, from this union, the bindu or bīja appears. Evidently vāk is not word or sound as we apprehend it. It is the matrix function, the 'causal stress' as we have before called it, by which the fundamental plenum of Power is evolved into general as well as special 'origins' or centres of functioning. Vāk is, so to say the 'Mother's womb' into which prāṇa enters as the necessary flow and fund of power in order to make it evolve into multiple forms and patterns'.

Therefore, it may be said that discussions on mere skelital forms of tonal arrangement of the melodies and their essentials, their mūrcchanās and alamkāras only throw light on the theoretical side of music, but cannot go deep into its core, and, consequently, the artistes and lovers of music fail to appreciate the real import as well as the divine essence of music. Therefore, music should be approached not only from the historical standpoint, but also from the spiritual standpoint as well.

In some of the occasions, I got privileges to meet Pandit Jaharlal Nehru and at every occasion, I was charmed to see his great personality, cheerful appearance and sweet and loving nature. In one occasion, I presented him some books of mine and of my Master, Swami Abhedananda, which he received with great interest and eagerness. Now I am taking the opportunity of dedicating this new book to his sweet and loving memory.

In conclusion, I express my deep sense of gratitude and ragard to Dr. V. K. Nārāyaṇa Menon, the Secretary of the Saṅgeet Nāṭak Ākādemi, New Delhi, for his learned Foreword to this book. He is a man of rare intellect and learning and is efficient in South Indian music. I feel pride to include his learned 'Foreword' in my book. I am indebted to Dr. B. C. Deva, for giving me some valuable suggestions about the musical instruments that are depicted in different Hindu and Buddhist Cave temples of India. I express my heartful thanks to Shri Subodh Kumar Chatterji, B.A. for going through the final copy of the manuscript of this book. I am indebted to Shri Manorañjan Mazumdar, the proprietor of the "Ānandadhārāk Prakāśan" for encouraging me in writing and publishing this book. I offer my thanks to Messts Calcutta Oriental Press.

## xxxi

Private Ltd. for the neat printing and prompt delivery of the book. I also offer my thanks to Khāled Choudhury, who has drawn the nice design for this book.

SWĀMI PRAJNĀNĀNANDA.

moorthy on the gandhara-grama, 26-27-Shri Ramanathan on the gandhara-grama. 27-Dr. B. C. Deva on the gandhara-grama, 28-Shri N. K. Bose on the gandhara-grama, 29-The practice of the gandhara-grama in the Ramayana-Mahabhārata, 30-Pandit Pundarika Vitthala on the oā-orāma. 31-Nārada on the two kinds of veenā, 32-The mūrcchanās of the grāmas, 32-33 -The gramaragas in the Siksa and the Kudumiamalia Inscription, 33-The vaidika and laukika tones, 34-How the tones evolved, 35-36-The iāti-śrutis and their sentiments, 38-The saptakas (octaves) of the Vedic music, 39-40-The register tones, 40-The science of the microtones developed during Bharata's time, 42-Music in the iāti-period, 43-The displaced tones of Bharata. 44-Bharata and the gandharva type of music, 44-45-Veenā and vamša, 46-The 18 iātis, 47-The ten characteristics of the jatiraga, 48-What do we mean by vadi, 49-The problem of amsa. 49-The ten essentials of Bharata, 50-The mandra and the tara gatis, 51-The vadya and the natvagiti, as described by Bharata, 52-Vastu and vidārī, 52-53-The dhruvās, 53-54-The padams, 55-The gramaragas and the dhruvās, 56-57.

#### CHAPTER III

The Jātis as Described in Bharata's Nāţyaśāstra

The jātis are the rāgas themselves, 58—The definition of rāga, given by Matanga, 59—The jātis in the Rāmāyaṇa, 60—Bharata on the rāgarāgiṇās, 61—The jātis were replaced by the rāgas, 63—The Brhaddesī on the rāga, 64,

58-64

#### CHAPTER IV

# Ancient Musical Instruments of India

65-85

Divisions of the musical instruments, 65-66-The stringed instruments of the Hebrews, 67-The instruments of the ancient Greeks and Romans, 67-Musical instruments of the ancient Babylon and Assyria, 67-The early American musical instruments, 68-Mr. Alexander musical instruments, 68-MacCulloch on the instruments, 69-The dundubhi and the bhūmidundubhi, 70-71-The dhanuryantram, 71-The evolution of the flute or pipe, 72-The construction of the veenā in ancient India, 73-The mārjanā or tuning-process, 74-75-The drums in the sculptures, 76-77—The kutapa-vinyāsa, 78 bhanda-vadya, 79-The arrangement stage, as described by Bharata, 79-The yavanikā, 80-The preliminaries before the abhinaya, 80-Method of the kutapa-vinyāsa, 81-83-Different kinds of kutapa, 83-Appendix to the chapt. IV., 84-85.

#### CHAPTER V

# Orchestra and Chorus in Ancient India

86-109

The chorus song in the Vedic Mahāvrata ceremony, 86—The group-singing in the Rāma-yaṇa-Mahābhārata, 87—The kutapa (orchestra), as described in the Nāṭyaśāstra, 87-88—The evidence of orchestra in the Caves of India, 89—The vṛnda-gāna and vṛnda-vādya in the pre-Christian era, 90—The term 'orchestra', 91—Prof. Pratt on orchestra, 91—By the rise of the opera in the 17th century, orchestra evolved in the West, 91-92—The orchestra in the 19th century, 92—Prof. Scholes on the Western orchestra, 93—

The orchestra between the Hyden-Mozart and periods, 93-Prof. Nicoll about theatre and orchestra, 94-Chorus, dance and music were connected with theatre in ancient times, 96-The dramatic art in the 19th century, 96-The ofchestra evolved in India in the pre-Christian period, 96-The characteristic the kutapa, as described in the Natyasastra, 97-The arrangement of the kutapa, 98-99-The Abhinavabharati on the kutapa, 99-100-The kutapa consisted of four kinds of instruments, 101-The nātya-kutapa and Śārangdev, 102-Bharata on vrndas, 103-Simhabhupāla on vrnda, 104-The gayani-vrnda and the kutapa-vrnda, 104-The geya-nātya in India, 105-Prof. Sambamoorthy on the kutapa, 106-Appendix to the chapt. V, 107-109.

#### CHAPTER VI

Saptatantrī-Veeņā in the Buddhist Caves of Pitalkhorā

110-122

Representations of some of the musical instruments on stone, 110-111—M. N. Despande on the Pitalkhorā Caves, 111—The saptatantrīveeṇās, engraved in the Caves, 111-112—The veeṇā with seven strings in ancient India, 113—The term sapta-dhātu connotes the idea of seven strings, 113—Different kinds of veeṇā in the Vedic and Buddhist periods 114—The veeṇā in the Guptila-Jātaka, 115—The veeṇās, citrā, vipañcī and dāravī, 115—The parivādinī and the saptatantrī, 116-117—John Barnet on lute or veeṇā, 116—The veeṇā in different Caves of India, 117—The bowed instruments, 118—The bow-shaped harps, 119—The present-day veeṇās, 120—Appendix, 121.

#### CHAPTER VII

The Concept of Raga

123-1-36

The conception of rāga is a grand one, 123—The rāgas in the pre-Christian era, 123-124—The rāgas in the Rāmāyana, 124—Bharata and the jātis or jātirāgas, 124-125—The definition of rāga by Matanga, 125—Vidwān Subbā Rāo and the tones of the rāgas, 126-127—The psychological process behind a rāga, 127-128—The thāţa or mela, 131—Rāga, tāna, and mūrcchanā, 132—The mūrcchanās were replaced by the thāṭas, 133—The rāgas are classified into three, 134—The further divisions of the rāgas, 134—The melas are always is heptatonic form, 135—The ten essentials of a rāga, 135—The seers of India about the rāga, 136.

#### CHAPTER VIII

Aryan and Non-Aryan Origin of Some Indian Rāgas ... ...

137-162

The sastra and sadhana, 137—The ragas should be studied in true historical perspective, 138—The raga, botta or bhotta, 139-140—The raga, takka, 140—Takka and thotta, 140-142—The ragas, bhairava and bhairavi, 143—Bhairavi evolved from the binna-sadja, 144—The saka raga, 145—The raga todi, 1451-60—Prof. O.C. Gangoly on the foreign ragas, 146—The turuska-todi, 147—The Hindusthani form of todi, 148—The dhyana of the todi, 149—The raga, nata, 140-150—The raga adana, 151—The raga khambaj 151—The raga bangali, 152—The raga gandhari, 153—The raga saveri, 153—The raga gurjari, 154—The raga kānāda, 154-155—The Persian tunes, 156-157—Pundarika Viţthala on the

Page

foreign rāgas, 157-158—Pt. Bhāvabhaṭṭa and Pt. V. N. Bhātkhaṇḍe on the foreign rāgas, 158—The Aryan and non-Aryan elements enriched the domain of Indian music, 160—Appendix, 161-162.

### CHAPTER IX

The Origin and Development of Dhruvapada ...

163-201

Different Western scholars on the origin of the dhruvapada, 163-Abul Fazl on the dhruvapada, 163-164-Rājā Mān of Gwālior and dhruvapada, 164-165-Gandharva or marga, 166 -What do we mean by prabandha, 166-The dhātus of prabandha, 167-The angas of prabandha, 167-168-Anibaddha and nibaddha pra-168-169-Sūda, āli and viprakīrna prabandhas, 169-Two kinds of dhruva, 170-The brahmagitis, 170-171-The prakaranas, 171-Different kinds of dhruva-prabandhas 172,-The music-parts of the prabandhas, 173-The characteristics of the dhruva-prabandha, 173-The dhātus of the prabandha, 174-175-The dhruva type of prabandhas, 175-How the latter type of dhruvapada developed, 176-The ancient exponents of the dhruvapada, 176-Gwalior and Vrndavana were the seats of culture of dhruvapada, 177-Sultan Ibrāhim Ādil Shāh II of Bijāpur, 178-Asad Beg's mission to Bijāpur, 178-Bakhtar Khan, the first teacher of Ibrahim Ādil Shāh II, 179-Asad Beg's report about Ādil Shah, 179-The dhruyapada and Mohommed Shah of Delhi, 180-Visnupur, the seat of culture of dhruvapada, 181-Dhruvapada means dhruvaprabandha, 181-182-The vānis of dhruvapada during Akbar and Tansen, 183-The character-

Page

istics of the rāgagītis, 184—B. K. Roychoudhury and the vāṇis, 185-186—The gharāṇās of dhruvapada, 187-188—The culture of dhruvapada in Bengal, 188-191—Appendix, 191-193—The difference between dhruva and dhruvā gānas, 194-197—Thākur Jaideva Singh's view about the dhruvapada, 197-201.

#### CHAPTER X

The Evolution of Kheyal and Its Development ..

202-226

The connotation of kheyal, 202-The wandering Qavval singers, 202-203-Various theories about the cause of evolution of kheval, 202-203-Captain Willard about kheyal, 203-Fox-Strangabout kheyāl, 204-\$ārangdev the kaivada-prabandha, 204-25-Kallinath and kaivāda-prabandha, 205-The rāsaka-prabandha. 205-206-The form of āksiptikā, 206-Kallināth on the rūpaka-prabandha, 206-207-The view of Pandit S. N. Ratanjankar, 207-The view of Thakur Jaideva Singh about kheyal, 207-208-The special features of the sastric ragagitis, 209-The sadharani-giti, 209-Alapti and alapa, 210-Rūpakālapti and rūpaka-bhañjanī, 210-The sthāva-bhañjanī, 211—Āksiptikā, rūpaka and alapti. 211-Amir Khusrau is not the inventor of kheyāl, 212-Thākur Jaidev Singh about the term, quala, 212-Daulat Shah on the Nuh-Sipir, 212-The Sharqui Rulers and kheyal, 213-Thakur Jaidev Singh's suggestions about kheyāl. 213-214-The Mohammed Shah, rangile and kheyal, 214-215-Niyamat Khan, sadarang and kheyāl, 215-The evolution of the gharānās, 215-216-The Seni school and Tansen, 216-B. K. Roychondhury and the gharanas, 217-218-The

development and culture of kheyāl in Bengal, 219-221—Appendix, 225-226.

### CHAPTER XI

# A Short Analysis of Music of Bengal

227-247

The folk songs in the Gupta and Pala periods, 227-The carya and vajra gitis. 227-Dr. Sukumār Sen about the Siddhācāryas of Bengal. gītagovinda-padagāna, 228-219-Sarangdev about carya, 229-230-The krsnakīrtana, 230-The nāma-kīrtana, 230-231-The significance of the term kīrtana, 231-Different types or schools of padāvalī-kīrtana. 231-Pāñcālī and yātra-gāna, 232-The dhap-kirtana, 232-Madhusudan Kinnar and dhap kirtana, 233-The meaning of the term kinnar, 234-The bāulgīti and its nature, 234-The bāul and murshida, 235-How the Sahaiiyā evolved, 236-The musical instruments of the bāulgāna, 237—The kayigāna, 237-239-The pāñcālī, 240-The meaning and characteristics of the kavigāna, 241-242-How pāñcāli evolved, 241-Pañcālī and jhumri, 242-The significance of panchaligana, 243-The yatragana and krsnayātrā, 244-The bhādugāna, 245-The patuāsangit, 246-The folk-songs are the source of higher classical songs or music, 247.

### CHAPTER XII

# A Short Survey of Dance of India

248-280

W. D. Humbly on the dances of the primitive people. 248—Dance in the Vedic Mahāvrata ceremony, 249—The tāṇḍava and the lāsya, 249-250—The āsārita type of dance. 250—The hallisaka dance, 250—Kavi Kālidās described about

types of dance in his kavyas and nātakas, 251-Dances are described in Śrī-Harsa's Ratnāvalī, 251-Vema-Bhupāla and Kavi Sudraka described different types of dance, 252-Mahārājā Chandragupta was a great patron of classical dances and songs, 252-The dancemotifs in different Caves of India, 253-What do we mean by a cari. 253-Cari, karana and mandala, 254-The postures of dances, tandaya and urdha-tāndava, 254-Dance motif in Taxilā mound, 256-The bharatanātyam, 257-258-The dance, kathākali, 260-Kathaka, 261-The manipuri, 262-263-The chhow dance, 263-264-Modern type of dances, 266-The characteristics of tandava, 267-The angaharas, 268-269 karanas, 269-The Orissi dance-motifs, 270-271-The hand-gestures in Orissi dance, 272-The handgestures in the Abhinavacandrikā, 273-Appendix, 274-280.

### CHAPTER XIII

The Acoustics of Indian Music

281-302

What do we mean by the word acoustics, 281-Dr. Burton on sound, 281-Every unit of vibration is possessed of a frequency, 282—What do we mean by a pitch, 283—The intensity of a sound, 283—The quality of a sound, 283—What do we mean by the word svara, 285—The sound forms are the basis of music, 286—Noise and music, 286-287—Dr. Alexander on sound vibrations, 288—Every sound has a resonance, 289—How do the vertices produce sound, 290-Dr. Burton has divided the musical instruments into three, 292—The characteristic fitures of the musical instruments, according to Dr. Burton, 292—Prof. Herbert-Caesari

## CHAPTER I

#### INTRODUCTION

A historical study of Indian music is meant to unravel the mystery of different grades of evolution of Indian music in different periods. It affords a man full scope for visioning the genuine structure, type and temparament of songs and melodies, musical instruments and dances. prevailing in different times. India has a glorious tradition of history of her achievements in the field of plastic art, painting, music, architecture, science, literatute, poetry, philosophy and religion, bearing on each of them the stamp of distinctive trait, quality as well as of spirit. India also did not lag behind in making history of music, dating from the most ancient primitive period up to the present time. The history of Indian music is full of materials of music, and they can be classified under different heads: firstly, the treatises on music, written by different authors of different times, which can be taken as the principal materials of constructing an authentic history of Indian music. Secondly, the rock-cut temples and inscriptions, caused to be excavated and engraved by different rulers of different times, together with the sculptures, paintings, copper-plates and coins of different periods. Thirdly, the writings of foreign writers on music as well as the history of music of other nations. Fourthly, the private diaries of the musicians and the musicologists, the local traditions transmitted orally, folklores and fables of music. All these should be properly studied in their historical perspectives, should be consulted for comparative study as well as

for corroboration of facts, dates and forms of evolution of materials of music, musical instrument and dance. These landmarks are distinctive stages in the development of the art of music, and they may be divided into major and minor ones. Evolution of music emerged from the concepts of tones and tunes, along with rhythm, and the emergence of tones and tunes were possible from the minute tones or microtones and their arrangements. So the problems of tones and tunes, along with the evolution of registers and scales, perception of consonance and dissonance, emergence of the concept of the melodies (ragas) and their classifications, evolution of murcchana, varna, alamkara, tana, anga, alapa or alapti, the manifestation of different musical phrases (sthayas) and compositions (prabandhas), the evolution of musical instruments like drum, flute, and lute, along with the question of origin of mela, or melakarta, masculine and feminine characters of the ragas, and the evolution of contemplative compositions (dhyānamālās) and pictures (rāgamūrtis) are the distinctive features in the study of history of Indian music.

In order to study the history of Indian music, it is imperative to divide the whole range of culture and civilization of India into several periods like pre-Vedic (primitive and prehistoric), Vedic, Hindu, Buddhist, Mohammedan, British and post-British, i.e. Modern. But these divisions do not appear to be adequate, as some of the periods, specially the Hindu and the Buddhist ones overlap each other, and it is, therefore, difficult to represent precisely music of those two periods. So it is better to divide the whole range of Indian history as well as the history of Indian music into three broad periods, ancient, mediaeval and modern.

In the history of India, we find that the civilized merchants or Panis really built the grand structure of culture and civilization of the prehistoric Indus Valley of the remote past. Some hold that these builders were the Aryans, nay the Vedic Aryans themselves, who were the original dwellers of India and never came from Central Asia or from any other parts outside of India. Others are of opinion that the original builders of the prehistoric Indus civilization were the Dravidians and not the Vedic Aryans. Opinions may differ, but we get ample evidence of the practice of music and dance, as obtaining in the prehistoric Indus Valley civilization. The archaeological excavations of different ancient sites in India, which are considered by experts to be continuation of the Indus civilization and culture, disclose the fact that even in that remote age of 5,000 or 4,000-2,500 B.C., the people were most civilized, artistic and cultured, and they were well-conversant with the art of playing flute and lutes (vamsī and veenā) and different types of drums (mrdangas). But unfortunately we do not know the exact type and technique of their music and dancing, for dearth of definite system of notation and historical records.

In the Rgvedic age (3,000-2,500 B.C.), we come across proofs of political, social and religious organizations among the Aryan people. Their vast literature undoubtedly prove that they were the most advanced people of the day. They used to perform sacrifices and sacred rites, and used to sing songs with different tones on those occasions. The rules and regulations, governing the songs, are found in the Sīkṣās, Prātišakbyas and the Brābamaṇa literature, and they also contain copious references of music of the Vedic time. Different kinds of lute (veeṇā) and

drum have also been described in the Vedic literature. The veenā with hundred strings (vāṇa) and kāśyapī or kacchapī, piccholā, kṣauṇī, etc. and primitive drums like the bhumi-dundubhi, dundubhi, etc. were used by the Vedic singers. The references are also found about dances, songs and musical instruments in the later Sūtra literature. Profs. Macdonell, Keith, Winternitz, Caland, Burnell, Jacobi, Waber, Sāstrī, Apte and others have mentioned about both vocal and instrumental music, while discussing the Vedic literature. In the classical and the post-classical periods, many new types of veenā like dāravī, gātra, citrā, vipañcī, raudrī, kūrmī, brāhmī, kātyāyaṇī, etc. and drums like puṣkara, bhāṇḍa, paṇava, mṛdaṅga, etc also evolved.

While commenting on the Grhyasūtra, Dr. Apte has made references about music that was cultured by the Vedic people. He has said: "Music or sangeeta of all three types ('nṛṭyaṃ, gītaṃ ca vāditraṃ') as well as chariot races and gambling continued to be the principal amusements of this (Sūtra) period". In the Sāmaveda (1. 22. 11) and the Āśvalāyaṇa-grbyasūtra (1. 14), we find descriptions of lute playing, dancing and singing, in connection with the simantonnayana ceremony. It is, therefore, proved that the Vedic people did systematically culture the art of music. The later Hindu society of India borrowed music from the pre-Vedic and Vedic people thus leaving behind a tradition of culture that enriched the art of music of India.

Now it may be taken for granted that Vedic music was much more developed and systematic with its fixed tones and scales, and that the pre-Vedic and Vedic music owed much to the undeveloped system of music of the most ancient primitive people. The diggings of the mounds of

the prehistoric Indus Valley cities have astounded the people of the world, by furnishing some crude types of pipe, lute (veena) and drum of different sizes, together with the bronze figurine of a nude dancing girl, which prove the practice of music in the society at least five thousand years ago. The Vedic literature also furnishes various references of Vedic music. By 'Vedic music' we mean the samans with tunes. When the rc stanzas were set to tones and tunes, they were called the Vedic music, samagana. The samans used to be sung in different forms in different Vedic recensions (śākhās). The Puspasūtra and the Nāradišīkṣā have fully described about those recensions and different methods of singing. The Vedic tones were used in the Vedic songs, and they were prathama, dvitīya, trtīya, caturtha, mandra (pañcama), atisvārya (sastha) and krusta (saptama). The tones of the Vedic music were in downward movement (avarobana-krama). Generally three, four, five and six tones were used in the samagana, and seven tones were used by the followers of the Kauthuma recension.

The samans, as mentioned in the Vedas and the Vedic literature, were the songs, set to tunes. According to Jaimani, the songs were but the internal efforts (abbyantara-prayatna) of the priestly class: "gītirnāma kṛyābhayantara-prayatna-janita-svara-viśeṣāṇāṃ-abhivyañjikā sāma-śabdābhilāpyā". Sāyaṇa, the commentator, has said that the sāmans were the songs, constituted out of the re stanzas and the tones like kruṣta, prathama, etc.: "sāma-śabdavācyasya gānasya svarūpamṛgakṣareṣu kruṣtādibhih saptabhih svaraih akṣara-vikārādibhyaśca niṣpādyate|kruṣtaḥ prathamo dvitīyastṛtīya-caturthaḥ pañcamaḥ ṣaṣṭhaścetyete saptasvarāḥ", te cāvyantarabhedairvahudhā bhinnāḥ." It is said that the sāmans

used to be sung with different modes and ways: "vahubbih prakarairganatmakam yat samasvarupam nirupitam". Sayana has also said: "samavede sahasram gityupayah". The samans were sung according to aksara-vikara (alteration of letters) like viślesana, vikarsana, abhyāsa and virāma. The stobbas used to play an important part in the singing. Jaimini has said in the Mimansadarsana (1. 2. 26): "sa niyata pramāna rci gīyate | tat-'sampādanārtho ya migāksaravikāro višleso vikarsaņamabhyāso virāmah stobba ityevamādayah sarve samavede samanayante'. The elongated letters like A ...... E ......... O ......... etc. were known as stobba. In the present-day system of classical music, the stobhas are used with elongation of the vowels, which create vital force in the songs. To cite an example, the part of the songs: "devadeva mabadeva gaurīpati maheśvara", etc. when sung as "de-eva-a de-eva-a mahā-ā-de-e-va-a" etc., the elongated vowels are the stobbas. Regarding the stobba, Sayana has said: "adbikatue satyrg-vilaksand-varnah stobbah". The stobba was divided into varnastobba, padastobba and väkyastobba. Like the processes of mutilation and elongation of the letters in the stanzas, the method of obliteration or deletion of letters (varnalopa or aksaralopa) in the songs were also found necessary, and so Sayana has said: "aksaravikāra-stobhādivat varnalopo'pi kvacid gitiheturbhavati". As for example, the word "agna ayahi" was uttered in the singing as "ognāyi". This rule used to be specially observed in the geyagāna, veyagāna or vegāna, yonigāna, etc. In fact, the samans were composed and practised in different manners.

In the Rk-prātiśākbya, the Vedic tones are called the 'yama', the toot meaning of which is 'to control' or 'to regulate'. So, as the tones use to control, conduct and

sustain the structure of the sāmagāna, they are known as 'yama'. The word 'yama' has been used in the Yogasūtra of Patañjali to connote the idea of control: "yama-niyamā-sana-prānāyama", etc. In truth, the seven tones are the fountain-head of not only of the scales and modes of the sāman singing, but also of the later evolved rāga, tāna, mūrcchanā, alamkāra, mela or melakartā, sthāya, prabandha, etc. and so they are regarded as the basis or ground of music of all times.

Some are of opinion that the tones of the Indian music are borrowed from the foreign nations like the Arabs, etc., observing the similarity of names of the tones of both the systems, Indian and Arabian. But that is not the fact. The names of the Arabic tones are: jek, du, si, tschār, peni, schesch, and beft (=sapta), and they resemble the names of the Vedic tones, prathama, dvitīya, trīīya, caturtha, pañcama, ṣaṣṭha, and saptama. To make it explicit, it can be shown by means of the chart in a comparative manner:

and the second statement and second	VEDIC TO	INES	
Arabic tones	Indian tones		European
			tones.
2.3	Sanskrit	Bengali	
r. jek	prathama	eka	С
2. du	dvitīya	du or dui	D
3. si	tṛtīya	tin	E
4. tschār	caturtha	cār	F
5. peni	pañcama	pāńca or	
, .	Local Control Control	pańcama	G
6. schesch	şaştha	chaya	A
7. heft	saptama	sāta	B-flat

Carl Engle's statement can be mentioned in this connection to make it more clear. He has said in his article, On the Musical Scales of Nations: "In the music of the Arabs, we also meet with similar intervals than our semi-tones. The notes of the Arabic scales, which are designated by the number from 1 to 7.....yek, du, si, tschār, peni, schesch, heft (also, as in our own music, by the first seven letters of the alphabet, which are in the Arabic ālif, be, gim, dal, he, wan, zain) are sub-divided into seventeen one-third tones". As for example,

Yk du si rschär peni schesch heft C D E F G A B-flat

As regards the question of borrowing of the tones of the Indian system of music from those of the Arabian system, it may alternately be taken that the Arabs incorporated in their system the names of musical tones of the Indian system of music, as there was a close relation between India and Arabia from very ancient time by means of interchange of trade and commerce. Calmet has said that before the death of the Prophet Mohammed (632 A.D.), music was current in Arabia in a developed form. The Arabs also borrowed many things from India through the medium of trade and commerce, and not only the Arabs, but all other nations of the world were also indebted to India in many respects. Greece, Rome, Mesopotamia, Chaldea, Assyria, Korea, China, Japan, Germany, Russia and other ancient civilized countries enriched themselves by borrowing ideas of art, religion and philosophy from India. From the pages of the history of the world it is evident that the Greeks specially borrowed many materials of culture, art, and civilization from India

in ancient time. Dr. Lecy O' Leary has admitted that the Pythagorean elements can ultimately be traced to an-Indian source.<sup>1</sup>

Sir John Malcolm is of opinion that the Persians borrowed many materials of music from India, He has admitted: "They (Persians) have a gamut and notes and a different description of melody, but they cannot be said to be further advanced in this science than the Indians. from whom they are supposed to have borrowed it".2 Carl-Eagle has also said in connection with his discussion on the Arabic intervals that the Persians appear to have employed at an early period similar intervals of the semi-tones. "After the conquest of Persia by the Arabs, about the middle of the seventh century of our Christian era, the music of the Persians and Arabs became, so to say, amalgamated, and they are still treatises extent of early Arabianand Persian theorists, in which the system of one-third tones is exhibited. Afterwards, however, some of the-Persian musicians adopted a system of twelve semi-tonesin the compass of an octave, like our chromatic scale".8

Allain Deniélou has also discussed on the similar problem, though in a different way. He has said: "It seemsthat some of the conceptions, which are the basis of Hindutheory, were known in Europe at the end of the middle ages, probably not through direct influence, but by way of Egyptian and Pythagorian traditions, transmitted to the

<sup>1.</sup> Vide De Lecy O'Leary: Arabic thought and Its Place in History, p. 10.

Arabs and Byzantines'. Regarding the antiquity of Indian music, Swami Abhedananda has said that the "Hindus first developed the science of music from the chanting of the Vedic hymns. The Samaveda was specially meant for music. And the scales with seven notes and three octaves were known in India centuries before the Greeks had it. Probably the Greeks learnt it from the Hindus..." Allain Daniélou has set forth many reasons in favour of the antiquity of Indian music in his Introduction to the Study of Musical Scales. He has said: (1) "The musical system of the Greeks had certainly not originated in their country ... One is bound to suppose that Pythagoras brought from the East the musical system which was adopted by country-men of Hellas. ... It was foreigners coming from India, Persia and Asia Minor the Phrygians Hyagnis, his son Marsyas and Olympus, the Thracians Lions, Thamyris and Orpheus, who impatted music to Greece. We, therefore, believe until better information is obtained, that the Hellenic tonal system had its origin in India or perhaps in China; the Greek instruments were all of Asiatic origin,....." "Greek music, as it was actually played by musicians, being of modal form, is necessarily included in the definitions of ancient Hindu music,...Greek music, like Egyptian music, most probably had its roots in Hindu music, or, at least, in that universal system of modal music of which the tradition has been fully kept only by the Hindus"."

<sup>4.</sup> Vide A Daniélou: Introduction to the Study of Musical Scales (1943), p. 139.

<sup>5.</sup> Vide India and Her People (1945), p. 216.

<sup>6.</sup> Cf. Introduction to the Study of Musical Scales, pp. 93-94.

<sup>7.</sup> Ibid., pp. 159-160.

Dr. Arnold Bake's statement has also thrown light upon this problem, though in a different way. He has said: "The Greek theory dominated the development of music in the West, to such an extent that even Chutch music in Russia followed rules derived from it till the most recent times, and music in the West of Europe, specially ecclesiastical, was under its sway for centuries. Whereas the whole Hellenistic world had adopted it already at the beginning of the Christian era,.....". Thus from all these comments we come to the conclusion that all the ancient civilized countries of the world, drew inspiration and received impetus in the art of music from India.

In the beginning of the Christian era, some new rāgas and gītis were included in the category of formalised regional (deśī) type of music which flourished side by side of the gāndharva type of music, the nucleus of which is to be found in Bharata's Nātyaśāstra, and fully delineated in Matanga's Bṛhaddeśī of the 5th-7th century A. D.

The grāmarāgas had their origin in the jātis or jātirāgas, having their bases in the two grāmas, ṣaḍja and madhyama, ("jāti-sambhutatvāt grāmarāgāṇi"). The gāndhāra-grāma fell out of practice at that time. Later on different kinds of mixed (miśra aṅga) rāgas evolved from the grāmarāgas. The mixture of the Aryan and the non-Aryan tunes (rāgas) commenced from the 3rd-5th century and continued up to the 12th-13th century A. D., and this admixture is evident in the works like Bṛhaddeśī, Saṅgīta-samayasāra and Saṅgīta-Ratnākara. The Turkish, Scythian and Persian tunes were also adopted in the stock of the Indian classical music, making them suitable to the taste and temparament of the changing society. The fusion took place mainly during the periods, 5th-7th and 11th-13th centuries A. D. The

rāgas were characterised by ten essentials like sonant, consonant, assonant, dissonant, etc., and there was a perfect consonance (svara-samvāda) between the notes, first and fourth and first and fifth, as was vogue in the ancient Greek music.

To give a brief account of the early form and theory of music of Greece, which were devised by Pythagoras and his dovout followers, I shall take privilege to quote most of the meterials from Prof. John Burnet's Greek-Philosophy (Thales to Plato), where the early Pythagorean musical and medical theories have been discussed. It may be taken as certain that Pythagoras himself discovered the numerical ratios for the determination of the concordant intervals of the scale. Pythagoras was a Samian, and he migrated to Italy 'because he disliked the rule of Palykrates'. It is said that Pythagoras flourished in 532 B.C., but as no actual dates are known, says Prof. Burner, it is safe to say that his activity belonged mainly to the last quarter of the 6th century B.C. Regarding the Pythagorean musical theory, Prof. Burnet has said that when the Greeks called certain intervals concordant, they were thinking primarily of notes, sounded in succession and not simultaneously. "In other words, the term refers to melodic progressions, and not to what we call harmonious chords. The principle is ultimately the same, indeed, but it is often of importance to remember that there was no such thing as harmony in classical Greek music, and that the word 'harmony' means in the Greek language, first 'tuning,' and then 'scale' ".

In the time of Pythagoras, says Prof. Burnet, the lyre had seven strings, and it is not improbable that the eighth was added later as the result of his discoveries. All the strings were of equal length, and were tuned to the required pitch by tension and relaxation. This was done entirely by ear, and the first thing was to make the two outside strings (hypatē and netē) (high and low) concordant, in the sense explained, with one another, with the middle string (mesē), and with the string just above it (tritē, later paramesē). "The notes of these four strings were called 'stationary' and were similarly related to one another in every kind of scale; the notes of the other three (or four in the eight-stringed lyre) were 'movable', and scales were distinguished as enharmonic, chromatic and diatonic (with their varieties), according as their strings were tuned more or less closely to the same pitch by as little as what we call a quarter-tone, as much as what we call a double-tone. It is obvious that none of our scales could be played on a seven-stringed lyre, tuned to the diatonic scale, is required for them. Even in that scale, however, the Greeks did not recognise the interval we called the third as concordant,"8

Prof. Burnet has said that it is quite probable that Pythagoras knew the pitch of notes to depend on the rate of vibrations which communicate 'beats' or pulsations to the air. That was also familiar to his successors; but neither he nor they had any means of measuring the rate of vibrations. As, however, the rate of vibration of two similar strings is inversely proportional to their length, it was possible for him to transform the problem and attack it on that side. The lyre did not immediately suggest this; for its strings were of equal length, but a few experiments with strings of unequal length would establish the truth. Prof. Burnet says that Pythagoras doubtless used a simple aparatus

<sup>8.</sup> Vide Dr. Burnet: Greek Philosophy (Thales to Plato), p. 46.

consisting of a string which could be stopped at different intervals by a movable bridge, and in this way reduced the experiment to a simple comparison of lengths on a single string. The result was to show that the concordant intervals of the scale could be expressed by the simple numerical ratios 2: 1, 3: 2, and 4: 3, or, taking the lowest whole numbers which have these ratios to one another, that the four stationary notes of the lyre could be expressed thus:

6 8 9 12

To represent these four notes by those of the gamut in descending order, it can be shown,

Netë	Paramesē	Mesē	Hypatê
Mi	Si	La	Mi

Now we may explain the discovery of Pythagoras as follows:

- (1) "When he took a length of string double that which gave the high Mi, it gave the low Mi. That is the interval which we call the octave and the Greeks called diapason. It is expressed by the ratio 2: 1.
- (2) "When he took a length of string half as long again as that which gave the high Mi, it gave La. That is the interval which we call the fifth and the Greeks called diapente. It is expressed by the ratio 3: 2.
- (3) "When he took a length of string one-third again as long as that which gave the high Mi, it gave Si. That is the interval which we call the fourth and the Greeks called diatessaron. It is expressed by the ratio 4: 3.
- (4) "The compass of the octave is a fifth and a fourth  $(\frac{3}{2} \times \frac{4}{3} = \frac{1}{6})$ , and the note which is a fifth from the netë is fourth from the bypate, and vice versa.

- (5) "The interval between the fourth and the fifth is expressed by the ratio 9: 8. This is called the 'tone' or pitch par excellence (probably from its importance in attuning the two tetrachords to one another).
- (6) "As there is no (numerical) mean proportional between 1 and 2, neither the octave nor the tone can be divided into equal patts".

Now this divisions remind us the division of tones by Bbarata, by means of the cala (shiftable) and acala or druva (non-shiftable) veenās.

Prof. Burnet is of opinion that there is a good reason for holding that Pythagoras did not go any further than this, and no attempt was made to determine the ratios between the 'movable' notes of the tetrachord till rhe days of Archytas and Plato. Aristoxenos tells us that the diagrams of the older musical theorists all referred to the enharmonic scale, which proceeded by what he called quarter-tones and a double-tone; but Pythagoras could not admit the possibility of quarter-tones, since the tone did not admit of equal division. "The internal notes of the tetrachord must, then, have been regarded as of the nature of the 'unlimited', and the 'limit' was represented only by the perfect concords".

Prof. Burnet has further said: "Now if we look at the four terms which we have discovered, we shall find that 8 and 9 are related to the extremes 6 and 12 as means. The term 9, which represents the note of the mesē, exceeds and is exceeded by the same number, namely 3. It is what is called the arithmetical mean. On the other hand, the term 8, which represents the note of the paramesē, exceeds and is exceeded by the same fraction of the extremes; for  $8 = 12 - \frac{13}{8} = 6 + \frac{6}{3}$ . This was called the subcontrary,

or later, for obvious reasons, the harmonic mean. The geographical mean is not to be found within the compass, of a single octave".

From the statement of Nārada's Nāradīśīkṣā of the 1st century A. D., we come to know that the microtonal units (śrutis) were in use in both the gāndharva and formalised desi types of music. The microtonal units or microtones are the minute perceptible tones. Bharata has analysed the seven laukika tones, ṣaḍja, etc. into twenty-two minute tones (śrutis) on the basis of the genus-species or jāti-vyakti (cause-effect) theory, as devised by Nārada.

The period covering the 5th-7th century to the 13th century A. D. can be considered as the period of renaissance in the domain of Indian music, because during this period many old and new ragas came into being from different sources, and they enriched the treasury of Indian classical music. The ragagitis were known by their respective ragas during Matanga's time, and many new ragas and gītis evolved from them. The ragas were determined by different murcebanas, which were again replaced by melas or thatas or melakartas in the 16th-17th century A. D. The intuitive authors and artists of music considered the ragas as the living embodiments of divine spirit, and they made them surcharged with aesthetic or emotional sentiments and feelings (rasa and bhava), composed the dhyanaformulas, and painted their exquisite colourful pictures ·(rāgamālā), which came to be known as the visualized music. Well has it been said by Prof. O. C. Gangoly in this connection that each raga or melody was then dedicated to its own theme, its ethos, its presiding genus,

<sup>9.</sup> Ibid., p. 48.

its devatās. And it was by the prayer of the adept musician, the singer, or the interpreter, who had to immerse in the theme and identify himself with it, that the devatās—the spirit of the rāga was made visible (mūrtimanta) in the symphonic form,—the nādamaya rūpa, and thus they used to visualize the image of the rāga in ecstatic vision.

Different kinds of musical phrases (sthāya) and compositions (prabandha) were in use even at the beginning of the Christian era, and they have been described in Bharata's Nāṭyaśāstra in connection with the classical dramatic performances. Matanga, Pārśvadeva and Śārangdeva have elaborated them in a systematic and scientific way in their respective works.

The history of development of classical music of South India is also interesting. In ancient times, there was no such artificial line of demarcation, dividing the music of India into Northern and Southern categories. Probably, during the 14th-16th century A.D., Madhava-Vidyaranya (1302-1387 A.D.), Ramamatya (1550 A.D.), and Pundarika Vitthala (1590 A.D.) flourished, and propagated the genus-species (janya-janaka) principle of the ragas, with mukbārī as the standard scale (śuddha-mela). The system of the South Indian music gradually began to take new shape, and afterwards became different from that of the North Indian music. Afterwards Somanath (1609 A.D.), Govinda Diksit (1614 A.D.) and Venkatamakhi (1620 A.D.) flourished with a new vision. The introduction of the seventy-two melakartās by Govinda Dīkṣit and Venkaṭamakhî brought into being an altogether different mode in

<sup>9</sup> Ibid., p. 48.

the South Indian music. But it should be mentioned in this connection that in spite of the introduction of the seventy-two melakartās or thāṭas, only nineteen out of them were practised during Venkaṭamakhī's time. The tonal forms of most of the rāgas of the South Indian system were also different from those of the North. The various padām, kṛti or kīrtanam, varṇam, rāgamālikā, pallivi, contributed by Purandaradāsa, Kṣetrajña, Tyāgarāja, Syāmā Sāstrī, Muthusvāmī Dīkṣitar, Svāti Tirunal and others, enriched the South Indian music.

The history of music of Bengal and Assam is equaly interesting. We learn from the history of Bengal that classical music and dance were extensively cultured during the rules of the Gupta, Pala and Sena Kings. Bengal was then known as 'Greater Bengal,' having within its fold the modern states of Assam, Bihar, Bengal proper (Eastern and Western), and Orissa. The classical dance and music, as expounded by Muni Bharata, in the Natyasastra, were properly practised by the Devadasis or temple dancing-girls in different temples of Greater Bengal. During the reign of Maurya Chandragupta, and specially during the time of the Great Emperor Asoka, Indian music was introduced to the Central Asian countries by way of Kashmere and Tibet, by the traders and religious missionaries. The music of the countries like Kuchi, Khāsgarh, Samarkand, and specially China were enriched by the process.

Now we find that during the 10th-11th century A.D., the classical ragas and talas were used in the religio-mystic songs of the Buddhist Siddhāchāryas of the Vajrayāna and Sahajayāna schools. In the early 12th century A.D., Thākur Jayadeva of Nānnur (Birbhum) composed the Gītagovinda-padagānas, and they were used to be

sung with different classical ragas and talas. The ragas of the caryapadas and the gitagovinda were different in their structures from those of the present-day system of the North Indian Hindusthani music. But they can be sung correctly by changing the standard scale that determines the tonal forms of the ragas, prevailing in these days. During the 15th-16th century A.D., Srī Chaitanya (1485-1533) composed the nama-kirtana out of the materials of the carya, gitagovinda-padagana, pancali, krsna-kirtana, baul and other religio-devotional songs that were current before and in his time. The nama-kirtana, though very simple, enriched the music of Bengal by its charming pathos. The kirtana-type of devotional song was composed, and used to be sung in praise of the Lord of the universe, superman, gods and goddesses, and heroes. It was known as the 'kīrtigāthā-gāna'. It has been described as the prabandha-gīti, having six limbs (angas), in Ghanasyama-Narahari's Bhaktiratnākara, and the Gitacandrodaya. The six limbs of the kīrtigāna or classical kīrtana are: svara, viruda, pada, tenaka, tāla and pāta, and they have been elaborately discussed in Sarangdeva's Sangita-Ratnakara, and Narahari's Bhaktiratnākara. Its allied classical prabandha-gāna is the kīrtilahari-gana which has also been described in the Sangita-Ratnākara.

After Stī Chaitanaya, Thākur Narottamadāsa (16th century A.D.) devised the līlā or rasa kīrtana, which was purely classical in form. He designed it after the prabandhagāna, dhruvapada. The rasa-kīrtana was accompanied by tālas, which are described in Narahari's (early 17th century A.D.) Sangīta-sāra-sangraha and Subhankara's Sangīta-dāmodara. In course of time, there evolved different schools of padāvalī-kīrtana with different styles from different

parts of Bengal, and they were garanhati, reneti, manoharsābi, mandāriņi, jbārkandī, etc. In the beginning of the 20th century, Madhusudana Kinnar or Madhu Kan also devised a new type of dhapa-kirtana, which was simple in its form, and classical in character. The 18th century was an epoch-making period in Bengal, as many of the stalwarts in the field of music, viz. Kaviranjan Ramaprasad Sen (1720 or 1730 A. D.), Ramanidhi Gupta or Nidhu Babu (1741-42 to 1838-39 A. D.) and others enriched Bengal by their classico-Bengali songs. Vishņupur (Bankura) became instrumental in infusing new spirit and inspiration into the domain of classical music in Bengal. Many of the Muslim Ustads from Delhi and Agra settled in Bengal, and consequently Pathuriaghata (Calcutta), Muktagacha (Mymensingh), Dacca, Gauripur (Assam), Gobardanga, Agartola, Chinsural, Hooghly etc. became the seats of culture of classical music in Bengal. Sir Jatindra Mohan Tagore, and his brother Sir Saurindra Mohan Tagore helped much for the spread of the culture of classical music in Calcutta and its adjacent places. The baul, bhatiyali, jari, sārī, gambhirā, tarjā, pāncālī, kālī-kīrtana, and other socioreligious folk songs evolved in different parts of Bengal.

Assam's contribution to the domain of Indian music is none the less. During the latter half of the 16th century A. D., Sankaradeva (16th century) preached a sort of neo-Vaiṣṇavism in Assam. He and his disciple, Mādhavadeva composed bargīta, ānkiyā-gīta, kīrtana-ghoṣā, nāmaghoṣā, bhātimā-gīta, payāra, etc. in different classical rāgas and tālas. These types of music of Assam may be divided into four main groups: (a) vocal, (b) instrumental, (c) dance and (d) drama or ānkiyā-nāts. (a) The vocal music is of different kinds, and they are borgīta (baḍagīti, the

great song), akkiya-gita, jugal-patal, ghoṣā-kirtana, totāiaurtti, nāmaghosā and kīrtana-ghosā. These are sung with different sastric ragas and talas. These are entrusted to different families and groups of people, known as Gāyanas, Bāyans, Pāṭḥaks, Ojāhs, Sutradharas, Shayuha and Udhāsin Bhaktas or Kewaliā Bhaktas. (b) The instrumental music includes khola, mṛdanga, bhortāla, mañjarī-tāla, nāgarā, etc. Different tālas are played on khola and mṛdanga. (c) Dances are of two kinds, ojāpali and gāyana-bāyana-nṛtta. (d) Dramas are of different types, and they are followed by songs or kirtanas. The different types of songs (gitis), as have been mentioned before, are still sung in different Satras, Nama-gharas and villages in Assam. The Manipuri dance and kirtana are regarded as the unique contribution to the domain of Indian music. This type of dance is always followed by themes, as are depicted in the Radba-kṛṣṇa-līla. The gestures and postures, together with constume are beautiful and graceful. The khola (mrdanga) accompanies the dance.

The history of the development of music in Orissa is also very interesting. The sculptures of the Jain Cavetemples of Udayagiri and Khandagiri, of the temples of Parasurāmesvara, Rājārānī, as also the colossal Sun-temple of Konārka bear ample evidences as to the development of classical and folk dances and music in Orissa. The Orissan dance and music, and different types of her folk song construe a fascinating chapter of Indian music. The Abbinayacandrikā, written by Mahesvara Mahāpātra, during the 12th century A. D., has described the gestures and postures, and different kinds of hand-poses (mudrās) of the Orissan dances, which differ from those described in Nandikesvara's Abbinayadarpana and Muni Bharata's

Nātyašāstra. Different kinds of musical instruments of Orissan type can also be seen in different sculptures of Orissan temples like Konārka, Puri, and Bhubaneśvara. Many of the treaties on Indian music were also composed in Orissa from the early 12th century upto the 18th century A. D., and of them the Gīta-prakāśa, Saṅgīta-nārāyaṇa, Saṅgīta-saraṇi, Saṇgīta-kāmoda, etc. are worthmentioning.

The history of Indian music is, in reality, very amazing. From the primitive period right down to the present day, it has created and is also creating a glorious history of its own, and the music of the other nations of the world are much indebted to it. Its range is vast, and so it is not possible to enclose it within the narrow compass of a few printed pages, still we are aware that there is necessity for such venture, as it will unfold before the eyes of the readers a picture, however small, of the achievements of the historic and glorious India in the domain of fine art of music.

# CHAPTER II

# MUSIC IN THE NĀRADĪSIKŞĀ AND THE NĀTYASĀSTRA

1

# The Naradisiksa:

Music lay asleep, as it were, in the womb of Nature, and its awakening means its manifestation in the gross form from the unmanifested causal one. The upholders of the Sānkhya and the Vedānta believe in the satkāryavāda, which means effect is the manifested form of cause that exists eternally. They maintain that everything comes out from that which already exists in a causal form. The theory of evolution also connotes the idea of gradual manifestation of that which already existed in a subtle or causal form, and involution implies the notion of going back to the causal state: "nāśab kāranarlayab". From this it is evident that evolution means the manifestation of something in a gradual process. Evolution is not, therefore, an entirely new thing, but the emergence of the new form out of the ashes of the old one, with some necessary changes like additions and alterations-adjustments and readjustments. It has been mentioned in the Rgveda:.. "süryacandramasau dhātā, yathā pūrvamakalpayat", i.e. the first-born Lord (Hiranyagarhha-Brahman) created (projected) the phenomenal universe with its sun, moon, stars, etc. as they existed in the previous cycle. The art of music also developed from the causal state into the gross form through the medium of gradual progress, and it will go on developing until it reaches perfection.

The rāga is the norm or matrix of Indian music. and it forms the main structure of Indian music. The word 'rāga' occurs four times in the Nāradīśikṣā: thrice in the second section (kāṇḍa) and once in the fourth section of the first chapter (prapāṭḥaka). It may be asked as to what does the word 'rāga' signify. Nārada says that the grāma-rāgas fully convey the idea and significance of the 'rāga' which means that pleases and soothes the mind of all living beings ("rañjayati iti rāgaḥ"). Nārada has described about the svara-maṇḍala which is constituted of tāna, rāga, svara, grāma, mūrcchanā, etc. Nārada says,

Sapta-svarāstrayo grāmā mūrcchanāstekavinisatih/ Tānā-ekonapañcāsadityetat-svaramaņdalam//

Further he says,

Tāna-rāga-svara-grāma-mūrechanānām tu lakṣmaṇam/, Pavitram pāvanam punyam nāradena prakīrtitam//

According to Nārada, tāna, rāga, svara, grāma and mūrcchanā, that constitute the svara-maṇḍala, are sacred and purifying, because they bring permanent solace and tranquility to the minds of men and women. Some maintain that Nārada of the Sikṣā has used the word 'rāga' in the sense of a note (svara) and not in the sense of a melody (rāga) which is formed out of the combination of notes or tones, and so he has used the particular word 'rāgasvara' instead of 'rāga'. Therefore the words in the śloka: ''tāna-rāga-svara-grāma' etc. and ''svara-rāga-viśeṣeṇa rāgasvara iti smṛtaḥ' do not seem to be very happy. As a matter of fact the grāmarāgas are named after the initial notes of the ancient grāmas like ṣaḍja, madhyama and gāndhāra. The practice of the grāma-rāgas were also current in the pre-Christian era, and they are found mentioned in the Great

Sand of the later of the later

Epics like Rāmāyaṇa. (400 B.C.), Mahāhbārata (300 B.C.) and Harivamśa (200 B.C.)

Some hold that the Nāradīśikṣā being a book of Vedic prosody, has nothing to do with the topics of music. But they are not correct in their views, because the Nāradīśikṣā deals with the fundamental laws and principles of both the vaidika and laukika types of music with their uses of metres, tones and tunes. Nārada has also described the essentials of vocal and instrumental music, based on the three ancient basic scales or grāmas like ṣadja. madbyama and gāndbāra. But, truly speaking, the use of the gāndbāra-grāma became almost obsolete during Nārada's time in the 1st century A.D. and he has admitted the fact in the NS:

Ṣaḍja-madhyama-gāndhārastrayo grāmāḥ prakīrtitaḥ/ Bhurlokājjāyate ṣaḍjo bhuvarlokācca madhyamaḥ//, Svargānnānyatra gāndhāro nāradasya mataṃ yathā/

The words 'bhub', 'bhuvah' and 'svah' connote the ideasof nether or human world, ether or spirit world and upper world or devaloka. Now, what do we mean by 'devaloka'? The devaloka or upper world, in the ancient times, signified the higher level of India which meant the Gandhara-desa (modern Kāndābāra), inhabited by the semi-divine and musicloving Gandharvas. It is said that the Gandhara-desa wassituated on the North-West Frontier of India as it is at the present day, and it is believed that it was the ancient site where the civilization and culture of India had their dawn. For this reason it was known as the sacred region of the bright spirits or devas. And it is a fact that the Gandharvaswere fully conversant with the use and application of the gandbara-grama in their system of music, which was known as 'gandharva'. Narada is said to be the promulgater of the gandharva school (sampradaya), and so it is believed by some that he knew that the gandhara-grama, which was suitable for the gandharva type of music for the Gandharvas, would not be suitable for the music system of the world, as the tonal arrangement of the gandhara-grama was somewhat difficult for improvisation in the practical field. But this theory or belief does not seem to be sound from the viewpoint of the strict logic, because we know that Muni Bharata has also left out the discussion of the gandhara-grama from the Nāṭyaśāstra, in the 2nd century A. D., though he has exclusively dealt with the system of the gandharva music. He has also admitted the fact that the gandharva type of classical music was favourite and pleasing both to the gods and the Gandharvas. He has said:

Gandharvamiti vijneyam svara-tāla-padāstayam//
Atyarthamistān devānām tathā prītikaram punah/
Gandharvānāmidam yasmāt tasmād-gandharvamucyate//

Thus we learn that though Muni Bharata is well-acquainted with the gāndhāra-grāma, yet he has not discussed it in connection with the gāndharva type of music.

Some scholars are of opinion that gāndhāra-grāma evolved first, hence it is the most ancient of the three grāmas. While discussing about the gāndhāra-grāma in connection with the article, Survival of the Useful in Music, which appeared in the "Journal of the Music Academy, Vo. XVII, 1946," (pp. 80-89), Prof. P. Sāmbamoorthy has said: "Of the Shadja, Madhyama and Gāndhāra grāmas mentioned in early literature, the Gāndhāra-grāma is the carliest. It is referred to in the Mahābhārata and in some Purāṇas. It became obsolete by the time of Bharata and Dattila". Further he has said: "In the Gā-grāma, the

pairs of notes, sa and ma, ri and dha, and ga and ni were Samvädis. The interval between Ga and Ma, between Ma and Pa and between Ni and Sa was the same, i. e. 10/9 or a Triśruti interval. \* \* The Gāndhār-grāma, in course of time was ignored because its Rishabha, Gāndhāra, Dhaivata and Nishāda were re-discovered in the Mūrcchanā, Uttarāyatā of Sa-grāma and in its reduced Panchama 40/27 in the Madhyama-grāma. The Svaras of the Ga-grāma can even now be heard in the Vedic chants (not the Sāmagāna) of the Vaidikas of South India". While discussing about the grāmas in the Expert Committee Discussion of the Music Academy Conference, Madras in 1958, another South Indian Scholar, Sri Rāmanāthan also discussed about the gāndbāra-grāma on the basis of the śruti values as given by Sārangdeva in the Sangīta-Ratnākara.¹ Sārangdeva has shown

<sup>\*</sup> Sārangdeva has quoted Nārada of the Siksā for the values given by him. The gandbara-grama has been referred to after the sadja and madbyama gramas, and it is evident that with the suddha-suaras of the sadja-grama as the basic scale, the notes of the gandhara-grama were evaluated. Sarangdeva says in the SRK: "Gandbara takes one sruti for reabba, which means that rsabha gets reduced from its tri-śruti value to the dvi-śruti value 16/15; gandhara also takes one śruti from madhyama, which means that gandbara is raised by a śruti, i.e. its value is raised to 6/5 from 32/27, and in consequence, the original interval of 9/8 that existed between gandbara and madhyama now becomes a tri-śruti interval of 10/9. The dhaivata takes one śruti from pancama, which means that pancama gets reduced to the frequency of 40/27. Nisāda takes one śruti from dbaivata, which means that dhaivata gets reduced to 8/5; nisada also takes one śruti from tāra-sadja, which means that the frequency of nisāda gets increased from 16/9 to 9/5".

that the sruti value of the gandhara-grama is identical with the dhaivata-murcchana of the sadja-grama, and can be equated with the vilarippailai of the Tamil sources. So, according to Srī Ramanathan, it fell into disuse owing to the difficulty of negotiating the two madhyamas.

Dr. B. Chaitanya Deva has also discussed the srutiproblem of the gramas in a somewhat different manner. According to him, the oldest defined scale was of the saman chant and it closely corresponded to the Sa-grama. "Hence it is safe to assume", he says, "that this grama (sa-grāma) is the oldest of the three and the other two are later developments". Regarding the gramas, sadja and madhyama, he has further said: "It can also be noticed that Su and Ma gramas have the most balanced pairs of tetrachords. But, in Sa-grāma, whereas Sa and Ma have both fourths and fifths, Pa, an important note, has only a fifth (sa) and no fourth. To rectify this, another scale had to be formed wherein Pa found a fourth and fifth. Since the scales were descending, Pa is lowered by a comma (it is to be noted that Ri is not raised) resulting in Ma-grāma. In this scale, though Pa has acquired a fourth" (vide Drone in Indian Music, in the Journal of the MMA, Madras). Regarding the obsolete use of the gandharagrāma, he has further advanced the theory that "with both the scales combined, Ga has no fifth and Dha lacks a fourth. This drawback is amended by creating the Ga-grama wherein the two notes find the requisite counter-parts in the other tetrachords, Now, in the Ga-grama, the madhyama, which was shown to be a very important note in ancient music, has only one consonant. Further, the pancama has no consonant note at all. Sa has only one consonant. Neither are the two tetrachords balanced. These reasons might have contributed to the gradual disappearance of this scale".

Some scholars are of opinion that the gandhara-grama is still in vogue by the name of sadbarita-grama like the kaisika-grāma which exists in the name of the dhaivatagrāma. N. K. Bose has written a thesis on Melodic Types of Hindusthan (1960), and there he has said that sadharita appears to have been actually called the gandbara-grama, when it was originally borrowed from the Gandharvas. The name was subsequently abundoned when it came to be regarded as a derivative of the sadja-grama. This accounts for the popular notion that the gandhara-grama exists in heaven only and not on the earth. One of the reasons for the discontinuance of the name seems to be the inconvenience in using it, because the starting note of the scale was the antara-gandhara and not the gandhara". But it should be noted in this connection that the names of the gramas, ṣadja, madhyama and gāndhāra do not occur by their initial letters sa, ma and ga, but they are named so by their basic murcchanas, which start from the notes of the said respective grāmas, e.g. in the sadja-grāma, it is the murcchana, uttaramandra which starts from sa or sadja; in the madbyma-grāma, it is the murcchana, sauvīrā which starts from ma or madhyama, and in the gandhara-grama it is the murcchana, nanda which starts from ga or gandhara. Therefore it is neither a fact that the sadja-grama signifies singing with sadja as śruti or tonic, the madhyama-grama signifies singing in madhyama as śruti or tonic and the gandhara-grama as singing with gandhara as śruti to tonic, nor does the interpretation that sadja-grama signify the mürcchanas in the mandra-sthayi or lower octave, madhyamagrāma, the mūrcchanas in the madhya-sthāyī or middle

octave, and gandbara-grama, the murcchanas in the tarasthayi or higher octave, but their names have been given from the initial letters of their murcchanas. So whether gandhara-grama really started from the antara-gandhara as its initial letter or note should further be investigated with care. Now it is a fact that since all the important intervals and scales were inherent and implied in the sadja-grāma and its murcchanas, and since by the re-allocation of srutis many new scales were obtained, the madhyama-grama gandbara-grama became practically useless. The murcchanas of the madhyama-grama and the gandharagrāma were either covered directly by the mūrochanās of the sadja-grāma, or indirectly by the resultant modes, obtained by the re-allocation of srutis of the tones of the murcchanas of the sadja-grama. Such is also the observation of Prof. Sämbamoorthy, while discussing on the evolution of the scales.

Nārada has said that the practice of the gāndhāra-grāma is restricted within heaven i.e. in the devaloka (and also in gandharvaloka). But in the Mahābbārata-Harivamŝa, we find mention of "ā gāndhāra-grāmarāgah", which means that the grāmarāgas were sung upto the gāndhāra-grāma. Nānyadeva of Mithilā has also described obout the gāndhāra-grāma, together with the rāgas, evolved from it, in the Sarasvati-bṛdayālamkāra, the commentary on Bharata's Nāṭyaśāstra. In the Sangīta-makaranda of Nārada II, the gāndhāra-grāma has been described in this way:

Ri-ma-yoḥ śrutirekaika gāndhārasya samśraya/ Dhaivata-śrutireka ca niṣāda-śruti-samśraya// Gāndhāragrāma-mācaste tadā tam nārada muniḥ/ Pravartate svargaloke grāme'sau na mahītale// That is, if one śruti is taken from each of the notes of rsabha and madhyama and is added to the śrutis of nisada, the scale or grama so formed is called the gandhara-grama by Muni Nārada (of the Siksā). This scale or grāma was prevalent in heaven, and not on earth. Again Paundarika Vitthala of the 15th-16th century A.D. has determined the structure of the gandhara-grama thus:

Ga-nyoh sthane ri-dhau yatra laghu-sadja payo-ni-mau/ Gandharo madhyama-sthane ga-gramo yastiko matah// That is, where rsabha and dhaivata are placed in the positionof gandhara and nisada, and nisada and madhyama in the position of laghu-sadja and laghu-pañcama, and gandhara in the position of madhyama, it is known as the gandharagrāma, according to the musicologist Yāstika. Now, from this determination of Pandit Vitthala we can assume that it is difficult for the artists in general to present the scale which is consisted of rsabha having two śrutis, madhyama having three śrutis, dhaivata having two śrutis and nisāda having three śrutis, and for this reason it is probable that the useof the gandhara-grama has become obsolete. On the other hand, it is quite possible that as the tonal values of rsabha, gandhara, dhaivata and nisada were re-discovered in the uttarāyatā-mūrcchanā of the sadja-grāma, together with its. reduced pancama as 40/27 in the madbyama-grama, a so-

<sup>2</sup> The frequencies of the notes or tones in the three gramas: with their cyclic cents are: DH NI. M R G 10/9 4/3 498 3/2 702 5/3 884 16/9 32/27 Sa-grāma... 1 996 182 294 5/3 884 4/3 498 32/27 294 40/27 16/9 Ma-grāma... 10/9 680 996 182 9/5 8/5 Ga-grāma... 16/15 4/3 40/27 1 6/5

the use and utility of the gandbara-grama gradually fell into disuse.

Nārada has mentioned about two kinds of veeņā, gātra and dāravī in connection with two types of songs (gāna), vaidika (Vedic) and laukika (post-Vedic). He has said,

Dāravī gātra-veeņā ca dve veeņe gāna jātisu/, Sāmikī gātra-veeņā tu tasyah srnuta lakşmaņam//, Gātra-veeņā tu sā proktā yaşyām gāyanti sāmagāh//,

There were two kinds of veenā, dāravī and gātra, to accompany the vaidika sāmagāna and the laukika gāndharva-jātirāga-gāna. The word 'gāna' here connotes the idea of the sāmagāna, and jāti signifies the idea of the jātirāga-gāna, hence Nārada says that gātra-veenā was meant for the sāman-singers. The gātra-veenā possessed of a gourd and a wooden stem, having five, six or seven strings. It used to be played in an inclined posture with the help of fingers of the hands, and used to be played on the thighs of the player. Regarding the method of playing the gātra-veenā, Nārada has said:

Hastau susamyuktau dhāryau jānubhyāmupari sthitau/
Gutoranukṛtim kuryād yathā jñānamatirbhavet//
Praṇavam prāk-prayuñjīta vyāhṛttostadanantaram/
Savitrīm cānuvacanam tato vṛttāntamārabhet//
Prasārya cāṅgulauḥ sarvā ropayet svara-maṇḍalam/
Na cāṅgulibhiraṅguṣṭḥa-maṅguṣṭhe-nāṅguliḥ spṛset//

From this it can be imagined how scientific and methodical was the method of playing of the veena in accompaniment with the songs.

Nārada has also described about the tānas or elaborations of the tones. There were 12 tānas in the sadja-grāma, 20

in the madhyama-grāma, and 15 in the gāndhāra-grāma = total 47 tānas. Besides, there were 21 mūrcchanās in each grāma, and they were allotted to devas, pitrs and rsis or gandharvas. There were presiding deities of each laukika tones. Nārada has said that vaidika and laukika songs (gānas) possessed ten qualities, from which ten kinds of effects were produced (guna-vṛttis), and they were raktam, pūrṇaṇ, alamkṛtam, prasannam, vyaktam, vikruṣṭam, slaknam, samaṇ, sukumāram and madhuram. He has also given the real significances of each such quality. He says that songs were significant and meaningful with these, qualities, and otherwise they were out of tones and tunes.

Närada has determined as well as defined the seven grāmarāgas like ṣāḍava, pañcama, madbyamagrāma, ṣaḍjagrāma, kaiśika, kaiśika-madbyama, and sādbārita, which are found clearly mentioned in the Kudumiāmālai Inscription of the 7th century A.D., engraved under the orders of Rājā Mahendravarman of the Pādukotai State, South India. I-le has beautifully defined the term 'gāndharvaṃ', and says,

Geti geyam viduh prājūāh dheti kāru-pravādanam/
Veti vādyasya samjūeyam gāndharvasya virocanam//
The commentator Bhattasobhākata explains the above śloka
thus: "gāndbarvasya āgatam gāndharvam tasyākṣaropalakṣitārtha-pratipādanena virocanam viseṣato rocanamuddīpanam bhavati ga-śabdena gānam lakṣyate, dha-kāreṇa vakāreṇa vaiṇikasya pravādanam \* \*"; i. e. when songs are
properly accompanied by musical instruments they are
known as gāndharvam. The gāndharva type of songs
was first promulgated by Druhina Brahmā or Brahmābharata, and was there after enriched by Sadāśiva or Sadāśivabharata and Muni Bharata and others.

Bharata has identified the tones of the vaidika music with those of the laukika ones, and this identification has been made by means of tonal quality and their pitch values. As for example, Nārada says,

Yali samaganam prathamah sa venor-madhyamah svarali/,
Yo dvitiyali sa gandhara-strtiya-stvrsabhah smrtah//
Caturthah sadja-ityahuh pancamo dhaivato bhavet/
Şaşthe nisado vijneyah saptamah pancamah smrtah//

That is, the tone prathama and its value (in the gana) are equal to madhyama and its tonal value (in the venu i.e. laukīka classical type of music); the tone, dvitīya and its value are equal to gāndhāra and its value; trītya and its value are equal to rṣabha and its value; caturtha and its value are equal to ṣadja and its value; pañcama or mandra and its value are equal to dhaivata and its value, and ṣaṣṭḥa or atisvārya and its value are equal to niṣāda; and saptama or hruṣṭa and its value are equal to pañcama.

The ancient musical instruments, veenā and the venu were used for the types of music, vaidika, and laukika, or it might be possible that Vedic music used to be determined by means of veenā, and the laukika one, by means of venu or pipe, made of bone, wood or bamboo. It may be asked as to why the lute or veenā was known as the symbol of the Vedic music and the pipe or venu as that of the classical formalised dešī and simple folk music. It is a historical fact that the pipe or venu is the most ancient musical instrument, which evolved immediately after the instrument of percussion i. e. drum. In the primitive time, the drum (dundubhi or bhumi-dundubhi) and the pipe or flute (venu or vamša) were used as musical instruments supporting the simple rude music of the primitive nations.

Gradually the gut-stringed musical instrument of the rude harp-size lute or veenā evolved, and in the Vedic period, it was considerably developed and used as accompaniment to the Vedic music. The Vedic music was more developed than the simple songs of the primitive as well as prehistoric times. It is also a fact that the materials of the Vedic music were taken from the folk music of the ancient times. as it came to be regarded as a symbol not only of the folk music, but also of all kinds of music other than the Vedic one. Similarly in the Vedic time, when the lute or veena evolved in such a manner so as to accompany the Vedic music, it began to be held as the symbol of the Vedic songs. In fact, musical instruments used to play important role in the music of ancient times. In the Natyasastra, we find that the drum, puskara used to determine the pitch values of the tones of music.

As regards the origin of tones, Narada has suggested that the musical tones evolved as if from the final vibrationunits of the tones (sounds) of birds and animals, e.g. the final tonal vibrations of peacock resemble the tonal pitch and value of the note, sadja, and so it is taken by some that sadja originated from the tone or sound of the peacock. Similarly the sound or call of the bull resembles that of rsabha; the sound of the ram or sheep resembles that of gandbara; the sound of the crane resembles that of madbyama; the call of the cuckoo resembles that of pancama; the sound of the horse resembles that of dhaivata, and the sound of the elephant resembles that of nisada. Perhaps some close observations were made in ancient times to find out whether tonalities or pitch-units of the musical notes resembled the sounds of the birds and animals, and this fact is delineated in the Sanskrit scriptures like Rkprätiśākhya, Nāradīśikṣā, Sangīta-Ratnākara, etc. However this theory needs further testing in the light of modern science and reason.

Nārada has further dealt with in the aphorisms 5 to 12 of the fourth chapter in the Sikṣā the scientific explanation of the origin of seven musical tones. His statements in the aphorisms 5 to 6 do not seem scientific, as he states therein that ṣaḍja rises (originates) from the throat (kaṇṭḥa), ṛṣabha from the head i.e. mouth, gāndhāra from the nostril, madhyama from the top part of the palate, pañcama from the conjunction of upper part of the palate, throat and mouth, dhaivata from the inner part of the brow (lalāṭa), and niṣāda from the conjunctions of all limbs. But, it has already been said that this explanation does not hold good, and so Nārada has said,

Nāsām kantha-murasthālu-jihvā-dantašca samšriali/ Şadbhi sanjāyate yasmāt tasmāt şadja iti smṛtah//

As the air passes through these six levels of nose, throat, top part of the palate, base of the palate, lip and teeth, so it is called sadja ('sadabbighātāt jāyate iti sadja'). Similarly he has further said,

Vāyuḥ samutthito nāveḥ kaṇṭḥa-śīrṣa-samāhataḥ/,
Nadaṭṣabhadyasmāt tasmādṭṣabha-ucyate//
Vāyuḥ samutthito nābheḥ kaṇṭḥa-śīrṣa-samāhataḥ/,
Nānā gandha-vahaḥ puṇyo gāndhārastena hetunā//
Vāyuḥ samutthito nābheruro hṭdi samāhataḥ/,
Nābhiṃ prāpto mahānādo madhymatvaṃ samaśnute//,
Vāyuḥ-samutthito nābheruro-hṭdi-kaṇṭḥa-śīrohataḥ/
Pañcasthānotthitasyāsya pañcamatvaṃ vidhīyate//
Dhaivataṃ ca niṣādaṃ ca varjayitvā svaradvayaṃ/,
Śeṣāt-pañcasthāna-sthitatvena sarvasthānāni dhāryate//,

From the above-mentioned slokas it is evident that air (vāyu) or friction of air in the process of conjunction with the limbs originates musical notes or tones, and this statement seems more scientific and rational. But it should be noted that sadja, rsabha, etc. are the formalised desi or laukika tones, and they are also the classical ones. The vaidika tones are different in their names and tonal values. The names of the vaidika tones are: prathama, dvitiya, tṛtīya, caturtha, mandra (pañcama) atisvārya (sastha) and krusta (saptama). Närada has mentioned that krusta originates from murdha (head), prathama from lalata (forehead), madhyama from bhruva (middle of the eyebrows), duitiya and trtiya from karnas (ears), caturtha from kantha (vocal chord), mandra from ura (upper part of the palate) and atisvarya from the lower part of the heart. These parts are regarded as the bases of the vaidika or Vedic tones. It seems to us that those limbs are not really the bases, but only the locations, where the Samagas used to touch them with the help of their fingers in the time of singing. So it may be regarded as one of the processes of observing the time-units and metres of different saman-singings.

There is another method of observing times or timeunits and metres, and though Nārada has given an evidence of it, yet there is an anomaly of statement, because, while giving examples of touching the fingers in the time of singing the sāmans with the respective Vedic tones, he has also mentioned about the laukika tones in a simultaneous way. As for example, he has said,

Angusthasyottame krustohyangusthe prathamah svarah/, Prādeśinyām tu gāndhāra-tsabhastadanantaram// Anāmikāyām sadjastu kanisthikāyām ca dhaivatah/, Tasyādhatācca yonyāstu nisādam tatra vinyaset// Nārada has also dealt with the problem of microtones, which were afterwards came to be known as jātis or causal microtones (jātiśrutis). He has enumerated the microtones as five, and they are: dīptā, āyatā, karuņā mṛdu and madhyā:

Dīptāyatā-karuņānām mṛdu-madhyamayosthā/ Śrutinām yo'viśeṣajño na sa ācārya ucyate//

Nārada has definitely said that a master (Ācārya) of music is he, who knows the intricate positions and problems of the microtones. Regarding their bases (sthānas) on the seven tones, he has said that dīptā resides in the Vedic tones, mandra, dvitīya and caturtha; karunā, in the tones, atisvārya, tṛtīya and kruṣṭa; and mṛdu, madhyamā or madyā and āyatā in the tone, dvitīya. The names of these microtones (śrutis) are very significant, as they convey aesthetic sentiments and emotional moods (rasas and bhāvas). As for example,

- dīptā— connotes the idea of brilliance, lusture, stimulation, etc.
- āyatā— connotes the idea of broadness, immensity, vastness, etc.
- karuņā—connotes the idea of compassion, pity, softness, etc.
- 4. mrdu— connotes the idea of timidness, softness, tenderness, humiliation etc.
- medhyamā or madhyā—connotes the idea of medium, balance, control, etc.

Muni Bharata has devised as well as divided the twenty-two microtones (*śrutis*) on the basis of these five causal microtones, as expounded by Nārada, and there occur some

common names among the twenty-two microtones. As for example,

	Bharata
•••	tīvrā
	kumudvatī
	mandā
***	chandovatī
•••	dayāvatī

The five causal microtones occur also in the base-tones like udātta, anudātta and svarita—high, grave and circumflex. Regarding it, Narada has said,

Dîptamudatte janiyat dîptam ca svarite viduh/, Anudatte mrdurjneya gandharva śruti-sampadah//

There is a controversy regarding the exact date of the Nāradīśikṣā by Nārada I. Some scholars ascribe the date to the 5th century A.D. and some to the 7th-9th century A.D. But most of the scholars are of opinion that it was written in the 1st century A.D., and this date has been accepted for many reasons.

The Nāradīśikṣā is a book on the science and art of the Vedic meters, phonetics, tones and tunes and the method of singing of the Vedic music, sāmagāna. It is the most important śikṣā among all others, as it deals with the problems of music, both vaidika and laukika. Again it should be remembered that the Nāradīśikṣā has, for the first time, determined the fixed scale of the sāman-singing. The Vedic tones has been called as yama, meaning that, which controls the tunes of the sāmagāna. The Rk-prātišākhya states: "triṣu mandrādiṣu sthāne ekaikasmin sapta-sapta yamāḥ bhavanti", i.e. three sets of tones of the Vedic music formed the complete saptaka

(European octave, containing eight tones, sa to sa) of both the vaidika and laukika music. So we get the seven tones from the three base-tones, udātta, anudātta, and svarita thus:

3 and 5	4, 1 and 7	6 and 2	
grave	medium	high	
(anudātta)	(svarita)	(udātta)	

Similarly we get the seven tones of the gandharva and desi types of nusic thus:

ri dha 2 6	sa ma pa	ni ga 7 3
(grave)	(medium)	(high)
bass	circumflex	acute

Again from the ślokas: "yaḥ sāmagānām prathamaḥ sa venor madhyamaḥ svaraḥ", etc., we get the following corresponding tones of both the systems of music, vaidika and laukika:

prathamamadhyama	(ma),		
dvitīyagāndhāra	(ga)		
tṛtīyarṣabha	(ri)		
caturthasadja	(sa)		
mandradhaivata	(dha) )		( ni )
atisvāryaniṣāda	(ni)	or <	dha
krustapañcama	(pa) )		pa )

Now, as the tones of the Vedic music were in downward trend: "krustādayāh uttarottaram nīcā bhavanti" (—the Sāmatantra), so the Vedic scale is known as: ma, ga, ri sa/dḥa, ni, pa (dḥa and ni being vakra), or as: ma ga ri sa/ni dḥa pa (being straight) i. e. prathama, dvitīya, tṛtīya, caturtha, mandra, atisvārya and krusta, or prathama, dvitīya, tṛtīya, caturtha, atisvārya, mandra and krusta. The Vedic tones had their movement towards the grave or bass—"mandra-gatih".

Again the Nāradīśikṣā narrates that there were different recensions (śākbās) of the Vedas, and the upholders of those rencensions were divided accordingly into different schoolssampradayas. The process of singing of different sāmagānas were different due to their application of different members of tone. The protagonists of some of the recensions used three or four tones in their saman songs; some five, some six, while those, who followed the recension of the Kauthuma sect, used seven tones. But usually five tones were used in the saman-singing (samagana). The Vedic tones had their definite pitches and values, and they were extended upto three registers (sthanas), mandra, madhya: and tara,-grave, medium and high or acute. Accord-, ing to the Nāradīśikṣā, the svaramandala was in use in the later system of the samagana. It is needless to mentionthat the Vedic music, samagana was the source or fountainhead of all kinds of post-Vedic music. The folk music might be the source of the refined and exalted music, but the sāmagāna was the source of inspiration of all types of music.

II

## The Natyasastra:

During the time of Bharata, in the 2nd century A. D., the system of Indian music was very much developed. The

renaissance of music in the beginning of the classical period (600-500 B. C.) was contemporaneous with that of in Greece. Brahma wrote his drama, Brahmabharatam at that time and formulated a new type of music, known as classical gandharva. Most of the materials of the Vedic music were incorporated in the gandharva type of music. It was systematically constituted with tones, microtones, scales, murcebanas, tanas, etc. The science of the microtones was much developed in Bharata's time, and he devised it with the help of two kinds of veena, acala, having fixed frets and cala, having shiftable frets. Bharata has formulated the principles as well as materials of the gandbarva on the basis of those, as delineated in Brahma's monumental work, and he has admitted the debt in the Natyasastra. has called his drama the 'Natyaveda', which is known also as the Pancamaveda or Gandharvaveda. Like Narada, Bharata seems to have been a scion of the clan of the Gandharva. Regarding his Natyaveda-cum-Natyasastra, he has stated:

Samkalpya bhagavanevam sarvān vedānānusmaran/ Nāṭyavedam tataścakre caturvedānga-sambhavam// Jagrāha pāṭḥya-mṛgvedāt sāmebhyo gītameva ca/ Yajurvedādabhinayān rasānatharvanādapi//1

The Lord Brahmā desired to compile a science of dramaturgy (Nāṭyaveda), and thus contemplating upon the four Vedas, he collected the materials thereupon and compiled the Nāṭyaśāstra. He took the plots of drama from the Rgveda, music from the Sāmaveda, the art of acting from the Yajurveda, and aesthetic qualities from the

<sup>1</sup> Vide Nātyašāstra (kāvyamālā ed., Bombay), I. 16-17.

Atharvaveda'. 'Now it is evident from these lines that the science of drama or dramaturgy, together with music, already existed in the Vedic time, and Brahmā or Brahmā-bharata carried on his investigations in the field of drama, dance and music in a novel way, with the help of the materials, as contained in the Vedas and Vedic music. In fact, Bharata has compiled his Nātyaśāstra, after following the footsteps of his grand predicessor, Brahmā or Brahmā-bharata.<sup>1</sup>

Besides the periods, ancient, mediaeval and modern, the history of Indian music can further be divided into three sub-periods, in a different way, and they are pre-jāti, jāti and post-jāti periods. The Vedic period, with its sāman songs, falls within the pre-jāti period; the jāti period ranges from the beginning of the classical period i.e. from 600-500 B.C. to approximately 5th-7th century A.D. and the post-jāti period begins nearly from the time of Matanga i.e. 5th-7th century A.D. and is extended upto the present time. But this division is made, according to the period of evolution of the jātis or jātirāgas. On the other hand, the previous divisions such as, ancient, mediaeval and modern are accepted by the historians.

The advents of Nārada and Bharata were in the jātiperiod. Both of them were great exponents of Indian
music, but their methods of treatment were different, to
some extent. Nārada was an annotator of music, obtaining
in the Vedic Sikṣās, and described both the types of music,
vaidika and laukika. But Bharata's treatment was more
elaborate, methodical and scientific. Though he borrowed

<sup>1 &</sup>quot;Ājñāpito viditvaham nātyavedam pītāmahāt"—Nātyaśāstra. I. 25.

most of the materials of music, dance and drama from Brahmā, the first and foremost exponent of Indian music, yet his manner of exposition was new and novel. It has been said before that Brahmā compiled the book, Brahma-bharatam, and similarly Siva or Sadāśiva composed the book on drama, Sadāśivabharatam. Abhinavagupta has mentioned about them in his commentary, Abhinavabhāratī thus: "etena sadāśiva-brahmā-bharata-traya-vivecanena brahmāma-tasāratā pratipādanāya \* \* "i.e. 'let me prove the substantia-licy of Brahma's view on nāṭya, after surveying the views of Brahmā, Sadāśiva and Bharata'. From this it is understood that Brahmā, Sadāśiva and Bharata, these three authentic writers on dance, drama and music, were known to Abhinavagupta.

It has already been said that during Bharata's time, in the 2nd century A.D., the gandbarva type of music was in practice, which, in its turn, was divided into three classes, Temple, Court and Drama. The Temple music was sacred, and used to be presented on holy occasions in the temples and before ceremonial rites. The Court music was confined to the Royal Courts, and the Dramatic music was used in the dramatic performances (abbinaya). The laukika seven tones like sadja rsabba, etc. together with two displaced or flat (komala) tones, antara-gandhara and kakali-nisada were used in those three classes of music. It should be noted in this connection that during Bharata's time, there were only two displaced or flat (vikṛta or komala) tones, and they were antara and kākalī. Before the Christian era, we do not get any reference of any displaced tones. In the Rāmāyaṇa, we find only seven pure (śuddha) jātis or jātiragas in use in all classes of songs. Even during the times of Matanga (5th-7th century A. D.) and Pārśvadeva (9thtones. In the early 13th century or a little before that, we get more displaced tones, and even sadja and pañcama were regarded as the displaced ones. Sārangdeva has mentioned about twelve displaced tones: "ta eva vikṛtāvasthā dvādaśa pratipāditaḥ". In the 16th century, twelve displaced tones were reduced to seven ("vikṛtaścaivāpi saptaivetyevaṃ sarve caturdaśaḥ"), and in the 17th century, during Venkaṭamakhī's time, we find the use of five displaced tones: "svarāḥ pañcāiva vikṛtā". It is probable that the increase and decrease in the numbers of the displaced tones were found necessary to fit in the structures of the rāgas in different times.

Regarding the gandharva type of music, Bharata has said that the term 'gandbarva' was known by its specific materials of svara, tala, and pada: "gandbarvamiti vijneyam svara-tāla-padāśrayam" (Kāśī ed. NS. 28.8). Now, what did the terms, svara, tāla and pada convey? Bharata has defined 'svara' as tones, grāmas, mūrochanās, registers (sthanas) like mandra, madhya and tara (low, medium and high), two sadhaarnas (intermediate displaced tones like antara gandhara and kakalī-niṣāda), four varņas like arobī, avarohī, sthāyī and sancārī), six limbs or angas, alamkāras, music parts or dhātus, etc. Similarly the term 'tāla' signified avāpa, niskrāma, viksepa, pravešika, šāmya, yāti, prakarana, gita, avayava mārga, padabhanga, etc., and 'pada' signified vyanjana, varna, sandbi, vibbakti, ākbyāta, apasarga, nipāta, taddhita, chanda, vṛtta, jāti, etc. As the materials of the gandbarva type of music were collected (anvista) from the Vedas i.e. from the Vedic music, sāmagāna, it was considered as vaidika and apauraseya i.e. independent of man's creation. In fact, the basic

materials of the gandharva type of music were traditionally handed down from the most ancient times, and it was afterwards modified by the expert musico-dramatists like Brahmā, Sadāśiva in the 600-500 B.C.

Muni Bharata has also adopted the gandharva type of music in the Natyasastra, but he has further modified it in a novel way. Regarding the source of the gandarva music, Bharata has stated: "asya yonirbhaved ganam veenā vamšastathaiva ca" (N.S. 28.10). The word 'gāna' signified the sacred Vedic music and the word 'vamsa' signified the formalised dess music. The lute or veena was the chief musical instrument of the Vedic times, so the Vedic music sometimes signified the word 'veena'. Again, as the pipe or flute (vanisa) of bamboo evolved in the second stage of evolution of the musical instruments and the lute or veena in the third stage, and as the refined Vedic music was mainly constituted out of the materials of simple regional-cum-folk music of the primitive and prehistoric times, so the most ancient pipe or vamsa stood as the symbol of music, other than the Vedic one.

Bharata has described eighteen jātis that evolved from the two basic scales (grāmas), ṣaḍja and madhyama, current in his time (2nd century A.D.) The jātis were the rāgas (melodies), or it can be said that during the time of classical period, the rāgas were known by the term 'jāti', the causal or basic type of melodies. Bharata has divided the jātis into two classes, pure (śuddha) and mixed (vikṛta) and they are: 1 "jātayo dvibidhā śuddhā vikṛtāśca, tatra śuddhā ṣaḍjagrāme—ṣāḍjī, ārṣabhī sadhaivatī niṣādavatī, gāndhārī madhyamā pañcamī madhyamagrāme....". These were the pure form of jātis, evolved from the two grāmas.

Besides, there were eleven mixed jātis, and they were: "ṣaḍjodicyavatī, ṣaḍjakaiśikī, ṣaḍjamadhyamā, raktagāndhārī, gāndbārodicyavā, madhyamodicyavā, gāndbārapañcamī, āndbrī, nandayantī, karmāravī and kaiśikī". The three jātis, ṣaḍja, madhyama, and pañcama were included in the category of svara-sādhāraṇa, having their initial notes (svaras), sa-ma-pa as intermediate ones.

Again the seven pure jātis were named after seventones (svaras), and the rest eleven ones were mixed, being an admixture of two or three jātis. As for example,

ı.	Şadjamadhyamā	ad	mixture	of	ṣāḍjī + madhyamā.
2.	Şadjodicyavā		,,	11	ṣāḍjī + gāndhārī + dhaivatī.
3.	Şadjakaiśikī -		"	,,	ṣāḍjī + gāndhārī.
4.	Gāndhārodicyavā		"	,,	ṣāḍjī + gāndhārī +
5.	Madhyamodicyavā			,,	dhaivatī + madhyamā. gāndhārī + pañcamī + dhaivatī + madhyamā.
6.	Raktagāndhārī		n		gāndhārī + pañcamī +, madhyamā + naiṣādī.
7.	Andhtī	•••	,,		gāndhārī+ ṣāḍjī.
8.	Nandayantī	•••	"	,,	gāṇdhārī+pañcamī
9.	Karmāravī		,,	**	+ ārşabhī. naiṣādī + ārṣabhī + pañcamī.
10.	Gändhārapañcamī		,,	,,	gāndhārī + pañcamī.
	Kaiśikī	•••	,,	"	dhaivatī + gāndhārī. + ṣāḍjī + madhyamā + pañcamī + naiṣādī.

In Bharata's time, the mūrchanās used to play the role of the modern thāṭas or melas or melakartās, so as to determine the correct structure of the rāgas. Bharata has divided the jātis into heptatonic (sampūrņa), hexatonic (sāḍava) and pentatonic (auḍava) forms, according to their number of tones or notes. He has considered the amsa as the most important and prominent tone in the jātis Regarding an amsa he has said: 'tatramso nāma,

Yasmin-vasati rāgastu yasmāccaiva pravattate/
Tena vai tāra-mandrānām yo'tyarthamupalabhyate/
Mandranca tāra-viṣayā panca-svaraparā gatiḥ//
Aneka-svara-samyogo yo'tyarthamupalabhyate/
Anyacca valino yasya samvādī cānuvādyapi//
Grahopanyāsa vinyāsa-vinyāsābhyāsagocaraḥ/
Parivārya sthito yastu so'msoḥ syād dasa-lakṣmaṇaḥ//

That is, a tone or note was known as an amsa, when it possessed of ten characteristics like:

- (a) the quality of creating impression of sweetness as well as that of attracting the minds of all living beings,
- (b) the capacity of creating aesthetic sentiments and moods,
- (c) the power of manifesting upto five consequitive tones in a downward trend in the lower octave (saptaka).
  - (d) which is surrounded by other tones,
- (e) the consonant and the assonant of which are prominent,
- (f) which is recognised by the production of the initial tone (graba),
- (g) which is recognised by the production of the final tone (nyāsa),
- (h) which is recognised by the production of the apanyasa, and
- (i) which is recognised by the production of the vinyāsa.

Therefore, the term amsa bore a special significance in Bharata's time, and as such whether amsa was equal to vādī or sonant in its status, should be minutely observed. But again we find that Bharata has dealt separately with the problem of the determining tones like, vādī, samvādī, anuvādī and vivādī (sonant, consonant, assonant and dissonant) in the same chapter (28th, Cf. Vārānasī ed.): "vādī caivātha samvādī anuvādī vivādyapi". In this connection, he has said: "tatra yo yatrāmsah sa tasya vādī" i.e. sonichow or other an amsa bears the similar status and value of a vādī, and he has been supported in this respect both by Matanga and Pārsvadeva.

Bharata has stated that there were 63 amśas in all in the two grāmas, ṣaḍja and madhyama. Matanga has defined amśa in a more explicit manner. According to him, an amśa is that which gives birth to a rāga, and is self-sufficient (vyāpaka): "rāga-janakatvāt vyāpakatvāc-camśaṣyaiva prādbānyam".

- (a) "Yasminnamśe kryamāne rāgābhivyaktir-bhavati so'pyamśah",
- (b) "Yasca vahu-prayogātarah so'pyamsah".
- (c) "Yo rāgasya viṣayatvenavasthitaḥ svarāḥ so'pyamśaḥ".

Matanga has said that an amsa has a tendency of becoming a vādī, and though Bharata has said that an amsa is also known as a graha, yet there lies a difference between an amsa (sonant) and a graha (initial). As for example, Matanga has said: "nānyevam grahāmsayoh ko bhedah? ucyate; amso vādyeva param, grahastu vādyādi-bheda-bhinnascaturvidhab". Pārsvadeva has defined amsā in the similar

<sup>1</sup> Vide Brhaddesi (Trivandrum ed.), p. 56.

way. He has said that an amsa means the prominent tone or jīvasvara, and so it is also known as vādī. Again it should be remembered that among the seven tones, amsa used to possess the capacity of creating the tune, and so it is known as the jīvasvara: "sapta-svarānām madhye'pi svare yasmin surāgatah, sa jīvasvara ityukte amso vādī ca kathyate"."

Bharata has given the full significance of the term, rāga by means of its ten essentials (daśa-lakṣaṇas). In truth, the intrinsic nature of the rāgas of all times, ancient and mediaeval and modern, are determined by the ten essentials. It has been said before that during Bharata's time (2nd century A.D.), rāgas were known by the nomenclature of the 'jāti', and they were also determined by ten essentials. As for example, Bharata has stated, "daśavidha-jātilakṣaṇaṃ./

Grahāmsau tāra-mandrau ca nyāsopanyāsa eva ca/

Alpatvam ca vahutvam ca ṣāḍavauḍavite tathā// 28.70 That is, jātis or jātirāgas were determined by the ten essentials like graha (initial), amśa (sonant), tāra (acute), mandra (bass), nyāsa (final), apanyāsa, alpatva (rarity), vahutva (multiplicity), ṣāḍava (hexatonic form), and auḍava (pentatonic form). Bharata says that these are the essentials or saliant features of a jāti (jātirāga). From the beginning of the Christian era upto the present time, there took place many changes in forms, names and meanings of many materials of music, including those of essentials or rāgalakṣaṇas, yet the traditional method or process has been

<sup>2</sup> Vide Sangita-samayasāra (Trivandrum ed.), p. 5.

<sup>3</sup> These have been fully discussed in my book:

Historical Development of Indian Music (Calcutta 1960).

followed throughout the ages, in respect of determination of the nature of a rāga. Even in the present system of Hindusthānī music, this method has been considered as an essential one. Paṇḍit V. N. Bhātkhaṇḍe has mentioned in his Śrimallakṣyasamgītam (1934):

Lakṣaṇāni daśoktāni lakṣyante tāvadādītaḥ/, Grahāmśau mandratārau ca nyāsapanyāsau tathā// Atha samnyasa-vinyāsau vahutvam cālpatva tathā/ Lakṣaṇāni daśaitāni rāgānām munayo'vruvan//,

So, from all these evidences, it will not be irrelevant to say that the jātis, as defined and described in Bhatata's Nāṭyaśāstra, were the rāgas (causal) themselves.

In connection with the jātis, Bharata has dealt with the downward and upward movements (mandra and tāra gatis), four varņas like ārobī, avarobī, sthāyī and sañcārī, different alamkāras like prasannādi, prasannānta, prasannamadbya, etc., mūrcchanās of the two grāmas like uttaramandrā, rajanī, etc., of the jātis. He has also described about the basic grāmarāgas like ṣadjagrāma, madbyamagrāma, ṣāḍava, pañcama, sādbārita, kaiśika and kaisika-madbyama, which were elaborately depicted with notations in the rock-cut Kudumiāmālai Inscription, installed by the Pallava Rāja, Rājā Mahendravurman, in the 7th century A.D., at the Padukotāi State, South India. In the 32nd chapter (cf. Vārānasī ed.), he has mentioned:

Mukhe tu madhyamagrāmaḥ ṣaḍjaṃ pratimukhe smṛtaḥ/ Sādhāritaṃ tathā garbhe marśe kaiśikamadhyamaḥ//, Kaiśikańca tathā kāryaṃ gānaṃ nirvahane vudhaiḥ/ etc.

These basic gramaragas were probably practised even in the pre-Christian era, as we find the statement of

Brahmā or Brahmābharata, as quoted by Matanga in the Brhaddesī:

"Mukhe tu madhyamagrāmaḥ ṣaḍjaḥ pratimukhe
bhavet/
Garbhe sādhāritaścaiva-avamarśe \* \* tu pañcamaḥ//
Citrasyāṣṭādaśāṅgasya tvante kaiśikamadhyamaḥ/
Suddhānāṃ viniyogo'yaṃ brahmanā samudāḥṭtaḥ//

These ślokas are similar to those, described by Bharata in the Nāţyaśāstra (Vārānasī ed., 32 chapt. 453-454).

The 31st and 32nd chapters of the Natyasastra are very important, as they deal elaborately with the topics of vadya and classical natyagīti like dhruvā. The 31st chapter contains at least 545 ślokas, and the 32nd one, nearly 484 ślokas. According to Bharata, tāla was known as 'ghana' and time or kala as interlinked with tala. The kalapata was known as laya, and laya was divided into three, slow (vilamvita), medium (madbya) and rapid (druta). Again kalās were considered as divided into three parts, citrā, possessing two matras, vartika, possessing four matras, and daksinā, possessing eight mātrās. Bharata says that tāla or time-unit used to be known by the measure of the kala: "kalā- kāla-pramānena tāla ityabhidhiyato" (31.7). tāla was of two kinds, soundless or beatless (n'sābda) and with sound or beat (sa-śabda). The soundless or beatless tālas were of four kinds, samyā, tāla, dbruvā and sannipāta. Bharata has elaborately described these talas in the Natyaśāstra. These tālas were again divided into slow, medium and rapid tempi (layas).

Bharata has further described about vastu and vidārī, of which a vastu was the part or form of a song, whereas a vidārī was the completion of a pada and a varna. The

musical essentials like amsa, nyāsa, apanyāsa, etc. were also known as vastu. In fact, the dictionary meaning of a vidārī was a part or a division of a tone (svara) or a song (gāna). A vidārī was divided into samudga, ardba-samudga, and vivṛta. Besides, it was further divided into mabā-vidārī, and avāntara-vidārī. In fact, the short divisions of a song or an ālāpa was known as a vidārī, and so, in that sense, the ancient divisions (dbātus) of a song like udgrāba, dbruva, melāpaka, etc. and also the modern dbātus like stbāyī, antarā, sañcārī and ābhoga are also known as vidārī.

Like vidārī, Bharata has dealt with the definitions of yati and prakaraṇa, which were essential in connection with tāla or rhythm. A yati was no other than a method of application of a tempo (laya) of a tāla. It was of three kinds, and they were, samā, srotogatā and gopucchā. Besides there were yatis like damaru, pipīlikā, etc. The yatis used to differ from one another for the arrangements of different tempi (layas). The function of a prakaraṇa was to make the songs (gītis) like madraka, vardhamānaka, etc, ready for singing. There were 14 kinds of prakaraṇa-gītis, and they were madraka, aparāntaka, ultopyaka, prakarī, obeṇaka, rovindaka as well as uttara, chandaka, āsārita, pāṇika, rc, gāthā and sāma. These prakaraṇa-gītis were sung in praise of Siva in ancient times, and so they were known as the Sivastutis.

Bharata has elaborately dealt with the dhruvā type of dramatic songs in the Nāṭyaśāstra. He has said that they were 464 in number, and were divided into sama and viṣama. The sama-dhruvās were posseessed of vṛṭṭas and akṣaras. The dhruvās had in them five categories like

jāti, stbāna, prakarana, pramāna and nāma. The dbruvāgītis like prāvesika, naiskrāmika āksepita, prāsādīka and santara were used in different functions of the dramatic performances (abbinayas). They were also known as pravesiki, naişkrāmikī, āksepikī, prāsādikī and santarā or antarā. The prāsādikī type of dhruvās used to create calmness, as it was saturated with pleasing and soothing aesthetic qualities. The pravosiki-dhruvas were used when any character first appeared on the scene. The naiskrāmikī ones were used when character left the stage. The aksepiki ones were at the discretion of the author of eminence in situations, not usually allowed. The pravešiki ones were used for bridging the gulf between two successive situations of contrary emotional appeals. The santara ones were used to cover the faults in the dramas or to smoothen over unexpected sudden incidents like height of anger, sorrow, forgetfulness, sleep, maden, fainting, falling down, etc. Vidwan Vasudeva Sastri of Tanjore has said that "the pravesiki-dhruva has changed its name to dharu in Tāmil and Telugu stage. In the dance-dramas, that were revived in Telugu and Tamil in the Vijayanagara or Carnatic Empire (called dhruvas), formed an integral part and were always accompanied by nṛtya, for which dance-syllables or jātis were added in some cases by the author himself".

In connection with the above-mentioned five kinds of dhruvā, Bharata has discussed about the significance of the gāndharva, constituted out of svara, tāla and pada. The meanings of svara and tāla are clear. The word pada connotes the idea of a song or songs in a drama, as distinguished from songs not intended for the stage, called prabandhas. The dramatic performance or visual representation by gestures being an invariable feature of drama, padas were

always accompanied by abbinaya. Vidwan Vasudeva Sastri says: "The characteristic of a pada is, therefore, that it is intended for nṛṭya or dance with gesticulation. When nṛṭya or dance with gesticulation came to be cultivated as a separate art, padas as special species of musical composition, came to take an established place in musical composition, along with prabandhas which were not intended for nṛṭya. The characteristic of a pada, as distinguished from other musical compositions, is that it is full of bhāva or aesthetic and emotional appeal, and is generally intended for nṛṭya, though it can also be sung without such accompaniment".

It should be remembered that Sastriji has explained that the padams are no other than the special type of emotional and lyrical musical compositions, which are used in the Carnatic music. This type of songs or compositions owe much to pada, as described in Bharata's Nātyaśāstra. In fact, the fountain-head of the Carnatic padams is the pada, an indispensible constituent of the gandharva, as mentioned in the Natyasastra. Bharata has used the word pada in the sense of songs to be used in the drama or abbinays. Bharata has said that pada forms the vastu of the gandharva type of music, and for that reason the tones (svara) and thythm (tala) are easily realised. The padas are constituted out of the combination of letters (aksaras), and when the padas are bound by rāga, tāla, yati, dhātu, anga, etc., they are known as the nibaddha type of songs (prabandha). Similarly the padas which were not bound by any tala, etc. were known as the anibaddha type of songs, and they were like the alapa or alapti. And so they were also described as satāla or with any rhythm, and atāla, without any rhythm. Bharata has said that the nibaddha type of padas was possessed of chanda, yati, akṣara, etc. In fact, the dhruvās were also known as padas or ancient prabandhas, accompanied by tāla, yati, laya, chanda, rasa and bhāva. The rāgas that were used in the dhruvās, were known as jātis or jātirāgas.

Bharata has described about the grāmarāgas like madhyamagrāma, ṣadjagrāma, ṣādbārita, kaišika, etc. and the gītis like māgadhī, ardba-māgadhī, sambhāvitā and pṛthulā were used as the parts of dhruvā-gītis. The dhruvās were applied according to suitable place and time. Both men and women took part in singing the dhruvās when they were used in the drama. Bharata says that naturally women took part in singing, because they were possessed of sweet voice and adept in the art of singing, whereas men were adept in the art of drama. Sometime both took part in singing and acting for their extra-qualities.

Bharata has also mentioned about different kinds of musical instruments. He has dealt with the veenās like citrā and vipañcī. The citrā-veenā was possessed of seven strings. The citrā is the forerunner of the modern sitāra. The vipañcī-veenā was possessed of nine strings. Besides, he

Pravešiki tu prathama dvitiyāsepiki smṛta/,
Prāsādiki tṛtiya ca caturthi cāntara dhruvā//,
Naiṣkrāmiki ca vijneya pancami ca dhruvā vudhaiḥ/
Etāsām caiva vyakṣāmi cchandovṛtta-nidatśaṇam//,
Gāndharvam yanmayā proktam svara-tāla-padātmakam/,
Padam tasya bhavedvastu svara-tālānubhāvakam//,
Yat kincidakṣarakṛtam tat sarvam pada-samjnitam/
Nibaddhaścānibaddhanca tat padam dvibhidam smṛtam//,

Satālanca dhruvārtheṣu nibaddham tacca vai smṛtam// etc.
—Nātyaśāstra (Vārānasī ed., 32nd chapt, 23-30).

has mentioned about the veenas like kacchapa, darava, ghosaka, etc. He has also described about the drums like puskara, jhallara, pataha, dardura, panava, dhakkina, etc. He has mentioned about different kinds of classical dances with hand-poses, which were used in the dramatic performances.

## CHAPTER III

## THE JATIS AS DESCRIBED IN BHARATA'S NATYASASTRA

Controversies rage round the meaning or significance of the term 'jāti' as described by Bharata. Some scholars are of opinion that there is no mention of the word 'rāga' in Bharata's Nāṭyaśāstra. But their views are not correct, as we find the word 'rāga' has explicitly been mentioned and explained at least in five places of the Nāṭyaśāstra, and they are. (1) "Jātirāgam śrutiscaiva" (Vārānasī ed. NS. 28.35), (2) "Yasmin vasati rāgastu" (21.72), (3) Rāgamārga-prayojakaḥ" (31.39), (4) "Evamenam vinā gānam nāṭyam rangam na gacchati" (32.350), (5) "Sālagā rāgaḥ saṃgharṣa eva ca" 32.475).

Some are inclined to take the word 'jāti' to mean 'genus' in a collective sense, and they say that the word 'rāga' in the technical sense of 'melody' would hardly be found in the Nāṭyaśāstra, and Bharata, therefore, used the word 'jāti' in the sense of 'genus'. This view was maintained mainly by Captain Day and some European exponents of Indian music. We think that Captain Day made a mistake when he stated, "And some centuries later when Saṅgāta-Ratnākara was written, the word 'rāga' appeared to have been substituted for jāti in the Nāṭyaśāstra'. The critical students of Indian music will find an inconsistency in Captain Day's statement, because it is a historical fact that long before Sāraṅgdeva of the Saṅgāta Ratnākara (early 13th century), Mataṅga fully defined and discussed

about the raga side by side with the jati in the Brhaddesi of the 5th-7th century A.D. Matanga has said:

Rāga-mārgasya yad-rūpam yannoktam bharatādibhih/ Nirūpyate tadasmābhir-lakṣya-lakṣaṇa-saṃyutaṃ// Yo'sau dhvani-viśeṣastu svaravarṇa-vibhuṣitaḥ/ Rañjako jana-cittānām sa ca rāga udāḥṛitaḥ//

That is, "as Bharata and other ancient musicologists (like Kohala and Yāstika) have not defined the word raga in a definite way, let us take up the task. Now, a raga is a kind of sound or dhvani, full of vowels, and it generates sweet vibrations that soothe the mind of all living beings". From this we must not apprehend that there was no system of raga prevalent in the pre-Matanga time (i.e. before the 5th-7th century A.D.), and for which Bharata has not discussed about any raga-feature in the Natyasastra, rather it is to be taken that Bharata has already followed the tradition of depicting the raga, as handed down from his revered predecessors like Brahmā, Sadāśiva and others. Bharata has mentioned about the ragas in the term of jatis, and has already discussed about seven pure and eleven mixed parent ragas (jatiragas) in a scientific manner, with their salient features like ten essentials, varņas, alamkāras, mūrechanās and different aesthetic sentiments and moods. He has also admitted the fact that the jatis were the source or fountainhead of the gramaragas and other kinds of ragas: 'jatisambhūtatvād grāmarāgāni'. Matanga has stated as to why the parent ragas like sadji, arsabhi, gandhari, madhyama, pancami, dhaivati and naisadi were known as jatis. He has stated in the Brihaddesi : "idanim laksanamabaśruti-graha-svarādi-samūhāj-jāyante jātayaḥ. Ato jātaya ityuchyante. Yasmājjāyate rasa-pratītir-ārabhyate iii jātayab. Athavā sakalā rāgader-janma-hetutvājjātaya iti. Yadvā jātaya iti jātayah. Yathā narāņām brāhmaņatvādayo jātayah, which means that the rāgas are known as jātis because they were born of microtones or śrutis, initial notes or grahas, and clusters of tones. And, for that reason, they are so called (jātis). Or as the realization of aesthetic sentiments is possible from them, they are known as jātis. Or, being the source of all rāgas, they are known as jātis. Or they are called jātis in the sense of classes, as for example, the Brāhmin, etc. forming classes of human being.

Attention may be drawn to the pure type of seven jātis, as mentioned in the Great Epic, Rāmāyaṇa of 400 B.C. Vālmīki has said that the wandering bards like Lava and Kuśa sang the rāmāyaṇa-gāna before the Royal Court of Rāmacandra, and the gānas were presented with seven jātis or jātirāgas, accompanied by mūrcchanās and tānas and with musical instruments like veeṇā, mṛdaṅga, etc. The tunes of the songs enchanted all of them who were present there. It is stated in the Rāmāyaṇa (canto IV):

Pāthye geye ca madhuram pramāņaistribhiranvitam/ Jātibhih saptabhir-yuktam tantrī-laya-samanvitam// etc.

The portion of the ślokas: "blādayat sarva-gātrāṇi manāṃsi bṛdayāni ca, śrotrāśrayaṃ sukhaṃ" etc. exactly coincides with the later definition of rāga: "śrotṛ-cittaṃ rañjayati iti rāgaḥ", given by Matanga in the 5th-7th century A.D. Now, from the reference of the Rāmāyaṇa, it is evident that the jātis were the parent or basic rāgas, and they were the forerunners or precursors of all the later rāgas, mārga and deśī.

The Mimāmsakas and the Vedāntists of India have recognised the jāti as universal or sāmānya, as distinct from

individual or viśeṣa. The universal or sāmānya is considered as eternal and unchanging, whereas the individual or viśeṣa is involved with change, decay and death, being the product of the universal. The Greek philosopher Plato called it the Type or Idea, which is permanent. Similarly, the jātis, as described in the Nāṭyaśāstra, might be taken as universals and, therefore, unchanging, and all other rāgas, being the product as individuals, are changing. Bharata and his followers believe in the potentialities of the jātis, and so they have maintained that the jātis must be considered as universals or genus, and the later evolved rāgas as vyaktis or species. Again the jātis and the vyaktis are not altogether different from each other, being the cause and the effect, and, for that reason, the designing of the effect is possible from the knowledge of the cause, the jātis.

Now, on the basis of this cause-effect or genus-species theory, some say that Bharata has not written any special chapter on the rāga-rāgiṇīs, as they were in vogue in his time, but has only given an elaborate scheme of the jātis or types, and that does not prove that there were no rāgas and rāgiṇīs prevalent in his time. The rāga-rāgiṇīs as such are individuals from the generic character, of which the conception of jātis can be formed, just as we form an idea of the individual from the jāti or type, to which they belonged. So it is not wise to conclude that during the time of Bharata, the jātis were only prevalent and not the vyaktis or individualized modes of rāga-rāgiṇīs, since jāti and vyakti are correlative to each other.

But this view is also untenable, as the students of history of Indian music fully know that in the beginning of the classical period (600-500 B.C.), when the gandbarva type of music was designed with the materials of the Vedic

music, the seven jatis or jatiragas were only prevalent in the society as the individualized modes of raga. It has been mentioned before that in the Ramayana, these seven basic jātis were described in connection with the rāmāyaņa-gāna. In the classical period i. e. from 600-500 B.C. to and-3rd century A.D., there were prevalent no other rages or raginis than the seven to eighteen basic ragas in the form of jātis. The janya-janaha scheme like jātirāgagrāmarāga, viz. cause-effect principle perhaps evolved in the beginning of the Christian era. The raga-ragini scheme in the form of masculine-feminine principle also evolved at a more recent date, in the middle of the mediaeval period, though the nucleus of it was found in the alapa-alapti scheme in the 9th-11th century, as evidenced in Parsvadeva's Sangita-samayasara. But it is quite sure that during Bharata's time, the jatis were only prevalent and played the role of the raga.

There are prevalent some other views regarding jātis. According to some, the jātis, as depicted in the Nāṭyaśāstra, were the music-parts or notations of the dhruvās and not the rāgas in themselves. The dhruvās, according to them, were the ready-made compositions or sāhitya and saṅgīta, and they were sung during the interval between the two acts of drama and also during public or household festivals in eulogy of the deities. So the jātis were the closed forms of music and as such were the precursors of the rāgas. When music began to be considered as an art independent of sāhītya, the rāgas and rāgiṇīs seem to have come into being. And though Bharata has mentioned the word 'rāga' in the term of aṃsha, it does not occur in its yogarūdha meaning. It stands only for musical value in general, and does not occur in its technical sense, though the origin of

rāgas is in the jātis, the music-parts of the ancient closed forms. During the time of Sārangdeva or even a few centuries before him, the jātis began to fall into the background, giving place to the rāgas.

But this view is not wholly correct. It is true that during the time of Sarangdeva or even a few centuries. before him, the jatis began to fall into the background, giving place to the more methodical system of ragas, but yet it is true at the same time that it is Bharata who has for the first time systematised the Indian classical music in a very scientific manner. Moreover he has fully dealt with. the theory of jatis, dbruvas, and other forms of music, together with dance and drama in the Natyasastra. It is clear from his description of the jatis that they were not really intended to be the notations or counterparts of the dhruvas (dhruvāgānas). Bharata has devoted two long separate chapters to these two types of ganas, jati and dhruva, current in his time. In fact, the jatis were the ragas as well as the ganas, as we find both the references of jatiraga. and jätigana in the Natyaśastra. Bharata has treated the jatis as the ancient primary ragas and the dbruvas as the stage or dramatic songs, quite different from the Vedic-Psalms that were confined to the community of the sagnika-Samagas. Regarding the dhruvas, Bharata has said that they were a class of hymnal or devotional songs withdifferent metrical settings (chanda-nibaddha), purely used for dramatic purposes ('pūrvaranga-vidhane tu'). He has also admitted in the chapter of the dhruvagana that he haspreviously discussed about the gandharva-gana, which was composed of svara, tala and pada, and after that he has. expounded the types of different dbruvas, possessed of svara, tala and pada. The dhruvas were included in the category of The ancient musicologist, Kohala has said,

Pañcadhā ca caturdhā ca trividam ca mate mate,

Kohalasya mate khyātam pañcadha vādyameva ca/

Suṣitam ca ghanam caiva carmabaddham tathaiva ca,

Tantrīgānam purā khyātam pañcadhā

vādya-lakṣaṇaṃ//

Nārada has said about the division:

Carmaṇā tāntrīkaṃ caiva ghanaṃ ca trividhaṃ

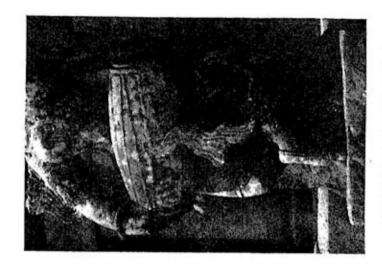

mataṃ/

Evam tridhā nāradasya mate vādyasya lakṣaṇam//
Dattila has followed Bhatata and has said,
Anaddham tatameva syād-ghanam ca suṣiram tathā/
Evam caturvidham vādyam dattilena prakīrtitam//

Sārangdeva has followed Bharata and Dattila:

"Țattatam sușiram cāvanaddham ghanamiti smṛtam
caturdhā \* \* ".

Now, if we study the history of music of all nations of the world, we find that they possessed the musical instruments to accompany their songs or to play them separately, and it is a fact that their musical instruments were divided into two, three or four main classes. The ancient Hebrew had a variety of musical instruments. In the Bible, the musical instruments have been divided into three main groups: (1) instruments of percussion, (2) wind-instruments, and (3) stringed instruments. Mr. Wanchope Stewart is of opinion that the instruments of percussion used to keep rhythms in dances and songs, and would probably be the first in the order of development, the rhythmical element in music being the feature which makes the strongest appeal to the primitive mind. The toph, tabret or timbrel was kind of hand-drum, formed

of a frame of wood, with a piece of skin, stretched over it. The usual shape of it was circular. The mesiltraim and selselim were made of brass, and they were used mainly for religious and magical purposes.

The stringed instruments of the Hebrews were played either with the hand or with plectrum. The bow-instrument, the precursor or forerunner of the lute or Indian veenā was almost unknown to the ancient Hebrews.

The ancient Greeks and Romans also did not know the use of the bow-instruments. Their lute-type of stringed instruments used to be plucked with fingers or beaten with a small plectrum, made of bone or wood. Their stringed instruments were divided into two main classes: the older simple and the instruments with large square sounding board. The original number of strings were seven like those of the Indian citrā-veeṇā, as described in Bharata's Nāṭyaśāstra. Besides the seven-stringed lyre, there was also in common use a number of different harplike instruments, with a far greater number of strings. Among other instruments, cymbals, kettle-drums and castanets were in use.

In ancient Babylon and Assyria, musical instruments were divided into three classes, percussion, wind and stringed. The instruments of percussion like drum (Sumerian āla and Semitic āla) would seem to have been used. Mr. T. G. Pinches has said that the earlier forms of percussion were very large, and were found indeed in one relic of about 2500 B.C. The stringed instruments like harp, the earliest example of which goes to 2500 B.C., the dulcimer, the primitive form of which goes before 2500 B.C., lyre, cithara, guiter, etc. were also in use. The wind-instruments like pipe, whistle or flute, trumpet, horn, etc. were also in practice.

The early American musical instruments divided into three main classes, percussion, wind and stringed. Mr. Brinton has mentioned at least four classes of stringed instruments of primitive type in the hands of American aborigines. The most important musical instrument of the Native Americans was the drum. H. B. Alexander has said that the drum varied in type from the Eskimo tambourine-like hoop with taut-skin, though singleand double-headed instruments, great or small, culminating in the huge snake-skin drum, whose blooming from the temple of the Aztec war-god, brought dread to the heart of the Spaniards. The teponaztli of the ancient Aztecs was the most interesting of the native drums, and "it consisted of a hollow block, in which were cut two tongues of differing thickness, whose vibrations produced tones commonly in the interval of a third, although drums have been found containing interval of a fourth, of a fifth, of a sixth, and of an octave".

Mr. Alexander has said that next to drum, the native iustrument was the Indian flageolet or flute, which seemed to evolve from the bone whistle with a single vent or stop. In its developed form, it was provided with a mouth-piece and had three, four, five or six finger-holes. Again, while discussing about "Prehistoric Art" (vide Report of US. National Museum, Washington, 1896, p. 524ff), Mr. T. Wilson has written that the whistles and flutes, made of human or animal bones, have been found in the deposits of the palaeolithic and neolithic ages, the flutes being pierced with holes at regular intervals or consisting of two holes, which, when joined, would make modulated tunes. Although these discoveries seem to give priority to wind instruments, it is obvious that others—e.g., drums of wood

with skin covering—being of more perishable material, were less likely to be preserved".1

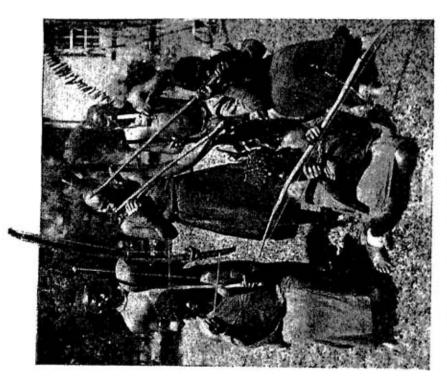

The most ancient musical instruments of India were veenā, veņu or vamsa and puṣkara or mṛdanga. But controversies rage round the question as to which of the musical instruments, drum, bow-instrument or flute (pipe) was the most ancient. Some are of opinion that flute or pipe was the most ancient type of musical instruments, while others maintain that drum was anterior to flute as well as bow in date. The latter view seems to be more rational and historical.

J. A. MacCulloch is also in favour of the latter view. He has said that nearly every tribe or race has musical instruments of some sort, the exceptions being found at the lowest stage of culture. "As the instances among peoples without musical instruments would seem to show, instruments of percussion-some form of drum, which is wellneigh universal-may have been invented first. Stringed instruments probably came next-the hunter's bow, as with the Damaras, being easily convertible into a primitive. form of these. Wind instruments, at least in their more elaborate forms, were probably invented last". In the most ancient Vedic literature, we find descriptions of crude earthen and wooden drums, covered with the skins of the wild animals. In the Rgueda, Samaveda, Yajurveda and Atharvaveda and also in different Brahmanas, we get references of drums like bhumi-dundubhi, dundubhi, panava, bhanda, karkari, etc.

<sup>1</sup> Cf. Encyclopaedia of Religion and Ethics, vol, IX (1917), p. 17.

The bhumi-dundubhi was perhaps the most ancient form of drum in India. The sound of the bbumidundubbi was very grave and loud and far-reaching. It used to be carved out in earth in the form of a hollow or pit and covered with the thick skin of any wild animal. It used to be struck with one or two logs of wood, and the resulting deep resonant sound used to be heard from very distant places. During the Brahmana period, the bhamidundubbi used to be struck by the tails of the animals. The sound of the bhumi-dundubhi was often used as means of signaling some dangers or approach of the enemies. The dundubbi was sometimes shaped out of the hollow trunk of a tree, the upper part being covered with the skin of the animal. From the Brahmana literature we come to know that different kinds of beasts were offered in different sacrifices and rites. Specially in the Mahavrata sacrifice, beasts were offered to the presiding deities, and their skins were used for making the drums like bhumi-dundubbi and dundubbi. Well has it been said by Dr. A. B. Keith, in connection with the Vedic Mahaurata (vide the 'Religions of India and Iran', vol. II): "The Mahavrata is by no means a bloodless sacrifice. There fall to be offered either one beast to be sacrificed to Indra and Agni or eleven animals; and in either case there is an additional sacrifice of a bull to Indra or to Prajapati, and in the former case of a goat to Prajapati. Now the skin of the sacrificial animal was removed and used to form the drum (bhumi-dundubbi), on which, with the tail of the victim, the priest made solemn music", The drum, vanaspati was also made in the same way. The dundubhi was somewhat a refined form of the bhumidundubbi, and it was used to be made out of mud or

log. The puskara, mṛdanga, and bhāṇḍa-vādya of the later date and the modern pākhawāj and khola are the prototypes of the ancient dundubhi.

The bow-instrument came into being perhaps after the drum. It was known as the dhanuryantram. The bow was the most important weapon of the nomadic primitive tribes. They used to live in the hills and dales, and forests and caves of the mountains. Their main food was the raw or half-roasted flesh of the hunted animals, and so they used to hunt all kinds of wild animals with the help of the bows and the arrows. They were also used as means to produce high sounds for signalling dangers like those of the bhumi-dundubhi and dundubhi. It has already been stated in my book, Historical Development of Indian Music that when the primitive savage men "became familiar with the use of iron, they began to hunt the wild animals and fight their enemies with the help of the bows and the arrows. Besides, other implements, the bows of bamboo used to serve the purpose of signalling the advent of the enemy or any other danger, as used to be served by the blazing flame of the fire. They used to produce the reverberating grave sounds by pulling the gut string of the

r In Sarangdeva's Sangita-Ratnakara, we find a different description about the ancient musical instrument, dundubhi. Sarangdeva has said (vide Abbinavabharata-sarasamgraba, p. 84):

Amradruma-samudbhūto mahāgātro mahādhvaniḥ/,
Kamsybhājana-sambhāragarbho valaya-varjitaḥ//,
Carma-vaddhānano vaddho vadhrairgādham samantataḥ/,
Dṛḍḥa-carmeṇa koṇena vādyo varṇena dundubhiḥ//,
Megha-nirghoṣa-gambhīra-ghonikārasyātra mukhyatā/,
Mangale vijaye caiva vādyate devatālaye//
Here we find the new modified form of the ancient dundubhi.

bow (jyā-śabda or dbanustankāra). That sound might be regarded as the source of their inspirarion for designing and constructing the musical instrument of the primitive people. The curvature of the bow supplied the idea of the method of constructing the body of their crude veena and the connecting gut string. It is interesting to note that the shape of the primitive veena was curved like the body of the bamboo bow. It was like the ancient lyres and harps, to some extent. The primitive men made the string of the veena out of the intestines of the wild animals, fastened them to the two extremes of its bent body and used to play it by plucking the string of the bow with the fingers. It seems that in the beginning, a single gut string was used to produce a mono sweet but grave sound. Gradually additions and alterations were made to improve t he structure of the veena and to increase the number of its sound, together with their tonal qualities. The primitive men sometimes connected two horizontal bars of bamboo or wood, fastened a gut string to the two ends of the bars, thus forming a triangle. This type resembles the ancient Georgia, Caucasus and Finland types of lyre to some extent".

In the third stage, evolved the flute or pipe. It is said that the sound, produced from the friction of air against the hollow part of the trunks of the trees, specially bamboo gave rise to the flute or pipe. The pipe was probably made out of the reed by making holes in it. Gradually it was fashioned out of wood and bone. The hole in the pipe was in imitation of the hollow part of the trunk of the tree. In the early stage, there was only one hole in the pipe, and gradually with the evolution of the tones, the holes were increased. Generally the pipes, in the primitive

period, possessed only two or three holes to produce two or three tones, low or high, or low, medium and high. All the songs, produced at that time, were in downward trend (avarohana-gati).

Now it can be imagined that drum being the most ancient form of musical instruments of the world, the primitive savage men used to practise their simple songs with two tones, upper and lower, in accompaniment of the drums only, to maintain rhythm and tempo in their songs and dances. They used to sing and dance as a means to break the monotony of their work-a-day life. There was certainly a starting basic tone in their songs, and most probably that basic tone used to be tempered with the tune of the drum.

In the Vedic times, the samans were sung to the accompaniment of different kinds of musical instruments like lute, pipe or flute, bow-instrument and drum. It has already been said that in the primitive period, the bow and pipe of reed, wood or bone had already been evolved, and were used by the primitive men. From the prehistoric mounds of the Indus Valley cities, crude form of bows or lutes, pipes and drums have been discovered, and they certainly substantiate the facts mentioned above. With the development of intellect, the skill and propensity of the Vedic people became more advanced and keen, and as such they gave shape to more developed form of lutes out of bamboo or wood for their bodies, muñjā grass or intestines of animals for strings, etc. The scale of the songs of the Vedic people was extended, and it consisted of four, five, six and even seven tones. The starting tone of the songs was always in the upper or high pitch, and the songs had the tendency to flow downward, as has been said before. The

Vedic music, being more developed than the primitive and prehistoric ones, possessed three registers (sthānas), a fixed scale, rhythm and tempo. The basic tone of the Vedic songs as well as the tones or tunes of the lutes (veenās) and pipes (vamšas) were tempered with that of the drum or drums, and this tradition has been handed down from the primitive and prehistoric times. During the time of Bharata (2nd century A.D.), we find the method of tuning (mārjanā) with the help of three drums or puṣkaras. Bharata has fully described the ancient traditional method of tuning (mārjanā) in the Nāṭyaśāstra (vide the Kāvyamālā edition, chapt. XXXIV, and the Vārānasī edition, chapt. XXXIII, 92-97). Regarding the tuning process, Bharata has said,

Māyūrī hyardha-māyūrī tathā karmāravī punaḥ/
Tisrastu mārjanā jneyāḥ puṣkareṣu svarāśrayāḥ//
Gāndhāro vāmake kāryaḥ ṣaḍjo dakṣiṇa-puṣkare/,
Urdhvage madhyamaścaiva māyūryaśca svarāśrayāḥ//
Vāmake puṣkare ṣaḍja ṛṣabho dakṣiṇe tathā/
Dhaivataścordhvage kāryaḥ ardha-māyūrakāśrayāḥ//
ṣṣabhaḥ puṣkare vāme ṣaḍjo dakṣiṇa-puṣkare/
Pañcamaścordhvage kāryaḥ karmāravyāḥ svarāsrayāḥ//
Eteṣāmanuvādī tu jātirāga-svarānvitaḥ/
Āliṅge mārjanaṃ prāpya niṣādastu vidhīyate//
Māyūrī madhyame grāme'pyardhā ṣaḍje tathaiva ca/
Karmāravī caiva kartyavyā sādhāraṇa-samāśrayāḥ//,

That is, there were three kinds of mārjanā, and they were known as māyūrī, ardha-māyūrī and karmāravī. Among those methods, the māyūrī used to be tuned in the middle cleft (madhyamagrāma), the ardha-māyūrī, in the first cleft (ṣadjagrāma) and the karmāravī, in the third cleft (gāndhāragrāma), based on the sādhāraṇa. The term

'sādhāraṇa' connotes the idea of an intermediate one between two tones. The tones, to which the puṣkaradrums were tuned, were based on the microtones or śrutisādhāraṇa, and were sustained and used in the tuning process. The remaining tones of the scale were shiftable or transferable. In the process of the māyūrī-mārjanā, the tone, gāndhāra used to be tuned on the left puṣkara (as there were three puṣkaras, two horizontal and one leaning), the tone, ṣaḍja, on the right, puṣkara, and the tone, pañcama, on the upper puṣkara. In the karmāravī-mārjanā, the tone, ṛṣabha used to be tuned in the left puṣkara, the saḍja on the right, and the pañcama, on the upper puṣkara. The tone, ṛṣabha which is the consonance or anuvādī to these three tones and is related to the rāgasvara of the jāti (jātirāga), used in the mārjanā of the ālinga.

Now, from this statement we find that in the mayurimārjanā, the puşkara-drums were tuned to the ṣaḍja, madbyama and dhaivata, and in the karmāravī-mārjanā, they were tuned to the tones, rsabha, pancama and nisada. In each of the methods of tuning (mārjanā), these three tones were considered as the primal ones of the gramas. Some are of opinion that in the mayuri-marjana of the madhyamagrama, the positions of the microtones and the tones were exactly the same as those prevailing in the modern pure scale (śuddha-thāṭa), vilāvala of the North Indian school of music and the Diotonic Majore scale of Europe, The modern suddha-thāṭa, vilāvala is no other than the sadharana-grama, as maintained by Sarangdeva of the Sangita-Ratnakara fame of the early 13th century A.D. It is interesting to note that Mahākavi Kālidāsa was fully aware of the utility and importance of the tuning process of the mayuri-marjana, and he mentioned about this process in his drama, Mālavāgnimitram: "māyūrī madayantī mārjanā manāgsī", i.e. 'māyūrī-mārjanā intoxicates the human mind'. From this it is evident that the tuning method of māyūrī was in practice in Kālidāsa's time (150 B.C.—400 or 450 A.D.). All the post-Bharata authors also adopted these ancient methods of tuning māyūrī, ardha-māyūrī and karmāravī, in their systems of music.

In the rock-cut temples of different places of India, carved in different ages, we find two or three drums of small size, engraved by the side of Siva-Nataraja in dancing posture. Those drums are but the replicas of ancient puşkaras. Three drums (puşkaras) are also to be seen carved in the Muktesvara temple of the 6th-7th century A.D., at Bhuvanesvara and three others in the cave-temple of Badami in Bombay of the 6th century A.D. Some are of opinion that two of these drums represent the two parts of a large drum, which used to be played horizontally, and the third one was small like the modern tabal. The small drum, known as alinga used to be placed on the lap of the player. Some of the drums represented in the sculptures of the 6th-7th century A.D. were chiselled in a different way. The modern tabal and bayan were perhaps shaped in imitation of the ancient puskaras. Some erroneously believe that the Persian and the Arabian artists and specially Amir Khasrau, brought into use for the first time the tabal and the bayan during the time of Sultan Ala-ud-din Khalji in the 14th-15th century A.D., cutting the ancient mṛdanga (or pākhawāj) into two halves. But this view is untenable, and is absolutely conjectural, as the sculptural evidences of the ancient rock-cut temples of India disclose the fact that two or three drums (puskaras) of different

sizes were used in music and dance in India long before the advent of the Persians and the Arabs as well as before the Muhammedan rule. The ancient method of tuning with the help of the puskaras came to be gradually replaced by the tempering of the string instruments, but exactly when and how the new method was adopted, we do not know.<sup>1</sup>

In the beginning of the classical period (600-500 B.C.), we find the emergence of the gāndharva type of music, designed by assimilating most of the materials of the Vedic music, by the Gandharva class of semi-divine people of the Gāndhāradeśa. Music of this period was consequently more developed than the Vedic one, having a scientific basis of its own, and was mainly known by the jātis as its melodies. In the Rāmāyaṇa (400 B.C.), the seven pure jātis (melodies) like ṣādjī, ārṣabhī, gāndhārī, madhyamā, pañcamī, dhaivatī and naiṣādī have been mentioned ("jāti-bbiḥ saptabhi-ruktaṃ tantrī-laya-samanvitaṃ"), and it is believed that the use of the svara-mandala was also in

In modern time, the method of tuning is generally worked out by the process of tempering two of the strings of the tumburu or tumburu-veenā in mostly the tones, şadja and pañcama or şadja and madbyama. The ṣadja being the drone or tonic, the tones, ṛṣabba and gāndbāra are produced from the vibrations of the ṣadja of the middle base (mudārā), and dbaivata and niṣāda, from the vibrations of the ṣadja of the lower base (udārā), and the rest. madbyama is produced from the concordant tone, pañcama. Though there prevails different views regarding it, yet it should be remembered that the modern method of tuning is always done in the ṣadjagrāma, which is very ancient.

practice at that time. Regarding the svaramandala, Nārada has said in the Siksā:

Sapta-svarātrayo grāmā mūrcchanāstvekovimsatih/, Tānā-ekonapańcāsadityetat svaramaņdalam//

That is, seven tones (laukika like ṣaḍja, ṛṣabha, etc.), three grāmas, twenty-one mūrcchanās, forty-nine tānas constitute the svaramaṇḍala. From this it is understood that the gāndharva type of music used to be practised with three registers, different mūrcchanās and tānas. Vālmikī has informed us that the gāndharva type of songs of his time used to be practised in accompaniment of the musical instruments like veeṇā, veṇu and mṛdaṅga. The tunes of the musical instruments, together with that of the songs used to be tempered with the basic or standard tone of the drums.

In the beginning of the 28th chapter of the Natyaśāstra (Vārānasī ed.), Bharata has described about the arrangement of different types of musical instruments to form an orchestra (kutapa), for the dramatic purposes. Musical instruments like veena venu, and puskara (drum) were the constituent factors of the orchestra. The musical themes of the orchestra were based on the basic structure of the jatis, and the tones of the musical instruments for the orchestra used to be tempered with a basic tone. From Bharata's statement we learn that they used to be tempered with the tunes of the drums (puskaras). Bharata has mentioned about three kinds of orchestra, and they are: (1) "kutapamiti caturvidhatodya-bhandani", i.e. a kutapa means a combination of four kinds of musical instruments, such as bhanda, etc. (2) "caturbidhatodyan kutapam", i.e. the four kinds of musical instruments form an orchestra.

(3) "kutapah samaveta-gāyana-vādaka-samūha", i.e. an orchestra that is formed by a combination of different musicians and instrumentalists.

Now, what do we mean by a bhānda-vādya? The bhānda-vādya was like the puṣkara or mṛdanga (modern pākhawāj) to some extent. The orchestra used to be generally arranged along with the musicians and instrumentalists before the beginning of the dramatic play. While discussing about the stage (ranga-mañea), Bharata has mentioned about the preliminaries of a play, and dance, playing of orchestra and recitals were the parts of the preliminaries. Regarding the preliminaries, Bharata has said in the Nāṭyaśāstra.

Asyāngāni tu kāryāṇi yathāvadanupūrvaśaḥ/
Tantrī-bhāṇḍa-samāyogaiḥ pāṭḥya-yogakṛṭaistathā//,
Pratyāharo'vataraṇaṃ tathā hyārambha eva ca/
Āśrāvaṇā vakrapāṇistathā ca patighaṭṭanā//
Saṃghoṭanā tataḥ kāryā mārgāsāritameva ca/
Iyeṣṭḥamadhya-kaniṣṭḥā ca tathaivāsārita kriyā//
Etāni tu vahirgītānyantaryavanikāgataiḥ/
Prayoktṛbhiḥ prayojyāni tantrī-bhāṇḍa-kṛtāni tu//
—Nāṭyaśāstra, V. 8-1 1

That is, the different parts of the preliminaries are to be performed in due order "with the playing of drums and stringed instruments as well as with recitatives (pāṭḥya) are as follows: pratyāhāra, avataraṇā, ārambha, vakrapāṇi, parighaṭṭana, saṃghoṭana, mārgāsārita and āsārita of the long, medium and the short types. These songs outside (the performance of a play) are to be sung by persons behind the curtain to the accompaniment of drums and stringed instruments".

Then the curtain (yavanikā) of the stage used to be removed, and after the removal of the curtain, dances and recitals were to be performed with the playing of all musical instruments, which were known as kutapa. Bharata has said regarding them,

Tataśca satvakutapairyuktānyanyāni kārayet/,
Vighātya vai yavanikām nṛtya-pāṭḥya-kṛtāni ca//,
Gītānām madrakādīnām yojyamekam tu gītakam/,
Vardhamānamathāpīha tāṇḍavam yatra yujyate//,
Tascotthāpanam kāryam parivartakameva ca/
Nāndī śuṣkāpakṛṣṭā ca raṅga-dvāram tathaiva ca//,
Cārī caiva tataḥ kāryā mahācārī tathaiva ca//,
Trikam prarocanā cāpi pūrvaraṅge bhavanti hi///
—Nāṭyaśāstra, Vārānasī cd., V. 12-15.

That is, after removing the curtain, some songs of the mardaka class was to be sung along with the playing of musical instruments, or one of the vardhamānaka class along with the class dance used to be applied. Then should take place one after another, utthāpana, parivartana (walking round), nāndī (benediction), šuṣkapakṛṣṭa, raṅgadvāra, cārī, mahācārī, etc.

Bharata has further described the order of the characteristics of all the preliminaries, which were known as pratyāhāra, etc., as have been said before. From the śloka 17 to 30, he has defined all the characteristics of the preliminaries. He has said: (1) arranging of the musical instruments (kutapa-vinyāsa) was called the pratyāhāra; (2) the seating of singers was called the avataraņa or coming down; (3) the commencement of vocal exercise for singing (parigīta) was called the ārambha or beginning; (4) adjusting the musical instruments for playing them in due manner was

called the asravana; (5) rehearing or dividing the different styles (vrtti) of playing musical instruments was called the vakrapāņi; (6) the strings of instruments were adjusted duly during the parighattana; (7) the samghatana was meant for rehearsing the use of different hand-poses for indicating the time-beats or tala; (8) the playing together (in harmony with one another) of drums and stringed instruments was called the mārgāsārita; (9) the āsārita was meant for practising the beat of time-fractions (kalāpāta); (10) the application of songs (gitavidhi) was for singing the glory of gods; (11) the utthapana was considered by some to be the beginning of the performance; (12) the parivartana was so styled because in it, the guardian deitiesof different worlds were praised by the director, walking all over the stage; (13) the nands or benediction was so called because it included (as well as invoked) the blessing of gods, Brāhmins and kings; (14) when an avakṛṣṭadbruvā was composed with meaningless sounds it was called suskāvakrstā and it indicated the verses got the jarjara; (15) the rangaduara was so called, because from this part commenced the performance which included words and gestures; (16) the cars was so called because it consisted of movements depicting the erotic sentiment and (17) in the mabācāri, occurred movements delineating the furious sentiment".1

Now, regarding the kutapa-vinyāsa or arrangement of the musical instruments in the stage, Bharata has said in the Nāṭyaśāstra: "eteṣāṃ prayogamidānīṃ vyakṣyāmi/

I Translations of the ślokas have been adopted from the English edition of the Nātyaśāstra by Dr. Manomohan Ghosh, Calcutta, 1951) to some extent,

tatropaviṣṭaḥ prāngmukho range kutapa-viniveśaṣaḥ kartavyaḥ tatra pūrvoktayor-nepathyagihadvārayor-madhye kutapa-vinyāsaḥ svarangābhimuka-mārdangika-pāṇavika-dārdarikeṣu gāyaka-gāyikā-vaimśika-vainika-sahiteṣu āśithi-lāyata-tantrīvaddhāstaniteṣu ātodyeṣu yathā-grāmarāga-mūr-ochanāmārjanānulipteṣu mṛdangeṣu dhārayā \* \* '' (vide NS. Vārānasī ed., chapt. XXXIII, 206); which means "the mārdangika (drummers) facing the east between the two doors of the green room, the pāṇavika to his left, the gāyakas to the south of the rangapīṭḥa facing the north, gāyikās to his front on the north facing the south, vainika to their left and two vainšikas to their right". In all the three types of theatre, players of musicial instruments occupy a place in the rangašīrṣa between the two doors.

Abhinavagupta has also described the method of arrangement of the orchestra (kutapa) in his commentary, Abhinavabhāratī, while commenting upon the śloka: "kutapasya tu vinyāsaḥ," etc. (V. 17). He has said: "nepathyagṛhadvārayormadhye pūrvābhimukho mārdangi-kaḥ/ tasya pāṇavikau vāmataḥ/ rangapīṭḥasya dakṣṇataḥ uttarābhimukho gāyanaḥ/ asyāgre uttarato dakṣiṇābhimukhasthitā gāyikyaḥ/asya vāme vaiṇikaḥ/anyatra vamśadvāra (dhāra)-kāvityevaṃ kutaḥ pāti kuṃ tapatīti śabda-viśeṣapālakasya nāṭyabhūmikojjvalatādhāyinaśca vargasya yo vicitro nyāsaḥ sa viprakīrṇānāmevātra dḥaukanātmā pratyā-bāra". 2

A female dancer (nartaki) was also associated with the arrangement of the orchestra, and she or they used to dance to the cadance of the drums. When Bharata has

<sup>2</sup> These have also been discussed in the Chapter IV.

mentioned about four kinds of orchestra (kutapa), he means to say about four kinds of musical instruments like tata, avanaddba, ghana and śuṣīra as constituting the orchestra. Sāraṅgdeva has divided the orchestra into three main heads, according to the merits of the instrumentalists. Siṁhabhupāla has said, that the combination of three kinds of kutapa formed the cluster or vṛnda. The vṛnda or samūha (combination of the instruments) was again of two kinds, kutapa and kolāhala. The last one was noisy something and was meant only for some specific function and action of the play. Sāraṅgdeva has given a detailed description about these orchestras. By the kolāhala-vṛnda, he means to say the orchestra, in which a number of musicians and instrumentalists conglomerated and was superior to the uttama-vṛnda.

We thus find that the practice of orchestra was prevalent in India even before the Christian era. Coordination of different kinds of musical instruments was strictly observed along with the compact body of sounds in ancient India. Even in the Aitareya-brāhmaṇa and the Vedic Prātišākhya, we find references to the samūha-gīta and gana-gīti, which were no other than the combination or unison of musical sounds or voices, accompanied by different musical instruments like veeṇā, veṇu and mṛdaṅga. The most ancient musical instruments like veeṇā, veṇu, and mṛdaṅga used to play an important part in music, dance and drama not only in ancient period, but also in the mediaeval period, and is continuing as such in the modern period, and they are regarded as the forbears of all kinds of musical instruments of India of later date.

The orchestra, as used in ancient times, will be discused in detail in the next chapter.

## APPENDIX TO THE CHAPTER IV

Now, from the ancient method of tuning or mārjanā of the puṣkaras, the method of smearing (pralepana) of casts (gāva) on leathers of both sides of the drums (puṣkara, bhānḍavādya or pākhawāj) also evolved. In fact, the method of smearing or pralepana (of mud, specially 'black mud' or śyāmā-mrttika, mixed with barley-paste or yavacūrņa), was in practice in ancient time, for ascertaining the just tones or tunes of the puṣkara-drums, and Bharata has described this process of smearing or daubing in the Nātyašāstra (vide chapter XXXIII). Bharata has said,

Mṛttikā lepane hyeṣām yathākāryantu mārjanam// Nadīkūlapradeśasthā śyāmā sā mṛttikā bhavet/ Toyāpasāraṇaślkṣṇā tayā kāryantu mārjanam//

Tatra godhūmacūrṇaṃ vā yavacūrṇaṃ ca dāpayed/ Yava-gopucchacūrṇaṃ tu kadācidūpabhujyate'// Ekastasya ca doṣaḥ syādekasvarakaro bhaved/, Evaṃ tu mājānayogāt śyamā svarakarī bhavet// —Nātyaśāstra (Vārānaśi ed.) XXXIII. 103-107.

11、一個相談の一種をはっています。

Bharata has said that for the purpose of smearing of the cast on leathers in both sides of the puṣkara-drums, the black mud was necessary. The water in the mud used to be given up. Sometimes wheat (godhāma) or barley paste (yavacārṇa), or dust, produced by the legs of the cows, were mixed with the black mud, and then it used to be smeared on the leathers for producing the just tones or tunes (sounds) in the puṣkara-drums. It seems that from this ancient process of smearing or daubing of the black

mud, mixed with wheat or barley paste was traditionally followed by the drummers, and when the bāyān and tabal were introduced in immitation of the puskara or mṛdanga in the beginning of the Muhammedan period, that ancient process of smearing or daubing of black cast or paste was adopted.<sup>1</sup>

## CHAPTER V

## ORCHESTRA AND CHORUS IN ANCIENT INDIA

It is generally believed that orchestra as well as chorus are of recent origin, and are introduced in India during the British regime. But this belief seems to be incorrect, as the Sanskrit treatises on drama and music bear eloquent testimony to the fact that urnda-vadya (or samaveta-yantra-vadana) or orchestra and vinda-gana (samaveta-samgita) or chorus were current in India even before the dawn of the Christian We find full description of the Mahavrata ceremony in the Srautasūtras, where it has been described that the wives of the priests used to sing songs in chorus to obtain offsprings. The hotr priests used to mount a swing and was swung to and fro in order to bring heavenly feelings, and unmarried girls used to dance around the sacrificial fire with water pitchers, the contents of which they emptied.1 From this it becomes evident that the wives of the priests and the young unmarried girls used to sing songs in unison, accompanied by dance. Now the songs of the wives of the priests and the maidens in same pitches and tunes might have known as chorus (samüha-samgīta) in ancient days. Again, we find references in the Vedic literature that lute (veenā) and drum (puskara) and other musical instruments used to keep rhythm of dances and songs of the dancers and the singers, and those combined musical

vide J. Gonda: Ascetics and Courtesans (in the 'Brahma-vidyā,' the Adyar Bulletin, vol. XXV, pts. 1-4, pp. 78-79. Cf. also Dr. A. B. Keith: Sānkhyāyana Āranyaka (London, 1908), p. VIII.

instruments were known as musical concerts or simple orchestras.

Pusparsi, the author of the Puspasūtra or Sāma-prātiśākhya, has mentioned about ganagīti, where he has said: "anyatara ganagītibhyah pratistotrīyam \* \*", but this reference about the ganagiti does not mean the real groupsinging or chorus. In the Rāmāyana, Mabābbārata and Harivamsa, we often come across references about the group-singing of the Brahmins and the wandering minstrels on the occasion of coronation, wedding, funeral ceremony and other sacred sacrificial functions and rites, and they may be regarded as the group-songs or chorous. Though different musical instruments were used in different auspicious occasions and in wars and funeral ceremonies. they cannot be considered as orchestra proper. Yet the practice of orchestra (samāha-yantra-vādya) was in vogue before the Christian era, as we find mention of proper forms of different kinds of orchestra in Bharata's Natyaśāstra, composed in the 2nd century A.D. Though controversy rages round the exact date of compilation of Bharata's Nāṭyaśāstra, yet most of the scholars have given their considerate opinion that it was composed or compiled during the period, mentioned above. Thus, as we find mention of kutapa (vinda-vadya) in the 2nd century A.D., we may take it for granted that it evolved and was in practice before the compilation of the Natyasastra of Bharata, Bharata, on his part, has also admitted that he compiled his Nātyaśāstra from the materials of the Nātyaveda, composed by his predecessor, Brahmā or Brahmābharata: "nātyaśāstram pravaksyāmi brahmaņā yadudābrtam" (NS. I. 1), and as such Bharata has termed his Nātyaśāstra as the samgraha-grantha, or 'book of compilation'. It is said that Brahmā or Brahmābharata composed the Nāṭyaveda out of the materials of the Vedic music, sāmagāna. in the beginning of the classical period (600-500 B.C.). Bharata has said,

Srūyatām nātyavedasya sambhavo brahma-nirmitam//

Nāṭyavedaṃ tataścakre caturvedāṅga-sambhabaṃ// Jagrāha pāṭḥyamṭgvedāt sāmabhyo gītameva ca/ Yajurvedādabhinayān rasānātharvaṇādapi// —N. S. I. 7, 16-17

Brahmā composed the fifth Veda ("tasmāt srjāparam vedam pañcamam sarva-varnikam"), the Natyaveda, collecting materials from the Vedas, Rgveda, Samaveda, Yajurveda and Atharvaveda. The Rgveda supplied the text (pāthya) of the Nātyaśāstra or Nātyaveda, the Samaveda, the tune or melody, the Yajurveda, the dramatic scheme and science, and the Atharveveda, the aesthetic sentiments and moods for drama, dance and music. It has been said before that Muni Bharata has composed his Natyaśastra, collecting materials as well as laws and principles, as prescribed in Brahma's Natyaveda of the pre-Christian era. Bharata of the Natyaśāstra fame has, therefore, mentioned about the kutapa or orchestra and the samuha-samgita or chorus as well as other ingredients for drama, dance and music in the Natyasastra, and from them it becomes evident that though we find frequent references of kutapa or orchestra and chorus in different literature, yet they were prevalent in the pre-Christian society, otherwise Bharata would never have written the line: "nātyaśāstram pravaksyāmi brahmanā yadudābrtam" (NS. I. 1).

Now it is found that Bharata of the Natyasastra fame has described about orchestra (kutapa) in connection with dramatic performance (nāṭyābhinaya). He has also mentioned about group-singing or chorus as well as the grammar and science of drama, dance and music. The sculptures and bas-reliefs of the pre-Christian and early Christian eras supply palpable evidences of group-recital of musical instruments (vinda-vadana) and group-singing or chorus (urnda-gāna), as prescribed in ancient India. In the Sitabengā Cave in the Madhya-pradeśa (2nd century A.D.), a dramatic stage has been excavated, in front of which there exist a music hall and a seat for the players of musical instruments, which go to prove that simple type of vinda-vādya or orchestra was in practice in the dramatic per-formances during the early Christian era. In one of the Ajanta Caves (2nd-7th century A.D.), a dramatic stage and a stage-room stand depicted. In front of the stage, some dancing girls (natis) have been painted in dancing posture, along with an orchestra to keep rhythms of their dance as in actuality. That simple orchestra was composed mainly of flutes and drums. On the bas-reliefs of the railings of the Barhut Stupa (2nd century B.C.) is to be found a band of players of musical instruments as if engaged in keeping rhythms of dance. Usually the orchestra or musical concert consisted of some harp-shaped lutes (veenās), drums (puskaras) and cymbals. In the paintings of the Bāgh Cave (4th-6th century A.D.), we also come across scenes of group-dances and concerts in the Caves (Nos. 4 and 5), consisting of drums, flutes, cymbals and music-sticks, accompanying the dances of fair maidens. Again in the temple of Kapilesvara (6th-7th century A.D.) at Bhubaneśvara, we fiind a grill, containing engraved

standing figures of națas and națīs. In the middle, there are figures of three națas and four națīs. Among them three națas are dancing in different gestures and postures, and of the four națīs, one is singing and the other is playing a harp-like lute (veenā), while the rest are dancing in unison with the concert. A similar scene is also found engraved in the Parameśvara temple (6th-7th century A. D.) at the same place, wherein one of the națīs is dancing in a sitting posture, the second one is beating a damaru-like drum with her right-hand, the third one is blowing a pipe, while the fourth one is playing on a cymbal as if to keep time in the concert. In different inscriptions, specially of the Magadhian and Maurya-Scythian periods, we find references of group-dance, group-singing, concert and orchestra.

Now, the question arises whether the scenes of the urnda-vādya and the urnda-gāna (orchestra and chorus), as engraved in different railings and Caves of the Buddhist Stupas and Hindu temples are to be termed as orchestra and chorus proper. It is a moot point. But it should be remembered in this connection that definite forms of concert and orchestra (kutapa or vṛnda-vādya) had already taken shape in the pre-Christian era, and Bharata has described them in the Natyasastra. The music experts and scholars have made a distinction between a 'concert' and an 'orchestra'. A concert, they say, is a combination of voices or sounds, or it can be said to be a musical entertainment, whereas an orchestra is a body of instrumental performers or a combination of different classes of musical instruments. In fact, a concert is a musical entertainment of concerted pieces, symphonies, etc., sometimes interpersed with songs, performed by an orchestra of many musical instruments.

The term orchestra has been derived from the Greek term orcheomai meaning, 'dance.' In ancient Greek theatres, it stood for the space, allotted to the chorus of the dancers. In modern theatres, the part of the building assigned to the instrumentalists; and in the modern concertrooms, the place occupied by the instrumental and vocal performers. The word 'orchestra' was also used to denote the musicians collectively with the instrumentalists.

Now, what do we mean an orchestra? Orchestra, says Waldo Selden Pratt, is the "general name for an ensemble of instruments and players of several different kinds under the direction of a single leader or conductor. It is distinguished from the chamber-ensemble by the variety of its constituents and by the fact that in some parts more than a single player is usually included. Its ideal is to serve as a complex, but unified instrument, like an organ, though composed of many living performers, each of whom is normally an expert soloist on his own instrument. In its highest development it is, therefore, the most elaborate vehicle for instrumental exposition and impression".

He has further said that an orchestra as a definite artistic agency "called into existence by the rise of the opera in the early 17th century. But the experiments throughout that century (as by Monteverdi, Costi, Lully, Legrenzi and A. Scarlatti) were extremely varied in the range and balance of the instruments employed. \* Even in the early 18th century, there was a tendency to use the wood-wind (flutes, oboes and bassoons) as the nucleus or as (as in the case of Bach) to exploit various instruments in

<sup>1</sup> Vide W. S. Pratt: The New Encyclopaedia of Music and Musicians (London, 1924), p. 101.

solo-effects rather than to seek contrasts and gradations of massed tone. It remained for the Mannheim group (about 1750) to fix upon the violin-quartet as the true centre for the whole and to perceive the ideal co-ordination with this of the wood- and brass-groups. \* Hence came the orchestral symphonies of the Viennese or classical school, which were as novel in instrumental conception as they were in structural detail. The further advances in magnitude and refinement of colour-effects waited for the early and middle 19th century, when Berlioz and Wagner set up standards that have not been greatly exceeded since. \* \*

"Prior to 1750, orchestral music, outside of accompaniments, consisted chiefly of overtures, and various forms of concerto, the former magnifying the contrast of successive movements and the latter the contrast between solo and tutti. With J. S. Bach set in the first currents that led with Hayden, Mozart and Beethoven to the rapid evolution of the symphony as the orchestral sonata. About 1800 the concert-overture began to detach itself from the overture proper. About 1850 appeared both Liszt's movement in favour of the symphonic poem and Wagner's prodigious transformation of the orchestral side of the opera, while one composer after another added to the growing appreciation of the orchestra as the special medium for effects and constructions dominated by light, colour, and warmth. Like every other instrument of major importance, the orchestra has called into being either new forms appropriate to its own genius or tended to remodel existing forms to match its transcendent capacity for expression".1

T Ibid., pp. 101-102. Cf. also Prof. P.A. Scholes: The Mirror of Music (1844-1924), vol. 1, (Oxford University Press), Chapter X, pp. 373-413.

Regarding orchestra and orchestration of the ancient Greeks and the Western nations, Prof. Percy A. Scholes is of opinion that "the idea of combining instruments is probably as old as instruments themselves, but the principles of what may be called systematic combination (and the art of orchestration is just that) were very slowly realized". So the development of the principles approximately spread over four dates viz 1600, 1700, 1800 and 1900. These dates were known as (1) the Montevedri period, (2) the Bach period, (3) the period of emergence of the modern orchestra, and (4) orchestration at the beginning of the 20th century. The Monteverdi period is known as the period of the early operas. In the second period, i.e. in 1700 A.D., some instruments were improved and some effective combinations were worked out with a growing tendency to standardize the central string section exactly as we have it today. In the third period, i.e. in 1800 A.D., a change of conception came into being. The keyboard instruments were outmoded, and the string ones were accepted as the invariable basis. In the fourth period, i.e. in 1900 A.D., the orchestra became more improved.

"Between the Hyden-Mozart period and the Struss period", says Prof. Scholes, "have come the work of the later Beethoven and of Wagner, and this great expansion of orchestral media, with its consequent enhanced variety, increased dynamic power, and greater aptitude for dramatic characterization, represents the influence of the Romantic movement plus that of the efforts of instrument makers during the greatest age of invention the world has yet seen".1

t Vide Prof. Scoles: The Oxford Companion to Music (9th edition, 1955), p. 733.

Thus we see that in the ancient Greek theatre-stages, there were orchestras, but they were only the semi-circular or square spaces in the front of the stages, where chorus danced and sang, and they were not meant for group playing of the musical instruments proper. Similarly in Hellenistic theatre-stages, in Graeco-Roman theatres, in Roman theatres, in Elizabethan theatres, in Italian Renaissance theatres, such semi-circular, diagonal or square orchestras were in existence for songs and dances, and not for players of the musical instruments. This is also true of the theatres of modern France and Germany.

Prof. Allardyce Nicoll also informs us that main features of the ancient Athenian theatre in the 6th-5th century A.D. was the religious plots of the dramatic plays, accompanied by chorus of lyric chants and orchestras, allotted front-spaces for dance and song. Consequently the theatres, says Prof. Nicoll, "when they are created, the chorus could make those elaborate terpsichorean movements which always were associated with the verses of the lyric chants. \* \* The bare hillside, then, when the round orchestra and the altar was the first theatre known to the Greeks..... The excavations undertaken at Athens by Professor Dorpfeld have shown that in the original Dionysian theatre, the orchestra stood 50 feet to the south of the present orchestra and had a diameter of 78 feet".1

In connection with Hellenistic theatre, Prof. Nicoll has further said that the "simple arrangement described

I Cf. Prof. Nicoll: The Development of the Theatre (1961). p. 20.

above, consisting of round orchestras, parodoi, rectangular skane with projecting paraskenia and low platform or stage, is all we can confidently assert for the earliest Athenian playhouse". In the Graeco-Roman theatres, the orchestra, which had been completely circular in purely Greek style, was encroached on by the scene-buildings, but always remained more than a semi-circle. In the Roman theatre, orchestra was cut sharply in half, also exhibiting semi-circle, bounded on the diameter by the front of the stage itself, generally styled the hyposcenium (or under-stage).

Thus we find that practice of proper orchestra or groupplaying of different musical instruments evolved in later period, in the 16th century A.D., or a little before that, in Greece, Rome, Italy, France, Germany and other ancient countries. There were music-rooms, the halls or seats for the musicians and players of musical instruments, and probably from those music-rooms evolved the orchestra in the 16th century, as a part and parcel of the theatres and dramatic plays.

Though it is a fact that theatre or stage and drama (play or abbinaya) are by no means one and the same thing, and though they stand in close relationship to each other, yet they each has its own boundary. "The theatre," says Prof. Nicoll, "extends considerably beyond the frontiers of the drama, while the drama similarly extends far on the other side beyond the frontiers of the theatre". Again it should be remembered in this connection that chorus or group-songs, dance and music were connected all with

I Ibid., p. 23.

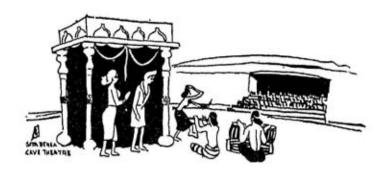

<sup>2</sup> Cf. Prof. Nicoll: The Theatre and Dramatic Theory (London, 1962), p. 11.

theatre and drama, at least in ancient times. In India also, dance, music and concert or musical entertainment and accompaniment were closely connected both with the stage (ranga-mañea) and dramatic play (abbinaya). In an engraving of the Duke's Theatres in Dorset Garden, published in 1673, we find that on the ledges underneath the two-side windows portraitures of a drum, a trumpet, and a violin, "whence we may conclude that these were the windows of the music-room. \* Save for the presence of the music-room, the arrangements were evidently not very different from those obtaining at the Theatre Royal".1

Again, when in late 1600 A.D., theatrical endevour was concerned with the efforts of the scene-designers, opera had become a fully established form of dramatic art. The orchestra-platform for the players of musical instruments was then felt necessary for help to the dramatic play, and the well-trained orchestras thus provided the musical accompaniment in operas in the West in the 16th century. But it should be remembered that in India, the germ or nucleus of the geya-nāṭakas can be traced to the early 12th century A.D., when Kavi Jayadeva composed the gītināṭya, Gīta-govinda. The operas in India were not merely a fantasia, but was a combination of poetry, music, dance and symbolism. The orchestra (samūha-vādya) was also a part and parcel of the Indian opera (gītināṭya).

It is a historical fact that orchestra (vṛnda-vādya) evolved in India even before the advent of the Christian era, and as has already been said, its prevalence is generally proved by Bharata's Nāṭyaśāstra. Bharata has styled orchestra (vṛnda-vādya) as kutapa. Besides kutapa or Indian orchestra,

mentions of assemblage of different musical instruments are to be found in different religious, royal and domestic functions, but they were not the orchestras or concerts proper. As for example, in the second chapter of the Nāṭyaśāstra (Vāṭānasī edition), Bharata has mentioned about different wind and percussion instruments on the occasion of laying of the foundation-stone of the theatre-stage. Bharata has said,

Pṛṣṭḥato yo bhavedbhāgo dvidhābhūto bhavecca saḥ/ Tasyārdhena vibhāgena raṅga-śīrṣaṃ prayojayet//

Sankha-dundubhi-nirghoşair-mṛdanga-paṇavādibhih// Sarva-tūrya-ninādaiśca sthāpanam kāryameva ca/ —Nāṭyaśāstra. II. 35-37.

That is, "these halves (behind him) should be again divided equally into two parts, one of which will be made the stage (rangasīrṣa) and the part at back the retiring room (nepathya). And during the ceremony (of laying of the foundation) all the musical instruments such as, conchshell, dundubhi (drum), mṛdaṅga (earthen drum), paṇava (small drum or tabor) should be sounded". Then Bharata has mentioned about Indian orchestra or kutapa in the second chapter:

Tasmānnivātah kartabyah kartṛbhir-nāṭyamaṇḍapaḥ// Gāmbhīryam susvaratvam ca kutapasya bhavediti/ —Nāṭyaśāstra, II. 82-83.

"For (in such a playhouse) made free from the interference of wind, voice of actors and singers as well as the sound of musical instruments will be distinctly heard".

Now, it was customary to represent the kutapa or vinda-vādya after the ceremony of laying of the foundationstone of the stage and in the beginning of the worship of the presiding deities: "sampūjya devatāh sarvāh kutapam samprayujya ca" (NS. III. 11). Now, it should be mentioned that Bharata has used the word 'kutapa' in different senses. As for example, he has mentioned kutapa sometimes as different musical instruments ("tatasca sarva-kutapair-yuktānyanyāni kārayet"—V. 12), and sometimes as orchestra or vṛnda-vādya. Similarly the commentator Abhinaba-gupra has used the word kutapa in three different ways: (1) "kutapamiti caturvidhamātodya-bhāndāni"; (2) caturvidhamātodyam kutapam"; (3) "kutapah sampheta-gāyana vadakasamūhah". It should be remembered that all these interpretations are correct, as the word kutapa sometimes denotes four kinds of musical instruments like taṭa, vitaṭa, ghana and suṣira; sometimes orchestra and also sometimes musicians and players of different musical instruments.

Then Bharata goes on to describe the arrangement of the musical instruments (kutapa-vinyāsa), which was known as pratyābāra. Besides, he has described about avaturaņa, āśrāvaṇā, vakrapāṇi, parighaṭṭanā, saṃghaṭanā, mārgotsārita or mārgāsārita, gītavidhi, parivartana, nāndī, etc. Regarding the detailed arrangement of the musical instruments (kutapa-vinyāsa) and their names, Bharata has said,

Kutapasya tu vinyāsah pratyāhāra iti smṛtah/
Tathāvataraṇam proktam gāyakānām niveśaṇam//
Parigītakṛyārambha ārambha iti kīrtitah/
Ātodya-rañjanānartham tu bhavedāśrāvanāvidhih//
Vādyavṛtti-vibhāgārtham vakrapāṇi-vidhīyate/
Tantrejastaraṇārtham tu bhavecca parighaṭṭanā//
Tathā pāṇi-vibhāgārtham bhavet saṃghaṭanāvidhih/
Tantrī-bhāṇḍa-samāyogān mārgāsaritamiṣyate//
Kālapāta-vibhāgārtham bhavedāsārita-kṛyā/
Kīrtanāddevatānām ca jñeyo gītavidhisthā//
NS. V. 17-21.

"The arrangement of the musical instruments (kutapa) is called the pratyābāra. The appearance of singers is called the avataraṇā. The commencement of vocal exercise for singing (parigīta) called the ārambha or beginning. Adopting the musical instruments for playing them in due manner is called the āśrāvanā. Reheatsing (lit. dividing) the different styles (vṛttis) of playing musical instruments is called the vakrapāṇi. The strings of instruments are adjusted duly during the parighaṭṭanā. The saṃghaṭanā is meant for rehearsing the use of different hand-poses (for indicating the time-beat). The playing together (in harmony with one another) of drums and stringed instruments is called the mārgāsārita. The āsārita is meant for practising the beat of time-fractions (kālapāta). And the application of songs (gītavidhi) is for singing the glory of gods".1

Regarding the arrangment of different musical instruments in orchestra (kutapa-vinyāsa), Abhinavagupta has said in the Abhinavabhāratī: "nepathyagrhadvārayormadhye pūrvābhimukho mārdangikah! tasya pāṇavikau vāmataḥ! rangapīṭḥasya dakṣiṇataḥ uttarābhimukho gāyanaḥ! asyāgre uttarato dakṣiṇābhimukasthitā gāyikyaḥ! asya vāme vainikaḥ! anyatra vamśadvāra-(dhāra)-kāvityevam kutam pātikum tapatīti śabda-viśeṣapālakasya nāṭyabhūmikojjvalatādbā-yinaśca vargasya yo vicitro nyāsaḥ sa viprakīrṇānāmevātra dḥaukanātmā pratyāhāraḥ" (V. 17). The meaning of the lines is this that the mārdangika to sit facing east between the two doors of the green-room, the pāṇavika to sit to his left, gāyaka to sit to the south of the rangapīṭḥa, facing

I These have already been described in the previous chapter (chapt. IV). It is to note further that the English translations of the ślokas have been adopted from Dr. M, Ghose's Nātyaśāstra to some extent.

south, the gāyika to sit at his front on the north facing south, vaiņika to their left and two vamšikas to their right. In all three types of players of musical instruments occupy a place in the rangašīrṣa between the two doors. The female musicians also used to be allowed to take part in the Indian orchestra. Regarding it, Abhinavagupta has said: "yadyapi kutapasya vinyāsa madbya eva ca gāyakasyābhimukho rangapīṭḥasyottarato gāyinya iti gāya-(yi)-kānām vinyāsah, tatbāpi tvavataraṇam nāma pṛthaguktamangānām gīta-(manganāgīta)-syāvasyambhāvitvam ranjakavarge kbyāpayitum | yadvaksyate—

"Yadyapi puruṣo gāyati gītavidhānaṃ tu lakṣaṇopetaṃ/ Strīvirohitaḥ prayogastathāpi na sukhāvaho bhavati//"

-Nāṭyaśāstra, XXXIII. 5-7.

That is, though in ancient Indian orchestra, male players of musical instruments were mentioned, yet for pleasing combination, it was the practice to engage female players also. Elsewhere Abhinavagupta has given the definition of kutapa in this manner: "kutam śabdam pātīti caturvidhamātodyam kutapam tat-prayoktrjātanca tasya višeṣeṇāvyavasthāpakānām tatra višeṣeṇa nyāso yathāyogam svara-tālalaya-kalādi-niveśaṇam sa eva pratyāhārādirāsārita-kṛyāntaḥ paripūrņo vinyāsaḥ]"

Bharata has said that the arrangement of musical instruments (kutapa) used to be made exclusively in connection with the presentation of dramas. And for this reason he has said elsewhere:

Vādyeşu yatnah prathamam tu kāryah sayyā hi nāṭyasya vadanti vādyam/
Vādye'pi gīte'pi ca samprayukte nāṭyasya yogo na vināśameti//
—Nāṭyaśāstra, XXXIII. 270.

The kutapa consisted of four kinds of musical instruments, and Bharata has elaborately dealt with them in the ātodyavidhi in the 28th chapter (Vārānasī edition) thus;

Tatam caivavanaddham ca ghanam susirameva ca/ Caturvidham tu vijneyamātodyam laksaņānvitam// Tatam tantrigatam jneyamavanaddham tu pauskaram/ Ghanam talastu vijneyah susiro vamsa ucyate//, Prayogastrividho hyeşam vijneyo naţakaśrayah/ Tatam caivavanaddham ca tatha natyakrtañca yah// Tatam kutapa-vinyaso gayanah saparigrahah/ Vaipańciko vainikaśca varhśavadaka eva ca// Mārdangikah pāṇavikastathā dārdutiko vudhah/ Anāviddhavidhāveşa kutapaḥ samudāhṛtaḥ// Uttamadhamamadhyabhistatha prakrtibhiryutah/ Kutapo natyayoge'tra nanadeśa-samaśrayah// Evam gānam ca nātyam ca vādyam ca vividhāśrayam/ Alātacakra-pratimam kartavyam nātyayoktrbhih// Yattu tantrīgatam proktam nānātodya-samāśrayam/ Gandharvamiti vijneyam svara-tala-padaśrayam// -Nātyaśāstra, XXVIII. 1-8.

From this we come to know that ancient Indian orchestra consisted of vaipañcika or vainika, vamŝa-vādaka, mārda-lika or pānavika or dārdurika. It can be divided into four main classes, players of lute or veenā, flutists, drummers and players of cymbal. The players were of three classes, uttama (best), madhyama (medium) and adhama (trite). The orchestra (kutapa) was arranged like alātacakra i. e. in a circle. These have been fully dealt with by Sārangdeva in the Sangīta-Ratnākara (vide III, prakīrņa chapter).

<sup>1</sup> Different reading-darbhariko,

La Sārangdeva has said like Bharata that drum, puṣkara was the principal musical instrument in the orchestra: "kutape tvavanaddhasya mukhyo mārdangikastatah". Simhabhupāla has also said: "avanaddhasya kutapa eko mukhyo mārdangikah". Sārangdeva has mentioned the names of the drums, which were used in the kutapa or ancient Indian orchestra, and they were paṇava, dardura, dbakkā, maṇḍi-dbakkā, dakkuli, pataba, karatā, etc. Besides them, he has mentioned the names of other musical instruments, which were included in the kutapa.

Sărangdeva has described about the nățya-kutapa i. c. combination of musical instruments, meant for drama. The natya-kutapa was divided into three classes according to their merits, and they were uttama (best), madhyama (medium) and adhama (trite). Simhabhupāla has said: "eteşam ca patranam uttama-madhyamadhamatuena kutapasyāpi traividbyam". When these three types of kutapa were used to be combined, they came to be known as vinda or combination (or cluster). The combined musical instruments or instrumentalists (vinda) were in their turn divided into best, medium and trite. (1) The best type of vinda consisted of four main singers, twelve accompanying singers, four flutists and four drummers; (2) the medium type of vinda consisted of two main singers, four accompanying singers, two flutists and two drummers; (3) the lowest (kanistha or adhama) type of urnda consisted of one main singer, three accompanying singers, two flutists and two drummers. Regarding them, Sarangdeva has said in the Sangīta-Ratnākara:

Gätț-vädaka-samghäto vṛndamityabhidhīyate/ Uttamam madhyamamatho kanisṭḥamiti tat tridhã// Cattaro mukhyogataro dvigunah samagayanah/
Gayanyo dvadasa prokta vamsikanam catustayam//
Mardangikasu catvaro yatra tad-vindamuttamam/
Madhyamam syattadardhena kanisthe mukhyagayanah//
Ekah syat samagatasastrayo gayanikah punah/
Catasro vamsikam dvandvam tatha mardalikadvayam//
—S. R., III. 203-206.

According to Bharata, these vindas or combined musical instrument-players and musicians were called the kutapa or orchestra: "āba vinda-višeṣam tu kutapam bharato munih" (SR. III. 211), though Sāraṅgdeva holds a different view to some extent. Saraṅgdeva has said: "anyadapi vindam kutapākhyam matāntarena" (cf. commentary of Sirihabhupāla). According to him, vinda, known as kutapa, was really the nāṭya-kutapa (orchestra proper) and was exclusively meant for use in dramatic performances. Sāraṅgdeva has further said that the nāṭya-kutapa used to be formed out of different persons, expert in the arts of abhinaya, aṅgabāra, maṇḍala as well as in the arts of dances like tāṇḍava and lāṣya, which were also current in the countries like Varāṭa, Karnāṭa, Lāṭa, Mālava, Gauda, Gurjara, Mahārāṣṭra, Andhra, Aṅga, Vaṅga, Kaliṅga, etc.:

Varāta-lāṭa-karṇāṭa-gauḍa-gurjara-koṅgkanaiḥ/
Mahārāṣṭrāndhra-hammīra-caulair-malaya-mālavaiḥ//
Aṅga-vaṅga-kaliṅgādyair-nānābhinayakovidaiḥ//
Aṅgahāra-payogajñair-lāsya-tāṇḍava-kovidaiḥ//
Vicitra-sthānaka-prauḍḥair-viṣameṣu suśikṣitaiḥ/
Nāṭyasya kutapaḥ pātrai-ruttamādhamamadhyamaiḥ//
—Ratnākara, III. 221-223.

It has already been said that the natya-kutapa was also divided into three classes, best, medium and common-

place: "eteṣām ca pātrānāmuttama-madhyamādhamatvena kutapasyāpi traividhyam".

Sithhabhupāla has used the terms vinda and samūha or samghāta to mean 'collection': 'samghātaḥ samūho vindamucyate'. The vinda or samūha-vādya was also of different classes, such as, kutapa-vinda i.e. collection of different musical instruments, vāmsika-vinda i.e. collection of flutes only, gāyanī-vinda i.e. collection of singers, kolāhalākhya-vinda i.e. collection of various musical instruments which generally used to create disturbance.

It has been said before that besides orchestra (kutapa), chorus (urnda-gana) was in practice in ancient India, in connection with the dramatic performances. The chorus used to be produced by different musicians, both male and female, and was known as 'gayani-urnda'. These musicians remained always attached to the dramatic plays or abbinaya. The expert musicians used to produce songs in unison, and they were accompanied by different musical instruments. The gayani-vinda and the kutapa-vinda were in touch with each other all the time. The gayani-urnda was also divided into three classes, best, medium and common-place. The best type of gayani-urnda consisted of two main singers, ten accompanying singers, assisted by two flutists and two drummers. The medium one consisted of one main singer, and four accompanying singers, assisted by one flutist and one drummer. The common-place one consisted of half of the number of the medium one. Some are of opinion that according to Bharata, the gayani-urnda, vāmšika-urnda and such other vindas were also known as kutapa: "aba vrnda-višesam tu kutapam bharato munih". But it is a fact that though the musicians in the gayaniumda

were accompanied by different musical instruments and connected with the dramatic plays, yet they used to sing songs for drama in unison, which was nothing but chorus (samūha-sangīta or vṛnda-gāna). Like kutapa or orchestra, the musicians used to create the ethosin dramatic plays. The vāmšika-vṛnda was composed only of flutes, and consisted of one main flutist and four subsidiary ones,

Eka syādvāmsiko mukhyascatvāro'syānuyāyinaḥ/,
Vāmsikānāmiti prāyastajjñair-vṛnda nigadyate//
—Ratnākara, VI. 667.

As has been said before that opera (geya-nāṭya or gīti-nāṭya). evolved in India in the early 12th century A.D., i.e. evenbefore the time of Sarangdeva, who appeared in early 13th. century A.D., and the palpable evidence in its support isthe astapadi or gitagovinda-prabandha-gana of Thakur Jaideva of Kenduvilva, in West Bengal. All over the worldwell-trained orchestras provide the musical accompaniments. in opera plays. In opera, dance is only incidental, and the dramatic action and conversation (abbinaya) take prominent role. In South India, different operas (geyanāṭakas) were written by great composers in different times. The charitrams, written in songs and verses, were produced as opera. The charitrams were known as the geyacharitrams. Well has it been said by Prof. Sambomoorthy: "A well-trained orchestra is absolutely necessary to provide the music accompaniment in operas. . In a properly balanced orchestra, constituted with attention to tone-colour effects, it is possible to achieve brilliant results".2 It is thus-

<sup>1</sup> Cf. Prof. Sambomoorthy: History of Indian Music (1963).

found that an orchestra is necessary for an opera or geya-nātya.

Prof. Sambomoorthy has further said: "Kutapa is the term for orchestra in ancient Indian music. There are references to tata-kutapas or stringed bands and avanaddba-kutapa or bands of drums. The kutapas provided musical accompaniment to the dramas in ancient times. In late times, the term sangita-melam came to be used to denote orchestras, playing classical music. The orchestras, designated to play folk music, were called by such names as naiyandi-melam, urumi-melam, etc."

It has already been said that genuine evidences regarding the existence of orchestra and chorus, accompanying dance and drama, are found from the sculptures and bas-reliefs of different Buddhist Stupas, railings and gates, monasteries and Hindu temples of ancient India. Evidences are also discernible (1) in the paintings of the Ajanta Caves, in one of which is depicted a theatre-stage and green-room with a dancing girl, dancing with her attendants, and female musicians are keeping rhythm of the dance; (2) the theatre-stage and green-room hewn out of rock at the Sitabenga-Cave, in front of which is the figure of a female dancer dancing, and a drummer and a flurist keeping the rhythm of the dance; (3) representations of dancing figures on the Bharut-railings; (4) the vrnda-vadya and dancing figures as well as the figure of a dancer and female players of musical instruments at the Bagh Cave paintings are worth-mentioning. The orchestra-

<sup>1</sup> lbid., pp. 86-87.

party and the dance-motive of a dancing girl (nați), as depicted in the Pāwayā at Gwālior of the 4th century A.D., is also very significant in this context. The orchestra, as depicted here, consists of a sarode like veeṇā, one harp-type of veeṇā, flutes, drums and cymbals. From all these it is evident that a simple form of orchestra was in practice in ancient India even before the dawn of the Christian era, though modern type of orchestra evolved in India in the beginning of the British Rule, as it has been fashioned after the design of the orchestration process of the West. But that does not mean that there was no orchestra in India before the British Rule. India had orchestra and chorus of her own, and that orchestra consisted of purely Indian musical instruments, based on melody and melodic elaboration.

#### APPENDIX TO THE CHAPTER V.

Regarding vinda and kutapa:

#### CHAPTER VI

# SAPTATANTRI-VEENA IN THE BUDDHIST CAVES OF PITALKHORA

The musicians as well as the musicologists and the lovers of music generally overlook the importance of archaeological finds relating to music. The treatise on music undoubtedly supply to us many a valuable clue with the help of which the obscure and forgotten chapters of history of Indian music get illumined and become meaningful. But it is a fact that the representations of musical instruments and dancing postures with different hand-poses (mudras) of different epochs, carved on the scone-walls and facades of various caves and temples of India furnish us with materials which are indispensable for proper appraisal of the art of music as it flourished in ancient India. As observed by Carl Engle, the sculptures and frescoes of musical instruments and dance-poses relating to different periods of history provide to us knowledge of the culture obtaining in those periods. These should, therefore, be regarded as valuable means to the understanding of the cultural heritage of a people.

Representations of some of the musical instruments on stone have recently been excavated from the Buddhist Caves of Pitalkhorā, carved in the Satmālā range, known also as Chandorā, on the northern fringe of Aurangabad District of Mahārāstra State. The caves of Pitalkhorā lie 50 miles to the south-west of the Ajantā Caves and 23 miles to the north-west of Ellorā. An earlier account of these

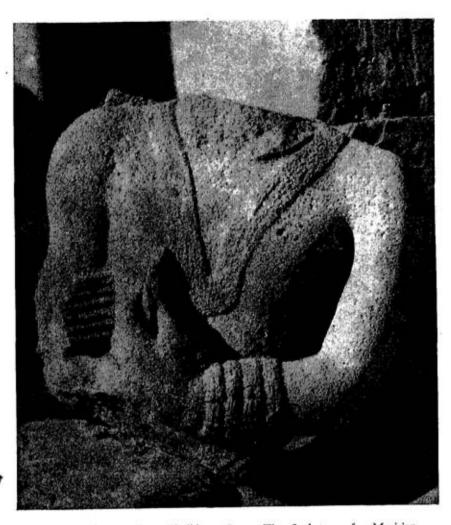

Caves, says M. N. Despandet seems to have appeared in 1853, when John Wilson gave a very brief description of the Chaitya Cave and the adjoining Vihara Cave. Fergusson and Burges also gave a more detailed account of the same in their monumental book, Cave Temple of India. In the "Report of the Buddhist Cave-Temples and their Inscriptions" (vide Archaeological Survey, West India, IV, London, 1883, pp. 11-12), Burges has further drawn particular attention to the Capitals on the pilasters of the Viharaand also dealt with the inscriptions, two in the Chaitya and five over the cell-doors of the Vibara, recording giftsfrom the the natives of Pratisthana. In more recent years, fresh light on these Pitalkhora Caves has been thrown by M. G. Dikshit in the Bombay Historical Society, Nos. 1-2, 1941. It is said that the development of the rock-cur. architecture started in the second century B.C. culminating in its final form in the sixth-seventh century A.D. The Caves were taken charge of by the Department of Archaeology, Government of India, in 1953, and are stillmaintained by them. The ancient name of Pitalkhora. seems to be Pitangalya, which has been mentioned in Ptolemy's account as Petrigala.

Now three portraitures of the saptatantri-veenā have been found engraved on stone-slabs, excavated from the debris in the forecourt of Cave No. 4 of Pitalkhorā. Besides them, have also been found one fragmentary sculpture of a winged Kinnara and one of a flying Gandharva. Though the nomenclatures of Kinnara and Gandharva are closely associated with music, as found in ancient lore, in the Epics, and

r The Bengali version of the Iataka, trnslated by Isana. Chandra Ghose.

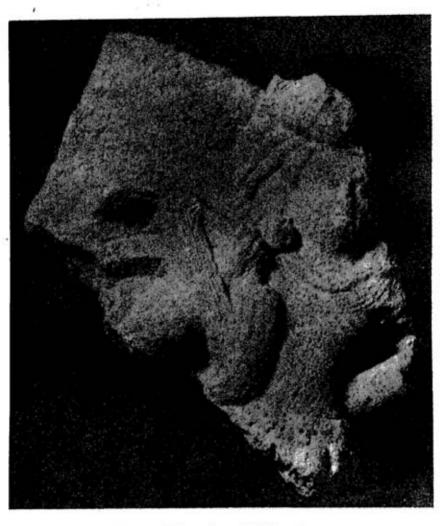

in the classical literature of India, yet the sculptural representations of Kinnara and Gandharva, as found in the Pitalkhorā Caves, are very peculiar in forms and features, for the winged Kinnara has been featured with collared beads in the right hand and a bowl of flowers in the left. The flying Gandharva has been depicted with a shield in his left hand, in heroic pose. During the Vedic period, says the historian R. C. Dutt, the Gandharvas, and the Kinnaras used to be considered as the enemies of the gods, but this conception underwent metamorphosis during the Epic period. It seems that the sculptors of the Buddhist Caves of Pitalkhorā adhered to the Vedic conception, while chiselling those figures of the Gandharva and Kinnara.

The saptatantri-veenas, together with their plectrums have been vividly depicted in some sculptures in Cave No. 4. The particular sculptures are three in number, two of which contain the representations of one female and one male musicians. In one of the two, a woman has been portrayed in a reclining posture, playing a veeņā, having seven strings, with her right hand. From the fragmentary piece of the sculpture it appears that the veena depicted thereon resembles in shape the Egyptian Harp. It is placed on the lap of the woman who holds the plectrum (kona) with her thumb and forefinger, and is seen plucking the second string of the saptatantri-veena. In the second one, a youth has been portrayed, holding a veena against his right schoulder, and seven strings of the veena emanating "from an elliptical gourd with a curved handle, at one end of which are tied the strings". In the third one is found the representation of a male figure, "wearing a graiveya and a bara round the neck and heavy floral wreaths on the wrists." A veena with seven strings is on his left arm,

(Nagarjunakanda, 2nd-3rd Century A.D.)

pressed against the left rib, and he holds the plectrum in his right hand.

The saptatantri-veenā was not a novelty in ancient India. In the Rgveda, we find mention of the veena, vana with hundred strings: "marutah vāṇam śata-sankhyābhis-tantrībhiryuktam veenā-višesam dhamanto vādayantab''. In the Rc. verse 10.32.4, it has further been mentioned: "mata yanmanturyuthasaya purvya'bhi vanasya sapta-dhaturijjanah". Sāyana has explained it as: "vānasya vādy asy a sapta-dbātub niṣādādi-sapta-svaropeto janaḥ abbigacchati tadvat tadguņopetam bhāvaḥ''. As the term "sapta-dhātuḥ" has been used with the word "vāṇaḥ," it is probable that 'sapta-dhātuḥ' signifies 'seven tones' that were produced in the hundred strings of the veena, vana. But we cannot agree with Sayana's interpretation of the term "sapta-dhatub" as notes like niṣāda, dhaivata, pañcama, madhyama, gāndhāra, rṣabha and ṣadja ("niṣādādi-sapta-svaropetah"), because the notes nisada, etc. are known as the seven notes of both the gandbarva and deśi types of laukika music that evolved after the Vedic period. The Vedic notes wene by the names of krusta, prathama, dvitiya, trtīya, caturtha, mandra and atsvarya, and it is reasonable to surmise that saptadhatub or seven notes, that were produced in the hundred strings of the veena, vana, were the Vedic ones. During the time of Katyayana of the Kalpasutra, the vana came to be known as the katyāyanī-veenā, and the commentator Karkācārya has called it the mahatī-veenā, possessed of hundred strings.

The saptatantri-veenā is one of the types of the veenā of the lute class of ancient India. The most ancient type of veenā was in the form of a bow, which was known as

dhanuryantram, or a musical instrument fashioned after the hunting bow, having the strings of gut. The 'bow' or dhanuryantram is regarded as the forerunner of all classes of string instruments of the world. The veenā with one string (ekatantrī) and the veenā with two strings (dvitantrī) are very ancient, and the historians are of opinion that all kinds of the later developed veenās evolved from them.

In the Vedic and Buddhist literature, different kinds of veepā have been mentioned, and the authors like Nārada of the Siksā (1st century A.D.), Bharata (2nd century A.D.), Matanga (5th-7th century A.D.), Pārśvadeva (7th or 9th-11th century A.D.) and Sarangdeva (early 13th century A.D.) as well as most of the post-Sarangdeva writers on music have described the characteristics of different kinds of veena in their respective works. The Birth-stories or latakas of Gautama Buddha were compiled sometime between the 3rd-2nd century B.C. Sir Wallis Budge has said in his monumental book, Baralam and Yewasef (1923), regarding the Birth-stories of Buddha that the orthodox Buddhists believe that this collection of the Birth-stories was in existence some three or four centuries before the Christian era. At the end of the 3rd century B.C. they were held to be sacred, and they were chosen as the subjects to be represented round the most sacred Buddhist buildings, e.g. in the relics of shrines at Sanchi, Amaravatī, Barhut, etc., and they were popularly known under the technical name of Jataka. The number of the Jatakas are 547 or 550 or 565 and of them the Veenasthuna and Guptila Jatakas in particular contain references about the musical instruments like the veena, venu, etc. It has been mentioned in the Guptila-jataka that Guptila and

Musila used to play the veenā, having seven strings i.e. saptatantrī-veenā. The Guptila-jātaka states:

Saptatanttī sumadhura mohinī veeņār/ Vādana šikhila antevāsika āmāra//1

The veenā with seven strings has also been described in some classical works of Kālidāsa. The veenā 'saptatantrī', perhaps resembled the eitrā-veenā, as described by Bharata in the Naṭyaśāstra in the 2nd century A.D. Bharata has said:

Saptatantrī bhaveccitrā vipańci navatantrīkā/ Vipańcī koṇavādya syāt citrā cāṅguli-vādanā// —NS., 29.114.

That is, the citra-veena, having seven strings, used to be played by finger, whereas the vipañci-veena, having nine strings, by plectrum (kona). Nārada has mentioned about the veenas, daravi and gatra in the Naradisiksa ( 1st century A.D. ). It is said that the daravi-veena, which contained seven strings, was used as an accompaniment to classical type of desi or formalised regional music. We also get the reference of the saptatantri-veena during the time of the Pallava King, Raja Mahendravarman, who lived in the 7th century A.D. It has been said that Raja Mahendravarman was himself an accomplished veena-player, and received his training in the veena from his learned teacher, Rudrācārya. The veenā, which he used to play, was known as the parivadini, having seven strings. Dr. Raghavan has said in this connection in his illuminating article: Music in the Deccan and South India (vide The

Bengali version, from the /ātaka, translated by Iśāņa Chandra Ghose.

Behär Theatre, No. 7, January, 1956): "To the east of Kudumiyamäläi Inscription, there is a label "parivädinī-da" helping us to understand the notation given in this inscription, as pertaining to the music on the veenā called parivādinī, a lute of seven strings". From this it becomes clear that the saptatantrī-veenā was in vogue in Indian society even from the 3rd century B.C. to 7th-8th century A. D.¹ Our modern sitār with seven strings is but the modified form of the ancient citrā-veenā, though it is erroneously believed that the Indo-Persian poet Āmir Khusrau fashioned and introduced it into India for the first time in the 13th century A.D. Most of the post-Bharata musicologists have also mentioned about the saptatantrī-veenā in their respective works on music.

Regarding the forms of the ancient musical instruments of the veeņā class, it can be said that most of them were bow-shaped, resembling the Egyptian harp, as has been

I John Burnet has said in his Greek Philosophy: "In the time of Pythagoras the lyre had seven strings, and it is not improbable that the eighth was added later as the result of his discoveries. All the strings were of equal length, and were tuned to the required pitch by tension and relaxation. This was done entirely by ear, and the first things was to make the two outside strings (hypaté and neté) concordant, in the sense explained, with one another, with the middle string (mesé), and with the string just above it (trité, later paramesé). The notes of these four strings were called 'stationary', and were similarly related to one another in every kind of scale; the notes of the other three (or four in the eight-stringed lyre) were 'movable' and scales were distinguished as enharmonic, chromatic, and diatonic (with their varieties), according as these strings were tuned more or less closely to the same pitch as the nearest fixed notes'.

stated before. The representations of the three saptatantriveenas, engraved on stones, which have been excavated from the Buddhist Cave (Cave No. 4) of Pitalkhora,1 are bow or harp-shaped, and most of the ancient veenas, though differing in number of strings, were of the same shape. The veenas featured in the sculptures of Gandhara (1st-2nd century A. D.), Barabudur (8th century A. D.), Kamboja (6th-13th century A. D.), Kizil (Turlan, Central Asia, 6th century A. D.), Amaravatī (2nd-3rd century A.D.), Ajantā (2nd-7th century A. D.), Nāgārjunakonda (2nd-3rd century A. D.), Sātnā (2nd century A. D.), Mahāvallipuram (7th century A. D.), Pāhārpur (8th century A. D.), Anurādhāpuram, Ceylon (2nd-3rd century A. D.), and other places resemble the bow-shape. The veenas of ancient Egypt (4000 B. C.) and ancient Sumer (3200 B. C.) were also bow-shaped. While discussing about the harp family, Hortense Panum says that the bow-harp was chiefly known from the Egyptian mural drawings in which it might be found as early as three to four thousand years B. C. The harp of antiquity did not use the front pillar which in the modern harp stays the string-frame, and the longest string was at the open side. Moreover, the frame of the ancient harps to which strings of unequal length were attached, took the form of a semi-circle or of an angle made of two staves. In the earliest known picture, the bow-harp only took the form of a somewhat more amply-strung counterpart of the bow-harp still in use among some of the north-African tribes. On a slightly curved and apparently

<sup>1</sup> Rock-cut Caves of Pitalkhora in the Deccan, published (1959) in "Ancient India" (Bulletin No. 15 of the Archaeological Survey of India) pp. 66-93.

still quite solid stick, which was of equal thickness from end to end, six strings were attached. A bow-harp was found in the tomb of Ka-Em-Nofer in Egypt, having seven strings. This kind of bow-shaped lute or veenā was prevalent in India in ancient times. The veenā, embossed on the coin of the Emperor Samudragupta II (4th century A.D.) is also of the identical shape (bow-shape). Again the veenās, perpendicular in shape with a gourd at each end, are also found in the sculptures of Mahāvallipuram (7th century A.D.), Ajantā (2nd-7th century A.D.), Bengal (Bāgālī-Kāleśvara, 14th century A.D.), and Rangpur (Bengal, 9th century A.D.). But the sculptural representations of the three saptatantrī-veenās of the Buddhist Caves of Pitalkhorā were palpably of the bow or harp type.

Now it may be asked in this connection as to why the bow-shaped as well as harplike veenās went out of practice in later days in Indian countries? It is a fact that most of the veenās, engraved in ancient sculptures and depicted in frescos and mural paintings in the Buddhist Cave-temples and monasteries as well as in the Hindu temples, are bow-shaped or harplike ones. It is found that ancient traditions die hard and generally followed by every society, in spite of emergence of new vision in artistic sense and creation. But it is also a fact that in the present Indian society, the bow-shaped as well as harplike veenās have become obsolete.

Prof. Rühlmann is of opinion that the bowed instruments had arisen independently at different times and in different places amongst advanced civilized peoples, but that they had always sprung from a primitive, rude form. Dr. Otto Anderson, Prof. Hortense Panum, Francis W. Galpin, Fétis and other Western scholars are of the same opinion to some extent. Regarding harp and its family, Prof. Panum has said that the harp family "is divided into two branches: (1) the Harp Proper, in which the strings are stretched freely so that the hands may reach them from either side, and (2) the Psaltery, in which the strings are extended over a sound-board so that they can be twanged from one side only".

There were also bow-shaped harps, and they were chiefly known from the Egyptian mural drawings in which it may be found as early as three to four thousand years B.C. "It may accordingly be considered with some probability as the original type out of which all the harps were evolved". In India, long before the advent of the Christian era, the veena used to be made out of bamboo and different kinds of wood in the forms of bow and harp proper. Most of the historians are of opinion that the Indian lute or veena first evolved from the bow, and the very primitive type of veena was in the shape of a bow (Indian, dhanu). Afterwards it took the shape or form of the harp. ancient Greece, Rome, Egypt, Western Asia, Assyria as well as in Wales, Scandinavian and other countries, the bowand harp-shaped veenas and other string instruments were in practice, and still these types of musical instruments are in use in different Western countries. History informs us that even the most ancient past becomes a common source of impetus and inspiration to all nations of the world in the field of new creation, and as such it is a matter of surprise as to how the bow-shaped and harplike veenas and other musical instruments went into oblivion from the present-day Indian society. The mystery of the real cause of their disappearance has not yet been unravelled, or it can be said that the question as to how, when and why the bow-shaped and harp-sized veenās went gradually out of practice from

the present Indian countries is purely a psychological one. It might have been the fact that as taste, along with the sense of beauty and artistic creation, change through ages, the present Indian society has found the practices of bow-shaped and harplike veenās as uncongenial for its purpose.

Again there may arise a question that will it be reasonable to assume or ascertain the real shapes, sizes and designs of the present-day veenas and other musical instruments from those of the ancient ones, as depicted in the ancient sculptures and paintings of the Buddhist and Hindu Cavetemples and monasteries? Because, even in present days it is found that most of the sculptures and painters are not fully conversant with the correct knowledge of the methods and principles of construction, of exact sizes and arrangements of the frets and wires in the instruments, and yet they chisel and paint or rather represent the musical instruments only to prove their existence and practice in the then society. It has been found that the depictions of shapes and positions of many musical instruments do not exactly tally with those of the modern instruments already existing in the present society. So some scholars are of opinion that it will not be wise to assume or ascertain the exact shapes, sizes, numbers of wire and fret of the modern musical instruments, from those, depicted in the ancient sculptures and fresco paintings. But it cannot be denied the fact that from the representations of the musical instruments in ancient sculptures and paintings, it is possible to know and ascertain that such and such musical instruments were in vogue in ancient society.

### APPENDIX OF THE CHAPTER VI

I. The method of playing on veenā, as described in the Nāradīśikṣā:

दारवी गालवीका च हे बीखी गानजातिषु । सामिकी गाववीया तु तस्याः श्रुत लक्स्याम् ॥ गाववीणी त सा प्रोक्ता यस्यां गायन्ति सामगाः। खरव्यञ्जनसंयुक्ता अङ्गल्यङ्गप्ररिक्तता ॥ इस्तौ संयुक्ती धार्यी जानुभ्यामुपरिस्थिती। गुरोरनुकृतिं कुर्यायथा ज्ञानमतिर्भवेत्॥ प्रणवं प्राक्ष्युजीत वाह्यतीस्तद्नन्तरम् । साविलों चानुवचनं ततो वृत्तान्तमारभेत्॥ प्रसार्य चाक्तुलीः सर्वा रोपयेत् खरमगडलम् । नचाङ्गलिभिरङ्गप्रमङ्गष्ठेनाङ्गलीः स्पृशीत् ॥ विरला नाहुली कुर्यानमुले चैनानमंस्पृशेत्। श्रक्तप्राप्रेण ता निखं मध्यमे पर्वेणि स्पृशेत्॥ मालद्विमालवृद्धानां विभागार्थं विभागवित्। श्रहुजीभिद्विमीलं तु प्राग्रेः सब्यस्य दर्शयेत ॥ बिरेखा तब दश्यते सन्धि तब विनिर्देशेत । स पर्व इति विज्ञेयः शेषमन्तरमन्तरम्॥ यवान्तरं तु सामस्त्वृद्ध्युं(१)कुर्यात्तिलान्तरम् । खरान्मध्यमपर्वसु सुनिविष्टान्निवेशयेत्॥ न चाल कम्पयेत्किश्चिदङ्गस्यावयवं बुधः। श्रधस्तनं मृद्ं न्यस्य इस्तमास्ते यथाकमम् ॥ श्रम्रमध्ये यथा विद्युद्दरयते मणिसूतवत् । एषच्छेदो विवृत्तीनां यथा वालेषु कर्तरि ॥ ( ज्ञपकः ) etc. -Nāradīśikṣā (Vārānasī ed.), Chapter VI.

H

The Veenatantra deals elaborately with the method of playing on the veena.

Vācanācārya Sudhākalaša says about veeņā:
एकतन्त्री द्वितन्त्री च त्रितन्त्री सप्ततन्त्रिका ।
एकिवंशितितन्त्री चेत् उत्तमा मध्यमापराः ॥
भजते सर्ववीग्रासु सैकतन्त्री प्रधानताम् ।¹
व्रह्महत्यां हरत्येपा दर्शनात् स्पर्शनादिप ॥
दग्डः शिवः शिवा तन्त्री नाभिभूनांभिरुच्यते ।
तुम्बं बिष्णुः कला ब्राह्मी वासुकिदीरकास्त्वतः ॥
स्वरान् प्रामान् मूर्छनाश्च तालालिप्तिश्चतीस्त्रथा ।
संसाध्य तस्यां रागास्तु सर्वे वाद्या(ः) सुबुद्धिभिः ॥
सरसाधनसंस्थानविन्दुसप्तकदग्ढया ।
वीग्या निर्मिताभ्यासो नादः शुद्धिकरः परः ॥
—Saṅgītopanisatsāroddbāra,
Chapter IV, 11-15.

III. Two kinds of playing, sakala and niṣkala: सकलं निष्कलं चेति तन्त्रीवाधं द्विधा भवेत्। सकोयां सकलं प्रोक्तं निष्कोयां निष्कलं भवेत्॥ श्रालापिन्यादि वीयाक्तं विशेषोऽयं प्रदर्शिरे। सकलं छित्रया (वा जीवया) युक्तं निष्कत्तं शून्यमेतया॥

I Different reading: चैकतन्त्री प्रधावताम् ।

# CHAPTER VII

#### THE CONCEPT OF RAGA

The conception of raga is a grand and wonderful thing that had ever been produced in the domain of music in the world. It is the outcome of human mind's direct mode of apprehending as well as appreciating the aesthetic beauty par excellence, as distinct from all contingent phenomenal things. It can be said to be the product of intuitive perception of the all-pervading abstract beauty, metamorphosed into a concrete idea or concept. This concept is a vital force that designed the grand structure of music. Really concept is the means for forming or constructing a conception of a thing. It is a general idea or meaning, bearing no distinct reference to any concrete object of sensing. It can otherwise be called a thoughtconstruction, carrying with it the idea or notion of a general nature or meaning which may be applicable to an individual or object. The concept of raga is, therefore, a product of thought or idea of settings of abstract ideal of tones, transformed in concrete form.

From a historical survey we find that rāgas probably evolved in the beginning of the classical period i.e. in 600-500 B.C., and they were evidently used in that time. In the Rāmāyaṇa and Mahābhārata, we come across the rāgas in a definite form. Nārada of the Sikṣā of the 1st century A.D. has mentioned the word rāga in connection with the seven grāmarāgas like ṣāḍava, madhyamagrāma, ṣaḍjagrāma, pañcama, sādhārita, kaiśika and kaiśika-madhyama. In the 4th canto of the Rāmāyaṇa, Vālmīki has definitely

described the pure (suddha) type of seven jātirāgas, with the application of their registers. (sthanas), murcchanas, and aesthetic sentiments and moods. The wandering bards like Kuśa and Lava used to sing the Ramacaritagana with the help of seven classical parent or causal melodies like the jatis. In the 2nd century A.D., Muni Bharata has only elaborated those seven jātirāgas into eighteen, adding eleven more mixed jätirägas. has formulated ten specific characters or essentials. like graba, amsa, nyāsa, alpatva, vahutva, etc. to determine the genuine forms of the jātis (rāgas). Like Vālmīki, he has also mentioned about the emotional sentiments and moods of the jatiragas so as to create the corresponding sentiments and moods in the minds of the appreciators. He has also admitted that the jatis are the precursors or forerunners of all kinds of marga and desi ragas to be evolved in future. Regarding the eighteen parent ragas or jātirāgas, described in Bharata's Nātyasāstra, MM. Rāmakrishna Kavi has said: "Among the ancient works on music, the ragas were classified into eighteen jasis, which simply show the main characteristic of ragas that come under each jāti". Unfortunately some scholars are not inclined to admit the status of the jatis, described in the Nāṭyaśāstra, as rāgas, because, according to them, the jātis of the Nātyašātra do not contain the real characteristic as well as do not bear the real significance of the ragas. But, we think, they fail to realize the real purport of the jātis and their ten essentials, as described by Bharata, Bharata has clearly said: "jātisambhūtatvāt", etc. While determining the characteristic or significance of the word jāti, Matanga has said : "athavā sakalasya rāgāderjanma-hetutvājjātyādaya iti". He has further said that all

the śrutis, grabas, and svaras (notes or tones) evolve from the jāti. So jāti, being the source or fountain-head of all kinds of rāgas, is known as the causal or parent rāga. As regards the specific character of the jātis, he has also said: "idānim višeṣa-lakṣaṇamāha-grabāmśau \* \*, tatrādau jātyādi-prayogo grbyate yenāsau grabah".

It is a fact that Bharata has not given any definition of the word rāga, but he has simply described the rāgas under the head of the jātis, with their determining essentials and other necessary features. It is Matanga, who, for the first time, has given a clear definition of rāga in the Brhaddess. Matanga has said: "yannoktam bharatādibi tadasmābbih nirā pyate". By the term ādi, he has meant Bharata and his contemporaries like Kohala, and others. Matanga has defined the word rāga in three different ways, and they are:

- (a) svara-varņa-viśeṣeṇa dhvanibhedena vā punaḥ/
  rajyate yena yaḥ kaścit sa rāgaḥ sammataḥ
  satāṃ//
- yo'sau dhvani-viśeşastu svaravarna-vibhūşitaḥ/, rajjako janacittānām sa ca rāga udāhṛtaḥ//,
- (c) ityevam rāga-śabdasya vyutpattirabhidhiyate/ rajjanājjāyate rāgo vyutpattih-samudā'hṛta//

From the above ślokas or definitions we come to know that the word rāga has been derived from the root 'rañi'— 'to tinge' or 'to impress'. Just as a sheet of white cloth can be tinged with some colours, in the like manner, the minds of men and animals get tinged as it were, with the pleasing vibrations of sweet sounds (tones) of music. In fact, the vibrations of sweet sounds of tones of both vocal and instrumental music create soothing and pleasing

sensations (samuedanas as the samskāras) in the mind, and the total material form of such sensations or impressions is said to be the raga. In fact, a raga is more than the sensations or impressions or a bundle of impressions, and that all kinds of sound, sweet or harsh,-musical or noise, create some impressions of their own, and as such it may be asked as to why all kinds of such impression cannot be termed to be the raga? To this question it can be answered that the intuitive musicologists as well as the scientists have carefully observed and examined the aesthetic aspects of all kinds of sounds and their vibrations, and have come to the conclusion that sounds of music i.e. musical tones are more delicate, charming, attractive and sweet than all other sounds, and so the vibrations or minute sound-units of music create sweeter and more soothing impressions in the minds of all, with their abiding value and beauty. And the name 'raga' has been so given as it creates pleasing impressions-cum-sensations in the minds of all living beings. Besides, the Sastrakaras have said that the ragas are possessed of some specific qualicies as well as characteristics which determine them and animate them with life and energy. We thus find that the ragas have in them the musical propensities and value, which attract the mind, help to concentrate the dispersed or scattered modifications of the mind, and thus lead the audiences and lovers of music to the realm of meditation, which brings peace, joy and happiness.

In this connection, it should be borne in mind that no single sound has the power to charm or attract any man or animal, but it requires to be combined with a successive series of agreeable sweet tones (sound-units) to produce the desired effect. Well has it been said by Vidwan T.V.

Subba Rão in connection with his Readership lecture on the Seven Lamps of Sangita: "A simple tone by itself has little or nothing to please, but in conbination with or in close succession to, certain other tones, its power to delight is high. A compound tone is always agreeable on account of the presence of the partials. These upper partials are produced by the vibration of the string in aliquot partsalong with the vibration of the whole string; and these notes agree with the note of the entire string. In this agreement lies the secret of the pleasurable sensation inmusic. . . Every note that is used in music must have at least a fair measure of concord with the fundamental. It must also agree with the note precedes it and the note that succeeds it. Though our system of music is melodic and produces its effects by a succession of notes rather than by a super-imposition of them, yet it must so far be conceded that the foundation of melody is harmony. The notes are derived on the basis of harmony, but they are applied. on the principle of melody. That the pleasure of harmony may be sensed by the ear, the sadja and pancama are always. sounded in the drone so that all the notes used may beperceived to agree with them".

Now, what is the psychological process behind the perception of a rāga? A rāga is a psycho-material object, because it originates first in the form of impressions (samskāras) in the depth of the mind, and then rises above the plane of the subconscious or unconscious mind and manifests itself in the outside world in the materialized form and is perceived by the senses. So when we say that we perceive and appreciate the rāga, it means that we perceive and appreciate the projected material form of the ideal aspect of the rāga. In fact, we ideally perceive and appreciate:

only the features of grace and sweetness (lavanya and madburya) of the raga, and the intricasies of the tones, having their movements like upward and downward motions (arobana and avarobana), are only the external features of the raga. Modern psychologists are of opinion that all the activities of our bodies and other organic functions are no other than the result of the reflex actions of the mind. When we hear a sound, sweet or harsh. pleasant or unpleasant, it at once enters our ears and produces agreeable or disagreeable impressions. That impressions are again translated into a kind of feeling or sensation (anubbūti or samuedana), and the mind immediately reacts through the reflex action, and then we pay our attention (mind) to the effect of the sound, which means we listen to and appreciate the sound. This happens also in the case of musical sounds or music. So we shall have to admit the existence of an intelligence or intelligent something behind the process as its mover or doer or director, and the process of our listening and appreciating music means we come in contact with both the intelligence (buddhi or caitanya) and the projected material form (vastu or visayasattvā) of music.

In other words, it can be said that the psyche<sup>1</sup> or mind is the reservoir of all kinds of impressions. When an object comes in contact with the psyche or mind through the gates of senses, it is transformed into impressions. The shining intellect then enlightens i.e. animates the impressions, which are at once translated into a sensation or feeling. The psyche or mind is conscious of the object

I In the Western Psychology, psyche is known as 'mind', whereas in the Indian Psychology, it is known as 'soul' or 'atman'.

with its intrinsic value and beauty. It happens during the perception of the musical sounds of the rāgas. As soon as we come in contact with beauty, grace and sweetness of the rāgas through the senses, they go at once into the brain in the form of impressions. Then the psyche or mind receives those impressions through the medium of the shining intellect, and they are again translated into the senses, and the result is that we perceive or realize or appreciate the rāgas, possessed of sensible forms and inherent qualities like beauty, grace and sweetness (saundarya, lāvanya and mādburya). And this is the process of perception of material things and qualities.

According to musicology, the rāgas evolve from the thāṭas, or melas, or melakartās. The thāṭas or melas or melakartās form the base or fountain-head of the rāgas. And it should be remembered that a thāṭa or mela or melakartā is also a rāga and it is known as the mela or melakartā rāga, which means the causal or parent rāga, just as a jāti (jātirāga) is recognized as the causal or parent rāga being the source of the grāmarāgas and different aṅga-rāgas, evolved in the later time.

Now, what do we mean by a thāṭa or mela? The word thāṭa is of Sanskrit origin, which means the structure or form (kāṭḥāma), and the word mela is also a Sanskrit one. A thāṭa or mela is a composite body of seven tones in ascent and descent series (ārohaṇa and avarohaṇa kramas).

I The word thāṭa (খাত) is a Sanskrit name, whereas ṭḥāṭa (হাত) is a Persian one, but both of them convey the same meaning of 'structure' or 'form' (kāṭḥāma or gaṭḥana).

A thata or mela is consisted of seven tones, and innumerable ragas (melodic forms) evolve from the thata or mela by the process of permutation and combination of seven tones. A thata or mela may be called a dynamic force-centre, from which innumerable ragas flower forth with their specific qualities and forms. Pandit Ahobala (1700 A.D.) has said: "mela svara-samūha syād ragavyanjana-śaktim", i.e. a mela is a combination of tones, and it has a power to create the ragas. Therefore every raga has a mela or thāta for its basis or ground of origin.

The murcebana is the precursor or forerunner of the mela or thata (or thata). The practice of murcchana was prevalent probably from the beginning of the classical period (600-500 B.C.). It is probable that when Brahmā or Brahmäbharata created the new type of gana, gandbarva out of the materials of the four Vedas (of the samaganas), the use of the murcchanas was in practice along with the rāgas (jātis or jātirāgas). In the Rāmāyana, Mahābhārata, Harivamsa and different Puranas, we find the use of murcchanas of different types along with different schools of gana. The murcchanas have been described in the early treatises like the Nāradīśikṣā, Nātyaśāstra and other contemporary works. From the 1st-2nd to 15th-16th century A.D., the murcchanas were recognized as the dominating principle for determining the nature and form of the ragas, both gandbarva and formalized desi. During the time of Nārada of the Sikṣā, Bharata, Dattila, Yāṣṭika, Matanga, Pārśvadeva, Sārangdeva, Nārada of the Makaranda, Somanath, Ahobala and even Pandit Damodara (17th century), the ragas used to be determined as well as recognised by their respective murcchanas.

A murcehana is a succession of seven tones in ascending

and descending orders. Etymologically it means 'swoon' (murccha). A raga is made to emerge by increasing or elevating it with the help of the murcchana. It is mainly divided into four, pūrņa, ṣāḍava, audava (or audavita) and sādhāraņa. A pūrņa mūrcchanā is so called because it is manifested with seven tones. A sadava murcchana is manifested with six tones; an audava murcchana, with five tones, and a sadharana murcebana is manifested with kakalinițăda and antara-gandhara tones. Matanga has said that a raga is called a murcchana when it is manifested in ascending and descending orders of tones: "murcebate yena rage bi murcchanetyabhisanjita". From this it is understood that a raga is no other than a murcchana, only difference between them lies in the fact that a raga is possessed of the pleasing and soothing capacity, inspite of its ascending-desending form, while a murcchana is possessed of the capacity of creating a raga. Pandit V. N. Bhatkhande has said,

melah syan-murcehanadharo gramadhara tu murcehana/ svarebhyo grama-sambhutih śrutayah svara-janmabhuh//, mela svara-samuhah syad-raga-vyanjana-śaktiman/

That is, the base or ground of a thata or mela- is the murcehana, or it can be said that a mela derives its origin from murcehana, a murcehana from a grama (ancient scale), a grama from a series of tones, and a tone from microtones (śrutis). So a mela is no other than a cluster of tones, from which a raga also originates. As for example, the murcehana, uttaramandra (of the adhara-sadjagrama) consists of the tones, sa ti ga ma pa dha ni; the murcehana, rajana consists of the tones ni sa te ga ma pa dha; the murcehana, uttarayata consists of the tones, dha ni sa ti ga

ma pa, and so on. So it is a fact that a raga is consisted of the successive tones to form its skelital structure. A tang also consists of successive tones. So it is found that a murcchana, a raga and a tana all these three musical principles are composed of series of successive tones, and, therefore, it may be asked as to what are the differences among them. The difference between a rage and a marcchanā has already been explained before. Now, as regards che difference between a murcchana and a tana it can be said that a murcebana is known by its successive series of ascending and descending tones, whereas a tana is recognised by its successive series of descending tones only. The text of Matanga's Brhaddesi is, in this respect, incorrect, and it has been correctly mentioned in Somanath's Ragavibodha (vide chapter I. 44). And it should be remembered that from different variations of murcchanas there evolved numerous ragas of different forms. In the present systems of Northern and Southern (Hindusthani and Carnatic) music, murcebanas have been replaced by the thatas or melas and melakartas, and the ragas of both the systems have originated from the melas and melakartas.

Now the students of Indian history of music know that the Sangita-Sästrakäras have mentioned about the three ancient scales like sadjagrāma, madhyamagrāma and gāndhāragrāma. In the times of the Rāmāyaṇa, Mahābhārata and Harivamsa (400-200 B. C.) and some of the early Purāṇas, these three grāmas were in practice, and the jātirāgas and the grāmarāgas used to be determined by these grāmas. Some are of opinion that the ancient grāmas were no other than the three modes, and the jātirāgas and the grāmarāgas used to be presented in the three different modes or ways.

But in the Mahabharata-Harivamsa, we get the reference as to the existence of six grāmarāgas ("sad-grāmarāgāni"), which were, it is said, the product of six ancient scales (grāmas). In the Nāradīśikṣā (1st century A.D.), we find the description of seven gramaragas, which correspond to the seven ancient scales, and they are supported by the Rock Inscription of Kudumiamālāi in the Pādukottai State, in South India, in the 7th century A.D. But it is surprising to note that Bharata has mentioned only two gramas, sadja and madbyama, and from this it will not be difficult to find out that during the 2nd century A. D., the gandharagrama became out of practice. We further come to know that by the times of Somanath, Srinivasa and Pandit Ahobala, the madhyamagrama also became obsolete, and from that time (17th century A.D.) the basic or adhara-sadjagrama exists as the base of the thatas or melas as well as of the ragas.

The mūrcchanā were also replaced by the thāṭas or melas probably by the time of Paṇḍit Rāmāmatya (1550 A.D.), and it bears confirmation of Paṇḍit Somanāth (1609 A.D.) and other music scholars. Paṇḍit Rāmāmatya has said: "svarānāmatha vyakṣate ye mela rāgahetavaḥ". Rāmāmatya has also formulated twenty basic (janaka) melas with the mukhārī at their head as the śuddha scale. After him, Paṇḍit Somanāth has mentioned in the Rāgavibodha: "atha kathyante melaḥ kramarūpāsti bhavanti" etc. In his commentary, he has defined the mela as "milanti var-gībhavanti rāgāḥ yatreti tadāśrayāḥ svara-samsthāna-višeṣā melāḥ, 'thāṭa' iti bhāṣāyāṃ'. It will be of interest to note that though Kallināth (1446-1465 A.D.), the commentator of the Sangīta-Ratnākara has not mentioned the term 'mela', yet he has used the term 'melana' in the sense of using in

musical parlance. Pandit Govinda Diksit (1614 A.D.) has mentioned that he has adopted his system of mela, following the 15 basic scales, advocated by Vidyāranya Svāmī (14th-15th century A.D.). From this we can assume that from the 14th-15th century, the system of replacement of mūrechanā by mela came in vogue. Therefore, by the times of Pt. Rāmāmatya and Pt. Somanāth mūrechanā as a determining principle of the rāgas completely disappeared, yeilding the place to the mela or thāţa.

The rāgas are classified into three main categories, śuddha (independent), sālaga or chāyālaga (dependent) and samkīrņa (mixed or compound). The śuddha rāgas are formed independently of other resources. Kallināth's definition of it is different, but yet new and novel. He has said that the śuddha rāgas (independent melodies) are those which do not violate the prescribed rules of the Vedic śāstrageya-gāna, and from this it is evident that the śuddha rāgas are age-long traditional. The sālaga or chāyālaga rāgas always depend on other rāga or rāgas for its or their constitution and nourishment. The samkīrņa rāgas are an admixture of both the śuddha and sālaga rāgas. Sārangdeva and Somanāth have described these three classes of rāgas in their Sangīta-Ratnākara and Rāgavibodha explicitly.

The authors on music have further classified the rāgas into three jātis, sampūrņa (cluster of seven tones), ṣāḍava (cluster of six tones), and auḍava (cluster of five tones). The jātis are determined by the number of tones of the rāgas. Further the rāgas can be divided into nine classes, mixed with each other, and they are: (i) auḍava-auḍava, auḍava ṣāḍava, and aūḍava-sampūrņa; (ii) ṣāḍava-auḍava,

ṣāḍava-ṣāḍava and ṣāḍava-sampūrņa, and (iii) sampūrņaauḍava, sampūrņa-ṣāḍava and sampūrņa-sampūrņa.

It should be remembered that a thata or mela is always in a heptatonic form i.e. it is constituted out of seven tones. But the ragas do not maintain the same number, although they born of the thatas or melas. As for example, we find that the ragas are sometimes heptatonic, sometimes hexatonic and sometimes pentatonic in forms. Again, a raga is known by its dominant note or tone, which called an amsa or a vadi. But it is interesting to note that by the time of Bharata (and century A.D.), the ragas (jāti-ragas) used to be determined by more than one amsa (which bear the equal status of a vadi). The amsa, graba and nyāsa are the three essentials of a raga, and they are part and parcel of the ten essentials or dasa-laksanas. The graha is the initial tone, whereas the nyasa, the final one. During Bharata's time, in the 2nd century A.D. these two essentials, graba and amsa were used as synonymous terms. But gradually they conveyed different meanings, and by the time of Matanga in the 5th-7th century A. D., they were treated as separate ones, though Matanga has said: "amsa vādyeva param, grabastu vādyādi-bhedabbinnah". An amsa or a vadi really determines the genuine form and nature of the raga, and so Matanga has defined vadi as "vadanāt iti vādī". Pārśvadeva (7th-9th or 7th-11th century A. D.) has also supported this definition. In fact, an amsa or a vādī is recognized as a predominant factor of a raga. A tone as a vādī (sonant) is always followed by a samvādī (consonant) and an anuvadi (assonant). The tone, samvadi may be called as a concordant one, because it helps to make vadi more explicit. The anuvadi or assonant plays the role of a subordinate tone. There is another tone, which is

known as a vivādī or a discordant one. It is said that the tone, vivādī spoils the form as well as the spirit of the rāga.

The seers of music in India never regard a raga as a mere skeleton of tones and semitones, but recognize them as an embodiment of living and dynamic force. They have made each raga divine, and regard them as a source of inspiration and hope. They have surcharged the ragas with different emotional sentiments and moods (rasa and bhava). Probably from the 15th-17th century A. D., the inspired poets composed the dhyanamantrams (contemplative compositions) of the ragas in colourful meters and beautiful words (chanda and sahitya), and the intuitive artists began to give them graceful forms in colours. The iconographical aspects and representations of the ragas were materialized in the vision of the artists, and so to say that the ideal vision of music became real and vivid at that time with its practical value and spiritual significance, which were the keynote to the songs, nay, to the life of all living beings.

# CHAPTER VIII

### ARYAN AND NON-ARYAN ORIGIN OF SOME INDIAN RĀGAS

We love music, but sometimes miss its ideal that prevailed in ancient India. We mainly dabble in the theory of music, which means generally the grammar of music. But strictly speaking, theory of music includes in its fold all the aspects other than the practical one, the sadbana, In the Upanisads and ancient Sanskrit texts, we come acrossthe terms like 'sastra' and 'sadhana'. By 'sastras' are meant the Vedas, Upanişads and other Vedangas i. e. six systems. of philosophy and a host of secular writing on science and art, whereas sadbana means the spiritual practice that enablesone to have a glimpse of the ever-effulgent transcendantal Reality. The sastras act as guides and help the aspirantsin their practices, by prescribing ways and means for attaining the highest truth. The sastras are but the theoretical part of music, containing the laws, rules and regulations that go a great way towards facilitating the practiceof music by man and ulitimately leading him to its highest ideal. In this sense, theory includes all branches of knowledge like literature, history, psychology, and philosophy of music, which colour and influence the practice of music inmanifold ways.

Indian music is not merely a skelital structure of tones and their permutations and combinations, but is something more than that. It is spiritual in nature and breadth of vision, and though it is performed with the help of material tones and tunes, it breathes the supramental

atmosphere, and raises the common man, who comes under its spell, to the level of the superman. The ragas of Indian music should be considered as living and dynamic. Their conception is not a superstition or make-belief one. During the 15th-16th century A. D., many intuitive poets visualised the forms of the ragas in contemplation, and composed dhyanamantrams which inspired talented artists to give them their shape in colour and lines. They certainly bear the stamp of inner significance, and possess merit that help men to realise the intrinsic meaning and solemnity of the ragas.

Besides, the ragas should be studied in true historical perspective. History is a genuine record or chronicle of the events that happened in the past. If you focus the search-light of history at the ragas of the Indian classical music, you will find that many of them have been adopted from the regional and tribal tunes of the Aryan and non-Aryan peoples of India. Some of them evolved as a result of the contact with foreign nations, while some were fashioned out of the materials resulting from the coalecence of the Indian and Persian elements. And this is quite natural. India always maintained a liberal and broad outlook. There were also many cultural and political contacts between India and different Western and Eastern countries, either through trade and commerce or through religious missions. Genuine evidences in this respect are not lacking. There are historical records of the Western savants like Megasthenes, Strabo, Plini, Ptolemy, Mcrindle, Herodotus and others, and Eastern travellers like Hinen Tsang, Itsing, and others in its support. The Scythians or Sakas, Parthians, Persian, Greeks, Bactrians, Turks, Huns and others invaded India many a time, and many of them were

culturally and politically influenced by the ideas of India, and vice-versa.

From the history of Indian Music we again learn that though the ancient musicologists like Kohala, Yastika, Durgāśakti, Matanga, Pārśvadeva and others were recognised as the staunch followers of Muni Bharata of the Natyasastra fame, yet, when they found that the gandharva type of the post-Vedic music gradually fell out of practice and became unpopular among the artists and lovers of music, they adopted a novel course in the process of Indian music, with a synthetic vision, and this act of renovation was not new in the annals of Indian music, Many of the regional and tribal tunes were formalised with the help of the sastric ten essentials (daśa-laksanas), and they were christianed after the places of their origin and also after the tribes accordingly. As for instance, we find that the ragas like malava, andhri, chevātti, gurjarī, kāmbojī, pulindikā, šāverī or śrāverī. bāngālī, takka, kaušikī, etc., were adopted from the current tunes of songs of those of the tribes of both Aryan and non-Aryan stocks. The raga botta or bhotta was also a tribal tune of the Bhotadeśa or the Tibetan speaking peoples. Matanga has said that ragas like takka, (or tanka or tanki), sauvira (or sauviri) and vesara, botta (or bhotta) originated from the treble clef or madhyamagrama between the 3rd-5th century A. D. But it will be interesting to know as to how the raga botta (or bhotta) came into being and was included within the fold of raga of Indian music. We know that the Buddhist religious and cultural missions crossed many times the borders of India, and travelled far into the lands of Iran, . Turkistan, China, Japan, Corea, Indo-China and different parts of the middle and East Asia, and even to the Western

countries, from Bengal (Gauda), Magadha, etc., through Kashmere, Tibet, Bhotan, Khotan, Samarkand, Yerekand, Sugda, Kutch, etc. From the Chinese chronicles we come to know that the Buddhist religious missions went to China several times through Central Asia and other places, early in the first century A.D. and that Indian culture, including music, both vocal and instrumental and dancing, were introduced in Kutch, Khotan, Samarkand, China and even in Persia and Arabia. In the eleventh century A.D., during the reign of the Pala kings of Bengal, there was a close contact between India and Tiber. Tiber became a powerful kingdom during the reign of Sranga-tsan Gampo, in the seventh century A.D. The Pala kings helped a good deal towards the propagation of Buddhism in Tibet. The Tibetan monks used to visit the monastries like Nālandā, Vikramšilā and Odantapurī, etc. for studying different subjects including Buddhist scriptures. Atīśā Dīpankara, a monk of Eastern Bengal, visited Tibet in the eleventh century A.D., during the reign of Nyayapala of the Pala Dynasty. Hundreds of Sanskrit manuscripts were translated into Tibetan language, of which the famous Tānjur and Kānjur are worth-mentioning. Through the medium of trade and commerce, religion and culture Tibet and its adjacent countries were intimately connected with India, and in this way it became possible to incorporate the Tiberan tunes into Indian music.

The rāga ṭakka, ṭaka or ṭaku, afterwards modified to tanka or ṭankī, was also a tribal tune of the Ṭakka race of the Aṭ-ṭok country. It is said that before the advent of Lord Buddha, Ṭakka or Aṭ-ṭok was situated on the bank of the river Sind. Taxilā was one of their cultural centres. Dr. P. C. Bāgchi is of opinion that "the Ṭakkas who lived for some

probably of foreign origin". But the rāga takka or taku was included within the fold of the Aryan music. The ancient musicologists are of opinion that takka is an ancient rāga like mālava and hindola. Kašyapa, one of the ancient musicologists has assigned a high place to takka rāga, and says that it is a very favourite rāga of Devī Lakṣmī, the goddess of fortune: "mukhya-gaḥ Lakśmī-prītikaratvāt". It has already been said that takka is known at present as tanka or tankī.

Like takka, botta or bhotta raga is also a regional tune, adopted from the Bhotadesa. In 306 A.D., Srang-tsain-Gampo married Bhrukuti Devi, the daughter of the king of Nepāl, and was converted into Buddhism. He established political as well as cultural relations with Magadha and Gauda through Nepal. But the raga botta or bhotta was adopted into the Indian classical stock, long before Srangtsan-Gampo, along with other regional ragas, takka, sauvira, mālava-pancama, sadava, bindolaka, takka-kausika and mālava-kaušika. In Matanga's Brhaddešī, written in the 5th-7th century A.D., these ragas have been given honourable position of the gramaragas, evolved from the jatiragas basic scales in the sadjagrama and the and cheir madhyamagrāma. The above-mentioned rāgas, including boțța or bhoțța, were used in the raga-gitis like suddha, bhinna, etc.

Regarding the Tibetan rāga boṭṭa or bhoṭṭa, Matanga has said that it evolved from the primary clef or ṣadjagrāma; "boṭṭa-rāgaśca ṣadjākhye". While describing the Tibetan tune, he says:

Syāt ṣaḍja-madhyamā-jāteḥ pañcamaśca vinirgataḥ/,
Boṭṭa-rāgaśca vijñeyaḥ pañcamāt so ('anta) madhyamaḥ//

The Tibetan tune botta manifests itself, by taking the four microtonal units from the fifth note, pañcama. Its initial (graba) and vital (amsa) notes are pancama, and the final (nyāsa) note is madhyama. The use of gandhara or nisada is frequent. Then nisada is used as a sharp note. It is heptatonic (sampūrna) in form, and is connected with the sacred ceremonial function. Its emotional sentiments like santa, etc. are used to make it graceful and lustrous. Sarngdeva has also followed Matanga. He says that the regional raga botta was used in the sacred memory of the Lord Siva, the divine consort of Bhavani Gauri, the daughter of the mountain Himālayas: "utsavo viniyoktavyo bhavānīpati-vallabham". Sārngdeva has composed a song for the raga with notatian, and the Sanskrit-Bengali composition (sahitya) of the song is strikingly similar to that of the mystic poet of Kenduvilva, Jayadeva. The composition of the song runs thus:

> Pavana-vilulita bhrāmita madhukara jalaja-reņu-paripiñjarita/ Mada-mandagatī haṅsa-vadhūrvicarita vikaśita-kumuda-vane//

which means, the water of the sacred lake on the Himalayan mountain is almost covered with the full-blown waterlilies. The bees being swayed by the wind are humming sweetly, becoming intoxicated with their sweet fragrance, and are collecting honey, mixed with the drops of water. The swan-bride (bansa vadbā) is sporting in the forest of blooming water-lilies in measured majestic rhythm.

The people of the Bhotadesa adopted Tantricism like Buddhism sometimes after the 11th-12th century A. D. Ācārya Indrabhūti propagated the Tantric Buddhism in Bengal probably after the ideal of the Hindu Tantricism already prevailing in India from ancient times. The Tantricism of Tibet or Bhotadesa may be an admixture of Hindu and Buddhist Tantric cults. In Tantra and Purana, the Lord Siva has been given an exalted and venerable position, and perhaps being aware of it, Sarngdeva has connected this raga of the mountains with Siva, the presiding deity of the Himalayas.

The ragas, bhairava and bhairavi were the ceremonial tunes of the aboriginal tribe, Bhirava, who lived in the Himālayan valley with the tribes like Abhīra, Savara, Candala, Pulinda, and others. Saradatanaya has mentioned about them in his Bhavaprakasana in the 14th century A.D. They were non-Aryans. Probably between the 3rd to 11th. century A. D., these two tunes were adopted into the Aryan stock, after rectifying them with ten essentials. Wefor the first time come to know about the ragas, bhairava and bhairavi, mentioned in the Sangitasamayasara (vide 3, 5, 17, 70) of Parsvadeva of the 7th or 9th-11th century A. D. The bhairava is known at present as the foremost tune adi-raga ("śubbrambaro jayati bhairava adi-ragah"). But from the historical point of view it is known that the first appearance of the raga bhairava, together with bhairavi took place inthe 9th-14th century A. D., and it was Pārśvadeva whohas enunciated both the ragas in Sangita-samayasara. So it must be taken to mean that bhairava has been enumerated as the foremost raga from the aesthetic viewpoint, and not from the historical one. The raga bhairava evolved out of the grāmarāga, bbinna-ṣaḍja, which in its turn originated from the jātirāga, ṣadja-udīcyavatī (S R. II. 79-82). Bharata and Sarangdeva have considered the sadja-udicyavatito be pentatonic, having its base in the middle clef or madhyamagrāma. The rāga, bhīnna-ṣadja was pentatonic, rṣabha and pañcama being left out. The bhinna-ṣadja was considered as a sacred ceremonial rāga, and used to be sung on the occasion of the sārvabhauma ceremony ("sārvabhauma motsave geyo"). The rāga bhairava was also pentatonic, and breathed the same spirit, and created the same sacred atmosphere like the bhinna-ṣadja ("prārthanāyām sama-svaraḥ").

The raga bhairaus also evolved out of bhinna-sadja, and was the heptatonic (purna). The bhairavi was considered as sacred like the bhairava, and was practised on occasion of sacred ceremony or worship ('devādi-prārthanāyām tu bhairavī viniyujyate'). Again it should be noted that according to Sarngdeva the bhinna-sadja was possessed of emotional units or aesthetic sentiments like śanta, bibhatsa and bhayanaka. Bharata is of opinion that the parent raga (jātirāga), sadja-udīcyavatī possessed emotional sentiments of śrngāra and basya (NS. 29. 1). We thus find that the emotional qualities of the bhinna-sadja were somewhat different from that of its causal raga, and it is probable that in later days the bhairava and even the bhairavi came to be munifested with the common qualities of their causal and remote causal ragas, i.e. they possessed santa (in place of sringara and bhayanaka) and karuna (in place of hasya and bibhatsa). Again it is a fact that the manifestations of emotional sentiments of both bhairava and bhairavi took some novel change in course of time, as we find that the emotive ingredients of bhairava and bhairavi, bhayanaka and karuna do not generate at all fear and compassion, rather they do help to generate serenity, calmness and peace, and thus bring about balance of mind, in accordance with the peaceful effect of śrngara or śantarasa.

The šaka rāga was also a tribal tune of the Sakas or Scythians. The Sakas were displaced from their home in Central Asia by Yul-chi, and were forced to migrate to the South. They were also found to be settled in Southern Afganisthan, in the beginning of the Christian era, and the territory they occupied, came to be known as the Sakasthana, the modern Sistan. They were one of the groups of Pahlava, Pārthiān and Kushān. Some of the Saka-Pahlava kings or Ksatrapas used to rule in Kapiśa near Taxila in the Western Punjab, and some at Mathura and Upper Deccan, and at Ujjain in Malwa. The Sakas or Scythians and Kushans were the cultured peoples. Different kinds of arts and crafts came into being during their regime, and the remnants of their art and culture are to be found in the Indian Society. Dr. B. N. Dutta has said in the book, Indian Art in Relation to Culture: "That the art of the Scythian period was an innovation, and died out after the cessation of the Scythian rule, is not borne out by the latest investigation. There has been a continuity of culture and its tradition". The Saka or Scythian raga was divided into two main forms, śaka-tilaka and śaka-miśrita. It is now almost obsolete in the present society. However, the śakaraga has been associated with Siva, the Lord of the universe ("Siva-priya"-SR. 3, 62).

The raga todi is called by its various names like todika, toddi tudi, tundi, etc. Todi or todika is the correct name. This raga evolved from the 'pastoral tune' of the shepherds or farmers. Originally it was the pastoral tune of the Turkish people. When the Turks invaded India like other foreign tribes, they left their pastoral-cum-national tune to the Indian society, and so it is considered a foreign tune. Dr. B. N. Dutt observes in his book, Indian

Art in Relation to Culture: "It is the classical musical system of the heyday of Hindu culture that existed in the time of Vākāṭaka-Gupta period. So long it had been independent of foreign influence. Then came the Turkish invasion. North India was engulfed by it. And the Turkish Todī was introduced in the Indo-Aryan musical system".

Prof. O. C. Gangoly has mentioned that in Subandhu's Vāsavadattā, we get the line: "samāsanna kinnarī-gītaśravana rasamana ruru visarena', which means 'the deer were mad with joy when they heard the song of a Kinnari (a young maiden) standing near by'. In the Kathasaritasagara, the influence of music over the deer has been mentioned several times: 'sa tena gīta-śabdena śrutena harino yatha akrstah', etc. Hemcandra too has mentioned this fact in connection with Kunala, the son of the Emperor Aśoka. He has said: 'Pāṭaliputra-nagare yatra yayau sa tu, tatra tatra yayuh paurāh gitākreta kuranga-vat'. During the mediaeval period, the hunters used to hunt the deer, humming a charming tune, which attarcted the deer. The historian Alberuni has described in his itinerary that he witnessed the hunters to entrap the deer with a perticular song, without using any weapon or trap. Prof. Gangoly has said that there is a beautiful allusion in the Nagananda of Sri Harsa, where Atreya mentions that when the deer heard the charming tune of song or veena, with closed eyes, the half-chewed green grasses fell down from their mouths. It is also on record that farmer maidens used to allure the deer by a peculiar charming tune, and thus they prevented to ravage their crops in the fields by the deer. The idea that the deer were susceptible to sweet tunes inspired the painters of the mediaeval India to paint

the picture of the raga todi, depicting a herd of deer, and a young maiden, with a veenā in her hand.

Pārśvadeva (7th or 9th-11th century A.D.) has described todī as a rāgānga-rāga, and turuska-todī and chāyātodi as the upānga-rāgas. The turuska-todi, according to Pārśvadeva, is heptatonic, having seven notes, and chāyātodi, pentatonic, having five notes, rsava and pancama being left out (varjita). In the Sangitamakranda, todi has been relegated as a subordinate raga of pañcama. Mammațăcarya has called it the janya-raga of nața. Someśvarācārya has called it the anga-raga of vasanta. Sārangdeva, following Pārśvadeva, has observed the note, madhyama as the intial (graha), the final (nyāsa) and the sonant (amsa). Pandit Ahobala has called todi, i.e. mārga-todī as hexatonic (sādava), rsabba and dhaivata being flat (vikṛta or komala), madbyama as the sonant (amsa), sadja, the final (nyāsā), and dhaivata, the initial (graba). It is manifested in the pauravi-murcchana of the middle cleft (madbyamgrāma), which is known as 'dha ni ri ga ma pa-pa ma ga ri sa ni dha'. It is sung in the morning.

Paṇḍit Somanāth (1609 A.D.) considers toḍī as the mela-rāga, which is known by its toñal structure: sa ri ga (sādbāraṇa), ma pa dha ni (kaiŝika). Lochana-Kavi (17th century A.D.) has given the description of the tonal form of toḍi which is similar to that of the bhairavī mela: sa ri ga ma pa dha ni; and from this it is understood that Lochana-Kavi admits kāphī as the standard pure scale (śuddha-thāṭa). Paṇḍit Dāmodara has described toḍī as evolving from the sauvirī-mūrechanā, which is known by its tonal atrangements of ma pa dha ni sa ri ga—ga ri sa ni dha pa ma. The notes, ṛṣabha and dhaivata of the

ancient form of todi were flat (komala), and it was hexatonic (sadava).

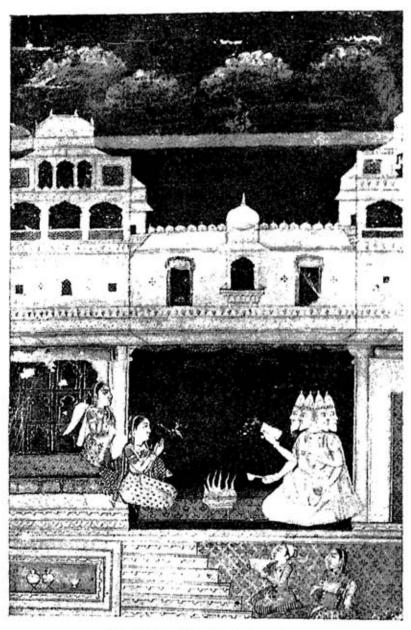

The tonal form of todi of the present Hindusthani system is: sa ri ga ma pa dha ni—sa ni dha pa ma ga ri sa. It is included in the todi-thata, and the sonant (amía or vādī) is dhaivata, and the assonant (anuvādi) is gāndhāra. It tends to manifest towards the later part of the scale (uttāranga-pradhāna), and the tonality of the note, gāndhāra resembles that of pīlu.

In the 15th-16th century A.D., as has been said before, the inspired poets composed the dhyānamantram of todi, and some competent painters drew its pictures in all grace and beauty, depicting a young maiden, with veenā in her hands, standing among a herd of deer, who stand enchanted with the sweet tune of the veenā. Rādhā Mohan Sen, a Bengalee musicologist has described todī as young maiden, who keeps vigil for her lover. She wears a white cloth, and is bedecked with precious ornaments. Her hair is glossy with oil and scented with camphor. She is sitting alone, and is playing on the veenā. But here the poet has lost sight of the real import of the rāga todī and, therefore, has painted her as a foppish lady.

Now, it may be asked whether there is any congruity between the contemplative composition (dbyāna) and the tonal composition (svararūpa) of the rāga todī. The tonal form of todī, prevailing in the present system of Hindusthānī music is: "sa rī ga ma pa dha ni sa—sa ni dha pa ma ga rī sa". Here the notes "rī ga ma dha" are displaced or flat (komala). But we find that the old tonal form of todī, as has been depicted even in Dāmodara's Sangītadarpana of the sixteenth century A. D., is hexatonic, having the notes, rṣabha and dhaivata as displaced or flat. The South Indian

Raga Todi (the Pastoral Tune) (Turkish Influence) Rajasthani painting (Jaipur) 18th Century A.D.

Raga Khambaj (Persian influence) 18th Century A.D.

todi is also hexatonic in its form and has been depicted as: sa ri ga ma dha ni—sa ni dha ma ga ri sa", having the notes "ri ga dha ni" as displaced. Now, though we find different tonal forms of todi prevailing respectively in the North and the South Indian systems and different dhyānaforms and exquisite paintings delineating the identical todi rāga, yet there can be discerned a fundamental unity underlying all dhyānas and paintings.

The theme of the contemplative composition (dhyāna) as well as the picture of the todi raga has already been discussed in connection with the historical and aesthetic significance of the same. However different may be the tonal forms of the todi raga as prevailing in the Northern and Southern systems in dhyanas and pictures, todi has been conceived and depicted as a fair young maiden, veenā in hand and pursued by a herd of deer, enchanted with the tune of the instrument. Therefore the real significance underlying the conception of the todi raga is that while culturing it, the artist will get completely absorbed in the central theme and tune of the raga, and become forgetful of the maiden tie of the contingent world that keeps one confined in the den of delusion. May the vivid example of the enchanted deer inspire the artists to pursue the art with unqualified devotion to make life blissful and divine on carch.

The raga nata is a melody of the heroic sentiment. It has been conceived and designed for using in the battle-field to inspire the soldiers. Pārśvadeva has mentioned about this rāga, naṭa, nāṭa or nāṭikā in the Saṅgāta-samaya-sāra of the 7th or 9th-11th century A.D. This rāga is also known as naṭi, nāṭi śuddha-naṭa, etc. The sentiment and aesthetic mood (rasa and bhāva) of the rāga naṭa are differ-

ent from those of the raga, natanarayana, which is known as the melody of rythmic dance. Pandie Damodara of the 17th-18th century A. D. has described about the dhyanamantram and features of nata-raga as:

Grahāmśa-nyāsa ṣaḍja syāt sampūraņa nāṭikā matā/ Turaṅgama-skandha-nibaddha-vāhuḥ/ Svarṇa-prabhaḥ śonita-śona-gātraḥ/ Saṃgrāma-bhumau vicaran pratāpī, Naṭo'yaṃ uktaḥ kila rāga-mūrtiḥ/

That is, the hands of the raga, nata or natika are placed upon the horse (ready for jumping upon the battle-field). The colour of the raga is red like blood, and he (or she) shines like gold. He (or she) walks in the battle-field with a heroic look, and he (or she) seems to be an embodiment of rage or anger. A Hindi poet has also described the raga in a beautiful way:

Chadi turangama cheyo yāhā janga,
Tāhā khamasāyaike khadge-vajavai,
Muṇḍa-kāti aru ruṇḍa-nāchāvai,
Jaru yogiṇī khappara śrona-purāvai,
Hāthime samasera dharai,
Sava vecra ghatā sava vecra jagāvai,
lyā vidhi bhāva vakhāniye bhairuki,
Rāgiṇī nata yoka bhayānaka-rūpa lakhāvai/

From the description it is understood that some warmelodies were prevalent in mediaeval India, and the rāga naṭa, nāṭa or nāṭikā is one of them. This tune or melody was used both by civilized and aboriginal tribes of India.

Besides the nata-raga, there were other ragas or melodies of heroic sentiment (veera-rasa,) and they were specially meant for war. Among others, the names of kalyana and

ādānā can be mentioned in this connection. The contemplative description of the kalyāṇa-rāga is,

Kṛpāṇa-pāṇistilakam lalāṭe, suvarṇa-veśaḥ samare praviṣṭaḥ/ Pracaṇḍa-mūrtiḥ kila raktavarṇaḥ kalyāṇa-rāgaḥ kathito munīndraiḥ//

The kalyāṇa-rāga, sword in his hand, is entering the battle-sield. He is red, majestic and of golden complexion. Again the contemplative description of the ādānā-rāga is,

Raņe praviṣṭaḥ smaracāru-mūrtiḥ vecre-rase vyañjita roma-harṣaḥ/ Pāṇau kṛpāṇaḥ kila raktavarṇaḥ āḍāṇa-rāgaḥ kathito munīndraiḥ//

The raga, adana is entering the battle-field, with a sword in his hand. He is also of red complexion, and majestic.

Now Särangdeva has described many grāmarāgas and bhāṣārāgas which were possessed of heroic sentiment, and they were: bhinna-kaiśika-madhyama, śuddha-sādhārita, śuddha-kaiśika, gauḍa-kaiśika, śaka, bhaṣmāṇa-pañcama, rūpa-sādhāraṇa, ṣaḍja-kaiśika, takka, hindola, sauvīra, etc., together with bhāṣārāgas like pañcama, śrī, barsa, nāgadhvanī, etc.

The rāga kāmbojī, kāmbodhī, khāmbāj, or khāmāich was the national tune of the people of Kāmbuja, Kāmboja, Cāmbodiā. The Chinese itinerant monk Houen Tsang has said that the people of Kāmboja were non-Aryans, and this fact has been corroborated by the Bhuridatia-jātaka. The Kāmbojians have been mentioned in the Vimsa-brāhmaņa of the Sāmaveda. Yāska has considered the language of the Kāmbojians as different from that of the

Aryans. Prof. Zimmer is of opinion that the Kambojians were closely related to the people who lived in the Uttarapatha or North-Western Province of India. Prof. Grierson has spoken of the similarity between the Kambojians and the Indians. The term 'Kambojian' is also found in the ancient rock inscriptions of Persia. Dr. Laksmana Sarūpa has observed that Yaska has classified the Aryans and the non-Aryans on the linguistic basis of spoken Sanskrit and Praker, and he is of opinion that both the Kambojians and the people of the East used primary Sanskrit while the Aryans and the Northerners used provincial Praker. This leads us to believe that though the Kambojians were a Sanskrit speaking people, yet they were not included within the Aryan clan, and as such the national tune of the Kāmbojians, Kāmbojī was originally known as the non-Aryan one. This view also finds support of Matanga in his Brhaddess and when it was included into the fold of the Indian classical music, it came to be regarded as an Aryan tune or raga.

The raga bangal or bangali was a tribal i.e. national tune of Vanga or Bengal. The raga, gauda or gaudi also evolved from Bengal, just as the literary style of gaudi (gaudirīti) evolved from Bengal. Gauda was once the capital of the Greater Bengal. The term 'Vanga' is to be found in the Aitareya-brāhmaṇa, 2. 1. 1., along with the names of Bagadh, Chera and other birds. Bagadh is another name for Magadha. With regard to the term 'bird', Dr. Pushalkar has said that probably it signifies that the people were of non-Aryan stock, and so the languages they spoke, were not intelligible to the Aryans. The name Anga along with Vanga occurs in the Baudhāyana-dharmasūtra, Mahābhārata and other epics and literature. Prof. Olden-

berg has called the peoples of Anga and Vanga as the ancient Aryans, but Dr. Pushalkar does not support this view. So it is a matter for investigation whether the raga bangal or bangal of the Vangadesa is of the Aryan or non-Aryan origin.

The rāga gāndbāra or gāndbārī was a tune of the Gāndhāradeśa, modern Kāndāhāra. It has been said in the Epics that the music-loving semi-divine Gandharvas were the inhabitants of Gāndhāra. The North-Western Province of India once came under the influence of culture and civilization of ancient Greece, and Gāndhāra too came within their orbit. But most of the historians are of opinion that the races like Gāndhāra, Savara, Niṣāda, Pulinda, and others were not really included in the Aryan group, and so the rāga gāndhāra or gāndbārī may be regarded as non-Aryan in its origin.

The ancient rāga pulinda or pulindikā was a tribal tune of the Pulindas. The Pulindas have been mentioned in the Mahābhārata. They are also mentioned along with the Andhras in the Asokan inscriptions. The capital of the Pulindas was called the 'Pulinda-nagara'. Probably the Pulinda-nagara was situated to the south-east of Darśāṇā or Vidiśā, modern Bhilsā. Again Darśāṇā was the former name of Rupanāth, where Asoka's pillar was found, and this Darśāṇā and its adjacent areas were really the seat of culture of the Pulindas. The rāga pulinda or pulindikā was, therefore, a tune of the non-Aryan people, having a developed culture.

The ragas, andhri, savari or saveri or sraveri and abbirist were also the tribal tunes of the Andhras, Savaras and Abhiras. The historians are of opinion that the Andhras, the Savaras and the Abhiras were partly under the Aryan influence and partly under the non-Aryan. In the Brāhmanic literature, they were known as the dasyns or robbers. The Andhras lived in the area between the rivers Kriṣṇā and Godāvari. Dr. H. C. Roychoudhury is of opinion that the Savaras were a branch of the Saura races of the hill tracts of Vizāgāpattam. The historian Plini has mentioned a race 'Suyeri' by name. The Savaras had their abode in Gwālior and even in the border of Oriṣṣā and Vindhyān forest. They were non-Aryans, and so the rāga śāverī or śrāverī can be regarded as the non-Aryan tune of the Savaras. The Ābhīras being the most important of the succeeding powers in the Deccan like the Vākāṭakas, Palhavas and Kadambas, the tribal tunes āndhrī and ābhīrī of the Andhras and Ābhīras can similarly be regarded as the non-Aryan tunes, though afterwards they were included within the fold of Indian classical music.

The rāga gurjarī is also known as a foreign tune, as it was adopted from the Gurjara-deśa. The Gurjaras entered India long after the Śakas or Scythians, Yavanas, Bahlīkas and Palhavas. Some are of opinion that the Gurjaras were a nomadic pastoral tribe, who lived in the Central Asian desert. They entered Āryāvarta by the North-West border of India. In the 7th century A.D., the Chinese traveller Hiuen Tsang has also mentioned about the Gurjaras. Some say that as the rāga was prevalent among the Gurjaras, it was known as gurjarī: "gurjarīya-deśa-pracārāt gurjarī". Nānyadeva, the king of Mithilā mentions gurjarī as a regional tune: "deśākhyā dākṣinātyā ca saurāṣṭrī gurjarī tathā". Yāṣṭika takes gurjarī as a subordinate tune (janya-rāga) of ṭakka, and according to some, it is a subordinate one of mālava-kauśika.

The raga kanada or kanada was formerly a tune of ele-

phant-hunting in the Karnata-desa. Prof. Gangoly has given a graphic description of the raga karnata in his illuminating article on the secret of the names of the ragas and raginis. He has said that ancient Karnata-desa was famous for hunting of the elephants. The king of the country, accompanied by soldiers, attendants, and singers was accustomed to hunting, and it was a common custom of the royal family of the period. It is said that a peculiar tune used to be sung when the elephant was killed, and while its tusks were presented to the king as a token of his triumphant hunting. That tune used to signify two things, one, the pathetic sound of the last breath of the dying elephant, and the other, a sound of extreme joy of victory in hunting. In the contemplative composition (dhyanamantrams) of kanada, as depicted in the Sangitadarpana of Damodara, we find the following description (one of the readings):

Kṛpāṇa-pāṇiḥ gaja-danta-khaṇḍaṃ
ekaṃ vahan dakṣiṇa-hasṭakena/,
Saṃstūyamānāḥ sura-cāraṇaughaiḥ
karṇāta-rāgaḥ kṣitipāla-mūrtiḥ//

Thus the raga kānadā or karņāţa may be said to be a 'hunting melody'. But, afterwards when the Karņāţa-deśa came under the influence of Vaiṣṇavism in the mediaeval time, the hero of the hunting, i.e. king came to be conceived as Srī Kṛṣṇa, and the story of slaying of the Gajāsura was interpolated in the factual episode of elephant hunting. The result was that the hunting tune came to be associated with the name of Srī Kṛṣṇa in a mutilated form as kāṇa and karaṇa, and lastly kānaḍā, though the real name of kānaḍā is karṇāṭa, which commemorates the regional tune of the Karṇāṭa-deśa. But whether the people of Karṇāṭa-

desa were Aryan or non-Aryan, that question requires to be resolved. Besides, we find the rāgas, āndhrī, sāverī or śrāverī, pulindikā, mahārāṣṭrī, mālava, etc., which evolved out of the regional and national tunes of those tribes. Matanga has given full description of those tunes, and they were adopted in the stock of the Indian classical music, either during his time or prior to him.

The Persian tunes also received honourable position in the domain of Indian music. As for example, though Pundarika Viethala has called bijej or bijjej as 'parada' or 'paradatta', i.e. of foreign gift, yet he has included it in the asavari scale, and has said in the Ragamanjari : "desikara vakharejah āšāvaryām bijejakah" (bejujjika?). He has further mentioned fifteen foreign ragas in his Ragamanjari, including nisavara. It is said that the raga nisavara was devised by Emperor Akbar. Similarly Lochana-kavi has mentioned in the Ragatarangini that the foreign raga phirdosta evolved out of the combination of varāţī, bāngālī and vibbāsa. In this connection, the names of the following tribal and regional, tunes or ragas are also worth-mentioning. They are: mharastra-gurjari, daksiņa-gurjarī, kāmodasimhala, dāksiņātya, karnāļa-gauda, dravida-ganda, saurastrī, dvitīya-saurastrī, dravidī, mangali, kālindī, etc. Besides them, there are other regional ragas like varāţī and its variants, and pancamī, saindbavī, gaudi, etc. The ragas like tumburu, pota (potta), dhvani, kandarpa, kolhāsa, raktahamsa, kokila-pancama, kiranavali, veghavatī, nadyā, paurālī, kacchalī, mādburī khañjanī, kauśali, dobyā, tānā, ravicandrikā, śālavahanī, etc. are also of the mixed elements, and they evolved during the renaissance period. The raga harmana or hammana seems to be of foreign tune (raga), which was taken from the national tune of the Armenians. I would like to quote the lines from

Dr. Bagchi's article: On the Diffusions of Indian Music in Ancient Times, in this connection. He has said: "The other name, Harmana seems to be of great interest. Matanga mentions it only once as Harmana (p. 84) but in another place as Bhammana (p. 100). The Sangita-Ratnakara mentions it as Bhammāņī (p. 225), but as the author of this work did not live before the 13th centuay A. D. he was simply reproducing mistakes of his predecessors. scens that Harmana (Praket Hammana) was the correct form of the name and Bharmana came to bh. in Indian script. Even Harmana is unknown, but it is not quite unreasonable to suggest a connection of this name with the ancient name of Armania-Armina. The Armenians like the Iranians of Central Asia were famous in the world of trade and were as such the intermediaries through which many traits of culture were carried to other countries".

Pandit Pundarika Viţţhala has said in the Ragamanjari:

Anye 'pi pārasīkeyā rāgāḥ parada nāmakāḥ/
Sampūrņāḥ sarva-gamakāḥ kākalyantaritāḥ sadā//
rahāyī devagāndhāre kānare ca nišāvaraḥ/
Sāraṅge māhuro nāma jangulā'tha vaṅgālake//.
Deśyāmahaṅgame nāma vārā mallāra nāmake/.
Kedāre'pi bhavet sūhā dhanāsyāṃ ca irāyikā/,
Jijārantyāṃ ca hausenī mālave mṛsalīkakaḥ//
Kalyāṇe imanī gāyet sapardā'tha vilāvale/.
Deśikāre vākhatejaḥ āsāvaryāṃ hijejakaḥ/
Devagiryāṃ mūsakākhya evamanye'pi yojayet//.

From this statement it is understood that many foreign melodies were taken in the stock of classical Indian music. Similarly Pandit Somanath (1906 A. D.) has said in the same manner in the Ragavibodha:

"Iyam turuşka-todi irākha-paryāyātayā karņāţa-gaudasya samacchāyatvena pardāiti loke/Tathāca kaeścttattadrāga samacchāyāḥ paradākyā dvādaśa rāgā ucyante/, Todayaḥ samṛddhyā husenī/Bhairavasya jhulusaḥ rāmakṛyāyāḥ mūsalī/Āsāvaryā ujjalaḥ/ Vihaṅga-dasya navarojaḥ/Deśakārasya vākharejaḥ/Saindhavyā hijejaḥ/ Kalyāṇa yamanasya pañcagrahaḥ/Devakṛyāḥ puskaḥ/Velāvalyāḥ sarapardaḥ/ Karṇā-ţasya irākhaḥ/Ānyoparāgānāṃ sugā durgā iti"/

Pandir Bhavabhatta has also mentioned about the changing phases of the ragas. He has said that lots of foreign melodies (ragas) were mixed with Indian ones. He has further mentioned in the Anupa-sangita-ratnakara and the Anupa-sangitavilāsa that many of the foreign melodies were taken into the stock of the classical Indian music. But it should be noted that Pundarika Vitthala, Pandit Somanath and Pandit Bhavabhatta have only compared the foreign melodies or tunes with their Indian equivalents, instead of enumerating the Persian or other foreign melodies or tunes. Pandit Visnunārāyana Bhātkhande has clearly mentioned the changes in melodies in one of his articles, Modern Hindusthani Raga-System and the Simplest Method of Studying the Same, which was read before the "Fourth All-India Music Conference", held at Lucknow in 1925. He has accepted the method of admixture of the foreign melodies with those of the Indian system. He has said: "Thus our present Hindusthani music is our ancient music as it has been modified in the course of centuries by contact with foreigners, and by incorporation of foreign methods of expression and foreign melody-types".

Now it is found that the musicologists and the historians have traced back to the sources of origin of some of ragas and their real significances as well. Though they have considered them as different structures of notes or tones, surcharged with emotional sentiments and moods, yet they believe that the ragas of India are full of spirit, and transcend the limitations of names and forms, and shine supreme in undying glory and exquisite beauty. They also consider the ragas as the means to a supreme end. The poets of the 16th-17th century have composed the contemplative compositions (dhyanamantrams) and the intuitive painters. have drawn colourful pictures for helping in the ways of concentration and meditation upon the divine forms (devemaya rupa) of the ragas, for spiritual illumination and upliftment. The jātirāgas, as depicted in the Great Epics like the Ramayana, Mahabharata and Harivamsa (400-200 B. C.), evolved out of the sacred remnants of the Vedic music, sāmagāna, and so they contained within them the sacred spirit and solemn ideal of the Vedic music. We know from the history of Indian music that from the jātirāgas evolved the grāmarāgas, and from the latter, different bhāṣārāgas, having in them the identical ideal and spirit. Intermingling and fusion of art and culture among different nations and different countries are inevitable in all ages, and the process undoubtedly enriches the domainof art and culture.

Again it may be temembered that India always maintains with her a broad outlook and synthetic vision. This has been maintained throughout the ages,—from the Vedic period down to the present time. She is prone to embrace and include all that comes unto her in the shape of wisdom and culture, and thus enriches her own priceless treasure of

art and literature, religion and philosophy. The tunes of the songs of the non-Aryan and the aboriginal tribes of India and even of countries beyond its pale, were all absorbed and included within the fold of her system of music, and some more notes were probably added unto them to make them suitable for and worthy of the raga forms. Matanga (5th-7th century A. D.) has said in his Brhaddesi that songs with four or less than four notes should not be -considered as the marga (or gandharva) type of music-"catub sourat prabbyti no margab," and it is probable that when the tunes of the aboriginal peoples with lesser notes were adopted into the system of formalised desi music, they were reformed (samsketa) and moulded into some new and novel forms. So far as the history of Indian music is concerned, this work of reformation commenced just after the time of Muni Bharata of the 2nd century A. D., i. e. during the 3rd-5th century A. D., and Kohala, Yastika, Durgāśakti, Matanga and others had their hands in this task of rectification-cum-adaptation. It is, therefore, the fact that both Aryan and non-Aryan elements of music helped to build the grand architecture of Indian classical music. The period of intermixture of the elements of different systems of music may be considered as the dawn of renaissance, and this renaissance took place in India several times, and ushered forth an era of new life and vigour into the whole system of Indian music.

### APPENDIX TO THE CHAPTER VIII

Some of the regional ragas, mentioned by Matanga in the Brhaddesi:

(क) भाषा चतुर्विधा प्रोक्ता मूलसंकीर्णदेशजाः ।
 छायामालाध्रयाः प्रोक्ता प्रामरागे व्यवस्थिताः ॥

## कश्यप उवाच--

संकीर्गा च मता नित्यं त्रेया वैदेशसम्भवा ॥ —वृहदेशां, भाषालद्मग्रम्

Besides them, Matanga has mentioned the names of numerous regional (deśaja) rāgas. Now, from them it can be shown that most of the ragās, which were included in the samkīrņa, bhāṣā, sādhāraṇa and chāyā categories, were known as regional ones. The regional rāgas evolved either from the countries or nations (deśaja or jātija). And we find that most of the bhāṣā or chāyā (mixed) rāgas (melodies or tunes) were either of Aryan or non-Aryan origin.

# CHAPTER IX

## THE ORIGIN AND DEVELOPMENT OF DHRUVAPADA

I

It is a common belief that dbrupada or dbruvapada type of nibaddba prabandba-giti originated in the State of Gwalior, and that it was Raja Man Singh Tomar, its Ruler, who was the first to devise and introduce it to the music enthusiasts during the 15th century A.D. This belief was specially maintained by the English scholars like Captain Williard, Sir William Jones, Dr. Griffiths, Sir Ousley and others, and also by some of the Indian musicologists, who followed them. To cite an example, Capt. Williard, in his book, A Treatise on Music of Hindoostan, has mentioned: "Most renowned of the Nayuks have been Gopāl, a native of the Dekhun i.e. Deccan, who flourished during the reign of Sooltan Ula-ood-deen and his contemporary Ummer Khosrow of Delhi; Sooltan Hoosan Shruque of Jaunpoor, Raja Man . . of Gwalior, founder of the Dhoorpud", etc. (p. 107). Again, some are of opinion that dbruvapada evolved from the regional folk songs of Gwalior and its adjacent places, and they argue that both dbruvapada and regional folk songs of Gwalior were similar in nature, and their methods of presentation were also the same, being devoid of tanas, etc. But these sorts of opinion or argument are conjectural ones, wanting in logical sequence and history.

In the Ain-i Akabari of Abul Fazl-i-Allami, it has been stated that dhruvapada was a kind of desi (regional)

song which was much in vogue in Agra, Gwalior, Bari and their adjacent places. Abul Fazl has also stated: "When Man Singh (Tanwar) ruled as Raja of Gwalior, with the assistance of Nāyak Bakshu, Macchu and Bhanu, who were the most distinguished musicians of their day, he introduced a popular style of melody which was approved even by the most refined taste. On his death, Bakshu and Machhu passed into the service of Sultan Mahumud of Gujrat, where his new style came into universal favour". Further "In the Dekhan, these songs are expressed he has stated: in their language by the term Chind (chanda = chandaprabandba), which consist of three or four lines, and chiefly laudatory. In the Tilanga and Carnatic dialects, they are called dhruva, and their subject is crotic. Those of Bengal are called bangala, and those of Jounpur, chutkala, while the songs of Delhi are called kaul and tārānā (?). These last were introduced by Amir Khusrau of Delhi in concert with Samit and Tatar, and by combining the several styles of Persia and India, form a delightful variety. The songs of Mathura are called Bishn-pad (visnupada) consisting of four, six and eight lines, sung in honour of Visnu. Those of Sind are styled Lähchäri, and are the composition of Biddyapat and in character highly erotic. In Lähore and the adjacent parts, they are called chand; those of Gujrar, jakri".

Perhaps this statement of Abul Fazl is based on mere legends and second-hand information, and it is also true that he was neither a musician nor an accomplished musicologist. Moreover, it is a fact that during the time of Rājā Mān of Gwālior (15th century A.D.), the dbruva-pada type of prabandha took a new shape and novel course, but it is equally certain that it was not invented but only

Hindu and Muslim musicians of outstanding merit, established a Gwālior school of music. Dr. Jadunāth Sarkār has supported this statement when he says: "After Rājā Mān, the renowned dhrupadīyā, Bakshu continued his service at the court of Vikramjit, the son of Mān Singh, and after his death, entered the service of Rājā Kirāt of Kalinjar, whence he was invited to the court of Gujrāt". The historian Bayley has also stated in his History of Gujrāt that "a minstrel, called Bacchu (i.e. Bakshu) attached to Sultān Bāhādur's court, who was taken before Humāyun on the capture of Māndu in 1535". From all these records we come to the finding that the culture of the dhruvapada-prabandha was prevalent during the Mughal period.

Now, let us trace the factual origin and growth of the dhruvapada, and find out whether it falls within the category of classical group of the prabandha-gīti, or merely under the deśī type or regional one, and this requires to be investigated from both the textual as well as historical points of view. In the Sangīta-Ratnākara, Sārangdeva defines 'gītam' as a combination of notes or tones, having the propensities of tinging i. e. producing sweet and pleasing impressions (samskāras) in the minds of all living beings as well as divides the gītam (song) into two main classes, gāndharvam and gānam. By 'gānam' he means the 'deśī gānam' or regional songs or tunes, composed by the experts of different parts of different countries.

The songs (gānam) were again distinct from the gāndharvam (gāndharva type of gīti), traditionally handed down from the masters to the pupils. According to Bharata, the gandbarvam was composed of svara, tala and pada; "svara tala-padaśrayam". Bharata has said,

Yattu tantrīkṛtam proktam nānātodya-samāśrayam// Gāndharvamiti tajjūeyam svata-tāla-padāśrayam//

This type of gana, gandbarva was pleasing both to the gods and the semi-divine Gandbarvas. Bharata has specifically explained the inherent characteristics of svara, tāla and pada, and from his description it becomes apparent that the jātis (jātirāgas), together with the grāmarāgas and other constituent rāgas, were known as 'gāndbarva'.

The gandbarva was also known as 'mārga', which means 'chased after' ('anviṣṭaṃ') or as one constituted out of the collected materials of the Vedic songs. Bharata's description about the gāndbarva is corroborated by both Kallinātha and Venkatamakhī. While commenting on the term 'gānaṃ', Kallinātha has defined it as 'dośī-gānaṃ', and it was composed by the Vāggeyakāras or composers and as such it was sung according to their sweet will ("sva-buddhyā gīyate"). But, according to Śārangdeva, dośī-gāna means the prabandba.

Now, what is meant by the term 'prabandha'? It means the gīti or song, systematically 'bound up' (nibaddha), comprising the music-parts (dhātus) like udgrāhaka, melāpaka, dhruva, antara or antarā, and ābhoga; and limbs (aṅgas) like svara, viruda, pada, tenaka, pāta and tāla; jātis like ānandinī, medinī, dīpanī, bhāvanī and tārāvalī ('prakṛṣṭo yasya bandhaḥ syāt sa prabandho nigadyate'). Therefore, 'prabandha' means the systematic and organised classical type of song (gīti). Simhabhupāla has also defined the prabandha in his commentary, Sudhākara in a beautiful way.

It has been said before that the prabandba-giti was possessed of different dhatus, angas, jatis and rasas or aesthetic sentiments. Now, what was meant by the terms dhātu, anga and jāti? A dhātu was conceived as a musicpart or amsa, implying a division of a giti or song. The first part of a prabandha went by the name of udgrabaka, meaning opening or commencing. This is an ancient name, but in the present Hindusthani system of music, it is known as sthāyī, i.e. a place where a gīti or song rests upon and commences to manifest itself. Melāpaka is the ancient name of the second part, and in it the prabandha used to fully manifest itself, keeping harmony with the first part. According to Rājā Raghunāth Nāyaka of Tānjore, the function of the melāpaka was to bring about a unity between the first music-part, udgrāhaka and the third one, dhruva. The dhruvapada-prabandha used to sprout forth as it were, in the first part and then manifests in full bloom in the second part. The name of the second part, melapaka is now known as antara. The antara or antara rests in between the first part and the third part. In fact, the music-parts are regarded as different parts or centres of manifestation of the prabandha, and all the parts, when bound up or taken together, form the complete structure of a prabandha, in conjunction with the raga. An anga (limb) conceived to be the essential feature of a prabandha. It is of six kinds,

- (a) svara or note like sadja, etc. with their respective pitches;
- (b) viruda or panegyric like 'they are my God,' etc. Pārśvadeva, Rājā Raghunāth Nāyaka and others are of opinion that the word 'viruda' means antagonism and that this meaning was current in the

country like Mahārāṣṭra (vide Saṅgītasudbā, IV. 54-55). As viruda connotes the idea of valour or prowess and thereby symbolize veera-rasa, so the limb, viruda is taken to create an atmosphere of valour and freedom in a prabandba gīti like dhruvapada, etc.;

- (c) a pada means a name of its object;
- (d) a tenaka means a cadence of note on a sacred symbolic standard as tena, na, te, etc;
- (e) a pāta uses to be a continuous limitation of sounds, proceeding from percussion instruments;
- (f) a tala, is a rhythm, expressed by beats at equal intervals.

Again a genus (jāti) is divided into five sections, and they are:

- (a) medinī which mean a prabandha, possessing six limbs;
- (b) ānandinī which means a prabandba, having five limbs;
- (c) dīpanī, which means a prabandha, possessing four limbs:
- (d) bhāvanī, which means a prabandha, made of three limbs,
- (e) tārāvalī, i. e., a prabandha, which is possessed of only two limbs.

So we see that the name of the genus or jati differs according to the number of its limb or anga.

- A dhruva-prabandha or dhruvapada was divided in ancient times into aniryukta or anibaddha and niryukta or nibaddha. The aniryukta or anibaddha type of dhruvapada-prabandha was not governed by the rigid rules of time-measures or mātrās. etc., and it was known as ālāpa. And from this it is understood that though dhruvapada used to be sung even in slow tempo (vilamvita laya), yet ālāpa or elaboration of the tonal forms was mandatory. The niryukta or nibaddha type of dhruvapada-prabandha was bound up with metres, time-measures, and other rules. The nibaddha-prabandhas used to be recognised by three different connotations (sanijāās) like prabandha, vastu and rūpaka.

Numerous prabandha-gītis were prevalent in ancient times, and they were sūḍa, āli or āli-saṃśraya and viprakārņa. The dbruva-prabandha-gītis were and even to this day are included in the category of sūḍa i.e. sālaga-sūḍa-prabandha: dbruvādi sālaga mataḥ' (SR, 4.3 11). Sāraṅgdeva has divided the sūḍa-prabandha into two, pure and mixed (śuddha and sālaga or chāyālaga).

Now, what were the śuddha-sūḍa prabandhas? The śuddha-sūḍa prabandhas were the jātis or jātirāgas, brahmagītis i like kapāla and kambala, together with the grāmarāgas, uparāgas, bhāṣārāgas, vibhāṣā-rāgas and antara-bhāṣā-rāgas and the prakaraṇa-gītis like madraka, aparāntaka, ullopya, prakarī, obenaka, robindaka and uttara plus the gītis like chandaka, āsārita, vardhamāna, pāṇika, roa, gāthā and sāma. Sāraṅgdeva says:, "jātyad-yantara-bhāṣāntaṃ śuddhaṃ prakaraṇānvitaṃ", whereas the commentator Siṁhabhupāla has only said: "śruti-prakaraṇa-mārabhya-antarabhāṣā-paryantaṃ", Rājā Raghunāth Nāyaka of Tānjore has also described the sālaga-sūḍa-dhruva in the same way (vide Saṅgītaśudhā, IV, pp. 800-809).

Now it is clear that the gandharva or marga type of gitis was known as prabandhas, and it has been

confirmed by both Bharata (2nd century A.D.) and Sārangdeva (early 13th century A.D.) The observation of Bharata, regarding the nāṭyagīti, dhruvā, may be cited in this connection. Bharata has said,

> Ya rcalı pāņikā gāthā sapta-rūpāngameva ca/ Sapta-rūpa-pramāņam hi sā dhruvetyabhisanjñitā// —Nāṭyaśāstra. NS. 32.2.

Sārangdeva has stated in the Sangita-Ratmākara: "elādiḥ śuddha", etc., and thus it is found that both Bhatata and Sātangdeva have defined the gāndharva and brahma-gītis in the term of prabandha-gītis.

Bharata has also divided the dbruvas into two classes, nibaddha and anibaddha, and their definitions differ from those of the regional or desi prabandhas to some extent. The commentator, Simhabhupala has mentioned about them in connection with ela and other prabandhas. He has said: "nanu bharatena eladinam chayalagatvam uktam, tat katham suddhatvam uchyate, tatrāha-chāyālagatvamiti". From this it is understood that Bharata has dealt with the prabandha type of classical gitis in the Natyasastra. While describing sixty-four dbruvas, he has said that the dbruvas were composed of different letters ('sama-vrttaksara-krtah'), dhatus and angas lik svara, viruda, tenaka, pata, pada, and tala, etc., Therefore, it is found that the dhruvas were recognised as the gandbarva type of prabandba-giti, and used to be presented in accordance with suitable place, time, and circumstance: "deśa-kālamavasthām ca jnātvā yojya dbruvā budhaib" (32.352).

It has been said before that Bharata has dealt with the brahmagītis like kapāla, kambala, etc: ('tanyakṣarāṇi vyakṣe yāni purā brahma-gītāni' NS. 31.95), and following Sārangdeva, Kallināth has also mentioned: 'jāti-kapāla-kambala-grāmarāgoparāga-bhāṣā-vibhāṣāntarabhāṣā-paryanta-mityarthaḥ', which means jātirāga, and kapāla and kambala gītis, etc. were known as the śuddha-sūḍa-prabandha-gītis. From all these it becomes evident that the dhruva-prabandhas of the sūḍa type were also prevalent during or prior to Bharata (2nd century A.D.).

Now, let us find out whether Dattila, Matanga. Pārśvadeva and others have admitted the sālaga-sūda type of dhruva-prabandha (ot dhruva-pada) in their respective works, Dattilam, Brhaddeśī and Sangīta-samayasāra. In the Dattilam, musicologist Dattila has described about the prakaraṇas like madraka, aprāntaka, ullopyaka, etc., in the ślokas 160-221, and in this connection he has mentioned the names of ancient as well as his contemporary musicologists like Viśvākhila and others. It has already been said that Sārangdeva has included madraka, aparāntaka, etc. as the śuddha-sālaga sūda-prabandhas: 'śuddham prakaraṇānvitam', etc. (IV. 312).

Though it is true that no definite mention of the dbruva-prabandha is to be found in the work, Dattilam, yet it may be taken for granted that as Dattila has discussed about the śuddha-sūḍa-prabandha, it is most probable that he had in his mind about the śalaga-sūḍa-prabandhas like dbruva, etc. Moreover, it is said that the treatise, Dattilam, which has already been published from Trivāndrum, is an incomplete (khaṇḍita) one, and so the presumption is strong that when the complete text of the work will see the light of the day, one may find mention of the dbruva-prabandha or dbruvapada, which will go a long way to prove its antiquity and practice without a shadow of doubt.

The descriptions of the prabandha-gītis are also found in Matanga's Bṛhaddeśī (5th-7th century A. D.). Matanga has termed the prabandhas as deśī, which means the formalised regional but classical gītis. He had defined and at the same time described various kinds of prabandhas like dḥenki, elā, daṇḍaka, dvipadī, caturanga, sarabhalīla, etc. It seems that the Trivāndrum edition of the Bṛhaddeśī is also incomplete like that of the work, Dattilam, and so it is not possible to cite the exact example of the dhruva-prabandha from it. But it is reasonable to presume that Matanga must have dealt with the sālaga-sūḍa-prabandhas like dhruva, etc. as he has already described about the śuddha-sūḍa type of prabandhas in his Bṛhaddeśi.

But the Jain musicologist Pārśvadeva has clearly mentioned about both the śuddha and sālaga-sūḍa prabandhas, including dhruva or dhruvapada in the Sangīta-samaya-sāra, written probably during the 7th-9th or 7th-11th century A.D. While describing eleven kinds of the dhruva-prabandhas, Pārśvadeva has said: "sāla-sūḍa-kramaṃ vyakṣe—ādau dhruva tato maṭṭḥo", etc. Here the word 'sāla-sūḍa' means sālaga-sūḍa, and 'dhruva' means dhruva-prabandha, and 'maṭṭḥa' means manṭḥa.

After Pārśvadeva, Sārangdeva has dealt elaborately with the prabandhas in the Sangīta-Ratnākara, and he has followed Pārśvadeva in this respect. It has been discussed previously that Sārangdeva has divided the sūḍa-prabandhas into two classess, śuddha and sālaga (chāyālaga), i.e. pure and mixed. The sālaga-sūḍa-dhruva-prabandha is the forerunner or precursor of the Hindusthānī dhruvapada type of gītis.

Besides the sixteen pure types of suda-prabandha, Sarangdeva has described another seven salaga-prabandhas like dhruva, mantha, pratimantha, nissāruka, addatāla, ekatāli, and rāsakā. These latter prabandhas were composed of three music-parts (dhātus) like udgrāhaka, antara and ābhoga, and melāpaka being left out ('ete, dhruvādayaḥ saptapi melāpakābhāvāstridhātavaḥ''). But the prabandhas like mantha, pratimantha, etc., of the dhruva class, comprised six limbs ('manthādayastu ṣaḍapi'').

Regarding the nature of composition as well as the form and process of embelishment of the dhruva-prabandhagāna, Sārangdeva has said,

Eka-dhātur-dvikhandah syādyatrodgrāhastatah param//
Kiñciduccam bhavet khandam dvirabhyasmidam trayam//
Tato dvikhanda ābhogastasya syāt khandamādimam//
Eka-dhātur-dvikhandam ca khandamuccataram param//
Stutyanāmānkitascāsau kvaciduccaikakhandakah//
Udgrāhasyādyakhande ca nyāsah sa-dhruvako bhavet//
Ekādasākṣarāt khandādekaikākṣaravardhitaih//
Khande dhruvāh sodasa syuh ṣadvimsatyakṣarāvadhi/

Simhabhupāla has made these ślokas explicit, when he says: "Dhruvādibhih saptabhir-gītaih sālaga-sūḍa-prabandhāḥ | teṣu dhruvam lakṣayati-ekadhātviti | pūrvam sadṛśageya-khaṇḍadvayayukta udgrāhaḥ kartavyaḥ | tato nantaram kiñci-duccam khaṇḍamantarākhyam kartavyam; etat trayamapi dvirabhyastam dvirgeyam | tato nantaram khaṇḍadvayam-yukta ābhogaḥ, tasya prathamam khaṇḍadvaya-mekadhātu sadṛśageya-khaṇḍadvayayuktam, dvitīya-khaṇḍam tato pyuccam gātavyam | asāvābhogastutyasya nāyakasya nāmnā yuktaḥ kāryaḥ | kvacitkeṣāmcinmate yamuccaikakhaṇḍo gātavyaḥ | udgrāhasya ādyakhaṇḍe ca samāptiḥ, sa dhruva iti jñeyaḥ | "

That is, the music-part, udgrāba was divided into two parts, and those two parts were sung in the same way (i.e.

in the same pitch), and for that reason, Sarangeleva has called them as 'eka-dhātu' i.e. as if they were one and the same part. But it should be noted that their compositions were different (matu-gata bheda), otherwise the same part used to be sung repeatedly. The next part used to be sung in acute or high pitch, and it was known as the antara. For that reason Simhabhupala has said: "kiñciduccam kbandam antarākbyam kartauyam". Sārangdeva has said "dbravabhogantare" etc., which means that in case of prabandhas of the sālaga-sūḍa class, antara used to be added other than the music-parts, dhruva and abhoga. The two parts of the udgraba, together with the antara (=three parts) were used for singing. The abhoga was also divided into two parts, and they, like the two parts of the udgraha, were also called as 'eka-dhatu' or undivided part. But the difference lied in the fact that between the two parts of the abboga, the last part used to be sung in high pitch, According to Sithhabhupala, the last part of the abhoga used to be sung in more acute or high pitch than the musicpart, antara. In the abhoga or concluding music-part, the name of the stutya or nayaka (author or composer) used to be added, and after the singing of the entire song (with its music-parts), the first part of the udgrāha used to be repeated, and then the song ended.

Now, it should be remembered in this connection that the music-part, dhruva was not used in any time in the ancient dhruva-prabandha, as it used to be dropped. But Kallināth has said: "ayamantaro laukika-rūpāntara ityucyate tathā tairdhruvaḥ khaṇḍasyāntara-vyapadeśaḥ kṛta iti mantavyaṃ", which means that antara-dhātu can be taken in the sense of dhruva-dhātu, as it was essential for the composition of the song. However, Kallināth has discussed elaborately

on this subject. In the present system of the Hindusthānī music, antara is used as antarā, with other three parts, sthāyī, sancārī and ābhoga. Kallināth has further said that the ancient form of dhruva-prabandha was comprised with tāla, and was included in the tārāvalī-jātī ('tārāvalī-jātīmanta'), as it was composed of two angas like pada and tāla.

Sārangdeva has described sixteen types of dbruva-prabandba, and they are: jayanta, śekbara, utsāba, madbura, nirmala, kuntala, kāmala, cāra, jaya-mangala, tilaka, lalita, etc. These dbruva-type of prabandhas have been specifically mentioned in the Sangīta-Ratnākara with their respective aesthetic sentiments and moods. Sārangdeva has said,

Jayantasekharotsähastato madhura-nirmalau//
Kuntalah kämalascaro nandanascandrasekharah/
Kamodo vijayakhyasca kandarpa-jayamangalau//
Tilako lalitasceti sanjñäscaiṣām kramādimāh/
Āditālena sṛṅgāre jayanto gīyate vudhaih// etc.
—Ratnākara, IV. 318-329.

To make the meanings of the ślokas of the prabandhas of the dhruva category, let us mention the commentary of Simhabhupāla, where he has said that sixteen kinds of dhruva-prabandha can be determined by adding one successive letter to each prabandha in a gradual process: "tasya bhedānāha—ekādaśeti| ekādaśākṣarakhaṇḍādārabhya ṣaḍvim-śatyakṣarakhaṇḍaparyantamekaikākṣaravṛddhyā jayantādayo lalitāntā ṣoḍaśa dhruvā bhavanti| teṣām krameṇa lakṣaṇamāha—āditālenets" (—Cf. Saṅgīta-Ratnākara, Ādyār edition, vol. II, pp. 313-315). Besides Śāraṅgdeva, Rājā Raghunāth Nāyaka of Tānjore (17th century A.D.) has also defined

the dhruva-prabandha, together with sixteen other sālagasūḍa prabandhas of the dhruva class in his Saṅgītasudhā (Cf. the Appendix to this chapter).

The dbruvapada of the latter period appears different in its form and method of presentation (gāyakī-bhangi) from those of the ancient period, and probably this change or re-orientation took place in the time of Rājā Mān Singh of Gwālior in the fifteenth-sixteenth century A.D. It has been mentioned that Rājā Mān modified the old śāstrie form of the dbruvapada-prabandha for its better and wider appreciation according to the taste and temperament of the contemporary society. Before him, Baijunāth i.e. Baiju Bāorā and Gopāla Nāyaka and other noted musicians of that time and the Kalāvids in the court of Sultān Ālāud-dīn Khaljī used to culture the dbruvapada with due ardour and spirit, during the 14th-15th century A.D.

Amir Khusrau, who was in the court of Sultan Ala-uddin, was an Indo-Persian scholar, poet and musician, and it is said that he was also a great lover and supporter of the dbruva-prabandha-giti.

The period of Sharqui rule at Jaunpur, and specially that of the Sultan Husian Shah Sharqui in the fifteenth century, witnessed the culture of the dhruvapada on a wide scale, and though the nucleus of the kheyāl or khyāl type of gīti evolved during the period, yet dhruvapada gained pre-eminence in the courts of the Sultanas. During the reign of the Emperor Akbar, or it can be said that from 1542-1605 A.D., the practice and culture of dhruvapada reached their high water mark. Swāmī Krishnadas, the celebrated author of the Gītaprakāsa, Swāmī Haridās, the disciple of Swāmī Krishnadas, Rāmadās, Miān Tānsen and a host of other eminent musicians gained abiding fame for the culture of dhruvapada.

Like Gwalior and Delhi, Rewa was also a seat or centre of culture of dhruvapada. We know from history that before joining the court of Akbar, Mian Tansen was in the service of Rājā Rāmachānd of Bandhogarh, Rewā, who was a great patron of dhruuapada. The Rājā was so great a lover and patron of music, and specially of dhruvapada that he gave Tansen in one day a crore of gold pieces. This statement has also been corroborated by the author of the Virabhanudayakāvyam. The author of the Vīrabhānudaya says that "for every song and each tana (?) and each dhrupad he (Raja) gave a crore of rupees to this musician (kalavid), namely Tänsen, who was the embodiment of the art of music". Though these statements of Badaoni and that of the author of the Vīrabhānudaya-kāuyam seem to be exaggeration to some extent, yet it is clearly understood that Rewa and even its adjacent places were famous for the culture of classical type of the prabandha-gitis.

Vrndavana was also a famous seat of culture of the prabandha-gītis. From the history of Bengal Vaisnavism we come to know that most of the Vaisnava savants, headed by Svarūpa-Dāmodara, Rāy Rāmānanda, Swāmī Krishņadās, Haridas, Krishnadas Kaviraja, Raghunathdas Swāmi Goswāmī, Thākur Narottamadās and others were wellthe sublime prabandha type of gitis. in It is said that Thakur Narottama devised the padavalikirtana on the structure and ideal of the classical dhruvapada in slow tempo at Khetari, Bengal. It might be the fact that Vrndavana drew its inspiration and impetus of the culture of dhruvapada from Gwalior and its adjacent places, but yet it cannot be denied that Vrndavana and afterwards Mathura created the schools of their own, and those schools were maintained by a host of Kalavids like Krishnadas,

Haridas and others. Those celebrated exponents of music were all upholders of dbruvapada.

Bijapur was also a seat of culture of classical music, and specially of dhruvapada. Sultan Ibrahim Adil Shah II of Bijapur was a contemporary to the Emperor Akhar. He devoted the best part of his life to the cause of classical music, in which he took interest from his early age. From Asad Beg's mission to Bijapur, we learn that Bijapur was so famous for its culture of classical music that Akbar and afterwards Jahangir were also attracted to this kingdom. From the editorial comments of the journal, Lalitakalā, April 1955-March 1956 and Joshi's, article on Asad Beg's Mission in the Potadar Commemoration Volume' 1950, we come to know that Asad Beg went on his Mission in 1603-1604 A.D. It has been stated: "Speaking about the events of 1603-04, Asad Beg says that he was invited to the Royal palace to bid farcwell to Ibrāhim Adil Shāh II of Bijāpur on the night of 27th Sh'āban. A grand music party had been arranged for the occasion. Asad Beg found Ibrahim so rapt in listening to music that he could hardly reply to Asad Beg's question. The conversation for sometime was mainly concerned with music and musicians".

It should be remembered in this context that dbruvapada was the most prominent feature of music culture of that time i e. in the 16th-17th century.

Dr. Nāzir Āhmed has written as follows in the 'Introduction' to the book, Kitāb-i-Naurās by Ibrāhim Ādil Shāh II that Ibrāhim was a master of dhruvapada (dhrupada), and his book in the same style became so popular as to attract even the Mughal Emperor Jāhāngīr, and the Emperor claimed the Kitāb-i-Naurās to be in form of

dbruvapada which Sultan learnt from Baktar. It has been stated that about four thousand skilled musicians thronged on the occasion, and the Sultan wished that skilful musicians should always adorn his court by their presence. Dr. Nāzir Ahmed has said: "The Sultan's achievements in music will be best judged from his own composition, the Kitab-i-Nauras. He has stated by Jahangir to have learnt this art from Bakhtär Khan, a notable statesman at the court of Bijapur, to whom the Sultan is stated to have married his niece subsequently". He has further stated : "Unfortunately the names of only two of the musicians have survived; the first is Bakhtar Khan about whom we have spoken earlier. He is stated to be the King's teacher in Dbrupada form of music. But he seemed to be younger than the Sultan himself. \* \* The other musician at the court of Ibrahim was Chand Khan. He is mentioned by the way in the Basatin-us-Salatin which shows that he was one of the pupils of the Sultan and was classed with the Huziris. He is stated to have wielded much influence and was a favourite of the Sultan".1

It has already been stated that Sultān's adherence to music was personally reported by Asād Beg who visited him in A.H. 1013/1604 at Akbar's behest. "When the Mughal envoy was to leave the Adil Shāhi court, a grand musical concert was arranged to celebrate the occasion. In that farewell party, Asād Beg found him so much wrapped in listening to music that he could hardly reply to his (Asād Beg's) questions. Their conversation centred

<sup>1.</sup> Cf. Kitāb-i-Naurās by Ibrāhim Ādil Shāh, edited by Dr. Nāzir Āhmed, and published by the Bhātatīya Kalā-kendra, New Delhi, 1956, pp. 48, 52-53.

round music and musicians. Ibrāhim enquired about Akbar's fondness of music, and was told that he listened to it sometimes. He then enquired of the Mughal envoy whether Tānsen stood or sat while singing before Emperor, and was told that in Darbār at day time he had stand while singing; but at night and on festive occasions Tānsen and other musicians were allowed to take their scats while engaged in their performance. Ibrāhim is stated to have expressed that music should be heard at all times and musicians should be kept happy and contended. He held the musicians in high esteem which is proved by his marrying his niece to Baktār Khān''.1

From the fact it is proved that dhruvapada used to play a prominent part in every musical function not only in the Royal court of the Mughal Emperor, but also in the kingdom of Ibrāhim Ādil Shāh II. After Akbar, the Emperors like Jāhāngīr aud Sāhajāhān were also great patrons of dbruvapada. The names of Jagannāth Kavirāj, Dirang Khān, Guṇasamudra Lāl Khān, the son-in-law of Bilās Khān, are worth-mentioning in this connection as noted exponents and connoisseurs of dbruvapada-prabandha.

In the beginning of the eighteenth century A.D., when Mohommed Shah was on the throne of Delhi, dhruvapada was held in high esteem in his court. The name of Mohommed Shah's court-musician Niyamat Khan, sadarang is worth-mentioning in this connection. Niyamat Khan, sadarang was a veenkara as well as a dhrupadiya. Though he devised a new style of kheyal or khyal in slow tempo, yet he was noted as an exponent of dhruvapada of the pure Seni

r Ibid., pp. 48-49.

school. The decadence in the culture and appreciation of dbruvapada came probably during the British rule in India. It came to a climax, when the last titular Mughal Emperor Shan Alam II ascended the throne of Delhi, and granted by a firmān, the Diwānī of Bengal, Bihār and Orissā to the East India Company.

Viṣṇupur (Bāṅkurā) and different parts of Bengal were also recognised as the seats of culture of dbruvapada. Because when the noted musicians of Senī school found no help and support from the Emperor Shāh Ālām II, they began to seek refuge in the Durbārs of different Muslim Nawābs, Hindu kings and rich landlords of Oudh, Betiyā, Viṣṇupur, Hooghly and different parts of West and East Bengal.

It may, therefore, be said that the prabandha-type of gītis originated during the pre-Christian era, and evolved through ages out of the ancient jātirāga and different grāmarāgas, as described in the Nāṭyaśāstra, Bṛhaddeśī, Saṅgīta-samayasāra, Saṅgīta-Ratnākara, etc., and attained development, assuming novel modes, new names and phases. It still survives in the form of modern dhrupada i. e. dhruvapada, though lacking in its prestine glory and traditional ideal. Ordinarily it is believed that the term "dhruvapada" (dhruva+pada) connotes the idea of sacred or celestial gīti or song, for "dhruva" means 'sacred' or 'that which is eternal, persisting and celestial,' and pada, meaning gīti or gāna, as has been defined and described in Bharata's Nāṭyaśāstra.

The word 'dhruvapada' has been derived from the classical type of the dhruva-prabandha, which has been described in the works of Matanga. Pārśvadeva, Sārangdeva and others. The root meaning of the word dhruva (dhru+a(ka))

may convey the ideas of 'calmness', 'straightness', 'permanency', 'deathlessness', 'sacredness', etc. But necessarily the term dhruvapada does not convey the idea of sacred or celestial song, as meant by the first part of the couplet: "vo dhruvani parityajya adhruvani nisevate" etc., It might have been the fact that in later period, the idea of sacredness or permanency was added or imposed on the dbruvapada type of giti or gana. Again the term dhruvapada was neither derived from the gandbarva dhruva (natyagiti), as described in Bharata's Natyaśastra, nor from the music-part (dhatu) dbruva, which is again a deviated form of dhuya of a song. It is purely a contemplative and majestic type of song, dhruun-prabandha of the salaga-suda class. It is seen that some of the scholars try to describe the dramatic song (nātyagīti) dbruvā, described by Bharata, as the forerunner of the dhruvapada, but they are absolutely wrong.

Originally the literaty composition (sāhitya) of the dbruvapada was graceful, majestic and contemplative by nature. It breathed an air of sublimity and grandeur in laudation of the gods and goddesses and the Father in Heaven, though in later days it lost that lofty ideal, to some extent. Because in later days, the dbruvapadas used to be composed in praise of the seasons, compositions of songs, Nature, kings and Emperors.<sup>1</sup>

<sup>1</sup> Different types of compositions of the dbruvapada;

During the time of Akbar, the four methods of improvisation of the prabandha-gītis (songs) centered on the regional utterances (intonations) of the compositions or sāhitya, and they were known as four vānīs. The name of the four vāņīs are: gaudabāra, khāndāra, dāgara and naobāra. It is generally believed that these vāṇīs evolved or were created for the first time during the reign of Akbar. But that is not the fact, as different gitis were in practice before the time of Matanga (5th-7th century A. D.), having different characteristics and methods of improvisation. Those gitis have been fully described by Matanga, Parsvadeva, Sarangdeva and others in their Bybaddesi, Sangitasamayasara and Sangita-Ratnakara. Matanga has said about seven kinds of gitis i.e. ragagitis, and they were; śuddbā, bbinnā or bbinnakā, gaudi or gaudikā, rāgagīti, sādhāraņī, bhāṣā and vibbāṣā. Those rāgagītis were so called because they were known by their respective ragas. Those ragagitis were possessed of different specific qualities or characteristics, and so when they were sung, they used to create different methods of improvisation, which can be taken at present as different styles of presentation.

According to Yāṣṭika, the rāgagītis were five in number, and they were: śuddhā, bhinnā, veṣarā, gaudī or gauda and sādbā-rita (or sādbāraṇī). According to Durgāśakti, the rāgagītis were three, and the ancient musicologist Sārdula approved only one rāgagītis. From this it is known that the ancient rāgagītis and even the grāmarāga-gītis used to be sung in different methods or styles.

Matanga and Sarangdeva have described about different specific qualities or characteristics of the seven or five ragagitis. To mention the outlines of their descriptions, it can be said:

- (a) The śuddhā type of the rāgagītis possessed tones, which were straight (rju), soft (komala) and melodious (madhura).
- (b) The bhinna type of the ragagitis possessed tones, which were used in curved lines or crooked way (vakra), but with subtle and sweet tonal modulations (gamakas).
- (c) The gaudi type of the ragagitis possessed tones, which were frequently used in three octaves (saptakas), with steady poise and some vibrations like kampana or gamaka.
- (d) The vesarā type of the rāgagītis possessed tones, which were used in rapid tempo (druta-laya) and quicker vibrations.
- (e) The sadharani type of the ragagitis had no special quality or feature of its own, and it used to be sung with the combination of four other gitis.
- (f) The bhāṣā type of the rāgagītis possessed sweet and tangible tones, added with kākus.
- (g) The vibhāṣā type of the rāgagītis possessed tones, which were pleasing and soothing. The tones were used

in all the octaves, and the gitis used to be sung or played with ease and with different gamakas.1

Different kinds of rāgas (i.e. grāmarāgas) evolved from those rāgagītis, and it might be taken for granted that rāgas (grāmarāgas), that evolved later, used to be sung and played in accordance with different qualities or characteristics of the rāgas.

It has already been said that during the time of Akbar (and of Mian Tansen), the dhruvapada-gitis used to be sung and played with mainly four vanis, which were afterwards known as four methods of improvisation of the songs. Those methods or ways of presentation of the classical prabandhagītis were, therefore, not altogether new inventions in the domain of Indian music, as different methods of presentation of songs were already in practice in ancient times (the examples of which have been cited in Matanga's Brhaddest and Sarangdeva's Sangita-Ratnakara). It will not, therefore, be wise to say that the later vanis or styles of improvisation evolved from those of the past. It might have been the fact that the vanis that gave rise to different methods of improvisation or presentation of the ragas (consequently of the ganas or songs) like ragagītis, gramaraga-gītis, etc. in the medieval time, during the reign of Akbar, were somewhat similar to those which were prevalent in ancient time.

Kumāra B. N. Roychoudhury has rightly observed in this connection that in the Hindusthānī dhruvapada, we find the names of four vāṇīs which indicated four different styles of the dhruvapada songs. The gauḍahāra-vāṇī

<sup>1</sup> Cf. Brhaddess (Travancore ed.), pp 82-84.

resembled the śāstric śuddhā-gīti, containing meeds in straight lines, according to the structures of the ragas. Miān Tānsen himself was a master of this style, although he was proficient in other styles as well. In the hierarchy of his youngest son, Bilas Khan, this style was mainly used. Similarly the dagara-vāņī resembled the bhinna-gīti, which contained meeds in curved lines with sweet and subtle gamakas. The dagara-vani was very charming, and it is said that that vāṇī was used in Vrndāvana by the disciples of Swami Haridasa, and also by Sarasvati Devi, the daughter of Mian Tansen. The husband of Sarasvati Devi was Miśrī Singh, the noted veenā-player. The khāndāra-vānī resembled the śāstrie vesarā-gīti, which contained quick gamakas. It is said that that vani or method of presentation (style) of the dhruvapada was used by Baj Bahadur, and also by Miśrī Singh in his veena recitals. Later on, the descendants of Miśtī Singh used both the dagara-vāņī the khāndāra-vānī. The naohāra-vānī resembled somewhat the gaudi-giti, which contained 'cchut-alamkara'. In that vāṇī, tones were used in a jumping way, with different gamakas. That vani was used as a part of the dbruvapada.

Srī Roychoudhury has further said that the vāṇīs of the dhruvapada used to indicate the words as well as the intonations of the words, which used to be produced in accordance with different emotional sentiments, contained in the rāgas. It is said that the sweet gauḍahāra-vāṇī used to create the emotional sentiments of calmness and peaceful tranquility (śānta-rasa); the dāgara-vāṇī used to create the sentiments of sweetness or pathos (madhura-rasa) as well as that of the sympathetic attitude (karuṇa-rasa); the khāṇḍāra-vāṇī used to create the sentiments of valour and heroic spirit (veera-

rasa), and the naohāra-vaņi used to create the sentiment of surprising movements of the tones, expressed in the adbhūta-rasa.

Gradually different schools of dhruvapada (gharāṇās) evolved to suit the different methods of improvisation of the songs. Those schools or gbaranas evolved no doubt after the unique style of Mian Tansen. The Seni-gharana of Jaipur specialised in the dagara-vani style of the dhruvapada. "In Lucknow, 'Vārānaśī and Rāmpur, two lines of the seni-gharana became very famous. The line of Bilas Khan specialised in the dbruvapada of gaudahāra-vānī, although they took up the dāgara-vānī to some extent. The Seni-musicians of the line of Miśri Singhji were specialists in the dagara and khandara vanis. Among other gharānās of dhruvapada, which grew up with the teachings of the Senī-musicians or of the disciples of Haridas Swami, the musicians of Betiya based their dbruvapadas on the khāndāra-vāņī, and the famous musicians of Visnupur made gaudabāra-vāņī the basis of their music. The vocalists of Mathura mainly sang the dbruvapadas of dagara-vānī. Another famous gharānā of dhruvapada led by Ustad Bahram Khan, flourished in Rajasthan".1

Now, it can be said that dhruvapada-prabandha-gāna is the basis or background of all kinds of music, kheyāl or khyāl, ṭappā, ṭḥuṁrī. etc., and even of classico-Bengali and Bengali folk songs. So the proper culture of dhruvapada-prabandha requires to be maintained and sustained in all its purity and supreme value even in these days, so as to

<sup>1</sup> Vide B. N. Roychoudhury: Hindusthani Music and Mian Tansen (Calcutta), pp. 6-10.

preserve the glorious tradition of sastriya classical music, and to enrich the priceless treasure of are culture of India.

#### H

#### THE CULTURE OF DHRUVAPADA IN BENGAL

During the early 19th century, Chinsura, (Hooghly) Krisnanagar (Nadiā) and Murshidābād became famous as the seats of culture of classical music, and specially of dbruvapada. Ustad Man Khan settled at Chinsura in 1806, and nearly during the same time, Ustads Bade Mian, Has-su-khān, Hardu-khān, Hīrā and Bulbul settled at Murshidabad, and Ustad Rasul Bux settled first at the Krisnanagar Rājbāţi, and afterwards at Stīrāmpur, Hooghly. When Ustad Man Khan came to Bengal and settled at Chinsura in 1806 A.D., the titular Emperor Shah Alam II of Delhi drew his last breath (in the same year). Shah Alam Il was a man of very weak personality, and he was extremely indifferent alike to the Hindu and Muslim Ustads in his court. It is said that when he granted the dewāni of Bengal, Behar and Orissa to the East India Company on the 12th August, 1765, the noted Ustads of his court, and also of Delhi and Agra began to migrate to different parts of India, and eventually sought refuge in different Durbars of Muslim Nawabs and Hindu Kings and Zemindars of different parts of the country. Some say that most of them settled in Bengal during 1757 to 1806 A.D. Hāyadāra Khān went to Betiyā, Chajju Khān settled at Lucknow, and Ustad Man Khan, and Ustads Bade Mian, Has-su-khān and others came in Bengal and settled at Chinsurā and Murshidābād.

Rāmachandra Seal of Chinsurā was the first and foremost student of Ustād Mān Khān, and the names of many other enthusiastic Bengali young men like Gopāl Chandra Pāṭḥak, Parāṇa Mukherji, Rāmakriṣṇa Pāul, Rāmakānāi Mukherjee and others are worth-mentioning in this connection. As regards the student of Ustād Rasūl Bux, the name of Rāmadās Goswāmī of Srīrāmpur is worth-mentioning and from Rāmadās Goswāmī, Harinārāyaṇa Mukerji of Vārānasī and Nimāi Chānd Ghoṣāl of Srīrāmpur learnt dbruvapada. Afterwards Harinārāyaṇa Mukherji learnt dbruvapada from many other Hindu and Muslim Ustāds. A Punjābī school is still prevalent at Chinsurā.

In the middle of the 19th century A.D., Calcutta became the chief centre of culture of classical music, under the patronage of Mahārāja Jatindra Mohan Tagore and Sir Saurindra Mohan Tagote. A 'Sangita-samāja' was established in Calcutta. At that time all the topranking Muslim and Hindu Ustads of India used to assemble from time to time in different mifles and soirces . at Calcutta, and created for the lovers of music a congenial atmosphere of classical music, and specially of dhruvapada, and of those Ustads the names of Maula Bux (1876) of Baroda, Ustad Ali Bux, Ustad Daulat Khan of Lahore, Hanuman Dasji of Gaya are worth-mentioning. Again those, who helped for the promotion of culture of dhruvapada in Bengal, the names of Mahārāja Ānanda Kishore and Mahārāja Nawal Kishore of Betiyā, Rājā Brajendra Kishore Roychondhury of Gouripur, Mahārāja Sūryakānta Achārya of Mymensingh, Jagat Kishore Achārya of Muktāgāchā, Bābu Sāradā Prasanna Mukherji of Gobardāngā, Jaikrishna Mukherjee of Uttarapārā, Rājā Rāo Jogindra Nārāyan Rāy Bāhādur of Lālgolā, Mahārāja

Jogindra Nath Roy of Natore, Raja Veer-Vikrama Bahadur of Agoretola stand prominent. Different styles of dbruvapada, obtained from different Ustads of different schools, grew up in Bengal, and gradually stalwarts like Ramsankat Banerji, Ananta Lal Banerjee, Ksetra Mohan Goswami, Jadu Bhatta, Aghore Nath Chakravarty, Wizir Khān, Mohammed Ali Khan, Radhika Prosad Goswami, Krishna Dhan Banerji, Guru Prasad Miśra, Laksmi Prasad Miśra, Ramprasanna Banerji, Visvanach Dhamari, Dani Babu or Satish Chandra Dutta, Gopāl Chandra Banerjee, Nikuñja Behari Dutta, Mahîm Chandra Mukherji, Lalit Mohan ' Mukherji. Girijā Sankar Chakravurty, and others appeared on the scene, and through their endeavour gave fresh impetus to the culture of dhruvapada in Bengal. The names of some of the living artists, those are still preserving the glorious tradition of the culture of dhruvapada in Bengal, are worth-mentioning in this connection. They are Sangitanāyaka Gopeswara Banerjee (died in 1963), Surendranāth Banerjee, Amarnath Bhattacharya, Yogindra Nath Banerjee, Dhirendranath Bhattacharya (died in 1964) and others.

The early compositions of Kaviguru Rabindranāth Tagore have a leaning towards dhruvapada, and he also learnt dhruvapada from the Ustāds like Vishņu Chakravurty, Srīkantha Sinha, and some others in his early youth. In fact, the vestiges of the graceful technique and mode of presentation of dhruvapada, as taught by the old masters, linger among the musicians, who still hold fast to the culture of the sombre and graceful type of Indian music. It is firmly

I Rabindranath's precious contributions in the domain of Indian music have been discussed in the Appendix III,

asserted that Bengal is still preserving the sacred tradition of culture of dbruvapada in its true perspective and colour, and in all its beauty, grandeur, and sublime aesthetic lusture.

#### П

### DIFFERENCE BETWEEN THE DHRUVA-GÄNA AND THE DHRUVÄ-GÄNA

The students of history of Indian music should know that two ancient types of song, dbruva and dbruva are not one and the same thing, but are different from each other in types, structures and applications. Because the former is the nibaddha prabandha type of song, included in the sālaga-sūda category, whereas the later is purely the stagesong of the nibaddha type of metrical song, meant for the dramatic performances. The dbruva-gana has been described by Matanga (5th-7th century A.D.) Parsyadeva (7th-9th or 9th-11th century A.D.), Sarangdeva (carly 13th century A.D) and other later authors in their respective works on music. Similarly the stage-song, dhruva has been elaborately described by Bharata in the Natyasastra (in the 32nd chapter, Varanasi edition). Regarding the dbruva-gāna, Sārangdeva has said,

Suddha chāyālagaśceti dvividhali sūḍa ucyate// Elādili śuddha ityukto dhruvādi sālago matah/

Adyo dhruvastato mantha-pratimantha-nisārukāh//

Ekadhātur-dvikhaṇḍaṃ ca khaṇḍamuccataraṃ paraṃ/ Stutyanāmāṅkitaścāsau kvaciduccaikakhaṇḍakaḥ// Udgrāsyādyakhaṇḍe ca nyāsaḥ sa-dhruvako bhavet// etc. —Ratnākara, IV. 310-318.

Kallinath has said in the commentary: "ete dhruvadayah saptapi melapakabhavat tridhatavah", i.e., the dhruva-gana is possessed of three music-parts or dhatus. Simhabhupala

has also said: "sālaga-sūdam lakṣayitumāha—śuddha iti / sūdo dvividhaḥ; śuddhaḥ chāyālagaśceti / \* \* dhruvādiḥ sālagaḥ; sālaga-chāyālagau paryāyau / (IV. 310-312) / sālagasūda-prabandhānvibhajate—ādyo dhruva iti / dhruvā-dibḥi saptabhirgītaiḥ sālaga-sūda-prabandhāḥ / tesu dhruvam lakṣyati—ekadhātviti / etc.

The śāstric dhruva-gāna or dhruvapada-prabandha-gāna or dhrupad was afterwards revived with a new vision by Rājā Mān Singh (Tomar) of Gwālior in the x5th century A.D. The dhruva-gāna is neither derived from the stage-song, dhruvā-gāna, nor from the music-part, dhruva-dhātu, but it is the nibaddha prabandha type of song.

But the dbravā-gāna is an old type of nibaddba stagesong, and it has been divided into different classes. Bharata has said (in the chapter XXXII, Vārānasī edition):

Dhruveti samjūitāni syur-nārada-pramukhair-dvijaih/

Ya rcalı pünikü güthü saptarüpüngameva ca/ Saptarüpam pramünam hi sa dhruvetyabhisaminitüli// Ebhyastvangebhya uddhrtya nünü-chandalıkrtüni ca/ Dhruvütvam yüni gacchanti tüni vyaksümyaham dvijüli//

-Natyaśāstra, 32.1-3.

The dhruvā-gāna is also known as the gāndharva; "dhruvā-vidhānañca mayā svara-tāla-padātmakam | gāndharva-metat kathitam mayā hi pūrvam yaduktam tviha nāradena" (NS.32.483-84). The sixty-four dhruvās evolved from the jātis or jātirāga-gānas: "catuḥṣaṣṭir-dhruvānām ca vijñeyo mūla-jātayaḥ" (32.326). Bharata and the commentator. Abhinavagupta have again divided the stage-song, dhruvā

into five main varieties for their dramatic uses and applica-

Praveśa-ākṣepa-niṣkrāma-prāsādikamathantaram/ Gānam pancavidham jneyam dhruvāyoga-samanvitam//2

Among these five dhruvās (1) the praveša-dhruvā is the song of entrance in the stage, or it can be said as the entry song ('patrasya pravesa'). (2) The aksepa-dhruva is the song used to reveal flavour of a particular situation ('rasantarakseparthamaksepa-ganam'). (3) The niskramadbruva is the song used to be sung when the actor used to walk out of the stage. It can be said to be the exit song ('pātrasya niskramaņe tu niskrama-gānam'). (4) The prāsādika-dbruvā is the song, designed to convey to the audience in an attractive form, the inward feeling of an actor so as to touch the heart of the audiences. ('pravistasyantargatam cittavettim samajikan prati prasadayitum prathayitum prāsāda-gānam'). (5) The antara-dbruvā is the song introduced during the interval of the actor; moving and walking about, and inspecting something on the stage ('antaramiti gati-parikramaņa-nirūpaņādi tatra yad gīyate tadantaram ganam'). Besides them, there were other varieties of dbruvā-gāna. But it should be remembered that all kinds of dbruvā-gāna were meant for or applicable to the dramatic performances, and this type of the stage-

ग Bharata has mentioned them as:
प्रावेशिको तु प्रथमा द्वितीयाचे पिकी स्मृता ।
प्रासादिकी तृतीया च चतुथी चान्तरा ध्रुवा ॥
नैष्कामिकी च विशेया पत्रमी च ध्रुवा बुधैः ।
प्तासा चैव वच्यामि छान्योग्रसनिदर्शनम् ॥
Nāṭyaśāstra (Vārānasī ed.), 32.23-24.

song is quite different from the dhruvā-gāna of the sālaga-sūḍa prabandba-class.

#### III

#### A VIEW

Let me mention and also quote, in this connection, a view, forwarded by an erudite scholar, śrī Ṭḥākur Jaideva Singh. This view was given in his paper on *Prabandha* and *Dhruvapada*, read in the All India Radio Symposium, held at New Delhi. He has forwarded:

"The first historical reference that we get about dbruvapada is its association with Rājā Mān Singh, Tomar
of Gwālior. He ascended the throne in 1486 A.D. He
did not invent dbruvapada. He only gave it an impetus.
It must have taken about hundred years for the development
of this style of musical composition before such a connoisseur
of music, as Rājā Mān Singh could extend to it his patronage
and take such a great interest in its development. We may,
therefore, safely say that the dbruvapada style of composition started some time about the middle of the 14th
century. The question is whether dbruvapada was entirely
an innovation or simply an evolution of an earlier form of
composition.

"A careful reading of the Sangīta-śāstras will at once show that dhravapada was only an evolution of the prabandha form of composition. The word 'prabandha' literally means anything well-knit or well-fitted. It is a blanket term for 'composition'. But in music it came to be used in the restricted sense of composition of a particular kind. Sārangdeva, the great musicologist of the

in his Sangīta-Ratnākara. Jayadeva has written his Gītagovinda in the style of prabandha. He graced the court
of Lakṣmaṇa Sena, who was king of Western Bengal and
flourished in the 12th century A.D. At the very outset of
his Kāvya, Jayadeva says that he is writing a 'prabandba':
"Śrī vāsudeva-rati-keli-kathā-sametametam karoti jayadevakaviḥ prabandham' (l.2). We have thus an evidence of
the prabandba form of vocal music from about the 11th
century A.D.

"We would do well, first of all, to ascertain the meaning of the word 'dbruva'. The word means 'fixed', 'determinate', 'definite'. Dhruvapada, therefore, means a song in which the padas or words are well-set in a definite structure or pattern. While it is difficult to find a regular use of dhruvapada earlier than the fifteenth century, dhruva in the sense of a definitely set pattern of a song is, at least, as old as Bharata's Nātyaśāstra. Commenting in the word dhruva in "ganam-pancavidham jneyam-dhruvayoga-samanvitam". In the 30th stanza of the 6th chapter of the Natyasastra, Abhinavagupta comments: "dhruvā gītyādhāro niyatah pada-samūhah" (p. 270, Gaekwad's Oriental Series, Barodā). Dhruva means the basis of song in which words are set according to a definite pattern. The word 'dbruva' occurs in the Natyasastra, and not dhruva, because it has been used as an adjective of gitt which is feminine. Bharata himself was concerned only with the dhruvas that were of

<sup>ा</sup> The commentator, Püjäri Goswāmī has also said: "एतत श्रीगीतगोविन्दाख्यं प्रवन्धं प्रकर्षेण वाध्यते श्रोतृणां हृदयमस्मित्रिति प्रबन्धस्तं करोति प्रकाशयति"।

use in the drama, but he admitted that there were dhruvās of other kinds also:

Yā rcaḥ pāṇikā gāthā saptarūpāngameva ca/
Saptarūpa-pramāṇaṃ ca tadhruvetyabhisañjitaṃ//
—NS. Kāvyamālā ed. p. 532

"He says that all the reas, pānikas and gāthās are 'dhruva'. Again he admits that there are many varieties of dhruva according to jāti, sthāna, prakāra, pramāņa and nāma:

Jātisthānam pramāņanca prakāro nāma caiva hi/ Jneyā dhruvāņām nātyajnairvikalpāh pancahetukāh// —NS. Vārānasī ed. p. 416.

\* \* Dhruva, in the sense of a musical composition of a definite pattern, is very old. Only as adjective of giti it was known as dhruvā; as an adjective of pada, it is known as dhruva. With regard to the musical pattern of the various dhruvas, used in Bharata's time, it is difficult to say what it was like, for we have no definite example of it before us. And so we cannot say whether there was any dhruva in Bharata's time which was similar to modern dhruvapada as a piece of musical composition.

"But the structure of prabandha, as given in the Sangīta-Ratnākara, is fairly clear. Let us see what Sārang-deva has to say on this composition:

"What is dhruva? Kallinātha says: "प्र यस्यात् नित्यत्वादित्यर्थः सक्तप्रवन्धेष्वनपायात्। तेन द्विधातुषु प्रवन्धेषु मेलापकाभोगयोक्षिधातुषु प्रवन्धेषु मेलापकाभोगयोक्षिधातुषु प्रवन्धेषु सर्वत्व भेलापकस्मेष परित्यागः। प्र वस्य न क्रनिद्धि परित्यागः''। Simhabhupāla adds: "प्र वस्वानिध्यत्वादिति। उद्प्राहानन्तरमाभोगान्तर च गानात्।" Dhruva is so called because it is a permanent or immovable component of a prabandha, and also because it is repeated after udgrāha and ābhoga i.e. it is the refrain of the song. In a prabandha which consists of only two dhātus, melāpaka and ābhoga are eliminated, but udgrāha and dhruva must be there; in a prabandha of three dhātus, melāpaka may be eliminated, but not dhruva. \* \*

"The prabandha form of music enjoyed great popularity upto the 13th century. From the fourteenth century, dhruvapada began to take its place. Dhruvapada was in its hey-day from the 15th to 18th century. The prabandha form slowly disappeared. It only survived for some time as an antique curio in some of the Vaisnavite temples.

\* It is thus clear that dhruvapada has evolved out of the prabandha. Pandit Bhäckhande quotes in his Comparative Study of Some of the Leading Musical Systems, the laksana of dhruvapada as given by Bhāvabhaṭṭa in his Anūpasangīta-ratnākara. Bhāvabhaṭṭa was employed in the court of Anūp Singh, the Ruler of Bikāner from 1674-1709 A.D. The quotation is reproduced below:

श्रथ ध्रुवपद-लच्चणम् । गीर्वाणमध्यदेशीयभाषासाहित्वराजितम् । द्विचतुर्वावयसम्पन्नं नरनारीकथाश्रयम् । श्रह्वाररस-भावायं रागालापपदात्मकम् ॥ पादान्तानुशासयुक्कं पादान्तयुगर्वा च वा ॥ प्रतिपादं यत्न वद्धमेवं पादवतुष्टयम् । उद्गाह्युवकाभोगान्तरं ध्रुवपदं स्मृतम् ॥ "The most interesting thing in this quotation is that though the names of the component parts of dhruvapada had changed since the 15th century, Bhāvabhaṭṭa, even in 17th century is describing dhruvapada in terms of prabandha, viz. udgrāha, dhruva, antara and ābhoga. This is a further proof of the fact that dhruvapada evolved out of the prabandha. \*\* In conclusion, it may be said that dhruvapada is an evolved form of prabandha style. In it, the musical idea stretches its wings in the sthāyā, soars up in the antarā, goes in the sañcarī, and finally with a broad sweep of notes in the ābhoga furls downits wings".

#### CHAPTER X

# THE EVOLUTION OF KHEYAL AND ITS DEVELOPMENT

Kheyāl or khyāl (kheyāl in Bengali and khyāl in Hindi and Urdu) seems to be an Arabic term, meaning 'thought', 'imagination', 'fancy', 'ideation', 'imaginative conception', 'respect', 'understanding', etc., and, therefore, kheyal or khyāl connotes the idea of some sort of song or verse which is imaginative and conceptual in its nature, or an execution at will, and this word or term has been imported to India through the medium of Persian language. fact, the term kheyāl or khyāl or khiyāl connotes the ideas of imagination and imaginative composition, and from the meaning or connotation it can further be inferred that kheyāl or khyāl is imaginative in conception, artistic and decorative in execution and romantic in appeal. Its theme or subject-matter is interpretative, and its form and method of excution are classico-romantic. In comparison with the dhruvapada-prabandha type of songs, the kheyal-prabandha is imaginative and creative, whereas dbruvapada is concentrative, contemplative and majestic.

Controversy rages round the origin or evolution of kheyāl or khyāl, and its term or name. Various theories have been advanced in this regard: (1) First, some trace its origin or evolution to qāwālī or qāvvālī type of regional love-cum-devotional songs. They are of opinion that some wandering Qāwāl or Qāvvāl singers were already in existence in different parts of Northern India, even before the time of Sultān Ālā-ud-dīn Khaljī and Āmīr Khasrau or

Amīr Khasroo, who lived in the 13th-14th century A.D., during Sultan Ala-ud-din's reign. The term kheyal or khyal was derived from the name gawali or gavvali, -a type of song of those wandering Qawals. (2) Second, some say that the result of admixture of decorative principle and word-structure of melody gave rise to the new and novel form of kheyāl. (3) Third, some hold that from the musical composition (prabandba), kaivada, possessed of three musical parts (dhatus) and bhavani-jati with three limbs (angas) of the 12th-13th century A.D., evolved the new form of kheyāl. (4) Fourth, some scholars are of opinion that not only kaivada, but other prabandhas like ekatālī and rāsaka are also the fountain-head of kheyāl. (5) Fifth, some others again argue that kheyāl was designed after the śastric aksiptika, which has been described by Sarangdeva in the Sangita-Ratnakara. The aksiptika is akin to pallavi of the South Indian system of music.

There are again differences of opinion regarding the innovator or originator of kheyāl. Some say that the Indo-Persian scholar, Āmīr Khasrau (Khasroo) was an accomplished musician as well as a musicologist, and that he himself was conversant with the popular type of song, the qāwālī or qāvvālī of the Qāwāls. It is said that he introduced kheyāl with a particular style of execution among the music-loving people of the then society. But most of the scholars have refuted this view, and consequently there arose some controversial theories regarding the innovator of kheyal. Captain Willard has said in his Treatise on the Music of Hindostān (1834) that kheyāl or khyāl was composed chiefly in the language, spoken in the district of Khyrābād, \* "Sooltān Hoosyan Sharque of Jaunpur was the innovator of this class of song". A. H. Fox-

Strangways has said in his Music in Hindostan (1914) that the commonest type of kheyāl was a later form of dhruvapada or dbrupad, supposed to have emanated from Muhammed (Sultan) Sharque in 1401-1440 A.D. Some hold that it was Sultan Hussain Sharque who developed kheyal on the basis of an older form of folk song that was prevalent in North India in the early part of the mediaeval But most of the scholars are of opinion that neither Amīr Khasrau nor Sultan Hussain Sharque was the innovator of kheyāl, but it was an outcome of the gradual process of evolution that was at work during the reign of any one of the Sultans like Ghiyas-ud-din Balban, Zalal-ud-din Firuz, Ala-ud-din Khalji and the Tughluq Rulers, supported by the inventive geniuses of the Muslim and Indo-Persian musicians. Some others again maintain that it was Niyamat Khān, sadārang, the court-musician of Sultan Muhammed Shah of the 18th century A.D., who really designed the novel type of kheyāl either on the structures of some old śāstric prabandbas or on his individual genius, with the mixture of different languages of that time.

Now let us discuss the views, set forth above as to their soundness. Regarding the prabandha, kaivāḍa, which is recognised as the source of origin of kheyāl by some scholars, Sārangdeva has said that kaivāḍa is possessed of two dhātus, dhruvā and udgrāha, and it ends in udgrāha.

Pāṭaiḥ syātām dhruvādgrahau kaivāḍe nyāsanam grahe/ Sārthakair-arthabīnaśca pātaiḥ sa dvividho mataḥ//

The commentator Kallināth has explained kaivāda with its characteristics as; "kaivāda iti karapāta-pradbānatvāt tadbbavo'pabbramsapadeneyam sanjnā; karapātastu vādyādbyāye vyakṣyante". Simhabhupāla has mentioned that when kaivāḍa-prabandha is possessed of pāta, akṣara (letters) and dbātus like dbruva and udgrāha, and the graha ends in udgrāha, it is known as kaivāḍa: "pātākṣarair-dbruvodgrāhau kartyavyau/ graha udgrāhe samāptiryasya sa kaivāḍaḥ." Kaivāḍa is of two kinds, sārthaka and anarthaka, and these are again divided into two tespectively.

From Kallināth's commentary we come to know that among the four varieties of the kaivāḍa-prabandha, the latter one or two are possessed of three music-parts (dhātus), and three aṅgas like pāta, pada and tāla, and so they belong to the category of the bhāvanī-jāti: "pātapada-tāla-baddhatvātraṅgo bhāvanījātimān". Regarding the bhāvanī-jātī, Sirihabhupāla has said: "tribhiraṅge-rūpanibaddhā bhāvanī". However, from the text of the Saṅgīta-Ratnākara we find that though the simple form the kaivāḍa-prabandha is possessed of two dhātus and two aṅgas, yet the mixed forms are not so, and, therefore, judging from all the forms of the kaivāḍa-prabandha it can be said that kheyāl or khyāl is not an offshoot or changed form of the kaivāḍa-prabandha.

Some say that kheyāl evolved from the prabandhas like rāsaka or ekatālī, because both the prabandhas are possessed

I Kallinath has further informed us that kaivāda-prabandha can be embellished with three dhātus, (including the ābhoga-dhātu, amputed with the names of the netā and the gātā, and then it will be included in the category of the bhāvanī jāti. But generally it is found that the kaivāda-prabandha is possessed of only two dhātus. Paṇḍit Ahobala has said in the Sangīta-pārijāta,

<sup>&#</sup>x27;Udgrāha-dhruvakau yasya pātaireva vinirmitau/, Padaiḥ kṛtvāntarābhogau kaivāḍo'tyanta śobhitaḥ//

<sup>-</sup>Sangita-pārijāta, 555.

of two dhātus, and are included in the category of the tārāvalī-jati, possessed of two angas. But this view seems to be untenable, because merely two dhātus of any ancient prabandha and two dhātus of kheyāl are not the sufficient reason and proof for the similarity of the said two types.

Further it is sometimes suggested that kheyal or khyal evolved from the settings of the nibaddha type of aksiptika which is possessed of svara and pada: "ākṣiptikā svara-pada-grathita kathitā vudhaiḥ" (SR. II.26). The mārga type of tāla like caccatputa is used in ākṣiptikā. The form of ākṣiptikā is different from those of ālāpa and rūpaka, and this has clearly been explained by Kallināth, while commenting on the śloka: "\* abhivyaktiryatra dṛṣtvā \* rūpakam tadvadeva...vidārikam" (SR. II. 24-25). But kheyāl is not an off-shoot of the nibaddha-gīta, ākṣiptikā for many teasons, rather it can be said that the rūpaka-prabandha is the forerunner of kheyāl. Regarding the rūpaka-prabandha, Sāraṅgdeva has said,

Rāgeņa dhātu-mātubhyām tathā tāla-layauduvaih// Nūtanai rūpakam nūtnam rāgah sthāyāntarairnavah/

Regarding it, Kallināth has said: "nūtana-rāgādinirmitatvādrūpakam navam bhavatītyarthah | raūjanādidharmayoge siddharūpāņām rāgādīnām nūtanatvam kathamityākāmkṣāyāmāha-rāgaḥ sthäyāntarairityādi" |. Similarly
Simhabhupāla has said: "navena rāgena dhātu-mattvādibhiśca tānai-rūpakasya nūtanatvam | \* rāgāmśa-bhedena
dhātusthāyāḥ sthāyāntarāṇi, tai rāgeṇa rāgo navo bhavati" |
Further Sāraṅgdeva has said,

Dhātu rāgāmsa-bhedena mātostu navatā bhavet/ Pratipādyaviseṣeṇa rasālamkāra-bhedataḥ/ Laya-graha-viseṣeṇa tālānām navatā matā// From both the commentaries of Kallinath and Simabhupāla we know: "rāgāmsabhedena dhāturnavo bhavati/ rasālamkāra-bhedena māturnavo bhavati/laya-graha-bhedena tālo navaḥ|tālo viśramvasya tulyena sāmyena viśrāmeņa vā navah/, chanda-ādibbirnavairacanā navā bhavati". From these it is understood that the rupaka-prabandha is a musical composition, which is novel and original in conception. The new forms of composition, rhythm, tempo, etc. are designed with different meters and aesthetic sentiments and moods. While comparing kheyāl with rūpaka prabandha, Pandit S. N. Ratanjankar has said: "Khyāla is a Persian word and in the context of our topic would mean imagination, a spontaneous idea, independent of traditional or accepted usages. The 'Roopakam' a type of songs referred to in the old Sanskrit Granthas, appears to have in it the germs of style". Further he has said: "Roopakam is a musical composition in which there is scope for creating novelty, something original out of the trodden path in the Raga as well in the wordings of the composition, by emphasising passages which, though ordinarily occurring in the Raga being sung, are prominent in some other sympathetic Raga, by using fresh words expressing some emotion, by making changes in the Tala and Laya. It may not therefore be too fantastic perhaps to consider the Kheyal as an off-shoot of the Roopakam type of musical compositions. Within a short time after Sarangdeva the old system of music was fast receding in the background and a new one in which influence of foreign music was beginning torush in was coming into vogue".

This subject has been elaborately dealt by Thakur Jaideva Singh. He has opened a new vistas of investigation into the origin of kheyāl. He has said about the

evolution of kheyāl or khyāl: "It is supposed that Amir Khusroo started this style or composition, and it did not exist in Indian music before. Amīr Khusroo flourished in the 13th century. Was there no indigenous style of composition in the 13th century which used all kinds of graces? Sarangdeva's Sangita-Ratnakara was written in the 13th century itself Let us turn to it for an answer to this question. Sarangdeva mentions five types of musical composition viz. śuddha, bhinna, gaudi, vesara and sādhāranī. He says: "śuddhā syādvakrair-lalitaih svaraih/ bhinna vakraih svaraih sükşmair-madhurair-gamakairyuta'. The main contention of Thakur Shahib is that kheyat or kbyāl evolved or rather developed in a new and novel form from the ancient śāstric sādbāraņī-gīti, and its charming style evolved from the rupakalapti that was current in the 12th-13th century A.D. Thakur Shahib has stated about his personal view: "I maintain that the socalled kbyāl style of musical composition is nothing but only a natural development of the sadharani-gitt, which used the exquisite features of all the styles. It is this sadharanigiti with the predominant use of bhinna in it that became the kbyāl".

Now the type of kheyāl or khyāl is known by its special charming style or method of execution. In Matanga's Bṛhaddeśī, we find five (even seven) kinds of rāgagīti which were possessed of different qualities as well as different methods of presentation. Sārangdeva has also mentioned those rāgagītis in his Sangīta-Ratnākara of the eatly 13th century A.D. Sārangdeva has said that five grāmarāgas, accompained by five gītis or rāgagītis, were current even from Bharata's time (2nd century A.D.). Simhabhupāla has stated: "grāmarāgāḥ pañca-prakāra

bhavanti/ kena višeseņa tesām pañca-prakāratvam? ata āha—pañca-gīti samāśrayāditi". Bharata has described four grāmarāgas, which were used in songs, accompanied by four gītis like māgadbī, ardha-māgadbī, sambhāvitā and pṛthulā. (vide Simhabhupāla's commentary on Sāraṅgdeva's "pañcadbā grāmarāgāḥ syuḥ" etc., SR. Ādyar ed., vol. II, p. 4). Regarding the characteristic of those gītis (rāgagītis), Sāraṅgdeva has said:

\*\* \* śuddhā syādvakrair-latitaili svaraili/, Bhinnā vakraili svaraili sukṣmair-madhutair-

gamakairyutā//
Gāḍḥaistristhāna-gamakairohati-lalitaiḥ svaraiḥ/,
Akhaṇḍitasthitiḥ sthānatraye gauḍī matā satāṃ/
Ohāṭī kampitair-mandrair-mṛdu-drutataraiḥ svaraiḥ//,
Hakāroukārayogeṇa hṛnnyaste civuke bhavet/
Vegavadbhiḥ svarair-varṇacatuṣke'pyatiraktitaḥ/
Vega-svarā rāgagītir-vesarā cocyate vudhaiḥ//,
Caturgītigataṃ lakṣma śritā sādhāraṇī matā/
—Ratnākara, II. 3-7.

The sādbāraṇī-gīti was "an eclectic style of composition which included within itself the excellent points of all other four styles". It was more charming than all other styles, because it was full of gamakas, pleasant, tender with sweet idioms and delicate nuances of emotion (kāku). The kheyāl or khyāl "adopted the style for its composition i.e. it embodied within itself the excellent features of all the styles and had a predominance of the bhinnā style i.e. it exploited all the gamakas without bothering about their names, khaṭkā, murkī, meend, (meeda), kampa, āndolana—everything was beautifully woven in its structure".

Further it must be remembered that the embellishment of the kheyāl is somewhat similar to that of the ancient śāstrie rūpakālapti. Now, what do we mean by a rūpakālapti? Sārangdeva has defined rūpakālapti thus:

Rūpakasthena rāgeņa tālena ca vidbīyate/ Yā proktā rūpakālaptili sā punardvividhā bhavet//

-Ratnākara, III. 197. Simhabhupāla has made it explicit when he has said: "pravandhasthena rägena tälena copalaksitä yä älaptih kriyate sā rūpakālaptih," i. e. when ālapti or ālāpa is accompanied by raga and tala, contained in a prabandha, it is called the rūpakālapti. Again what do we mean by an ālapti? Simbabhupāla has said: "yena svara-sandarbhena ragah prakatikriyate sa alapti sa dividha, ragalaptih rūpakālaptisca| \* \* yā rūpaka-prabandhe elā-manthādyanapeksa pravartate sa ragalaptih sa caturhhih \* " (vide the detailed commentary, SR., III. 197 and the Adyar ed. of SR., vol. II, p. 178). The rupakalapti was the creative and imaginative song (manodharmi-sangita), whereas the ragalapti was purely a technical one. The rupakalapti was again divided into two, pratigrahanikā and rūpakabhanjanī. Simhabhupāla has further given the definitions of the two bhanjanis as: (1) "yasyāmālaptau rūpakah sainsthitah prabandhāśrito yah sthaya-varno'vayavastasya prabandhasya padamanena nana-prakaro'neka-bhangikah kriyate, sa sthaya-bhanjani/ rūpaka-bhañjanī lakṣayati-taib padairiti | taib prabandhastbai padaih; tena prabandhasthena manena samagrameva rupakamanythanyath bhangi-visesena yasyamalaptau-gamako gayet, sā rūpaka-bhañjani" (p. 180). The term sthāya connotes the idea of melodic phrase or a phrase of a musical composition. But the word sthaya, that occurs in the sthaya-bhanjani, means "a part of the composition itself".

From the commentary of Simhabhupāla it is understood that the sthāya-bhañjanī connotes the idea of a well-marked creative imagination, whereas the rūpaka-bhañjanī means that an artist "is not tied down to the tānas, occurring only in the composition that he is embellishing or singing, but also uses other tānas ('tānāntaraiḥ'), appropriate to that particular rāga, embellished with gamakas, etc.". So by a close observation it is found that the embellishments, rendered in the kheyāl or khyāl type of songs, were also used with the śāstric bhañjanīs, sthāya and rūpaka.

Regarding ākṣiptikā, rūpaka and ālapti, as mentioned previously, I would like to draw the attention of the readers to Kallinath's commentary on the śloka: "abbivyaktiryata dṛṣtā sa rāgālāpa ucyate/rūpakam tadvadeva \* \* ākṣiptikā svara-pada grathitā \* \* " (SR., II. 24-25). There Kalli-. nath has drawn the marks of distinction among those three musical elements, and has said: "ayamarthah-apanyasesvaviramyaikākāreņa pravṛtta ālāpaḥ, sa evāpanyāseṣu viramya viramya pravrttam rūpakamiti/ākṣiptiketi nibaddha-gītibhedah/ \* \* svara-pada-grathitā, sadjādisvaropetaih padaih padartha-vācakaih sabder-grathitā racitā pada tālādyāksiptatvādāksiptiketyanvarthā juudhair-matangādibhih kathitā" (p. 21). The rupakalapti is sometimes different in its nature and embellishment from those of aksiptika, pure rapaka and alapa or alapti. And it has also been shown a distinction between a prabandha and a rūpaka, because a prabandha lays emphasis upon the beauty of 'form' and a rupaka on the beauty of 'creative fancy'. So, regarding evolution of kheyāl or khyāl, it can be said that it developed upon the already existing ancient structure of the sadharani-giti, having its basis on rupakālapti for the imaginative and creative style.

So kheyāl is neither altogether a new or foreign importation in Indian music, nor did Amir Khusrau invent it in the 13th century A. D., rather it was current mostly among the Muslim musicians of the Arab-Persian stock, known as the Kawals. The Kawals were adepts in the art and culture of qāwāli type of regional songs in rapid tempo (druta laya), and their fanciful mode of singing used to employ only 'qaula.' "The word quala," says Thakur Jaideva Singh, "means the same as the Sanskrit word vācana. Though both qaula and vācana are words of wide application, meaning only word or statement, in music both of them have got a restricted sense. Just as in Hinduism, singing a vācana or vāņī or šabda means singing a mystic or devotional song, even so in Islam quovali or singing quala means a mystic song in accordance with the orthodox belief of Islam". It is a historical fact that Amīr Khusrau was much interested in quwali or quvvali, and he mastered. this type as well as composed many imaginative verses or songs. He also admitted this fact in his monumental work, Nub Sipir. Daulat Shah has mentioned in his Account the personal statement of Khusrau thus: "I have written three volumes of poetry, and my musical compositions (qāwālī, gazal, etc.) would also amount to three volumes, if they could be reduced to writing". Amir Khusrau flourished in the 13th century A. D., and at the same time Sarangdeva flourished and composed his epoch-making treatise on music, Sangita-Ratnākara (early 13th century). Amīr Khusrau was a man of extraordinary merit and intelligence, and he was well-versed in Urdu, Hindi, Persian, Sanskrit, and other languages. So it might be the fact that, being a scholar and a music-loving man himself, he was quite aware of the colourful form of the śastric sadbarani-ragagiti, together

with the imaginative style of the rupakalapti, full of so much embellishment, as described in Sarangdeva's Ratnakara. It is most probable that he thought it better to designate the fanciful type and style of qawali of his time as kheyal or khyal for better understanding and sweet rendering. But we do not know whether he can be credited for doing that. And if that be so, then it is also possible that the newly introduced type and style gradually attracted the attention of all music and beauty-loving peoples of that time and, consequently attained refinement through gradual novel process during the time of the Sharqui Rulers in the 15th century A.D.

The Sharqui Rulers were great lovers as well as patrons of fine arts like architecture, painting and music, and so it can be assumed that kheyāl or khyāl got their support, and it was much improved and better understood during the time of Sultan Husain Sharqui. During Akbar's time, in the 16th-17th century A.D., it was also nurtured by top-ranking musicians of refined and elegant taste, and it is said that the master musicians like Sūraj Khān, Chānd Khān, Bāz Bāhādur, Rupamatī and others of the time were much interested in the culture of kheyāl, though it did not enjoy Royal patronage like dbruvapada, and, therefore, it remained outside the pale of Royal courts and aristocratic societies of the time. A very few scholar again believe that kheyāl was appreciated by the Muslim Rulers and even by Akbar himself. It might be possible that kheyāl was much appreciated by the musicians, music-lovers and even by the kings and the Royal families. Let me quote in this connection some suggestions, made by one of the connoisseurs of music, Thakur Jaideva Singh. He has said: "Since

the style was ornate and romantic, it did not find favour in the temples. It was mostly patronised by the Kathiks, the dancing girls and kings. The Sharqui kings of Jaunpur patronised this style to a great extent in the 14th-15th century. It was quite popular in the 16th century. There is in Braja Bhāṣā a very important work, called Chaurasi Vaispavān-kī Vārtā. This was compiled by Srī Gokulanācha, the grandson of Śrī Vallabhācārya. the life of Kṛṣṇadāsa Adhikārī, who was the accountant of Srī Nātha temple, he mentions an interesting incident: "jaura eka samaya śrīnāthjike bhandarame.....khyāl tappā gāyata buti jaura.....sau kṛṣṇadās bāzārme tāmāsai me jaya thade bhaya". The passage is a long one. I have quoted only the relevant portion which shows that khyāl was sung at that time. • \* Srī Vallabhācārya flourished in the 16th century. The incident mentioned above, therefore, relates to some date in the 16th century". From this it is evident that the kheyal or khyal singing was much appreciated in the society during the Mahammedan period, and it was warmly appreciated by the musicians as well as music-lovers even during the time of the Emperor Akbar. And it might be quite possible that Emperor Akbar was also an appreciator of the ornate and romantic style of kheyāl, though some are of opinion that kheyāl or khyāl singing was not patronised by the Emperor.

But kheyāl gradually attracted the minds of the beautyloving artists, the later Sultāns and Royal families. The kheyāl was highly develoved during the time of Sultān Muhammed Shāh in 1719-1748 A.D., under the able guidance of Niyāmat Khān, who was an adept in both dhravapada and veeṇā. Niyāmat Khān won the title of

'sadarang' from Sultan Muhammed Shah for his great talents and theoretical and practical knowledge in classical music. It is a fact that Niyamat Khan, sadarang designed the elegant classical form of kheyāl in a majestic and colourful slow tempo (vilambita laya) like dbruvapada. It has already been said that he designed kheyal either on the basis of some sastric prabandha-gitis, as delineated in the ancient Sangita-sästras, or innovated it absolutely in a new and novel form, based on the somewhat reformed type of kheyal that already existed in the society. Truly speaking, Niyamat Khan, sadarang hightened the classical form of kheyāl, and made it to be appreciated by the top-ranking musicians and Royal sovereigns of that time. Thence from, it attained the similar high position as enjoyed by dhruvapada, and gradually came to be developed with many modifications and changes in forms and styles and decorative elements even upto the present time. In the 19th-20th century, there evolved some colourful novel styles in kheyal through individual efforts-cum-methods of execution or embelishment, and they were named after noted places (seats of culture) and artists. To name a few: Gwaliorgharāṇā, Agrā-gharāṇā, laipur-gharāṇā, Pātiyālā-gharāṇā, Kirāņā-gharāņā, Āllādīyā khān-gharāņā, etc. Different kinds of gamaka, subtle tāna, meeda, bol or vānī, laya (tempo), etc. were the salient features constituting their differences.

## The Evolution of the Gharanas:

In fact, the gbarāṇās or different methods or schools of embelishment or improvisation of the classical songs did not only evolve through the medium of culture of the kheyāl type of songs, but also evolved in connection with the dbruvapada of different vāṇīs as well as with different

methods of recitals of the musical instruments like veena, sitar, etc. From the historical records of Indian music of the mediaeval time, and specially of the Muhammedan period, we come to know that mainly two gharanas evolved during or after the reign of Alaud-din Khalji, the noted Pathan Ruler, and they were: (i) the kalawanta-gharana and (ii) the qawal-gharana. (i) The kalawanta-gharana was established by Baiju Bāwarā (or Bāorā), who was quite a different man from Baijunath, the court musician of Akbar and Brja Chand, the disciple of Swami Haridasa. It is said that the kalawanta-gharana was maintained and propagated by Nayaka Gopalalal, who hailed from South India. (ii) The qāwāl-gharāṇā was founded by Āmīr Khusrau, the court-poet of Alaud-din Khalji. It is said that this gharānā was also patronised by Sultan Hussian Sharqui of Jaunpur. The noted singers of the qawal or quawal and tarana types of songs as well as the instrumentalists of that time were included in these two gharanas.

Later on, says B.N. Roychoudhury, a third gharāṇā was established by the instrumentalists, who used to play on senai and tabal. "With the increase of the number of female singers and dancing girls in the Royal court, there arose a fourth gharāṇā of the instrumentalists accompanying them. The Ustāds of the third and the fourth gharāṇās were called Mirāsīs and Dḥādīs."

After the death of Miān Tānsen, the Senī school of music (Senī-gharāṇā) evolved with its three main aspects; (1) the first type of the Senī-gharāṇā was formed by Tānsen's youngest son, Bilāsasen (or Bilāsa Khān, the tāna-

<sup>1</sup> Vide Hindusthani Music and Mian Tansen (Cal.), p. 25.

taranga) at the Delhi Durbar. That gharana represented the gaudī-vānī of dhruvapada. (2) The second type of the Senī-gharānā was formed by Tansen's another son, Suratasen, who used to sing dhruvapada in dagara-vani. His discendants subsequently settled at Jaipur. (3) The third type of the Senī-gharānā was formed by Miśrī Singh, the son of Mahārāj Samokhan Singh and the husband of Sarasvatī Devī, the daughter of Miān Tānsen. Miśrī Singh's discendants formed the main school of veena recital, and used to present dbruvapada in both the dagara-vani and khandara-vani. Besides these three types of Seni-gharānā, the other famous gharānās were established by Brija Chand and Suradasa at Mathura, whose disciples were the Brahmin priests, while Chand Khan and Suraj Khan were the founders of tilmandi-gharana of dhruvapada in Punjab.

To give the list of the main gharāṇās, let me take the privilege of quoting the list, forwarded by the noted Veenkāra and musicologist, B. N. Roychoudhuty of Gautīpur in his booklet, Hindusthāni Music and Miān Tānsen:

- "1. The Seni-gharāṇā of dhruvapada and rabāb, formed by three great brothers, Jāffar Khān, Payār Khān and Bāsat Khān of Lucknow and Vārāṇasī.
  - The Senī-veeņkāra-gharāņā, laid by Nirmal Shāh of Lucknow.
  - The Qāwāl-gbarāṇā, laid by Bade Md. Khān Kāwāl of Lucknow and Gwālior.
  - The Gwālior-gharānā of kheyāl, formed by the two great Kheyāliyās, Hassu Khān and Nātthu Khān.

- The Agrā-gharāṇā of dhāmār, formed by the descendants of Khān (Dhāmār) and who later on became disciple of Shāh Sadāraṅg.
- The Betiyā-gharāṇā of dhruvapada, formed by the disciples of Hāidār Khān Senī of Lucknow, who were the Kathakas of Vārāṇasī as well as Muslim Ustāds of Kalpī.
- The Biṣṇupur-gharāṇā of dhruvapada, formed by Rāmaśańkar Bhattācārya.
- The Tilmandi-gbarana of Panjabi dbruvapada singers.
- The Labore-gharāṇā by the Punjābī Kheyālīyās, disciples of Shāh Sadārang.
- 10. The Ataruli-gharāṇā of dhruvapada and kheyāl, founded by the Brāhmiņs of Mathurā, who embraced Islam later on.
- II. The Dagar-gharāṇā, founded by Bāitām Khān, a great scholar and Dhrupadīyā, and who was a descendant of a priestly line of Mathurā.
- 12. The Seni-gharāṇā of sitār of Jaipur, founded by the celebrated Amrica Sen.
- 13. The Sarode-gharāṇā of Shāhārānpur, disciples of Omrāo-Khān, a son of Nirmal Shāh Senī.
- The Sarode-gharāṇā, founded by Niyāmutullā Khān, a disciple of Bāsat Khān Senī.
- The Sitār-gharāṇā of Lucknow, founded by Golām Md. Khān, a disciple of Omrão Khān Senī".

Further mention can be made about the Rāmpurgharāṇā, the latest gharāṇā of India. This beautiful gharāṇā was founded by Bāhādur Hussain and Amīr Khān, who were possessed of some special charms in the use of alapa, dhruvapada, dhamar and in instrumental music. But it should be mentioned that during the time of Haidar Ali Khan of the Rampur State, the disciples of Bahadur Hussain or Amir Khan were followers of other gharanas, but they changed their old style (gharana) and were influenced by the styles of their masters and thus became identified with the Rampur-gharana.

# The Development and Culture of the Dhruvapada in Bengal:

Now, let us briefly survey the development and culture of kheyāl in Bengal. By 'development and culture of kheyāl in Bengal', I mean the historical development and proper culture of Hindusthani type of kheyal in Bengal. A close study as well as survey of the history of music of Bengal reveals that the Hindusthani type of kheyal was introduced in Bengal not more than fifteen or twenty decades ago, though the age-long Hindu-Mohammedan traditional culture of dhruvapada existed in Greater Bengal from the 15th-16th century A.D. The Greater Bengal comprised whole of undivided Bengal, Assam or Kamarupa, Behar and Orissa. Śrī Chaitanya appeared during the period intervening the last quarter of the 15th century and first quarter of the 16th century A.D., and during his time, Svarūpa-Damodara, Ray Ramananda and other talented Vaisnaya savants were fully conversant with the Hindu-Muslim classical music, Most of them were both musicians and musicologists. The authentic book on music, Gītaprakāśa was written by the Vaisnava savant of the Gaudiya sect, Swami Krsnadas in the first half of the 16th century i.e. during the time of Ramananda Ray and

Pratăparūdra-Gajapati, During the latrer part of the 16th century, Țhakur Narottamadās introduced the new mode of rasa or līlā kīrtana on the basis of slow or bilamvita dhruvapada, which used to be sung in the gaderhāți or garānhāți style. Besides, many Vaiṣṇava savants like Harinārāyaṇa Suri, Gajapati Nārāyaṇadeva of the Khemudi line, Kavi Nārāyaṇa and others wrote books on music which go to prove the genuine culture of classical music in Bengal. Narottamadās, Ghanasyāma Naraharidās and others learnt classical music from both the Hindu and Muslim Ustāds of that time. But it should be noted in this connection that even then the Hinduschānī type of kbeyāl had not been introduced in Bengal.

From the early 18th century, classico-Bengali songs like tappā and tap-kheyāl were introduced by Kaviranjana Ramaprasad Sen, Bharata Chandra, Ramanidhi Gupta or Nidhu Bābu and others. The tap-kheyāl was a type of song which used to be sung after the style of somewhat tappā and kheyāl mixed, and this type of classico-Bengali songs still exist in Bengal. Many musicians and composers like Haru Thakur, Dewan Raghunath Ray, Dewan Ramadulal, Rama Basu and others appeared in Bengal and enriched the treasury of Bengali songs by their valuable compositions. Though the Hinduschani kheyal was not in practice at that time, yet, as has been said before, the neoclassical charming and romantic types of tappa and tapkheyāl, having rich artistic and aesthetic sentiments and feelings, were in practice, and they were known as the Bengal style of music'. Specially Ramanidhi Gupta brought a renaissance in the classico-Bengali songs by composing and improvising new type of tappa, and from this it can be presumed that tappa was introduced in

Bengal earlier than Hindusthani kheyal, and that Bengal of the 18th-19th century had her full share of the legacy of traditional music, which came to be known as the aristocratic vaithaki sangita.

The period of hundred years, extending from 1800 to 1900 A.D. witnessed another renaissance in the domain of classico-Bengali songs, when different traditional ragas like vasanta, ganri, püravi or pürvi, sähänä, vägesvari, luma, khāmbāj, multāna or bhimpālasrī, etc. and different tālas like yat of eight matras, adatheka of 16 matras, madbyamāna of 32 mātrās, medium ekatāla, divided into four parts, having three matras in each part, ada, posta, etc. were composed and cultured on one side, and the seed of Hindusthani kheyal was sowed on the soil of Bengal on the other. As on one side the composers and musicians like Dāsarathi Rāy, Rasika Chandra Rāy, Manomohan Basu, Sridhar Kathak, Govinda Adhikary and others appeared and enriched the classico-Bengali songs like pañcali, tappa, tap-kheyal, etc. through the medium of kṛṣṇa-yatra, kathakatā, rāmāyaņa-gana, jhumura, kavigana, tarjā, etc., so on the other towns like Chinsura, Hooghly, Srirampore, Uttarapādā, Nadiā, Krishnanagar, Murshidābād, Govardāngā, Vishnupur-Bānkurā, Natore, Mymensingh, Gaufipore, Dacca, Assam-Gauripore, Agaratola, Comilla, Calcutta and its adjacent places became gradually the seats of culture of classical music like dhruuapada and kheyal, owing to the advent of a host of Hindu and Muslim Ustads like Man Khan, Bade Mian, Hassu Khan, Hardu Khan, Delwar Khān, Nobi Kāwāl Miran, Rahim Bux, Mohammed Khān, Ali Bux, Kakubha Khan, Niyamat-ulla Khan, Daulat Khan, Nanne Khan, Uzir Khan, Kale Khan, Basat Khan, Moradāli Khān, Alādiyā Khān, Abdul Karim Khān, Imdād Husain

Khān, Sājjād Muhammed Khān, Amir Khān, Maulā Bux, Faiyaz Khan, Rajav Ali Khan, Rahamat Khan, Ala-nd-din Khān, Enāyet Husain Khān, Kāssem-āli Khān, Khālilā Bādal Khan, Pandit Vishnu Digambar, Pandit Vishnu Narayana Bhaskar Roy Bua, Ramchandra Seal of Bhatkhande, Chinsura, Gopal Chandra Pathak, Ramsankar Banerji, Siva Miśra, Viśvanath Rão, Miśra, Käśinäth Näräyana Hanumandāsjī of Gayā, Sonijī, Laksmī Prasād, Bhāiyā Shāhib Ganapat Rão, Maizud-dīn Khān, Aghore Nāth Chakravurty, Jadu Bhatta, Prasad Mukherji or Nulo Gopal, Kşetra Mohan Goswami, Radhika Mohan Goswami, Krishnadhone Banerji, Anantalal Banerji, Kaliprasanna Banerii, Vāmācharan Banerii, Rāmaprasanna Gopeswara Banerji, Lälchänd Badal, Surendra Nath Mazumdar, Girija Sankar Chakravurty and others. these stalwart musicians helped much to promote the culture of classical Hindusthani music like dbruvapada and kbeyāl alike. Zeminders and noted music-lovers like Rājā Jatindra Mohan Tagore, Sir Saurindra Mohan Tagore, Raja Brajendra Kishore Roychoudhury, Seth Duli Chand Babu, Syāmlal Ksetrī, Mahārājā of Nātore, Sūrya Kānta Ācārya of Muktāgāchā, Sāradā Prasanna Mukherji of Govardāngā, Veer Bikrama Bahadur, Lalchand Badal, Bhupendra Nach Ghose of Pathuriaghaça and others patronised the culture of not only kheyal, but also of dhruvapada in Bengal.

It should be mentioned in this connection that though kheyāl gradually got firm footing on the soil of Bengal from the 19th century, yet the culture of dhravapada was much appreciated than kheyāl by majority of music-loving people of Bengal. The Hindusthānī kheyāl was first introduced in Bengal by expert exponents like Aghore Nāth Chakravurty of Hatinābhī, Prasād Mukherji or Nulo

Gopāl of Calcutta, Siva Nārāyaņa Miśra, Pandit Guru Prasad Miśra and their able conremporaries. Though Aghore Nath Chakravurty and Nulo Gopal were specially proficient in dhruvapada, yet were accomplished Kheyāliyās as well. They taught their students slow kheyal with vilamvita gamaka-tana, and they themselves neither used, nor did they teach their pupils the druta balaka-tānas in kheyal. Pandit Siva Nārāyana Misra and Guru Prasād Misra were noted Kheyāliyās at that time in Bengal, and they should also be given credit for introducing the Hindusthäni kheyal in Bengal, Aghore Nath Chakravurty, Rādhikā Mohan Goswāmī, Surendranāth Mazumdar, Nikunja Behäri Dutt of Sivpur, Harendra Nath Seal and others also composed many Bengali songs and improvised them in purely Hindusthani style. It is said that Ustad Rahamat Khan, and afterwards Ustad Abdul Karim Khan introduced alapa in kheyal, and the system of improvisation of sargams (svaragramas) in kheyal was also introduced by Ustad Abdul Karim Khan, and this system or method is still prevalent in kheyal in Bengal. The name of Vishnu Chakravurty, the music-teacher of Kaviguru Rabindranath may be mentioned in this connection for the introduction of both Bengali and Hindusthani kheyals in the Brahma-Samāj in Calcutta.

Before Ustad Kale Khan came to Calcutta, the noted Kheyaliya Ustad Nanne Khan became very popular. He also introduced kheyal in slow, medium and rapid tempi among the musicians of Bengal. It is said that Ustads Nanne Khan, Kale Khan and Maizud-din Khan practically introduced the druta balaka-tana in kheyal for the first time in Bengal. Gaohar Jan and many others learnt kheyal from Ustad Kale Khan, and along with the names of Nasirud-din.

Khān, Hanumāndasjī of Gayā, Ustād Faiyāz Khān of the Raṅgile gharāṇā of Agrā, Ustād Ābdul Karim Khān of the kirāṇā gharāṇā, Khālifā Bādal Khān of the Gwālior gharāṇā, Būmācharaṇ Banerji of Behāla, Rādhikā Prasād Goswāmī, Girijā Saṅkar Chaktavurty of Calcutta, Nagendranāth Bhaṭṭāchārya of Rāṇāghāṭ, Nagendranāth Dutt and others are worth-mentioning for the promotion of culture of classical kheyāl in Bengal.

The present trend and prospect of kheyāl in Bengal are encouraging and bright in every respect. Different institutions of classical music have been established nearly all over Bengal, and kheyāl of different styles are properly taught in them by expert musicians. Truly speaking, the culture of dhruvapada, for which Bengal won a great reputation for more than two hundred years, is now being gradually replaced by kheyāl. Different musical soirces and conferences are also giving impetus to the culture of classical music, specially of kheyāl, in whole of Bengal, and as a result thereof, kheyāl is being appreciated more and more, and is forming a part of education and aesthetic culture of Bengal.

#### APPENDIX TO THE CHAPTER X

The characteristics of same of the gitis and prabandhas:

- (a) The sādbāraṇī-gīti:

  ऋग्रुभिर्नानिने: किचित् सृद्मात्स्द्मीथ सुअवै: ।

  इपद्दुनेत्र कर्तव्या सुद्भिर्नानिनेस्या ॥
  - प्रयोगे सम्प्रीः स्ट्नीः काकृतिब स्योजितैः । एवं साधारम्। जेशा सर्वगतिसमाश्रया ॥
- (b) The ragalapa, rupaka and aksptika:

  विनिश्वको गर्भसन्धी शुद्धसाधारितो हुएँ: ।

  ध्रहाशमन्द्रताराणां न्यासापन्यासयोस्तथा ॥

  श्रान्पत्वस्य बहुत्वस्य बाडवीड्डनयोरिप ।

  श्रान्थिकर्यन दश स 'रागानाप' उच्यते ॥

  'हपकं' तद्वदेव स्यात्प्रथग्भृतविदारिकम् ।
- चमत्पुटादितालेन मार्गतयिवस्पिता ॥
   'आद्विप्तिका' खरपदम्रथिता कथिता बुधैः ।
   नोक्षे करणवर्तग्यं। प्रवन्धान्तर्गतेरिह ॥
   मतन्नादिमताद् ब्रमो भाषाऽदिष्वेव रूपकम् ।\*\*

Regarding them, Simhabhupala has said:

"प्रहत्वादीनां लक्त्रणानां यत्नाभिन्यिकिर्दृश्यते स रागालापः । विवादि-खरान्पृथक्कृत्यः रागालापलक्षणयुक्तं रूपकम् । मार्गत्नययुक्तेन चचतपुटादि-तालेन खरपदयुक्ता या गीयते साऽचितिका" ।

> (c) The definition of the kaivāḍa-prabandha; पार्टै: स्वातां श्रु वोदशाही केवाडे न्यसनं श्रहे । सार्थकेरथेहीनेश्व पार्टै: स द्विविधो मतः ॥ स शुद्धैर्मिश्रितै: पार्टै: शुद्धो मिश्र इति द्विधा ।

> > -Ratnākara, IV. 200-201

Regarding the kaivāḍa prabandha, Sitishabhupāla has said: ''पाटाच्चरैर्घ् नोद्माही कर्तनी। मह उद्माहे समाप्तिर्यस्य स कैनाडः। स च द्विविधः; सार्थकैः पाटैरैकः; अनर्थकैर्द्वितीय इति। पुनर्राप द्वितीयः शुद्धो सिश्र इति द्विविधः। केन्नलैः पाटैर्निरचितः शुद्धः; पदस्त्ररादिभिर्म- श्रितैः पाटैर्मिश्र इति ॥२००॥ इति कैगाडप्रबन्धः॥''

- (d) The rasaka and the ekatali prabandhas:
- (i) Cf. Sangīta-Ratnākara, IV. 176-181. (prabandhā-dbyāya).
- (ii) Simhabhupāla has said regarding the rāsaka:

  (a) ''यो गमकस्थानवर्जितं भोम्बडलच्म भजते, रासतालेन गीयते स रास इत्युच्यते । \* \* 1 Kallināth has said: ''तालादिनियमादयं निर्युक्तो गमकस्थानकव्यतिरिक्तभोम्बडलच्चणातिदेशेन मेलापकाभात्विधातुः, पदतालबद्धत्वात् बङ्गस्तारावलीजातिमान् । १७६-१८०। इति रागक-प्रबन्ध।"
- (iii) Regarding the ekatali-prabandba, Simhabhupāla has said: "उद्प्राहो ध्रृवश्च द्विगांयते; श्वाभागध्रुवावर्धतः सकृदगीत्वा, श्वाभागध्रुवाभ्यामन्यत्नोद्ग्रादो न्यासः समाप्तिः सैकतालोपनिवद्धैकतालिका। श्रस्यासुद्ग्राह श्वालापमालेग्रोति केषाधिनमतम्।" Kallinath has said: "तालनियमात्रिर्युकोऽयं मेलापकाभावात् विधातुः पदतालवद्धत्वेन बाहस्तारा-वलीजातिमान्।" ॥१=१॥

## CHAPTER XI

### A SHORT ANALYSIS OF MUSIC OF BENGAL

Bengal's contribution to music as well as to other phases of arts is immense. Beginning from the plain folk songs like ballads of the Gupta and Pala periods down to the current classical type of music, there had been changes, adjustments, re-adjustments, additions and alterations, together with various innovations in the forms of musical compositions and musical phrases, melodies and tempi It should be remembered in this through the ages. connection that mainly two types of music, folk and classico-folk, along with classical one were always in practice both in the rural and urban societies not only of undivided Bengal, but also of Greater Bengal (Vrhad-Vanga), which consisted of whole of Bengal, Behar, Orissa and Assam. The Zemindars and Nawabs as well as the art-loving wealthy men of Bengal always patronised music, dance and drama for their healthy culture and wide appreciation.

The musical compositions and musical phrases (prabandbas and sthāyas) of songs like vajra and caryā of the Vajrayānī and Sahajayāni Buddhists of the 10th-11th century A.D. used to be sung with classical (śāstrīya) melodies and rhythms (rāgas and tālas), accompanied by musical instruments like lute with one string or two (ekatārā or dotārā), and drums of various sizes and cymbals. The Buddhist Yogīs sometimes used to dance with their songs in ecstatic joy like the Arabian Sufis and Christian mystics of the mediaeval time. Some scholars are of opinion that song like caryā was not only composed by the Buddhists monks alone, but by the Saivaite and Vaisnava Tantrists as well. "The writers of the mystic songs," says Dr. Sukumār Sen, "were generally known as Siddhācāryas inasmuch as they were spiritual masters (Acaryas), and were believed to have attained the final beatitude (siddhi). Some were reputed as great Yogis (Mabayogi, Yogirāja), and others as Avadbuta (literally 'purified' i. c. washed clean of ignorance or delusion)". Similarly a sacred and ritualistic song like vajra was also in practice among the Vajrayani Buddhises (as carya was in practice among the Sahajayani Buddhists), and that both the songs, carya and vajra were composed in old Bengali or proto-vernacular (avabatiba). The carya or caryagiti (pada) is also known as the cakragiti. The word 'cakra' is specially used in the Tantric sadhana (both Hindu and Buddhist) to mean a circle of the sakti-sadbakas (usors), engaged in the Tantric functions. The padas or ganas do not only hear the literary and social values, but also religious and spiritual ones, and, therefore, it will be wise to call them the socio-religious songs. Ordinarily they are known as the 'Buddhist Mystic Songs'. Munidatta wrote a commentary on them in the 14th century, and from it we come to know their philosophical as well as social significances. Different kinds of classical sastrio tāgas like mallārī, kāmoda, bhairavī, mālašrī, mālasī-gabudā, gabuda or gauda, kanbu-gurjari, bangal, śavari, gunjari (gurjari?), ramakrī, patamafijarī, aru, devakrī, desākba, dbānaśrī, varādī or valāddī(?) were used in the caryāgiti.

The gitagovinda-padaganas or astapadis were composed by Thakat Jayadeva of Kenduvilva (West Bengal) in the 12th century A. D. They seemed to be constructed after the form of the caryagiti of the mystic Buddhist

Yogis, though their languages differed from each other to some extent. The songs of the gitagovinda are the prabandha type of gitis, which means they are duly bound up with sadangas like music-part (dhatu), thythm (tala) and other angas. The language of the gitagovinda-padaganas is a combination of Praket and Sansket. Dr. Sen is of opinion that the songs of the gitagovinda are written in Sansket, but their rhythm and rhyme belong to apabbramsa poetry. The padas or songs (ganas) of the gitagovinda are. tuned in classical melodies and rhythms. It is said that sometimes the astapadis were sung accompanied by classical dances, as formulated by Bharata in the Natyasastra in the and century A. D. It has been recorded in Kalhan's Rajatarangina that in different temples of Kartikeya and Siva, natis and natas and specially the devadass (temple dancing girls) used to perform dances according to the laws and principles, set forth in Bharata's Natyasastra during the times of Gupta and Pala kings. During the reign of Raja Laksmanasena, the culture of both classical dance and music were properly maintained. the mangalagitis were in practice and their materials and themes were taken from different Mangalakāvyas. The mangalagitis were the of socio-religious songs, and they were very popular among all classes of people. Sarangdeva has described both carya and mangalagiti as classical ones in his Sangita-Ratnakara. He has said,

(a) Admyātmagocarā caryā syātdvitīyāditālataḥ//,
Sa dvidhā cchāndasaḥ pūrtyā pūrņāpūrņa tvapūrtitaḥ/,

Samadhruvā ca vişamadhruvetyeşā puņardvidhā//

Simhabhupāla has said: "yasyām pādānāmante'anuprāsayuktaḥ, adyātmavācakaiḥ padairupnibaddhā sā caryā"; i.e. the last line of the caryāgīti is with anuprāsa. It is spiritual in nature. It is so composed that its words (sāhitya) convey the idea of spirituality and sacredness.

(b) Kaiśikyām boţṭarāge vā mangalam mangalaih

padaili/

Vilamvita-laye geyam mangalacchandasäthavä//

-RK., 4. 303.

Simhabhupāla has said: "kaišikarāge boṭṭarāge vā kalyāṇa-vācikaiḥ padair-vilamvitena layena maṅgalo geyaḥ"; i.e. the maṅgalagāna used to be sung on auspicious occasions, along with the words (sāhitya) that conveyed sacredness, and with the rāga, kaišika or boṭṭa (the bhuṭiyā or Tibetan melody), and it used to be sung in slow tempo.¹ Some are of opinion that the maṅgalagīti of the ancient time and the maṅgalakāvya-gāna of the mediaeval time are not one and the same, and it might have been the fact that the maṅgala-kāvya-gānas used to be composed and sung in the spirit and under the inspiration of auspicious type of the ancient maṅgalagāna.

Gradually there evolved the classical form of kṛṣṇa-kīrtana, formulated by the Vaiṣṇava savants like Vaḍu Chaṇḍīdās of Nānnura (West Bengal), Kavi Vidyāpati of Mithilā and others. They were composed after the form of the gītagovinda-padagāna to some extent, and they used to be sung with the help of classical rāgas and tālas. The songs of the kṛṣṇa-kīrtana paved the way for formulation of the nāma-kīrtana, introduced by Śrī Chaitanya.

I Cf. the Appendix II of this book, where the mangalagite has elaborately been discussed.

The contribution of Orissā to kīrtana was not less important, as many of the prominent Vaiṣṇava savants of the 15th-16th century were either disciples or followers of Chaitanyadeva. Rāya Rāmānanda, Murārigupta, Svarūpa Dāmodara and others were the constant companions of Srī Chaitanya at Gambhirā in Puri, and as they were most efficient musicians of that day, they helped to enrich the treasury of the kīrtana-gāna. Rājā Pratāparudradeva Gajapatī also rendered immense help to the propagation of kīrtana, as promulgated by Mahāprabhu (Chaitanyadeva).

In the roth chapter of the Bhagavat, which was written, it is said, on the basis of the Pancaratra-sambita and different Puranas, the true significance of kirtana has been mentioned, and it has been defined there as the auspicious type of giti in praise of Sri Kṛṣṇa. In other sense, it was known as 'guna-gāthā' or 'gīta-kīrti-gāna'. In the 16th century, when Thakur Narottamadas returned from Vendavana (Mathura) to Khetari (in the Rajasahi district), he arranged a conference of kirtana, where he formulated and introduced the classical type of padavali-kirtana on the basis of the dhruva-prabandha-gana, which he mastered from the accomplished Vaisnava musicians at Vrndavana. His style of kirtana was known as garānhāţi or gaderhāţi, and it was recognised as the līlā or rasa kīrtana. He also introduced the gaureandrika of kirtana at that time. After him, three other types of kirtana, manaharsahi, reneti and mandārinī evolved. Kavīndra Gokul also introduced a new type of kirtana, known as jharkhandi, evolved from Jharkhanda, Midnapore.1

The mabājana-padāvali-kīrtana has not been elaborately, dealt here, as it has been discussed elsewhere in detail. Cf. author's

After the mabajana-padavali-kirtana, the dhap type of kīrtana (or dhap-kīrtana) evolved with the admixture of the padāvalī-kīrtana and the pāncālī or yātrā gāna. So the dhap-kirtana can be recognised as an intermediate musical feature of padavali-kirtana and pancali or yatra. dbap-kirtana was introduced in the early 19th century, and it was prevalent from 1825-30 to the beginning of the 19th century A.D. Dr. Sukumar Sen is of opinion that pañcali is the forerunner of dhap-kirtana, and from the kīrtana, tukka (or bbāngā-kīrtana i.c. mutilated form of kīrtana), pāńcālī and yātrā evolved. Some say that dhap-kīrtana evolved from the padavalī-kīrtana, and yātrāgāna as well as pāncālī evolved from the dhapkīrtana. But most of the scholars are of opinion that dhap-kirtana is the product of admixture of the ganas, padāvalī-kīrtana, pāncālī and yātrā. The theme of the dhap-kirtana was composed mainly of the sportive plays of Srī Krsna (brja-līlā).

The word 'dḥap' is a product of rural or local language (deśaja-bhāṣā). It conveys two meanings or ideas, one of which is pattern of construction or form, and the other is the sound, caused by the fall of an empty or hollow matter on the ground. As regards the meaning of dḥap-kīrtana, we can take the second meaning which conveys the idea of sound of an empty or hollow matter, and as such the word dḥap-kīrtana does not convey the idea of a real classical type of mahājana-padāvalī-kīrtana, but an immitation or a changed form thereof. Really the dḥap-

The Historical Development of Indian Music (1960). Vide also the second introduction: Padāvali-kīrtaner Paricaya, in 'Balarām Dāser Padāvali' (Navabhārat Publisher, 1362 B.S.).

kīrtana does not follow the strict rules of singing, as set forth in the padāvalī-kīrtana, but is sung or embellished in its own way. Again the performers of the dḥap-kīrtana do not follow the method or practice of singing of gauracandrikā before they begin the real theme of the kīrtanagāna. Sometimes they sing their own compositions (composed padas), along with the traditional ones, with the help of classical rāgas and tālas. They also use tukka (bhāngā-kīrtana) in the form of a lecture or conversation, instead of using ānkhara (tāna of the classical kheyāl type of song), as used in the padāvalī-kīrtana. Sometimes they use words for creating laughter (bāsyarasa) in the mind of the audiences. So it is found that in later days, the dḥap-kīrtana has been divided into two, dḥap-kīrtana and dḥap-yātrā. The dḥap-yātrā is performed exclusively by women.

It is said that Madhusūdan Kinnar (or Madhu Kān)<sup>1</sup> introduced the dhap (light) type of kīrtana, though there rages differences of opinion regarding it. Satish Chandra Mina has admited this fact in his History of Iessore and Khulnā (Beng.). Mr. S. C. Mitra has written that just as Dāsu Rāy and Govinda Adhikāry earned great reputation in the kṛṣṇa-kīrtana in West Bengal, so Madhu Kān in the like manner earned it in East Bengal for his new and novel type of dḥap-kīrtana or pāncāli(?). The word kinnar connotes the idea of celestial dancing class of people, the evidence of whom are found in the Rāmāyaṇa, Mahābhārata, Harivaṃśa, Bhāgavata and different Purāṇas, along with the names of Yakṣa, Rakṣa, Rākṣasa, Gandharva. In fact, the word kinnar counotes the idea of a dancing class of people like the word naṭa. The father of Madhu-

The title 'Kan' is the diminutive form of 'Kinnar',

sūdan was Ānanda Kinnar by name, and he used to earn his living with music. 'Kinnar' was his title which defined that he was musician (naṭa) by class. Madhusūdan inherited the tradition of culture of music from his father as well as from his family. Some are of opinion that he introduced the dḥap kīrtana in the form of pāñcālī, and earned great reputation for his own unique style. Ordinarily he was known as Madhu Kān. The main themes of his kīrtana were four in number, and they were kalanka-vañjana, akrursamvāda, māthur and pravāsa. All of them were composed with the legends and stories of Lord Stī Kṛṣṇa.

The baulgiti or baulgana evolved in the Radadesa in West Bengal (some types of the baulgiti also evolved in East Bengal). It is also known as the debatattva-gana, because the Bauls sing songs with the Buddhist-cum-Yogic interpretations of the material body. They recognize the Sabaja, instead of God or Atman, and that Sabaja resides in the gross material body, being free from all kinds of impurities and imperfections. So a Baul tries to be a Sahajamānuṣa by means of the kāyā-sādbana, (by practice of the body). Music helps him in his religious practice. The word 'baul' connotes the idea of a man who is batul or mad, and, therefore, a Baul is mad after the realization of the Sahaja. The Arabic term of baul or auliya is oyalia or deoyana (or dewānā). The kāyā-Sādhakas are divided into four, aul, baul, daravesa and sai. The Sai or Swami is the topmost Sādhaka of the Bāuls.

Regarding the significance of the terms bāul and bāulgāna, Dr. Shashibhūṣan Dāsgupta has said: "The Bāuls belonging to the Hindu community are generally Vaiṣṇavite in their faith and those belonging to the Muslim community are generally Sufi-istic and in both the schools

the emphasis is on the mystic conception of divine love. The word bāul with its Hindi variant bāur may be variously derived; it may be derived from the Sanskrit word vātul (affected by mind-disease i.e. mad, crazy), or from vyākula (impatiently eager); both these derivations are consistent with their modern sense of the word, which denotes inspired people with an ecstatic eagerness for a spiritual life where one can realise one's union with the eternal Beloved—'the Man of the heart'. The name Bāul as also its cognate form of Aul can very well be associated also with the Arabic word āwliyā (plural of wāli, a word originally meaning 'near,' which is used for 'friend' or 'devotee'), that refers to a class of perfect man. With the Bengali word Bāul we may also compare the Sufi word Diwānā which means mad, i. e., free from all social responsibilities''.

Regarding baul and their murshida-songs, Dr. Dasgupta has mentioned about a Sufi-istic influence of sama
(song, together with dance in a circle) as well as of the
Sufi's spirit, upon them.<sup>2</sup> But this estimatation should be
examined in its proper historical perspective. He has said:
"In the murshida-songs of the Bauls we find a mixture of
the Indian spirit with the spirit of Sufi-ism".<sup>3</sup>

The baul or baulgīti probably evolved from the caryagīti, because like carya, all the Vaiṣṇava-Sahajiyā type of songs like baul, kartabhajā, etc. are socio-religious in nature. Not only that, but it is also a fact that all the

I Vide Obscure Religious Cults (As background of Bengali Literature), Calcutta University, 1946, pp. 187.

<sup>2</sup> Ibid., p. 193.

<sup>3</sup> Ibid., p. 194.

mystic songs like caryā, vajra, bāul, etc. evolved from the doctrine of sabaja (sabajavāda) of the Sahajayāna school of the Tāntric Buddhists of the 10th-11th century A.D.

Now, what do we mean by the sahajavada or sahajiya doctrine? The sahajiyā doctrine evolved from the Buddhist Sahajayana in later days. The followers of Buddha were afterwards divided into two main sects, Hinayana and Mahāyāna. The Hīnayāna was also known as the Srāvakayāna or Pratyeka-buddha-yāna. Gradually Mantrayāna school evolved with the adoption of Tantric interpretation and practice of the religious doctrines of Buddha. The Mantrayana was also known by its three main branches, Kalacakrayāna, Vajrayāna and Sahajayāna. The Vajrayānī Buddhists adopted in their religious practices three prime formulae, mantra, mandala and mudrā, and Vājradevī was their supreme deity. The Sahajayana sect or school practically evolved out of the Vajrayana one, or it can be said that Vajrayana gradually culminated in the Sahajayana. The prime aim of the Sahajayana school was to attain the transcendental state of mahasukha like nirvana or sunyata of the Madhyamika one. According to the historical records it is known that the doctrine of sabaja of the Sahajayana school reigned supreme over Greater Bengal, comprising entire Bengal, Bihar, Orissa and Kamarupa or Assam in the 10th-12th century A. D. The padas (or ganas, because all kinds of pada were known as ganas or songs at that time) like carya, vajra, baul, etc. practically evolved during that time. Those Vaisnava-Sahajiyā or Vaisnava-Tantric songs really evolved from the doctrine of the Buddhist Sahajayana. The Vaisnava religion also got intermixed with the Buddhist Sahajayana to some extent, and, it is sometimes believed that the Vaisnava-rasa-kirtana also evolved out of the materials of

caryā and other sahajiyā padas, which were the products of the Sahajayāna doctrine.

The Bauls use musical instruments like gopiyantra and cymbal (mandirā) to accompany their songs, wear yellow robes, and use tinkling anklets (nāpura) round their ankles. They also dance in a circle along with the rhythms of their songs like the Arabian Durbises and Persian Sufis. Some of the tunes or musical modes of the baulgīti are more or less influenced by those of the padāvalī-kīrtana.

Besides the baulgiti, there are umā-samgīta (āgamanī-samgīta), śyāmā-samgīta, kālī-kīrtana, etc. which are purely devotional and spiritual in nature.

The devotional and classico-Bengali songs, composed by Sädhaka Rämaprsäd, Kamaläkänta and other mystic salnts as well as the songs, composed by Bhäratachandra, Nidhu Bäbu, Raghunāth Dewān, Rājā Rāmmohan Roy, Dāśarathi Roy, Govinda Adhikāry, Madhusūdan Kinnar (Madhu Kān), Girish Chandra Ghose, Krishnaprasanna Sen, Jyotirindranāth Tagore, Satyendranāth Tagore, Rabindranāth Tagore¹ and others are the valuable assets to the music of Bengal. Different kinds of classical and devotional songs of the Brāhma-samāj are worth-mentioning in this connection. The ākhdāi, baf-akhdai, kavigāna, pāñcālī, yātrāgāna, rāmāyaṇa-gāna, jhumur, kālī-kīrtan are also the special features of classico-folk songs of Bengal.

Regarding the kavigāna, Iśvarchandra Gupta has said that before the 1210 śāla (Bengali era), Mahārāj Navakrishņa Bāhādur of Sobhābāzār, Calcutta, patronized the ākhḍāi type of song. In 1211 śaka, Rāmanidhi Gupta

I Vide the detailed discussion on the music of Kaviguru Rabindranath in the Appendix III,

(Nidhu Rābu) introduced the culture of ākhdāi both at Sobhābāzār and Bāgbāzār, Calcutta, and it should be mentioned that classical ragas and talas were used in the ākhdāigāna. Gradually the practice of bāf-ākhdāi was introduced in Calcutta and also in Chinsura. In the beginning of the 18th century, the kavigana evolved and was introduced in both the common and educated societies of Calcutta. The kavigana was socio-religious in nature. Regarding the kavigana, Dr. Dinesh Chandra Sen has said : "The Kavi songs had originally constituted part of old Yatras or popular plays. The simple episodes in Yatra, especially those of the nature of light opera, were in course of time wrought into a separate class of songs, which were sung by those distinct bodies of professional bards called Kaviwālās, whose domain was thus completely severed from that of the Yatta parties".1 Dr. S. K. De is of opinion that the "existence of kavi-songs may be traced to the beginning of the 18th century or even beyond it to the 17th, but the most flourishing period of the Kaviwalas was between 1760 and 1830". Rasu-Nesithha, Hari or Haru Thakur, Ram Babu, Nitai Vairagi and other noted Kaviwālās died in 1830. Dr. De has further said in this connection: "After these greater Kaviwālās, came their followers who maintained the tradition of kavi-poetry up to the fiftees or beyond it. The kavi-poetry, therefore, covers roughly the long stretch of a century from 1760 to 1860, although after 1830 all the greater Kaviwalas one

<sup>1 (</sup>i) Vide History of Bengali Language and Literature (Calcutta), p. 679.

<sup>(</sup>ii) Cf. Nirajan Chakravurty: Unavimsa Satābdir Kaviwālā O Bāngālā-Sāhitya, (Bengali), pp. 22-40.

by one had passed away, a kavi-poetry had rapidly declined in the hands of their less gifted followers".1

So we find that kavigāna was in practice from 1760 to 1860. The themes of the kavigāna were taken from the legends and stories of the Rāmāyaṇa, Mahābhārata, Harivamsa, Bhāgavat and different Purāṇas. Some are of opinion that kheḍu or kheuḍa-gāna is the forerunner of the kavigāna. It is a historical fact that the type of kavigāna, which was prevalent in Sāntipur and Fuliā in the middle of the 18th century, was known as kheuḍa, and this fact has been mentioned by Bhāratachandra in his book, Annadāmaṅgala. But it should be mentioned in this connection that old form of pāñcālī is the real source of all kinds of classico-folk songs, including the kavigāna of Bengal.

The kavigāna begins with the music-part, citen, and then the mahadā is sung, and at last antarā is sung. The words or literary compositions (sāhitya) of the kavigāna principally depend on the tunes, or it can be said that sāhitya of the songs is used in accordance with the nature of production of the tunes. The kavigāna is mainly composed of four classes of musical themes, known as mālasī, sakhī-samvāda, goṣṭḥa and kavi or kavi-laharī. The mālasī causes to arouse the emotional sentiments as well as devotion in the minds of the audiences. This type of kavigāna is composed with different rāgas and tālas. The sakhī-samvāda type of kavīgāna simultaneously describes joy and sorrow of the nāyakas and nāyikās of the themes. The goṣṭḥa type of kavigāna is composed of the stories of the early life of

I CF. Dr S. K. De: Bengali Literature in the 19th Century. p. 302.

Srī Kṛṣṇa, and it is full of sweetness and affection. The kaui or kaui-laharī type of kauigāna generally arouses wits and laughter in the audiences. The Kaviwālās or composers of the kauigānas are really gifted with poetic genius, because they sometimes extemporarily compose the songs (compositions of the songs) from memory during the times of singing.

Regarding the classico-folk song, pañeali, there is a great controversy among the scholars, Dr. Haripada Chakravurty has ably discussed all the different views about pancali in his book, Dasarathi O Tahar Pancali (Bengali, 1367 B. S.). The pañcali is mainly a religio-devotional as well as social type of song. The pancalis like Ramalila, Kranalila, Mahabhārata, etc. are the religio-devotional ones, whereas those of Manasā, Dharmathākur, Mangala-chandī as well as Vidyāsundar, are the social type of songs. Dr. S. K. De is of opinion that the old Bengali poems were generally known as pañcali: "This word shows that we owe at least some forms of old Bengali meters of Pancal or Kanauj". Dr. D. C. Sen is also of the same opinion. In fact, there was a meter, known as pancal in Praket. Again in the Alamkara-sastra, păńcālī was a style of writing like those of gaudī, vaidarbhi, sauraseni, etc. Bharata has described about those styles in the Natyasastra. So it might be the fact that there was a special pattern of song (pancali), written in the pancali style.

According to Dharmananda Bharati, the spelling of the word will be pañcali (इ) instead of pañcali (१). This term is the product of Radadesa in West Bengal, and the suffix ali means the bee (madhukara or makṣikā). He has said that it is said that in ancient time, the stalwart or topranking persons were known as 'the Bee of the village'. In

In Midnapore, Bāńkurā and Bīrbhūm districts, many persons were known by their ancestral titles, ali, bhramara, etc. Before the time of Kaśīrāmadās (of the Mahābhārata of the Bengali version) and even in his time, many persons of the community were known as 'pāñcāli', because they used to sing the chaḍā, tarjā and jhumura, accompanied by folkdance and comic ('sain sājiyā nāchita evain tāmāsā karita'). They were gifted with natural talent and used to extemporize the verses and songs of pāñcālī. Dāsarathi Roy innovated a new type pāñcālī with the prevailing old type.

Some say that the name pāncālī is known by its five limbs (angas) like song (gāna), costume (sāja), dual practice of chadā (chadār ladāi), composition of songs and dance. Some say about different meanings and materials of these five limbs. Some hold that pāncālī is known by its definite method of singing (gāyana-paddhati). Paṇḍit Harekṛṣṇa Mukhopādhyāy has given a śāstric or classical interpretation of the pāncālī, which is valuable for the students of history of Indian music. According to him, pāncālī evolved from the kṣudra-gīti or saṃkīrṇa-gīti or rūpaka-gīti, and in this respect he has quoted Paṇḍit Narahari Chakravurty's Bhaktiratnākara:

Tāla dhātu-yukta vākya-mātra kṣudra-gīta/
Dhātu pūrve ukta udgrāhādi yathocita//
Suddha sālager prāya kṣudra-gīta haya/,
Ithe antyānuprāsa praśasta śāstre kaya//
Kṣudra-gīta bheda cāri, citrapadā āra/
Citrakalā dhruvapadā pāñcālī pracāra//,

r Cf. Dr. Haripada Chakravurty: Dāsarathi O Tāhār Pāñcālī (Bebgali, 1367 B.S.), p. 45. Vide also 'Bhārati-Patrikā; Śrāvana, 1349 B. S, pp. 300-301.

The pancali is different from the jbumri type of song, and it is also different from the mangalagana and the padavali, because the pancali is of the visama-dhruva type and it is divided into sama, ardha-sama, visama. Pandit Mukhopadhyay says that the pancali has no definite name or significance of its own, as the kṛṣṇa-mangala, siva-mangala, dharma-mangala, manasa-mangala, chandi-mangala and other mangala-gītis were sung in the tunes of the pancali. But it should be remembered in this connection that pancali used to be sung along with chada, whereas the mangalagītis had no verse or song like chada, and so it will not be wise to mix up the pancali with the mangalagīti. According to Mukhopādhyāy, Dāsatathi Roy composed his new and novel type of pancalī with the admixture of the kavīgāna and the mangalagāna.

In fact, Bengali literature for the mass (jana-sāhitya) was of two kinds, dhāmālī and laukika-pāncālī. Between these two, the dhāmālī was an original and ancient literature for the mass or general public. But it was regarded as illegal (avaidha), whereas the pāncālī was legal (vaidha). The dhāmālīs are composed with the plots of the characters of Srī Kṛṣṇa and Siva, but they are not meant for the educated society, and, therefore, are played outside the village, among the uncultured mass. The laukika-pāncālī is divided into two, old and new. The pāncālī, as introduced by Dāśarathi Roy, was known as the new one. But the old pāncālīs like Mangala-Chaṇḍī, Sūrya, etc. and the mangalagītis like Manasā-mangala, Chaṇḍī-mangala, Dharma-mangala Nāth-mangala (like

<sup>1</sup> Ibid., p. 47, Cf. also The Yugantara (Puja Number) 1360 B.S., p. 48.

Gorakşa or Gorka-vijaya and the songs of Gopichand) were the old types of pāñcālī. Sometimes the Kṛttivāsī-Rāmāyaṇa and Kaśīdāsī-Mahābhārata were known by the name of Rāmāyāṇa-pāńcālī and Bhārata-pāńcālī.1

According to Dr. Sukumār Sen and others, the pāñcālī type songs evolved from the songs, which accompanied the plays of the dolls (pañcalika or putul-nach) in ancient India, This type of plays with songs was connected with the Sanskrit dramas. Dr. Sen has said in this connection: "These early Bengali devotional narrative poems are classed as 'Pancali' or 'Pancalika' which originally meant 'doll' or 'pupper'. The name indicates that at the beginning the devotional songs were sung and poems chanted supporting a puppet-show of the story. Even now a puppet-show in Bengal is accompanied by chanting of verses narrating the story and punctuated by beating of drums and cymbals. An abridged version of this is the showing of the painted scroll ('Paça') depicting the stories of the devotional narratives. The man showing the scroll chants the story in crude (often extempore) verse as he unrolls it. This popular show, which obtained in West Bengal only, is fast disappearing. Banabhatta has mentioned such show of Yamapata in his Harsacarita".9

Dr: Sen has also found a reference of the song like pāñcālī in the Vṛbaddbarmapurāṇa, which was current, he believes, in the 12th-13th century A.D. He is also of opinion that as the Pāñcāladeśa was a land for designing or

<sup>1</sup> Cf. Dr. Tārāpada Bhattāchārya: Banga-Sābityer Itihāsa, vol. 1. (Beng., 1962), pp. 8-1c.

<sup>2</sup> Vide Dr. Sen: History of Bengali Literature (published by the Sāhitya Academy, New Delhi, 1960), p. 24.

making the dolls, so the dolls were known by the name of the country, Pañcala (i.e. pañcalika), and the song pañcals used to be sung along with the display of the dolls.

Now all the views, subscribed by different scholars, mentioned above, do not help us much to form a definite idea about the real origin and significance of the song, pāñcālī. Some say that pāñcālī is a demunitive form of the yātrāgāna. But it seems that yātrāgāna evolved from the pāñcālī.

The old form of yatragana was practically known as the nāțagāna or nāțagīti. În the Chaitanya-bhagavat, it is mentioned that Srī Chaitanya himself took part in the play of the natagiti, Rukminibarana. But, in truth, we do not find any ancient Bengali book on the yatragana. It is said that the definite form of yatragana was introduced in the 19th century, and that form was influenced by the Gitagovinda. The yatragana was divided into three according to three kinds of subject-matter, and they were Kṛṣṇa-yātrā, Vidyāsundaryātrā and Rāma-yātrā, and among them the Kṛṣṇa-yātrā was most ancient. The real name of the Krsna-yatra was the Kālīyadamana. In the Kālīyadamana-yātrā, all kinds of sportive plays (līlās) of Kṛṣṇa were included. The dance was a special feature of the ancient type of yatragana. The jbumura was also known as one of the types of yatra, as duet songs (dvaita-gana), lagni and dance were the definite features of the jhumura-gana. The lower type of the jhumura was known as leto.1

<sup>1</sup> Vide Dr. Tarapada Bhattacharya: Banga-Sabityer Itibasa, vol. I. (Beng., 1962), pp. 342-343.

But it is a fact that kavigāna, ākhdai, hālf-ākhdāi, yātrāgāna and tarjā almost belong to the same class of the pañcali, though they differ from one another in regard to their songs, plots or themes (pālās), literary compositions or sābitya, musical instruments, number of musicians and players and also their methods of presentation or singing. The pāncālī used to be sung by a band of musicians not less than five. The leading singer (mūla-gāyena), supported by his two assistants (dobāra or pāli), sings first the lyric lines of the pañcali and then the other assistants repeat those lines. The leading singer sings the lines of the pāncālī in slow tempo (vilamvita laya) and the assistant singers sing in rapid tempo (druta laya). The leading singer use a chowri or yak tail-fan in his left-hand and a cymbal (mandirā) in the right hand and the tinkling anklets (nupura) round both the anklets. Sometimes a drum (mṛdanga) accompanies the pāñcālī song.

Different types of song are connected with daily life of the peoples of Bengal. The folk-songs like bhādu, paṭuā, jāga, yugīyātrā, bhāṭiyālī, jārī, sārī, gambhīrā, gheṭu, marphāti, murśidyā, gājan, dāḍākaui, bolān, mālasī, kheuḍa, ālkāph, dehatattua, gājīrgāna, letogīta, nalegīta, bhātelgīta, pauṣa-pārvaṇa-gīta, hātugīta, vayāni, bhāsān, mānickpīrergāna, gurusatya, trināther-gāna, caḍakapūja-gāna, aṣṭakagīta, kānāi-balāi-gīta, etc. are the sources of living inspiration and joy in the lives of men and women of rural Bengal. Musical instruments like ektārā, dotārā, gopīyantra, sārindā, muralī, āḍa-vānśī, tiprā-vānśī, sīngā, mādala, khola, kānśī, kbañjani etc. are used in those folk songs.

The bhadu songs are current among men and women of Manbhum. In Bankura, West Burdwan, Birbhum, bhadu is specially sung by the unmarried girls to the rhythm

of dhāk (drum). These are narrative songs, and are similar to karam songs of the nomadic tribes of Chotanāg-pur. Karam means the kadam tree, and men and women sing karam around the planted branches of the kadam tree. Dances are followed by the song. Men and women dance with different poses with the beat of different drums. Flutes of bamboo sometimes accompany the song.

The paţuā songs are also narrative ones, and they narrate the lives and greatness of the tribal gods and godesses. Different images of gods and godesses are painted on cloth, and when they are shown to the audiences, paţuā songs are sung with different melodies. They are not followed by any musical instrument. The rhythms of the paṭuā songs are sometimes observed by the clapping of hands. These songs are current at the south of Manipur, and at Assam, north of Bīrbhūm and different parts of West Bengal. Besides, bhāoaiyā, jāga, yugīyātrā, other kinds of songs are also current in different parts of West and East Bengal. The ṭusu song is similar to bhādu song.

It has already been said before that baul songs of West Bengal are religious. They are sung in connection with Tantric and Sahajiya spiritual practices. They are followed by ektara or dotara. The jara songs are expressive of the sentiment of valour (veera-rasatmaka), and are always followed by dances. The sara songs are sung when boats ply over the rivers. The ghetu songs are loving ones, and they are sung with dances. The jhumura, gambhira, bhāṭiyālī, etc. are narrative and socio teligious songs. There are many types of songs which are connected with religious functions (vratas) like kukkuṭi-vrata, sūrya-vrata, sejuti-vrata, sandhyāmanī-vrata, yama-pukura-vrata, etc. Some of the vratas are observed by

aged women and some by unmarried girls. Different kinds of folk-songs (lokagīti) are attached to these religious viatas, and many of them are accompanied by dances. The literature of these songs are oral and at the same time traditional. The singers do not rehearse, but simply sing in a traditional manner They are sometimes accompanied by dances and musical instruments. The gājan songs are sung in memory of Dharma-Thākur and Nīla-Siva. Dances are observed in the gājan songs. Besides these, there are numerous rural songs and folk dances that inspire men and women of Bengal.

The folk-songs are the source of higher classical songs (music). In the ancient treatises of music, we find that local (desi) tunes of different countries and races were absorbed into the stock of classical music, when they were reshaped and refreshed with the sastric ten essentials (dasalaksana) like sonant, consonant, assonant, etc. All the folk-songs are attached to social functions as well as to religious ceremonies, whence people used to imbibe sacred atmosphere all the time. These songs appeal to the heart and transform the domestic atmosphere of the village into spiritual one. The folk songs are really the fountain-head of people's new energy and inspiration, and as such they should be revived and properly maintained and cultured for the upliftment of the human society.

## CHAPTER XII

## A SHORT SURVEY OF DANCES OF INDIA

Dancing is an art of rhythm in movements, expressed through the medium of different limbs of the body. It is an outward expression of inner joy and pleasure of human beings. If we look into the pages of history of the most ancient primitive peoples of the world, we find that they were fond of dance and music. They used to dance in accompaniment of their speech-songs and songs in praise of rain-god, weather-god, vegetable-god, war-god, witch-god, presiding deities of diseases, supernatural powers, spirits, etc. In fact, dance and music were the part and parcel of life of the primitive tribes of most ancient times. Well has it been said by W. D. Humbly: "The importance of dancing among the primitive people is much greater than among civilized nations; and among the former, emotional life, whether ambre or gary, is capable of expression in bodily movement". From this it is known that the primitive men were devout lovers of dance and music. The joyful stimulus and urge lay at the root of the evolution of their dance and music, which were sometimes simple and sometimes violent. Dance and music were the means to get solace and peace in the tiresome tenure of their lives.

Dancing may, therefore, be called the most ancient as well as living art of human beings. In the prehistoric Indus Valley cities, a bronze dancing girl was excavated by Rāi Bāhādur Dayārām Sāhāni, and its exhumation has proved that the culture of dancing was prevalent even in that remote past in all its artistic display and grace. Some

ingredients of music like crude type of lute (veena), pipe (venu) and drum (mrdanga) were also excavated, that speak of culture of music in that prehistoric time. In the Brahmana (Vedic) period, we find the practice of dancing before the blazing sacrificial altars. The maidens with water-pitchers used to dance round a fire, singing different sacred sacrificial hymns. Dr. Keith, Prof. Oldenberg, Prof. Hillebrandt and other Western Vedic scholars as well as the Vedic scholars of the East have admitted this fact. The solemn dance of the maidens round the fire in the Vedic Mahavrata rite is worth-mentioning in their connection (Vide Dr. Keith: The Vedic Mahaurata, published in 'The Third International Congress for the History of Religions for 1908" (Vol II, pp. 55, 58). In the classical period (600-500 B.C.), the gandharva type of music was in practice. During the time of Bharata, in the 2nd century A.D., dancing took a new and novel classical turn to form an indispensible part of drama. Bharata has fully dealt with different types of dance, along with different handposes (mudrās) and gestures and postures in the Nāţyaśāstra. He has defined and described the dances of tandava and lāsya, in connection with the classical dramatic songs like madraka, vardhamāna, etc. The tāndava was meant for men, as it was vigorous and masculine in concept, andlasya, for women for its grace and dalliance. The dances, tandava and lasya were included in the category of nartana. Because nartana was divided into two, nrtya and netta. Nartana, which was composed of as well asexpressed the emotional sentiments and moods, was knownas nrtya, and nartana, which was composed of rhythm and tempo, was known as nrtta. These two, nrtya and nrtta were again divided into two classes, vigorous tāṇḍava and graceful lāsya. It has been said in the Saṅgītasārāmṛta,

Bhāvāśrayam nartanam hi nṛtyamityabhidhīyate//
Yattāla-laya-niṣpannam nartanam nṛttamīritam/

From these, it is understood that tāṇḍava was possessed of veera-rasa, and tāsya was possessed of sṛṅgāra-rasa. King Tulajā (1729-35 A. D.) has divided nṛtta into four, peraṇaṃ, prenkhaṇaṃ guṇḍalī or gauṇḍalī and daṇḍa-rāsakaṃ.

The āsārita type of dance was very famous at that time, and this type of dance was traditionally handed down from the times of the Mahābhārata and the Harivamśa (300-200 B. C.). In the Harivamśa, āsārita has been mentioned as citra-tāṇḍava, which was followed by pure type of karaṇas and musical instruments. The pure type of the seven jātis (jātirāga-gānas) were also sung along with the āsārita dance. It has been mentioned in the Harivamśa that the wives of the Bhaimas used to sing and dance with gestures and postures to please Kṛṣṇa. The ballisaka dance was also practised during the time of the Harivamśa, and the commentator, Nīlakaṇṭha has said that ballisaka was a kind of dance, in which many women dancers took part: 'ballisakam vahabbih strībhih saha nṛtyaṃ'. This type of dance was known as a sportive play, and it was, in later

time, known as the rāsa-nṛtya, which women dancers dance in circle in accompaniment with songs and musical instruments. The dance, gaṅgāvataraṇa was also prevalent during the time of the Great Epics. Nīlakaṇṭḥa has said that the gaṅgāvataraṇa was also known as a dancedrama (nṛtya-nāṭya).

Similarly different types of classical dances have been mentioned in the works of Kälidas, Sudraka, Visnu-sarma and others. Mahākavi Kālidās (from 100 B. C. to 400 or 450 A. D.) has described about dance-types like nandyavarta, caturasra, ardba-caturasra, etc. in his diffeent works. In the Vikramorvass, he has mentioned about different technical aspects of music and dance through the character of Citralekhā, a friend of Urvašī and Sahajanyā. Kālidās has described the characteristics of dance-types like duipadīkā, jambhalikā, khandadhārā, carcarī, bhinnakā, valāntikā, etc., which Citralekhā mastered from his danceteacher. The dance-type, khandadhārā was one of the varieties of the dance, doipadika or doipadi. Similarly it has also been described that the dance of jambhalika was one of the varieties of dvipadikā. From this it is understood that the dance, duipadika or duipadi was the main or basic dance, and khandadhārā, jambhalikā, etc. evolved from it. It has been mentioned that the dancetype of khandaka or khandikā was also prevalent during the Gupta period, and it was different from the dance of khandadhārā.

In Srī-Harşa's Ratnāvalī, we also come across with the dance, dvipadikā. The commentator of the Ratnāvalī has mentioned that there were four kinds of dvipadikā, and khandaka was one of them. Again we get the reference

of the dance, carcari which used to be practised as an alternate one or as a variety of the dance, dvipadikā. The dance, carcari used to be played with the song, carcari, which used to be composed of three or four lines. It is said that the dance, carcari used to be practised by the female dancers, and it was a type of lasya. According to Vema-Bhupāla, the dance, of carcari used to be applied with the prime sentiment, śrngara, but Rana Kumbha differed from Vema-Bhupāla, because, according to Rānā Kumbha, carcarī used to be played with any one of the rasas and talas. Kalidas has mentioned about other types of dance, and they were khuraka, kutilika, galitaka, etc. Sarangdeva has mentioned about them in his Sangita-Ratnakara in the early 13th century A. D., and from these it is learnt that those dance-types were traditionally preserved upto the end of the ancient period. Kavi Sudraka has mentioned about different kinds of classical dances in his Mrcchakatika. Visnu-sarma (and century A. D.) has described about different dance-motifs in his Pancatantra. In the Gupta period, the culture of classical dances were much appreciated. It is said that Mahārājā Chandragupta-Vikramāditya (5th century A. D.) was a great patron of dance and music, and he constructed the dancing and music halls, attached to his Royal palace for the proper culture of classical dance and music. His able son, Mahārājā Kumāragupta also preserved the tradition of his father, and used to patronise the dancers and musicians in his Royal palace, Maukharirāja Prabhākara-vardhana of Thanesvara was also a great patron of classical dance. He also constructed a dancing hall in his Royal palace where dancers, both male and female, used to get privilege to culture the art of dance in its true perspective.

It is interesting to note that a dancing scene of some națis on an open air stage is seen depicted in the Udayagiri Caves near Bhubaneśvara, Orissā, which proves that the distinctive style of classical dance, as has been described in Bharata's Nāṭyaśāstra, was in practice long before the advent of the Christian era. Well has it been said by an art critic that on the walls of the Caves of Udayagiri "are to be seen in a fairly well-preserved shape exquisite works of art depicting different facets of life. The precision and accuracy with which the artist used his chisel inspire the awe and admiration of anyone who visits the Caves".

It has already been said that during Bharat's time, the dance-motifs took a new and novel course. The caris and angharas were used in dances, as they were in vogue during the Epic time. Bharata has mentioned about a marga dance, and it used to be performed in accompaniment of the drums like puskara. Generally two or three puskaras were used in ancient time, and among them two were placed erect and one leaning. The hand-poses (mudrās) were used to express the ideas of the dancers, and this process was handed down from the beginning of the classical period (600-500 B. C.). Bharata has defined the 24 ayuta-bastas and 13 yuta-bastas (cf. NS. IX), which were considered essential for the classical dances. He has also explained cari and mahacari (cf. NS. XI) and mandalas like ākāśa (aerial) and bhauma (terrestrial), together with different graceful movements in accordance with aesthetic sentiments and moods (gati-pracara, rasa and bhava-cf. NS. XIII). The dance-equipments like cari, karana, khanda, mandala, etc. were interrelated with one another.

Now, what do we mean by the term 'cārī'? A cārī connotes the idea of articulation of limbs like leg, upper

part of the leg, thigh and waist. Even the movements of a leg were known as cari. The movements of two legs were known as karana, and when all the karanas were joined together, they were known as khanda. Again three or four khandas used to form a mandala. A cari and a mandala used to be demonstrated together. In the 12th chapter of the Nātyašātra, Bharata has described about the mandalas like utkranta, vicitra, sucividdba, etc. The mandalas were shown along with the arigas and the combination of musical instruments, which were known as kutapa. Bharata has described about four kinds of kutapa or orchestra in the Natyasāstra. From the archaeological excavations, we come to know that the classical dances like tandava, urdbva-tandava, etc. used to be practised long before Bharata of the Natyaśastra, fame. A statuette of a dancer (nata) in the posture of urdbua-tandava has been discovered from the historic Bhir Mound site of Taxila, which proves that classical dances were in practice in the pre-Christian India. The motif of the dancer of the Bhir Mound site seems to be that of the dance prevalent long before the Maurya and Gupta periods. The statuette has been preserved in the Museum of Taxila, and it was discovered by Sir John Marshall in 1913. Sir John Marshall has assigned a pre-Mauryan date about the 5th-4th century B. C. to the dance posture of the nata. The dancer is in the lalata-tilaka posture, composed of a vrscka pose with one of the legs thrown up to the head for making a tilaka on the forehead by means of the big toe. Regarding the ürdhva-tandava, Nandikeswara has said (vide the Bharatarnava, p. 416):

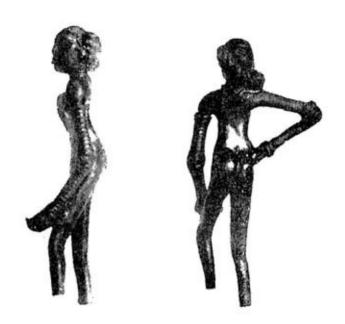

Sthitvā vāmapadenaiva-mullokitadṛśā tadā//
Kuñciṭaṃ dakṣiṇaṃ vāmaṃ dakṣiṇa-śruti-saṃnidhau/
Nibeśya śikharau hastau tayoḥ sthānamihocyate//

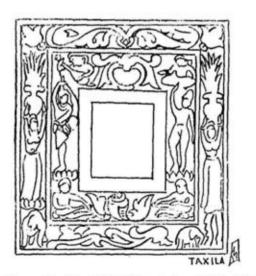

Dakşinah sikharo hasto vakşahstbanamupāsritah/ Vāmasca hastastanmaulau dakşinanghrmupāgatah// Etādrsa-nrtim kuryādūrdhvatāndava-nattane/

That is, standing on the left-foot and assuming the ullökita (slighty upward) look, the dancer lifts the left-leg and holds it up in front of the right-ear, the right-hand holding sikhara-mudrā is held at the chest and the left-hand holding the same mudrā is held over the head clasping the right-foot. And in this posture, the dance takes place. The tāla for this tāṇḍava is jhampa, which consists of a druta, a druta-virāma and a laghu making up 2½ mātrās. The dance-syllables are: kiṇa jakaku thātaddhita ḍhem tho thatiku tha dhi ta ḍhem. These syllables are uttered in a wonder-struck manner.

India has been preserving the tradition of art of dance, both folk and classical, from very ancient time, and its tangible evidences are found in different tock-cut temples Besides the figure, found in Terracotta from of India. Taxila, numerous dancing postures of Yaksinis and celestial nymphs are found engraved on Bharhut railings, Amaravatī, Udayagiri and Khandagiri. Nāgārjunagonda, Ajantā and other rock-cut temples. They are the genuine proof of culture of dance and music in ancient Indian society. It is true that there might have happened many changes in motifs and techniques of dances throughout the ages on account of new innovations and new outlooks, and as such the dancemotifs and dancing of the ancient times differ from those of the mediaeval, and those of the mediaeval, from the modern, but the art and its spirit and practice still remain in their prestine glories. Various types and styles of dances of various ages have enriched the treasury of this

dynamic are of dance. In connection with his valuable arricle, A New Document of Indian Dancing, Prof. O. C. Gangoly has said that the tradition of Indian dance art had disappeared from the North, surviving in the practices of the gilds of dances under the active patronage of South Indian Temple Foundations. But the Bhīr Mound slab of Taxila has proved that the dance are used to be cultured in ancient time in its true perspective throughout India, irrespective of boundaries of North and South. In North India, the classico-religious dance of Manipuri school evolved with new and novel technique in Manipur, Assam, Besides, many socio-religio-folk type of dances evolved in different rural areas of India. In Bengal, different types of simple dances evolved in connection with the song-types of baul, gambhira, kīrtana, together with different religious vratas, rites and ceremonies. The classico-folk type of dances like seraikela, raibense, chhow, etc. also evolved in the North, in Setäikela, Purulia, Maurabhanj and other districts of West Bengal and Orissa. The classical form of kathaka dance evolved in Lucknow. It is said that Isvariprasad was the innovator of this graceful type of dance, and it was and enriched by Thakurprasad, aferwards nourished Mahārāj Vrndādīn, Acchan Mahārāj, Sambhu Mahārāj, Ajamat Ali, Rahat Ali and others. At Vārāņasi, Allahabad, Jaipur and other places in the North, different types of classical dance also evolved. The kathaka dance is purely based on aesthetic sentiments and moods, together with the nayāka-nāyikā-bheda. A special school of dance also evolved at Santiniketan, in connection with the gitinatyas (musical dramas) and nrtya-natyas (dance-dramas), composed by Kaviguru Rabindranath Tagore. Rabindranath himself devised the dances for his songs and dramas with the help

of different techniques and textures of dances like bharatanāṭyam, kathākali, manipurī, kathak, serāikela, rāibense, kaṇḍuyana of Ceylon, together with the dance-motifs of Java, Bali and other places. In fact, all the motifs and techniques of all kinds of dance, indegenous and foreign, were incorporated in his styles or schools of dance, and yet it was possessed of a special characteristic of its own.

bharatanātyam, katbākalī and other types of dance evolved in the South. The Siva-Națarāja of South India is a charming and marvellous example of Indian dance as well as of plastic art. Every part of the image of Națarāja throbs with dynamic rhythmic movements. A separate temple at Chidambaram is consecrated to Siva-Națarāja. In the four Gopurams of the Chidambaram temples, there are 108 beautiful illustrations of karanas, most of which were engraved according to the dictums, as laid down in Bharata's Natyasastra. It has been said: "On both side-walls of each of the long entrances of the four towers of the Națarāja temple at Chidambaram, there are sculptures in dancing poses, carved out on stone-pillars, situated near the walls at a reasonable distance from one another. On each side of the entrance there are seven pillars, each having eight compartments. In each of these compartments of equal size, there are three figures, one big and two small in size. The large figure of a female dancer represents the dancing poses or a karana, and the small ones represent two drummers standing on the sides of the dancer. Below each compartment the Sanskrit verse of the Natyaśāstra of Bharata, describing the particular karaņa, depicted in the compartment, is inscribed on the stone in legible Grantha script". Thus, there are (7 ×8=56) poses or karanas on each side making a total of 112 figures on both the sides of each entrance. Out of the 112, only 108 figures represent the 108 karanas of the Natyasastra.

Indian dance is divided into four main categories, as they represent four types of graceful school or style, and they appear different for their special techniques, textures and styles or interpretations. As for example,

(1) The bharatanātyam is the purest and oldest form of Indian dance. It evolved in the South, and has preserved the pure Indian tradition as well as Hindu spirit. It is said that the dance-form of bharatanātyam was designed by Muni Bharata, the author of the Natyasastra. Brahma or Brahmabharata initiated Muni Bharata into this art of dancing, and Bharata cultured and preached it in the world in a new and novel form. Some are of opinion that the real significance of the name or term bharatanātyam was taken from the syllables of bba + ra + ta, which mean bbava + raga + tala. So we can take that the classical dance, bharatanātyam is the embodiment of these three categories, emotional sentiments and moods, melodies and rhythms. These are essential for making perfect this type of dance. It has been said before that Bharata has classified the dance-motifs into two main classes, nytta and nytya. The term, netta signifies the pure or abstract form of dance, where as nrtya, the expository dance that employs an elaborate gesture language and interpretative dance or abbinaya. So the dance, bharatanātyam is a harmonious blending of both these types of dance, netta and netya. It is impersonated by a single dancer, usually a woman. Different costly costumes are used in this dance. A small group of orchestra, consisting a singer or a group of them, a flute and a drummer, which rouses the memory of the ancient vinda-vādya, kutapa. The music of the orchestra

plays the role of commentary on the dance. The bols with different rhythms and tempi are executed by means of the feet, and different gestures i. e. movements of different parts of the body, including that of eyes and eyebrows, together with different hand-poses (mudrās), embellish the majestic bharatanatyām (dance). It is said that this elegant style of dance was developed by the dancing girls (devadāsīs) in different temples as well as in Royal Durbārs of South India. It was previously known as 'dāsīyāttam'.

The following features of dance like allaripu, yatisvaram, šabdam, varnam, padam and tillana are attached with the present system of the bharatanātyam, whereas in ancient time, the colourful features like sadiranatyam, bhagavatamela-nataka, kurubhanji and kucipudi were in practice along with the majestic dance, bharatanātyam. The sadiranatyam used to be practised with its different phases like dāsīātyam or dāsīāttam, cinuamelam, bhogamelam, tāñjori, etc. The bhāgavatamelam was religious in nature, and used to be practised mostly by the Brāhmins. The kurubhanji was like a ballet or combined performance of dance (vrnda-nrtya) and used to be performed especially by women. Its ancient name was 'kutral-kurubhuñji'. Siddhendra Yogī introduced the dance-type of kucipudi. This type of dance-feature was practiced by male dancers.

Among the dance-features, āllāripu, yatisvaram, šabdam, varņam, padam and tillānā, the feature āllāripu or āllārimpu is first taken for the unfoldment of the beautiful lustre of the limbs to be used or performed in dance. The artist first performs the pūrvaranga and asks for blessings from the audiences. Then it slowly and gracefully proceeds to

exhibit different movements of the dance. Then yatisvaram is taken to elaborate and beautify the gradual development of the dance, bharatanāṭyam. This feature is exhibited with the help of the sargams or 'cluster of tones', having meladic form and value, and it is accompanied by drums and cymbals (mṛdaṅga and mandirā). This type of dance-feature really rouses the emotional sentiments, and creates a sensation of pleasure in the audiences.

Next to yatisvaram, the dance-feature, śabdam is performed with great skill. The feature, śabdam connotes the idea of devotional music, having dramatic themes in it. After śabdam, varnam is taken with the combination of nāṭya, nṛtta and nṛtya, which are the essential features of dramatic performances. In this dance-feature, the tunes of the orchestral songs are accompanied by rhythms and emotional sentiments and moods. At last the dancefeature, tillānā is performed with different tempi like slow, medium and rapid (vilamvita, madbya and druta). The entire performance of the dance, bbaratanāṭyam is exhibited in the primary sentiment (ādirasa), śṛṅgāra, which, according to Muni Bharata, is the best and most divine sentiment.

(2) The dance-drama, kathākali evolved in Mālābār (in Kerala) in South India. At first, the themes of kathākali used to be drawn from the sacred stories of Rāmachandra and Srī Kṛṣṇa, taken from the Rāmāyaṇa and the Parāṇas.¹ Later on, it has drawn its themes from different Hindu myths and legends. It is dramatic in form, accompanied by

I The themes of ancient type of kathākali were composed of sacred stories of Rāmachandra and Srī Kṛṣṇa, and they were known as 'rāmanāṭyam' and 'kṛṣṇanāṭyam'.

interpretative dancing. It contains not only the dance technique, but also calls for 'a high degree of mimicry and histrionic abilities'. The emotional sentiments and moods (rasa and bhāva) play a prominent role in this dance, and so it is duty of the performers of kathākali to evoke the corresponding rasas and bhāvas in the spectators. The performers are required to demonstrate the movement of every muscle of the face in order to express mental states and their paychological implications.

The vigorous and masculine form of kathākali is expressed in the tānḍava style of dance. The veera and raudra rasas are its predominent features. The musicians recite the stories, the musical instruments are played with the songs, and the actors of kathākali appear one by one and effeciently present their graceful and expressive dances. As the most energetic aspect of this dance is kalasamas or pure tānḍava dance, so the feature is thiranottama or 'peering over the currain'. This dance-type is really artistic and colourful.

(3) Kathaka is a popular type of art-dance of North India. It employs both the aspects of dance, nāṭyadharmī and lokadharmī. The naṭyadharmī dance-style of kathaka is imaginative or idealistic, as it evokes aspirations and emotions in the mind of the spectators with symbolic language, whereas the lokadharmī one is more realistic in its aspects. It is said that in the Muhammedan period, the kathaka dance was patronised by the Muslim Rulers, and the Hindu Rulers, who were under the influence of Muslim rule, were also lovers of this type of dance. In the beginning of the 20th century, the contributions of Mahārāj Kālkā-prasād and Mahāraj Brindādīn were immense in the field of kathaka dance. Kālkā-prasād and Brindādīn were the sons of

Thākuradās, who was the renowned court-musician of Nawāb Wāzid Āli Shāh of Lucknow. It is said that this last Nawāb of Lucknow, Wāzid Āli Shāh was a great lover as well as a patron of the kathaka dance. Mahārājis Kālkā-prasād and Brindādīn paid more attention to both of the aspects of tāndava and lāsya, and perfected or renovated them in their own ways for applying them to the kathaka. They introduced paraņas, which were the recitation of the lyrical passages with rhythmic syllables. The paraņas were accompanied by gats, todāhs and tukrās. Besides Kālkā-prasād and Brindādīn, the names of Acchan Mahārāj, Sambhu Mahārāj, Kārtickrām and Jailāl Mahārāj (of Jaipur) are worth-mentioning in the field of kathaka dance.

In the kathaka dance, the facial expressions, together with the hand-poses are known as mudrās and abhinaya. A toḍāh is a dramatic sequence with exhibiting action in a rapid tempo (druta laya), and a tukrā is a brilliant rhythmic sequence 'which excels in double and treble timing'. Generally tālas like dhāmār, ektāl, tritāl, jhāptāl, dādrā, etc. and musical instruments like a sārengī and a pair of tabal or a pākhwāj are used in the kathaka dance.

(4) The manipuri dance is essentially lyrical, aesthetic, sober, serene, and purely religious in nature. From different motifs of this dance, it seems that an ancient form of socio-religious dance has been stylized in it in a new pattern. Some believe that manipuri type of dance reminds us of the ancient epic dance of hallisaka which used to be performed by the Bhaima wives and men during the time of the Mahābhārata-Harivamsa. It is also seen that in the old form of manipuri dance, religio-mythological themes of Siva-Pārvatī used to be adopted and performed,

but with the advent of Vaisnavism, this type of theme was replaced by the Rādhā-Kṛṣṇa-līlā.

The manipuri dance is mainly divided into four, laiharobā, astra-vidyā, calan-gāthan and rāsalīlā. The laiharobā type of dance is almost obsotele at present. The astra-vidyā is an ancient type of dance, and it is known as the sword or spear dance. The calan-gāthan type of manipurī dance was specially introduced at the advent of Vaiṣṇavism at Manipur. It may be called a kīrtana-dance, accompanied by musical instruments like manjirā, karatāla and khola. At Manipur, khola is known as mṛdaṅga, and the size of the karatāla is large. The kīrtana songs accompany the manipurī dance.

The rasalila type of manipuri dance is a most popular one in Manipur, Assam. It represents the sportive play of Śrī Kṛṣṇa and his divine consort Rādhā. The rāsalīlā is divided into four, kunja, vasanta, maba and nitya. The first three types, kunja, vasanta and maba are performed in the months of Aświn, Vaiśākha and Kārtika, while the nitya-rāsa is performed at any time in any festival. The rasa-dances begin with themes of Gitagovinda, Govindatilamrta and other Vasnava litetary works. The Sutradbara first explains the subject-matter of the dance and introduces the main feature of the play, and then the dancers begin their dances with graceful manner. The gostalīlā dance is also performed in the month of Kartika. Special types of costume are used in the manipuri dance, They are very richly bedected and are costly and colourful. These costumes are specially made in Manipur.

The chhow dance of West Bengal originated first in Seraikela and Mayurbhani, the adjacent ex-feudatory States

of Orissã. It is known as a religious type of dance of Bengal, specially played on the occasion of caitra-parva or Spring Festival in the month of April in honour of Naça Bhairava, the dancing Siva. The dance chhow forms an integral part of pūjā-ceremony of the deity, which is intended to supplicate blessings on the Ruler himself and his subjects.

The word obhow literally means a 'mask' (mukhosa) in Seraikela. Srī D. N. Pattanāik has said: "As it is a mask-dance, in Seraikela, they call it the chhow-nṛtya. But in Mayurbhanj, the chhow-dancers do not use masks. Both tradition and legend prove that this form of dance was first known as chhauni-nṛtya (camp-dance). Chhauni literally means a military camp, where Oriyā soldiers (known as Pāika) were practising war techniques through dance, Later on chhauni-nṛtya came to be known as chhow-nṛtya". Srī Pattanāik further informs us that the chhow dance of Mayūrbhañj, in its original state, was in the form of 'Farikhela' or 'sword-play'. The participants were known as Farikar or sword-player. "This was done with sword and shield in hand. The sword-play was almost in the form of war-dance. Various war-drums were only accompanying instruments of the dance".2 The primary aim of this wardance was to develope the physical excitement and courage in the dancing warriors. Some magical ideas were also attached to this type of dance, for creating fear and awe in the mind of the enemies.

<sup>1</sup> Vide the Souvenir of the Kālā-Vihāra-Kendra, Cuttack, 1959-60, p. 18.

<sup>2</sup> Ibid., pp. 18-19.

The basic principles of chhow dance were known as upalaya, popularly known as uphuli. They were again divided into two sub-classes, bātiārdhara and kalībhanga. "The principles of former type are for male characters and the latter type for female characters. Hātiādhara literally means 'holding an arm', the principles of which are very vigorous'. It is interesting to note that in every performance of chhow dance (natki), marching movements are clearly discernible. So, from very close observation it is proved that chhow dance of Mayūrbhanj was, somehow or other, different from that of Serāikela, because the former was purely a heroic war-dance.

It is said that from the chhāunī-nṛṭya a new type of dance like asari-chhow-nṛṭya evolved with its art-value and special beauty. The asari-chhow-nṛṭya became very popular and prominent among the people, and it is nowadays played for popular entertainment and culture. Though in the beginning, war formed the theme of the chhow dance, yet gradually the stories from legends, folk-tales, the Mahā-bhārata, Rāmāyaṇa and Purāṇas were adopted for constituting the theme of chhow. "During the reign of Śrī Kṛṣṇa-Chandra Bhañja Deo (19th century), chhow dance already established itself as a distinct school of dancing in India. He himself was taking particular interest in the dance and with the help of the nṛṭya-gurus (dance-masters) codified the techniques of chhow dance for its systematic training and culture, which was not done so far".1

A peculiar type of music accompanies the chhow dance, the tunes of which are folk. The wind intruments of sānāi type, known as mahuri, and various types of big war-

I Ibid., p. 20.

drums, known as dhumsa, a small drum, known as nāgārā, dhol, chadchadi are played with the chhow dance. The music or sounds of the musical instruments reflect the moods of the chhow-dancers, so as to interpret the tunes correctly. The dance begins with slow footsteps with vilamvita-kalā, known as chāli. Then gradually speed of the dance and tempo are increased, and the dance is performed in the madhyama-kalā, known as upalaya, and at last the climax of the dance is performed in quick tempo or druta-kalā, known as naṭki. Mostly the tunes of the jhumur songs are played in this part of the dance.

Besides these, there are verious types of dance, classical, classico-folk and folk, prevalent in India, and they are not only treated merely as a form of art, but also as the perenial source of living inspiration and joy. The regional or folk type of dances like ghatu of Sylhet, gambhīrā of Māldah, rāivense and gājan of Bīrbhūm, karam and nāṭuyā of Puruliā, bihu of Assam, jhumur of the aboriginal Sāntāls of West Bengal, pāik of different rural regions of Bengal, as well as different folk dances of Rājasthān, Kāshmere, Punjāb, Mahārāṣṭra, Orissā, Madras, Ceylon and other places are worth-mentioning in this connection.

Modern type of dances are also evolving with their unique styles and graces. And it is a fact that all kinds of dances, classical and folk, help men to regulate their ways of social life by means of observing different measured rhythms of dances, and thus they are helped to approach nearer to the gigantic rhythm of the Nature or Prakṛti, which regulates and vitalizes all the time all animate and inanimate objects of the universe. The rhythms of different dances are the miniature forms of the spontaneous universal dance of Nature, which is symbolized as Siva

Națarăj, and if the artistes properly concentrate their minds and energies upon the regulated rhythms of dances of Nature, they will be in a position to get nearer to perfection, which will bestow upon them eternal balance and everlasting bliss.

Now let us give a short account of characteristics of different classes of dance, as described by Bharata in the Nāṭyasāstra. The 4th chapter of the NS. is known as the tāṇḍavalakṣaṇa one, Tāṇḍava is the most ancient and classical type of dance. It has been said before that the dance, tāṇḍava is divided into two, violent one, meant for the male dancer, and gentle one (sukumāra or tāṣya), meant for the female dancer. Bharata has said in this connection,

Prāyeņa tāṇḍava-vidhir-devastutyāśrayo bhavet/ Sukumāra-prayogastu sṛṅgāra-rasa-sambhavaḥ// —NS. IV, 265-66.

That is, the classic dance, tāṇḍava is meant mostly for the adoration of gods, but the gentler sukumāra (lāsya) form of dance is related to the prime sentiment, sṛṅgāra. Tāṇḍava is majestic and heroic in its nature. It is accompanied by aṅgabāra, karaṇa, recaka, sthāna, cārī, etc., as well as different hand-poses (mudrās) and gestures and postures (hāva and bhāva): "nānā-kāraṇa-samyuktai-raṅga-bārair-vibhūṣitaṃ." While mentioning about aṅgabāras, Bharata has said,

Tato vai taṇḍunā proktamstvangabārān mahātmanā/ Nānā-karaṇa-ṣamyuktān vyākhyāsyāmi sa-recakān// —NS. IV, 18-19.

<sup>5</sup> Cf. Sadāśiva Rath Sharmā: Tānḍava-Poses in Orissā Sculptures, in the 'Souvenir' of the Kalā-Vikāśa-Kendra, Cuttack, 1958.

The angahāras are 32 in number, and they are: sthirahasta, paryastaka, sucīviddha, apaviddha, ākṣiptaka, udghaṭṭita, viṣkambha, aparājita, viṣkambhāpasṛta, matta-krīḍā, svastikarecita, pārśvasvastika, vṛścika, bhramara, matta-skhalitaka, madavilasita, gatimaṇḍala, paricchinna, parihṛttarecita, vaiśākharecita, parāvṛtta, alātaka, pārśvaccheda, vidyutbhrānta, uddhṛtaka, ālīḍḥa, recita, acchurita, akṣiptarecita, sambhrānta, upasarpita and ardha-nikuṭṭaka.

The angabāras are known by their different movements of hands and feet, and so all the angabāras consist of different karaņas. The karaņas are but a combination of movements of hands and feet in dance. Two karaņas make one mātrikā, and two, three or four mātrikās constitute one angabāra. Again three karaņas make a kalāpaka, four, a sangabāra, and five, a sangbātaka. Thus the angabāras consist of six, seven, eight or nine karaņas. Bharata has said in this regard:

Hasta-pāda-samāyogo nṛttasya karaṇaṃ bhavet/
Dve nṛtta-karaṇe caiva bhavato nṛtta-mātrikāḥ//
Dvābhyāṇ tri-caturābhir-vyāpyaṅgahārastu mātṛbhiḥ/
Tribhiḥ kalāpako jñeyaḥ caturbhir-maṇḍalakastathā//
Pañcaiva karaṇāni syuḥ saṅghātaka iti smṛtaḥ/
Ṣaḍbhirvā saptabhirvāpi aṣṭabhir-navabhistathā//
Karanairiha saṃyuktā aṅgahārāḥ prakīttitāḥ//

-Nātyaśāstra (Vārāņasī edition), IV. 30-33.

Bharata has given descriptions of 108 karaṇas, composed of different movements of hands and feet: "eteṣāmiha vkṣyāmi hasta-pāda-vikalpanaṃ" (vide all the definitions and descriptions of the 108 karaṇas in the Nāṭyaśāstra, Vārāṇasī edition, IV. 34-55). These karaṇas are applicable to dance, fight, personal combat, walking and movements in general. The nettahastas are applied to the karaņas, the sthānas, cāris and nettahastas are known as mātrikā, the variations of which are known as karaņas.

Bharata has also given the definitions of 108 karaṇas and different angabāras. Regarding recaka. Bharata has said,

Caturo recakamscaiva gadato me nibodhata/ Pada-recaka ekalı syat dviciyalı kaţi-recakalı// Kara-recakastrtīyastu caturthah kantha-recakah/ Recitākhyah pṛthag-bhāve valena cābhidhīyate// Udvāhanāt prthag-bhāvāt valanāccāpi recakah/ Pārśvāt pārśva tu gamanam skhalitaih calitaih padaih// Vividhaścaiva pādasya pāda-recaka ucyate/ Trikasyodvarttanam caiva kaţī-calanameva ca// Tathapasarpanam caiva kaţī-recaka ucuate/ Udvartanam pariksepo viksepa-parivartanam// Visarpanam ca hastasya hasta-recaka ucyate/ Udvāhanam sannamanam tathā pārśvasya sannatih// Bhramanam cāpi vijneyo grīvāyā recako vudhaih/ Recakairangahāraiśca ngtyantam vīksya śamkaram// Sukumāra-prayogeņa nrtyati sma ca pārvatī/ Mrdanga-bheri-patāhaih bhānda-dindima-gomukhaih/ Panavair-dardurādyaiśca nānā-todyaih pravāditaah//

-Nātyašastra (Vārāņasī edition), IV. 240-248.

That is, among the recakas, the first is known as pādarecaka, the second, as kaṭī-recaka, the third, as hasta-recaka,
and the fourth, as grīvā-recaka. The movements of these
four limbs, foot, waist, hand and neck are connected with
the recaka. The term recaka connotes the idea of moving
round of the limbs of the body separately or 'its drwaing
up or its movement of any kind separately'. To cite the

English translation of the four racakas, done by Dr. M. Ghose, it can be said that among the four kinds of recaka: "Pādarecaka going from side to side with wavering feet or with differently moving feet, is called their recaka. Kaţīrecaka rising up the trika and the turning of the waist as well as its drawing back, is called the kati-recaka, Hasta-recakarising up, throwing out, putting forward, turning round and drawing back of the hand is called its recaka. Grivarecaka-rising up, lowering and bending the neck sideways, and other movements of it are called its recaka. Seeing Sankara (Sīva) dance with recakas and angahāras, Pārvatī too performed a gentle dance (lit. danced with delicate forms), and this dance was followed by the playing of musical instruments like mrdanga, bheri, pațaha, dindima, gomukha, panava and dardura". All these musical drums were made of clay and wood, and these drums, accompanied by lute (veena) and flute (venu or vamsa) used to from the kutapa in ancient time. It has been said before that the drum, puskara was made of clay or wood, it accompanied dance and music in ancient time.

In the Orissan treatise, Abbinayacandrikā, written by Maheswara Mahāpātra, in the 12th century A.D., it is found that some new types of hand-pose (mudrā) were used in ancient Orissi dance, and they are also evident from different sculptural representations in different temples of Orissā. The Jaina Cave-temples of Udayagiri and Khaṇḍagiri provide numerous examples of representations of dance, and they were curved on different facades in low relief. One of the earliest ruined temples at Bhubaneśvara is the Bhātateśvara near the Rāmeśvara is still preserving remains of some sculptures of hand-poses and dancing

postures, which, it is believed, were used in the Orissan dances and dramatic plays. "A sunken panel marking the transition between the cubical and the curvilinear portions of the temple, shows among other motifs, a procession of Siva's marriage in which Lord Siva riding Nandī is headed by a procession consisting of the gods such as Visnu, Brahmā, Agni, Nārada and Siva-gaņas, and of the two dancing girls throwing their hands in eestacy with the rhythmic movements of their feet. The freize is only partially preserved, but Nārada playing on the veenā and the two dancing girls heading the procession are clearly discernible. In the actual marriage scene of Siva too, the dancing girls make their appearance. One scene of Siva's marriage appearing in the Parasuramesvara temple depicts a dancing girl in midst of several deities with Siva and Parvati as the bride-groom and the bride. Human activities and sentiments have no doubt been attributed to gods and goddesses and it is, therefore, interesting to note that the custom of engaging dancers and musicians on the occasion of marriage, so widely prevalent in modern times, goes back to hoary antiquity".1

The great temples of Puri and Konārka, built during the rule of the Gangā dynasty in Orissā in the 12th century A.D., also preserve many sculptural remains of hand-poses and dance-postures. And it can be said without hasitation that those classical hand-poses and dance-postures clearly show the evidence that they were designed and curved according to the laws and principles as prescribed in

r Vide The Souvenir, publish by the Kalā-Vikāśa-Kendra, Cuttack (1958), p. 3.

Bharata's Nāṭyaśāstra and Nandīkeśvara's Abbinayadarpaṇa. The Orissi hand-poses and dance-postures gradually evolved with their special forms and graces in Orissā through the process of interchange of ideas of arts and cultures. Well has it been said by Dr. Pānigrāhī: "Through the perennial process of give and take, Orissā gave to and received from other parts of India certain characteristics of these fine arts and then giving them the impress of her own genius constituted to new system known to us as the Orissi music and the Orissi dance"."

The hand-poses of the Orissan dance, as mentioned in the text of Mahāpātra's Abhinayacandrikā, are fifty-eight in number. The single hand-poses are 26 and those of double hand-poses are 24 plus 8 traditional single hand-poses = 58. The Orissi dance is always accompanied by Orissi songs, composed by different ancient bards of Orissa, namely Kavi-samrāṭ Upendra Bhañja, Kavi-sūrya Baladeva Rath, Banamālī Dās, Gopāl Krishņa and others. The performers of Orissi dance skilfully represent different hand-poses to express different meaning and significances of the songs, and thus they create the aesthetic value in the entire abhinaya.

Now a comprehensive chart of the Orissi hand-poses has been put forth by Dr. D. N. Pattanāik in his article on Hand-Gestures in Orissi Dance. Let me take the privilege of quoting some portions of the chart, so as to throw some lights on the idea of the forms of the hand-poses,

r Cf. Dr. K. C. Pānigrāhī: Sculptural Representation of Music and Dance in Orrisā in the 'Souvenir', published by the Kalā-Vikāśa-Kendra, Cuttack, 1958, p. 10.

generally used in the Orissi dance. Dr. Paţţanāik has

"Abhinayachandrikā	Nātyaśāstra	Abbinayadarpana
Dhvaja	Patāka	
Dhyāna	Arāla	
Ańkuśa	Kapittha	
Bhaya	Mukula	
Nirdeśika		Suchimükha
		Mrugaśīrsa
I-lańsa-paksa	•••	(Mṛgaśīrṣa?)
Gomukha		Simhamükha
Mrugāksya		
(Mṛgākṣya)	***	Hansasya
Ardhachandra	Ardhachandra	
Aratrika	Sikhara	•••
Kaşipta (?)	Alapadma	***

"Other hand-gestures of the Abbinayachandrikā", he says, "namely Daṇḍa, Sarpaśīrṣa Balaya, Prabodhikā, Sūkachañchu, Lulita, Birodha, Tāmbula, Bastra, Chaturmukha and Chatura have no similarity with any of the hand-gestures, mentioned in the Nāṭyaśāstra and the Abbinayadarpaṇa. Mentions of Sarpaśīrṣa, Sukachañchu, Ardhachandra and Chatura are also found in the Nāṭyaśāstra and the Abbinayadarpaṇa, but except Ardhachandra others bear no similarity".

It has been said before that the textual single handposes of Orissi dance are twenty-six and traditional single

vide Dr. D. N. Partanāik: Hand-Gestures in Orissi Dance, in the 'Souvenir', published by the Kalā-Vikāśa-Kendra, 1958, p. 28.

ones are eight in number, constituting a total number of thirty-four, whereas in the Nāṭyasastra, the numbers of the single hand-poses are twenty-four and in the Abbinayadarpana, twenty-eight only.

## APPENDIX TO THE CHAPTER XII

1

General Rules for Dance (नृत्यस्यसामान्यविधिः):

## CHAPTER XIII

## THE ACOUSTICS OF INDIAN MUSIC

The word 'acoustics' is derived from the Greek verbakono—'to hear', and as such the acoustics of music means the science of auditory vibrations of music, sensed by the auditory nerve. It is the study of the physical basis of music. Helmholtz in Germany, Köening in Paris and Lord Raybigh in England mainly worked on this physical process of music in a scientific manner and on the mathematical basis. In India also, efforts have been made in this direction for making music and its culture perfect in system and sublime in quality.

Acoustics, not only of music of India, but also of music of all civilized countries of the world is mainly concerned with the nature of sound and its vibrations, and also with its relationship to music, resources, intensity, loudness, pitch, register, audition, musical quality, consonance, scale, temperament, harmonic analysis, air columns, musical voice, production of good voice, etc. Thus acoustics of Indian music can also be said to be the physics of Indian music.

Now from the viewpoint of physics, the word 'sound' is commonly used in two different senses, says Dr. E. H. Barton, (1) to denote the sensation perceived by means of the ear when the auditory nerves are excited; and (2) to denote the external physical disturbance which, under ordinary conditions, suitably excites the auditory nerves. And from this standpoint acoustics really connotes the idea of the 'study of sound'. It can be said to be the branch of physics which deals with vibratory motion as perceived by the sense of hearing. So three things are imperative

for the production of sound, musical or non-musical, and these three things are: (a) same medium to receive and transmit the vibratory motion; (b) the parts of the body in vibratory motion should have such shape, size and motion as to cause a disturbance to advance through the air; and (c) our ears should 'enable us to perceive the sensation of sound only when effected by to-and-fro movements whose number per second lies between certain limits'. So to produce sound sensations, it is necessary that our vibrating body should conform to this requirement also.

All sounds may be divided roughly into two classes, noise or non-musical and musical sounds. Though ordinary sounds are not known as musical ones, yet they may not be recognised as noise or irregular sounds. Now the difference between noise and musical sound lies in the fact that noises are irregular or sudden, whereas musical sounds are comparatively smooth, regular balanced and sweet.

If we study the science of musical sound, we find that musical sounds are possessed of vibrations, because they are no other than the sumtotal of sweet and soothing vibrations. Dr. Barton has defined vibration as the period which is no other than the time from the instant when the vibrating point passes through any position to the instant when it next passes through the same position, moving in the same direction. Again, every unit of vibration is possessed of a frequency, and the frequency of a vibration is the number of vibrations, performed per unit time. Thus frequency is the reciprocal period. Again, the amplitude of a vibration 'is the maximum displacement, assumed by the vibrating point in the course of its motion'. Next the phase of a vibrating point at any instant is the state of its displacement and motion at the instant in question'.

All musical sounds are characterised by three features like pitch, intensity and quality. Now, what do we mean by a 'pitch'. The pitch of a musical sound is a feature, recognised by every one. It depends upon the period or frequency of the vibrations constituting the sound. The greater the frequency, higher the pitch. Dr. Barton has shown that a pitch is specified in two distinct ways: (a) scientifically, by the statement of the period or frequency of the vibration, or by the logarithm of its frequency, and (b) musically, by the statement of the period or frequency of the vibration, or by assigning to the sound in question its position in a certain accepted series of sounds constituting a musical scale.<sup>1</sup>

The intensity of the sound-waves is a purely physical quantity, independent of the ear. It is proportional to the wave energy passing per unit time through unit area. So, we find that a pitch depends upon the frequency, whereas an intensity upon the amplitude of the vibration. The foundness of a sound 'depends upon the intensity of the waves producing it, and increases and decreases with the intensity for a sound of given frequency, but in a way difficult precisely to define, and scarcely susceptible of strictly quantitative statement'. The quality of a sound serves to distinguish between musical sounds of the same pitch and intensity, produced on different intruments, say, the voice, the violin, the organ or any other musical instrument; and it is found that different qualities are observed in various musical sounds, vocal and instrumental.

<sup>1</sup> Vide A Text Book on Sound (London, 1932) p. 9.

<sup>2</sup> Ibid. p. 15.

microtones (jāti-śrutis). The musicologists of India have also determined the colours, presiding deities of the tones, as well as of the rāgas which are but the outcome of combinations of tones (svaras) They also observed the ancient grāmas, mūrechanās, tānas, varņas, etc., as the products of musical tones.

The modern musicologists, after incorporating in their scheme the Western mathematical divisions of microtones into different vibrational units, have devised some definite vibrations of both the sharp and flat notes. The sounds, are the finer matters in vibrations, as light, electricity, etc., are. The finer matters are the ethereal particles in motion, energised by the dynamic eternal force or energy. Music primarily implies tones and melodies, but in the final analysis, its material elements are resolved into that divine cosmic energy, which creates, sustains and destroys everything in this phenomenal world.

The Western musicologists are of opinion that sound forms the basis of music, and though all kinds of sound are the outcome of vibrations of ethereal particles, yet musical sounds (sound-units) are specially distinct from the ordinary non-musical sounds or noise. The musical sounds are smooth, regular, periodic and pleasant and are of definite pitch, whereas non-musical sounds, in their turn, are rough, irregular, unpleasant and, therefore, are possessed of no definite pitch. So there is a difference between a musical sound and a noise, and this difference between musical tones and noises can generally be determined by attentive aural observation without artificial assistance.

Hermann Helmholtz says that a "noise is accompanied by a rapid alteration of different kinds of sensations of sound", whereas "a musical tone strikes the ear as a perfectly undisturbed, uniform sound which remains unaltered as long as it exists, and it prevents no alteration of various kinds of constituents". So it is understood that musical tones are the simpler and more regular elements of sensations of hearing, and they have a periodic motion. "By a periodic motion", says Helmholtz, "we mean one which constantly returns to the same condition after exactly equal intervals of time. The length of the equal intervals of time between one state of the motion and its next exact repitition we call the length of the oscillation, vibration or swing, or the period of the motion". So from the definition of periodic motion we get the answer thus "the sensation of a musical tone is due to a rapid periodic motion of the sonorous body; the sensation of a noise to non-periodic motions".

A musical co-ordinated sound or tone is intelligible when it is possessed of recognizable pitch, and noise is a complex of frequencies, assembled more or less at random and having no recognizable pitch. When a sound-complex includes all audible frequencies in equal ratios, says Charles E. Osgood, it is called 'white noise', analogous to the production of white light in vision through mixture of all wave lengths of light. The difference between noise and tone as psychological experiences is to some extent modifiable by experience,—as Chinese music sounds like noise to most occidently trained ears. In fact, the vibrations of sound communicate themselves to the air in contact with the vibrating system, and this to-and-fro vibration is communicated through air from the source to the ear of the listener.

<sup>1</sup> Vide Sensations of Tone (Dover ed., 1954), pp. 7-8.

Dr. Alexander Wood says: "We have three principal aspects of the musical note to consider: (a) the vibration of the source, (b) the transmission through the medium, and (c) the reception by the hearer". Therefore sounds, whether tone, speech or noise, have frequency and pitch that create amplitude of vibrations and loudness. Bodies, vibrating very slowly, says Dr. Wood, do not produce sensation of sound, but when their frequency reaches about 20 or more per second, we begin to hear very low sound, and as the frequency continues to rise, we hear higher and higher pitch, until finally at a point roughly 20,000 vibrations per second we cease to hear sound. All sounds have, therefore, vibrations, and all sound-vibrations have three physical attributes, viz. frequency, amplitude and vibration, which give rise in the mind of the audiences three psychological tonal attributes, and they are called pitch, loudness and tone-quality.

A sound has a quality of its own, and different kinds of sound are possessed of different specific qualities. A musical sound has in it a musical quality, termed klaugfartee in German and timbere in French. In Indian music, this quality may be termed as svatantra-dharma. Dr. Alexander Wood has suggested that if a tone of the given and definite pitch is played successively on two different musical instruments, and played with exactly the same loudness, we can distinguish between two sounds, and refer each to its appropriate instrument. The basis of this judgement is the quality of the sound. The German physicist Chalandus (1756-1827 A.D.) first experimented this process of musical quality of sound on a vibrating plate, and afterwards it was attempted by Hermann Helmholtz in terms of partial tones. Helmholtz insisted that differences

in quality were all capable of explanation in terms of particular selection of partial forms, associated with any note and their relative intensities.

Every sound has a resonance, and this resonance is transmitted by the help of vibrations in the form of waves. Now, what do we mean by a resonance? A resonance is the result of vibrations of a sounding body, being communicated to another body. It can be said to be the throwing of one body into the co-vibration by another body. The resonance or free resonance is a sympathetic phenomenon of vibration of sound that evolves motion or vibrating body. The principle, underlying the phenomenon, was first promulgated by Galilio (1564-1642 A.D.), and was afterwards systematically worked out by Wallis, Marloye, Helmholtz and other Western scholars.

We hear and appreciate everything audible through the medium of ear, and it is a remarkable instrument that has been given to human beings. The ear is commonly divided into three parts, the outer, the middle and the inner ones. The outer ear is known as the pinna. sound-waves travel down the external auditory meatus, the hole in the ear and strike the tympanic membrane at its end, which is a band of skin that separates the outer and the middle ears. Music is produced either by human voice or instruments, and the sound-vibrations of music charm and captivate human hearts by creating sweet and soothing impressions (samskāras). So music is partly a conscious and partly a subconscious or unconscious act, and the subconscious exercise of motor nerves, says Banavia Hunt, can only be translated into the realm of consciousness in terms of subjective physical sensation.

Music, which is produced by the human voice, is transmitted with the help of vocal mechanism. Now the question arises as to how it is produced by the vocal cords. It is the product of a main wave, modulated by a number of subsidiary waves. The main wave takes form immediately in front of the larynx, holding vocal cords due to the vortices or rotating cores of pressure of air, which issue from the vibrant slit.

But how do the vortices produce sound? The air in the throat remains stagnant, until disturbed by jets of air pressure from the lungs. The vibrating cords, opening and closing in alternate sequence, inject vortices into the restricted passage of throat immediately above, which corresponds to the mouth-piece of a brass intrument. These progressive cores of air set up pressure vibrations in the stagnant air, each vibration occurring at the velocity of sound (11,00 feet per second) and the frequency per second corresponding to the number of vortices forming per second, and the number of complete vibration excuted by the vocal cords per second. Thus if the cords are vibrating at the rate of 25 times in one second, in that same space of time 25 vortices will be ejected into the throat by the cord, and 25 pressure vibrations will occur in the stagnant air of the throat. The acoustic result will be the sounding of middle C. Now the air in the throat, covering a restricted space, imposes a loud resistance on the vibrating cords and their associated vortex system, and in consequence, considerably enhances the efficiency of the acoustic output.

In fact, the wave-front, produced immediately in front of the cords, is amplified in the mouth, which acts somewhat as a horn or tube, terminating in a flare. The size

of the vortices, proceeding from the vibrant slit of the cords, also varies in accordance with the air of that slit, which can be adjusted within limit by the vocalist. As the latter sings an ascending scale of tones, he gradually reduces the diameter of the vortex rings until they become quite small in comparison with those he was manufacturing, when singing the lower notes. Since the cords execute a simple harmonic motion, the vortices produce the fundamental frequency only, but this simple wave is modulated by the vibrating air column and formant of the throat and larynx; hence the 'laryngeal voice', which is essentially embryonic and constitutes the main sound wave of the vocal system, consists of the fundamental and harmonics plus a small percentage of formant. The 'laryngeal voice' is amplified by the throat and mouth, but it is worthy of note that the singer is able to direct the sound column in the throat, either outwards towards the mouth or towards the pharynx. The directing . process is carried out by the adjustment of the cords, since the use of a section of cords propells the vortices and resulting sound column towards the soft palate or even behind it in the direction of head cavities; while the employment of the entire cord directs it towards the hard palate. In all cases, however, it must be understood that the sound is ultimately reflected into the mouth and is transmitted as a progression of spherical waves into outer space.

In dealing with the acoustics of music, something must be dealt about the musical instruments, specially about the stringed ones. Dr. E. H. Barton has elaborately dealt with the methods of construction, measurments and tonal qualities of different kinds of Western musical instruments in his book: A Text Book on Sound. He has divided the musical instruments into three chief divisions, viz. (1) the exciter, or means of producing vibrations; (2) the vibrating system; and (3) the manipulative mechanism for the production of the various notes of the scale for expressions, etc. The vibrating system, he says, may often with advantage be subdivided into a vibrator of definite pitch and a resonator which reinforces, and otherwise, modifies the sounds, produced by the vibrator.

Dr. Barron has further divided the characteristic features of the musical instruments into seven classes, and they are: (1) the range or pitch or compass of the instrument; (2) the interval relation of the possible notes or the scale of the instrument; (3) the power and delicacy of tones producible; (4) the noises accompanying the begining or finishing of the sounds; (5) the possible or inevitable change of intensity of the sounds while they last; (6) the quality of the sound after it is completely established by musicians often termed tone; (7) lastly, the instrument may be restricted to the production of one note at a time, or be capable of producing simultaneously two or more notes, i.e. it may be restricted to melody or capable of harmony.2 He has also scientifically divided the various musical tones into following five classes: (1) those with the full harmonic series of partials, i.e. including the prime the relative frequencies are 1, 2, 3, 4, 5, 6, 7, etc.; (2) those with harmonic partials, but forming only the odd series of natural numbers i.e. the relative frequencies are 1, 3, 5, 7, etc.; (3) tones with inharmonic

<sup>1</sup> Vide A Text Book on Sound (London, 1932), pp. 406-471.

<sup>2</sup> Ibid., p. 408.

partials; (4) simple tones, usually limiting cases of the foregoing three classes in which the upper partials are indefinitely diminished or suppressed; (5) tones with harmonic partials, but, whatever the pitch of the note, those partials near some one or more fixed pitches specially reinforced, the others being relatively discouraged.<sup>1</sup>

The human voice, whether musical or non-musical, possesses two units of element, primary and secondary. The first element, says Prof. Herbert Caesari, is the initiatory process, set in motion by the vocal cords, and culminating in the second columns; second is the resonance element which is derived from the various cavities. Bonavia Hunt is of opinion that when we speak of resonance, we mean one or two possible phenomena; either the sympathetic vibration of an air column, enclosed in a chamber or cavity. The former is represented by the bony and cartilaginous framework that holds the body together, the latter by the slightest prompting of the parent system. These resonators all impose their complex wave forms on the main wave when 'compted' to it, and modify and modulate it in such a way that both quality and intensity are profoundly affected.

Though real and abstract music is known by its manifestation of tones or different arrangements of tones only, yet to the mass or multitude it is manifested as the combination of tones and words. Generally speech (word) and song (tone) make music, expressive and recognisable. But there lies a difference between speech and song, and that difference is perceptible due to the use of vowels and

<sup>1</sup> Ibid., p. 409.

consonants attached thereto. Prof. Bartholomer is of opinion that, in general, song prolongs the vowels and shortens the consonants, while speech does not dwell on vowels, and, therefore, is occupied with consonantal sounds for a larger proportion of the time. In fact, a song or tune tends to prolong the vowels which means the vowels in general may be sung with an open throat and mouth, permitting power as well as beautiful quality, whereas consonants are usually produced by narrowing or more or less complete closures at one or more points between back of the tongue and the lips.

Song can afford to sacrifice speed for beauty. Speech, on the other hand, must usually get its message across as quickly as possible, and since the understanding of it is based largely on perceiving the consonants, they are usually sufficiently emphasized while many vowels are passed over as quickly as possible. Instead of an enlarged back throat resonator as in good singing, the result is then a more or less constant tonic construction of the throat during speech, because of the frequent occurrence of consonants without sufficient intervening vowels time to permit enlargement. Now, the positions of the larynx, pharynx, tongue, velum, lips, and other parts are almost constantly changing to a much more rapid degree than song. Besides another "difference between song and speech is that, in general, song follows a more or less strict melodic outline, sustaining for definite durations certain pitches in a certain scale, with relatively little but rapid sliding from one pitch to another, while speech has no formal melody, but slides constantly up or down depending on the sense of words to be inflected. The sustaining of certain pitches and qualities, as in singing,

makes it more difficult to understand the word, even if they are carefully pronounced".

Regarding the position of vowels in music, it can be said that when songs are composed and sung, attention is always given to the words and tunes of the songs, and special stress is laid on the pronunciation of the vowels. The vowels are taken to be the vital force or prana in Indian music, because they add aesthetic lustre and beauty to the ragas (melodies) and, consequently, to the songs (gitis) also.

The vowels are produced with open mouth i.e. with the open or untouched tongue and the lips, whereas consonants by narrowing more or less complete closure at one or more points between the back of the tongue and the lips. When songs are sung with the use of maximum quantity of vowels, they create greater number of emotional quality and enjoyabilty, whareas when they are sung with the use of greater number of consonants, they rather stand in the way of creating aesthetic lustre. By way of an example: while defining a rāga, Mātanga and Parśvadeva and others have said that when a rāga comprises greater number of vowels, it pleases and soothes the minds of those who listen to it. Matanga says in the Brhaddesī,

- (a) Svara-varņa-višeseņa dhvanibhedena vā punaḥ/, Rajyate yena yaḥ kašacit sa rāgaḥ sammataḥ
- (b) Yo'sau dhvani-viśeṣastu svara-varṇa-vibhuṣitaḥ/ Rañjako jana-cittānāṃ sa ca rāgaḥ udāḥṛtaḥ//

That is, when the combinations of notes are possessed of greater number of vowels and pronounced with variant sounds or intonations, the expert musicians call them raga,

because the notes create sweet impressions on the minds of men and living animals. Pārśvadeva too has said in similar vein in the Sangita-samayasāra.

In fact, the vowels are the emotional units, and they create maximum aesthetic feelings of calmness and joy in the hearts of living beings. Again, when consonants are pronounced or elongated, they take the help of vowles which make them pleasant and sweer. So a vowel is considered by the Indian philosophers as Siva or Puruṣa, while a consonant, being dependant on a vowel, is considered as Sakti or Prakṛti. Sakti or Prakṛti is inactive by herself. She becomes dynamic, when comes in contact with Siva or Puruṣa. The vowels, being independent and self-evolved, are full of concentrated energy, whereas consonants, being dependent on vowels, are not a free agent to create a peaceful and calm atmosphere.

Indian music is enriched by rāgas which are fully manifested in their ālāpas. The ālāpas are more lively than the songs, because ālāpas manifest themselves by the help of vowels, whereas songs being composed of different words, constructed of vowels and consonants, cannot create peaceful and delightful atmosphere which ālāpas do. In the Vedic songs, we come across the stobbas that used to elongate or lengthen the words or syllables, used in the sāmans, and it is for the use of the stobbas that the sāmans used to rouse a spirit of serene peace and blessedness in the hearts of the priests who used to perform the sacred sacrifices. The vowels are also the base (ādbāra) of the vocal tones, and they are pronounced in relation to their respective pitches.

Prof. Herbert-Caesari is of opinion that vowels are formed primarily in the larynx in an embryonic form, and

then completed, matured and reinforced by the variform cavities of mouth and pharynx. The five classic vowels like A E I O U and 12 vowels, A, AA, (a, a=朝. 朝 etc.) in Sanskrit and Bengali, are the basis of correct and good emotive singing. The correct reinforcement of the prime sound "is impossible if the throat is unable readily and accurately to adust itself in every part to meet and satisfy the exigencies of the particular vowels, or shade of vowels. Each vowel must be deliberately formed; they must each be visualised, felt and heard by the singer. By securing, feeling and hearing the vowels during such deliberate formation, the singer is able to control both the formation and the enunciation of the vowels as well as the direction taken by the relative columns of sound; by which mental-physical process the throat is rapidly moulded". So every vowel must be given a characteristic of its own, and its formation must always be deliberate, and that means a singer must memorize the exact sensation of every vowel, and he must develop a mental vision of the shapes of all vowels at all pitches.

It is true that fundamentally the mechanism of physical and mental activities is same or identical in all peoples in all countries and "it is precisely the variations of thought and of physical form which distinguish and divide them into races: race-physique". Similarly, voices are all moulded after the one and the same model, but yet "the slight variations of form and quality of the vocal organs, quantitatively and qualitatively distinguish one category of voice from the other, and the individual voices belonging to a particular category".

The natural voice is the good voice, which produces sweet, melodious and charming music. But what do we

mean by a natural voice? A complete natural voice is one "that, without training, is able to articulare, enunciate and sustain with perfect ease and freedom all vowels on all pitches in its particular compass. In other words, a voice that has no mechanical defects or difficulties, no matter the pitch or the vowels on that pitch, a voice is a voice in which exact laryngo-pharyngeal adjustments obtain automatically at any and every pitch with any and every vowel within its compass . . . A completely natural voice, while acoustically perfect and physiologically balanced, is not necessarily beautiful (although it often is); it can possess mechanical perfection and yet be divorced from beauty". But there are differences of opinion regarding the view, as expressed by Prof. Herbert-Caesari. Because good voice must always be adorned with beauty, and, therefore, it must necessarily be beautiful. The ideal tone or voice is a gift of God, and it cannot be said as to how it can be achieved and maintained. Such is also the opinion of all the master musicians of all over the world.

Now, all artists cannot attain the ideal tone, in which a quality is predominant, yet everyone should sincerely try to acquire a good and natural voice. It is also a fact that a good voice of a singer physiologically depends upon his sound physique, cool and balanced disposition and good thought. As exuberance of emotion destroys the creation of art, so absence of emotion or its excess stands in the way of creative art. Therefore, emotion of a good singer should always be measured and well-balanced, and be guided by reason and intel ligence with a sense of proportion.

In the Sangita-sastras, we read that the tones (svaras) and, consequently, the melodies (ragas) are the embodiments

of aesthetic sentiments and feelings (rāsas and bhāvas), and a singer is required to be competent to call them into action. The bare tonal structures of the ragas are in themselves devoid of life or energy, and life or energy in infused in the ragas by the artists through the medium of movements of the tones. It has already been said that the Nāradīśikṣā (1st century A.D.) has mentioned about five microtonal units like diptā, āyatā, etc. which are no other than the aesthetic force-centres. These five microtonal units (śrutis) form the fountain-head of twenty-two microtones, devised by Bharata in the Natyasastra. The tones again are the product of twenty-two microtones, nay, of innumerable tone-units that are surcharged with emotional sentiments. The ragas are the product of combination and permutation of tones, having ascending and descending series. Therefore, as the microtones, devised both by Narada and Bharata, are surcharged with emotional sentiments, so are the ragas, and so when a singer has learned to infuse balanced thought into the formation of tones and when he had learned the accurate laryngo-pharyngeal adjustments on all pirches with all vowels and the intimate relation of the latter to the former, and when such formation and adjustments are coolly deliberate, then his voice takes on a peculiar quality that is subtle and indefinitely but eminently attractive and satisfying. It is precisely the quality of intelligent industry that attracts, effects and rouses an audience.

A good voice is a boon to a musician. But this alone is not sufficient assurance for making anybody a good musician, for a good musician should be well-equipped with the knowledge of both theory and practice of music, Because practice without theory is barren and meaningless and vice versa. In fact, one is precondition to the other. A good musician should, therefore, possess perfect knowledge of microtones, tones and sidetones, together with that of the sonant, consonant, assonant and dissonant, alamkāra, tāna, gamaka mūrechanā and other music materials. He must have the knowledge as to what kind of emotional sentiments and moods are produced by different kinds of note, sharp and flat, and should also be an adept in the methods of their proper application in music.

First of all he is expected to conceive and idealise the divine pictorial forms of the rāgas in his mental horizon or ecstatic vision, and then transform and present them in material forms. He must bear in mind that Indian rāgas are not mere lifeless skeletons of tones or microtones, but are living, dynamic and beneficial bodies. He. therefore, should not indulge in mere mechanical feats of calculations of tones and statistics of tonal patterns of the rāgas, but must take them to be one of the material means to make his experimental knowledge perfect, and must also concentrate his mind upon the ideal of spiritual sādhanā.

Now a question has been raised by Prof. Vernon Lee as to what is the nature of music and what music does in the mind of the audience or hearer. To this he has said: "Since, from the psychologist's point of view, an art is not the material collection of objectively existing pictures, statues, poems or musical compositions, but the summing up of a set of spiritual processes taking place in the mind of the artist and in the mind of him who receives the artist's gift. Or rather, the work between the activities of the artist and those of the beholder or hearer. Indeed, musical aesthetics ought to be the clue to study of all other branches of art, first and foremost because the evanescence

of music's material makes it more evident that the work of art really is the special group of responses which is susceptible of awakening in the mind of its audience, including the composer himself, who mentally hears his own work in the process of building it up and taking stock of its whole and its parts.

"The enquiry what music is, therefore resolves itself, for those thinking like myself, into an enquiry as to what music does in the mind of the hearer; or, more correctly, of what the mind of the hearer does in response to the music which he hears. But the 'mind of the hearer' is not an individual entity; it is only a convenient average of the phenomena common to all or most minds of all hearers under examination. And the first result of such examination is to reveal that these hearers' minds, although similar in one or two main points which oblige us to classify them as hearers of music, are in other respects dissimilar, indeed so dissimilar that we are obliged to consider them as belonging to opposed classes. Therefore, before being able to say how music acts upon mankind as a whole, we have to enquire how music acts upon different categories of human beings; which, as already remarked, in another way of saying how minds or various categories of types of hearers act in response to the music they hear".1

However, self-analysis as well as self-confidence are essential qualities for every student and teacher of music. They should be cautious of the psychological attitude of different hearers. There should be a mutual understanding

<sup>1</sup> Vide Prof. Vernon Lee: Varieties of Musical Experiences in the "Problems of Aesthetics", edited by Eliseo Vivas and Murray Krieger, (New York, 1960), pp. 296-297.

between the artist and the audiences for better understanding of the greatness as well as the intrinsic value of music.

In fact, development of a musician depends firstly, upon his or her aptitude and devotion to the art, and secondly. to the understanding of perfect balance of voice, and thirdly, to concentrated attention on the rasatmakala of the suaras and the ragas. Musicians must bear in their minds that the rasatmakala of the svaras as wall as of the ragas forms the background of Indian music. He must, therefore, avoid vibratory and erratic application of voice or sound and also erroneous use of tones that spoil the spirit of a raga and consequently of a song. He must be conversant with the art of applying grace or sparsasvaras, mūrechanās, tānas, gamakas, etc. for making the ragas living. He must remember that music is both a science and an art, and as such it should be taken as a means to an end in human life and not as a meaningless exuberance of emotion and fanciful creation of the mind. He must know that music has a meaning that conveys the idea of freedom of the soul, and it takes men to the eternal haven of bliss and tranquillity.

## CHAPTER XIV

## THE ICONOGRAPHY OF INDIAN MUSIC

The term 'iconography' is derived from two Greek words eikon, meaning image, and graphia, meaning writing, drawing, etc. The term eikon is synonimous with the Indian word area or image. Therefore, the term icon signifies an object of worship, a figure that represents a deity or a saint, in painting, mosaic, sculpture, etc. It is, in some way or other, associated with the sacred rituals, connected with the worship of particular Divinities. Therefore, iconography is a special branch of knowledge or study that deals with the images of deities. Iconography of Indian music also connotes the idea of the study of figures, images, deities, and pictorial representations of the rāgas that form the norm of Indian music and are regarded as the presiding deities of music.

The word 'image' is derived from the old French and Latin word image, which signifies the idea of 'likeness', i.e. vimba or pratika. The idea of pratika as a symbol is found in the Vedas and the Upanisads, where spiritual aspirants are instructed to concentrate and meditate upon an object that represents the indeterminate (nirguna) Brahman. The 'ieon' or 'image' serves also the purpose of a sign or symbol which is used for an object. The science of iconography is also closely related to religion or religious cult that teaches one to realize Divinity in a man or in an object. Some argue that music, being an art, has no connection with religion or spirituality, But that is not correct. Because art is an expression or a

symbol of Nature, and it unveils as well as represents the exquisite beauty of Nature, which, in its turn, is the representation of the world-essence. Atman, that pervades, sustains, and animates the whole universe. Art unfolds the immanent as well as transcendent beauty and blessedness of the Atman that shines behind Nature, and as such art ever goes hand in hand with religion and spirituality.

Music in India is a superb creative art, infused with a religious feeling. Music is a spiritual sādhanā that uplifts the consciousness of man to the highest. It is not just a subtle fabric of tones and tunes, of fancy and dream, but is a dynamic spiritual expression. The ancient seers saw in their ecstatic vision the divine forms of the rāgas, realized them, and transmitted them to humanity. They realized the rāgas as both objective and subjective—material and spiritual ones, and not merely as the mert structures of tones and tunes. So a rāgas is a psycho-material object that spiritualizes both the body and the mind, and helps men to transcend both matter and mind, so as to get the luminous apperception of the Absolute.

Music is looked upon in India as a living art, having matter (sound) for its body and spirit (melody) for its soul. Or it can be said that the psycho-material body of music is the rāga, which takes shape out of the permutation and combination of tones and microtones, which are again surcharged with emotional sentiments and moods. It has already been said before that the seven tones have been divided into twenty two śrutis (microtones), and these śrutis have been classified into five species: āyatā, mṛdu. madbyā, karuṇā and dīptā. In Sanskrit Grammar, āyatā is derived as ā-yama-ta, the root, yama

meaning restrainc. Therefore ayata expresses the attitude of tranquility (santavastba) of the mind. Mrdu denotes the attitude of humanity, and it is derived from the root mrd with the affix ku. This type of mental trait is the outcome of complete surrender, ignoring the sense of egoism (dasya). Madbya expresses the sentiment of friendship (sakbya), and is formed out of the root 'man' with the affix 'yak'. Karuna is formed out of the root, ky-unan, which means the scattering of the affectionate sentiments (vatsalya-rasa). Dipta expresses the sentiment of self-dedication, and denotes sweetness (madburya). Therefore music finally aims at the eternal joy, and one can realize the blissful state of mind through music. The highest reality, nada-Brahman is itself a transcendent sentiment (raso vai sab). It has been said before that Muni Bharata has worked out twenty-two microtones on the basis of five emotive microtonal units, as devised by Nārada of the Siksā. And as the tones are the material forms of the combination of subtle microtones and the microtones in their turn are saturated with emotional suggestivity, so the tones and consequently the ragas are also surcharged with aesthetic lustre and beauty.

Music is a sign or symbol that signifies bliss and beauty, for which it really stands. The function of a symbol or sign is, in fact, to refer to that for which it stands. Some make a distinction between 'symbol' and 'sign' from the standpoint of logic. Dr. Stebbing has said that it is not possible to draw a hard and fast line between a 'sign' and a 'symbol'. What we understand, he says, is always a symbol in a sense. "Hence, to understand a verbal symbol is to know what it refers

to, i.e. to know the referend for which it stands". Prof. Russell has asserted that sometimes logical symbolism makes things difficult to understand, while, according to Prof. Whitehead, symbols have invariably been introduced to make things easy. But both the assertions are correct from different points of view, for, on the one hand, the vagueness of the symbol creates difficulty in grasping the real import of a thing or an object, while, on the other, clear and distinct symbol helps us to apprehend the meaning for which it stands. So music may be considered as an interpretative sign or symbol that clearly signifies its prime object, the universal Soul or Atman.

Benedetto Croce has said in connection with art in intuition that "the symbol has sometimes been given as the essence of art. Now, if the symbol be conceived as inseparable from the artistic intuition, it is a synonym for the intuition itself, which always has an ideal character". Dr. Freud has also termed the true symbol as the expression of an intuitive perception, "which can as yet, neither be apprehended better, nor expressed differently". Dr. Jung has called this symbol a sign, which signifies the intuitive perception of some things. While discussing about the formal structure of art and iconic signs and expressiveness, Professors Ritchie, Morris, and Hungerland have fully discussed this subject. Charles Morris has said that the work of are is, in some sense, a sign, and it is the basic doctrine of aestheticians from Plato to Dewey. It is an intelligible interpretation of the doctrine of 'imitation' to regard it as a theory of the sign-character of the work of art. The sign or symbol, therefore, works as a language for the communication of meaning and value.

Again, music is the language of the Impersonal. It is a symbolic medium, through which the solemnity and grandeur of the Divinity find expression in the visible world. Thus the musicology of India recognizes the rāgas as the very embodiment of the Divinity. The artists sing or play on instruments and the audiences listen to them. It means that through singing some songs or playing some instruments they worship the goddess of music, the Sura-Sarasvatî to receive her benediction. And for this reason both the acts of singing and appreciating are considered in India as a spiritual discipline or sādhanā, and through this sādhanā both the performer and the good listener of music find solutions to the mystery of life and finally attain God-consciousness.

Now, let us see how and when the idea or conception of the pictorial forms and images evolved in India. Dr. J. N. Banerjea is of opinion: "In India, iconism and aniconism existed side by side from a very early period, and this feature is also present even in modern times. Buddha could be represented by means of such symbols as the Bodhi tree with Vajrasana beneath it, his foot-prints, the stupa, etc., which were directly associated with him; in the Amaravati and Nagarjunakonda sculptures of the and and 3rd centuries A.D., we find him being depicted iconocally and aniconocally at the same time, though in the earlier Buddhist art of Central India he used to be represented only in the latter manner. Similarly, Brahmanical cult-deities could as well be worshipped in the Saligramas, the Bana-lingas and the Yantras, as in images...".1 Some are of opinion that worship of the Buddha image is very ancient, and from the Buddha image,

Vide The Development of Hindu Iconography, 2nd edition, p. 82.

image-worship itself came into being. Dr. Coomäraswämy has observed in connection with the representative of Buddha and Siva on coins thus: "In Buddhist art, we find at Bhārhut and Sānci the tree, wheel, etc., on or behind an altar, clearly designated in the inscriptions as Buddha (Bhagavato) and worshipped as such... Later on the figure of a human teacher takes its place upon the throne, the old symbols being retained as specific designations... In the same way with Hindu types; thus we find at first the humped bull alone, then a two-armed, and finally a four-armed figure accompanying the bull, once the representative of deity, now his vehicle, while other symbols are held in the hands as attributes".1

But, if we go the into Vedic literature, we find that the sacrificial stake (yūpa) was the symbol of worship long before the worship of the sacred mound or stūpa, which was recognised as the representation of Buddha. And so it will not be unwise to think that the stūpa-worship was designed after the Vedic yūpa-worship, which was conceived as the sacred seat of the Sun god, Mithra. The Sun or Mithra was once the chief deity of the Aryan race, and long before the Buddhist era, the worship of the sacrificial stake or yūpa as the seat of the Sun god was in practice in connection with the Vedic sacrifices, rites and ceremonies. Symbol-worship was, therefore, prevalent in India in the Vedic times, and this practice was also common amongst all the ancient nations of the world. Again, before the Christian era, Pāṇini (550 B.C.) and Patañjali (300 B.C.)

Vide Dr. Coomāraswāmy: The Origin of Buddha Image. Prof.
 C. Gāngoly has also dealt on this subject in his book, Origin of Buddha Image.

have mentioned it in their Astadhyayi and Mahabhasya respectively. In the Great Epics like Rāmāyaņa, (400 B.C.), Mahabharata (300 B.C.) and Harivamsa (200 B.C.), we come across the worship of sacred symbols. In the Rāmāyana, we find that after the exile of Sītā, Rāmacandra performed the Asvamedha sacrifice with 'Sītā represented by a gold statue. Besides, from all the historical and mythological evidences of ancient nations of the world, we learn about the existence of idol or image worship in connection with religious functions. That image-worship was prevalent in the civilization and culture of the prehistoric Indus Valley cities, is clear from the excavation of the mounds of Mohenjo-daro and Harappa, where idols of gods and goddesses have been discovered. Among the findings, we come across an image of the Mother Goddess, Durga and that of a Yogi with his eyes pointed to the tip of the nose, inscribed on clay seals which bear the stamp of exquisite workmanship. Many composite human and animal figures, together with the figures of deities, nude and half-nude, found on seals and amulets, excavated from the prehistoric mounds of Mohenjo-daro and Harappa, "very probably stand for divinities in their theriomorphic or therico-anthropomorphic forms, though many others are to be regarded as mere accessories. Most, if not all, of the above icons of cult gods were being worshipped by the people in those days". The Vedas and Upanisads prescribe symbol-worship (pratīka-upāsanā) for the spiritual aspirants, in order to help them to have a glimpse of the imperceptible transcendental Brahman in meditation. The reflection (pratibimva) of the sun in the sky has been compared with a mundane man, who is essentially the Brahman or Atman. The Upanisads also state that, in a sense, the reflection is

nothing but the Essence itself, for a face of a man is an index or reflection of the man himself. That is, reflection can stand for the object. All these go to show that symbolworship (pratibimua or pratīka-upāsanā) was prevalent in ancient India long before the advent of Buddhism.

Regarding the use of sculptures as symbols, we find that in the Buddhist period, sculptured representations of the life stories (latakas) of Lord Buddha, were carved in the stupas and cave temples of Amaravati, Bharhut, Badami, Ellorā, Elephançā, Mathurā, Gāndhāra, Sānci, Nāgārjunakonda, etc. The mural paintings of Bagh, Ajanta, etc. are also the genuine proofs of the use of human figures as symbols. Many of the Hindu temples of the post-Vedic period, including their dancing halls (natyamandir), are decorated with the sculptures of Naças, Naçis, Yakşinis, and different musical instruments like śankha, veena, venu, and different sizes of drums (mrdanga ot puskara). We thus get evidences of symbols in the sculptures and paintings that were chiselled and painted after the gods, goddesses. and sacred objects of the past. Now it is understood that idol or image worship generally developed in connections with the worship of divine and semi-divine beings, heroes and heroines in the remote past, though their conception differed in different countries possessing different tastes and temperaments.

In Vedic time, the res or stanzas, with notes, were known at the sāmans or sāmagānas. They were sung before the sacrificial altars for invoking the presiding deities like Varuṇa, Mithra, Indra, Agni and others. The gāndharva type of music evolved in the period 600-500 B. C. out of the remnants of Vedic music, though the former took different forms and shapes from those of the latter. The

later authors on music have observed that the mārga or gāndharva type of sacred music was meant for the celestial region. This dictum was of the period when the mārga or gāndharva type of music was replaced by the classico-regional or formalised deśī type of music, approximately in the 3rd-5th century A. D. Kallināth, the celebrated commentator of the Sangīta-Ratnākara has said that the jātirāgas, grāmarāgas and some of the anga or chāyā rāgas were included in the category of the mārga or gāndharva type of music. The gāndharva type of music used to be considered sacred, because it evolved out of the holy Vedic music. Again the gāndharva type of music was sung with the help of the rāgas (jāti and grāma rāgas) in different registers, rhythms and tempi and aesthetic sentiments.

Now, for enunciating the origin of the rāgas, the authors of the mythico-historical epics have taken the help of symbols for clarification of the subject in a mystic manner. They have stated that the five ragas evolved from the five mouths of the Lord Siva, and the rāga naṭanārāyaṇa, from the mouth of Devī Gaurī. We notice that the Siva-Sakti or Tāntric cult was predominant when the said conception arose. From the iconographical viewpoint the worship of the Siva-Sakti principle is very important. In the iconographical conception of music, Siva has been conceived in two ways, one, in the symbolic way, the phallus being the emblem, and the other, in the anthropomorphic way, the idol or image being the emblem. The practice of worship of Siva and Sakti is very ancient, as is evidenced from the findings of the prehistoric Indus Valley mounds. In some of the ancient rock-cut temples, Siva has been depicted as a five-faced god. The names of the five faces are: Sadyojāta, Vāmadeva, Agbora, Tatpuruṣa, and Išāna,

which are again the five aspects of the sun. The mythological interpretation of the origin of the ragas relates to the five mouths, and the five ragas have been conceived to correspond to these five mouth-cum-gods:

ı.	Sadyojāta	•••	Srīāga
2.	Vämadeva		Vasanta
3.	Aghora		Bhairava
4.	Tatpuruşa	•••	Pañcama
5.	Iśāna		Megha <sup>1</sup>

The five faces of Siva, as represented here, are the five symbols of the five main rāgas, and these symbols are no other than the icons. The five primordial elements (sukṣma-bhūtas) like earth (kṣiti), water (apah), fire (tejas), air (marut) and ether (vyoma) have been conceived as the symbols or signs of those above-mentioned rāgas. The primordial elements are signified by the vijamantras (mono cryptic letters) like lam, yam, ram, vam, ham (vi, vi, vi, vi). In Tantra, seats for the vijamantras have also been conceived, and they are known as cakras (force-centers or plexuses). The cakras are possessed of different colours and presiding deities (varnas and adbiṣṭḥūtrī-devatās), The five Tāntric code-languages (vija-mantras), plexus (cakras)

<sup>1</sup> It has been said in the Sangita-darpana, 160-162:

शिवशक्तिसमायोगाद्रागणां सम्भवो भवेत् ।

पश्चास्यात् पश्चरागाः म्युः वष्ठनतु गिरिजामुखात् ॥

सवीवकान्तु श्रीरागो वामदेवाद्वसन्तकः ।

श्रघोरात् भैरवीद्भूतत्पुरुवात् पश्चमोऽभवत् ॥

इशनाख्यान्मेधरागो नावारम्भे शिवादभूत् ।

गिरिजाया मुखाक्षास्ये नटनारायगोऽभवत् ॥

and colours (varnas) have also been taken as the symbols i.e. icons of the five ragas. They are as follows:

Five tace- cum-mouth of Siva	Primordial element	Vijamantra	Plexus (Cakra)	Rāga	
Sadyojāta	Earth (kṣiti)	Lam	Műlãdhāra	Śrīrāga	
Vāmadeva	Water (apah)	Yam	Svādbiṣṭḥāna	Vasanta	
Aghora	Fire (tejā)	Ratn	Manipura	Bhairava	
Tatputușa	Air (maruta)	Vaṃ	Anāhata	Pañcama	
lśāna	Ether (vyoma)	Ham	Viśuddha	Megha	

In the Täntric literature of the Buddhists, five dhyāni-Buddhas or Tathāgatas have been conceived in accordance with the five skandas, which were designed after the five material elements (pañca-bhūtas) of the Sānkhya philosophy. The five material elements were earth (kṣiti), water (apaḥ), fire (tejas), air (mant) and ether (vyoma). These five material elements, together with the five sense-organs (indrivas) evolved from the five potential or causal elements (tanmātrās), which were known as generic essences of the sound (śabda), touch (śparsa), colour (rūpa), taste (rasa) and smell (gbrāna or gandha). The five dhyānī-Buddhas were like the five emanations of Siva, known as Sadyojāta, Vāmadeva, Aghora, Tatpuruṣa and Išāna. The dbyānī-Buddhas evolved with their divine consorts or Saktis, having

five different vijamantras, vāhanas, mudrās and locations (sthānas) respectively. In the Advayavajra-samgraba, the five dhyāni-Buddhas have been depicted as five kinds of consciousness (jñāna) and they are: (a) suvišuddha-dharma-dhātujñāna = Virocana, (b) ādarša-jñāna = Akṣobhya. (c) pratyavekṣaṇa-jñāna = Amitābha. (d) somantā-jñāna = Ratna-sambhava, and (c) kṛtyanuṣṭhāna-jñāna = Amoghasiddhi. The same primordial consciousness manifest as five different forms. Now, the five dhyānī-Buddhas may be mentioned according to the five orders of emanations or faces of Siva as:

dhyānī-Buddhas	skandas	directions	colours	elements	loca- tions
1. Amoghasiddhi	sainskāra	north	green	kşiti (gandha)	legs
2. Amitābha	samjāā	west	red	apalį (rasa)	mouth
3. Ratna- sambhaya	vedanā	south	yellow	tejas (rūpa)	navel
4. Akşobhya	vijñāna	east	blue	marut(\$parsa)	beart
5. Virocana	rūpa	centre	white	vyoma(\$abda)	head

From both the charts of the emanations of Siva and Buddha, it is seen that the conceptions of primal emanations of the five ragas evolved purely on the basis of mythico-philosophical ideas of man.

In the Upanisads, the five faces-cum-mouths of Siva have been conceived as the five flames, i.e. blazing tongues of the sacrificial fire. The fire has been considered as the sacred symbol of Siva in the Vedas, as the sun is that of Visnu or Väsudeva. The five faces of Siva are also known as

(eastern), Bhairava (southern), Nandīvaktra Mahādeva (western), Umāvaktra (eastern), and Sadāsiva (the fifth face on the top known also as Isana). His three eyes, ten arms, the shield and trident, matted hair, tiger-skin all bear some inner significances. In the Visnudharmottara-purāņa, there are descriptions of the concrete forms of the various deities, including Siva. They are "almost invariably accompanied by references to such esoteric symbolism underlying them, and the Puranakara thus lays emphasis, on the face that what is being worshipped is not what it appears to be, but is something beyond it". Another Vedic name of Siva is Rudra, which corresponds to Agni or fire. The treatises on music have also mentioned fire and air, in connection with the origin of the causal musical sound (nada). been stated in the Sangita-Ratnakara (1.3.-6) as:

Dehastham vahnimāhanti sa prerayati marutam/.

Na-kāreņa prāņa-nāmānam da-kārarenamanalam viduh/, Jātah praņāgni-samyogāttena nāde bhidīyate//

The subconscious mind is the storehouse of energy, and it has been conceived as the eternal blazing fire in an inverted triangular altar ( \( \nabla \)). The triangular altar is the symbol of the subconscious mind or mūlādhāra-cakra. Not only musical sounds, but every particle and object of the world also evolve out of this causal fire, which is known in Tantra as the kāmakalā or kundalinī (divine latent energy). The kundalinī is the base of the causal sound or nāda, which is the fountain-head of music, and it has been conceived in a two-fold way, unmanifested (anāhata) and manifested (āhata). When the manifested subtle sound comes out through the medium of vocal chord, it is known as 'music'

or raga. Thus we notice that music has been manifested in manifold ways. Again, a symbol always stands for an object, and in music it has been conceived as a pointer to the real object that looms in the background of the symbol, and that object is Atman, which is the fountain-head of everything in the universe.

The supreme aim of music is to realize the Essence that shines behind music. So the ragas have been conceived as the media for the realization of the World-Essence, which is the source of all-knowledge, all-intelligence and all-bliss. The seers of music felt within themselves the necessity of animating the material structures of the ragas. Living under the spell of time, space and causation, they imagined form of the Formless and personified the Impersonal. They conceived the idea of the tonal forms, possessed of flesh and blood like human beings and thus deified the ragas. Then the invisible ragas became visible in material forms. Sometimes it is said that the visual forms and their corresponding conceptual ones (dhyānas) cannot be established on a logical basis, as the tonal structures of the ragas are not constant, being under the sway of change in different circumstances and different ages. Again, though the intuitive poets composed the conceptual forms or dbyanas of the ragas, yet some of them composed dhyanas of the same raga in a quite different way, which means that there cannot be a fixed standard of dhyana-themes of the ragas. But this argument or objection does not hold good at all. Because, by the change of the tonal forms (ragarupa) or lyrical texts (sahitya), the central theme or essence is never affected. As the one and unique Brahman, being the substratum of the changing phenomena, does not suffer any change in itself, rather its unbroken existence and

essence remain the same, so the number of placed (sharp) and displaced (flat or chromatic) tones, together with its tonal structures may undergo changes, but the basic ideal or conceptual character of the ragas does not change at any time. It should be remembered that the poets and the seets of music composed the conceptual forms (dbyanas) of the Ideal or basic Type of each of the ragas and not of their skeletal forms, and at the same time they considered the ragas as living, immortal and divine. In fact, all true and talented artists desire permanent peace of mind through the practice (sadbana) of music, and so through constant concentration and meditation upon the eternal Ideal of music (i.e. rāga), they attain that state. By way of example, it may be said that the conceptual forms or dbyānas of gods and goddesses like Siva, Kālī, Durgā, Gaņapati, Sarasvatī, Indra and others may be composed in different ways, but the central idea, together with the basis dhyanatheme remains always the same, just as though a man undergoes changes from childhood to youth, from youth to old age, yet the basic identity of the man remains the same. So the number of notes and description of conceptual forms may change from time to time, but their basic forms and intrinsic nature and value suffer no change at any time under any circumstances. According to the inscrutable law of nature, every thing in this world of space and time undergoes change, the old forms are replaced by the new ones and. the new ones by the newer ones, and so on, but it should be noticed that the basic character of every thing always remains unchanged. One thing may be described in manifold ways, the one and unique world-essence Brahman may be called by various names, but the Essence or Brahman is not affected thereby. The oldest literature of the Hindus,

the Rgveda has stated: "ekam sad viprā vahudhā vadanti", i.e. the one divine existence may be called by different names, but the fundamental existence remains the same. In fact, the conceptual forms (dhyānas) of the rāgas are known as the copies, prototypes or doubles, and so the icons of the rāgas may not be real by themselves, but they signify the Real that stands or shines behind the unreal or apparent. The seers of music are the worshippers of the real and not of the images of the rāgas, though it is taken for granted that they worship images or shadows of the rāgas. So we should not be confounded with the anomaly that the colourful conceptual forms or dhyānas of the old rāgas do not correspond to the new ones.

Now, what idea does the conceptual form (dbyana) of raga convey, and what is its true significance? It has already been stated that the conceptual forms are the media that help and intensify the inward tendencies of the artists, and thus enable them to understand and appreciate the intimate relation, existing between the tonal forms and the real divine forms of the ragas. It has been said before that in India, the ragas are not considered to be mere settings or skeletal structures of tones and tunes, but are taken as living ones, having in them real significance and value. The Vedic Rsis perceived the energising vibrations of the life-principle (pranaspandana) in every atom and molecule of the universe. They regarded the sentient and insentient beings of the world as the positive and the negative poles of the same The ragas themselves are neutral Brahman. divine and dynamic life-principle, and as such they should be studied and looked upon from the religio-philosophical as well as psycho-material viewpoints for the better

realization of their real import, deep significance and inner sublimity.

It may be asked as to why those sentiments and moods of the rāgas were given material forms. The answer is that it is a fact that men of the material contingent world of space and time recognise and appreciate everything through some concrete media. Though the ultimate aim and object of all mortals are to reach the transcendental unity and happiness, yet they live and move in this world of matter so long the real value of human life is not realised by them. The emotions and emotive feelings of the rāgas were also conceived as material forms for easy grasp and appreciation of the men of the material world. This conception became inevitable for men of music in order to visualize the intrinsic value and beauty of the rāgas.

Let us take as example of a comtemplative composition (dhyāna) of the rāga bīndola. Though there is no mention of any dhyana-mantra of the bindola in the Sangita-Ratnākara of the early 13th century A.D., yet Sārangdeva has given some contemplative descriptions of it, while describing its specific character and form. He has said: "geyo veere raudra'dbhute rase, vasante prahare makara-dhuaja-vallabhe", etc. From thus it is understood that the raga bindola is possessed of the sentiments like veera, raudra and adbbuta, and is meant for the spring season. Now the significance of the name of the raga is that which creates vernal atmosphere, and quickens the hearts of men with love, joy and hope. The raga bindola is, therefore, sung in the spring and specially in the holy festival, that takes place in the spring. In the 16th 17th century A.D., the contemplative poets composed the dbyana-mantra of the hindola thus: "dolasu khelasukhamadadhana", etc.

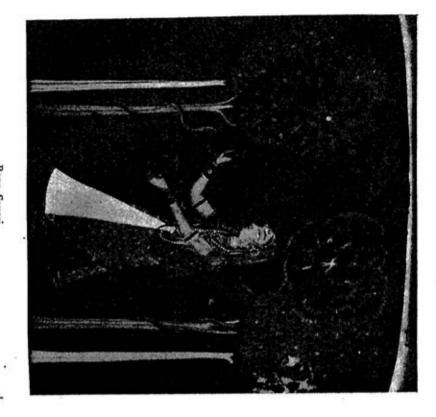

The ragas bindola has been represented here as a motive force that sways the hearts i.e. emotions and feelings of men. The raga has been described that he is rocking on a swing, surrounded by young lovely maidens. As has already been observed that the ragas of Indian music are not the mere lifeless structures of svaras, murcehanas, alamkaras, tanas, gamakas, ten essentials or dasa laksmanas and other music materials, but they are imbued with emotions that animate and elevate the mind and personality of the music artists and music lovers. As different contemplative compositions (dbyanas) are the suggestive descriptions of the same Divine Mother, of the unisere, so are the dhyanas of the ragas. Patañjali has called these suggestive descriptions as the symbol or vācaka: "tasya vācakah praņavah" i.e. the universal mystic word Om or Pranava is the vācaka or medium of expression. The contemplative compositions or dhyanamantras of the ragas are, therefore, essential for realizing the real and divine forms of the ragas, and this realization will guide men to the path of absolute freedom and eternal peace. So, music has been termed by some poets as the language for expressing the greatness and grandeur of the Beautiful, and as the ragas are the very core and foundation of music so they should be nurtured with care for realizing the divine essence of Indian music. The contemplative compositions or dhyana being the direct suggestive symbols of the ragas, should be taken as the essential media for visualising the devamaya-rupas of the ragas.

Again it may be asked as to whether the aestheric representations (rasa-rūpa) of the melodic forms or rāgas were in vogue before their pictorial representations (citra-rūpa) came into being; because it is a fact that the pictorial representations (citra-rūpa) as well as the contemplative

Raga Hindola

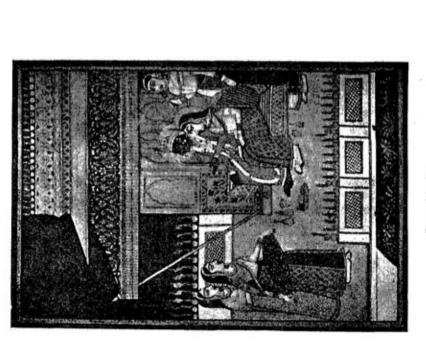

Persian influence
(Rajput painting, end of the 17th Century A.D.)

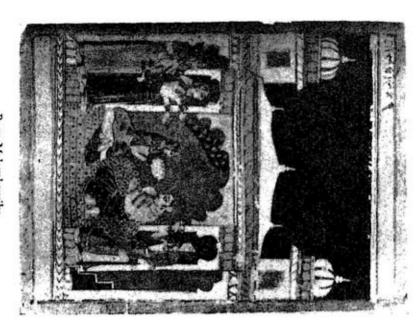

Raga Saveri (Rajasthani School, 18th Century)

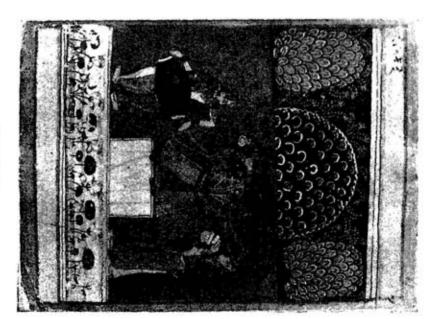

Raga Megha or Megha-Mallar (Rajasthani School, 18th Century)

Raga Dipaka (Rajasthani, 18th Century)

Raga Malavakausika (Rajasthani with Mughal influence, 18th Century)

Raga Vasanta (Rajasthani, 18th Century)

compositions (dhyana-rupas) of the melodic forms (ragas) were made in accordance with their aesthetic sentiments and moods (rasa and bhava). The answer to this question is that it is a historical fact that the contemplative compositions or formulae (dbyana-mantras) were first conceived by the intuitive poets in accordance with the aesthetic sentiments (rasas) of the melodic forms (ragas), and the colourful pictorial representations (citra-rupas) were afterwards executed according to those comtemplative compositions (dhyāna-mantras). From this viewpoint it can, therefore, be admitted that the nucleus (bijas) of the contemplative compositions or formulae as well as their pictorial representations already lie burried in the very depth of the conception of aesthetic sentiments of the melodic forms or ragas. In other words, it can be said that the conceptual forms of the dhyana-formulae of the ragas were in existence long before their actual representations from the painters' brush.

Regarding the existence of the aesthetic sentiments of the rāgas we find that Vālmīki has described in the Rāmāyaṇa (400 B.C.) the aesthetic sentiments of the seven suddha jātirāgas like ṣaḍjī, ārṣabhī, gāndhāri, etc.: "jātibhi saptabhiryuktaṃ tantrīlaya-samanvitaṃ// rasaiḥ śṛṅgāra-karuṇa-hāsya-raudra-bhayānakaiḥ/ veerādibhi rasairyuktaṃ "". In the Nāṭyaśāstra (2nd century A,D.), Bharata has also followed the rules as mentioned by Vālmīki. In the 29th chapter (Vārānasī edition, 1929) of the NS., it has been mentioned:

Şadjodicyavatī caiva // Şadja-madhyama-vāhulyāt kāryam śrngāra-hāsyayoḥ/// Ārṣabhi caiva ṣādjī // Veerādbhūte ca raudre ca ///

Rasam kāryamavasthām ca jñātvā jyojyāli projoktṛbhih/

Evametā vudhair-jūeyā jātayo rasa-samsrayāḥ//
—Nāṭyaśāstra, 29, 1-16.

In the 5th-century A.D., we find that Matanga has described about the intrinsic sentiments (rasas) of the jātirāgas in the rāga-laksana chapter of the Brhaddeśi: "bhinna-sadjah \* , vibhatsa-bhayanakan rasan" (p. 89); "bbinna-pañcama \* \* vibhatsa-bhayānakau rasau" (p. 89). etc. In the 9th-11th century A.D., Parsvadeva has also described about the ragas, having their respective sentiments. In the 3rd chapter of the Sangita-samayasara, he has mentioned: "su-payoh kampitascaiva śrngare viniyujyate", i.e. the raga vasanta should be sung with the application of the sentiments, srngara (3. 16); "sadjanyāsa-grahāmšasca rase veere prayujyate", i.e. the rāga śrī should be sung with the application of the sentiments, veera, etc.". In the early 13th century A.D., Sarangdeva has described the sentiments of the gramaragas in the 2nd chapter of the Sangita-Ratnakara: "kakalyantara-sanyukto veere randre'dbhute rase", i.e. the gramaraga, sadjagrama should be applied as representing the sentiments, veera. raudra and adbhuta (2. 29); "bhayanake ca veeradau rase", etc., i.e. the raga gauda-kauśika should be sung with the application of the sentiments, bhayanaka, veera etc. (2. 41).

In this way it can be shown that all the ragas used to be sung according to their respective aesthetic sentiments, for creating different emotional moods in the minds of the appreciative audiences. Thus the aesthetic sentiments of the rāgas were essential all the time and their contemplative formulae were composed not earlier than the x6th-x7th century A.D., as are evidenced by the Sanskrit treatises on music (Sangīta-śāstras) of that time. The Rāgamālās were drawn immediately after the composition of the dhyāna-formulae.

It has been said that in the hey-days of India, music was nourished and developed purely from the religious standpoint for material as well as spiritual upliftments of the human society at large. But gradually music lost its pre-eminence and ancient heritage, and became an instrument of secular delight at the hands of the laity and a sort of pastime with the royal dignitaties. Time has come when it should be revived and studied in its true perspective, and the responsibility of it rests on the shoulder of the present generation. Music is a means to an end, and it should, therefore, be cultivated purely from this standpoint.

It may be mentioned in this connection that some of the conceptual forms (dbyānas) of some rāgas appear dissolute and sensual. But it should be remembered at the same time that they are no other than the divine expression of the prime sentiment, śṛṅgāra, (Eros) which has been regarded as the first and foremost aesthetic sentiment by Bharata in the Nāṭyaśāstra, and also by the later Vaiṣṇava philosophers. The śṛṅgāra-rasa is the manifestation of the Beautiful. The nude figures, depicted on the temple facades of Jagannāth at Purī,¹ and other shrines of India might be due to the influence of the Tāntric Vāmācāra cult, but from the standpoint of artistic beauty and grace, their nudity does not affect the mind of the onlookers, nor sully

<sup>1</sup> These have recently been replaced by figures of different deities.

the serene beauty of art. The nude sculptural figures of the Yakṣinīs and the half-nude ones of some of the deities and the female attendants of the Royal household were not chiselled out for depraying the human taste, but they were considered as symbols, as it were, of the basic creative sentiment, śṛṅgāra. It should again be remembered that 'to the pure every thing is pure' and that art being an expression of the Beautiful, it is not a believer in the commonplace notions of indecency and indecorum. As light and shade—brightness and darkness—appear as different shades of the same resplendency which means beauty when viewed from different angles of vision, so both of them are indispensable media for the realization of the Absolute, the transcendental Beautiful.

Now let us illustrate some of the icons of some main ragas that form the fundamental features of Indian music. They are:

- 1. Bhairava: The raga bhairava represents the image of the Lord Siva. He possesses two hands and three eyes. The current of the sacred Ganges rushes down his tawny matted hair, the crescent moon is on his forehead, crawling serpents are in his hands, a garland of skulls is round his neck, and he is dressed in a tiger-skin. A shining trident and damaru (kettle-drum) are in his hands. He rides on the bull, Nandi.
- 2. Mālava-kaušika: He is a lovey youth. Though he drinks honey (madhu), yet he looks grave and serene. There hangs a garland of pearls round his neck, and he wears a blue linen. He is engaged in merry-making (rasa-krīdā) with fair young maidens.
- 3. Hindola: He is a lovely youth surrounded by beautiful young ladies. He looks like an embodiment

of love. The spring blossoms around him with all its beauty and lustre. He swings amongst the maidens who are playing the veenās and beating the drums. It is said that the Lord Siva created him out of his navel-lotus (nābhi-padma).

- 4. Dipaka: He is youth, and weats a red cloth. There shines a fine garland of pearls (gajamuktā) round his neck. He is always engaged in merry-making with the youths and young maidens. Riding on an elephant, he travels on hills and dales during night time. He sings a celestial song that soothes the heart of every-one and at the same time creates fire which destroys all the trees and animals of the forest on the mountain. It is said that dipaka-rāga originated from the scorching rays (eyes) of the sun.
- 5. Śrī: He wears garlands of padmarāgamani and sapphires. He shines like hundreds and thousands of suns and moons. He is seated on a golden throne, wearing a snow-white cloth, and holding a full-blown lotus. Some of his beloved maidens (nāyikās) are singing and dancing around him, and some others are playing on veeṇās and tamburās, accompanied with drums. It is said that śrī-rāga originated from the navel of the earth.
- 6. Megha:, He is of deep blue colour like that of the blue lotus. He wears the othre cloth (gairika), and his matted hairs appear like the cluster of clouds. He holds in his left hand a trident (triśūla) and in the right a sword (kṛpāṇa). He looks like a young warrior. In the descriptions of the icons of the rāgas, I have mainly followed Saṅgāta-taraṅgiṇā by Radhā Mohon Sen of Bengal. Besides these, there are other kinds of descriptions of the conceptual forms of the rāgas, composed by different poets.

Now, what is the exact time when the conception of graphic representations of the musical modes or raga-themes came into being? Nānālāl Chamanlāl Mehţā is of opinion that the idea was unknown to the poets, seers and the painters of the 15th century, and also to Sāraṅgdeva (early 13th century), who wrote his standard work on Indian music, the Saṅgīta-Ratnākara, in the court of the Yādava King Sihhana of Devagiti. Now, it was the common practice that the painters copied and translated the ideas of the poets, and those poets were no other than the seers of the rāgas and the sābitya of music. The intuitive philosophers, poets and seers of music furnished the intellectual and aesthetic materials of the conception of the pictures and stone-figures and set down the rules, on and within which the artists were free to express them.

Regarding the date of the emergence of the raga and ragini pictures, Mehta has further mentioned in the Studies in Indian Painting: "It is, therefore, probable that the Ragini picture first came into vogue some time in the 16th century, after the advent of the Moghuls, when the entire fabric of the common life of the people was undergoing a subtle transformation which found expression in the propagation of the cult of Bhakti, broadcast through the exalted verse of the Vaisnavite poets, and the inspired word of Chairanya... for unlike the Gupta renaissance, the 16th century revival was democratic in its nature and universal in its appeal. It is also interesting to note that there are Hindu as well as Moghul versions of Ragini and Baramasi (seasonal) pictures, which can be easily distinguished by their characteristic differences of style and treatment. Some of the Moghul melody-pictures have Persian inscriptions. A good Rajput Ragini picture has more of temperament and imaginative feeling, while the Moghul version is generally perfect as regards the splendour of its stage effects. The Rāmpur State Library has an excellent series of Rāgamālā pictures in the Moghul style of the late 18th or the early 19th century. Most of the Rāgamālā belong generally to the 17th and the 18th century and there are not many pictures which can be confidently assigned to an earlier period".

Now, before coming to any decision as to whether the Ragamala pictures first came in vogue sometime in the 16th-17th century A.D., let us discuss some of the comments, made by the experts in the field of art and culture. There is no doubt that the ancient musicologists formulated some theories of music, and the conceptual form of every raga was composed according to those theories. So far as the printed Sanskrit book on music is concerned, we get Pandit Somanātha's Rāga-vibodha (1609 A.D.), and in that book we get the conceptual forms or dbyanas of many of the ragas. Some are of opinion that Narada had already composed the conceptual forms of the ragas in his Pancamasārasambitā, generally ascribed to 1362 Saka, which corresponds to 1440 A.D. But there is a controversy regarding the date of the said book, and it is also a matter for investigation whether Nārada composed dhyānas prior to Pandit Somanath (1609 A.D.) Now, besides the tonal forms, the conceptual form of each raga has been conceived in two different ways, one, with the body of sound (nada-tanu) and the other, with the body of deity (devamaya-tanu). The colourful paintings of the ragas of the Rajasthani School were executed in Rajputana, and Dr. Coomaraswamy is of opinion that these paintings were executed from the early

<sup>1</sup> Mr. Meta has used the spelling 'Moghul' instead of Mughal.

13th to the middle of the 19th century A.D. He has said in his celebrated Kājput Paintings (Oxford, 1916): "Rājasthani paintings are those works which have been executed in Rajputana from Bikaner to the border of Gujrat, and from Jodhpur to Gwalior and Ujjain. We either know, or may infer that the great centres of Rajasthani paintings have been Jaipur, Orcha and Bikaner, and presumably Udaipur and Ujjain, possibly also Mathura at an earliest date ... Its period may be taken as from about the beginning of the 13th century A.D. when the Rajputs were disposessed of capital cities such as Delhi ... to the middle of the 19th century". Percy Brown is of opinion that the Rajasthani Ragamala paintings were executed from 1550 to 1900 A.D. Regarding the characteristics of those paintings, he has said: "This Rajput painting, for that in the title by which it has become designated, is essentially Hindu in expression, and in many aspects demonstrates that it is the indigenous art of India, a direct descendant of the classic frescoes of Ajanta."

Besides the Rājasthānī Rāgamālā pictures, there are Pāhaḍī, Mughal and post-Mughal rāgā-rāgiṇī paintings. The Pāhāḍī paintings of the rāgas evolved from the land extending from Jammu to Almorāh, and within this vast region, the paintings of Jammu and Kāṅgrā Valley were of greatest value. The Rājputs of the Kāṅgrā Valley protected the region from the invasion of the Muhammedans until 1806-1846. According to Percy Brown, the Rāgamālā paintings of Kāṅgrā reached the zenith in pictorial quality.

During the reign of the Emperor Akbar (1542-1605 A.D.), the Rāgamālā paintings were executed with new vigour and spirit. Basil Gray has said in connection with the

intermingling of the Mughal and the Rajasthani Arts: "He (Akbar) was the real creator of the school of Mughol painting as of the Mughol Empire". Mughol paintings of the ragas of that time were influenced by Rajasthani paintings, to some extent, because "the Rajput Rajas had a special position in the Mughol Empire..... The Rajas of the Rajput States now helped the vernacular renaissance by supporting the poets, musicians and painters, while at the same time, through them, the Hindu and the Mughol made contact".1 Regarding the Rajput portrait of the indigenous school, Prof. O. C. Gangoly has said that "after the development of Mughol school of Portrait in the early 16th century, the two schools, the earlier indigenous Indian and the later Mughol-got entangled and influenced each other. It is now, therefore, difficult from the products of the fusion of the two to recover the outlines of the earlier Hindu traditions and the few surviving examples seem to prove that the pure Rajasthani idiom has been practised side by side with the mixed Mughol style" (Marg. Vol. VII, Sept. 1954, No. 4, pp. 14-15). This can also be applied to the Rajasthani paintings of the Ragamala pictures. Prof. Goetz has also expressed the same opinion, while dealing with Rajput sculpture and painting under Raja Umad Singh of Chamba (Marg. Vol. VII, Sept. 1954). Many are of opinion that from the 13th-14th to 18th-19th . century, the Ragamala paintings and the visual raga-ragina pictures evolved with their exquisite beauty and colour.

The Bijāpur School of Rāgamālā paintings also reached its zenith under the patronage of Ibrāhim Ādil Shāh II.

<sup>1</sup> Basil Grey has used the spelling 'Mughol'.

<sup>2</sup> Prof. Gängoly has also used the spelling 'Mughol'.

He was a contemporary of Akbar and Jāhāngīr, and he "stove hard to evolve a distinctive Deccani culture which incorporated what was best in indigenous and foreign tradicions". Adıl Shah II was a fine musician and composer, and the Kitab-i-Nauras is a genuine proof of his musical talent. He composed many songs in bhopālī, malhār, gaurī, kedara, purab (pūrvī), kanada, dhanasrī, asavarī, ramakeli. maru, naurez (?), etc. Dr. Moti Chandra has said in his article, Portraits of Ibrahim Adil Shah II (Marg. Vol. V, No. 1, pp. 24-28): "It is interesting to note that in several songs certain ragas are visualised. Bhairava is visualised as Siva with the crescent moon upon the forehead, holding a human skull in one hand and crident in the other; he is served by the bull; he wears a tiger skin and serpence are his ornamenes. Malhar visualises rainy weather with dark clouds, the lightning, the trees with new leaves and dancing peacocks. Asavari is a beautiful young woman wearing red garments and yellow bodice; Kalyānī, again a charming woman, wears variegated indigo garments ; Karnāţī is visualised as a charming lady wearing an indigo blue sāri and blue bodice, and Rāmakelī is visualised as a charming girl of dark complexion playing with her friends". But Dr. Moti Chandra has raised some doubt whether these Deccani Hindi dhyana-- mantras are based on some Sanskrit text, which remains to be traced. To this it can be said that dhyana-mantras, though differing in their compositions or descriptions, are to be found in the Sanskrit texts on music by Pr. Somanath. Pt. Damodara, Narada of the Raganirupana, and others. Now, regarding the original quality of the Bijapuri style of Ragamala paintings Dr. Moti Chandra has further said :: 1 "If Akbar gave a new direction and outlook

painting in the North, it was Ibrāhim who brought the Deccani painting to a perfection which could claim for it an important niche in the temple of Indian Art'.

The Ragamala paintings of Murshidabad, Bengal are also worth-mentioning in this connection. "The first phase of Mughal painting in Bengal", says Robert Skelton, "begins with the decline of patronage of Delhi during the reign of Aurangzeb (1658-1707). The Murshidābād technique of Rāgamālā paintings really reached their zenith, during the short reign of Sirāj-ud-daulā, the young Nawab. Out of a set of four Ragamala paintings of the period in the collection of Mrs. D'Arcy Hart, one depicts Hindola-Raga (1755 A.D.) and the other Kakubha-Ragini (1755 A.D.). Among the paintings from other Ragamala sets of the same period, mention may be made of Syamagujjari-Ragini (1755 A.D.) in the collection of Bodleian Library, Bhairavi Ragini (1755-60 A.D.) and Kedara-Ragini (1770 A.D.) in the collection of India Office Library and also that of Vilavala-Ragini (1770 A.D.) in the collection of Victoria and Albert Museum". Robert Skelton has further stated that "a characteristic female type from the series is found in the Kakubha-Rāginī, where between two leafy, fruit-laden trees, the girl is watched by peacocks as she awaits her lover with garlands. Among paintings from other Ragamala sets, which can be assigned to this period, the treatment of Syamagujjari from an album in the Bodleian Library effectively draws us into its mood of quiet reflection. Another painting in the same collection depicts a young girl bedecked with jewels and garlands approaching a shrine at night, her supple charms emphasized by the sombre simplicity of the background. The row of

dark, rounded bushes edging the horizon in this picture is a characteristic Murshidābād idiom".

It can be said in conclusion that the pictorial representations of the rāgas of Indian music are essential for formulating the imaginative impulse which is responsible for transforming the abstract notes of music into concrete forms or images. The pictorial representations of the rāgas are necessary for visualizing the aesthetic or emotive essence of the rāgas, for the attainment of perfect peace and enlightenment in this domain of delusion.

#### APPENDIX TO THE CHAPTER XIV

The Dhyanamantrams and Sahityas of the Five Principal Ragas:

## ा भैरवः:--

(a) गङ्गाधरः शशिकलातिलकिन्नेतः
सर्वैिनभूषिततनुर्गेजकृतिवासाः।
भाखत्तिशूलकर एष नृमुग्डधारी
शुभाम्बरो जयति भैरव श्रादिरागः॥
1

<sup>1</sup> There are different descriptions of this dhyana.

(b) धैवतांश प्रहन्यासो रिपहीनोध मागतः । भैरवस्तु हि विज्ञेयः धैवतादिक मूर्च्छनः । धैवतोविकृतोयत श्रीडवः परिकीर्तितः ॥

- मालवकौद्दाकः (मालकोपः):—
  - (a) श्चारक्रवर्गो धृतगीरयष्टिः वीरः सुवीरेषु कृतप्रवीरः । वीरेर्युतो वैरिक्षपोलमाला-मालीमतो मालवकौशिकोऽयम् ॥
  - (b) पड्जप्रहांशकन्यासः सम्पूर्णः कौशिको मतः। मूर्छना प्रथमा ज्ञेया काक्लीस्वरसम्मतः॥

<sup>1</sup> There are different readings of this dhyāna.

# हिन्दोलः :—

- (a) नितम्बनी मन्दतरित्ततासु दोलासु खेलामुखमादधानः । खर्वे क्योतयुतिकामयुक्तो हिन्दोलरागः कथितो सुनीन्द्रैः॥
- (b) हिन्दोलको रिधत्यक्तः सलयः कथितो बुधैः । मूर्छना शुद्धमध्या स्यात् श्रीडवः काकलीयुतः ॥

# 4. दीपकः:--

- (a) वाला-रतार्थं प्रविलीनदीपे

  गृहेऽन्धकारे सुभनो प्रवृत्ता ।

  तस्याः शिरोभूषगारव्रदीपैः

  लज्जां तदानी कृतवान्प्रदीपः ॥
- (b) षड्जप्रहांशकत्यासः सम्पूणों दीपको मतः !मूर्छना शुद्धमध्यास्यात् गातव्या गायनै सदा ॥

<sup>1</sup> There are different descriptions of this raga.

## 5. શ્રીઃ:-

- (a) अष्टादशाब्द स्मरचारुमूर्तिः 1 धीरोक्षसत् पक्षवकर्णपूरः । पङ्जादिसेव्योऽरुखनस्रधारी श्रीरागराजः चितिपालमूर्तिः ॥
- (b) श्रीरागः स च विख्यातः सलयेण विभूषितः । पूर्णः सर्वगुर्णोपेतः मूर्छना प्रथमा मता । केचित्तु कथयन्तेन ऋषभलयसम्मतम् ॥

<sup>1</sup> There are different readings of this line.

### 6. **申**取::-

- (a) नीसोत्पलाभव-पुरिन्दुसमानचैलः पोताम्बरस्तृथितचातकयाच्यमानः । पीयूपमन्दहसितोघनमध्यवती<sup>र</sup> वीरेषु राजति युवा किस मेघरागः ॥
- (b) मेघः पूर्णा धवयः स्यात् उत्तरायतमूर्छनः । विकृतो धैवतो गेयः श्रकारस्यपूरकः ॥ —सङ्गीतदर्पणम् (Tānjore edition, 1952).

It should be noted in this connection that though the tonal forms of some of the ragas have now been changed, yet their dbyana-forms shall nearly be the same.

II

It has already been mentioned about the nadamaya and devatamaya forms of the ragas. Pandit Somanath (1609 A.D.) has described the nadamaya-rapa of the ragas in V. 11-12 (pancama-vivekab) and the devatamaya-rapa in V. 167-168. Pt. Somanath has said,

(क) सुखरवर्णविशेषं रागस्य वोधकं द्रेधा । नादारम च देवमयं तत्कमतोऽनेकमेकं तु ॥ १३॥

नादात्मेति । नादात्मकं पड्जादिसमूहरूपं ध्वनिमयम् । देवमयं च देवतः-देहमयं च । तद्द्विधिं रूपं कमतोऽनेकमेकं च ; रागस्य नादमयं तु रूप-मनेकम् ; देवतामयं त्वेकमेवेत्यर्थः ॥११॥

(ख) उक्तं रूपमनेकं तलद्रागस्य नादमयमेवम् ।
 श्रथ देवतामयमिह कमतः कथये तदंकिकाम् ॥
 श्रथ देवतामयमेककं कमतः तेनैवोहेशकमेण कथये । १६८

In fact, the nādamaya form of a rāga is the svara-rūpa (tonal or sound form), whereas the devatāmaya form is the dbyāna-rūpa (contemplative divine form). Regarding the devatāmaya-rūpa or divine visual form of the rāga, Prof. O. C. Gāngoly has said: "How can the language of words be translated into the language of visible forms? But the new discoveries of science in various spheres are achieving new miracles every day, and expert scientists have discovered common fundamental principles underlying the language of sound and the language of form. It has been proved that when sound develops a very large number of vibrations it can convert itself into visible forms. At such a stage audible things and objects become apprehensible on the path of our eye-sight. But these miraculous reconciliations of contradictory forms of natural phenomena do not much help us

to find a logical justification for representing musical forms in the effigies of visual forms and colours. This practice can only be explained on the basis of certain peculiar theories as to the essence of Indian melodies, enunciated by our musical sages. According to this theory, it is believed that each raga or ragini has its peculiar psychic form, corresponding to its sound-body over which the former presides as the nymph, deity or devata, the presiding genius or the god of that particular melody. These devatas of Image-Forms dwell in the supercerrestrial region-the Paradise of Musical Symphonies-from which ethereal region each melody could be evoked and induced to descend to this earth through the prayer of the musical performer with the aid of the definite of symphony, peculiar to each melody. In order to induce these angels of music, the ragas and raginis to descend from their Paradise to the dusty level of this earth of ours, our music practitioners have to undertake strenuous penances and sadhana and send up their prayers in peculiar shapes through different forms of meditative processess and formulas, to please these Angels through these melodies, descend on the voice of our singers and on the strings of our musical instruments. It is further claimed by our musical sages that by the recital of these dhyana-ślokas, that is to say, the contemplative verses describing the melodies, one can visualize the Angelic Forms of the raga-devatas. When these presiding Angels of melodies descend on this earth, being pleased with the adoration of our musical sadbakas by reason of their spiritual presence, this little piece of material earth of ours, at least, for a short time, is turned into a Paradise of melodies. and mortal man, through the medium of immortal melodies, have the chance of tasting the Ambrosias of Heavens".

Further he has said: "On the basis of these descriptive verses painters have prepared pictorial representations of most of the melodies in miniature sizes, the verses being quoted on the top of each pictures. ..... That these pictorial diagrams, visualizing the spirit and character of each melody, were prepared for the use and guidance of our music practitioners, is proved by the fact that at a certain stage the descriptive verses were composed in the Hindi language for the benefit of those who did not understand the Sanskrit language. At the time of Akbar, these descriptive verses were translated into Persian, as most of the musicians of the court of Akbar did not read the Hindi language, and for the benefit of this group the verses were rendered into the Persian language, and many pictures of ragas and raginis have survived, carrying the descriptive comments, written on the pictures in Persian script and language. ..... We have a complete vocabulary in terms of significant melodies to express the whole gamut of human feelings in all shades and varieties of moods, skilfully woven with the moods of nature, and related to our reactions to the various situations in life, of actions of love, of suffering, of enjoyment".1

<sup>1</sup> Cf. The Rājasthānī Painting: Illustrations of Rāgas and Rāgiņīs, in The Puṣpāñjalī, published on behalf of the B. T. Mill Ltd., Burhanpur. R. S. (Nimar) by Mr. A. R. Kanoriā, in 1957, pp. 85-87.

#### CHAPTER XV

# THE AESTHETIC-CUM-PSYCHOLOGICAL ASPECT OF INDIAN MUSIC

T

A study in the art and science of Indian music should be preceded an enquiry into the mystery of the unfathomable depth of one's being. Well has it been said by the eminent psycho-analyst, Dr. Jung that speech is originally a system of emotional and intuitive sounds,—sounds that express terror, fear, anger, love, sympathy, etc. Such is also the views of the Indian Alamkārikas and playwrights, headed by Bharata, Abhinavagupta, Bhojarāj, and others. Bhatata has expounded eight kinds of aesthetic sentiment that come out from the level of man's basic psychic content, and generate emotional feelings or moods, like terror, fear, love, etc. In music, these emotional moods (bbāvas) or mental attitudes manifest through the medium of the tonal sound.

Music is the combination of word and tune,—sāhitya and sura, nay, it is an emotional presentation of sounds or succession of sounds or tones—an emotional symbolism of man's inner depth. When the colourful tones are presented, both the musicians and the listeners cannot but help expressing their mental attitudes outwardly by the movements of head and limbs. The movements of the material body are exercised due to the reflex action, corresponding to the modifications of the mind. A rāga is an emotional product or emotive manifestation of the mental attitudes, and so it

expresses the aesthetic feelings of love, devotion, anger, hatted, egoism, etc. The intuitive artists saw in their ecstatic vision the emotional forms of the ragas, and the poets composed their contemplative compositions (dhyānas), corresponding to specific colours, movements and sentiments.

Music is an aesthetic representation of the artist's inner depth. It is rather a projection of artist's own mental feeling and imagination in the outer world. It is, therefore, a transformation or translation of the ideal into the real, or it can be said to be the production of the tonal form or picture, corresponding to that of the mind, combined with colour, pitch, grace, harmony, melody, successions of tones and microtones.

The inherent desires or impulses of man and all animals are the cause of outward manifestation of everything. A man designs the ideational form or image of a thing first in his mental plane and then projects it outside in materialized form. So all the material constituents of music are. in a sense, the mental construction, and have their being in the outside world, corresponding to mental images. Indian Vedantists also admit that the outward expressions are but the reflections (prativimba) of things behind the mind, and they are known as vimba, like the image of a human face on a mirror. It is a double or projection of the real face behind. Music is, therefore, a psycho-material or idealreal object, and so the intuitive artists cultivate music for appreciating both its forms, ideational and real-subtle and gross. In fact, music is designed, apperceived and enjoyed both inside and outside. As the First-born Lord, Isvara projects without efforts the manifold world from within, in order to witness and enjoy His own beauty

and glory par excellence, which is known as the sportive play (līlā), so an artist of music begins music with the help of tones and tunes from within and then enjoys the beauty, grace and grandeur of his own projection (systi). The works of construction and enjoyment of music happen simultaneously or co-existently, as Dr. S. Alexander says in some different way, in his Space Time and Deity that the enjoyed and the contemplated are together or compresent. He says: "The contemplation of a contemplated object is, of course, the enjoyment which is together with that object or is aware of it". The artist, therefore, doubly enjoys his creation or projection of music: first, the construction of his art, and then enjoyment in himself and appreciation from his sympathetic audiences. The case of a sculptor or a painter is the same. All the cultivators of Fine Arts, musicians, sculptors and painters, adopt the same process, in the construction or projection of their motifs or themes, though techniques and textures of their productions differ from one another.

Men sing and dance to express their feelings of joy and sorrow. They enjoy, they lament, and they express their awe and reverence, through the medium of colourful tones and balanced rhythms of songs and dances. Now, what is the cause behind? It is because the psychic content, that lies with him, stirs his emotion and makes him to create, project and enjoy music. It may be called the emotional side of the musical experience, which is known as sensuous appreciation and creation or projection. But psychologists, Revesz of Holland and Seashore of America are of opinion that though the concept of musicality is attached to the psychology of music, yet the musical experience in relation to emotion and sensuous

appreciation are not the entire thing in the field of musicality. Prof. Revesz says that we must hold fast to the thought that the musical aesthetic is the beautiful in music; and it is the real core of the matter as far as musicality is concerned. It has a reference to the autonomous emotional effect of music, to the pleasure, deriving from the specific musical intellectual form of the art creation, which, in musical persons, can arouse responsive feelings and create aesthetic experience or emotive feeling.

The aesthetic content is an important thing in the domains of psychology and philosophy of music, and it should be experienced and appraised. But such an experience is mental or psychical in its character, and so it must be inwardly digested and fashioned. So it must be taken that a musical person is possessed of a deep understanding of musical form and structure, together with the inward aesthetic content and its consciousness. In truth, it is the inward tendency of the musical person to dive deep into the mood of music and get a relation to it, which has an effect on his whole spiritual being.

Prof. Revesz is of opinion that a man of music who truly and sincerely seeks to appreciate the aesthetic content of music, that lies deep at the bottom of tone, tune and colour of the musical composition, profoundly feels as though he is creating the art. Therefore musicality is an inborn quality "that requires (as is also capable of) development—irradiates the whole individual, and accordingly forms a characteristic trait of the personality as a whole". Prof. Carl Seashore and psychologist Johannes von Karies are almost of the same opinion, though they differ from Prof. Revesz, regarding the symptomatic characteristics of musical aptitude and musical talent.

Now, what do we mean by aptitude and talent? These two things are essential in the creative or interpretative field of music, together with the real appreciation of both the psychological and aesthetic contents. By aptitude we mean the inhorn capacity of a person, that helps him to realize and develop certain general or specific types of behaviour, properties, and capacities. Therefore aptitude is a potential ability and a native latent endowment, by means of which productive powers may be realised through the operation of environmental factors and the systematic training of the personality.

On the other hand, talent indicates capacities far above the average in a special field of human activity. Talent is specially evident in the realm of music like prodigy. It has been divided into two types, the creative and the reproductive-interpretative. Though sometimes they manifest simultaneously in one person, yet they seem highly independent. But inspite of all these things or capacities, one should lay paramount stress on the spontaneous musical inspiration, welling up from the depth of the unconscious. The unconscious or subconscious layer is the original base of the psychic content, and it sends forth inspiration and creative urge, to compose or compile music and to create beauty and life-force in it. The unconscious or subconscious layer is the 'vast field', say Swamis Vivekananda and Abhedananda, where hundreds and thousands of impressions (samskaras) of past and present incarnations of every living being lie burried. These embeded impressions or psychic contents are the prime-mover of characters and habits of all living beings.

Psychology of music is exclusively concerned with the awakening of the flashes of the primal psychic force-centre.

The study in the psychology of music brings unto us a clear understanding as well as an intuitive perception of utility and importance of the force-centre, and it gives us a full realization of the real object and ideal of the musical contents. The great laboratories like those of Bell Telephone Company, Harvard and Iowa Universities of America, have made considerable researches on the psychological aspect of music, which have enriched the Western musicology. We are glad to know that in India, the Deccan College of Poona has started researches on physics and psychology of music under the able guidence of Dr. Sankaran, Dr. B. Chaitanya Deva and others. Similarly the Indian Institute of Science at Bangalore has started psychological study and research of Indian music. Their scientific findings will undoubtedly help us to unravel many things of music, that still remain as mysterious, unsolved or unexplored in the field of musical study. The University of Jabbalpore and that of Annamalai, Madras are also making experiments on the effect of music on the properties of matter and plants. from the standpoint of Organic Chemistry and Botany. All these new constructive experiments and researches on Indian music will pave the path of the artists and the musicologists to visualize and interpret music in a better and more logical way.

#### II

It has already been said that sound is the flesh of music, and melody, emotional sentiment and mood are its blood. Sound evolves in a successive order from the subterranean self. "The science of sound", says Dr. Miller, "is related to at least three phases of human endeavour, the intellectual,

the utilitarian and the aesthetic". The Indian Tantra and other philosophies admit more than these three phases.

The field of science of sound still ramains unexplored. Hermann Helmholtz was a great German scientist of the nineteenth century, and his book, The Sensations of Tone explored the mystery of structure of musical sounds and their intervals, nature of voice production and hearing, and development of musical scales, pitch, colour, etc. After him, Keönig, Raybigh, Boehm and other eminent scientists made observations and experiments in the field of sound theory. The scientists of the twentieth century, like Sir James Jeans, Sullivan, Einstein and others have thrown much light on the field of musicology. The psycho-analysts like Dr. Freud, Dr. Adler, Dr. Jung and others did some work on the origin of the sound, and have declared that the unconscious or preconscious is the origin of the gross sound. The Tantra also states that the unconscious or kundalini is the seat of the causal sound or nada. The gross sound can be classified into two main heads, musical and non-musical. The unmanifested sound is the causal one and it is known as the anabata-nada. The manifested sound is known as the abata-nada.

Sound becomes musical when it is pleasing and soothing. The succession of sounds that pleases and soothes the minds of men and animals are known as 'rāga', and the very name of it expresses the true significance of it ('rañjayati iti rāgaḥ'). Bharata, Sāraṅgdeva and other authors on drama and music have described ten specific qualities (daśavidhaguṇas) to determine the nature of a rāga, and those qualities are: pūrṇa, prasanna, madbura, ślakṣṇa, sama, rakta, vikruṣṭa, sukumāra, alamkṛta and vyakta. Vālmikī also says in the Rāmāyaṇa (400 B.C.): 'sabitau madburaṃ

raktam sampannam svara-sampadā. The quality, rakta signifies the pleasing sounds, emanating from veenā, venu or vamšī and vocal chord of man. In the early Christian era, Bharata has also determined the ten characteristics of a rāga, which are strictly observed even to his day, in both the Northern and Southern systems of music. But in spite of all these qualities and characteristics, the psychological aspect of music is concerned with the aesthetic or emotional side. The psychology of music states that emotional sentiments are the fountain-head of music, and they animate music with living sensation and feeling.

Now, what are the emotional sentiments (rasa) and moods (bhava)? The emotional sentiments are the aesthetic qualities or properties of the mind (psyche), and they originate from different attitude and environmental conditions of it. Now the very connotation of the term rasa, says Prof. S. N. Sastri, is "that which can be relished' ('rasyate iti rasah';" 'āsvādyatvāt rasah'). Effect of the relish of rasa, metaphorically called flavour, is very wondertul. It creates an ecstatic joy in the heart of the enjoyer, and leaves upon him an impression of delight (lokottara-ananda). It is compared to the bliss, enjoyed by a Yogin when he is in unision with the Self. The relish of rasa creates a concentrated state of mental harmony (sattuodreka) unadulterated with any other element of human nature; and for this reason, irrespective of nature and substratum of a particular type of rasa which is relished, there is an outcome of joy to a sensible person (sabrdaya). That is why when karuna-rasa or bibhatsa-rasa with grief and disgust as their basic features produce a state of jubilance in the mind of the enjoyer, and elevate him far above the region of human limitations and transport him to the realm

of total bliss ("rase vai sab, rasam labdhvā ānandī-bhavati" "Taittiriya Upanisad, II-VII). It is so possible for the simple reason that an enjoyer, in course of his cognition (bhavana) of a rasa, feels that his individual existence in this world. which is subjected to diverse disabilities by virtue of his birth, caste, status, wealth and other circumstances, sinks, and he is in full sympathy with the sentiment which is an expression of Self. This enjoysome attitude is the result of the force of fruition which is again a mental operation or an effectum mentis called bhogakrttva-vyāpāra. These two forces of cognition and fruition (bhavakatva and bhogakṛtva respectively relieve the enjoyer of his individual existence and identifies him with the substratum (alambana) of the rasa. The cumulative effect of these two forces is to remove the collateral obstructions from the course of identification, which are caused by such factors as distance of time, place and personality, including feeling of unapproachability to the other alambana of rati, felt by the relisher in case of the śrngāra-rasa. The mental fusion (druti) is the result of the sentimental relish (rasāsvāda), which has a maddening effect having an oblivious tendency".1

The Vaiṣṇava philosophers classify the emotional sentiments (rasa), into eight or nine classes. In the Bhaktirasāyaṇa, eleven kinds of emotions are prescribed for achieving the highest kind of love (prema), which makes communion with all-love God possible. The Vaiṣṇava sādhakas mention that the permanent aesthetic feeling (sthāyī-bhāva) is the only means of attaining the celestial love, which knows no selfish return and material gratification.

<sup>1</sup> CI. The Laws and Practice of Sanskrit Drama, vol. I (1961), pp. 258-259.

The Upanisad says that the all-beautiful and all-love God is the emotional feeling Itself: "raso vai sah". Madhusudana Sarasvatī says in his Bhaktirasāyaņa (1. 10) that the all-bliss God is transformed into emotional feeling: "bhagavān paramānanda-svarūpah svayameva hi " rasatāmeti".

In the Bhaktirasāyana, Madhusūdana Sarasvatī says "ata stadeva bhavatvam rasatām yāti," i. c. the modal consciousness (vrtti) itself is manifested as the aesthetic sentiment (rasa). Bhatata says in the Natyasastra (VI. 32) that the permanent emotional sentiment (sthayi-rasa), together with the moods evolves as vibhava, anubhava, vyabhicaribhava: "vibhavanubhava-vyabhicari-rasa-samyogad-rasanispattib". He says further that as medicine is made from the extract of many herbs and vegetables, so the emotional sentiment grows from the combination of different mental moods. Śrī-Sańkuka, Bhatta Lollāta, Abhinavagupta, Viśvanath Chakravurty and others and the authors of the Bhaktirasāmytasindhu, Ujjvalanīlamaņi, Bhaktisandarbha, Pritisandbarbba, etc. also deal with the permanent emotional sentiment or sthayi-rasa. The teachers of music like Narada, Sarangdeva, Somanäth, Dāmodara, Ahobala and others have discussed elaborately with this subject in their respective works.

Bharata has elaborately dealt with the theory of sentiment in the sixth chapter of the Nāṭyaśātra. He poses the question, as to what is meant by rasa. Rasa is said to be an experience (anubhūti). As a man is pleased with a good taste of rice and different kinds of delicious vegetables, so we get experience of the permanent emotional sentiment, originated from different kinds of mental moods, gestures and postures. Bharata says that rasa and bhāva are coexis-

<sup>1 &</sup>quot;Atrāha-rasa īti kah padārthah/ ucyate-āsvādyatvāt/katha-

tent, one cannot evolve without the other, as a tree comes out from a seed, and again it bears fruits with seeds. But rasa is a primary one, and bhāva rests on it.

Dr. S. K. De has said in connection with the definition or interpretation, as advanced by Bharata in the Natyasastra that "by its ambiguity taxed the ingenuity of his followers and led to a great deal of controversy regarding its true interpretation; and as such writer tried to explain it in his own way, it gave rise to a number of theories on rasa. There are four such theories associated with the names of Lollaça, Sankuka, Bhatta Näyaka and Abhinavagupta; but Jagannatha (Rasagangadhara, p. 28) speaks of eight different interpretations".1 Dr. De is of opinion that Bhatta Lollata appears to have been one of the earliest formulators of such an explanation. But his work is unfortunately lost, and it is said that Abhinavagupta's Abhinavabharati (commentary on the Natyasastra) deals with most of Bhatta Lollata's theories or views on rasa. Most of the scholars are of opinion that while explaining Bharata's theory of rasa, Lollata "took the vibhava as the direct cause (karana) of rasa which, therefore, is an effect (anukārya or utpādya), and the term nispatti of Bharata should be explained as utpatti or pusti".2

māsvādyate rasah/yathā hi nānū-vyanjana-samskṛtamannam bhunjānā rasānāsvādynti sumanasah puruṣā harṣadīmscadhigacchani tathā nānā-bhāvābhinya-vyancitān vāgāngasattvopetān sthāyibhāvānāsvādayanti sumanasah prekṣakāh harṣādīmscadhigacchanti/tasmānnātyarasā itya-bhīvyākhyātāh//"—Nātyasāstra, VI. 32 (Baroda edition).

Abhinavagupta has said in the Abhinavabharati: "Etaduktam bhavati—na rasanāvyāpāra āsvādanam/api tu mānasa eva". In fact, the aesthetic sentiments are felt or realized through the medium of mind.

<sup>1</sup> Dr. De: History of Sanskrit Poetics, vol. II (1960), p. 117.

<sup>2 1</sup>bid., p. 118.

Mammata and his followers have made Lollaça's interpretation of rasa more clear by saying that the permanent mood or sthayin is directly connected (mukhyataya vrttya = sāksāt sambandhena) with the hero, and, therefore, the rasa resides in the hero. But there is an objection to this theory.1 Sankuka rejects the interpretation of the utpatti-vadins, who are said to follow, in their peculiar theory, the Mīmāinsā school of philosophers. "Sankuka, on the other hand, thinks that the rasa is not produced as an effect, but inferred by the spectator, and the inferred feeling is relished ... The realization of rasa, therefore, is a by him as rasa. process of logical inference, and the nispatti of Bharata's sūtra is explained as anumiti, vibhavas standing to rasa in the relation of anumapaka or gamaka to anumapya or gamya".2 Dr. De says that vibbavas, therefore, do not constitute either the efficient cause (kāraka-hetu) or the logical cause (jnānakabetu) of rasa, as held respectively by Lollaça and Sankuka. Bhatta Nāyaka maintains that rasa is enjoyed in connection with the vibhavas through the relation of the enjoyer (bhoktā) and the enjoyed (bhojya). So abhidbā, bhāvakatva and bhojakatva, these three different functions are necessary for the realization of the aesthetic sentiment or rasa. word, bhavakatua or rasa-bhavana is derived from Bharata's general definition of bhava. According to Bhatta Nayaka. rasa consists in the sthayi-bhava or permanent mood.3

Dr. De estimates that the theory of rasa, as advanced by Lollata, is akin to that of the Mīmāmsā philosophy, the

<sup>1</sup> See the detailed discussion in Dr. De's History of Sanskrit Poetics, vol. II (1960), pp. 118-119.

<sup>2</sup> Ibid., pp. 119-120.

<sup>3</sup> Cf. detailed description in Dr. De's History of Sanskrit Poetics, vol. II (1960), pp. 123-127.

rasa-theory, as advanced by Sankuka, is akin to that of the Nyāya, and the rasa-theory, as advanced by Bhatta Nāyaka, is akin to that of the Sankhya philosophy to some extent. In fact, Abbinavagupta is of opinion that the realization (pratiti) of rasa results from its manifestation (abhivyakti) by the power of suggestion, and consists of a state of relish, known as rasanā, asvāda or carvanā. "What is manifested, is not the rasa itself, but its relish; not the mood itself, but its reflection in the form of a subjective condition of aestheric enjoyment in the reader. This state or relish partakes no doubt, of the nature of cognition ... ".1 This rasa-theory is advanced or determined generally by the dhuani-school. The dhuani-school adopts "the moods and feelings as an element of the unexpressed, and tries to harmonize the idea of rasa with the theory of dhuani or suggestion".2 Dr. De is of opinion that the elaboration of the rasa-theory, however, by this school (dhuani-school) in the direct tradition of Lollaga, Sańkuka and Bhatta Nayaka, is associated by Mammata and others with the name of Abhinavagupta. All the later writers of the dhuani-school, from Dhananjaya to Jagannatha, have accepted, more or less, this theory of rasa.

Bharata has given the elaborate description of eight kinds of emotional sentiment or rasa, and they are: sṛṅgāra, hāsya, karuṇa, raudra, veera, bhayānaka, vibhatsa and adbhuta (creative, laughing, lamenting, attacking, valorous, fearful or rapid expanding, ridiculous and surprising sentiments). Bharata has mentioned them as,

<sup>1</sup> Ibid. pp. 131-132.

<sup>2</sup> This view is generally maintained by Anandavardhana and his followers. But it should be remembered that there is some difference in the general theoretical positions of Anandavardhana and Abhinavagupta.

Sringara-hasya-karuna-raudra-vira-bhayanakah/ Vibhatsadbhuta-samiñau cetyaștau nățye rasah smrtah / / -Nātyašāstra, VI. 15

Viśvanath and other Alamkarikas have admitted the motherly feeling or 'tenderness' (vātsalya or vātsala) as the ninth emotional sentiment. But the modern authors on Alamkārašāstra include 'calmness' (šānta) as the ninth rasa. From the eight kinds of sentiment (rasa), eight emotional moods (bhavas) originate, and they are: affection, laughter, grief, anger, ridicule, fear, hatred and surprise (rati, hasa. śoka, krodha, upahāsa, bhaya, jugupsā and vismaya). Bharata has stated them as.

Ratir-hūsaśca śokaśca krodhotsāhau bhayam tathā/ Jugupsā-vismayaśceti sthāyī-bhāvāḥ prakīrtitāḥ// -Nātyašāstra, VI. 17.

It is a fact that Bharata has not mentioned about the santa-rasa, which develops from nirveda or sama, in the Natyasastra, and instead of it he has described the ādirasa, śringāra (but in the Kāvyamālā edition, of Bombay. of the NS., the ninth rasa, śanta has been mentioned). The santa-rasa brings tranquillity of mind. The sattvikabhavas of the santa-rasa are horripilation, perspiration, cool tears and change of voice. But according to Bhatta Prabhākara, śānta-rasa can prevail only in the śrāvya-kāvyas, and not in the dramatic literature or nataka. "But later rhetoricians like Jagannatha ably refute this view and believe that even the scenic art can, without prejudice, admit the ninth rasa. In actual practice also, the view of Jagannatha finds support in plays like the Bhatrhari-nirveda".

The very few canonists like Viśvanātha believe in the existence of the tenth rasa, vatsalya or affectionate sentiment, "which subsists between the parent and child, guru and his pupil, and all such individuals related inter se as persons in loco parentis et fili, like the ruler and the ruled. But all such feelings are subject of hhāvadhvani, and for the reasons detailed above they are incompetent to prevail as durable states and develop into independent rasas. Even Paṇḍitrāja Jagannātha, the most modern and rationalist among the classical critic canonists does not feel inclined to go far beyond the dictum of Bharata in recognising eight rasas and to favour the loose opinions of poeticians like Rudratā and Bhojadeva".1

Bharata and the post-Bharata poetics regard the sex-emotional feeling (śrngara) as the primary one. It is, in reality, the primary divine impulse of creation or creative urge and an outward expression of the subconscious or unconscious mind, which has been described by the authors of the Tantra and Yoga philosophies as kāmakalā or kundalinī. The kāmakalā or kundalinī is no other than the unmanifested divine creative energy that lies latent in the bed of the basic centre of consciousness, known as the mūlādhāra. As ic is in itself unmanifested, it is known as the coiling energy, and the Tantra philosophy has described it as a serpent that moves in a crooked way and thus symbolises the expression of dynamicity. The latent as well as the potent phases of the kundalini is said to be the undivided Prakrti, the undifferentiated consciousness. In Vedanta, the latent kundalini may be compared with the avyakta Iśvara, whereas the potent one, as vyakta Isvara or Hiranyagarbha, from which the manifold universe evolves. It is the 'hunger' (tanhā) as

<sup>1</sup> Ci. Dr. Surendra Nath Sastri: The Laws and Practice of Sanskrit Drama (Varanasi, 1961), pp. 284-85.

the English philosopher, T. H. Green has said, and the kāma or tapah, as mentioned by the Upaniṣad. It has been alligorically described in the Upaniṣad that Prajāpati, the Creator desired to be the 'many' and he manifested him as many or the manifold universe. The divine desire (kāma or samkalpa) of Iśvara-Hiranyagarbha was the product of the basic sentiment, sīngāra-rasa. It is, therefore, absolutely different from the 'libido' or narrow sexual impulse, as advocated by Dr. Freud. Drs. Adler and Jung have called it an 'energy of life' or a 'psychic energy' that forms the background of all kinds of desire and impulse of all living beings. Bergson calls it as élan vital, which may be compared with the dynamic phase of the cosmic energy or Prakṛti. The Alamkārikas have divided the śīngāra-rasa into two, and they are vipralambha and sambhoga.

Bharata has elaborately described about the emotional sentiments with their classifications in his monumental work, Nāṭyaśāstra in the 2nd centnry A.D. He has said that the original emotional sentiments (rasas) are four in number, and they are śṛṅgāra, raudra, veera and vibhatsa. From them originated successively hāsya, karuṇa, adbhuta and bhayānaka.¹ All these sentiments are possessed of colours (varṇa) and presiding deities (devatā). The seers of music have imagined that everything in this world is animated with the life-force or energy. The authors of drama and Alaṃkāra have divinised the rasas, bhāvas and chandas. The authors of music have described the tones and tunes,—the rāgas and rāgāṇīs as divine and living. Bharata has mentioned about the colour of śṛṅgāra-rasa as blue-black, that of bāsya as

<sup>1</sup> Cf. Nātyaśāstra (Vārānasī ed.), VI. 39-41.

blue (asita), those of raudra, veera, bhayānaka and vibhatsa as white (kapota), red, yellow (gaura) and black respectively. The presiding deities of the rasas, śṛṅgāra, hāsya, raudra, karuṇa, vibhatsa, bhayānaka, veera and adbhuta have been conceived as Viṣṇu, Pramatha, Rudra, Yama, Mahākāla, Mahendra respectively (—Cf. NS., VI. 42-45).

The basic jātis (jātirāgas) used to be sung according to their respective emotional sentiments (rasas): "jātayo rasasamsrayāḥ" (NS. 29. 16). Bharata has said that the tones of the rāgas should be produced, according to eight emotional sentiments, and the sentiments of the seven tones might be used in two different ways:

 Yo yadā valavān yasmin svaro jāti-samāśrayāt/ Tat-prayukte rase gānam kāryam geye prayoktr-

bhih/, /.

Madhyama-pańcama-bhuyiṣṭam hāsya-sṛṅgārayor-

Şadjarşabha-prāyakṛtaṇ veera-raudrādbhuteṣu ca// Gāndhāra-saptama-prāyaṃ karuṇe gānamiṣyate/ Tathā dhaivata-bhuyiṣṭḥaṃ vībhatse sa-

bhayanake//

-Natyaśastra, (Varanasī ed.), 29. 12-14.

II. Hāsya-sṛṅgārayoḥ kāryau svarau madhyama-

pañcamau/

Ṣaḍjarṣabhau ca kartvayau veera raudrād-

bhutesvatha / /

Gāndhāraśca niṣādaśca kartavyau karuņe rase/ Dhaivataśca prayoktabyo vībhatse sa-bhayānake//

-Ibid, 29. 17-18

The former one has been mentioned regarding the dominant tone of the ragas, whereas the latter one for ordinary tones of the ragas. In the Sangita-Ratnakara, Sarangdeva has mentioned about the distinctive colours of the tones, which are produced according to the vibrations and pitches of the sounds of the tones. Sarangdeva says,

Padmābhaḥ piñjaraḥ svarṇa-varṇaḥ kundaprabho'sitaḥ/ Pītaḥ karvura ityayaṇ.....//1

The commentator Simhabhūpāla has made it clear, when he has said; "padmābho rakta-varņah sadjah, rsabhastu piñjara īsat-pītavarņah, gāndhārah svarņa-varno tipīta-varņah, madbyamah kunda-varņah subharah, pañcamo sīta kṛṣṇa-varṇah, dhaivatah pīta-varṇah, niṣādah karvuro vicitra-varṇah".2

#### III

We know that the vibrations of the atoms produce electricity, sound, light, aesthetic sentiments and emotive feelings, etc. As light and sound can be perceived and felt, so also the colours, sentiments and emotive feelings. Similarly attempts for determining the colour-theory of the musical tones were made in the West. Specially from the middle of the 18th to the middle of the 19th century A.D., the seven specific colours of the seven musical tones were made clear. Besides Louis Bertrans Castel's attempt, we find that George Field (1787-1854) appropriately determined the respective colours of the seven (European) tones. In 1816, Field first published his Chromatics or the Analogy, Harmony and Philosophy of Colours. In working

<sup>1</sup> The Sangīta-Ratnākara (Adyar ed.), Vol. I (1943), p. 96.

<sup>2</sup> Vide the Appendix attached to this chapter.

out his analogy with music, he associated the tone C with blue, E with red, and G with yellow. The Diatonic Scale thus became:

C = blue G = yellow

D = purple A = yellow-green

E = red B = green
F = orange C = blue.

But Prof. A. B. Klein said that this determination of Prof. Field was not correct for his inadequate knowledge of physics and chemistry. Yet, in spite of his shortcomings, Field must be given credit for some very original theories. Afterwards F. O. Macdonald adopted the Newtonian scale, and published his thesis on Sound and Colour, in which he proved the colours of the seven tones as,

C=red

D = orange G = blue E = yellow A = indigoF = green B = purple.

Prof. Klein said that Macdonald's estimation was not correct for want of proper mathematical value. But after Macdonald, Sir William Barnett, the Science Master at the London International College made a much more thorough investigation of the vibration theory of colour harmony. He found that the succession of colours in the spectrum was red, orange, yellow, green, blue, indigo and violet, and likewise, the succession of the musical tones in the scale was C, D, E, F, G, A, B.

After Barnett, Edward Lacy Garbett, F. J. Hughes and others made investigation upon the colour theory. F. G. Hughes was a great-nephew of Erasmus Dārwin and a cousin of Chārls Dārwin. In 1883. he published the

thesis, Harmonies of Tones and Colours, and adopted the following Diatonic Scale;

C=red

D = orange G = blueE = yellow A = violet

F == green B == ultra-violet.

In 1881, Theodor Seemann published his thesis on The Laws of Colour-Harmony, based on Hay's paper on Laws of Colour-Harmony, and he found the colours of the tones of the Chromatic Scale as follows:

C=carmine F=green-blue

CH = scarler G=blue
D= orange GH = indigo

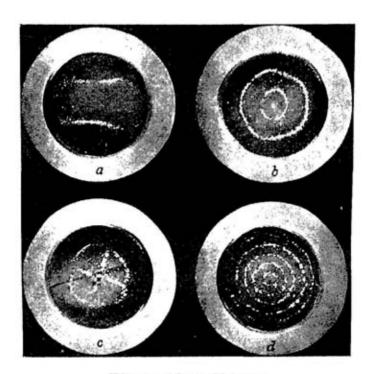

D# = yellow-orange A = violet

E = yellow A H = brown

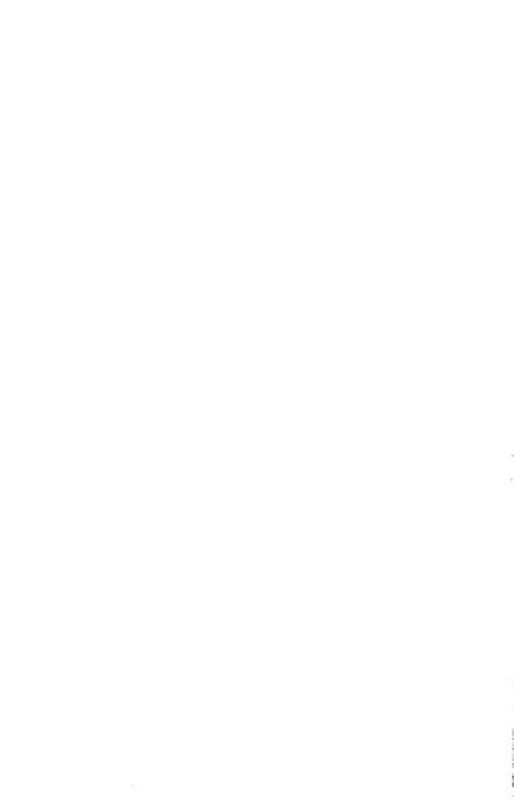

F | = green C=carmine.

Prof. Seemann remarked:) "We thus see that the colour scale consists of colours and shades in their vibrational order as in music, ascending and descending by semi-tones". (vide also Mrs. Sargent Florence's devisement on the similar Chromatic Scale). But in Prof. Klein's opinion, Seemann's investigation was also not correct. After Prof. Seemann, Prof. Campbell, Prof. Wilkinson, Rood, Helmholtz, Ruskin, Church and others made investigations upon the colour-theory in relation to the musical tones, and new lights were thrown upon the subject.

Dr. P. S. Dubash has summarized the opinions of the Western savants, regarding the colour perception in the book, Colour Psychology in his own way. He has mentioned that Mrs. Christian Ladd Franklin forwarded his theory that the eyes are the medium of colour vision, and

Vibrations of sound in sand.

in their act of vision some photo-chemical actions take place. Eyes contain two kinds of photo-chemical substances. "One of these is decomposed by all kinds of light, and by their action of decomposition on the nervous organs of the retina gives the sensations of black-grey-white series; the other is decomposed in a particular way by red, green and blue lights, and gives these colours and their mixtures". Von Kries called this theory of Franklin as 'duplicity theory', and Marion Luckiesh favoured this theory and said, "this theory is based upon anatomical evidence of the existence of rods and cones in the retina. The former are assumed to be responsible for achromatic sensations and the latter for both achromatic and chromatic sensations. The rod action is supposed to be largely responsible for sensation of light at twilight illumination, and is in general move responsive to rays of shorter wave-length. The cones, however, are supposed to act only under stimuli of brightness, represented by the range above twilight illumination and not to be greatly increased in sensitiveness by dark adaptation".1 But Dr. F. W. Edridge-Green differed, to some extent, from Luckiesh regarding this stimulation. According to his theory of visual purple, the decomposition of the visual purple by light chemically stimulates the ends of the cones, and a visual impulse is set up which is conveyed through the optic nerve fivers to the brain. The cones do not contain the visual purple, but the rods contain it between them, yet the visual purple affects the cones and not the rods. Edridge-Green maintained that the visual impulses

<sup>1</sup> Vide Colour Psychology (1944) published by New Book Company, Bombay.

of colour, caused by the different rays of light, differ in character just as the rays of light differ in wave-length.

Now it can be asked as to how the colour of a thing or an object is perceived. Well it has been said by Swamī Abhedananda, in his book, Doctrine of Karma (1947; pp. 129-30): "You see a beautiful colour in a flower. If you analyse it and study carefully, physiology will tell you that you do not see any colour there. There is no colour. There is some kind of vibration of ether. It is a play of light, and light is nothing but vibration. But an ignorant person says, 'I see it, here it is, how can I deny it?' It is true that he cannot deny it. But what he sees and feels is not just exactly what it is in reality. There is a certain kind of vibration which comes from the flower and produces a kind of inverted image on our retina. And that image even we do not see, but that image produces a molecular change in the optic nerve and in the cottex of the brain at the back of our head, and then it is translated into feeling or sensation. Then we try to trace the cause of that sensation, and by the law of causation we see it is there. That flower has caused this sensation, and we call it red or yellow or whatever colour you may call it. The colour could not exist if you did not have the optic nerve, the retina and the brain". Now, from the phenomenal viewpoint, colour and other sense objects have existential and conditional values, and, therefore, colour is pragmatically seen and felt. The colour, as produced by the vibrations of the sound-units of the ragas, is, therefore, possessed of practical value. In music, colours are the medium for the

<sup>1</sup> Vide-Dr. Dubash: Colour Psychology (1944), p. 6.

appreciation of distinctive tonal forms of the rāgas, and so they are important from the psychological viewpoint. They may be the product of the vibrations of the light of the sun, but yet they produce some sensations of tones and tunes in the brain of the artists as well as of the audiences.

But there are differences in opinion regarding primary colours. Some Western scientists hold that primary colours are red, green and violet, because, they say, the spectroscopy cannot break up green into blue, and yellow and violet into blue and red. Some again differ from it. In the Rayeda, we find red, white and black colours have been mentioned as the primary ones : "lohita-śukla-kṛṣṇāṃ" ('लोहित-शुक्त-कृष्णाम्'), and from the mixture of these three, other colours were made. But the scientists of the modern time differ somewhat from the names of the primary colours as mentioned in the Veda. Regarding the perception of colours, George E. Thorp said that musical tones and their respective colours are coalescent i.e. "they are produced simultaneously by the same agent, they are inseparable and also have equal prominence. Therefore colour audition is not the mere association of the idea of colour with tone, but an actual sensation". "After studying for months," he further said in his paper, published in the Edinburgh Medical Journal, "I first noticed that it was the slight movements of the base of the tongue, when singing the scale which produced these changes in quality, colour, and form of the tones. Moreover certain movements of the tongue had the effect of projecting the tones from the mouth, while others seemed to detain them in the throat and impart to them a peculiar throaty quality. In singing words, the tongue moved from base to lip, and on this account the same words sometimes had several colours, qualities and forms. Thus in 'holy' the

"ho' used to be hollow in sound and dark brown in colour; when the tone is more intense, the colour is red. The law governing change of colour I have observed to be the same as far change in quality, viz the change depends upon the number, order, and relative loudness of the upper partials in the tone". Mr. Thorp made an experiment of this theory on the 20 blind men, and found the following colours, associated with the sound of musical notes: C-blue, D—navy blue, E—bright yellow, F—brown, G—green, A—white and B—black. "The brightness of musical notes", he says, "was altered according as it was played in a higher or lower octave; but each note preserved its own colour, E and F sharp giving rise always to a yellow photism".2

Do (key-note)—strong, firm. Re—rousing, hopeful. Mi—steady, calm. Fa—desolate, awe-inspiring.

So-grand, bright.

La-sad, weeping.

Ti-piercing, sensitive.

We cannot but be reminded of the Beetheven enthusiast who claimed that a single chord, nay even a single semiquaver, of his favourite master contained more emotional quality than all the music of Bach added together".—Cf. Science and Music (7th impression, 1953), pp. 184.

<sup>1</sup> Cf. Colour Psychology, pp. 128-129. Cf. also Dr. Miller: The Science of Musical Sounds (New York, 1922), pp. 118-120.

<sup>2</sup> Sir James Jeans also admitted the emotional qualities of the scales, modes and notes of music, while discussing about the problem of Key Characteristics, in connection with harmony and discord. Regarding it, he discussed the views of Plato and Helmholtz, and said that the "power of subjective imagination seems to be very strong. Some hearers even claim to find emotional qualities in individual notes—here is a list from Curwen's Standard Course of Lessons and Exercises in the Tonic Sol-fa Mathod (1872):

Dr. Dubash has given some genuine illustrations of the effect of colour perceptions in his book, Colour Psychology, and have come to some decisive indicative conclusions. He says that (a) the white colour has no such perceptible vibrations, and, therefore, is ineffective; (b) yellow is ineffective and is not pleasant; (c) black is unpleasant because of too much effectiveness; (d) there is an audible difference of tone and pitch in colours; (e) red is the most pleasant to the ears though some consider green and even black as most pleasant. The colour sense of the musical tones can be known as the psychic or sixth sense, and so it should be regarded as different from gross physical sense to some extent. It may be called as an intuitive perception of the colour.<sup>1</sup>

Again, Prof. A. B. Klein carefully dealt with the different problems of colour-music and coloured light in his illuminating book, Coloured Light: An Art Medium, published second time in London in 1937. In this book, he forwarded that as arts are no other than languages for conveying ideas, so one invidual wishes to make another partake of his experience, and the struggle to find the integral word to embody the idea is the essence of the artistic spirit. The special art-language have, therefore, evolved in response to the need for man to convey to his fellow creatures his perception and experience of certain relations of order in the universe as perceived and experienced by him under the limitations of time and space. "The colour-musician", said Prof. Klein, "will be concerned with ideas which arise from the relation between the physical world revealed by light, the physiological structure of the visual organ, and the imaginative spirit of Man. These ideas are ideas of order, of balance, of harmony, in their relation to visual experience".

<sup>1</sup> Vide pp. 138-145.

Prof. Klein's research and labour have created a new sensation in the fields of sound and light, though he followed his great predecessors, who worked hard in the same field in the past and the present. Prof. Klein informed us that Louis Bertrand Castel was probably the first to imagine the existence of an independent art of colour-music. Now the word 'colour-music' connotes the idea of lightmusic, which means the sound-vibrations correspond the light-vibrations that have emotive value, and cause emotions in the mind of sensible creatures. In Castel's opinion, at every period, light has been compared to sound. Such is also the opinion of Rev. H. R. Haweis. Rev. Haweis maintained in his Music and Morals that colour-art, exactly analogous to the sound-art of music, is possible, and is amongst the arts which have to be traversed in the future, as sculpture, architecture, painting and music have been in the past. In the middle of the 19th century, A. Wallace Rimington discovered his theory of colour-organ and proved that sound-music and light-music might be simultaneously performed to the mutual enhancement of their respective emotional effects. After him Louis Favre was also a pioneer in the field of colour-music. He also subscribed his opinion that music occurs in time and not in space, and that a colour-music could either take place in space as in the case of juxtaposed or moving colours, or in time, as in the case of a changing coloured light, filling the visual field. He thought that colour-music likely to develop first of all on the lines of the latter one.

During 1900 A.D., E. G. Lind made fresh research on the subject, and found that colours of sound (colours emitted from sound) could distinctly be visible from the human voice. From his observation of seven spectrum colours and seven notes in the diatonic scale, the following comparative values of sounds and colours were found:

Vibrations of Sour	Vibrations of Light					
C - 259		•••	Red	-	476	billions
D - 289			Orange	_	511	**
E - 322		•••	Yellow	_	546	,,
F - 343		•••	Green		588	**
G - 385	***	***	Blue	-	630	
A - 427			Indigo		665	**
B 483		•••	Violet	-	721	

Now the human eyes are sensitive to vibrations of very great frequency; "but the range of rapidity of vibrations between the red and the violet is only in the proportion of about two to one; that is to say, the vibrations which produce violet light are a little more than twice as numerous as those which give the sensation of red light. For otherwise is it with the ear which can hear regular vibrations as low as thirty-eight a second—the period of the lowest audible musical note (i.e. the lowest audible musical note has a frequency of some 16 vibrations per second)—and as high as 38,000 vibrations, which is about the pitch of the squeak of a bat. The proportion, it will be seen is 1,000 to 1; and that is a preliminary reason why it is difficult to attune colour to sound. It is pethaps also a reason why sound affects the senses more than colour".

With regard to direct translation of music into colour, Prof. Lind said: "The two arts, (colour and music) so far in harmony as we have shown, it might be assumed that what would please the ear in one should please the eye in another. If, then, a musical instrument could be constructed that when performed upon, coloured sound would be produced, we might expect lively tunes to emit bright colours, and sad and minor tunes subdued and secondary colours, and pleasing and sympathetic sounds, colours of a like nature". After Prof. Lind, Thomas Wilfred Alexander Burnett Hector, M. Luckiesh, R. A. Houstown, Lewis Barnes, Leonard G. Taylor and others worked on the same field of experiment and research, and they came nearly to the same conclusion regarding the colour theory in relation to musical sound.

While discussing on 'past and present proposals', Prof. A. B. Klein said that the musicians have appropriated the word colour principally to describe the sensous charm of art of music. The musicians of the 19th century specially used the word colour to describe the transformation in effect, which results from the use of various combination of a given musical idea. The psychologists have carried out certain investigations "as a result of which the conclusion has been reached that colours unquestionably possess what is known as emotive value".

A band of scholars, artists and scientists also made research on the field of psychological effect of colour-music, based on the experiments on a polyphonic music. Prof. N. A. Wells was one of them, who made research specially on the effective value of colours, which showed "a remarkable agreement, in a large number of subjects, as to the moods awakened by the simple pure colours of the spectrum and purple". Afterwards, Smith, Wasburn, Crawford and Dr. C. S. Myers developed this method, after employing divisions of perception type, equally applicable to colour appreciation. Prof. Klein ably gave a historical review of the past masters, who let their solid opinions, regarding the value of the problem of colour of the musical sounds.

From his survey it is known that Aristotle (384-322 B.C.), Leonardi da Vinci (1452-1519 A.D.), Sir Isaac Newton (1642-1527), Lonis Bertrand Castle (1688-1757), Robert Warving Därwin, Dr. Thomas Young, Goethe (1749-1832), Hermann von Helmholtz (1821-1894), John Ruskin (1819-1900) and others admitted that musical sounds carry in them the emotive value that inspires and animates men. The Munsell Colour System, Typor System of Colour-Harmony, Tudor-Hart System of Sound and Colour have also added value to the discovery of colour-music.

The emotional sentiments and moods are the means through which men and women, irrespective of caste, creed and colour, appreciate and enjoy music. The Indian Poetics are of opinion that without emotion, music is barren and lifeless. So the authors on music, ancient and mediaeval, have conceived of colours of the tones, which have also been approved by the scientists and psychologists of both the East and the West. Sārangdeva has described the colours of the tones, together with their presiding deities, which are no other than the symbols or signs of the respective tones. The Sangīta-Ratnākara has described these colours and deities as follows:

Notes	şadja	rşabha	gāndhāra	madhyama	pañcama	dhaivata	niṣāda
Colours	padmäbha	piñjara	svarņa	kunda- prabha	asita	pīta	karvura
Deities	Agni	Brahmā	Sarasvatī	Śarva	Śrīśa	Gaņa	Iśvara

Like Bharata, Sarangdeva has mentioned that the notes, sadja and rsabha should be sung in veera-rasa, the note, dhaivata in vibhatsa and bhayanaka rasas, the notes,

gāndbāra and niṣāda in karuṇa-rasa, and the notes, pañcama and madbyama in bāsya-rasa. The tones and tunes or melodies (svaras and rāgas) have also been depicted as living forces and deified as gods and goddesses.

#### IV

The latter authors of music have classified ragas into three classes and they are masculine, feminine and neuter. They have recognized the raga-bhairava as the foremost raga: bhairavah adi-ragah'. Most of the authors are of opinion that the raga-bhairava is possessed of three main emotional sentiments, śrngara, karuna and bhayanaka. It has already been said that Bharata of the Natyasastra fame considers śrngāra as the divine basic sentiment (ādi-rasa). It is the prime creative urge (kāma or desire), by the help of which the indeterminate Brahman (nirguna Brahman) appears as the determinate one (saguna Brahman). The eternal undivided One manifests as the manifold appearance: tapo'tapyata, eko'ham vahusyam prajayeya'. The Vaisnava philosophers and the Alamkarikas also consider śrngara as the best possible means to enjoy the celestial love dalliance of Radha and Kṛṣṇa. The mystic poet Jayadeva (12th century A.D.) describes Rādhā as the embodiment of śṛṅgāra: 'śṛṅgāraḥ sakhi mūrtimāniva madhau mugdho hariḥ kridati' (1,48). If we analyse the Gitagovinda of Jayadeva we find that no single statement shows the poet's desire to have union with Kṛṣṇa, as Rādhā had, and he only sings in praise of love dalliance of Radha and Krsna. The same attitude is found in Chandidasa, Vidyapati and other Vaisnava mystic poets and savants.

According to the philosophical-cum-theological works of Bengal Vaisnavism, Rādhā is nothing but the transfi-

guration of the infinite potency of Love, contained in the very nature of Kṛṣṇa. In fact, "the divine love between Rādhā and Kṛṣṇa has been conceived anthropomorphically, through the analogies of human love" says Dr. Sasibhūşan Dasgupta. Further he has said: "Human love has been analysed psychologically into all its varieties and niceties to the minutest details, and it has been found on analysis that divine love can be expressed only through the analogy of the most intense and the most remantic and unconventional love that exists between a man and a woman, who become bound together by the ideal of love for love's sake'. This love or divine love is the expression of the basic sentiment syngara or creative urge. The stone figures of natas and natis (male and female dancers), depicted on the walls of the temples of Orissa, represent the expression of the śrngara-rasa. Those nude figures may appear ordinarily obscene and objectionable to the common observers, but they appear divine from the artistic and aesthetic viewpoints. The syngara-rasa that saturates the raga-bhairava, brings fixity of mind, serenity, tranquility, concentration and meditation, renunciation or nirveda unto the artists and the lovers of music. The latter Alamkarikas consider santa, instead of śrngara, as the basic sentiment. Regarding the sentiment santa, Lochana has said: "moksaphalatuena cayam paramasarva-rasebhyah pradhanatamah". purusärthanisthatvät Following Lochana, Abhinavagupta has also said in the Abbinavabbarati: "tasmadasti śanto rasab \* \* | tatra sarvarasānām śāntaprāya evāsvādo na vaisayebbyo viparivīttya/ tanmukhyatalabhat kevalam vasanantaropahita ityasya sarvaprakrtitvābbidbānāya pūrvamabbidbānam / /

Some say that the bhayanaka-rasa that saturates the ragabhairava or that is generated from bhairava, creates the

mental attitudes of terror and fear. But that is not the real fact. The bhayanaka-rasa that permeates bhairava, brings the attitudes of reverence (sraddha) and divine submission (prapatti) to God, which help the Sadbaka to attain perfect detachment (nirveda) from the deceitful worldly desires. Such is also the function of the karuna-rasa, which is generated from the total tonal manifestation of the raga-bhairava. It does not bring the attitudes of melancholy, grief or sorrow, despair and dissapointment, but rather creates the mental attitudes of calmness and detachment. The raga-bhairava has been called as the melody-type of the confluence of night and day (sandbiprakāśa-rāga), because it brings new life, vigour and energy to all the animate objects of the world. It manifests itself before the sunrise, and welcomes the rising golden sun, the force-centre of the gigantic universe. During this time, the whole atmosphere of the Nature remains calm and tranquil, with a complete balance of breathing of the living beings. The seers of music saw in their vision a harmony between the tonal manifestation of the raga-bhairava and the serene atmosphere of the morning. The śrngara or santa rasa that predominates over the whole atmosphere of the morning as well as of the manifestation of the raga-bhairava, helps men to enjoy both outward and inward peace and tranquility which are permanent. The psychological aspect of music is concerned with these aesthetic and contemplative things, which make music dynamic and divine.

#### APPENDIX TO THE CHAPTER XIV

I

The texts from the Nāṭyaśāstra (6th and 7th chapters) and the Abhinavabhāratī about the aesthetic sentiments and emotional contents (rasas and bhāvas):

### Ш

Regarding sentiment (rasa), colour (varṇa) and sacred varṇavīja, Sāraṅgdeva has said:

पद्माभः पिक्ररः खर्णवर्णः कुन्दप्रभोऽसितः॥ पीतः कर्वृर इत्येषां अ अ ।

सरी वीरेऽद्भृते रींद्रे घो वीभत्से भयानके । कार्यो गनी तु कहणे हास्यश्टकारयोर्मपी॥

—सङ्गीत-रङ्गाकरः १।३। ४८-४६, ४६.

The specific colours (varpas) of the sentiments, sṛmgāra, etc. have been described in the Nāṭyaśāstra, VI. 42-45 and the Viṣṇudharmottara-purāṇa.

# ॥ सिंहभूपाल ॥

These are the Tantric interpretation of the musical tones. The process requires the spiritual practice or sadhana with the help of the real spiritualised soul (guru). Besides, consult, in this connection, the theory of colour-vision as well as 'Thomas Young's Theory of Light and Colour-Vision, as discussed in William McDougall's An Outline of Psychology (London, 1939) pp. 223-224, and The Mind, N.S. Vol. X.

#### IV

Now, let me take the privilege of quoting some portions of 'Relation between Tone and Colour Perception' from the chapter IX of the book: Introduction to the Psychology of Music (Longmans, 1946) by Prof. G. Révész (pp. 123-125), for which I owe my debt of gratitude to the learned author and also to the publisher. Prof. Révész has said:

"There are certain persons-at all events few in number -who automatically associate tones and tone qualities with distinct colours. Their identification of isolated notes is due to the primary acoustic impression, but to the optical, mnemonic, or intuitive image associated with it. Such a reciprocal relationship between tone and colour is known in psychology as colour (or coloured) hearing (Synaesthesia). By colour hearing we understand the fixed permanent association of acoustic sensations with optical images. In persons with pronounced colour hearing, certain tonal stimuli always create involuntarily, regularly, and constantly the same colour sensations (socalled chromatisms or photisms). These chromatisms or photisms can be divided into three classes, according to type: perceptual, as though the colours were actually seen; conceptual, when the colour is envisaged as an ideated sensation; and mental, when the colour only comes to mind, when only its name is suggested to the conscious mind. \*

"The tests on synaesthetes have brought to light a large number of synaesthetic variants. There are persons with a very finely nuanced system of subjective colours for all the notes in the octave (including the enharmonic variants), as well as for all the major and minor modes, intervals, instruments, and vocables. In other synaesthesia is limited to the notes (tone qualities) with enharmonic distinctions. Many synaesthetes construct the 'traids' and 'melodies' from individual colour elements. They 'see' a melody as tiny coloured dots in a dotted line like variegated glass beads on a string. Besides this analytical colour hearing, there is also a 'synthetic' type. In this latter the chords and melodies are not formed from the constituent elements; but each entity appears in a definite colour, or colour nuance. Musical works, as such, are 'dipped' as it were in one single colour—according to the key, for example. \* \*

Brown with a deep, dark voice.

Lavender with a soft, melancholy voice.

Yellow with a shrill, high voice.

Red with a high, ringing voice.

Blue with a fairly colourless voice." \*

### CHAPTER XVI

#### THE PHILOSOPHY OF MUSIC

The philosophy of fine arts like poetry, music and architecture, including painting and sculpture generally conveys the idea of theory of the beautiful as well as of the science of artistic creation and its nature, and this view was specially maintained by Hegel and the Hegelians. But "the works, where in the philosophy of art is discussed, are primarily concerned with the technique, and the philosophy is closely related to it". It is generally believed that the arts of poetry, music and architecture, painting and sculpture arouse an intense feeling and urge to experience and appreciate both the sensible and the supersensible objects, and though at first their representations are indirect in terms of the physical expressions, yet, at last, they directly appeal to the depth of experience or feeling, and create aesthetic joy and beauty.

Aesthetics (Gk. aisthētikos) is also a branch of philosophy, as it is absolutely concerned with the problem of emotional content, value and beauty. The philosophy of music, like many other high branches of knowledge, says Dr. William Pole, claims attention rather on intellectual than on utilitatian grounds. Moritz Hamptmann first tried to establish a philosophical theory of music in West. He published a book entitled, Die Natur der Harmonik und der Metrik, zur Theorie der Musik, in 1853, and built his theory entirely on transcendental metaphysics, borrowed chiefly from the system of Hegel. But as he dealt with only the abstract problem or truth of music, his theory was highly philosophical, and was not

easily appreciated by common mass of people. A few years later Hermann Helmholez published his book, The Doctrine of the Perception of Musical Sounds, considered as a Physiological Basis for the Theory of Music, and tried to establish a relation between the boundaries of physical and physiological acoustics on the one side, and of musical science and aesthetics or philosophical structure of music on the other. Dr. Tyndall and Mr. Sedley Taylor also made considerable researches on the theory and science as advanced by Hermann Helmholtz. As regards the contributions, made by Helmholtz, Dr. Pole has said that philosophy of music "as established by the investigations of Helmholtz, implies not the bare enunciation and explanation of acoustical phenomena, but the general philosophical analysis of musical structure, to which the acoustical element is only introductory, and which really extends into a much wider domain".

Well has it been said by C. E. M. Joad: "Philosophy is concerned not with phenomena, but with their meaning; not with facts, but with values; not with what is, but with what ought to be; not with means, but with ends". Really end or value is the prime achievement in philosophy, and that end or value is sought to be realized in one's experience: "yad avagatam sat svavititayā iṣyate tat prayojanam". Or it can be said that "the terminal end is always happiness and absence of unpleasantness, while the instrumental ends are objects or actions which, directly or indirectly, bring about the final end". It is an undeni-

<sup>3</sup> Cf. The Vedantaparibhaja,

<sup>4</sup> Cf. The Siddhäntamuktavali.

able fact that a man seeks happiness or pleasure in his life, and tries to avoid pain and sorrow, living in this world of cause and sequence. But the question is what sort of happiness or pleasure he seeks. Generally it is found that he seeks happiness or pleasure in his life as a result of his actions and aspirations and enjoys that happiness or pleasure to mitigate his selfish motive only. But, perhaps he fails to get and enjoy it all the time in all actions, because happiness and pleasure (sukba) are always mixed up with unhappiness and sorrow (duhkha) like the compresence of light and darkness. Or it can be said, in other words, in the dictums of the Upanisad that "happiness, which admits of a more or less is the bliss of Brahman, manifested in the mould of the internal organ, antabkarana, due to contact with objects, whereas unsurpassable or absolute happiness is Brahman itself".1 Now, in regard to music, man generally cultures music in order to enable him to get material gains and worldly pleasures. The philosophy of music states that music is the highest art, because it confers upon man absolute bliss and happiness, which are permanent and persisting all the time.

It should be remembered that the province as well as the outlook of philosophy of music are very broad and liberal, because they contain not only the materials of the supersensible divine world, but also of the sensible material one. It informs us of the real aim and object of music, and also deals with the laws and principles, together with the raw materials of music. As for example, as to the question:

<sup>1</sup> Cf. Dr. A. G. Krishna Warrier: Brahman as Value (in the "Brahmavidya", the Adyar Library Bulletin, Vol. XXV, pts. 1-4, 1961, pp. 479-480.

what do we mean by the philosophy of music, Dr. Pole says that a philosophy of music shall contain the enquiries into various musical problems like (i) the musical sounds, (ii) the nature of the simplest elementary modes in which the material is arranged or prepared for use, (iii) the distinction between two varieties of music, known as melody and harmony, along with other musical materials like counterpoint, time, measure, rhythm and form of music. "And broadly speaking", says Dr. Pole, "we may fairly assume that the principles, which have determined or influenced them, may be classed under two distinct heads, namely, physical principles and aesthetical principles". By physical principles are meant such principles as can be deduced, according to the laws of natural science, from the physical nature of musical sounds and from their known physiological effects on the human ear. By aesthetical principles are meant such principles as have resulted from the free action of the human mind, independently of any physical considerations.1 Now the philosophical investigation of music will show that the truth lies between these two extreme principles.

The main material of music consists of tones or sounds, and philosophical concept of music centres round this sound theory. In India, the seers of music found out this truth and idea long before the West dreamt them. Long before Helmholtz, the intuitive authors on music of India discovered the mystery of sound (causal sound or nāda), which forms the background of the grand structure of music, and philosophy of music is absolutely concerned with the theory and value of the causal sound (nāda). In the previous

<sup>1</sup> Vide Dr. Pole: The Pholosophy of Music (1879), p. 12.

chapter, we have discussed about the theory of aesthetic or emotional sentiments and value of music, and in this chapter, we shall deal with the problem and value of the philosophy of music, mainly, conceived by the Indian seers and authors.

From the philosophical analysis of the problem and mystery of the universe it is found that everything material is based on its subtle form, and everything subtle, upon its causal one. The cycle of cause and effect forms the world of appearance. Man's intellectual pursuit begins with an enquiry into the cause of everything around him, and with this act of enquiry, metaphysics begin as a theoretical aspect of philosophy of being and becoming. The philosophy of music is also concerned with an enquiry into the ultimate cause of the manifestation of music, and helps men to get into the core of its mystery and offers them the everlasting bliss and happiness even in this life on the earth.

In the primitive society, men and women used to sing and dance as a part of pastime and pleasure in their everyday life, but they did never enquire about the cause behind music and dance. With the gradual development of culture and civilization, there was an awakening in the intellectual and intuitional pursuits of men, and they began to seek and dive deep into the real significance of music and dance.

Now, what is the cause as well as the foundation behind music? Philosophy and science of music state that sound is the cause and also the foundation of music. Sound is known in Sanskrit as nāda. Sound is produced by the friction of heat-energy (agni) and vital air (prāṇa-vāyu). It produces tones and tunes, or it can be said that music is produced by the vibrations of the sweet and soothing sound-units. Rāgas,

varnas, mūrecbanās, tānas, alamkāras, etc. are also the outcome of the sweet and agreeable vibrations of the sound. From the science of music we know that a rāga is a psycho-material object, and it is constructed out of man's innermost feelings and sensibilities, together with material ingredients of tones and tunes.

The world of appearance is guided by the inscrutable law of cause and effect. The biologists are of opinion that a unicelular germ of life or a bioplasm, after passing through various stages of evolution, ultimately manifests in the form of a highly developed human being. Such happens also about music. The perfect form of music comes into being, after passing through various stages of becoming from a potential germ of sound. By a close observation into the cause or origin of sound, the scientists find that a latent force or psychic energy is the source of evolution of sound. Patañjali has said in the Mahābhāṣya that the latent force or psychic energy remains in the form of primordial causal sound, known as 'sphota'.

The sphota is the substratum (ādhāra) of all kinds of sound, subtle and material. The sphota is the all-inclusive (sarvānusyūta) universal causal sound. It is divided into different forms like pada-sphota, šabda-sphota, etc. The pada-sphota means the awareness of the sphota of a word which is necessary for the knowledge of the meaning (artha) of the word (śabda), exactly as the knowledge of a genus (jāti) is required for recognizing the individual belonging to it. The Nyāya philosophy admits the theory of generic concept (jāti). The generic concept can be said to be the pada-sphota of the grammarians. The pada-sphota is an important part of the unique and universal sphota. The Kāshmere-Saivism has dealt with the theory of dhvani like the Alańkārikas as

a vital part of poetry or literary composition. Alamkārika Anandavardhana is of opinion that theory of dhvani is built on the theory of sphota. Abhinavagupta has admitted it to some extent, though he is in great favour of the rasa theory i.e. the theory of emotional sentiment. Acarya Bhatrhari has dealt on the theory of dhuani, based on the sphotavāda in his Vākyapadīya. Abninavagupta and Mahimabhatta have followed Bhatthari in this respect. Abhinavagupta has said from the viewpoint of the Saivagama that vak or abbilapa (consciousness or expression) is not only gross and determinate, but also subtlest and indeterminate in its essence. According to the philosophy of grammar, the paravak is essentially identical with the ultimate Reality, the Brahman. The sphota as such is free from all kinds of determinacy and gross expression, and yet it is determinate when manifests itself as the gross body of speech (dhuani). So the sphota is both immanent and transcendent,-determinate and indeterminate in its nature, and from the rationalist viewpoint, the theory of sphota upholds the doctrine of identity-in-difference.

The Saivagama-Tantra calls it the theory of voluntarism or svatantravada, according to which, the absolute vak or sphota "manifests all from itself, in itself and by itself and by its universal free-will. All that constitutes the world of experience, whether unity or diversity or unity-in-diversity, whether subjective or objective or the relation between them, such as that of causality or action, etc., is the manifestation of the absolute free-will". So the Saiva-Tantra holds that free-will is the ultimate Reality of all, and, therefore, sphota, the substratum of all articulate and inarticulate sounds or speeches (dhvani), creates all kinds of sound, musical and non-musical, through the medium of

its free-will. The grammarians differ somewhat from the doctrine of the Saiva-Tantra. Some say that it will not be wise to hold that the theory of dhuani is based upon the theory of sphota, as maintained by Anandavardhana, because there is some difference between the significances of the two theories. To summerise their views. I would like to quote Dr. S. K. De, while he says: "The word dhuani itself, as Anandavardhana pointed out, is sometimes used by the grammarians for the word or letters which reveal the sphota. Mammata's remarks in this connection are pertinent. In his Vrtti on the definition given by him of dhuani (1.4), he says that the dhuani is, according to the grammarians, that word which reveals the all-important sphota, inasmuch as through it arises the knowledge of the word's meaning. Others, by whom he signifies the writers on the dhvani-theory is Poetics, carry this doctrine of the grammarians a step further and apply the term dhoani to the meaning as well as to the word, which is capable of suggesting a meaning superseding the one which is directly expressed. Intrinsically the two theories have scarcely any mutual connection; but what the Alamkarikas really wanted was an authority for their assumption of the power of vyanjana, which the great grammarians did not acknowledge. The sphota-theory of the grammarians, however, presupposed something similar, for the varnas of a word reveal, as it were, the ideal word. Hence it afforded an analogy which could at least boast of the authority of the Vaiyakaranas, the prathame vidvamsah and which could therefore be seized upon by the Alamkarikas as the foundation of their own theory of suggestion, .....Although it accepted, with some modifications, the grammarian's analysis of the nature and

function of speech and based its theory of dhuani, on the analogy of the theory of sphota, the school really started independently with distinct theory of expression of its own, which demonstrated a function of vyanjana and vyāngārtha untraceable in earlier speculative literature. But the influence of other schools of Poetics on the composite work on the Dhvanikara and Anandavardhana cannot be ignored".1 Regarding the real significance of the sphota, Dr. De has further said: "The sphota, which has been likened to the neo-Platonic logos, is of often translated by the terms 'expression', 'concept' or 'idea'; but none of these terms brings out its essential nature. Some philosophers propounded and the grammarians took it for granted that a word has intrinsically a word-prototype corresponding to it. The sphota is not exactly this word-prototype, but it may be explained as the sound of a word as a whole, and as conveying a meaning apart from its compoent letters (varnas). The sphota does not contain exactly the sounds of the order peculiar to the letters, but the sounds of something corresponding to them are blended indistinguishably into a uniform whole. When a word is pronounced, individual sounds become reflected in some degree in the order of the sphota in which the particular sounds are comprised; and as soon as the last sound dies away, the sphota, in which the idea corresponding to all these sounds is comprised, becomes manifest and raises to our consciousness the idea thus associated. The sounds of a word as a whole, therefore, and a part from those of the constituent letters, reveal the sphota".2

<sup>1</sup> Vide History of Sanskrit Poetics (1960), Vol. II, pp. 143-144.

<sup>2</sup> Ibid. p. 143.

Now let us discuss the matter of the philosophical doctrine of sound that forms the background of music and musicology in a more explicit way. Pānini, Patañjali, Bhatrhari, Nageśa, Punyaraja, Helaraja and others are of opinion that the causal sound or sphota is the substratum and fountain-head of the cosmic world-process. According to them, sphota is uncreated and eternal. But the Naiyāyikas and the Vaisesikas have opposed their views, and have refuted the doctrine of eternality of sound (sabdanantavada). They say that words and languages, made up of sound, are created by man, and, therefore, have beginning and end, which means they are perishable. But they, who defend the eternality of sound as well as the doctrine of sphota, advance arguments that sounds are not created, but manifest through the medium of the vocal chord, and so the nature of their eternality is not lost. But, according to the grammarians, says Dr. P. C. Chaktaborty, sound (śabda) is not lifeless mechanism, invented by man. It is more than a mere sound or symbol. "It is consciousness that splits up into the twofold category of sabda (sound) and artha (meaning), and what we call vak as the vehicle of communication, is nothing but an expression of caltanya (spirit) lying within". According to Patanjali, words are divided into two, nitya and kārya, -eternal and created. The nitya-śabda is the supreme reality, which transcends the limitations of time and space. It is the parāvāk as well as the para-Brahman. The conception of vak as Vagdevi has glorified the idea of akşara or udgitha. Dr. Chakraborty has further said that the doctrine of sphota, as expounded and nourished by the grammarian, marks the climax of mysticism, reached by the Sanskrit Grammar. "The assumption of a spiritual phenomenon like sphota, to which all sounds are reducible and from which all meanings

follow, furnishes a clue to the origin of sound. To the grammarian, sphota is indivisible (akhanda), and represents caitanya in its purest form. Its sacred and lofty nature was much exaggerated by the grammarian so that it was finally identified with Brahman (—Vaiyākaraṇabhūṣaṇa). The conclusion, at which the grammarians had arrived after all their speculations on śabdatattva is this supreme identity.

Bhatrhari was a staunch advocate of the doctrine of sound (sphotavāda). According to him, the śabdatattva and the Brahmatattva are interchangeable (vide Vākyapadīya, 1.1). All words and meanings are but the apparently different aspects of one and same thing. Bhatrhari was thus conscious of that mabāsatta or Highest Universal which permeats all. He made his Vedāntic position perfectly clear, when he said that "satta represents the real essence of all things; it seems to be manifold in consequence of the diversity of objects; it is to be regarded as the summum genus which is denoted by all words, all prātipadīkas (crude forms), verbal roots and suffixes like tva and tal (—Vākyapadīya, 3.33.34)". But it should be remembered that this satta is not equal to the eternal supreme soul of Vedānta.

Bhatrhari maintained the theory of eternality of sound (sphota) in a different way. He said in the brahmakānda of the Vākyapadīya that Brahman, without beginning and end, is the indestructible essence of speech or sound. It is manifested in the form of things, and from it springs also the creation of the world-appearance. In fact, Bhatrhari, Nāgeša and others have established an identity between śabda and Brahman:

(1) 'anādinidhānam brahma śabda-tattvam yadaksaram',

Vide The Cultural Heritage of India, Vol. 1 (published by the R. K. Mission, 1st edition), p. 674.

(2) 'brahmedam śabda-nirmāṇam \* \*'. In the Yogasūtra (1. 27), we find the close relationship between vācya and vācaka i. e. between the praṇava and the Brahman—'tasya vācakaḥ praṇavaḥ'. The Vedāntasūtra (1. 3. 28) has also supported the evolution of the world from the causal sound on the logical basis of perception and inference. Sankara has said: "eta iti vai prajāpatirdevānasrjatāsīgramīti \* \* śastramabhisaubhagetyanyāḥ prajāḥ'.

It should be noticed that Sankara has drawn a mark of distinction between the 'evolution from the Brahman' and the 'evolution from the sound' from the view-point of causation. From the viewpoint of the evolution from the Brahman, the Brahman is implied as the material or essential cause (upadana-karana), while from the viewpoint of the evolution from the sound (sabda), sound is implied as only the efficient cause (nimitta-kārana). So, when Sankara has advanced his view of evolution of the world-appearance from the sound (sabda) in the commentary of the Brahmasūtra, he has taken it as the matter of ordinary experience. Vyasa has said: "śabda iti cennātah prabhavāt pratyakṣānumānābhyām, Sankara has explained in the commentary: "na cedam šabda - prabhavatvam brahma - prabhavatva - vadu - padanakāraņatvābbiprāyeņocyate / ......cikīrsitamartha-manutisthn tasya vācakam šabdam pūrvam smrtvā pašcātta - marthamanutisthatīti sarvesām nah pratyaksametal/tathā prajāpaterapi srastuh srsteh prak vaidikah sabda manasi pradurvabhuvah, paścattadanugatanarthan sasarjeti gamyate" (-Sankarabhāsyam, 1. 3. 28). That is, Sankara means to say that the creative will (sisyksa) of God, that has been sanctioned by the sacred Vedic dictum, is the cause of evolution of the world-process. So Sankara has not practically accepted the views of the sphotavadins or grammarians, who hold the

view that the world emanated from the eternal sound (śabda) or sphota.

Some divide the causal sound or sphota into dhauni and varna. They say that when sounds are pure and simple and do not convey any definite meaning or sense, they are known as dhuanyātmaka-śabda, and when they are intelligible and capable of being expressed by letters, they are known as varnātmāka-śabda. Upavarṣa is of opinion that letters really constitute the stuff of the word ('varnā eva tu śabda iti bhagavanupavarṣaḥ'), and this view has been accepted by Sankara and Sabra Swāmīn. Patañjali has also accepted this view in the Mahābhāṣya to some extent, as he has hold the view that sounds are articulate (vyaktavāk), when they are turned into letters. The audiable or articulated sound is known as vaikharī.

Now, what do we specifically mean by the word sphota? It is called sphota, because the meaning is ultimately expressed by it and not by sounds of momentary existence. The derivation of sphota is 'sphutatyartho'smāditi sphotāh' and 'vācakatā sphotaikaniṣṭḥā'. Again when a sentence is conceived as an indivisible unit, it is called sphota. It is recognised both as internal and external entities. Sphota as an internal entity is the spiritual indivisible consciousness in essence, and it is revealed by the sound or dhvani.

It has already been said that the grammarians identify sphota with the Brahman, the world-essence. They say that sphota is the source of knowledge of the sound (śabdārthakāraṇa), and it is not consisted of mere letters, as some believe. This view of the grammarians is quite different from that of Upavarṣa, and, consequently, those of Sańkara and Sabara Swāmīn, who have followed Upavarṣa. According to the grammarians, sphota is sacred and divine, and it

symbolizes the conscious element or cit-śakti. Bhatrhari has mentioned in the Vakyapadiya that the study of the science of sound leads men to the realization of all-pervading God, and thus has fully supported the doctrine of the śabda-Brahman (śabda-brahmavāda). Nāgeša has quoted in his Laghumanjusa (vide p. 172) that nada, being the source of all forms of vak, is called the sabda-Brahman. Regarding the doctrine of sphota, as expounded in the Sarvadarsanasamgraha, Sayana-Madhava has said in connection with the Paniniyadarsana: "tasmat varnanam vacakatvanupapattau yadvāladartha - pratipattih sa sphotah varnātirikto varnābbivyangyartha - pratyayako nityah sabdah sphota iti taduido vadanti/ata eva sphutyate vyajyate varnairiti sphoto varnābhivyangyah sphutati sphutībhavatyasmādartha iti sphotortha-pratyāyaka iti sphota-sabdārthamubhayathā nirābuh / ......tathā-coktam bhagavatā patañjalinā mahābhasye ...... (Pātañjala Mabābhāsya, p. x) iti/..... sphoto nadabhivyangyo vacako vistarena vakyapadiye vyavasthāpita ityantena prabandhena".1 E. B. Cowell and A. E. Gough have translated the portion thus ...... as letters cannot cause the cognition of the meaning, there must be a sphota by means of which arises the knowledge of the meaning; and this sphota is an eternal sound, distinct from the letters and revealed by them, which causes the cognition of the meaning. It is disclosed (sphutyate) or revealed by the letters, hence it is called sphota, as revealed by the letters or from it is disclosed the meaning, hence it is called sphota as causing the knowledge of the meaning, these are the two etymologies to explain the meaning of the word', etc.

<sup>1</sup> Vide the Sarvadarsana-sanigraha (edited by M M Abhyankaropā-dhyāya Vāsudeva Sāstrī and published by the Bhāndārkar Oriental Research Institute, Poona, 1924, p. 360.

The sphota can be compated with the divine mystic word. Om or pranava, wherefrom all the forms of speech or vak are supposed to emanate. The author of the Yogasatra has also identified the sabdatattva with the Brahmatattva. Nagesa has compared sphota with the eternal phase of the pranava: "etadavasthātrayamapi......sūksma-pranavarūpab" (vide the Lagbumanjusa, p. 179). He has also admitted that sphota alone is expressive of sense or meaning and is the potentiality or infinite consciousness, which is known as bindu, composed of three basic subtle qualities or gunas. The bindu is an inexhaustible and infinite source of energy or saktitativa. The unconscious part of this energy is known as vija, while the combination of the conscious and unconscious parts (cit and acit) is called nada. The intelligent part of it is known as bindu, and it has been said that it is the ultimate source of all forms of speech or vāk. Nāgeša bas said in the Laghumanjusa (p. 171): "pralaye niyata-kala-paripakanam sarva-pranikarmanamupabhogena..... māyā cetane īsvare liyate tatah paramesvarasya sisrksatmika mayavrttirjayate/tato bindurupamavyak. tam trigunam jäyate/idameva śaktitattvam/tasya bindoracidamso vijam, cidacinmisro'ngso nadab, cidamso vinduriti .....".

In the Rgveda (1. 164. 45), we find the mention of tour kinds of vak:

Catvāri vāk-parimitā padāni tāni vidur-brāhmaņā ye manīşinah/

Guhā triņi nihitā nengayanti tutīyam vāce manuşyā vadanti//

The last and fourth form of speech (vaikhari) is spoken by men through the medium of the vocal organ. Patañjali has also said about four kinds of padas like noun, verb,

preposition and particle: "catvāri padajātāni nāmākbyātopasarga-nipātah". Bhatthari, Nāgeša, Gaudapāda Sayana have also divided the speech into four parts, para, pasyanti, madhyamā and vaikharī. These four kinds of speech "correspond to four different stages, through which nada passes till it becomes perfectly audible. Thus, we may start with binds or the final point as the crude germ of sound and proceed from the muladhara to the visuddha, in order to see how sabda-Brahman or paräväk transforms itself into popular speech. From binda, it is said, arises nada which is called sabda-Brahman; it is featureless, intellectual in essence, and possesses the characteristics which are favourable to the cosmic creation. It is the essence of the world that is often signified by such words as rava and para. The nature of the paravak, as described in the Mahabharata and elsewhere, convinces us that it is luminiferous consciousness residing in the muladbara, creative but indestructible. It is what is known as the sabda-Brahman or the essence of the Logos. When nada or paravak gets manifested a little and the iternal air that serves to reveal it comes up to the navel region from the mūlādhāra, we have pasyantī form of the vak which is not divisible into parts. Those two kinds of speech are exceedingly subtle and cognisable by the Yogins alone in a state of perfect spiritual absorption (samādbi). Next in order comes madbyamā which is revealed by the same air, when it passes to the region of the heart. It has intelligence as its only ingredient. Nagesa has drawn our attention to the fact that these three kinds of vak, gradual stages of amplifications as they are of the same nada, represent, so to speak, the minutest, the minuter and the minute forms of pranava. The vaikhari form of speech is what is spoken by men. It is generated when the internal air passes through the throat and reaches the

The grammarian philosophers say that the śabda-Brahman manifests itself in gross form through the medium of sound or dhuani. Now, what do we mean by 'sabda-Brahman'? In the Vākyapadīya, Helārāja interprets the sabda-Brahaman or Word-Absolute as the nature of pure bliss or suddbananda. Punyaraja, another commentator of the Vakyapadiya, does not accept this theory, as according to him, the Word-Absolute can be identified with samuid or consciousness, and not with ananda or bliss. Bhatrhari has stated that the Word-Absolute is the ultimate reality, and it can be reached through the medium of the word or śabda. So words should be balanced and chaste or purified. Because, says Dr. G. N. Sastri, "strict adherence to chaste forms gradually results in the emergence of a special kind of merit leading to permanent spiritual advancement. For this reason, the correct readings and intonations of the Vedic mantras create a holy atmosphere that helps men to enjoy quiteness and perfect tranquility". Punyaraja calls this tranquil state as ksoma that bestows emancipation (apavarga) to men, and make them free from the chain of delusion.

Bhatrhari and some of his followers maintain that the state of pasyanti is the eternal sabda-Brahman itself, and madhyama and vaikhari are the manifestations of pasyanti. Bhatrhari says that pasyanti is the summum bonum of human existence, and it is itself the conscious entity (cit). Pasyanti can really be said to be the transcendental consciousness, in which the distinction between word and

<sup>1</sup> Cf. Dr. P.C. Chakraborty: The Linguistic Speculations of the Hindus (Calcutta University, 1933), pp. 49-50.

import, the knower and the knowable, vanishes. But Helārāja, and specially Puņyarāja differ from Bhatthari. They are of opinion that pasyants is the first divine manifestation of the śabda-Brahman or sphota, and not the śabda-Brahman or sphota itself. Some of the neo-grammarians differ from all of them, as, according to them, para, and not pasyanti, is the first and prime manifestation of the sphota. But Helārāja and Punyarāja have opposed this theory. The Saiva philosophers of the Kashmere Trika system hold the similar view, as maintained by the neo-grammarians, and it scens that the latters were somehow or rather influenced by the Saiva school of Kashmere. The philosophers of the Trika school hold that paravak gives birth to the three states, pasyanti, madhyamā and vaikhari, and so vaikhari is regarded as the first evolved principle, and though it is an effect of paravak, yet is pure, indivisible and eternal. It is the cause of madhyama, which is sensed by the mind only, and from madbyama, vaikhari evolves as the gross material one. According to the authors on music as well as the Sangītašāstras, vaikharī manifests as the gross tunes and tones of music.

While dealing with pasyanti and other states in the Sivadṛṣṭi, Somānandanāth says somewhat in a different way that pasyanti is regarded as the individual soul or jīva, who experiences different objects of enjoyment from the material body which is known as the bhogakṣetra. But it should be remembered that individually it is known as the jīva and universally it transcends the limitations of body and senses. So the grammarian philosophers designate the universal one as an enjoyer or pramātā, which is an all-knowing entity, the prime object of human achievement and an eternal one. The universal aspect or stage of pasyantī is reached, when

the veil of nescience is removed and the limiting adjuncts of time, space and causation are transcended. Therefore the real status of paśyanti is no other than the supreme universal Reality. Madhyamā evolves from the vibrating surface of paśyanti, and it may, therefore, be regarded as an idea of becoming in the part of paśyanti. Madhyamā may be compared to a stuff of the intellect or buddhitattva of the Sānkhya philosophy. It manifests itself as two divergent entities, prāṇa and apāṇa, or bindu and nāda, which rise from the navel base, mūlādhāra. "When the stage of madhyamā", says Dr. G. N. Sāstrī, "is crossed, paśyantī comes up, as it were, into the cavity of the mouth through the medium of the two breaths and touches the different scources of articulation. It is known as vaikharī, in which the discrete letters of the alphabet find their proper expression".

Abhinavagupa of the Kāshmere Trika school has also described the stages of pasyanti, etc. in a beautiful mannar in his commentary, Parātrimsikā. He maintains that Paramasiva. the Brahman, assumes the form of paravak or transcendental Word for self-enjoyment, which may be regarded as the sportive play or līlā on his part. Again parāvāk manifests itself as Sadasiva and Isvara i.e. as the power of knowledge and the power of activity (jñānaśakti and icchāśakti). Though these two manifestations are essentially known as pasyanti and madbyama, yet pasyanti is different to some extent from madbyama, because in the state of pasyanti, the notions of subject and object are absolutely negated or transcended, whereas in the state of madhyamā, they remain as separate entities and are cognizable. These have further been lucidly explained in Abhinavagupta's Tantrāloka. Well has it been said by Dr. Gaurinath Sastri in the Philosophy of Word and

Meaning: "There he (Abhinavagupta) says that parāvāk assumes the state of pasyantī when, through its innate autonomous spontaneity, it externalized itself. As the order of the denoter and its denotation does not arise in that state, we find no differentiation. It is the light of consciousness alone which shines with all its lustre, and, consequently, it is described as the cognizer or the seer ..... In madhyamā, which is purely intellectual, the differentiation between the denoter and its denotation becomes slightly manifested. It is described as the intermediate stage between indistinct and distinct manifestation. And the name madbyamā owes its origin to this fact. The stage of distinct manifestation of the difference between the denoter and denotation is called vaikhari, which exhibts the sequence of letters and syllables. Each of the three stages, pasyanti madhyamā and vaikharī, is further divided into three stages, gross, subtle and super-subtle. Thus the gross form of pasyanti is represented by the prelude to a song as denoted by the technical term, alapa, in which there is no differentiation of letters and which is singularly captivating. The gross state of madhyamā is represented by the sound which arises when the fingers play upon a musical instrument, say, a drum (mrdanga). The gross stage of vaikhari is represented by what produces the various letters. The subtle conditions of each of these manifestations are respectively represented by the desire to sing, the desire to play upon a musical instrument and the desire to speak. And the super-subtle conditions are represented by the pure knowledge which lies as the source of the aforesaid desires".1

Cf. Philosophy of Word and Meaning (1959), pp. 74-75. Cf. also Shri P. B. Mukherji: The Metaphysics of Sound (An Appendix to Japasütran, 1961), pp. 71-73.

Similar interpretations have been given by Maheśvarānanda in the Maharthamanjari. Bhaskararaya has also described these states in a somewhat different way. According to him, śabda-Brahman manifests first in the basic lotus (muladhara) and then is known as parasvak. When it comes up to the third base of manipur, it is known as pasyanti, and as soon as the same breath reaches the heart of svādbisthāna, it is known as madbyamā, and the subsequent manifestation of the sabda-Brahman is vaikhari, which is grossest and represents itself as vija. In this state, breath strikes the different places of articulation. In fact, the cakras are not plexuses or gangila, but are the centres of consciousness or primary knowledge. "The causal sound or nāda is produced in the basic cakra by the action of volition of the self on the vital air. It is called the paravak. When it ascends to the svadhisthana cakra, it unfolds itself and becomes pasyanti, and when it ascends to the anahata-cakra, it is united with intellect or buddhi and becomes madbyamā. Gradually it ascends upward and reaches the visuddha-cakra in the throat, and becomes vaikhari. From there it rises towards the head, spreads over the palate, the tongue, lips, teeth, the root of the tongue, etc. and produces articulate sound".1

Now, as  $v\bar{a}k$  or speech is the cause or fountain-head of music, the science and the theory of  $v\bar{a}k$  should be studied with care in connection with music. The word  $v\bar{a}k$  comes from the root  $v\bar{a}ch$ , which means 'to speak'. The word  $v\bar{a}k$ , therefore, connotes the idea of voice or sound,

 <sup>(</sup>a) Cf. Dr. J.N. Sinha: Indian Philosophy (Emotion and Will),
 Vol. II. (1961), p. 11.

and this sound manifests itself in three main aspects, para (supreme) or kārana (causal), sūksma (subtle) and stbūla (gross). The paravak is the cosmic ideation (systi-kalpana) of the Lord, the Creator (Isvara). Well has it been said by Sir John Woodroffe: "The feminine noun vak, therefore, means literally both voice and word it utters, as also the sound of inanimate objects. It has the same sense therefore as śabda. Artha is meaning or object. Pratyaya is mental apprehension. All things have a threefold sense, supreme (para), subtle (suksma) and gross (sthula). Paravak is the causal stress which, in terms of pratyaya, is the cosmic ideation (srsti-kalpanā) of Isvara. \* \* But vāk is also an effect, eiher subtle or gross. Pasyatī-vāk is vāk actually going forth as Theana (seeing), producing or manifesting as süksma madhyamā-vāk or Hiranyagarbha-sabda which is the matrika state of sabda, as it exists in man prior to its gross manifestation as the varnas in spoken speech (vaikharī-vāk). In the Rgveda, Sarasvatī (V. 43. 11) is called Paviravi or daughter of the Lightning, that is, of the great vajra which sustains the worlds, which according to Sayana is mādhyamikī-vāk",1

Vedānta admits four-fold states of evolution of the prime principle which are known as Turīya, Iśvara, Hiranyagarbba and Virāţa. Tantra states that the psychic energy sleeps under the bed of the subconsciousness or unconsciousness. The pure consciousness or śuddba-cit remains in its core, veiled with causal nescience or māyā. The mystic poet Rāmaprasād has described it as "prasuptā bhujagākārā svayambbu śiva-veṣṭḥiṇī". The treatises on music state

<sup>1</sup> Vide The Garland of Letters (1922), pp. 1-2. Cf. also Śwāmī Pratyagātmānanda: Japasūtraņ (Madens, 1961), pp. 22-26.

that when the current of the vital air or prāṇa-vāyu comes in contact with the will-power or icchā-śakti, there originates a vibration (spandana), resulting in a subtle audible sound, which is called the anābata-nāda. Then gradually it becomes grosser and grosser, and manifests at last through the vocal chord and is known as the ābata-nāda or musical sound.

Let us investigate as to how and when philosophy or philosophical idea of music came into being. The germ of the philosophical idea can be found in the great epic, Mahābhārata (vide the āśvamedhika-parvam, 53. 52-54). The epic says,

Tatraika-guṇa ākāśaḥ śabda ityeva sa smṛtaḥ/
Tasya śabdasya vakṣyāmi vistareṇa vahūn guṇān//
Ṣadjarṣabhaḥ gāndhāro madhyamaḥ pañcamaḥ smṛtaḥ/
Ataḥ paraṃ tu vijñeyo niṣādo dhaivatastathā//
Iṣṭacāniṣṭa-śabdaśca saṃhataḥ pratibhānavān/

Evam vahuvidho jñeyaḥ śabda ākāśa-sambhavaḥ//. The compilation of the great epic in its present form began from 300 B.C. and, therefore, we can assume that before 300 B.C. the philosophical conception of the origin of music evolved in Indian society. The sociological condition of epic India was quite favourable for the evolution and growth of the philosophical idea, and we should not forget that the monumental work on philosophy, the Bhagavat-gītā was also the product of that synthetic period (samanuaya-yuga). The portion of the śloka 54: 'śabda ākaśa-sambhavaḥ,' i.e. 'sound had its origin in the ether' is very significant. The neo-Nyāya philosophy says 'śabdaguṇamā-kāśaṃ', i.e. sound is the category of ether. Following the doctrine of the Sāṅkhya philosophy the compilor of the Mahābhārata states:

Ākāśamuttamam bhūtam ahamkārastatah parah/, Ahamkārat parā buddhih buddherātmā tatah parah//. This doctrinal truth has again been mentioned in the Gītā as 'yo buddheḥ paratastu saḥ (III. 42). From this it is understood that the basic psychic content or ātman is the fountain-head of everything in this phenomenal world. This psychic content is the cause of sound, both musical and non-musical. The later musicologists say that the vital force of science of music or musicology is the nāda, the ātman: 'gītaṃ nadātmakaṃ'. Sinhabhupāla, the commentator says: 'nādātmakaṃ nāda ātma-svanūpaṃ yasya', i.e. the causal sound is the vitality or the psychic force-centre of music. Matanga, the author of the Bṛhaddešī (5th-6th century A.D.) identifies the causal music (nāda) with the presiding deities of creation, preservation and destruction (Brahmā, Viṣṇu and Maheśvara). He has said:

Nādarūpaḥ smṛito brahmā nādarūpo janārdanaḥ/

Nādarūpa parā-śakti nādarūpo maheśvarah//
That is, the divine idea, that was in a seed form before creation i. e. projection (sṛṣṭi), manifested with its richness and beauty. In Bharata's (2nd century A.D.) Nāṭyaśāstra, we find that the raw materials of music were collected from the Sāmaveda, whereas literature (sābitya) was taken from the Rgveda, drama from the Yajurveda and the emotional sentiments from the Arthavaveda.

Jagrāha pāṭḥyamṛgvedāt sāmebhyo gītameva ca/, Yajurvedādabhinayān rasānartharvanādapi//

Evam bhagavatā sristo brahmanā lalitātmakam/

Abhinavagupta has said in his commentary, Abhinavabhāratī: "pāṭḥya-gata-svara-prasaṅgāt tadanantaraṃ sāmebhyo gītaṃ jagrāhetyuktaṃ.....evakāreṇa gīta mantraṃ tata gṛhītaṃ gitīṣu sāmākhyeti nyāyāt tadādhāradhruvapadayojana-mṛgvedādeveti darśayati" etc. The idea of the philosophy of music is found in Matanga's (5th-7th century A. D.) Bṛhaddešī in a more developed form. He has divided music into two parts, music with rhythm (nivaddha-gāna) and music without rhythm (anivaddha-ālāpa): "nivadhaścānivaddhaśca mārgoyam dvividho mataḥ". These two kinds of music evolved from a central or basic energy. Matanga has enumerated five grades of evolution of the musical sound, and they are: subtle, subtlest, manifested, unmanifested and mechanical, "sa ca pañcavidho bhavet sūksmaścāivātisūksmaśca vyaktaśca kṛtrimaḥ". He has laid stress upon its source or basic psychic content, the nāda. In fact, the nāda is the determinate (saguṇa) form of the absolute Brahman, and its real indeterminate (nirguṇa) aspect is the ātman, which is the pure and absolute consciousness. Matanga has said,

Na nādena vinā gītam na nādena vinā svaraḥ/,
Na nādena vinā nṛttam tasmānnādātmakam jagat//
The world of appearance is the projection of the nāda, the śabda-Brabman. In the 7th-9th or 7th-11th century A. D.,
Pāraśvdeva has laid great importance to the foundation of music, the nāda. He has said that the raw materials like svara, rāga, vādya and tāla compose mainly the form of music, but all of them have their ground in the unmanifested causal sound, nāda:

Svaro gītam ca vādyam ca tālaśceti catuṣṭayam/
Na sidhyati vinā nādam taṣmānnādātmakam jagat.//
In the Saṅgīta-Ratnākara, we find that Sāraṅgdeva has synthesized all the doctrines of the Pātañjala-Mahābhaṣya, the Yoga-darśana, Tantra and Vedānta in his inunciation of the philosophical foundation of music. In the beginning of his book, he adores reverentially the śabda-Brahman, who assumes the body of sound: 'nādatanu'. Siṁhabhupāla

has said that nādatanu is an epithet of the śabda-Brahman: "nādastanuḥ svarūpaṃ yasya taṃ, śabda-brahmetyuktatvāt". Sāraṅgdeva has said,

Brahmagranthija-mārutānugatinā cittena hṛt-pankaje/

Vande nādatanum tamuddhura-jagad-gītam mude śankatam//

Sārangdeva has identified the causal music (nāda) with Sankara, the śabda-Brahman. The static causal music is also known as the brahma-granthi. While commenting on the word 'brahma-granthi', Sinhabhupāla says that the navel base, mūlādhāra is the divine base or ground of the Brahman-knowledge. The aspiring lovers of music can attain the immortal bliss of the transcendantal consciousness by concentrating their mind upon that place: "brahmapadam sakalavighna - vināśa - nighna-hṛdayam paramātmānam smārayat-prathama-niveśān-mangalācaraṇamapi bhabiṣyatīti manvāno nāda-svarūpam mokṣa-nidānam prathamam brahmapadam prāyunkta". Kallināth has said that when the navel psychic energy rises up to the twelve-petalled plexus (anāhata-cakra) in the heart, it shines as the all-consiciousness ātman, and the Upaniṣad calls it the Puruṣa in the form of a thum: "aṅguṣ-

<sup>1</sup> Regarding nādatanum, Sithhabhupāla says: 'नाद्ततुम्, नाद्सतुः खरूपं यस्य तम्; शब्दत्रह्मो त्युक्तत्वात्। यद्वा नादेन कार्येन कारणमाकाशमुप-लक्षयेत्; तेनाकाशखरूपमिल्पर्थः, आकाशोऽप्येका मूर्तिः परमेश्वरस्य; एत-दुपादानं च परमेश्वरस्यापि शब्दकारणत्वात्तद्गुप्रहस्य प्रन्थखरूपशब्दविस्तर-समाप्तिसाधनत्वाभिव्यर्थम्।" Kallināth says: "नादतनुं नादिवप्रहम्, 'तत्त्रख्दा तदेवानुप्राविशत्' इति श्रुतेः। \* \* ऊर्द्धनाडीसंलमा यास्तिरश्चो नाज्यस्तासु चित्तकृष्टमाष्त्राहतेष्ठत्पत्रो नादः पदशब्देन लच्यते, तत्स्थे तदुपचारात्।"—SR. I. 1.

thamatrah purusa madhya atman tisthati". The psychic sound at last manifests itself as the audible pleasing musical sound, and soothes the hearts of men and animals. But it should be remambered that though it unfolds itself as the gross material form, yet it contains in it the potentiality of the Divinity. In the Sangita-Ratnakara (third utpatti-prakarana of the svarādbyaya), Sārangdeva has elaborately discussed the divine nature of the causal sound. He says that when the causal sound manifests in the level of the heart, it is known as bass or mandra; when it is manifested in the level of the throat, it is known as medium or madhya, and when it is manifested in the base of the tongue, it is known as high or tara (SR. I. 3.7.). The three levels are frequently known as Brahmā, Visnu and Maheśvara, the presiding deities of creation, preservation and destruction, with their ethical qualities like rajas, sattua, tamas. The medium one is the balancing point or nabbi of the two extremities, lower and higher-bass and high. The balancing centre is the neutral point of the poles, positive and negative. Mandra and tara are the two extremities of an octave (Indian saptaka). The philosophy of music ceaches how to create a balance between the bass (mandra) and the high (tāra). In an octave (saptaka), we find that the fourth note, madhyama plays the role of the medium, and it brings a balance between two groups of notes, 'sa-ri-ga' and 'pa-dha-ni'. So it is a common practice to demonstrate the ragas from the medium octave (saptaka). Even in the Vedic period, we find that among the three register tones, anudatta, svarita and udatta, the middle svarita used to bring balance between anudatta and udatta, ('samāhāra-svaritah'). This practice bears a very deep philosophical meaning and spiritual significance too.

Regarding the microtones (śrutis), Sārangdeva has said that from the differentiation in the capacity of our hearing the causal sound, the twenty-two minute sound-units or microtones are realized. Those microtones are easily recognized in the frets of the veenā. Pandit Kallināth quotes Matanga's view, regarding the mystic seeds of sound of seven tones, and they are harivija, kāmavija, etc., connected with the eight vargas like ka-ca-ta-pa-ya-sa. Here we find the influence of Tantra philosophy on music. The theory of astrology has also been adopted for the determination of the names of the microtones. Singhabhupala quotes Matanga, who maintains both the theories of tranformation (parināmavāda) and manifestation (abbivyaktivāda). Sitinghabhupala says that there are differences of opinion ('atra vahudhā vipratipattib'), regarding the origin of microtones. He puts forward five theories in favour of the origin of the microtones, and they are: (1) theory of concomittance (tādātmyavāda), (2) theory of cause-effect or anticidentprecedent (kārya-kāraṇavāda) (3) theory of superimposition (vivartavāda), (4) theory of manifestation (abhivyaktivāda) and (5) theory of tranformation (parinamavada). From

<sup>1</sup> Sărangdeva has forwarded three kinds of doctrine, dvalta, visisţādvalta and advaita as regards the creation of the worldappearance or music. He has said,

य श्रात्मा परमात्मा च विश्रान्त्यै संहरत्यथ । तदेतत्सृष्टिसंहारं प्रवाहानादि संमतम् ॥ ते जीवा नात्मनो भिन्ना भिन्नं वा नात्मनो जगत् । शक्तया सृजन्नभिन्नोऽसौ सुवर्यां कुराडलादिव ॥ सृजल्मविधयेल्यन्ये यथा रज्जुभुजंगमम् ॥

this we come to know the trends of philosophical tendency in the province of Indian music.

The rāgas evolve from the process of combination and permutation of different kinds of ascending and descending notes. Paṇḍit Damodara has also mentioned about the philosphical conception of origin of the rāgas and rāgiṇīs in the Saṅgītadarpaṇa. He says that all the rāgas evolve from Siva and Sakti: five principal rāgas from five mouths of Siva-Pañcānana and one from the mouth of Gaurī. The rāgas like śrī, vasanta, bhairava, pañcama and megha came out of the five mouths of Siva, which are known as sadyovaktra, vāmadeva, aghora, tatpuruṣa and īśāṇa, and the rāga, naṭanārāyāṇa came out of the mouth of Gaurī.

Siva-śakti-samāyogāt rāgānām sambhavo bhavet/
Pañcāsyāt pañca-rāgāh syuh şaṣṭḥastu girijāmukhāt//
Sadyovakrāntu śrīrāgo vāmadevādvasantakaḥ/
Aghorāt bhairavodbut-tatpuruṣāt pañcamodbhavat//
Īśāṇākhyān-megharāgo nādyārambhe śivādbhūta/
Girijāyā mukhāllāsye naṭṭanārāyaṇo'bhavet//¹

This philosophical conception of the Siva-Sakti principle had its root in the notion of the related and the relation, which means the cause and the effect. Everything material or mental—gross or subtle—has a causal relation between the antecedence and the precedence. When an event is followed by another event, we call the former a

Regarding the doctrine of superimposition (vivarta), Kallinath says:
"अन्ये वेदान्तिनः । अविद्ययाऽधिष्ठानाज्ञानेन । तल दृष्टान्तः—यथा रज्जूर्भुजंगममिति । एतेन प्रपद्धस्यातस्वतोऽन्यथाभावाद् ब्रह्मविवर्तत्वं दृशितम् ॥"

<sup>1</sup> It has also been discussed and quoted before in the chapter of the Iconography of Indian Music (cf. pp. 311-313).

cause and the latter an event. The cycle of cause and effect designs the world of appearance. When music first appeared in the human world in the primitive society, men did neither bother their heads about its problem of origin nor its cause, and so no philosophical idea did grow at that time behind the art and culture of music. In the Vedic time, music was cultured mainly for religious and spiritual achievements, and it was regarded as a means to an end of the human beings at large. In the beginning of the classical period (600-500 B. C.), music was known as 'marga' or gandbarva type of music, and it was designed after the form and ideal of the sacred Vedic music, samagana. It was sacred and celestial in its nature. The genusspecis (janya-janaka) scheme had already appeared in the domain of Indian music, which had its origin in the collected materials of the Vedic music. The materials as well as methods of the gandbarva music were searched for ('mrganvesane') and were collected from those of the Vedic music, and so it was known as 'marga'. The gramaragas had their origin in the jātis or jātirāgas ("jāti-sambhūtatvāt grāmarāgani"), and, therefore, they evolved according to the scheme of janaya-jānaka or antecedence-precedence, which brought the idea of the cause-effect relation. The cause is conceived in the Tantra as the masculine or male principle, whereas the effect as the feminine or female one. The male is known as the productive one that generates and sustains the effect. It has already been stated that in the Naradisiksa (1st century A. D.), we come across for the first time the notion of the subtle tones, known as microtones (śrutis), and they are tīurā, āyatā, mṛdu, madhyā and karuṇā. From these five causal microtones, twenty-two microtones evolved in the latter time, and they have mentioned and described by

Muni Bharata in the Nāṭyaśāstra. It is said that Muni Bharata devised the twenty-two microtones according to the emotive values of the five causal microtones, as described by Nārada in the Sikṣā. The five causal microtones of the Sikṣā are known as jātis ('janakatvāt jātiḥ') or genus, whereas the twenty-two microtones are known as uyakti or species. The jāti or genus is conceived as Siva, being the cause, and uyakti or species as Sakti, being the effect. Bharata's genus-species scheme of the mycrotones are as follows:

- t. Dîptā: which possesses the aesthetic quality of brilliance or shining radianc. The latter evolved microtones like raudrī, vajrikā, tīvra and ūgrā are included in the category of the diptā-jāti, and these microtones also possesses the similar emotive qualities as those of dīptā.
- II. Ayatā: which possesses the aesthetic quality of vastness or expansion. It contains the latter developed microtones like krodhā prasāriņī, sandipanī, rohinī and kumudvatī, having similar emotive sentiments of broadness and abundance.
- III. Mṛdu: that possesses the aesthetic of softness and calmness, and it contains the microtonal units like ratikā, prīti, kṣiti and mandā, having similar emotional sentiments as that of mṛdu.
- IV. Madhyā: that possesses the balancing quality, and it contains raktā, ramyā, ranjanī, mārjanī, and kṣobhiṇī, having similar asthetic quality.
- V. Karuṇā: that possesses the emotional sentiments of compassion and sympathy, and it contains the microtonal units like dayāvatī, madantī and ālāpinī, having similat pathetic and compassionate nature.

<sup>1</sup> These have already been discussed before in some of the chapters,

It has already been said before that the scheme of jātivyakti or genus-species has now been reduced to cause-effect
relation (kārya-kāraṇa-sambandba), and it is rooted in the
notion of the Siva-Sakti-principle that forms the background
not only of music, but also of everything in this phenomeral
universe. Regarding the class (śrenī) of the rāgas, Paṇḍit
Somanāth (1608 A.D.) quotes a śloka from the Aumāpataṃ
by Umāpati (14th century A.D.):

Suddho rañjanakārī svena echāyālagah parāśrayatah/ Saihkīrņastūbhayathā mata-muditamumāpaterevam// —Rāgavibodha (Adyar ed. 1945), IV. 3.

That is, while explaining the rāgas from the viewpoint of the Saiva-Tantra school, Umāpati has said that the rāgas of pure type are the embodiment of the Lord Siva, the chāyālaga or sālaga type of rāgas are that of the Sakti, and the samkīrņa type of rāgas are that of the Siva-Sakti combined principle. The intuitive artists and musicologists describe two forms of melody-type (rāga), and they are soundform (nādamaya or śabdamaya) and deity-form (devatāmaya). They have understood the importance of deification and visualization of the melody-types (rāgas), and they realized the fundamental psychic values of the rāgas by the proper application of emotional interpretation of them. Paṇḍit Somanāth has clarified the doctrine of invoking the presiding deities of the rāgas by means of dhyāna-formula, and says:

Uktam rūpamanekam tattadrāgasya nādamayamevam/
Atha devatāmayamiḥa kramataḥ kathaye tadaikaikām//
—Rāgavibodha, V. 168.

but here they have been dealt in a different way in relation to twenty-two microtones, as advanced by Bharata.

'That is called rupa, which, by being embellished with sweet flourishes of svaras (tones), brings a raga vividly before one's mind. It is of two kinds, nadatma (one whose soul or essence is sound), and devamaya (devatā-dehamayam), one whose soul or essence is an image incarnating the deity, of which the former has many phases and the latter has only one'. The physical sound-forms being impregnated with aesthetic sentiments and moods become vivid and divine, and they are transformed into image-forms as incarnations of those emotional aspects. Prof. O. C. Gangoly says: "The application to the theory of Indian music, this doctrine of image-worship i.e. the idea of invoking the presiding deity, or the spirit of the divinity by means of a dbyana-formula, an evocative scheme of prayer for contemplation, has led to the conception of the forms of ragas and raginis in dual aspects viz. as audible Sound-Forms, and visible Image-Forms-"nādamaya-rūpa and devatāmaya-Both the Brahmanical and the Buddhist Tantras have conceived different code mantrams (vija-mantrams) for invoking the presiding deities, and they believe that gods and goddesses incarnate as the code mantrams. According to Tantric cult, the vija-mantrams or seed-formulas are the symbols (pratikas) of the deities. Pantanjali has said in his Yogasūtra that the mystic word A-U-M represents the determinate Brahman. The Mimānsakas do not believe in any materialized form of the gods, and so they admit the existence of a mysterious power or potency (apūrva) in music. In music, thought or feeling, distilled in sound, becomes itself an independent object. It assumes a tune-form which is definite, but

Vide Rāgas and Rāgiņīs (1948) p. 96.

contains a force, which is called 'apūrva', and the apūrva offers boon to the sādbakas.

In Vedic time, the Revikas used to perform sacrifices, and they regarded the tongues of the blazing fires as the representatives (pratinidhis) of the gods and the goddesses. So the conception of the process of deification was a common practice in India. It is an iconographical process of personification or symbolization of the image-forms (icons). and this divine process is entirely based on psychological-cumphilosophical conception of music. The speculative process of philosophy of music designs an idea of the contemplative prayer-formulae of the Indian ragas, and so the intuitive poets composed the dhyanas of ragas and raginis with colourful compositions, and the painters drew beautiful pictures of them. The emotional sentiments and moods are the states or modifications of the mind, and the mind being enlightened by the self-effulgent light of the Atman, conceives, designs, and manifests music in the material form.

According to philosophy of music, the divine psyche or Atman is the foundation (adhisthāna) of music. The psyche sings eternally the immortal song of the absolute music, which is formless and colourless in essence, and yet it manifests as phenomenal music with the gross raw materials of tone, tune, rhythm, grace, etc. The philosophy of music states that the absolute music is subjective, whereas its objective form is visual and audible phenomenal music. The absolute music is like the 'Idea' or 'Type' of Plato. It is the true Logos or divine 'Word' of the Christian theology. In the begining, there was a pute Idea in God and He created the manifold universe from within, and within Him there sleep all kinds of impression (samskāras) of the projection of

the world in potent form. The Vaisnava mystics say that there is going on the supersensual music eternally in praise of the Divine glory of Radha and Kṛṣṇa in the celestial ragion of immortal Vrndavan (Nitya-Vrndavan). That eternal celestial music is the absolute music. The absolute music is not, therefore, altogether inconceivable, but is conceivable through the medium of the concentrated and spiritual mind, Well has it been said by Prof. O. C. Gangoly, regarding the absolute painting: "Absolute painting, though they represent nothing, evokes a disinterested aesthetic sensation, due to happy perception and contemplation of special relations, dimensions, proportions, accents, colour, value and rhythm inherent in the quality of design, claiming to attain the condition of music. But this demonstration of the quality of non-representative painting does not invalidate to capacity of the painter's craft to represent, delineate, or imitate nature or to render themes of human or emotional significance. And if music possesses, as it indeed does, in a large measure, the power of creating forms of 'pure emotional values', it is not incapable of rendering and expessing concepts evocative or human emotions". The phenomenal music, being the copy of the absolute music, contains within it the potentialities of divine nature and supra-mundane beauty of the absolute music. For this reason, the material tones and tunes also sing the song of the Divinity. Rabindranath Tagore has said: 'For music, though it comprehends a limited number of notes, yet represents the infinite'. So the phenomenal music has infinite possibilities for revealing the inner nature of man, nay, for making mortal man the immortal god-man.

Poet Tagore has further said that music "is the most abstract of all arts, as mathematics is in the region of science". It is sublime art as "the pure essence of expresiveness in existence is offered in music. In music, the feeling distilled in sound becomes itself an independent object. It assumes a tune-form which is definite but a meaning which is undefinable, and yet which grips our mind with a sense of absolute truth".

India is the land of spirituality. Here philosophy of music is looked upon as a spiritual sadhana, which elevates and animates the level of man's consciousness, and kindles in the cave of his heart the perpetual light of the Divine knowledge, and makes him free from the den of delusion forever and ever. The intuitive authors of music of India are fully conscious of this secret, and have made music the best and putest means for attaining the Godrealization. The philosophical foundation of music rests upon the solid rock of the realization of the immortal soul of music. Therefore, we should be educated to know that soul of music, because proper training and education can only harmonize the chords of the phenomenal music with those of the transcendental grand music of man. The arrists as well as the art of music should, therefore, be raised upon the high level of spirituality, and they should be conscious of the grand truth of philosophy (darsanaśāstra) of India that man can see God face to face, can get an immediate awareness of the Absolute, as the task of philosophy of India is to solve the riddle of the universe and to discover the ways and means to man's perfection in life.

## APPENDIX TO THE CHAPTER XVI

I. About dhvani and nāda from Matanga's Bṛhaddeśī:

यथानुभूतदेशाच ध्वनेः स्थानानुगादपि ।

ततो विन्दुस्ततो नादस्ततो मालास्त् नुक्रमात् ॥४॥

वर्णास्तु मालकोद्भूता मालका द्विधा मताः ।

स्वरव्यक्षनहृषेण जगज्ज्योतिरिहोच्यते ॥४॥

ततो वाक्यानमहावाक्यं वेदा साङ्गा ह्यनुक्रमात्। वक्कास्ते ध्वनितः सर्वे ततो गान्धवंसम्भवः ॥१०॥ ध्वनियोंनिः परा होया ध्वनिः सर्वस्य कारणम्। श्राकान्तं ध्वनिना सर्वं जगत् स्थावरजङ्गमम् ॥१९॥ ध्वनिस्तु द्विविधः प्रोक्को व्यक्काव्यक्कविभागतः। वर्णोपलम्भनाद व्यक्को देशीमुखसुपागतः ॥१२॥

इदानीं सम्प्रवद्यामि नादलच्यासुत्तमम् ।

- 5. According to the ancient musicologists like Matanga, Pārśvadeva, Sārangdeva and others, the microtones (śrutis) evolve from the causal sound, nāda. Regarding the process, Sārangdeva has said:

जातः प्राणाप्त्रसंयोगालेन नादोऽभिधीयते ॥

व्यवहारे त्वसौ लेघा हृदि मन्द्रोऽभिधीयते। कएठे मध्यो मूर्भि तारो द्विगुण्यश्चोत्तरोत्तरः॥ तस्य द्वाषिशतिभेदाः श्रवणाच्छुतयो यतः। हृयुर्वनाडीसंलमा नाभ्यो द्वाविंशतिमेताः॥

--सन्नात-रलाकरः १।३।७-८

# ॥ कल्लिनाथ ॥

प्राणनामानं प्राण इति नाम यसासी प्राणनामा, तम्। एतेन मन्त्रशासा-चुसारतो वीजाच्चराणां तत्तद्देवताताद्रूप्यापस्याऽत्र नकारदकारौ प्राणाप्ती इत्युक्तं भवति । विदुः, मान्त्रिका इति शेषः । जात उदितः ; श्राभिव्यक्त इति यावत् । उक्तपन्नविधनादस्याप्यविशेषेण गीतोपयोगित्वे प्राप्ते, हत्करुठमूर्य-स्थानेध्वेव श्रुतिपदनाडीसद्भावात्त्रस्यस्यैव नादत्रयस गीतोपयोगित्वम् । ९।३-६

6. Regarding difference of opinion about the number of microtones as well as the variations in the musical sounds, Kallinath has said:

श्रन्ये त्विन्द्रियवैगुरायात् तिविधं श्रुतिं मन्यन्ते । इन्द्रियवेगुरायं च तिविधं सहजं दोषजमिनधातजं चेति । श्रतिन्द्रियं मनः । तत्त सत्त्वगुरायुक्तं सहचम् , रजस्तमोयुक्तं दोषजम् , श्रम्लादिरसोपहतमिनधातजिमस्यर्थः । श्रपरे तु वातिपत्तकफर्सनिपातमेदिमिन्नां चतुविधां श्रुतिं प्रतिपेदिरे । तथा वाह तुम्बुहः —

उच्चेंसारो ध्वनी रूचो विश्वेयो वालजो युधैः। गम्भीरो धनलीनस्तु श्रेयोऽसी पिलजो ध्वनिः॥ श्लिग्धश्च युकुमारश्च मधुरः कफजो ध्वनिः। लयाणां गुणसंयुक्तो विश्वेयः संनिपातजः॥

इति । एते तु शब्दभेदत्वेन वचयन्ते । श्रपरे तु वेरवादयो मुनयो नवविधां श्रुतिं मन्यन्ते ।

Musical tones and melodic types are sometimes interpreted with astromical, anatomical and Indian medical (āyurvedic) terms, which really does not convey the philosophical idea of music. The philosophy of music is absolutely concerned with the basic or causal sound (nāda) and its true realization as the highest knowledge and existence which make the artist (sādbaka) free from the bondage of the delusive world.

### CHAPTER XVII

## THE PRIME OBJECT OF INDIAN MUSIC

We love music, but it it is asked as to why do we love music, we cannot give a satisfactory answer to it. If we say that we love music for our own satisfaction, the answer will not be correct. But it should be remembered that music is an art, which contains within it an universal appeal and an inner urge for expansion, Music conveys the idea of broadening our mind and intellect. It enlightens our soul for realizing the real import and value of art and life. So the culture of music does not require any suspension and limitation. It does not mean that we should be contented with practice of mere skeletons of ragus and raginis, which are framed out of the combination and permutation of tones, but we shall have to dive deep into the very core of the ragas and raginis, and shall realize their true emotional aspect and spirit. We shall have to infuse life in them and make them dynamic and fit to be divinised and visualised in our intuitive vision.

Music is a system of education which imparts knowledge and experience as to how to elevate and animate the levels of consciousness. The world of ours seems to be very sweet in the outset, but it ultimately deludes us with its outward charms and grandeur. So the wise men temain apart from its fleeting beauty and go deep beneath the surface of it, and find solution of the mystery of their life.

Music is a gift or boon to human beings, because it

consoles the mind and helps the mind to concentrate and meditate upon a universal centre; makes men free from the fetters of false knowledge and ignorance, and bestows permanent peace and happiness even in this earthly life.

In the primitive society of the most ancient days, the uncivilized nomadic tribes, not only of India but also of all the countries of the world, used to sing and dance for consoling their heavy hearts and for mitigating cares and anxieties of their daily life. They used in their songs one, two or three notes, high, low and medium. Their songs were very simple. They used in those songs simple drums of wood and flutes of bamboo, wood or bone of animals. They used to dance with the rhythms of songs of charms, weather, marriage and other aspects of worldly life. The very walk of their life was accompanied with the sweet tunes of music and rhythmical cadences of dancing. In the civilized society too, music became the prime means to men's household life and to their peace and solace. So from the dim antiquity up till now, music has preserved its glorious march and tradition, and men find their hope and consolation of life in it.

But music requires a systematic study and sustaining striving. In the Vedic days, the sincere pupils used to sit at the feet of their wise teachers and take lessons in the spiritual knowledge, and this master-pupil (guru-śiṣya) tradition is being carried on in the field of study even to these days. Perfection (siddhi) in every aspect of life is always preceded by practice in its truest kind, and a man reaps his ripe harvest in the field if he sows the seeds in time. The childhood is the best time for taking training in culture of fine art of music, because habit and tendency

of a child are ready to receive all he gets in this time. It is the nature of a child to acquire new things from the surroundings and environments he lives in, and thus he expands the sphere of his knowledge and experience. The childhood is also an impressionable age of life. So, if a child is taught music properly by the experienced teachers, it never goes in vain. The impressions of learning music in the childhood remain deep in the bed of subconscious or unconscious mind, they rise again in the ripe age and help men to master over the subject. The tones and tunes of music create sweet sensations in the mind of the child, stimulate his physique and thus bring new energy and vigour in him. Then the mind of the child becomes a new centre of knowledge and intuition. A new vision is then opened to him with new hopes and aspirations, and the world of ours appears to him as entirely new.

The conception of a raga is very deep and meaningful in Indian music. It gets into the softest corner of the minds of men, irrespective of caste, creed and colour. The tones create the melodic patterns with their colourful ascents and descents and with harmonic relations, together with alamkāras, mūrochanās, tānas and ten essentials which bring life into music. According to the psychology of music, the microtones and tones are surcharged with aesthetic sentiments and moods, and they make the skeletal forms of the ragas be impregnated with those qualities. So when men, women and children come in contact with tones and tunes of music, they are absorbed, and their dark deposites of the minds are slowly replaced by the bright ones, and their hearts are purified so as to receive the self-effulgent light of the immortal Atman. The realization of the knowledge of the Atman is the be-all and

end-all of all music artists and music lovers. The prime object of Indian music is, therefore, to get the blessed boon of the Divine knowledge that makes men free from the chain of delusion forever and ever.

But the present-day tendency of music culture seems to be commercial and deplorable, because it has confined itself within the walls of self-inverest. It has also vitiated the taste and temperament of both the artists and the artlovers. It should, therefore, be refined and viewed in its true perspective and colour. We should remember that as man's power and capacity are limited, it is not possible for him to meet all the requirements he wants in this world of desires. The Upanisad states that continual pouring of clarified butter into the fire cannot extinguish it, rather it enhances the flames. To extinguish the fire, water is necessary. So the culture of the art of music in terms of selfish interest may add to the acquisition of material prosperity, but cannot mitigate the real desire of one's mind. The real aim of man is to reach the goal of the Self-realization, and through the medium of music this achievement is fulfilled much sooner.

Let us remember always that the art of music is maintained and sustained only by the artist's sincere love for art, purity and perseverance. Teachers, environments and external guides can only help men to manifest the powers and experiences that lie latent in their subconscious mind. They are the best means or mediums. But we should remember that we ourselves are to unlock the door that confines the unfathomable beauty and greatness of music. Musicology always complies with the real ideal of music, and the artists and the art-lovers should always be conscious of this highest aim and object. India is

the land of spirituality and ecstatic joy, and every fine art of India, be it music, painting or sculpture, turns its face towards the lofty ideal of the achievement of unbounded joy and immortal bliss.

# APPENDIX I

# AN ANALYSIS OF MUSIC IN AN OLDEST PURANA

Indian classical music has a very long history from dim antiquity, and the onward march of that history has not yet concluded, nor will it come to an end, so long as its science and art have life and force. It is bound to change and be modified, owing to the impact of changing circumstances and altering phases of the Indian mind. But amidst such changes and modifications, sincere and serious study of the treatises on music will enable us to discover the foundation, on which the cultural evolution of Indian music has been built up. We are still in the spade-work stage, and have to carry on research patiently and indefatigably.

A study of music in the Epics is most important and essential. History cannot afford to ignore the facts of this eventful Epic period. Many things of music that are now obsolete and dead, might be found to have been current in the Epic period. In the Great Epics like Rāmāyaṇa, Mahā-bhārata and Harivamśa, we get ample materials of the gāndharva music. Different materials of music are found in the Epics like Mārkaṇdeya-purāṇa, Vāyu-purāṇa, Agnipurāṇa, Vṛhaddharma-purāṇa. Viṣṇudharmottara-purāṇa, etc.

The Puranas are the documentary records of social customs and manners of the great Epic age. They are the evidences of social, political, educational, religious, philosophical and spiritual aspects of the then society. Rise and fall of the different clans and kingdoms with

their war and peace—conflict and amity—have built up the mythological history of the Hindus and other nations of the post-Buddhist India. Though most of the Puranas are recorded allegorically in an exaggerated way, yet they carry in them the historical truth and value.

The Rāmāyaṇa, Mahābhārata and Harivamśa can also be enlisted in the category of the Purāṇas. The Harivamśa is a supplement to the Mahābhārata. Some say that the Rāmāyaṇa, Mahābhārata and Purāṇas are merely the mythological interpretations giving in them no genuine facts and conveying no authenticity. But that is not true. Their putting is only in the mythological garb, but truth lies in them with all the historical significance and value. So the Purāṇas must be treated as history, and we should investigate and penetrate into them so as to explore the mysteries of the Epic India.

We are at present concerned with some of the notes on the Markandeya-purana that claims priority over all the Puranas. The Markandeya-purana, says Dr. Winternitz, "is one of the most important, most interesting, and probably one of the oldest works of the whole Purana literature. Yet even this Purana is no unified work, but consists of parts which vary in value and probably belong to different periods". Prof. S. Bhīmsankara Rão says: "Brahma-purana stands first and it is called Adi-purana, and Visnu-purana stands 3rd in the list. Some are of the opinion that Vayu was the oldest". It is said that the Tāmil lexicographer was familiar with the tradition that the Siva-purana was a Maha-purana. But Ramachandra Diksitar holds quite a different view. He says that in "priority of date, style, contents and the peculiar classification into four padas, the Vāyu-purāņa can easily be ranked

as the Mahā-purāṇa". Prof. Fārquhar is of opinion that the Mahā-purāṇas are twenty in number, and in that respect both the Vāyu and the Siva Purāṇas enjoy the status of the Mahā-purāṇa. But Rāmachandra Dikṣitar, like Dr. Winternitz, says that the Purāṇas really "constitute a work of various periods in succession. The Purāṇas were composed of facts with adjustments and re-adjustments in different periods covering several centuries".

It is said that Vyāsa after compiling the Itibās as (histories) and the Purāṇas (mythologies), composed the Mahābhārata to complete his task in the domain of literature and learning. Vyāsa also admitted this view in the Mahābhārata (Ch: VIII, 34. 1498). But this admission, in our view, bears no strong historical evidence, as it is a fact that many of the Purāṇas borrow their materials both from the Rāmāyaṇa and the Mahā-bhārata.

Prof. Pargitar opines that the Bhavişya-purāņa was the source of the Matsya, Vāyu and Brabmāṇḍa Purāṇas. And in this way it can be shown by many parallel passages that all the Purāṇas are indebted to each other for their discussions. Again, it can be proved that most of the Purāṇas hold in them the traditions that have been developed at different centres of religious activity where local events were inserted subsequently. As for example, Prof. Bhīmśankara Rāo mentions: "the Brahma-purāṇa represents Orissā version, the Padma-purāṇa that of Puṣkara, the Agni-purāṇa that of Gayā, the Vāyu-purāṇa that of Mathurā, the Vāmana-purāṇa that of Thaneśwar, the Kūrma-purāṇa that of Nārānasī, the Matsya-purāṇa that of the Nabada-Brāhmiṇs". So it is evident that the Purāṇas were composed or compiled in different times with the topics and annals of different

countries and dynasties. But Rāmachandra Dīkṣitar tells us that though "the composition of the Purāṇas is to be spread over a large expanse of time, covering some countries in the epoch of the Brāhmaṇas and the Upaniṣads, we already find some reference to a form of compositions allied to the Purāṇas". So he assumes that the earlier Purāṇas were composed at the last stage of the Vedic period, though it is impossible to determine the exact dates and definite natures of them at the present time.

Some are of the opinion that the earliest Dharmaśāstras, such as Gautama and Āpastamba, mention the names of the Purāṇas. By the time of Kauṭilya's Arthaśāstra (4th century B.C.) it was counted as one of the subjects of studies for a royal prince. But it is true that the word 'Purāṇa' is again found in the XV maṇḍala of the Atharvaveda and in the Chāndogya-upaniṣad (VII. 1.2). In the Chāndogya-upaniṣad, it is mentioned that Nārada, asked by Sanatkumāra, said that he studied the four Vedas and also the fifth Veda—the ltihās and the Purāṇa and the Mahābhārata and other subjects. So it can be concluded that the Purāṇa or Purāṇas won the priority over the Vedas and the Upaniṣads. But that is not possible.

Some scholars hold that the Purāņas are prior to the Rāmāyaṇa and the Mahābhārata "with the exception of the Mārkaṇḍeya and perhaps a few more". Again there rages a controvery as regards the priority of the Rāmāyaṇa and the Mahābhārata. The renowned South Indian historian Dr. Kṛṣṇaswāmī Iyengār holds that the events of the Rāmāyaṇa took place after the great war of the Mahābhārata. That is, he is inclined to ascribe the date of the Mahābbārata prior to the Rāmāyaṇa. But Dr. Winternitz has shown that though it is commonly

believed by many that "the Mahābhārata belongs to a ruder, more warlike age, while the Rāmāy aṇa shows traces of a more refined civilization", yet it can be proved that the Rāmāyaṇa is earlier than the Mahābhārata for many reasons.

Again Ramachandra Diksitar has said that from the closer study it is found that some of the Puran as are earlier than the Ramayana and the Mahabharata and even than the Harivamsa, the supplement to the Mababharata. Because it is that the Puranas never mention the name of the Ramayana and the Mahabharata, whereas in the Ramayana, Mahabharata and Harivamsa, the mention of the names of some of the Puranas can be found. Dr. Winternitz is of opinion that the "Puranas certainly existed already long before the final reduction of the Mahābhārata. ..... and the Harivamsa not quotes the Vāyu-purāņa, but in many places agrees literally with the Vayu-purana transmitted to us". The scholars like Holtzmann, Hopkins and Lüders also agree with Dr. Winternitz. Prof. Hopkins has mentioned that "the description in our Vayu-purana is more ancient than the one given in the Mahābhārata". Prof. Lüders has also proved that "the Rsya-Srnga-legend has an older form in the Padma-purana than in the Mahabharata". So Dr. Winternitz sums up from all the conclusions: "From all this it appears that Puranas, as a species of literature, existed long before the final reduction of the Mahabharata and that even in the Puranas which have come down to us, there is much that is older than our present Mahabharata".

Rāmachandra Dīkṣitar has further said: "A study of the Purāṇas shows that the earlier Purāṇas were composed in the period prior to the Mahābhārata and

Gautama Buddha, while the later Puranas were composed in the epoch following Buddha". Prof. Pargitar also admits that the Visnu-purana (III. 17, 8-18, 34, Cf. Pad. VI, 263, 67-70) has some accounts of Buddhism and Jainism. Prof. V. A. Smith has shown that "the Visnu-purana is very reliable as regards the Maurya dynasty (326-185 B.C.) and the Matsya-purana is also very reliable as regards the Andhra dynasty (which came to an end about 225 A.D.), whilst the Vayu-purana describes the rules of the Guptas, as it was under Chandra Gupta I (about 320-330 A.D.)". Ramachandra Diksitar admits the views of Prof. Smith to same extent, and says that the "version of the Visnupurana, with regard to the Mauryan dynasty and of the Vāyu-purāņa to the early Guptas, has found general acceptance among scholars. The Vayn version of the Gupta rule is believed to be a description of the reign of Chandra Gupta I, who ruled Magadha from 320-330 A.D.". So from this it can be concluded that most of the Puranas contain account of the genealogies of the kings. They contain the genealogy of the Anava, Paurava, North Pāncāla, Kānyakubja, Kāśī, and the Iksvāku dynasties. The Markandeya-purana gives in detail the early history of the Vaisala dynasty (Ch: 113-36).

The etymology of the term 'Purāṇa' has been furnished by the Vāyu-purāṇa as 'yasmāt purā hi anatidaṃ purāṇam,' i.e. 'that which lives from ancient times is known as Purāṇa'. The general characteristics of the Purāṇas are of five kinds, and they are:

Sargaśca pratisargaśca vamśomanvantarāni ca/ Vamśānucaritam ceti lakṣaṇānām tu pancakam//

The Puranas must contain five kinds of characteristics

(laksanas) and those characteristics are: primary creation, secondary creation, genealogy of gods and patriarchs, period of Manus, and the history of princes of solar and lunar dynasties and of their descendants. However Dr. Winternitz lends his ultimate view as regards the date of the Puranas as: "All that we can safely conclude is that the earlier Puranas must have come into being before the 7th century, for neither later dynasties nor later famous rulers such as, for instance, Harsa occurs in the list of kings. The Markandeya-purana is one of the eighteen Puranas. To enumerate them in the order it can be shown: (1) Brahma, (2) Padma, (3) Vaisnava, (4) Saiva or Vāyavīya, (5) Bhagavata, (6) Nāradīya, (7) Mārkandeya, (8) Agneya, (9) Bhavisya or Bhavisyat, (10) Brahmavaivarta, (11) Linga, (12) Varāba, (13) Skandba, (14) Vāmana, (15) Kūrma, (16) Matsya, (17) Garuda, (18) Brahmanda. Mārkāndeya-purāņa has been designated after the name of the sage Markandeya. In this Purana, the deities like Indra and Brahma have taken more prominent part than Visnu or Siva. The Vedic deities like Varuna, Mitra, Prthivi and Agni have played their roles in some portion. According to Pargitar, the oldest part of the Markandeya-purana "may belong to the third century A.D., but may perhaps be earlier". Dr. Winternitz mentions that in the Markandeya, the portion of the Devi-mahatmya has been inserted in later time than the 6th century A.D.

Now let us discuss about the materials of music that are depicted in the Markandeya-purana and analyse that of music therein. The Markandeya-purana is divided into 237 chapters, and only a portion of the 23rd chapter (Beng. ed. 23rd and Bombay ed. 28th) has been devoted to the discussion of music. Besides, there are some discussions on dancing, singing and drumming (nṛtta, gīta, vādya) in other chapters (Beng. 149 and Bombay 154, etc.). The main discussion on music begins with an allegorical dialogue between the serpent-king Aśvatara and his brother Kambala on one side, and the Goddess of Learning or Devī Sarasvatī on the other. The names of the kings, Aśvatara and Kambala occur also in the Rāmāyaṇa, Mahābhārata, Harivamśa and other Purāṇas. In Śāraṅgdeva's Saṅgīta-Ratnākara (1210-1247 A.D.), we find the mention of "kambalā-śvatarastathā" (1.16). In the Mahābhārata (300 B.C.), we get the names of Kambala, Aśvatara and Kāliya together: "kambalāśvatarau cāpi nāgaḥ kāliyastathā" (1.35.10). Sāraṅgdeva has mentioned also the names of Kambala and Aśvatara, while he determines the jāti or genus of music. As for example, he says.

Etadalpa-ni-gāsvāliuh kambalaśvatarādayah// Alpa-dvi-śrutike rāgabhāṣā'dāvapi tanmatam/

-S.R. 1.7.22-23

Kallināth (1446-1465 A.D.) has quoted here the views of Bharata, and says: "pañcamī-madhyamā iti bharata-matānusārinā vacanena, 'etadalpa-ni-gāsu' iti kambalāśva-tarādi-matānusārinā vacanena' (vide SR. Poonā ed., p. 78: Adyār ed., vol. 1 p. 117). Simhabhupāla (1220 A.D.) has also mentioned: "alpa-niṣāda-gāndhāre rāgabhāṣādāvapi svarasādhāraṇam proyoktyamiti teṣām kambalāśvatarā-dīnām matam' (vide SR. [Adyar ed.], Vol. I, p. 178). From this it is clear that Aśvatara and Kambala wrote some authoritative books on music and we often find them to be referred by the ancient authors. We notice that like Kohala and Dattila, and Nārada and Tumburu, the names of Aśvatara and Kambala are also mentioned together

in many places, as the 'old authors' on Indian music ('vṛddha saṃgitācāryās').

The Markandeya-purana describes that the king Asvatara made a severe penance for many years together. He seems to belong to the Naga dynasty (naga-vamsa). The Naga dynasty is considered to be one of the branches of the Scythian race. "The Nagas", says Pracyavidyamahārņava N. N. Basu, "spread their influence not only over India, but also at one time over whole of the civilized world. Alexander the Great observed dragon-worship and the influence of serpent-worshippers in the Punjab" (vide The Archaeological Survey of Mayurbhanja, Vol. I. p. XXXV. Cf. also Cunningham's Archaeological Survey Report, Vol. II. p. 9). Prof. Fergusson says that he noticed a picture of some serpent-worshippers, curved in stone, in the east gate of Sanchi (vide The Serpent-Worship. p. 33). Prof. Grünwedle also admits it (vide the Buddhist Art in India, p. 62). The Chinese traveller Yuan Chawang has mentioned it in his travelling records (vide Watter's On Yuan Chawang, Vol. II, p. 133). Before the reign of the Nanda Kings, the Naga dynasty was in existence in India, and it is not definitely known whether the dynasty was connected with the Sisunaga dynasty. In the Pali literature and the Puranas, the names of the nine Nandas are traceable. Dr. B. M. Barua is of opinion that after 140 years of the passing away (mabāparinivvāṇa) of Gautama Buddha (probably in 348 or 347 B.C.) the Siśunaga or Saiśanaga dynasty was extinct (vide Aśoka and His Inscriptions, Vol. I, pp. 41-42). Dr. B.C. Lähā says that the Sisunaga dynasty was established before 600 B.C. or perhaps in 642 B.C., by a chiefrain of Vārānasī, named Siśunāga, who fixed his capital at Girivraja or Rajgrha (vide Tribes in Ancient India, p. 199). Again

it is found in the history that the Naga King 'Champeya' established his kingdom on the bank of the Champa that runs between Anga and Magadh.

The serpent-king Asvatara was very fond of music. His intense longing for knowledge in the art and science of music made him take a vow of severe penance, for getting a boon from the Goddess of Learning. The Goddess was very pleased with his austerity. She appeared before him and offered him a sacred boon: "evam stutā tadā devī viṣṇurjihvā sarasvatī". She said to the king Asvatara,

Varam te kambala-bhrātah prayacchāmyuragādhipa/ Taducyatām pradāsyāmi yat te manasi vartate//

'O king of the serpents and the brother of Kambala, I have been pleased with you. I wish to confer upon you a boon. So my son, ask whatever you desire'. Asvatara was very glad to see his vow fulfilled. His heart was moved by the sweet and affectionate words of Devi Sarasvati. He said to the Goddess with awe and reverence:

Sahāyam dehi devī tvam pūrvam kambalameva me/ Samasta-svara-samvandhamubhayoh samprayaccha ca/

O Devi, if you are pleased with me, at first make my brother Kambala a constant companion of me, and then bestow upon both of us the divine boon of art of music by means of which we two can master all the science and knowledge of notes'.

Now it may be asked who was Devi Sarasvatī, the Goddess of Learning?, In the Sambitās and the Brāhmaṇas, Sarasvatī has been described as 'a river' ('nadī-rūpā') like Dṛṣadvatī, Indus (Sindhu), etc. Most of the European scholars have interpreted the word 'Sarasvatī' as the river. In the Satapatha-brāhmaṇa (3.2.4.2.7), we find an allusion

of the stealing of the Soma creapers (somalata) by the semidivine music-loving Gandharvas. The Gandharvas, it is said, were the dwellers of the North-West Province of India. The ancient musicologists like Nārada, Tumburu, Hāhā and Huhu, Viśvavasu, Aśvacara and Kambala were all included in the stock of the Gandharva. The allusion in the Satapatha-brahmana proves that the Gandharvas were the born musicians, and they practised traditionally the gandbarva type of music that evolved in the beginning of the classical period in the 600-500 B.C. out of the remains of the Vedic music, sāmagāna. In the Mārkandeya-purāņa, the Goddess of Learning has been called as the 'tongue of Visnu' ('visnujihuā-sarasvatī"). In the Vedic period, the sacrificial fire (Agni) was conceived as the sun of the nether world (prthui). The sun in the sky was conceived as Mithra or Mitra (universal friend of the world) and the sky, as Varuna or the 'ocean of milk' (ksiroda-samudra). The sun is worshipped from very ancient times, and gradually it was conceived as the presiding deity of the sacrifice. Consequently the sun was looked upon on the earth as 'fire' or Agni. Gradually the fire (Agni) was considered as the representative (pratinidhi) of the sun in the sky. With the evolution of the anthropomorphic ideas of the gods and the goddesses, both the sun and the fire were conceived as Visnu. As the sun pervades the whole universe with its rays, so Visnu pervades everything phenomenal with his sublime glory and magnanimity. In the Epic literature, we find the allusion of Trivikrama or Vamana, who stretching his three legs, covered or pervaded the three worlds, while accepting the boon from demon Vali. Vāmana's three legs represent the three regions (lokas), earth, etherial space or sky and heaven (bhuh, bhuvah and svah), which again convey the idea of all-pervasiveness (sarva-vyāpakatvam). The mythological god, Trivikrama or Vāmana has been conceived as the divine incarnation of Viṣṇu or the sun. So the significance of the word 'Viṣṇu' holds the same idea of all-pervasiveness. The rays of the sun, together with the flames of the sacred sacrificial fire, were conceived as the 'tongues'. The Goddess of Learning (Sarasvatī) was afterwards considered as one of the presiding deities, being identified with the sacrificial fire. Therefore the word 'viṣṇu-jihvā' became an epithet of Devī Sarasvatī. Sarasvatī was also conceived as the presiding deity (adhiṣṭḥātrī devī) of all kinds of learning and Fine Arts.

Therefore Devi Sarasvati, as an embodiment of the rays of the sun or flames of the fire, being earnestly asked by the king of Gandharva, Aśvatara, for proficiency in the art and science of music, granted the prayer, and said with a smile 'be it so' ('tathāsta'). The Goddess then bestowed the desired boon upon Aśvatara and Kambala, saying,

Sapta-svarā grāmarāgāḥ sapta pannaga-sattama/
Gītakāni sa saptaiva tavatīścapi¹ mūrcchanāḥ//,

"O king of the serpents, both you and your brother Kambala will be able to master the seven notes, seven grāmarāgas, fifty-nine tānas, and three grāmas. Moreover, I bestow upon you the boons of getting efficiency in four padas, three tālas, three yatis, and four todyas (ātodyas). By my benediction and grace, both of you will be able to acquire the knowledge of these arts, their vowels and consonants. I am pleased to bestow all these boons upon you and your brother Kambala. Now I have given everything to you and your brother. In heaven, human world and netherworld—everywhere you will be honoured".

On a perusal of the Mārkandeya-purāna, we find the names of the seven laukika notes, ṣadja, ṛṣabha, gāndhāra, madhyama, pañcama, dhaiuata and niṣāda, as opposed to the vaidika ones. The 6th-5th century B.C. was an epochmaking period, as the Vedic music was replaced by the newly devised gāndharva type of music at that time. A demarcating line has been drawn in the history of India between the music, vaidika and the laukika. The vaidika or Vedic music, sāmagāna, with its variants were sung with the seven notes, prathama, dvitīya, tṛtīya, caturtha, mandra, atisārya and kruṣṭa. The pioneering dramatist and musicologist Brahmābharata (commonly known as Brahmā, Druhina, Pitāmaha, etc.) was credited to have devised the gāndharva music. As most of the materials of the gāndharva

<sup>9</sup> svaravyañjanayośca yat.

music was sought for and collected by him, it was known as 'mārga' (mṛg—anveṣaṇe). The microtones (śrutis) being considered as the (subtle) notes, the Mārkandeya-purāṇa does not feel to mention them separately.

It has been said before that the seven gramaragas are śadava, pańcama, madbyamagrama, sadjagrama, sadbarita, kaiśika-madbyama and kaiśika. In fact the grāmarāgas are six in number, as the kaiśika-madhyama and kaiśaka are one and the same raga. As the ragas have their foundations in the basic scales, sadjagrāma and madbyamagrāma, they are known as the 'grāmarāgas'. They evolved out of the jātis i.e. jātirāgas: "jātisambhūtatvāt grāmarāgāņi". The jātis or cast melodies are the primal rāgas. They have also been mentioned in the Ramayana (4th canto). The wandering Bards, Lava and Kuśa used to sing the Rāmāyaṇa-gāna, added with pure type of jātirāgas (śuddha-jātis). They were seven in number, and were known as the gandbarva music. Out of them, six gramaragas evolved during 400-200 B.C. as we find them in the Mahabharata and Harivāmśa, and they were even played in the gandharagrām:, 'ā-gāndhāra-grāmarāgam gangāvataraņam tathā' (vide HV. Vișņuparvam, 89 canto). In the Nāradīśikṣā (1st century A.D.), Nārada has mentioned seven types of grāmarāga, as have been mentioned before. In Mārkandeya-purāna (3rd-5th century A.D.), we find also seven kinds of gramaraga, and it seems that the author of the Markandeya-purana has followed Nārada of the Sikṣā. These seven grāmarāgas are also supported by the Kudimiyāmālai Stone Inscription, installed by Rājā Madendravarman in the seventh century A.D. The seven kinds of tonal arrangements are also found in the seven grāmarāgas, as evidenced by the Rock-Inscription.

The seven gitis, as mentioned by the Markandeyapurāņa, are the ragagītis or ragas by themselves. Bharata deals with the gitis like magadhi, ardha-magadhi, etc., which were used in the stage songs, dhruvā-gītis. But Matanga (5th-7th century A.D.) has fully described the seven gītis, which were described in terms of the rāgas. Matanga says that the gitis were: śuddbā. bbinnā or bbinnakā, gaudī or gaudikā, rāga, sādbāraņī, bbāsā and vibbāsā or vibbāsika. There are controversies regarding the number of the gītis (rāgagītis) among the ancient musicologists like Kohala, Yāstika, Sārdula, Dürgāśakti and others. The Mārkandeyapurana has followed the method of Matanga of the Brhaddesī. From the Sangīta-Ratnākara (early 13th century) we come to know that there were other kinds of gītis like brahmagīti, kapālagīti, etc., which were devised, it is said, by Brahmā or Brahmābharata in the pre-Christian era. Sarangdeva has also described the seven gītis like re, gāthā, pāņika, etc., but the Mārkandeyapurana is not concerned with those seven types of the gandharva-giti.

It may be taken that during the time of the Mārkaṇḍeya-purāṇa (3rd-5th century A. D.), gāndhāragrāma was absolutely out of practice, and so, when he says about the seven mūrechanās, it should be taken that it describes seven mūrechanās of the ṣaḍjagrāma and the madhyamagrāma, which were current in its time. But it is interesting to mention that the author of the Mārkaṇḍeya-purāṇa has also mentioned the names of the three basic scales, ṣaḍja, gāndhāra and madhyama. Muni Mārkaṇḍeya has said,

Tato hāhā-huhuścaiva nāradastumburustathā/ Upagāyitumārabdhā gāndharvaṃkuśalāraviṃ/ Sadja-madhyama-gāndhāra-grāmatraya-viśāradāḥ/ Mūrcchanābhiśca tānā liśca¹ samprayogaiḥ sukhapradam//,
—(106 canto)

From the text it may be assumed that the gandharagrāma was also in practice in the time of the Mārkandeyapurāna and consequently its tānas and mūrcchanās. But from the evidence of the Nāṭyaśāstra we know that in the beginning of the Christian era, the gandhāragrāma was obsolete in the society, though the practice of the gāndharva type of music was current: 'gāndharvam kuśalaravim'.

The murcchanas of the sadjagrama are: uttaramandra, rajanī, uttarāyatā, asvakrāntā, abbirudgatā, matsariķītā and suddha-sadja, whereas those of the madhyamagrama are: sauvirī, bariņāśvā, kalopanatā, śuddha-madhyā, mārgvī, pauravi and brsyaka. The Markandeya-purana admits the forty-nine tānas: "tānāścaikonapańcāśat." Bharata differs from it. Bharata has described eighty-four tānas: "tānaścaturasiti". Dattila follows Bharata, and says that the tanas can be classified into three categories, complete (pūrna), incomplete (apūrna) and intricate (kūța). But it is interesting to note that Narada (1st century A. D.) describes, in the Siksa, the forty-nine tanas of three gramas, sadja, gandhara and madhyama. He admits 14 in sadjagrāma + 20 in madbyamagrāma + 15 in gāndhāragrāma = 40 tānas. Visnusarmā also admits in the Pancatantra (2nd-5th century A. D.) fourty-nine tānas: "tānāstekonapancāsat".

The author of the Mārkandeya-purāna states like Nārada (of the Sīkṣā): "grāmatrayañca" i.e., there are three ancient scales or grāmas, ṣadja, madbyama and gāndhāra. But from Bharata's Nāṭyaśāstra we know that the gāndhāragrama

<sup>1</sup> Different reading : tālaišca.

was obsolete from the beginning of the Christian era. Regarding the type of composition, the Purāṇa states: "caturvidham padam" i. e., the padas are four in number, and Bharata is of opinion that everything, which is composed of letters, is known as pada. The pada makes the notes and tempi manifest, and so it is known also as 'vastu': "padam tasya bhaved-vastu svara-tālānubhāvakam". Bharata divides pada first into two, nibaddha and anibaddha, and then into satāla (with rhythm) and atāla (without thythm), Bharata says:

Nibaddhañcanibaddhañca tat padam dvividham smṛtam/ Atālañca satālañca dvi-prakārañca tadbhavet//

Sārangdeva admits this division of the pada, and says that the satāla nibaddha padas are possessed of four music-parts (dhātus), six limbs (ṣaḍanga=svara, viruda, pāṭa, etc.), and atāla anibaddha pada is known as an ālapti or ālāpa. The Mārkandeya-purāna probably considers those nibaddha and anibaddha and satala and atala padas as four in number. But Bharata and Sārangdeva have classified them into two groups, satāla-nibaddha and atāla-nibaddha, though they appear as four in number.

By tālam the Mārkandeya-purāna means the 'rhythm' which is of four kinds and they are: āvāpa, niṣkrāma, vikṣepa, and praveśaka. Those rhythms (tālas) create three kinds of tempo, and they were slow (vilamvita), medium (madhya) and quick (druta). The Purāna admits these three tempi ('laya-trayam''). Regarding prakāra, yati and todya i. e., ātodya, the Mārkandeya-purāna admits three kinds of prakāra, three kinds of yati and four kinds of ātodya, which were current in its time. The three kinds of yati are: samā, srotogatā, and gopucchā, and four kinds

of ātodya are: tata, suṣira, ānaddha and ghana. The Saṅgīta-dāmodara of Subhankara (middle of the sixteenth century) states,

Tamānaddhañca suṣiraṃ ghanamiti caturvidhaṃ/ Tataṃ veeṇādikaṃ vādyamānaddaṃ murajādikaṃ/ Vaṃsyādikastu suṣiraṃ kāṅsya-tālādikaṃ ghanaṃ//

The word 'ātodya' signifies the musical instruments, and they are divided into four classes, tata i. e. the musical instruments that are played with the help of steel or gutted strings like veenā, and veena class of instruments, saroda or saroda-veenā, tamburā or tumburu-veenā, sitāra or saptatantrī-veenā, etc.; (2) suṣira or wind instruments; like veņu, śankha, vamśī, gomukha, śingā, etc.; (3) ānaddha or skin-covered instruments like different kinds of drums, and (4) ghana or the înstruments, made up of iron or brass like cymbal, etc.

Besides the vocal music, the Mārkandeya-purāna describes different kinds of musical instruments and the art of dancing. Regarding musical instruments, the Purāna states,

- (a) Veeņā-veņu-mṛdaṅgānātodyasya parigtaham/, Karoti gāyatām vittam: nṛtyatāñca pṛayacchati/ (68 canto)
- (b) Prāvādyanta tatastara veņu-veeņādi-dardarāḥ/,
  Prṇavā puṣkarāścaiva mṛdaṅgāḥ patahānakāḥ//
  Devadundubhayaḥ śaṅkhāḥ śataśo 'tha sahastaśaḥ/
  Gāyadbhiścaiva gandharvai-rnṛtyadbhiścāpsarogaṇaih/

Turya-vāditra-ghoṣaiśca sarvam kolāhalīkṛtam/,
(106 canto)

<sup>1</sup> These have been fully described in Bharata's Nātyašāstra.

(c) Jaguh kecit tathaivanye mṛdanga-paṭahanakan/, Avadayanta caivanye venu-veenadikamstatha//, (128 canto)

From these ślokas we come to know that various kinds of musical instruments like venu, veenā, dardura, paṇava, puṣkara mṛdaṅga, paṭaha, deva-dundubhi, śaṅkha etc. were used at that time. The art of dancing was prevalent among both classes of people, aristrocratic and common. The dancing was also pratised by the ladies of the harem. In the Royal courts, the dancing girls had free access. The Mārkaṇdeyapurāṇa states:

- (a) Pragīta-gandharvagaṇāḥ pranṛttāpsarasāṃgaṇāḥ/ Hāra-nūpura-mādhurya-śobhitānyuttamāni ca// (10 canto)
- (b) Viśvācī ca ghṛtācī ca urvaśyatha tilottamā/,
  Menakā sahajanyā ca rambhāścāpsarasāṃ varāḥ//
  Nanṛtu-rjagatāmīśe likhyamāne' vibhāvasau/
  Hāva-bhāva-vilāsaḍḥyān kurvantyo' bhinayān vahūn//
  (106 canto)

From these it is evident that the dancing girls like Tilottama, Rambha, Viśvaci and others used to take part in the dramatic plays. Their dances were accompanied with different gestures and postures and aesthetic sentiment and moods.

Now we find that the Mārkandeya-purāna furnishes us with the materials of music that were traditionally cultured from very ancient time. The type of music practised was purely gāndharva, though some of the regional (deśi) materials are found mentioned in the Purāna. It is a historical fact that during the time of the Mārkandeya-purāna, the work of formalization of the aboriginal regional tunes had begun, and some of the non-Aryan tunes also got

into the stock of the Aryans. However scanty may be the materials of music in the Mārkandeya-purāna, their historical value and importance are immense. The Epics are the fountain-head of inspiration, and they supply us the materials of music to compile a reliable history of Indian music. We should, therefore, study the Epics and analyze the ingredients of music therein, which will enable us to have a synthetic vision to get into the realm of cultural history of glorjous India.

## APPENDIX II

#### MANGALAGITI: ITS SIGNIFICANCE AND FORM

Most of the historians are inclined to ascribe the time of Mahākavi Kālidās between 150 B.C. and 400 or 450 A.D. In Kālidāsa's different poetical works and dramas (kāvyas and nāṭakas), we come across the words, maṅgalagīti and gītamaṅgala. To cite one or two examples of them, Kālidās has mentioned:

- (a) mūrechanā-parigṛhita kaiśikaiḥ kinnarairuşasi gītamaṅgalaḥ"/—Kumārasambhava, 8.85.
- (b) sambhāvitānām giritājaputryā grhe'bhavanmangalagitakāpi//-Kumārasambhava, 11.33.

That is, 'when the kinnaras were engaged in singing the mangalagīti with the help of the rāga kaišika and impregnated with murchana at day-break, Siva, who was most worthy of being praised and worshipped by the wise ones, awoke with the blossoming of the hundred petaled golden lotus'. Now, this mangalagiti and gitamangala were no other than the sacred mangalācarana-gīti. Kālidās has mentioned that the mangalagiti used to be sung with the raga (gramarāga) kaišika, consisting of a mūrechanā. It is a historical fact that from the time of Bharata of the Natyasastra fame (2nd century A.D.) down to that of Pandit Damodara of the Samgita-darpana (15th-16th century A.D.) the ragas used to be determined by their respective murcchanas. A murcchana is a structure of seven tones with their ascending and descending series ("svarānāmārohakrama mūrcchanā"). Sarangdeva of the early 13th century A.D. has dealt elaborately with the varieties of murcchana of the three gramas,

and before Sārangdeva, Bharata, Matanga, Pārśvadeva and other ancient dramatists and musicologists have fully dealt with the problem of murcchana. We know from Sarangdeva's Sangīta-Ratnākara that the rāga kaiśika was possessed of gandharadi-murcchana. The raga kaisika used to manifest itself in different forms like suddha-kaisika, sadja-kaisika, mālava-kaišika, thakka-kaišika, botta-kaišika, bbinna-kaišikamadhyama, gauda-kaiśika, etc. Kālidās was fully aware of importance and utility of the murcchanas of the ragas, and so wherever he has mentioned some ragas, gramas and ganas, he has used the word murcchana to make them explicit. As for example, while describing the deplorable condition of the departed wife of the exiled Yaksa, he has mentioned about the murcchana of the gandharagrama, which was appiled by the Yaksini for abbicarika purpose on the wires of the veena: "niksipya veenam . . . mūrcchanām vismaranti".

Now the gītamangala, that occurs in the śloka: "mūrcchanā parigrihita kaiśikaiḥ" etc. was actually the nibaddha prabandha-gāna. Sārangdeva has described in the fourth prabandha chapter of the SR. that the prabandas were mainly of three kinds, and they were: sūḍa or mārga-sūḍa, āli or āli-samśraya and viprakīrņa (SR. IV. 22). The viprakīrņa-prabandha was of thirty-six varieties, and they were: elā, karaṇa, dhenkī, . . . dvipadī. catuṣpadī, carcarī or cāñcara, caryā, paddhaḍī, rāhaḍī, viraśrī, mangalācaraṇa, dhavala, mangala, etc. (SR. IV. 23-32). The nāma-kīrtana, introduced by Śrī Chaitanya in the 1485-1533 A.D., and the rasa or līlā kīrtana, innovated by Thākur Narottamadās in the 16th century A.D., were no other than the karaṇa-prabandha-gāna, as described by Sāraṅgdeva. Even Thākur Jayadeva (12th century A.D.),

Badu Chandidas (early 14th century A.D.), Thakur Vidyāpati (14th century), and other Vaisnava savants composed many dobas and padavalis in avabattha-saurasenivanga or vanga-maithili languages before Srī Chaitanya, and they were known as classical type of karana-prabandhagana. The natagiti of Bengal, composed in the avabattha language, was also known as the prabandha-giti. The Carnataka composers like Achalanandadas (15th century A.D.), Narahari-tirtha (13th century), Sripadarāja (third quarter of the 15th century), Vyāsarāja (15th century), Vādirāja (1480 A.D.), Purandaradas (1484 A.D.), Tyagaraja, Muthusvāmī Dīkṣitar, Syāmā Sāstrī and others composed songs which were known as the classical kirtana-prabandhagana. The karana-prabandha is of nine kinds, and accordingly for their special features they were again divided into three main classes, mangalarambha, anandavardhana and kirtipürvikā labari or kirtilabari (SR. IV. 142). The last one, kirtilabari-karana-prabandha was designed after the form of kirtana or padavali-kirtana. The gitamangala or mangalagiti was also included into the category of the prabandha-giti.

Besides the mangalagīti, Kālidās has mentioned in his different Kāvyas the names of the prabandhas like cacarī, caryā, jambhalikā, etc. The cacarī-prabandha or cāńcara used to be sung on the occasion of holī festival in the spiring season: "sā vasantotsave geyā cacarī prākṛtaiḥ padai" (SR. IV. 290-291). The caryā was purely spiritual: "adyātma-gocarāḥ caryāḥ" (SR. IV. 4. 292). In the 950-1200 A.D., the Sahajayānī and Vajrayānī mystic Yogīs of the Buddhist, Jain and Nātha sects composed many dohās (caryās) in code language (sandhyā-bhāṣā), and they were known as the padas i.e. nathagītis and caryāpadas. The

dhavala and mangala gītis were also spiritual in their nature. Sārangdeva has mentioned about them in connection with the dhavala-prabandha-gāna: "āśīrbhir-dhavala-geyo dhavalādi-padānvitaḥ" (SR. IV. 302), i.e. the dhavala-prabandha used to be sung with the word of blessings and dhavala verses, The mangala-prabandha used to be sung either with the rāga kaiśika (or kaiśiki) or boṭṭa (or bhoṭṭa), consisting of mangala verses (padas) in a slow tempo (vilamvita-laya). Sārangdeva has mentioned about the method of embellishment of the mangalagīta or gītamangala thus:

Kaiśikyām bortarāga vā mangalam mangalaih padaih/ Vilamvita-laye geyam mangala-cchandasāthavā//

-SR. IV. 303.

Thus we find that there were current two kinds of kašika-rāga in the ancient Indian society: one, the jāti or jātirāga and the other, the grāmarāga. Bharata has described the kaiśika-jāti as one of the eighteen jātirāgas in the Nāṭyaśāstra (28.45), and Nārada has mentioned about the kaišika-grāmarāga in the Nāradīšiksā (vide the Vārāņasi edition, p. 409). Narada has said that the gramaraga kaiśika was mentioned by the musicologist, Kasyapa: "kasyapah kaisikam piaha madhyamagrama-sambhavam" (IV. 11). The commentator, Bhattosobhākara has said that that kaisika, madhyamagrama, sadava and other gramaragas used to be duly sung in ancient India. Matanga (5th-7th century A.D.) has mentioned in the Brhaddesi that the gramaraga kaiśika used to be sung along with the prabandha, dbruvā specially meant for the dramatic performances: "dhruvāyām viniyojanam" (śloka 265). The commentator, Mallinath has regarded kaiśika or kaiśiki as a raga. Mallinath has said: "kaiśikaih svikrta-raga-viśesaih." Kallinath has said about the bhasaraga, kaisiki, and it is

the bhāṣārāga of the śuddha-pañcama (SR. IV. 207). As regards the boṭṭa or bhoṭṭa rāga, Sāraṅgdeva has said that this grāmarāga, boṭṭa used to be sung on the occasion of religious functions in commemoration of Siva, the Lord of Bhavānī: "utsave viniyoktavyo bhavānīpati-vallabhaḥ" (II.50).

It is said that botta or bhotta is a classical raga, imported from the Bhotadesa in the Tibetan region. Dr. P.C. Bagehi has said that the bottaraga might be connected with the Indian names of Tibet, as botta (bhutiyā or bhotta) however does not occur either in Sanskrit inscriptions or in texts before the 7th century A.D. Such might be the case of the classical raga takka or tanki, which was collected or imported from At-tock or At-tak janapada (town), situated on the bank of the Indus river. The evidences of inclusion of innumerable regional tunes (ragas) into the stock of classical music are found in Matanga's Brhaddesi, and it is a historical fact that there were intermixture of tunes of the Aryans with those of the aboriginal tribes of ancient India. The bottaraga of the Bhotadesa used to be sung on the occasion of sacred ceremonial functions like the rāga kaišika: "bhoṭṭaja-ri-dha-sañcāra giyata sarva-mangale." Now it is clear that the mangalagiti or gitamangala, as mentioned by Kālidās in the Kumārasambhava, used to be sung either with the help of kaisika or batta (or bhotta), exclusively for sacred religious purpose. Kallinath (1446-1465 A.D.) has also mentioned that with the help of mangala verses and the ragas kaisika or botta, the sacred song, mangala used to be sung in auspicious fanctions: "kaišika-rāge botta-rāge vā kalyāņa-vācikai padair-vilamvitena layena mangalo geyah, athavā mangala-nāmanā-chanadasā". (SR. IV. 303). As regards the special feature or

characteristic of the dhavala-prabandha-gāna, Kallināth has further said that the four sacred symbols like śańkha, cakra, gadā and padma should be mentioned in the composition (sāhitya) of the dhavala-gīti. Again in every verse (caraṇa), there shall occur twenty mātrās in the song and all these were again divided into five groups.

The mangala-giti used to be profusely sung in Bengal, and specially in the Rādadeśa in West Bengal from the 13th to the 18th century 'A.D. From Vipradās (Manasā-mangala) to Bhārata Chandra (Annadā-mangala), the religiomythological ballads like mangala-gāna, etc. used to be sung în different villages of Bengal with śāstric rāgas and tālas. From the musical references, as mentioned in Kālidāsa's works, we come to know that arts of drama and music used to be cultured by both the rural and urban people of mediaeval India, and the literary compositions (sābitya) of those songs and dramas were written both in Sanskrit and Prākrit.

### APPENDIX III

# RABINDRA-SANGÎT AND RABINDRANATH

Rabindranath was a born composer as well as a musician. He was nurtured in an atmosphere of Indian classical music from his childhood. Calcutta, particularly the poet's ancestral palace at Jorasanko was the venue of the culture of classical music. Many leading and reputed Muslim and Hindu musicians came at that time from Delhi and other places of North India and settled in Vishnupur (Bāńkurā), Hooghly, Cinsura, Krishnagar, Srīrampur, Calcutta, Gobardāngā, Mymensingh, Gaurīpur, Assam, Tipperāh, Betivā under the patronage of music-loving Rājās and landlords. Vishnupur, in those days, was recognized as the most prominent centre of culture of music in Bengal. Rabindranath got impetus and inspiration in music first from his brothers and associates. Musical soirees were held now and then at the Tagore Palace of Jorasanko. Poet's father Maharsi Devendranath Tagore of revered memory was himself a great admirer and patron of classical music. He encouraged his beloved youngest son, Rabindranath to compose songs and poems. He also engaged some reputed music-teachers like Visnu Chakravurty, Srikantha Singha and others to teach Rabindranath pure type of classical and other kinds of devotional music. It is said that Jadubhatta of Vishnupur for sometime taught him some dbruvapadas of different ragas and talas, but Rabindranath himself did not admit this fact.

Rabindranath's voice was resonant, chatming and sonorous from his very boyhood. He had exceptional merit

and aptitude in exactly imitating the most difficult dhruvapadas and dhāmāras. In his Jivanasmṛti ('Reminisence'), he mentioned that fact that not only he heard good songs, but learnt them as a part of his life's sadhana. He had also an innate propensity for mastering intricate talas. He had great regard for dbruvapada type of prabandhagītis in the early period of his life, and composed many dbruvapadas in Bengali after the pattern of the old traditional ones. His compositions were rich in poetic value and beauty, shedding aesthetic lusture. He departed, in this respect, from the steriotyped method of composing songs that prevailed in the past and threw new light thereon. Most of the compositions of classical songs of the past masters are bereft of poetic value and beauty, but he fashioned a tie of harmony between words and tunes (kathā and sura) of songs. The compositions (sāhitya) of songs underwent significant transformation at the touch of his magic want at it were.

The music, that evolved and nurtured on the soil of India and that maintained throughout the Indian spirit and tradition, is known as 'Indian music'. Indian music has a special charm, characteristic and feature of its own, and so it differs from music of all other countries. Rabindranath realized this truth, and recognized it as the most exalted of all arts. He observed in the Religion of Man that music "assumes a tune form which is definite, but a meaning which is indefinable, and yet which grips our mind with a sense of absolute truth". "Our music," he said elsewhere, "transcends the presincts of everyday life, so there is to be found so much of tenderness and indifference to worldly joys and sorrows as if it is ordained to reveal the story of the innermost and inexplicable mystery that

surrounds the soul of man and of the universe". While comparing the music of India with that of Europe, he said: "In India, our best thoughts are engrossed in the devotion to song, and we have to overcome the difficulties mainly in the song; in Europe devotion to voice is their first concern, and they perform most complicatedly wonderful feats with it. An appreciative audience in India are content to listen to the beauty of the song alone; but in Europe they listen to the singing of the song". He further said: "I hold that the provinces of Western and Eastern music is, as it were, strangely entwined with the activities of life, so it becomes easy to connect the air of a song with multiform experiences of life". Many of the savants of other countries are of the same opinion that Indian music is superior to others for its superb emotional appeal, together with transcendental nature and beauty.

Rabindranath was a stunch follower of traditional Indian music, and yet he was a man of independent spirit in every walk of his life and so he sometimes revolted against the steriotyped method of practice of music. He believed that the new things may rise from the ashes of the old ones, and every epoch of history possesses certain new outlook and novel character and idea of its own. It is true that music of both Vedic and classical times underwent some novel change during the Muhammedan period, and music that was prevalent in the mediaeval time is sure to take some new course in the present time. As everything in this world of change is not constant, so principle and practice of music of every age must be subject to change with some new additions and alterations, to suit the taste and temperament of the people of different ages. Rabindranath was a bright example of his own conviction. So as days were on, he left

the beaten tract in the domain of Indian music, and brought about some innovations in the field of music. In this respect, he may be termed a revolutionary-cum-rationalist. His way of presentation of classical type of songs took a novel course without exhibiting some unnecessary batas and tānas, having different mathematical arrangements of svaras and talas. He laid special stress upon the spirit of both compositions and tunes of his songs. He believed that thythm and tempo (tāla and laya) create symmetry and harmony in songs, but yet there should be proportionate control and balance in them, because the acrobatic feats of intricate and disproportionate tanas, batas and talas spoil the harmonious developement of the ragas as well as of the songs. So let not the tanas, batas and talas lord over the songs, but remain as the loving companions of the songs. He composed hundreds and thousands of songs of different types, keeping an eye upon this ideal. He set tunes to almost all of his songs himself and made some of the songs to be tuned by his near and dear ones after his manner. He used to sing those songs, so as to test their intrinsic value and quality, and also taught them correctly to others. Though he generally followed most of the traditional forms of the ragas, yet brought about an admixture in many of them and adopted those forms that were prevalent in the old Bengali songs and in songs of the Vishnupur School.

Rabindranath maintained that melody (sura) does not depend on words (sahitya), but what words fail to convey, melody can do it with perfect ease, and that where words end, melody begins, and yet words (sahitya) are necessary for the easy unfolding of the hidden beauty and grandeur of melody (sura). Again words are the signs or symbols of

the songs, whereas the tunes or melodies are life of them. So, according to Rabindranath, the words of the tuneful songs must be of deep significance as well as of poetical value, so as to help the artists and the audiences to easily grasp the divine beauty that underlies the songs. He, therefore, composed songs which were both musical and lyrical (suradbarmi and kāvyadbarmi), to cover the entire fields of music and its appreciation. It has already been said before that Rabindranath was both a composer and a tuner. He composed songs and added tunes to them according to the temperament of themes and compositions of the songs. He said that a tune is a combination of motions i.e. sweet vibrations of the prana or vital energy, which create a divine urge and feeling in the hearts of the artists and the listeners, so as to make them transcend the deceitful limitations of time and space. Therefore a tune is a moving unit which is creative and living.

Rabindranāth was not a blind follower of any chalked out path, but was a lover of progress and yet he followed a suitable method that was nourished on the soil of Bengal. He was a follower of the Vishņupur School, and it is said that this School was an offshoot of the Seni gharāṇā of Delhi, which took some new and novel form in the hands of the talented Bengali Ustāds of Vishņupur. The śāstric rāgas were already prevalent in Bengal, but for some unknown cause, many rāgas and even tālas took some new forms other than the traditional ones. As for example, the rāgas like puravī or pūrvī, bhairava, bhairavī, vasanta, vihāga, rāmakelī, pañcama, lalita, vāgeśrī, sindhu, etc., and tālas like yat, āḍāṭḥekā, madhyamāna, teerā, ekatāla, dhāmāra, etc. took some novel forms and methods of presentation. Rabindranāth incorporated in his system

most of the forms of the ragas that were current in Bengal. He devised also some new ragas and talas, with the combination of the systems of both the South and the North. Sometimes he did not follow the rigid rules of sharp (śuddha) and flat (komala) notes in the structutes of the ragas, and so he incorporated many tunes in a raga and made it an organic whole. His methods of presentation of the ragas as well as of the songs are very simple and appealing. His later dbruvapada type of songs are not at all the imitative ones, and yet they are very majestic, sweet and significant. His kheyāl, ṭappā and thumri types of songs possess some special qualities. He loved synthesis. So many of the Western and Eastern tunes were coalesced in his system of music for the formation of new models. He synthesised dance with music in some of his dramas and enriched their rhythms and tempi.

Rabindranath's creative genius flowered forth in the songs and dances specially composed and conceived for the gitinātyas and nrtyanātyas. Or it can be said in other words that the gitinātyas like Vālmikipratibbā, Kālamṛgayā and Māyārkhelā and the nrtyanātyas like Chitrāngadā, Chandālikā and Syāmā, etc. are the landmarks of his creative faculty of composing songs and conceiving dances. He travelled extensively all over the world, and noticed with keen interest varied tunes and techniques of music and dances, both classical and folk, prevalent in different countries, and sometimes, adopted them in his own system. He also assimilated the European and Irish tunes (melodies) in his music. In dance, he introduced the techniques of Bharatanātyam, Kathākali, Kathaka, Manipurī, Kandayan, Seraikela, Raibense, together with those of the ballet dance of Dovenshire, England, and dances of Java, Bāli and other countries. Now, if it is questioned whether Rabindranāth did introduce any new school of music or dance, the answer will be in the negative. He was to innovate a new aspect and infuse a new spirit in music and dance, and this is true in respect of his dramas also, which brought an awakening in the field of historic art. He was a lover of truth and beauty, and as such although he had his mind fixed upon the ideals of the Vedic and classical and mediaeval India, yet he was fully conscious of the ever-changing taste and temperament of the human society.

Rabindranath was a man of rare genius. He was not merely a composer and musician, but also a great poet, an eminent educationalist, an artist, a scientist and a historian, and above all a messenger of peace, love and humanism. His aesthetic sense and spiritual vision were unique. He brought about a renaissance in the field of art, literature and music, and gave a new impetus that inspired not only the people of India, but also all the art-loving peoples of the world. I-le not only composed the classical type of songs, but many baul, bhatiyals and devotional songs as well, and himself used to sing like a God-intoxicated mystic. He also composed many kirtanas after the ideal of the Vaishnavapadāvalī. His national songs breathe a spirit of love and devotion for his motherland, and may be regarded as the fountain-head of living inspiration to all classes of people of all countries.

He was a man of faith and self-confidence. He was a believer in God and His beautiful creation. His songs are, therefore, full of praise of Nature and her Creator. In short, his songs can be divided into main six classes, and they are pujā, prakṛti, prema, anuṣṭḥānika, svadeśa and vicitra. His seasonal songs (rtu-saṃgīta)

are full of dynamic rhythms. His outlook was always surcharged with spiritual fervour. He maintained that absolute freedom (mukti) can be attained through music in the midst of innumerable sufferings and a thousand bondages of the world. They should not be shunned, he said, but should be harmonized in our life, and transformed into divine beauty and hevenly bliss through one's own supreme realization. So most of his songs are full of adoration and supplication of the supreme Being and as such stir the very depth of heart of man irrespective of caste, creed and colour.

We can tentatively discern five strata in the evolution of Rabindranath's compositions or songs, and these strata throughout prove the creative genius and dynamic personality of the poet. He had in him an intense progressive outlook, but his notion of progress was supplemented by finality or fulfilment of the goal. (1) in the first stratum was found many religious and devotional dbruvapadas and old Bengali songs with classical ragas and talas. Here he mainly followed the past old masters like Tanasen, Baijunath, and others. (2) In the second stratum, though the first initiative was not entirely given up, yet he was found here to follow some new and novel course in music, with the admixture of different ragas and talas. The words got prominency in the songs, and the tunes were set according to the texture and temperament of the compositions. The tempers and tunes of telena, tappa and other ragagitis, together with European and Irish melodies of Thomas Moore, were adopted in the compositions of his songs. The gitinātya Vālmikipratibhā was produced and staged at that time (1881). Rabindranath also recorded in his reminiscences (Jivansmṛti) that the Valmikipratibha was born of an admixture

of Indian (deśi) and European (vilāti) tunes or melodies. Gradually some of the dance-dramas (nrtyatnātyas) like Māyārkhelā and Kālamrgayā came out from his facile pen, though the last one was later incorporated in the Valmikipratibbā. Alterwards dramas like Rājā-O-Rāņī, Visarjan and lyrics like Bhanusimher-padavali came into being with new types of songs, dialogues and dances. (3) In the third stratum, we find that Rabindranath's musical compositions were greatly influenced by the emotional mood or temperament of Bengal. The tunes then got slight prominence, and he composed many devotional songs at that time. (4) In the fourth stratum, we find him as a master composer of lyrical songs (kavyadharmi-gitis), the tunes having full accord with the words, and Rabindranath here was found to lay more stress upon the emotional sentiments in his songs. His national songs were composed mostly during the last part of the third or first part of the fourth strata. The baul, bhatiyali, jari, kirtana types of songs were composed at this time. The dance-drama Citrangada came into being at this time, and the techniques of dances like bharatanātyam, kathākalī, of the South, kathaka of Lucknow, and manipuri of Assam were introduced in it. Besides, the techniques and textures of dances, mentioned above and the dance recital of the Citrāngadā also were enriched by an admixture of regional dances like seraikhela, rāibense, gambbirā, gājan, kāzri, caiti, together with the dances prevailing in Java, Bali and other places of the Far East.

In the socalled fifth stratum, we find Rabindranath mainly composing songs of peaceful sentiments (śāntarasa). He was living at that time the life of a mystic or Godintoxicated man. He used to consider himself as a mere

のことなる

child of Nature, as a result of which we got the songs describing the play of the six seasons (rturanga or rtucakra). Many of these songs are akin to the folk-songs, describing the natural beauty, sublimity and simplicity of villages and peaceful environments of Santiniketan and Silaidaha. He had an intense love for his motherland, specially for Bengal, his land of birth. His kirtana and baul types of songs are marvels of composition and tune. He had a high estimation of the padavali-kirtana of Bengal. He observed: "Our kirtan music of Bengal came to its being like a star burning whirlpool or emotion in the heart of a whole people, consciousness was aflame with a sense of reality, that must be adequately acknowledged".

Rabindranath was a lover of music of all nations, yet he had a soft corner for the music of his own land. I-le said that Indian music is superb for its lofty ideals and living spirit. He listened to European music many times, collected materials from them, and adopted them in his own music, where and when necessary. But it should be noted that he always Indianized them. It has been said before that while comparing Indian music with the European one, he maintained that Indian music has the innate power to awaken the emotional sentiments and spiritual urge in man, whereas European music stirs only the emotional depth; the one enters direct into the inner chamber of the heart of man, whereas the other gives only the knock at the door. So there lies a difference between the two, from the viewpoints of religious and spiritual significances. To quote his own words in this respect: "At first, I must admit your Western music jarred upon me. I heard Madame Albani sing a song in which there was an imitation of the nightingale. It was childishly imitative of the mere externals of nature that I could

take little pleasure in it. \* \* It seems to me that Indian music concerns itself more with human experience as interpreted by religion that with experience in an everyday sense. For us, music has above all a transcendental significance. \* \* \* Our music draws the listener away beyond the limits of everyday human joys and sorrows, and takes us to that lovely region of renunciation, which lies at the root of the universe, while European music leads us to a varriegated dance through the endless rise and fall of human grief and joy".

From this we learn that Rabindranāth's outlook of music was quite different not only from those of the European and other Western countries, but also from those of the socalled composers and musicians of India. He had an out-an-out religious and spiritual outlook, and, in this respect, he preserved the tradition of spiritual India in the domain of music. His music must, therefore, be looked upon and preserved as the priceless heritage of glorious India, so as to uplift the level of consciousness of the human society.

In conclusion, it can be said that Rabindranath was a mighty ocean, in which there mingled all the streams of schools and styles of music. He synthesized all types of music, classical and folk in his system, and roused a new hope and inspiration not only in the hearts of compatriots, but also in those of all people of the world. His music is serene and simple, and it reaches the innermost core of everyone with easy grace. It should not, therefore, be kept confined within a privileged class to make its scope for expansion rigid, but be placed on a common or universal platform which may be approached by and accessible to all classes of people,—artists and artisans, so as to make them enjoy its enchanting flavour and exquisite beauty, so that it may 'vibrate in the memory' ever and anon.

H

Five of the beautiful compositions of songs of Rabindranath, which were composed in Bengali, in imitation of the traditional Hindī dhruvapada songs, are given herewith in the devanāgarī script:

- (क) महाराज, एकि साजे एले हृदयपुरमामे । चरणतले कोटि शशी सूर्य मरे लाजे ॥ गर्व सव दृटिया, मूर्छि पडे लुटिया, सकल मम देह मन वीगासम वाजे ॥ एकि पुलक-वेदना वहिंछे मधुवाये, कानने यत पुष्प चिल मिलिल तव पाये । पलक नाहि नयने, हेरि ना किछु भुवने, निरखि शुधु श्रन्तरे सुन्दर विराजे ॥
- (ख) शान्ति कर बरिषणा नीरव धारे, नाथ, चित्तमाभी;
  सुखे दुखे सब काजे, निर्जने जनसमाजे।
  उदित राख नाथ, तोमार प्रेमचन्द्र,
  अनिमेष मम लोचने, गभीर तिमिर-माभे।।2
- (ग) सुन्दर वहे आनन्द-मन्दानिल, ससुदित प्रेमचन्द्र,अन्तर पुलकाकुल।

I This song was composed in imitation of Suratasena's composition: मेरे दुन्द दल साजे दशरथ-सुत राम, पदम दश कोटित कोटि कोप धायो, etc. in Bihāg—Jhāmptāla (cf. the notation in Rāma-prasanna Banerjee's Saṅgitamañjarī (1935) pp. 531-532).

<sup>2</sup> This song was composed in imitation of Tānarāja's song: शम्भू हर पदयुग ध्यानि वखानि, नाथरक तोरि कीरतन दिन रैंग, गावत जनसमाज। etc. in Tilaka-kāmoda—surpbāktā or sūlatāla (cf. the notation in the Saṅgītamañjarī, pp. 330-322).

कुज कुजो जागिछे वसन्त-पुन्य-गन्ध, शून्ये वाजिछे रे स्रनादि वीगाध्विन ॥ स्रचल विराज करे शशी-तारा-मण्डित सुमहान सिंहासने त्रिभुवनेश्वर । पदतले विश्वलोयु रोमाधित जय जय गीत गाहे सुर-नर ॥

- (घ) प्रक्रगड गर्जने आसिल एकि दुर्दिन,
  दाहरण घनघटा, श्रविरल श्रशनि तर्जन।
  घनघन दामिनी, भुजङ्ग-स्नत-यामिनी,
  श्रम्बर करिछे श्रम्थ नयने श्रश्रु वरिषण॥
  छाडरे शङ्का जागो भीह,
  श्रलस श्रानन्दे जागाश्रो श्रम्तरे शकति॥
  श्रकुरह श्रील मेलि हेर प्रशान्त विराजित,
  महाभय महासने श्रयहरा स्ट्युझय-हपे भयहरण॥
  4
- (क) आज विश्विष्ठ वसन्त-पवन छुमन्द, तोमारि छुगन्ध है। कत आकुल प्राण आजि गाहिछे गान, चाहे तोमारि पायो आनन्दे है।। ज्वले तोमार आलोक युलोक भूलोके,

गगन-उत्सव प्राज्ञने,

<sup>3</sup> This song was composed in imitation of Budhaprakāśa's song: शक्कर शिव पिशाकी गङ्गाधर, विषधर ( = विखधर ) नामदेव ईश्वर डमहक्कर, etc. in Imana-kalyāṇa—surpbāktāla or sūlatāla (cf. the notation in Saṅgītamañjarī, pp. 264-266).

<sup>4</sup> This song was composed in imitation of Jānakīdāsa's song: प्रचएड गर्जन सजल वरषा (वरखा)-ऋतु, काम आगम अति-विरिह्ति जियन तर्जन, etc. in Bhupālī—surphākta or sūlatāla (cf. the notation the Sangītamanjarī pp. 276-275).

चिर-ज्योति पाइछे चन्द्र तारा, श्राँखि पाइछे श्रम्थ हे। तव मधुर-मुख-भाति-विद्दृसित-प्रेम-विकशित श्रम्तरे, कत भकत डाकिछे 'नाथ, याचि दिवस-रजनो तव सङ्ग हे'।

उठे सजने प्रान्तरे लोक-लोकान्तरे, यशोगाथा कत छन्दे हैं, ऐ भवशरण प्रभु, श्रभय-पद तब सुर-मानव-मुनि बन्दे हे ॥

Besides these, Rabindranath independently composed some thousands of songs of various aspects in different ragas and talas, and they are recognized as the precious treasure of Indian music.

<sup>5</sup> This song was composed in imitation of Ranganāth's (Jadu Bhaṭṭa of Viṣṇupur) song: श्राज्ञ वहत सुगन्ध पवन सुमन्द मध्र वसन्तमें, हर मकुर पर-युथ मध्य मदहर निरत कर रव कुझमें। etc., in Bāhār—teorātāla (cf. the notation in Sangītamañjarī, pp. 486-488).

#### III

Rabindranāth said (original Bengali is given herewith in the Devanagrī script):

९ । संगीत कोन एकटि रागिणीते यतइ रमनीय सम्पूर्ण हप प्रहण करक ना केन, साधारण भाषाय एवं वाहिरेर दिक थेके ताके असीम वला याय ना । रूपेर सीमा आछे । किन्तु रूप यखन सेंड् सीमामालके देखाय तखन सत्यके देखाय ना । तार सीमाइ यखन प्रदीपेर मतो असीमेर आलो ज्वालिये धरे तखनइ सत्य प्रकाश पाय ।

-साहित्येर पथे।

२। श्रामादेर देशे संगीत एमनि शास्त्रगत, व्याकरणगत, श्रनुप्रानगत हइया पिंडयाछे । स्वाभाविकता हइते एत दूरे चिलया गियाछे ये, श्रानुभवेर सहित संगीतेर विच्छेद हृइयाछे, केवल कतकगुला सुर-समष्टिर कर्दम एवं राग-रागिग्गीर छाँच श्रो काटाम श्रवशिष्ट रहियाछे ; संगीत एकटि मृतिकामयी प्रतिमा हइया पिधयान्त्रे, ताहाते हृदय नाइ, प्राण नाइ। एइहप एक्ट् छाँचे ढाला, श्रपरिवर्तनशील संगीतर जड प्रतिमा श्रामादेर देवदेवी-मूर्तिर न्याय बहकाल हइते चिलया श्रासितेछे । ये कोन गायक-कुम्भकार संगीत गडियाछे. प्राय सेइ एकइ छाँचे गडियाछे । एइटुकु माल ताहार वाहादुरी ये, ताहार सम्मुखस्थित आदर्श मृतिर सहित ताहार गठित प्रतिमार किछ्नाल तफात हय नाह: एमनि ताहार हात दोरख । \* संगीते एतखानि प्राण थाका चाइ, याहाते से समाजेर वयसेर सहित वाडिते थाके, समाजेर उपर निजेर प्रभाव विस्तृत करिते पारे श्रो ताहार उपरे समाजेर प्रभाव प्रयुक्त हुय। समाज-वृत्तेर शाखाय शुष्क माल ऋल्डाखरपे संगीत नामे एकटि सोनार जाल वाँथिया देश्रीया हइयाछे, गाछेर सहित से वाडे ना, गाछेर रसे से पुष्ट हय ना, वसन्ते ताहाते मुकुल धरे ना, पाखीते ताहार उपर वसिया गान गाहे ना। गाछेर आर किछ उपकार करे ना, केवल शोभा वर्धन करे।

शोभावर्धनेर कथा यदि उठिल तवे तत्सम्बन्धे दुइ एकटि कथा वला स्रावश्यक। \*\* नानाविध कापडेर पाडे, रेखाविन्यास स्रो वर्णविन्यास द्वारा विविध नयनरञ्जक श्राकृति-सकल चित्रित हय, किन्तु शुद्ध ताहा ते इश्रामरा इटालीयदेर न्याय चित्रशिल्पी विलया विख्यात हइव ना। श्रामादेर संगीतश्रो सेइल्प सुरविन्यास माल, यतच्या श्रामरा ताहार मध्ये श्रामुगाव ना श्रानिते पारिव, ततच्यो श्रामरा उच्छेगीर संगीतवित, विलया गर्व करिते पारिव ना।

---भारती १२== आपाछ।

३। श्रामादेर कालोयाति गानेर एइ ये राग-रागिणी, इयार रसटा कि ? राग शब्देर गोडाकार माने रं। एइ शब्दटा यखन मनेर सम्बन्धे व्यवहार करा ह्य तखन वोभाय भालां लागा। वांलाय राग कथाटार माने कोध। इ'राजिते passion विलते भालो लागा थार कोध दुइइ वोभाय। भालो लागा थार कोध एइ दुइयेर मध्ये एकटा ऐक्य आखे। एइ दुटो भावेइ चित्त-उद्दोपित हह्या उठे। एइ दुयेरइ एक र', सेइ रंटा राडा थ्रोटा रक्तेर रं, हृदयेर निजेर आभा।

-संगीतेर मुक्ति ।

४। ठाटगुलिर श्रायतनेर उपरइ गान-रचियार खाधीनता निर्भर करे। राजिमिल्ली इँट साजाइया इमारत तैरी करे। किन्तु तार हाते इँट ना दिया यदि एक एकटा श्रास्त तैरी देयाल किंवा महल देश्रीया याइत तवे इमारत गडार तार निजेर वाहादुरी तेमन वेशी थाकित ना। सुरेर ठाटगुलि इंटर मत हईलेइ तादेर दिया व्यक्तिगत विशेषत्व प्रकाश करा याय, देयाल किंवा श्रास्त महलेर मत हइले तादेर दिया जातिगत साधारणताइ प्रकाश करा याय। श्रामादेर देशेर गानेर ठाट एक एकटा वड वड फालि, ताकेइ विल रागिणी।

—संगीतेर मुक्ति।
