PREFACE

This book is intended as a guide to the appreciation of the earliest phoneticians. Whitney’s pioneer expositions of certain of our sources some eighty years ago are acknowledged in the introductory chapter; but a general reinterpretation has now long been overdue, and this fact is in itself suggestive of the remarkable quality of the Indian texts. For it implies that they display a level of phonetic discourse beyond the full comprehension of Whitney and his contemporaries, such as only the advances of the late nineteenth and the twentieth centuries enable us to appreciate today. The recognition that analyses so advanced in their technique should have been evolved at so early a date may well inspire a salutary scientific humility, and it would be at once arrogant and pessimistic not to expect that a reinterpretation will again be necessary in another eighty years—or even eight.

I am grateful to Professor J. R. Firth for the encouraging interest he has shown at all stages in the progress of this work, and no less for his constructive suggestions; and I am happy to acknowledge the researches of Dr. Siddheshwar Varma, the stimulus of whose published work has been augmented for me by the background of his personal association with Professor Firth over twenty years ago—an association which has led, in the light of contemporary linguistics, to a fuller realization of the wealth that lies in the ancient treatises. My thanks are also due to Professor J. Brough, who read the work in manuscript and made a number of helpful criticisms, and to Mr. C. A. Rylands and Mr. R. H. Robins, who generously undertook to read the whole of the proofs during my absence in India.

Finally I acknowledge the generosity shown by the authorities of the School of Oriental and African Studies in providing a full subvention for the publication of this work.

INTRODUCTION

O.O. The Grammatical Achievement

In the sphere of grammar it is a gratifying custom of present-day linguists to pay lip-service to the greatest of descriptive grammarians, the ancient Indian Pāṇini: and it was an eloquent tribute to his achievement that one of the great linguists of our own time should write:

Indo-European comparative grammar had (and has) at its service only one complete description of a language, the grammar of Pāṇini. For all other Indo-European languages it had only the traditional grammars of Greek and Latin, wofully incomplete and unsystematic. ... For no language of the past have we a record comparable to Pāṇini’s record of his mother tongue, nor is it likely that any language spoken today will be so perfectly recorded.¹

But in spite of the invaluable translations of his work by Böhtlingk and now by Renou, unless the linguist is himself also a Sanskritist there are insuperable difficulties in the way of a full appreciation of Pāṇini’s achievement; and even for the Sanskritist a complete understanding is not easily attained—again to quote Bloomfield,

Even with the many commentaries that we possess ... several lifetimes of work will have to be spent upon Pāṇini before we have a conveniently usable exposition of the language which he recorded for all time.

It is indeed in the extent of the interpretative material, some of which has itself attained to a canonical status, that we find striking evidence of the honour accorded to the great grammarian in his own land.² But this profusion of commentaries also bears witness to the difficulties of Pāṇini’s technique: composed with an algebraic condensation, his work is a linguist’s and not a language-teacher’s grammar, and for the more pedestrian purpose of teaching Sanskrit rewriting was a practical necessity, thus giving rise to further grammatical hierarchies descending to a miscellany of school-grammars of recent date.³ It has been calculated that there are in existence over a thousand different Sanskrit works on Sanskrit

¹ L. Bloomfield, Language, v. 270 ff.
² In the Pradīpoddhyota of Nāgoji Bhaṭṭa, written some two thousand years after Pāṇini’s Astādhyāyī, we have a sub-commentary of no less than the fourth degree.
³ E.g. Rāmacandra’s Prakṛityākhaṃṇḍaḥ < Bhaṭṭoja’s Siddhāntakauṃḍaḥ > Varadarāja’s Laghukaṃṇḍaḥ.

B2398 B
grammar, by Pāṇini’s model: beside such a concourse the thousand manuscripts of Priscian’s Latin Grammar, the pride of our western tradition, are but a drop in the grammatical ocean. We have also to remember that Pāṇini himself acknowledges a number of predecessors, whose work, except for fragmentary citations, has been lost to us—Burnell has listed by name no less than sixty-eight of these pre-Pāṇinean grammarians; well might the medieval philosopher Kumārila remark,

We cannot think of any point of time totally devoid of some work or other dealing with the grammatical rules treating of the different kinds of roots and affixes.

But commendable as the cause may be, the non-Sanskritist can hardly be expected to acquire the grammar of Sanskrit—for which the Indian tradition prescribes twelve years’ study—to the sole end that he may more fully appreciate the work of the ‘linguistic Homer’, or of later ‘grammatical saints’.

In phonetics, we all too rarely look back beyond the great names of the nineteenth century—Henry Sweet, A. J. Ellis, Alexander Melville Bell—except occasionally to honour a few lonely and half-forgotten figures of the immediately preceding centuries. We justify some of our more grotesque and inadequate terminology (e.g. ‘tenuis’ and ‘media’) by tracing it back to the Latin grammarians, sometimes as far as Dionysius Thrax or even Aristotle: but generally speaking the expressions of ancient phonetic thought in the west have little to repay our attention or deserve our respect, whereas Indian sources as ancient and even more ancient are infinitely more rewarding. And in this field the linguist is fortunately in a more advantageous position to appreciate the ancient achievement, in that the acquisition of a working knowledge of the Sanskrit sound-system demands no very considerable labour, and in so far as there is a basis for general phonetic discussion which there is not for ‘general grammar’.

0.1. The Indian Influence on Western Phonetics

Moreover the link between the ancient Indian and the modern Western schools of linguistics is considerably closer in phonetics than in grammar. For whilst Pāñinean techniques are only just beginning to banish the incubus of Latin grammar, our phonetic categories and terminology owe more than is perhaps generally realized to the influence of the Sanskrit phoneticians. The impact of Sir William Jones's 'discovery' of Sanskrit on the course of Western linguistics is well known; but Jones, apart from his knowledge of the Sanskrit language, was also acquainted with the traditional statements of its sound-system: in his 'Dissertation on the Orthography of Asiatic words in Roman Letters' the whole order of treatment and descriptive technique is clearly based on Indian models. In a paper on 'The English School of Phonetics' Professor J. R. Firth has said of this great orientalist,

Without the Indian grammarians and phoneticians whom he introduced and recommended to us, it is difficult to imagine our nineteenth century school of phonetics.\(^1\)

The influence of the Indian works on the phonetic views of William Dwight Whitney may be clearly seen in the discussions published in the *Journal* of the American Oriental Society during the years 1862–6, subsequent upon the appearance of Lepsius's *Standard Alphabet*;\(^2\) and we have the feeling that without their teaching Whitney might not have been in a position to express self-righteous indignation against that other country from which he had learnt so much—

It is really amazing how some of the most able physiologists and philologists of that nation (i.e. Germany) have blundered over the simple and seemingly obvious distinction between an \(s\) and a \(\tilde{s}\), an \(f\) and a \(v\), a \(p\) and a \(b\), etc.\(^3\)

The 'seemingly obvious' distinction of voiced and voiceless here

---

\(^1\) *TPS* 1946, pp. 92 ff.

\(^2\) It is remarkable that a German study of the English School should fail to make any reference whatever to the Indian influence (H. Raudnitzky, *Die Bellsprachliche Schule: Ein Beitrag zur Geschichte der englischen Phonetik*, Marburg 1911).

\(^3\) *A Standard Alphabet for reducing Unwritten Languages and Foreign Graphic Systems to a Uniform Orthography in European Letters* (London, 1885).

referred to was subsequently recognized by Lepsius as 'derived from the Sanskrit grammarians'.

In England the Indian influence is evident in the work of A. J. Ellis, especially in Part IV of his *Early English Pronunciation*, where frequent references are made to Whitney's translations of the ancient works and also to his own observations on the speech of latter-day pandits. He displays on occasion a fuller appreciation of the ancient statements than Whitney had done, and generously remarks on their descriptions of 'voiced h'.

The wonder is, not that they should be indistinct, but that they should have been so much more distinct than the host of European grammarians and orthoepists who succeeded them.

As yet, however, the linguist cannot survey the Indian phonetic achievement without undertaking an extensive course of reading, of which only a certain proportion will be relevant to his purpose; and on the other hand, without having viewed the overall framework of the Indian analysis he can hardly assess individual descriptions. The principal works have been translated and commented upon (so far as the phonetic climate of the translator's environment permitted) by such Western scholars as Whitney, Weber, Regnier, and Max Müller, and more recently by Indian scholars amongst whom may be especially mentioned M. D. Shastri, S. K. Shastri, and M. Ghosh. An interesting selection of special problems has been discussed in detail by Siddheshwar Varma in his *Critical Studies in the Phonetic Observations of Indian Grammarians*. The present study aims at presenting a systematic account of Indian phonetic doctrine so far as it appears to possess more than purely Sanskritic interest. Where Western antiquity provides any particularly striking parallels or contrasts, some account of these has been given with a view to the comparative evaluation of the Indian statements. Occasional discussions related to later Indo-Aryan developments have been inevitable in establishing a control for the pronunciations described in the treatises.

0.2. *The Sources*

Of the works themselves it will be sufficient to note that they fall into two main categories, the *Prātisākhyaśas* and the *Sikṣās*.

1 *JAOS* viii. 344.

2 See further 1.120. below.
The former are phonetic treatises relating to the pronunciation of the four Vedas, namely:

<table>
<thead>
<tr>
<th>Rg-Veda</th>
<th>Rk-Prātiṣākhya</th>
</tr>
</thead>
<tbody>
<tr>
<td>Śāma-Veda</td>

<td>Atharvā-Prātiṣākhya.</td>
</tr>
</tbody>
</table>

The Śikṣās on the other hand are, with some exceptions, less specifically related to a particular Veda, but in many cases supplement the teaching of the Prātiṣākhyas. Whilst it is likely that the Prātiṣākhyas are based on an early Śikṣā (such as that referred to in the Taittirīya Āraṇyaka), our extant texts of the latter appear to be of later date than the former: the most important of them, the so-called Pāṇīntya-Śikṣā, is sometimes claimed as the original Śikṣā and in consequence put back to a very early date: but this, as also its attribution to Pāṇini, is highly doubtful. Varma places the Prātiṣākhyas in the period 500-150 B.C. and the extinct Śikṣā literature between 800 and 500 B.C. It is significant that one at least of the extant Śikṣās contains the admission,

If Śikṣā and Prātiṣākhya are found at variance, the Śikṣā is said to be the less authoritative, as the deer is weaker than the lion. Apart from these specifically phonetic works, numerous statements on phonetic matters are to be found in the grammatical works, more especially in Pāṇini’s Aṣṭādhyāyī and Patañjali’s

---

1 As Whitney himself has admitted, the text which he has edited and translated under this title is probably not the AP, and so should strictly be known by the title which it bears, viz. Śaunakīya Caturādhyāyikā. Nevertheless, the AP, if such it be (ed. S. K. Shastri, V. B. V. Shastri), contains almost nothing of general interest, and for present purposes the title AP may be retained without disadvantage to refer to Whitney’s edition.

3 VII. ii. 1, om. śikṣāṃ vyākhyāyāṃ. The subjects of the Śikṣā are given as śiṣṭāḥ (‘sound-unit’), śvarṇaḥ (‘tone’), mātrā (‘quantity’) balaṃ: sāma sāntānāh. Sāyaṇa interprets balaṃ as ‘degree of buccal closure’ (cf. 1.11. below), sāma as ‘tempo’ and sāntānāh as ‘junction’.

5 Cf. Thieme, op. cit., p. 86 n.

Sarvāsvamata-Śikṣā, ed. Franke, 49.

śikṣā ca prātiṣākhyaṃ ca virudhyete paramparo
śiṣṭāca sūryāvyaśaṃyaṃ mitaṃ yathā.
Mahābhāṣya; and it is evident that in India, unlike Europe, grammatical writers availed themselves of the best professional phonetic advice. In such ancient and non-technical works as the Brāhmaṇas, Āranyakas, and Upaniṣads we find a familiarity with various phonetic categories, e.g. 'articulator', 'place of articulation', 'stop', 'fricative', 'semivowel', 'vowel', and 'voice' (in its technical connotation); and in the White Yajur-Veda there appear in an anatomical list various features which belong to the structure of articulatory and not of general physiological analysis, e.g. 'teeth-rims', 'alveoli', and parts of the tongue, of which the tip is appropriately associated with Sarasvati, the goddess of speech.

The aphorisms of the phonetic works are at once prescriptive and descriptive. Their avowed purpose is to preserve the oral tradition of the sacred texts; to this end the direst penalties are threatened for mispronunciation, including descent to the hell of Kumbhipāka; the competent pupil, on the other hand, is encouraged by verses such as that which closes the TP—

He who knows the distinctions of tone and length may go and sit with the professors—

—a felicity which the commentator interprets as applying not only in this world but also in the next. However, the authors of our treatises were clearly phoneticians rather than priests, and a scientific curiosity, coupled with keen audition and an effective methodology, led to descriptions which must surely have transcended their original terms of reference.

Nor are the accounts of the various authors identical; we find considerable divergences of pronunciation as between one treatise and the next, and we may surmise that these disagreements in many cases reflect actual dialectal features corresponding to the location of the several Śākhās or Vedic schools. In such matters there is a singular lack of religious dogmatism, and the authors

---

1 Paraṇjali (Mbh. ii. 1, on Pāg. i. ii. 32; Kielhorn, i. 208) makes the important point that the study of grammar presupposes adequate phonetic education.
2 e.g. Gopatha Br. i. 24 (sthanānupradāna-karāṇam); Ait. Ar. III. ii. 1, Chānd. Up. ii. xxii. 3-5 (śparśa, śrīman, antasthā, śvara, ghoṣavat). Cf. Liebich, Einführung in die ind. einheimische Sprachwissenschaft, ii. 9; Weber, Ind. St. iv. 75 ff.
3 Cf. Hjelmselev, Omkring Sprogeteoriens Grundlæggelser, p. 51.
4 On these terms see further 2.03 below.
5 FS xxv. i.
6 Pāṇātālī Ś. (ŚS, p. 65).
7 xxiv. 6. śvara-mātrā-vibhāga-jña gucheśa ācārya-saṃsādam.
refer to each other's opinions in a commendably objective manner. Certain pronunciations, however, are generally recognized as faulty, and lists of such faults (e.g. in chap. xiv of the RP) are hardly less interesting than the details of the approved pronunciation.

The Prātiśākhyaś have received the attentions of various later commentators. In so far as these are the bearers of a continuous tradition, they are able to augment and elucidate the laconic brevity of the aphorisms: unfortunately, however, the main stream of the tradition seems in many cases to have been lost, and the commentaries that we possess have a habit of wrapping the obvious in obscurity instead of casting light on the numerous difficulties. Moreover, it is clear that the intellectual climate of phonetic study had undergone a marked deterioration between the time when the treatises were composed and the time of our commentaries. In general we may say that Henry Sweet takes over where the Indian treatises leave off—though in some matters even Sweet could have learnt from them: and a recent study of a modern Indo-Aryan language has successfully shown that many of the ancient descriptive techniques can still be employed to advantage. These early phoneticians speak in fact to the twentieth century rather than to the Middle Ages or even the mid-nineteenth century, and many a statement which the commentators and even Whitney or Max Müller have failed to comprehend makes immediate sense to the phonetician today. The one outstanding exception to the general mediocrity of the Indian commentators is Uvāja, whose interpretations of the RP and of the VP reveal an enlightened and enlightening approach to a variety of phonetic topics.

0.3. The Sanskrit Alphabet

Whilst the statements with which we shall be concerned are of wide phonetic interest, even the most general of them are of course based on the description of a particular language, namely Sanskrit. On p. 20 a chart is therefore provided showing the basic system of sound-units as generally assumed by our treatises: certain divergences from this system will be considered in their appropriate place. As regards the transcription, two conventions have been

employed: for purposes of textual quotation, the standard Roman transliteration of the Devanāgarī text is used (in italic type)—this will not generally concern the non-Sanskritist, as the texts will be translated and the original Sanskrit, unless it calls for special comment, relegated to footnotes. Where, however, Sanskrit sounds and sound-sequences are made a subject of phonetic discussion, a transcription is used which departs in some respects from the standard system, and which I have found convenient in the teaching of Sanskrit phonetics: such transcriptions are printed in heavy I.P.A. type. In the chart on p. 20 the two conventions are shown side by side. Where narrower transcriptions are required, these are indicated by the use of square brackets.

It should be stressed at this point that, except for transcriptional purposes, the representation of a complex structure by category-labels based on a monosystemic analysis is an unacceptable procedure, which has nevertheless been adopted by the many modern linguists who favour an exclusively ‘phonemic’ approach: the reason for setting up such a system in our chart is that the Indians themselves have done so. It is true that the Devanāgarī method of writing is syllabic, but the analysis underlying it and actually set out, for example, in the varṇa-samānnāya or ‘alphabet’ at the beginning of Pāṇini’s grammar, comes very near to that which a modern ‘phonemicist’ would evolve for Sanskrit by a substitutional-distributional analysis of the word-isolates.¹ However, we can hardly criticize our predecessors of some two millennia ago for a procedure which only a few linguists in the last two decades have begun to reject as inadequate;² and we shall see that the Indians, unlike many of their Western successors, appreciated that this technique was a means to a limited practical end, and by no means the ultimate analysis.

0.4. The Principles of Description

We come now to a consideration of the fundamental principles of analysis and description as postulated and as observed by the authors of our treatises.

In early Indian linguistic discussion we find a full awareness of the view that the basic linguistic unit, upon which all other analyses must be founded, is the sentence; a famous couplet of Bhartrhari's treatise on general linguistics, the Vākyapadīya, where the matter is debated at some length, states the case in the following terms:

Within the sound-unit the component features have no independent existence, nor the sound-units within the word; nor have the words any separate existence apart from the sentence.\(^1\)

For purposes of phonetic description the basic unit is also sometimes stated as the 'breath-group' (eka-prāṇa-bhāva),\(^2\) corresponding in the Vedic hymns to one line of verse. The tendency to deny independence to the word is further stressed by the Sanskrit system of writing, which (unlike, e.g. Old Persian) takes no particular account of word-division.\(^3\) Thus word-sequences such as taaneva, tat punah are written together as taaneva, tatpunah, the sequences -ne- and -tpu- being represented as single graphic units (आ, ता). This elimination of the inter-word spaces as indications of junction is partially compensated by the graphic representation of such phonetic junction-features as the available symbols are capable of showing: thus the junction of tat+bhavati is written as tadbhavati, tat+frutvaa as tacchrutvaa, tat+hi as taddhi, maa+udakaih as modakaih, and so forth. Certain other junction-features are not generally indicated, sequences of the type -h+k- or -h+p- being only sporadically written as -xk- or -φp,\(^4\) since x and φ are outside the phonemic and hence the general graphic system. Even rarer is the indication of the linking\(^5\) prescribed by the phoneticians in sequences such as taa+abruvan (for taah+abruvan), which is generally written with hiatus as taa abruvan.\(^6\) Elsewhere junction-features may be neither written nor prescribed, so that no distinction is recognized between, for example, na tena likhito lekhaḥ, 'he did not write the letter',

---

\(^1\) i. 73. Cf. Rosetti, Le Mot, p. 20.

\(^2\) TP v. 1. Cf. Sweet, Primer of Phonetics, § 93; Rousselot, Principes de phonétique expérimentale, p. 972 ('Le mot ... n'existe sans altération qu'à l'état isolé. ... Le groupe respiratoire possède une individualité propre'); Thumb, Handbuch des Sanskrit, § 160.

\(^3\) Cf. Whitney, Skt. Gr., § 9 n; Bloch, L'Indo-Aryan, pp. 75 f.

\(^4\) Cf. Wackernagel, Al. Gr., § 226.

\(^5\) Cf. Wackernagel, op. cit., § 285 b (β).
and *natena likhito lekhah*, 'bowing, he wrote the letter'; this fact provides material for the construction of various types of word-play and riddle based on alternative divisions of the piece,* and our treatises do not mention any phonetic criteria by which a distinction might have been indicated in utterance.² Whether in fact there were subtle distinctions of prominence such as are capable in English of differentiating, for example, *a notion from an ocean*³ we cannot tell—it would certainly be unwise to deny the possibility on the basis of an *argumentum ex silentio*—but it appears certain that in Sanskrit a delimitation of the word by purely phonetic criteria was even less of a possibility than in English.

The Vedic texts in fact come down to us in two principal forms: the *Samhitā* or 'compound' text, with the sentence or breath-group as its basic unit, and the *Pada* or 'word' text, having the word-isolate as its basis; the latter is generally recognized to be an artificial analysis devised by grammarians and others for purposes of instruction: that of the *Rgveda* is generally attributed to the ancient grammarian Sākalya.⁴ In the *AP* we find,

The study of the word-isolates is designed to teach the beginnings and ends of words, and their correct form, tone and meaning.⁵ to which the commentator adds,

Without studying the word-isolates one might make errors in the continuous text; it is for this reason that the study of the isolates is necessary.⁶ Some statements of the relationship of *Pada* to *Samhitā*, however, seem to have left room for misinterpretation: the *RP* makes the highly ambiguous observation, 'samhitā pada-prakṛtiḥ',⁷ which according to the interpretation of 'pada-prakṛtiḥ' (where *prakṛtiḥ* = 'basis') might mean either 'The Samhitā is the basis of the Pada' or 'The Samhitā has the Pada as its basis'; the term *prakṛti* is also regularly used of the word-isolate in contradistinction to *vihāra* ('modification', 'variant'), the latter being applied to

---

¹ Cf. *Mbh.* i. i. 1 (Kielhorn, i. 14).
² Though so long as the tonal system survived, this must in many cases have provided a means of distinction.
⁶ *... apadādhyāyī samhitām vindīyayet; tasmād ebhiḥ kāraṇair avadyādhyeyāni.*
⁷ ii. 1.
the junction-forms. A convincing solution to the difficulty is provided by the \textit{Vaidikhābharaṇa}, a commentary on the \textit{TP}, which points out that as a result of statements such as the above 'certain slow-witted persons have made the mistake of thinking that the Veda is constituted of the word-isolates', whereas in fact 'the word-isolates are only treated as a basis for the purpose of facilitating instruction'.

Here also should be mentioned the \textit{Krama-pātha} or 'repetitive' text, in the simplest form of which a word-sequence $1:2:3:4:5$ is recited in pairs as follows—$1\ 2:2\ 3:3\ 4:4\ 5$, with the realization of the appropriate junction-features between the members of each pair. This device forms an instructional stepping-stone between the \textit{Pada} and \textit{Samhitā} texts; it appears to be held in no very high esteem, and the most that the \textit{RP} can say for it is, the \textit{Krama} is of no use to one who knows both the \textit{Pada} and the \textit{Samhitā}.

The \textit{Krama} is of no use to one who knows both the \textit{Pada} and the \textit{Samhitā}.

The recognized function of the Prātiṣākhyas appears to have been instruction firstly in the pronunciation of the word-isolates and secondly in the mode of their synthesis in the sentence. The first of these duties, however, involves the teacher in further analysis, below the word-isolate level: and since all analysis must be followed by synthesis, the \textit{TP} aptly observes that there are various types of synthesis—of words, of syllables, and of sound-units, to which is added as a fourth category, if we follow the commentator’s interpretation, the reintegration of syllable-structure. Whitney, failing to understand this passage, can only remark that these four rules have no significance whatever, being a mere bit

$^1$ On iii. 1. \textit{vibhakta-rūpa}ya \textit{tu prakṛti-tvam vyutpādana-saukaryārtham}\textit{ādirāya}.

$^2$ Cf. \textit{RP} xi. 44.

$^3$ xi. 66.

\textit{kramaṇa} nārthāḥ \textit{pada-samhitā-vidah}

\textit{na codrayāpaya-kāro na ca trutah}.

$^4$ Cf. Sweet, op. cit., § 91.

$^6$ This interpretation of \textit{aṅga-samhitā} is based on xxii. 1 (\textit{svaṁjanaṁ svarāṅgam}); cf. also 3.20 below.

$^7$ For the fourth category cf. especially Sweet, loc. cit., 'Synthesis, lastly, deals with the organic and acoustic grouping of sounds into syllables, etc., and the divisions between these groups.'
of outside classification, in which someone has amused himself by indulging'. In one passage of the RP Uvaṭa notes that strictly speaking the author is exceeding his duties by giving rules for tonal synthesis within compounds; the basis of synthesis, he claims, should be whole words as institutionalized units: he is prepared to be indulgent, however, for

... just as a flower-picker may also pick fruit, and a wood-gatherer may also gather honey, such is the case."

O.41. Phonetics and Phonology

There is, on the other hand, one respect in which our treatises do not fulfil the functions which they claim. The first verse of the AP declares,

Our subjects are the (phonetic) attributes in junction and in isolation of the four word-classes, viz. noun, verb, preposition and particle."

This grammatical enumeration suggests that we may expect something like a phonological treatment, with grammar and phonetics integrated into a functional whole; and Uvaṭa, commenting on the VP, goes so far as to claim,

This treatise excels all other treatises in that it combines the two disciplines of phonetics and grammar."

This, however, is in the nature of a pious aspiration which regretfully does not see fulfilment: for our text makes scant reference to any grammatical function. Particularly remarkable is the failure of the phoneticians to discuss one of the outstanding phonological processes of Sanskrit, that of 'vowel-gradation': for certain phonological purposes it is convenient to recognize a system of vocalic alternation of the type:

<table>
<thead>
<tr>
<th>Grade</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>i</td>
<td>e</td>
<td>ai</td>
</tr>
<tr>
<td></td>
<td>u</td>
<td>o</td>
<td>au</td>
</tr>
<tr>
<td></td>
<td>P</td>
<td>ar</td>
<td>aar</td>
</tr>
</tbody>
</table>

1 siddha, lit. 'established'.
3 caturnām pada-jātānām nānākhyadopasarga-nipātānām sandhya-padyau guṇau prahījanam.
4 On i. 169.
5 Cf. Lüders, Vṛddha-Śikṣā, p. 102; Goldstücker, Pāṇini, pp. 195 ff.
The working of this alternation is seen in verbal forms such as:

<table>
<thead>
<tr>
<th>P.P.</th>
<th>Inf.</th>
<th>Pr. Ind.</th>
</tr>
</thead>
<tbody>
<tr>
<td>stutá</td>
<td>stótum</td>
<td>staúti</td>
</tr>
</tbody>
</table>

Though ignored by the phoneticians, this alternation is duly noted by Pāṇini (in his opening aphorisms) and his followers, who treat Grade 1 (corresponding to the Indo-European ‘reduced’ grade) as basic, giving to Grade 2 (= IE ‘normal’ grade, or ‘Vollstufe’) the title of guna or ‘secondary quality’, and to Grade 3 the title of vyddhi or ‘increase’.¹ A further phonological process which is similarly disregarded is that of samprasāraṇa (lit. ‘extension’),² whereby a sequence of the type va, i.e. v+syllabic, alternates with u, i.e. ‘syllabic v’ (cf. Pr. Ind. svapīti: P.P. supta-, &c.). Pāṇini uses the term both for the process and for the resultant vowel;³ but we find neither the term nor any discussion of the process in the phonetic works. Nor again do we find there any use of that great creation of Pāṇini’s genius, the phonological zero.⁴

This mention of phonological omissions, however, is not to be taken as in any way detracting from the value of the treatises from a purely phonetic point of view.

0.42. Terminology

Before proceeding to the textual material some account must be given of certain terminological features which run through the whole system of description.

A particular problem is presented by the word varṇa, which can

¹ Pāñ. i. 1.2ff. vyddhir ād-ātic: ad-ēh gunah: sho guna-vyddhi. The term and process of guna are in fact first referred to by the early etymologist Yāska (Nir. x. 17, deriving leva from sīyate). Only passing references are found in the phonetic works (guna in RP xi. 10, vyddhi in VP v. 29, AP (ed. S. K. Shastri) iii. 1.13, 4.3). Cf. Edgerton, Skt. Hist. Phonology (JAOS Supp. 5, 1946), §§ 118 ff.
² The relevance of the term is not clear. The form pradṛṣaṇa is also found, and is used by the AP (ed. Shastri) iii. 1.13 c to refer to the replacement of -bhy- -p- in dīpa < dabh-. See further Edgerton, ‘Samprasāraṇa “Emergence; emergent (vowel)” ’, JAOS lxi. 222 ff.
³ I. i. 45. is yuṇah samprasāraṇam. Cf. vi. i. 168 (also vi. i. 13, vi. iv. 131).
be most conveniently discussed by reference to the terminology of the Latin doctrine of letters.¹

The usual method of designating a particular Sanskrit consonant-unit is to realize its 'potestas' by combining it in a syllable with the vowel -a² (e.g. k(a), corresponding to a 'figura' अ); the 'nomen' is then provided either by this syllable alone (i.e. ka) or, more usually with the suffix -kāra,³ lit. 'making' (i.e. ka-kāra). In the case of the vowels the necessity of adding -a does not of course arise (thus e.g. figura अ, potestas i, nomen i or i-kāra). Alternatively the nomen may be manufactured by realizing the potestas in combination with the enclitic particle iti⁴ (e.g. k(iti), giving a nomen kitī), which has an effect comparable with that of our graphic device of inverted commas (i.e. kitī = "k")

The outstanding exception to this mode of designation is r, which is given the nomen 'repha',⁵ variously interpreted as meaning 'growl, snarl' (cf. the Latin 'littera canina') or 'tearing' (as of cloth).⁶

To refer to a sound-unit in general, however, we encounter the word varṇa, the use of which is concisely summed up by the VP—

What are listed (sc. in the varṇa-sanāmnāya) are varṇas.⁷

But the term varṇa is never used to form a nomen in the manner of -kāra. Its suffixal use is in fact strictly limited: it is found appended only to the short vowels, with the function of designating not only, for example, the short vowel i itself, but also the long i (i) and the rare protracted i (i):⁸ to denote simply the short vowel, i-kāra and not i-varṇa is used. It thus becomes evident that varṇa primarily denoted not a sound-unit but a more comprehensive sound-quality (in fact always a vowel-quality):⁹ as Patañjali expresses it, it is a generic term comprehending a whole family of sounds' (varṇa-kula).¹⁰ This function of the term is consistent with

¹ See e.g. Donatus (Keil, iv. 368).
³ TP. i. 16–17. varnāh kārattaret varnādkhyā: ahārā-vyavāta vyavājanānām.
⁴ VP. i. 36. nirdeśa iti.¹⁰ e.g. TP. i. 19. ephos tu rasya.
⁵ Fāndikābh, on TP i. 19. ripyate ripśyate vastrād-pātana-dhanivād uccār-yata iti rephak.
⁶ i. 34. upadiśta varnāḥ (Uvāṭa: varṇa-sanāmnāye kathā varṇāḥ).
⁷ Cf. TP i. 22. hrasvo varṇottarās trayāṇām, on which Tribhūṣyaratna has varṇottara hrasvo hrasvo-dīrgha-plutānām abhyā bhāvati.
⁸ A solitary exception is provided by Pān. vii. iv. 53 (vī-varṇayor...)
⁹ Mān. i. i. 1 (Kielhorn, i. 13), a-varṇākṛtir upadiśta savam a-varṇa-kulam grahiyati. With varṇa-kula cf. especially D. Jones, The Phoneme, § 22.
its meaning in other contexts, namely 'colour'—a band of the vocalic spectrum. And although the word comes ultimately to designate simply a 'sound-unit', it is noteworthy that Pāṇini's varna-'samānnayā' gives only the short vowel of each quality—an analysis which Pāṇini further supports by his treatment of the long vowels as phonologically equivalent to two short vowels of the same varna. Whilst we may note also the graphic similarity of the short and long vowels in the Devanāgarī script (ष ख ि ः ज), it is unnecessary to suggest, as Sköld has done, that Pāṇini's listing may have a graphic basis: whether or not Pāṇini knew an established system of writing is still a moot point, but he was certainly too great a linguist to allow orthography to affect his phonological analysis.

Of some interest in this connexion is the indifference to vowel-length in the writing of Latin and Greek; the attempts of early Latin orthographers to introduce double writing (aa, &c.) for the long vowels had no lasting success, and a Greek grammatical scholiast, noting that 'there are 24 letters but many more sounds', points out that the single letter α may bear various prosodies of length, aspiration, and tone.

We have now to consider the translation of varna. In the specialized, suffixal use discussed above it may be adequately represented by 'quality' ('1-quality', &c.); it is its wider usage that presents some difficulty. Whilst it there has much in common with the modern term 'phoneme', no phonemic theory is implied by it, and it would be reading at once too much and too little into the term thus to translate it. The non-committal 'sound-unit', by which we have thus far represented it, suffers from the disadvantage that, unlike varna, it is restricted to technical usage. A happier rendering, and one which would fit into the Latin terminological

1. Śiva-Sūtra 1-2.
2. See further 2.10 below.
4. A famous but unsatisfactory argument in favour is that of Goldstücker, Pāṇini, pp. 13 ff.
5. Cf. Sten Konow, op. cit., p. 296 ('... the term śamānmâya indicates a traditional enumeration handed down verbally from teacher to pupil, and not a written list').
7. Schol. on Dionysius Thrax (ed. Hilgard, p. 32 = Bekker, Anecdota Graeca, pp. 774 f.).
tradition, is 'letter'\(^1\)—letters after all come very near to being unselfconscious phonemes.\(^2\) One objection that may be brought against the term is that the \textit{varṇa} of our earlier authors may have possessed no \textit{figura}:\(^3\) and it is true that if they were acquainted with any system of writing, they do not allow it to obtrude itself on their discussion of \textit{potestas}—even at a time when writing was certainly well known and widely employed, reading from a written text was condemned as one of the 'six vilest modes of recitation'.\(^4\) However, it does not seem that the absence or latency of this third attribute need prevent us from using an otherwise convenient term; and we may support it by the fact that when the language does come to be written, each \textit{potestas} and \textit{nomen} of the phoneticians' catalogues receives its appropriate \textit{figura}-label.\(^5\)

It remains to mention in this connexion that certain elements discussed by our authors, some of them included in their individual versions of the alphabet, are excluded from the Pāṇinean \textit{varṇa-samānmāya}: outstanding amongst these are the fricatives \textit{-h} (\textit{visarjaniya}), \textit{-f} (\textit{upadhmāniya}), \textit{-x} (\textit{jihvāmūliya}), the nasal \textit{ŋ} (\textit{amuvāra}) and the faucal plosives (\textit{yama})—all of which are bound to a more closely limited series of contexts than the other letters and so are given the title of \textit{parāśraya} or 'dependent'.\(^6\) A further title accorded to them by the Pāṇiniya-Śiṣṭā and certain other treatises presents some difficulty:

The fricatives \textit{-h}, \textit{-f}, \textit{-x}, \textit{amuvāra} and the \textit{yamas} share the place of articulation of the sounds whereon they depend, and are to be known as 'ayogacāha'.\(^7\)

The term \textit{ayogacāha} is generally interpreted as meaning 'drawing unyoked' (\textit{a-yoga}-), and is explained by Patañjali as follows:

\[\ldots\text{ because they draw unyoked, i.e. are heard though not mentioned (i.e. though not included in the Pāṇinean \textit{varṇa-samānmāya}).}\]

\(^1\) Cf. Abercrombie, 'What is a "Letter"?', \textit{Lingua}, II. 1, 54 ff.
\(^4\) Sarvasaṃmata-Śiṣṭā, 36.
\(^5\) \textit{gīti śōkī śrāh-kampi tathā likhita-pāthakah}
\[\textit{amurtha-śīlo īpo-kamṭhī ca taḥ e tē pāθhakāddhamāḥ}.\]
\(^6\) Cf. Konow, loc. cit.
\(^7\) \textit{PŚ} 5. \textit{amuvāra} \textit{visargai ca śka-śpau cāpi parāśrayau.}
\(^22\) \ldots \textit{ayogacāhā vijīyād ārāya-thānā-bhāginah.}
\(^8\) \textit{Mbh.} i. 1. 2, on \textit{Pāñ. ŠŚ.} 5 (Kielhorn, i. 28): \textit{ke puṇar ayogacāhāḥ: visarjaniya-jihvāmūliyopadhmāniyāntavārāmnāmāntikya-yamah: kathām puṇar ayoga-}
But 'drawing unyoked' seems hardly to be a natural metaphor for 'heard (though) excluded'. Uvaṭa, in his commentary on the VP, has an interesting alternative; he takes the initial a- of the term not as privative but as referring to the letter a and standing for the alphabet as a whole: his explanation then reads,

'They are called a-yoga-vāha because they draw, i.e. attain their realization, only when joined with a, &c., i.e. with the letters of the alphabet.'

In view of this explanation, Weber reads simply yogavāha in both text and commentary, but appropriate as the term would be as applying to the contextually bound nature of the elements in question, it is to be noted that the RT specifically distinguishes ayogavāha (= the contextually dependent elements) from yogavāha (= the other letters).

An important terminological distinction underlying a large number of the ancient descriptions is that of sthāna and karaṇa (lit. 'place' and 'organ'), which, generally speaking, denote the passive and active organs of articulation: as the commentary to the AP explains,

'The sthāna is that which is approached, the karaṇa that which approaches.'

The terms closely correspond to what Pike calls 'Point of Articulation: yad ayuktā vahanty umapadītā ca śriyante. There follows a discussion as to which prayāhāra the ayogavāhas could be included under, ending with the suggestion that they may belong under none (athavācīlaśannopadeśaḥ karaṇayāḥ), and Kātyāyana accordingly assumes the title to refer to this lack of a prayāhāra (adyuktāḥ prayāhāralakṣanena).

1 The explanation of the Paññijāka (on PS, loc. cit.) is easier but hardly more acceptable (na vidyate yogāḥ samyogo varṇāntareṇa yeṣām). Böhtlingk’s interpretation (Pañ. (1840) ii. 413) is fanciful—'Trennung hervorbringend, die Vocale von den Consonanten scheidend, zwischen Beiden in der Mitte stehend.'

Wackernagel attributes the strangeness of the term to its having been originally coined for the teaching of children (Ai. Gr., i. p. lxxi, n. 7: 'Dies und der humoristische Charakter mancher Termini wie ayogavāha—weisen auf Herkunft aus dem Jugendunterricht').

2 On viii. 18. abhārdādū varaṇa-saṇāmmāyena sahitāḥ santa ste vahanty atma-lābham prāpanavan tyogavāhāḥ. For the use of abhārdā, 'a, &c.' as = 'abc' cf. Sāyunā on Taśṭ. Ar. vii. ii.

3 viii. 23 ff. Cf. on PS, loc. cit. (Ind. St. iv. 354) and on Pratiṣṭā Sūtra, 22.

4 The greater appropriateness of this term was evidently felt by Canarese grammarians who adopted it instead of ayogavāha (see P. S. S. Sastri, Lectures on Pratiṣṭā's Mahābhāṣya, i. 143 n.). The Amareśi S. (SS p. 121, §§ 50–51) has samyogavāha.

6 On i. 19, 25. yad upakhramyate tat sthānam: yenopakhramyate tat karaṇam.
tion' and 'Articulator'. In a large majority of cases the articulator is an area of the tongue, viz. 'root of the tongue' (jihvā-mūla), 'middle of the tongue' (jihvā-madhya) and 'tip of the tongue' (jihvāgra), whilst the opposing points of articulation are 'root of the jaw' (hanu-mūla), i.e. soft palate, 'palate' (tālu) and 'teeth' (danta) or 'teeth-roots' (danta-mūla). The same classification is extended to the lips, so that in the articulation of the bilabials the AP and the Tribhāgyaratna prescribe the lower lip as karāna and the upper lip as sthāna; and the AP goes so far as to apply it, somewhat artificially, to infra-buccal articulation in the case of the glottal sounds, for which the 'lower part of the glottis' is considered as the karāna.

The specification of minor distinctions of sthāna in the alveolar area is sometimes not as clear as we could wish, but in the absence, so far as we know, of palatographic aids, this is perhaps hardly surprising. An attempt to apply the system to the feature of nasality can only lead to confusion, the nose in such cases being stated by some treatises to be the articulator and by others the point of articulation.

Other terminological items of less wide application will be discussed under their appropriate headings. The reader is also referred to the excellent glossary now available in vol. iii of Renou's Terminologie grammaticale du Sanskrit.

0.43. Order of Analysis

The treatment here adopted closely follows that of the Indian analytical procedure, which recognizes three main stages:

i. Analysis of the basic articulatory 'processes'.

ii. Segmental analysis of the speech-stream ('letters').

iii. Synthesis ('prosodic features').

1. Phonetics, pp. 120 ff.

2. i. 25. oṣṭhyānām adharaṇgham (sc. karāṇam).

4. i. 19. khaṇṭhyānām adhara-khaṇṭhā.

5. The first recorded instance appears to be that of an Englishman, J. Oakley-Coles, who in 1871, in the cause of phonetic accuracy, painted the roof of his mouth with a mixture of flour and mucilage (cf. Rousselot, Principes, p. 53).

In (ii), where the individual segments are made the basis of description, the fragmented processes are regarded, by a common but questionable technique of inversion, as 'distinctive features', serving, together with the various articulatory positions, to differentiate one letter from another. Once the basic processes have been described, however, phonetic discussion under heading (ii) is largely confined to the places of articulation.\(^1\)

\(^1\) Cf. Trubetzkoy's distinction of 'Artikulationsartgegensätze' and 'Lokalizadorungsgegensätze' (TCLP iv. 103 f.).

1. Also 'anuvṛtra' — *ṃ ṇ*
   'anuvṛśika' — *ṁ āṅ*

*Note.* The order of letters as presented in Pāṇini's Śīva-Sūtra shows considerable divergences from the above: this fact, however, is explicable by the phonological, as opposed to phonetic, approach there adopted. Cf. Thieme, op. cit., p. 104: 'The arrangement of Pāṇini's list of sounds, which at first looks rather disorderly, is explainable as due to the phonetic catalogue of sounds having been adapted to the practical requirements of the grammar, in which Pāṇini wanted to refer to certain groups of sounds by short expressions.'
PART I

PROCESSES

1.0. Mental

The Indian phoneticians spend but little time in discussing the mental or neural bases of speech. The introductory stanzas of the PŚ are representative:

The soul, apprehending things with the intellect, inspires the mind with a desire to speak; the mind then excites the bodily fire, which in its turn impels the breath. The breath, circulating in the lungs, is forced upwards and, impinging upon the head, reaches the speech-organs and gives rise to speech-sounds. These are classified in five ways—by tone, by length, by place of articulation, by process of articulation and by secondary features. Thus the phoneticians have spoken: take careful heed.1

The 'secondary features' here referred to (anupradāna) are interpreted by the Śīkṣā-Prakāśa as 'amunāsikā', 'nasality, etc.' (see further 1.10 below).

The musical treatises contain similar statements, though these are less closely related to the actual speech-organism. The relevant passage of the Sangitataratnākara reads as follows:

The soul, desirous of expression, instigates the mind; the mind then excites the bodily fire, which in its turn impels the breath. This then moves gradually upwards and produces sound in the navel, the heart, the throat, the head and the mouth. . . .2

Parallels to such statements are not far to seek in the west, notably in the doctrine of the Stoics. Zeno is quoted as defining speech in terms of

a stream of air extending from the principal part of the soul to the throat and the tongue and the appropriate organs,3

whilst Aristotle described it as

the striking against the so-called 'artery' (i.e. trachea) of the air exhaled by the soul.4

1 9–10.

2 I. iii. 3 ff.
3 Plutarch, De Plac. Phil. iv. 22. 903c (στόμα διατείνει ἀπὸ τοῦ ἰχνονομοῦ μύερο φόρον καὶ γυάλτης καὶ τῶν οίκεον ὀργάνων).
4 De Anima, ii. 420b (πο πληγὴ τοῦ ἰσαμενόν ἄρος ὑπὸ τῆς ἐν τούτῳ τοῖς μορίοις ὕψότης πρὸς τὴν καλυμένην ἀρτησίαν ἄτοις ἅττοις).
1.1. Physiological

A general statement such as that of the PS also introduces, in a rather haphazard manner, some mention of the basic articulatory processes (prayatna) which are more systematically presented by other treatises.

1.10. Classification

These processes are divided into two main types, ābhyyantara, 'internal', and bāhya, 'external'. The first type comprises processes occurring within the buccal cavity ('intra-buccal') and the second those occurring elsewhere ('extra-buccal'). For the first type both the VP and Pāṇini also use the term āśya-prayatna, 'mouth-process': this is interpreted by Patañjali as referring to the area from the lips to the 'kākulaka', the latter being further identified by Kāliyaṭa as the thyroid cartilage or 'Adam's Apple'. The Indian classification of the processes may be summarized as follows:

1. Intra-buccal processes (ābhyyantara-prayatna)
   (a) Closure — associated with the class of stops.
   (b) Opening — vocal, vowels.
   (c) Constriction, of two degrees, associated with
      (i) the class of fricatives,
      (ii) semivowels.

2. Extra-buccal processes (bāhya-prayatna)
   (a) Glottal — associated with voice and non-voice (breath).
   (b) Pulmonic — aspiration and non-aspiration.
   (c) Nasal — nasality and non-nasality.

Not all our statements adhere rigidly to this descriptive framework, but it may be taken as a generalization of the various systems, and is set out in precisely the above terms by Patañjali and by the Āpiṣali-Sikṣā. Departures from this system arise when, by the inversion already mentioned, the basic processes are considered as

i. 43 (glossed by Uvaṭa as muḥa-prayatna).

distinctive features serving to differentiate one letter from another. A passage from the TP may be quoted in this connexion:

The distinction of letters is effected by secondary features, by combination, by place of articulation, by the position of the articulator, and by length.  

The meaning of some of these terms is made clearer by Uvāṣa, who quotes this passage in his commentary on the RP; as an instance of 'secondary feature' (anupradāna) he mentions the voice-process (2a in the above summary); as examples of 'combination' (samsarga) he gives aspiration and nasality (2bc); and he interprets 'position of the articulator' (karana-vinyaya) as referring to the intra-buccal processes of closure, opening and constriction (1abc), which he exemplifies in the statement,

Between letters having the same place of articulation and secondary features, e.g. i, y, j, acoustic distinction is effected by the articulator.

But it will be noted that in the TP's statement of 'distinctive features' these processes are treated on the same terms as the places of articulation and a prosodic feature such as length, to which other writers also add tone. This, however, is by no means only an ancient Indian failing: Twaddell, for instance, in his monograph On Defining the Phoneme, is prepared to admit as parallel 'component terms of articulatory differences' such various features as places of articulation, duration, and the processes of voice, aspiration, closure, and constriction.

A list of five resonators (prātiṣrutka) is also given by the TP,
PHONETICS IN ANCIENT INDIA

of which the buccal, pharyngeal, and nasal may be justified: the
further mention of 'chest' and 'head' as resonators, however, is
probably taken over from the subjective terminology used in
India, as in the west, for the description of the various voice-
registers.\(^2\)

We will now examine in detail, and in the order set out above,
the statements on the individual processes.

1.11. Intra-buccal

Four degrees of closure between s̱thāna and karāṇa are recog-
nized. Maximal closure is referred to as śṛṣṭa, 'touching', and
minimal closure as vīrṣṭa, 'opened'.

1.110. Vowels and Consonants

The process of minimal closure, or 'non-contact' (asṛṣṭa)\(^1\)
provides the phonetic criterion for the distinction of vowels (svāra)
from consonants (vyaṇjana): the TP expresses this in the following
terms:

For the vowels the 'place of articulation' signifies the place to which
approximation is made, and the 'articulator' refers to the organ which
effects the approximation. For the rest the 'place of articulation' refers
to the place where contact is made, and the 'articulator' refers to the organ
which effects the contact.\(^6\)

Maximal closure, on the other hand, provides the criterion for
the category of stops (sparśa).\(^8\)

Thus far no problems arise. But the intermediate degrees of

\(^5\) e.g. AP i. 29. śṛṣṭaṁ sparśāṇāṁ karāṇam.
constriction are designated by various terms. The Ap.Ś. refers to the four intra-buccal processes as

(i) Contact (ṣṛṣṭa)
(ii) Slight contact (ṭṣat-ṣṛṣṭa)
(iii) Slight openness (ṭṣad-viṝta)
(iv) Openness (viṝta),

a classification which is reminiscent of our modern terminology for describing degrees of vowel-closure. The PS employs a rather different set of terms:2

(i) Contact
(ii) Slight contact
(iii) Half contact (nema-ṣṛṣṭa)3
(iv) Non-contact.

The statement of the AP provides some difficulty of interpretation. Like the Ap.Ś., it mentions (i) contact, (ii) slight contact, and (iv) openness; under (iii), however, we find the words 'and openness' (viṝtam ca).4 Patañjali, who quotes this statement, is probably right in saying that we must here understand 'slight' (ṭṣat) from the preceding rule, thus bringing the statement into line with that of the Ap.Ś.5 The AP commentator, however, suggests that the whole term ṭṣat-ṣṛṣṭa is to be understood,6 so that (iii) would then read 'slight contact and openness'—a description which is more to the point than it might at first appear (see further i.111 below).

To (ii) the RP gives the further title of duḥ-ṣṛṣṭa, 'imperfect contact'.7

Processes (ii) and (iii), like (i) and (iv), provide classificatory criteria, (ii) for semivowels and (iii) for fricatives. The application

of this descriptive framework may be exemplified by the palatal series as follows:

(i) Contact — c
(ii) Half contact — y
(iii) Half openness — [ʃ]
(iv) Openness — i

1.11. Fricatives

One of our treatises gives a more detailed account of the articulation of the fricatives by process (iii). The TP, having remarked that ‘the fricatives are articulated in the same places as the corresponding stops’,¹ goes on to say, ‘But the centre of the articulator is open’,² a statement which lends some support to the view of the AP commentator quoted above. Whitney, commenting on this doctrine, makes the criticism that,

This prescription of an unclosure of the middle of the organ is rather an artificial device for saving the credit of the general prescription of actual contact in all the consonants.

Palatograms showing the articulation of the fricatives by modern Indian speakers would tend to support the TP’s observation as against Whitney’s uninformed scepticism.³ In the case of the retroflex fricative the AP gives a rather more graphic description by referring to the tongue as ‘trough-shaped’⁴ (cf. Grammont, on s, z, ‘... la langue se dispose en forme de gouttière et forme un canal très étroit ...’).

The general term for the fricatives is āśman, literally ‘hot, steaming’, perhaps because of their resemblance to the hiss of escaping steam: it is glossed by Uvāṭa as vāyu, ‘wind’.⁵ The term is applied not only to the letters ū s but also to φ - x - h and h,⁶ and to the

⁴ i. 23. saha-ravaya droghihā.
⁵ Traité de phonétique⁶, p. 69 (see also p. 70, figs. 81-82). Cf. Pike, op. cit., p. 121 (‘... grooved, as for a sibilant ...’); Sievers, Gr. d. Phonetik⁷, § 314(‘Nicht minder wichtig ist aber, wie es scheint, daß bei ihrer Bildung die Zunge in ihre Mittellinie zu einer schmalen mehr oder weniger tiefen Rinne eingekerbt wird.’)
⁶ On RP i. 10. See further K. C. Chatterji, op. cit., pp. 207 ff.
⁷ Pānini (Śiva-Sū. 5) appears to classify h also as a semivowel, but as the Mbh. points out (i. i. 2, on Pān., loc. cit., Kielhorn, i. 27) this is only for convenience in stating certain phonological rules.
breathy release of the aspirated stops (ṣṭman). There is no special term corresponding to 'sibilant', though excessive sibilation is referred to by the RP as kṣvedanam, 'whistling'.

1.112. Semivowels

As regards process (ii), with which is associated the class of semivowels, the validity of the analysis is not entirely beyond question, involving as it does the postulation of a greater degree of contact for this class than for the fricatives. In the case of the lateral I and the rolled r the classification might be justified; but the case for y and v [w] is less clear. We should expect the criteria for setting up a category of semivowels to be phonological, and related to the fact that they do not function as sonants in the structure of the syllable; from the phonetic point of view y and w might be described with the close vowels i and u, and we may suspect that in erecting a separate phonetic category for them the Indians have been misled by their system of letters. As Pike points out,

Syllabic contextual function is reflected in phonetic alphabets. Sounds which are described by the same procedure but which are used differently in phonemic systems as syllabics in contrast to non-syllabics are given different symbols, and at times are given names such as 'semivowel' and the like.

The apparent failure of the Indians to recognize the phonological (as opposed to phonetic) basis of this category of letters has the result that whereas i is regularly classed as 'open' or 'lacking contact', the corresponding semivowel y is described as having 'slight contact'. Regarding the nature of this contact a more specific statement is found in the TP:

For y contact is made on the palate by the edges of the middle of the tongue.

The accuracy of this particular statement would in fact be sup-

1 xiv. 20 (Uvaṭa uḍhi ko varṇasya varūpo dhvamih). A further fault in their pronunciation is given the name of lomāyā, lit. 'shagginess'; it is interesting that the same metaphor is used in the general Greek term for the aspirates, viz. δυός.
2 On the alternative labio-dental articulation see 2.05 below.
3 See further observations on p. 67, n. 2 below.
5 Cf. Pike, op. cit., p. 143.
7 ii. 40. tdlau jihvā-madhyaṃṇādhyaṃ yahāvē.
ported by palatographic evidence—it is the description of the vowels that is really at fault, no distinction being generally made between open and close qualities; it should be mentioned, however, that the TP, in discussing the e-vowel, prescribes some degree of contact, an observation which could again be supported: it is only strange that it should make no such statement with regard to i, where the contact is considerably greater. The TP also mentions 'approximation of the lips' for the articulation of the lip-rounded vowel u. The tradition of the TP is followed by the VS, which refers to lip-protrusion in the case of u and, discussing the process of openness generally associated with the class of vowels, points out that this does not apply in the case of i and u, whilst the next rule goes on to mention actual contact. It is presumably to isolated statements such as these that the AP is referring when it gives as the opinion of some sources that contact is involved in the vowels, an opinion which Whitney impatiently dismisses as 'too obviously and grossly incorrect, one would think, to be worth quoting'.

Against the foregoing criticisms of the Indian analysis it may be argued that in certain contexts, more especially as initials, y and v were more tensely articulated than elsewhere, and involved greater contact than in the case of i and u; for this we have the specific statements of a number of the Sikṣās, some of which even prescribe for y a pronunciation as j in such cases—an observation which is significant with regard to later developments. Only on

9 e.g. Yājñavalkya-S. 150.

I have observed this pronunciation of y- in recitation of the Śuklayajurveda (Vājasaneyi-Mādhyanatī), as also a peculiar tense stop realization of v- in certain cases (cf. the 'āttāmapāppāṇaprāyatā' of the gloss on Yāj. S. 158.)

10 e.g. Skt. yava>Pkt. jōva (>Hindi jōw), etc. Cf. also the development
such grounds could the doctrine of a special degree of closure for the semivowels be justified; the earlier treatises, however, quote no such evidence in their defence.

The Sanskrit term for the category of semivowels is anta(h)sthā, lit. 'standing between'. It is tempting, and has tempted modern commentators, to interpret this term as referring to the postulated 'intermediate' degree of contact discussed above, or, like our term 'semivowel', to their phonological alternation. The ending -sthā, 'standing', however, is more readily applicable to the place which these letters occupy in the alphabet, viz. between the stops and the fricatives; and it is doubtful whether the ancient sources provide evidence for any other interpretation.

A comparison with the ancient western classification is here of some interest. It will first be necessary, however, to mention that the Indians do not set up their vowel-consonant distinction on exclusively phonetic grounds: it has also a phonological basis in the structure of the syllable (see further 3.20 below); from this point of view the vowel is defined by its ability to function as a sonant or syllabic nucleus—as the RP observes:

A vowel with a consonant, or even by itself, forms a syllable, and it is significant that Patañjali etymologizes the word svāra (‘vowel’) as <svayām rājate = ‘is autonomous’.

In Greece also both types of criteria were employed. Plato mentions the classes of phōνίευτα (lit. ‘having voice’) and ἄφωνα (lit. ‘lacking voice’); these categories, exemplified by Greek vowels and consonants respectively, appear to be set up on a phonological basis, and might be rendered by ‘sonant’ and ‘non-sonant’. Aristotle goes on to relate this phonological distinction to the phonetic criteria of ‘non-contact’ (ἀνεῦ ἀρος; cf. Skt. asṛṣṭa) and ‘contact’ (μετὰ ἀρος; cf. Skt. sṛṣṭa). Plato further men-

tions a sub-category of consonants which have 'noise (φόη) but no voice' or 'no voice but some sound (φθόη)\textsuperscript{5}', and which he elsewhere calls 'intermediate' (μεσα). Aristotle refers to this class as ημμήφωνα, 'half-sonant', and proceeds to define them by a combination of phonological and phonetic criteria; the 'sonants', he says, are 'without contact and independently pronounceable', the 'non-sonants' are 'with contact and not independently pronounceable', whilst the 'half-sonants' are 'with contact and independently pronounceable'.\textsuperscript{2} The only actual example of these 'half-sonants' given by Plato is—rather surprisingly—s: to this Aristotle adds r, and a full list is given by Dionysius Thrax, followed by Dionysius of Halicarnassus, viz. s, z, I, r, m, n.\textsuperscript{3} Thus the Greek 'half-sonants' turn out to be the fricatives, the liquids and the nasals: in the absence of I or r vowels and (in Attic-Ionic) of y or w glides, the question of a phonological category of 'semivowels' (the usual translation of ημμήφωνα)\textsuperscript{4} does not arise. We are here in fact dealing not with semivowels but with 'continuants' of various types, some of which may have quasi-syllabic function outside the Greek phonological system—as Dionysius Thrax expresses it.

They are called 'half-sonant' in that, when used in murmurings and hissings, they are only less sonorous (ενφωνα) than the 'sonants'.\textsuperscript{5}

And it is noteworthy that the Latin grammarians generally include amongst their 'semivocales' the Latin fricative f,\textsuperscript{6} but not the semivowels y and w (j, v).\textsuperscript{7} Some Greek sources seem also to have classified as 'half-sonant' the h-element of the voiceless aspirates ph, th, kh (ϕ, θ, χ):\textsuperscript{8} the inclusion of the aspirate h- is rejected by

\textsuperscript{1} Cf. the German use of the term 'Geräuschlaut' (e.g. Dieth, Vademecum der Phonetik, §§ 200 ff.); see also Bloomfield, Language, p. 95.

\textsuperscript{5} Loc. cit.

\textsuperscript{6} ημμήφωνα δὲ λέγεται, ὅτι πάροδον ἀστὶ τῶν φωνητῶν εἰσάγα γα καθομέν ἐν τῷ μεσα καὶ σχισμα.

\textsuperscript{7} See e.g. Donatus, Keil, iv. 367; Priscian expressly disagrees with this inclusion (Keil, ii. 9, 11).

\textsuperscript{8} Ibid., 13.

\textsuperscript{9} Cf. Sextus Empiricus, Adv. Gramm. (Math. i), 102. It is also to be noted that in the list of Diogenes Babylonius the aspirates are not included amongst the stops (cf. Diog. Laert. vii. 57). Attempts have been made to explain this classification by assuming an affricate or fricative realization (cf. Sturtevant, op. cit., § 903;
Priscian, but appears again in the Old Icelandic grammatical treatises, which also include the Icelandic dental fricatives.

The Greco-Roman tradition of the 'semivocalis' still finds expression in the work of Grammont:

Les semi-voyelles sont encore éminemment des spirantes et aussi bien des fricatives et des constrictives.

There is in fact little common ground between the Indian approach to the antahstā and the Greek approach to the ἄρμιθων. The only mention in our Indian sources of a contrast between instantaneous and continuous articulation is that of the RP:

For the stops there is momentary contact; for the vowels and fricatives there is continuous non-contact;

and the only Western statement of a special degree of contact is that of Marius Victorinus:

Semivocales in enunciatione propriae ore semiclusio strenunt.

Our own term 'semivowel' has its origin in the Greek ἄρμιθων, through the medium of the Latin semivocalis, whilst its employment, though not its justification, generally corresponds more closely to that of the Sanskrit antahṣṭā.

It is further to be noted that our term 'liquid', a word more convenient than descriptive, owes its origin to the west rather than the east. The Greek term ὑγρός, lit. 'moist', 'fluid' (translated by the Latin liquidus) is first used in a phonetic sense by Dionysius Thrax, who applies it to the Greek ι, ρ, μ, η:6 most of his commentators interpret the word as meaning 'slippery', i.e. 'unstable', with reference to the metrical effect of these sounds as second members of a group stop + liquid, where a preceding syllable containing a short vowel is of 'doubtful' quantity, a state also referred to as ὑγρός. Terentianus Maurus, however, explains the term as referring to their 'lubrica natura', in that they may function either

Blass, Pron. of Ancient Greek, trsl. Purton, pp. 101 ff.); but such a pronunciation cannot be supported so early as second century B.C.

1 Loc. cit.
4 xiii. 9, 11. IFYIYI MHHHTIA: ZVARANUVAOSMAM 1FYIYIYI MHHHTIA.
5 Keil, vi. 32.
7 Hilgard, pp. 40, 342; Bekker, pp. 816 ff. Cf. Priscian, Keil, ii. 9; Max. Victorinus, Keil, vi. 216.
as vowels or as consonants\(^1\)—a remarkable interpretation as applied to the phonological systems of Greek or Latin.\(^2\) Atilius Fortunatianus sees in the term a reference to lack of tenseness (\textit{quaem minus virium habeant});\(^3\) and other interpreters of Dionysius Thrax refer simply to their ‘smooth and even articulation’.\(^4\)

‘Liquid’ is in fact one of those terms of which Grammont has said,

‘Elles sont consacrées par un long emploi, grâce auquel le lecteur sait immédiatement de quoi l’on veut parler; des appellations nouvelles pourraient être plus adéquates sans offrir le même avantage.’\(^5\)

1.113. \textit{Retroflexion}

Amongst the intra-buccal articulatory processes we might have expected the Indians to have mentioned one further feature, namely, retroflexion. This, however, is generally discussed by them in connexion with the places of articulation (see 2.03), and also in relation to its prosodic function (see 3.10). To consider the retroflex articulations on the same terms as the velars, palatals, dentals, or labials is, even from the point of view of the Indian descriptive framework, not entirely justified.

In the \textit{TP} we find a prescription regarding the position of the articulators in their quiescent or ‘neutral’ state (a close parallel to Sievers’ ‘Ruhelage’\(^6\) or ‘Indifferenzlage’):\(^7\)

\[
\ldots \text{the tongue is extended and depressed, and the lips are in the position for } a.\]

\(^1\) Keil, vi. 350.

\[... Græcus udas nominat: \]

\[lubrica est natura in illis namque et alternus vigor: \]

\[nunc enim vocalis uum, nunc ministrat consonae.\]

\(^2\) More justifiable is Macdonell’s use of the term (\textit{Skt. Gr.}, p. 11, § 17, B. 1, on Skt. i, u, 5, 1)—‘Vowels which are liable to be changed into semivowels ... liquid vowels’. Cf. Renou, \textit{Gr. Sammer.}, § 5.

\(^3\) Keil, vi. 279.

\(^6\) \textit{Gr. d. Phonetik}, § 35.

\(^7\) \textit{Gr. d. Lautphysiologie}, p. 15; cf. also Sweet’s ‘Organic Basis’ (\textit{Prime}, §§ 184 ff.) and Viétor’s ‘Artikulationsbasis’ (\textit{Elen. d. Phon.}, §§ 128 ff.)

\(^8\) ii. 20–21, \textit{anádele parṇyāttā jihvā: akāraṇād ośthau, on which Tribh., yatra ... anádeśaśattra ... jihvā ... tāśūnam-hūṣā bhavati} (cf. Sievers, ‘Die Zunge liegt schlaff in der Mundhöhle’).
In this condition the velar, palatal, dental, and labial articulators are approximately opposite their respective places of articulation, and the utterance of these series is effected simply by means of the closure-processes already discussed. This, however, is not the case with the retroflex series, which is articulated, as our treatises recognize, 'by rolling back the tip of the tongue'—that is to say, the place of articulation is not automatically determined by the application of the closure-processes to the apical articulator: there is need of a further prayatna, 'articulatory effort', which might with consistency have been included at this point.

1.12. **Extra-buccal**

1.120. **Glottal**

In their recognition of the voicing process the Indian phoneticians make one of their greatest single contributions. The term for 'voiced' (ghosavat) is, as we have already seen, found in early non-technical literature, and the specialist discovery is likely to have been of even earlier date. To designate the glottis the Indians use either the word kānṭha, which in non-technical usage means simply 'throat', or more specifically khāḥ (or bilāṁ) kānṭhashya, 'aperture of the throat'. In the Indian musical literature we also find the picturesque term sārīri vinā, 'bodily lute', which some authorities have interpreted as referring to the vocal cords; in a recent paper, however, Dr. A. A. Bake has pointed out that this interpretation is unfounded, and that 'strange to say, there is no trace of the knowledge of the existence of the vocal cords in the texts on the theory of music'. The following are typical of the phonetic statements:

\[ \text{The air, respiration, or pulmonic emission, at times of vocal activity,} \]

---

2. e.g. *TP* ii. 37. jihvāgreṇa pratīṣṭya mūrdhāni ṭavargē. *AP* i. 22. mūrdhanyān jihvāgreṇa pratīṣṭitam. *VP* i. 78. mūrdhanyāḥ pratīṣṭyaḥgām.

3. The VS alone suggests this basic distinction (288-9):

\[ \text{kavargādiśu jihvādī-madhyāntosthena copari:} \]

\[ \text{ṭavargē vahtra-madhyaṇa jihvāgreṇa yathā sṛṣṭet.} \]

Cf. Lüders, pp. 92, 94.

5. e.g. *Sangitādarpaṇa,* i. 48. Cf. also *Alt. Ar.* iii. 2. 5.

7. In a paper 'The Anatomical Background of Indian Music', read at the Leyden Congress of Orientalists, June 1950.
becomes breath (śtāsa) or voice (nāḍa) according as the glottis is open or closed.¹

When the glottis is closed, voice is produced; when it is open, breath.²

The words used to refer to the two poles of this articulatory process are samyṛta, 'contracted, closed', and vivṛta, 'opened': it will be remembered that the latter term was also used in the description of the intra-buccal processes.

As regards the relationship of the voicing process to the various letters, the AP states,

Breath is emitted in the case of the voiceless consonants, and voice in the case of the voiced consonants and the vowels.³

The Mbh. also notes the effect of the voicing process on intervocalic 'voiceless' stops, saying of the c in a word such as pacati,

It is overlaid by the voicing of the preceding and following vowels,⁴ a feature which is further supported by the statements of the Prakrit grammarians.⁵

Apart from the two poles of 'breath' and 'voice', a number of treatises introduce a further factor into their descriptions; the RP observes that,

When the glottis is in an intermediate condition (between closed and open) both breath and voice are produced,⁶ and goes on to relate this feature to the individual letters as follows,

Breath is emitted for the voiceless sounds and voice for the others, except for the voiced fricative (h) and the voiced aspirates, where both breath and voice are emitted.⁷

¹ RP xiii. 1-2. tāyuh prāṇah kośthyam unupradānam kanṭhahya khe vivṛte samyṛte vā āpadyate śvāsataṁ nāḍatām vā vāktrihāyām.
² TP ii. 4-5. samyṛte kanṭhe nāḍaḥ kriyate; vivṛte śvāṣaḥ. Whilst ghoṣavat, aghoṣa are generally used for 'voiced', 'voiceless', the usual term for voice is nāḍa and not ghoṣa; this fact leads to misunderstanding on the part of later writers, who list nāḍa and ghoṣa as separate processes—e.g. Siddh. Kauṁ. 12.
³ i. 12-13. śvāṣa 'ghoṣyate unupradānāḥ: nāḍo ghoṣavat-svareṣu.
⁴ i. iv. 4, on Pañ. i. i v. 109 (Kielhorn, i. 355). pūrva-parayor hrādena pracchāyate; cf. Kāṇṭhā, ādyor akheyar ghoṣavatār madhye cahāru ghoṣavān īvā laksyata ity arthaḥ.
⁶ xiii. 2. ubbhayam sāntaro bhau.
⁷ xiii. 4-6. śvāṣa 'ghoṣadānāḥ: itaretāṁ tu nāḍaḥ: sāṃsārmaññā ghoṣadānā śvāṣā-nāḍaḥ.
This is supported by the statements of the TP, viz.

When the glottis is in an intermediate condition, 'h-sound' is produced;¹

For vowels and voiced (unaspirated) consonants the emission is voice, for voiceless consonants breath, and for h and the voiced aspirates 'h-sound'.²

Further, the RP condemns as a fault in the pronunciation of h 'excessive breath or similarity to a voiceless sound'.³

Regarding this third category of glottal 'half-closure' or 'h-sound', Max Müller remarks,

Dies ist eine indische Vorstellung, welche wohl nicht zu rechtfertigen ist,⁴

and Whitney in a series of unsympathetic comments,

I confess myself unable to derive any distinct idea from this description, knowing no intermediate utterance between breath and sound. . . .

(The RP) declares both breath and sound to be present in the sonant aspirates and in h, which could not possibly be true of the latter, unless it were composed, like the former, of two separate parts, a sonant and a surd; and this is impossible.⁵

. . . . The attempt to establish this distinction is forced and futile. . . .

That intonated and unintonated breath should be emitted from the same throat at once is physically impossible.⁶

Needless to say, the two western scholars were wrong. The modern Indo-Aryan languages bear ample evidence, if evidence were needed, that the aspiration of the voiced aspirates (gh, jh, &c.) is voiced aspiration,⁷ and there are strong historical and phonological reasons for believing the Sanskrit h to have been 'voiced h' [ɦ];⁸ the possibility of such an articulation is no longer a matter of doubt—to quote one of many available descriptions:

A voiced h can be made. For this sound the vocal cords vibrate along

⁷ See e.g. J. R. Firth in Harley, Colloquial Hindustani, p. xxi.
⁸ e.g. h < *gh in hima (beside Av. xima, &c.). Within Sanskrit cf. alternations such as ghanti\|hanти, dhā\|hīta, &c., and junctions of the type tat+hī = taddhi. Cf. Thumb, Handbuch des Sanskrit, § 54.2; Edgerton, Skt. Hist. Phonology, §§ 45 f.
a considerable part of their length, while a triangular opening allows the
air to escape with some friction.¹

The failure of early western phonetics to take note of the voicing
process has already been suggested. Aristotle, in a passage of his
Histioria Animalium,² in fact comes nearer to its discovery than is
generally recognized: in making the distinction between vowels and
consonants he says that whereas the latter are produced by the
tongue and lips, the former are produced ‘by the voice and larynx’.
But the matter is not further pursued by him or his successors, and
the western tradition is really that which begins with Dionysius
Thrax; the latter distinguishes the three classes of Greek stops
(voiceless, voiced, voiceless aspirate) by their degrees of ‘aspiration’,
viz. as ‘smooth’, ‘medium’, and ‘rough’ respectively,³ the
voiced stops being considered from this point of view as inter-
mediate between the voiceless unaspirated and the voiceless aspirated
stops. It is difficult to see how this classification can have been
justified: Sturtevant has now rightly abandoned an earlier theory
that the statement could refer to a lenis/fortis distinction;⁴ and
another hypothesis, which would to some extent fit Dionysius’
classification, namely, that the Greek β, δ, γ represented voiced
aspirates, is supported by no positive evidence whatever.⁵

But whether or not this description was ever applicable to Greek,
it was evidently not in the case of Latin, and with one notable
exception is not taken over by the otherwise ovine Latin grammar-
ians. The responsibility for transmitting to us the still familiar
Latin translation of the Greek terms—tenuis, media, and aspirata⁶
—must be borne by Priscian, who takes over the Greek classification
in its entirety. Undaunted by the fact that Latin possesses no
aspiratae, he applies the term to the Latin fricative f, which he

¹ Westermann and Ward, Practical Phonetics for Students of African Lan-
guages, § 250 (with diagram).
² iv, 9, 535a (τὰ μὲν οὖν φωνῆτα ἡ φωνή καὶ ὁ λαρυγξ ἄφθασθαι, ὡς δὲ ἀφωνα ἡ
γλῶσσα καὶ τὰ χείλη).
μὲν τρία, θ, ψ, χ, μὲν δὲ τοῦτον τρία, β, δ, γ, μὲν δὲ εἰρημένα, δὲν τῶν μὲν φολῶν εἰσὶ
διωτέρα, τῶν δὲ δαιῶν φολάτερα. Cf. Dion. Hal., De Comp. 83; Aristides
Quintilianus, pp. 29, 54 Jahn.

The δαια/φολά distinction is in fact found earlier in Ps.-Aristotle, De Audib-
ibilibus 824b.
⁵ Ibid., § 94.
⁶ The Latin translations tenuis and aspirata (for Gk. ψηλή, δαια) are remark-
able: we should expect lenis and aspera (cf. spiritus lenis/asper for πνεῦμα ψηλός/
δαια).
identifies with the Greek ϕ (the latter having by his time probably developed its present fricative value). The ambiguity which the term thus developed was ultimately to provide Jacob Grimm with a deceptive symmetry in his famous statement of the Lautverschiebung.  

As regards the nature of the distinction between the voiced and voiceless Latin stops, the ancient writers seem to have had only the vaguest impressions. With t and d there is the suggestion of a different place of articulation—a method of differentiation that we find perpetuated in Ben Jonson’s English Grammar. The learning of the distinction is recommended by Quintilian as an essential item in a boy’s education, but he guardedly omits to discuss the matter in detail. In a description by Terentianus Maurus, dealing with the distinction between b and p, g and k, there is a suggestion, though obscurely expressed, that the author had recognized the extremely important lenis/fortis opposition (which Whitney was rather too ready to dismiss); and Marius Victorinus, paraphrasing this statement, does in fact use the former term. But any good that may have resided in these descriptions quickly perished; the medieval grammarian Hugutio distinguishes aliquaundo from aliquauno by the position of the stress, licet enim d et t sint diversae litterae, habent tamen aedeæ affinem sonum, quod ex sono non posset perpendi aliqua differentia; 

and in the seventeenth century John Wallis states the distinctive feature to be nasality. Only in the latter part of the nineteenth century, under the influence of Indian teaching, does the recognition of the voicing process make headway.

I.121. Pulmonic

It will be convenient to consider next the process of aspiration, in as much as one of our treatises, the PS, links this with the voicing process:

h and the voiced aspirates are voiced, the semivowels and voiced stops

1 Keil, ii. 20: ‘Inter c sine aspiratione et cum aspiratione est g, inter t quoque et th est d, et inter p et ph sine f est b. Sunt igitur haec tres, hoc est b, d, g, mediae, quae nec penitus carent aspiratione nec eam plenam possident.’

2 For discussion cf. Jespersen, Languages, p. 44.

3 e.g. Mar. Vict., Keil, vi. 33.

4 For text see Sturtvant, op. cit., § 189a.

5 Haase, De Medii Aevi Studiis Philologiciis, p. 34.

6 Grammatika Linguar Anglicanae, pp. 15 f.
are partly voiced; the voiceless aspirates are breathed, the voiceless stops are partly breathed. This is the law of speech.  

In other words, h and the voiced aspirates are considered as more fully voiced than the non-aspirates, and the voiceless aspirates more fully breathed than the non-aspirates. In the case of the voiceless pair the statement makes good sense when we consider śvāsa, ‘breath’, as referring to ‘force of voiceless breath’ rather than simply ‘voicelessness’. This interpretation is supported by the statement of the TP that,

More breath is emitted in the other voiceless consonants (i.e. the aspirated stops and the fricatives) than in the unaspirated stops, and is in accordance with the grammatical and later phonetic terminology of the distinction between aspirate and non-aspirate, namely ‘mahā-prāṇa’, lit. ‘big-breath’, and ‘alpa-prāṇa’, lit. ‘little-breath’.  

If we now turn to the PS’s statement regarding the voiced pair, similar considerations apply: nāda, ‘voice’, being interpreted as ‘force of voiced breath’, the statement implies greater breath-force on the release of the aspirates than of the non-aspirates. The justification for such a statement is clearly reflected in kymographic tracings, where the voiced breath correlates with a particularly high amplitude in the vocalic wave-forms; from this point of view h and the release elements of the voiced aspirates may be considered as an ‘overblowing’ of the following vowel (cf. also 2.00 below).

The Indian treatment of the aspiration-process provides little else for discussion, with the exception of a statement in the RP that,

Some say that the aspiration of the aspirates consists of a homorganic fricative.

11 xiii. 16. sōmāraṁ ca sōmāraṁ usmanāluh uṣṭhāhena.
a view that is repeated for the voiceless aspirates by the \textit{Ap.Ś.}

The breathy release of an aspirated stop inevitably has, as Sweet observed, ‘something of the character of the preceding consonant’; and, in the voiceless series at least, varying degrees of affrication are to be heard from speakers of some modern Indo-Aryan languages. Dialectal pronunciations of this type are likely to have existed in the case of Sanskrit; the later development of the aspirates, however, hardly supports Uvaṭa’s assumption of a strongly affricated pronunciation (\textit{pφ}, \textit{ts}, \textit{kx}) such as is attested in, for example, High German.

1.122. Nasal

The nasalization process may occur in combination with various intra-buccal processes, and the ancient statements regarding the mode of combination for the most part present no great difficulty of interpretation. The nasal consonants are referred to either as \textit{nāsikya}, ‘nasal’, or \textit{anunāsika}, ‘having a nasal component’. Of the mechanism of the process the \textit{TP} says simply that,

Nasality is produced by opening the nasal cavity.

Our phonetic treatises, as also Pāṇini, realize that both nose and mouth are involved, and the \textit{TP} further points out that the articulator is as for the corresponding oral consonants. Applied to the stop series (\textit{sparśa}, \textit{spṛṣṭa}) this process gives rise to the nasal consonants \textit{n}, \textit{nī}, \textit{n}, \textit{n}, \textit{m}: nasalized forms of three of the semivowles, \textit{y}, \textit{I}, \textit{v}, are also attested as junctional features in Vedic Sanskrit and duly noted by the phoneticians.

In connexion with the vowels the working of the process is similarly quite clear. Here again the term \textit{anunāsika} is regularly

\textit{yajnapa} ṃ vāṣṭu for \textit{yajn}aṁ + \textit{vāṣṭu}

Only I is found in Classical Sanskrit (and only when = phonological -n). \textit{P} is not attested (see, however, Konow, op. cit., p. 309); this is in accordance with the non-occurrence of geminate \textit{r} (cf. junctions of the type *-\textit{r̥} + -\textit{ṛ} = -\textit{ṛḥ} or expected *-\textit{ṛr̥} = -\textit{ṛḥ}).
used, as opposed to the śuddha or 'pure' non-nasalized vowels.¹ Another term, however, is also used by some of the treatises, namely rākta, 'coloured', nasalization being referred to as rāga or rāṅga, i.e. 'nasal' colour.² Some of our authors give picturesque descriptions of the quality of these vowels: the account in the Sarvasamantata-Śīkṣā is as follows:³

The nasal colour should arise from the heart,⁴ with a sound like that of bells: just as the milkmaids of Surāṣṭra cry 'takrāāāā ('buttermilk'), so should the nasality be realized.

The nasalized vowels are not of frequent occurrence. They appear in certain types of junction (e.g. trīr ekadaśā īha for trīn+ ekadaśaun+īha),⁵ and as features of finality in the sentence or breath-group.⁶ Apart from such cases there was a tendency, censured by the RP but general in the modern Indo-Aryan languages, for vowels to take on some degree of nasal 'colour' in contact with nasal consonants.⁷

But apart from the above, the accounts given by our treatises, as also the system of writing, present us with a third sub-category of the nasalization process. The name which this third feature bears is 'anusvāra' (ṁ, ṇ), which might be literally translated either as 'after-sound' or 'subordinate-sound'. The contexts in which it may occur are clearly defined. It is restricted to post-vocalic position, and its primary context is before the fricatives ḷ, ṝ, s (and also h), in cases where historical and phonological evidence point to an alternation with m or (medially) n;⁸ at an early date it also made its appearance under certain conditions before r,⁹ and in Classical Sanskrit replaces the Vedic ṣ and ṣ before y and v.

respectively (see above). Its optional use is further extended, even as early as Pāṇini, to word-final position preceding a stop, where previous phonetic teaching had prescribed a homorganic nasal; later treatises extend this practice to morpheme-junctures within the word, and even to intra-morphemic position, being followed in this last extension by the graphic practice of manuscripts and of some printers. In Prakrit it is further extended to the position before an initial vowel.

The phonetic value of this feature, however, has provided a problem for phoneticians and commentators whether ancient, medieval, or modern. Some confusion may perhaps be avoided by first considering the evidence for its pronunciation in the earlier and more limited contexts, namely, before the fricatives. Sequences of the type -\(\text{VmjS}\)- (where \(V\) = any vowel and \(S\) = any fricative) were phonologically parallel to sequences of the type -\(\text{VLL}\)- (where \(L\) = any semivowel except \(r\)) or -\(\text{VNT}\)- (where \(T\) = any stop and \(N\) = homorganic nasal): sam\(\text{j-skṛta}\), for example, is parallel to sa\(\text{l-laya}\) and to san\(\text{-taana}, \text{sam-paata, }&c.\) Thus the nasality in the types -\(\text{VLL}\)- and -\(\text{VNT}\)- conforms to both the \(\text{sthāna}\) and the \(\text{ābhyanatara-prayatna}\) of the following consonant; by its parallelism with these sequences one might also make the theoretical supposition that -\(\text{VmjS}\) - -\(\text{VZS}\)- (where \(Z\) is a nasalized fricative), a form of realization that may be heard, for example, in Modern Icelandic, where in a phrase such as \(\text{sóln skín fugurst}\) the word-junctures are realized with some overlapping of the nasalization and friction processes (in a segmental representation -\(\text{Z s}\)-, -\(\text{V f}\)-). In only one Indian statement, however, is there any implication that \(mj\) is to be considered as a fricative.

In a number of languages the tendency is in fact for the nasality in such contexts to be realized in the preceding vowel, and for the

4. Cf. Pischel, § 348 (Hemacandra, i. 24).
5. Cf. Stefnen Einarsen, Icelandic Grammar, pp. 19, 29: Beiträge zur Phonetik der Islandschen Sprache, p. 18. Note also Petrovic, De la nasalité en Roumain: "Ce n'est pas seulement le lieu d'articulation qui devient identique à celui de la consonne suivante, mais aussi le mode d'articulation."
6. RP i. 10, with Umaja's comment. On the general rarerness of nasal fricatives cf. Grammont, Traité, p. 95; Martinet, TCLP viii. 282; and on the incompatibility of friction and voice in Skt. cf. p. 44, n. 4.
7. Cf. especially the development in Avestan (Bartholomae, Gr. § 62), e.g. da\(\text{stąqm}\) beside Skt. da\(\text{ṃsiḥ}, \text{mu\(\text{ṃ}\)ram beside Skt. man\(\text{ṛ\(\text{ṃ}\)ram.}"

syllabic quantitative pattern to be maintained by a lengthening of the vowel; as Sweet long ago pointed out with regard to Latin,

m before the hisses and semivowels represented a nasal lengthening of the preceding vowel.¹

The same development is postulated for *-ni- in Irish,² and is further attested in Old Lithuanian by alternations of the type kändu (pres.): kšiū (fut.).³ Amongst the modern languages parallel alternations may be quoted from Polish⁴ and Spanish.⁵

On the basis of analogies in other languages it is therefore tempting to assume that the value of rni was a nasalization and lengthening of the vowel (if not already long); this view was adopted by Whitney,⁶ and has support in the fact that the TP speaks of anusvāra as having precisely this value,⁷ whilst the AP makes no mention of it apart from anusāsika.⁸ Whitney further supports his interpretation by the fact that the anusvāra symbol is written over the vowel-symbol (e.g. ः for amṛṣa). The lengthening of the vowel is implied in the statement of the TP that metrically a syllable which is nasalized is equivalent to a syllable containing a long vowel.⁹

But on the other hand some of our authorities quite certainly distinguished the terms anusāsika and anusvāra, as the following passage from the VP indicates:

According to Aupāśiṇī anusāsika of a vowel occurs only before a following vowel (Uvāṭa, e.g. maḥāṇi indraḥ), whilst before a following consonant there is an insertion of anusvāra (Uvāṭa, e.g. gaṇayeṣaṃ tvaṣṭre).¹⁰

A similar view is taken even by the VS, which in most respects is

² Cf. Petersen, Keltische Gr. i, §§ 53, 50, 94, 3.
³ Leskien, Litauisches Lezbuch, § 25, 2; note also present tense formations of the type saqū. The nasalized vowels of Old Lith. (q, &c.) are now pronounced as non-nasal long vowels.
⁵ Cf. Navarro Tomás, Pronunciación Española, pp. 111 ff.
⁶ On TP ii. 30; cf. Grammont, op. cit., p. 365.
⁷ Loc. cit. anusvṛttamān anusādāh, with xv. 1 ... pūrva-nara 'mundāhah.
¹⁰ iii. 130–2. amuṇḍikam upadāṭ ... neva Aupāśiṇī: amuṇḍareṇa uvaṭijane (Uvāṭa: ayam upadāṭa-nahdrayor antarā bhavati).
closely related to the TP. The attempts to describe the phonetic value of this 'insertion', however, are remarkably unhelpful. The PS describes it as 'sounding like the lute'; the RP classes it with the vowels and fricatives as lacking contact, and elsewhere says that it has either vocalic or consonantal qualities; and at least one ancient grammarian could not be certain whether it was a nasalization of the vowel or a separate nasal unit.

It is thus extremely difficult to determine the phonetic basis of our descriptions. Translations of the difficulty such as spirantical to vowel-like u (m) do not really help; metrical considerations alone provide no clue since syllables of the types VNC, VVC, VVC would in any case be metrically equipollent; and modern Sanskrit pronunciations are so various with regard to anusvāra as to be of little assistance. It seems certain, however, that some of the ancient writers had perceived something other than a simple nasalization of the vowel; the linear nature of this feature is indicated in the VP quotation above, and we have also the statement of the TP that some authorities prescribe the insertion of a 'nasal increment' after the vowel. In the present state of our knowledge it would perhaps be unwise to say more than that these authorities had observed some form of nasalized glide in the transition from the vowel to the fricative. Their disagreements as to its vocalic or consonantal nature may perhaps have a dialectal basis; in this connexion the following slight indications may be noted on either side:

(i) In describing the mode of transition from a to i/u in the

1 VS 169 (Lüders, p. 85).

7 Cf. Grierson, On the Modern Indo-Aryan Vernaculars, p. 101; also JFRAS Cent. Supp. 1924, p. 119 ('In schools, to prevent certain sounds being neglected, the teaching Pandits have all sorts of expedients to enforce their existence upon the pupils'). An extreme example is provided by the realization of ṅ in Yajuvedic recitation as [ghum], e.g. [aghumjuna] for amjuna.
8 xv. 2-3. naḥāsāṃ: tatas te anusвārah (Trībh.-svārā para 'anusvāra dāgama bhaṭati).
Cf. discussion Bergaigne-Whitney in MSL ii. 31 ff., 194 ff.
9 Both Bloch (op. cit., p. 371; Cinquantenaire de l'école pratique des hautes études 1921, Partie orientale, p. 65) and Chutterji (op. cit., § 130) seem to suggest a lengthening of the vowel with nasalization of the second portion.
diphthongs ai/au, the RP compares it to the union of a with anusvara:1 this comparison, with its implication that aj in some way resembled a diphthong,2 is on the face of it reminiscent of the Portuguese ‘sonorization’ of nasals (cantão<Lat. cantan(I), &c.).3 Some support for such a realization is perhaps provided by Oriya baśa<Skt. vanja, &c.4

(ii) The treatises which insist on a consonantal interpretation of anusvara (generally velar)5 are of late composition,6 and this pronunciation is expressly condemned by Uvaṭa in his commentary on the RP.7 North-western developments, however, as exemplified by Sindhi vaṁśa<vaṁsa, haṁsa<haṁsa, are suggestive of a transition -NS->N'S- (cf. the Sanskrit sandhi mahaantsan for mahaan+san, &c.).8

The extension of anusvara in Classical Sanskrit to cases where the following consonant is a semivowel provides no fresh difficulty. But, as already mentioned, Pāṇini allows the optional use of m in certain cases where earlier treatises prescribe a homorganic nasal. It has been suggested that this extension was purely graphic, and based on the convenience of the simple symbol ' to represent nasality,9 this seems less than fair to Pāṇini’s linguistic competence, though the possibility of a phonological rather than phonetic basis for the extension must not be overlooked.

Graphic considerations may well underlie the later extension of

---

1 xiii. 41 (hram anusvårā-vaṭiṣṭhātavaṭ).
2 ai/au are in fact contrasted with e/o, where the qualities of a and /u are ‘fused’ (xiii. 40, sansurdid); cf. 2. 13 below.
4 Of interest, though of doubtful historical significance, is the Marathi pronunciation of Skt. tatmams, e.g. wām (< ama-), maɔɔ (< mamsa-), ɔhiiwa (< ahimśa), ɔiWh (< sinha-). If this does in fact reflect an historical feature, the realization of anusvāra might be simply stated in terms of homorganic articulation for every case, including the fricatives—e.g. *-am+s- > *-ɔɔ s-; friction and voice being mutually incompatible, the heavy quantity of the syllable, if it contains a short vowel, is maintained by a w-type vowel-closure (cf. on eisorga-sandhi, p. 68, n. 1); thus *-ɔɔ s- would > *-aw s-, &c.
5 Cf. Varma, op. cit., p. 15, and VS 170 (Lüders, p. 87). Note also the present-day Bengali pronunciation of Skt. m as 9.
6 Note, however, the VPr’s reference to a velarity of unspecified type (i. 83. jhuradālyāmusvāra haun-nilena); cf. APr. Ś. i. 10.
7 xiii. 22.
anuśvāra to replace homorganic nasals within a morpheme. Of such extensions Whitney has said:

To ... write the anuśvāra sign in the interior of a word for a nasal mute which is equally radical or thematic with the succeeding non-nasal ... seems an indefensible practice, and one wholly to be disapproved and rejected. These strictures are directed against Max Müller's support of the practice referred to, but there is much to be said on the other side. For although this 'slovenly and undesirable habit' may well have grown out of mere graphic convenience, it incidentally recognizes an important phonological principle, namely, that the n or m in a sequence Vnt or Vmp is a very different functional unit from that in VnV or VmV; for whereas in the latter case n and m are mutually contrastive, this is not so in the former case. The homorganic nasals form a single phonological unit, and a phonological transcription will recognize this fact. This is particularly the case in those modern Indo-Aryan languages where the only purpose of certain nasal symbols taken over from Sanskrit (velar, palatal, retroflex) is to represent homorganic nasality before consonants of the appropriate series. In some dialects, moreover, we find alternative pronunciations of the type VNT/ṽ:T, i.e. an alternation of homorganic nasal (para-savarṇa) with nasality and length of vowel (anuvāsa); in such cases the convenience and phonological appropriateness of a single symbol for the two pos-

1 Lithuanian here provides another parallel, in that the indigenous grammars extend the nasal vowel-symbol (which is phonetically justified before the fricatives) as a graphic device for writing the homorganic nasal before stops (e.g. piti for pıtı): cf. Leskien, op. cit., § 26.

Note also that the Sārvasaṃmata-Śikṣā, in prescribing this extension (32), acknowledges that anuśvāra here 'lacks its peculiar properties' (i. . ity atrāṇau-vāro 'pi vidharmakaḥ').

2 JAOS ix. 69 n.
3 Hitopadesa, Introd., pp. x-xi.
4 Whitney, Skt. Gr., § 73b.
6 Note also the use of a special symbol (♀) for the homorganic nasal in Avestan, where there can hardly be any question of graphic convenience (n = ı, m = cl): cf. Bartholomae, Gr., § 268. 53.
7 Even in Sanskrit the palatal p cannot be justified on a distinctive basis (cf. Eremear, Lang. xxii. 89 ff.).
8 Cf. Prasad, op. cit., pp. 407 ff. (e.g. lámbar/ḷá:ba). Similar alternations are historically suggested by doublets in Marathi (cf. Bloch, La Formation de la langue marathe, p. 82).
sible realizations are obvious. Possibly similar alternations were prevalent in more ancient times, and gave rise to at least some of the confusion which besets the early phoneticians.

The problem of *anuvāra* has been considered at some length; for whilst it is in itself disappointingly unrewarding, it serves to demonstrate how little we might know if our sources had been equally imprecise on other points. In view of their generally high standard of competence it seems fair to assume that the phonetic problem in question was a particularly difficult one, complicated perhaps by multiple contextual, dialectal, and personal fluctuations. If we were to seek an attested feature of a modern language such as might give rise to uncertainties of a similar order, if not of type, it might perhaps be found in the Japanese so-called 'syllabic nasal' (ŋ), which has so strangely received special recognition amongst the otherwise general phonetic categories of the International Phonetic Alphabet.

### 1.13. The Vargas

With regard to the three extra-buccal articulatory processes discussed above (glottal, pulmonic, nasal) it should finally be remarked that their combination with the intra-buccal process of maximal closure gives rise to a set of five *sparśa* letters for each of the five

1 Cf. Bloch, loc. cit. 'La regularité de cette alternance fait que le seul signe de l’*anuvāra* suffit à noter ces deux cas: dans le cas où la voyelle est brève, il représente la nasale de même ordre que la consonne qui suit; si la voyelle est longue, l’*anuvāra* a la même valeur que l’*anuvadha*.

2 Before condemning the Indians for their disagreements and obscurities in the description of *anuvāra*, it may be salutary to compare the diversity of modern descriptions of the Japanese feature in question; the following may be referred to:

- D. Jones, *The Phoneme*, p. 88, n. 3.

Whilst not implying adverse criticism of all these statements, we may wonder whether linguists in a distant future, reading such various accounts—ranging from 'semi-consonne ou semi-voyelle' to 'voiced frictionless mediovular spirant'—will have any clearer an idea regarding the phonetic value of the Japanese 'syllabic nasal' than we have regarding that of the Sanskrit *anuvāra*. 
places of articulation—e.g. for the velars k, kh, g, gh, η. Each such set is known as a varga, ‘class’, the members of which are sometimes referred to by number as follows:

- Voiceless non-aspirate—‘1st.’ (prathama)
- Voiceless aspirate —‘2nd.’ (dvitiya)
- Voiced non-aspirate —‘3rd.’ (tritiya)
- Voiced aspirate —‘4th.’ (caturtha)
- Nasal —‘5th.’ (pañcama) or ‘last’ (uttama).

In the table on p. 20 the block of 5 by 5 varga letters is enclosed within the heavy line.
PART II

LETTERS

2.0. Consonants

It is the Indian practice to describe the places of articulation in the reverse order to that of the IPA. Quite logically they begin with those which are nearest to the origin of the air-stream and work progressively upwards and forwards towards the lips.

2.00. Pulmonic and Glottal

Thus the first organs to be considered are the lungs, which are treated as the place of articulation for the voiced h [h] and voiceless -h. This treatment, however, is optional; most of the treatises also allow these sounds to be classed as 'glottal fricatives'—a term which is still commonly accepted today, though in need of revision (the Greek term 'breathing' (πνεῦμα) might be more appropriate).¹

The following statements illustrate the alternative prescriptions:

The fricatives h and -h are glottal (kaṇṭhya); or, as some say, pulmonic (urasya).²

h and -h are glottal; the latter may alternatively be considered as pulmonic.³

Certain of our authors allow the pulmonic alternative only in the case of h followed by nasals or semivowels:

h before nasals and semivowels is to be considered as pulmonic; otherwise it is glottal.⁴

¹ Particularly in view of its frequent prosodic function (the Greek πνεῦμα is a προσοδικός); cf. J. R. Firth, TPS, 1948, p. 131.
² RP i. 39-40: prathama-paṇcama ca deva uṣmanām (sc. kaṇṭhyan); khec etā urasya.
³ RT 2-3. hāh kaṇṭhe: urasy vitarjaniyo va.
⁴ PS 16.

hahāraṃ paṇcamaṁ yuktam antahstāḥsbhi ca samyutam
aurasyam tva viṣṇyāti kaṇṭhyam āhūr atasyaṁtvat.

Cf. Sarvasaṃmata-Ś. 42.

hahāraṃ aurasaṁ viṣṇyād antasthāśau parāśu ca
uttameṣu parasyo evam...

The basis of this distinction is problematic; but it is to be noted that for one form of junction initial groups of the type h + nasal or semivowel are optionally treated as if the h were phonematically irrelevant (khīhnte, kīh hyah, &c.—see further 3.122 below), i.e. h is considered as a prosodic, non-linear feature of
We have already suggested that Sanskrit ś [ś] might be considered as an 'overblowing' of the following vowel; the close relationship of both ś and -ḥ to their vocalic context is mentioned by the TP:

For ś and -ḥ the glottis is the place of articulation; but in the opinion of some authorities ś is homorganic with the beginning of the following vowel, and -ḥ is homorganic with the end of the preceding vowel.1

Whitney's observations are for once entirely sympathetic; with reference to the pulmonic nature of these sounds he says,2

'The authority who called the aspirations chest-sounds may also be commended for his acuteness, since in their production it may even be said that the throat has no part: it is only, like the mouth, the avenue by which the breath expelled from the chest finds exit;3 elsewhere he shows himself to be in agreement with the view that they are homorganic with their vocalic context:

Why, then, shall we pronounce the larynx the 'characteristic place of production' of ś, any more than of the vowels? ... An ś is a sound which is produced in any one of these same positions of the mouth-organs (sc. as for the vowels), but with the vocal cords in the larynx only slightly approached.4

'The RP rather surprisingly lists this homorganic realization amongst the 'faults' in chap. xiv;5 but Uvaṭa quotes another commentator who considers this statement to be out of place, and who prefers to treat it as a rule rather than a prohibition—'for not even the gods could pronounce it in any other manner.'6

This will be a convenient point to give some account of various breathiness (cf. BSOAS xiii. 944 f.), the realization of which may occur simultaneously with that of the phonematic units. It is perhaps this peculiarity that our treatises intend to indicate.

2 On Ap. i. 19.

3 I cannot agree with Fry (Lang. xvii. 199) when he states: 'The use of the adjective mūrṣa ... does not appear to be more than a hazy attempt to localize the open spirants representing ś in pāsa.'

5 xiv. 30.

6 anya-thāna ... devār api ma lakṣya uccāraṇītum.
problems connected with -h. This voiceless breathing primarily occurs only in final position in pausa, where historically it replaces *s (or less frequently *r).\(^1\) Corresponding to -h in pausa, there appeared in conjunction with initial voiceless consonants the appropriate homorganic fricatives (viz. -x, -f, -s, -s, -f).\(^2\) Three of these fricatives, f, s, s, occur also in initial and medial positions, where they are in parallel distribution and qualify as separate phonematic units, which consequently find their place amongst the other 'letters of the alphabet'. -x and -f, however, as also -h, are 'a)yogavāha' (cf. o.42 above), i.e. they are bound to final position, and are in complementary distribution (-x before velars, -f before labials, and -h in pausa). This alternation is understandable enough, and it is impossible to agree with Whitney's evaluation of -x and -f:

It may be fairly questioned, perhaps, whether these two sounds are not pure grammatical abstractions.\(^3\)

Since these variants are not included in the alphabet, special names are devised for them, viz. visarjaniya (or later visarga) for -h, jihvāmūlya for -x, and upadhmānya for -f. The last two terms provide no difficulty: jihvāmūlya, lit. 'formed at the root of the tongue', is the general term for 'velar', and upadhmānya means literally 'blowing upon'—the consecrated description of the voiceless bilabial fricative.\(^4\) The term for -h is not so readily explicable—a fact which is reflected in Monier-Williams's dictionary:

It is called Visarjaniya either from its liability to be 'rejected' or from its being pronounced with a full 'emission' of breath, or from its usually appearing at the 'end' of a word or sentence.

The verb from which the word is derived (vi-sarga-) has meanings of the type translatable by 'to discharge, relax, cast off', &c. We shall

\(^1\) Cf. e.g. gharman beside Gk. ἀγαθός, antah beside Lat. inter.

\(^2\) AP ii. 40. visarjaniyayus para-sasthāno 'ghoṣe.

\(^3\) RP iv. 31-2. aghoṣe . . . cœsmanam sparsa uttare tatsthānam . . . tam evavasthānam āṣmayī.

\(^4\) RT 177. āṣmad sthānam (Comm. āṣmad ca para-sasthānam āpādyate).

\(^5\) TP ix. 2. aghoṣa-paras tasya sasthānam āṣmayī.

\(^6\) VP iii. 6-12.

\(^7\) Skt. Gr., § 69. Cf. on AP ii. 40, 'The division of this indistinct and indefinite sound into three kinds of indefiniteness savors strongly of over refinement of analysis.'

For other sceptics see note by Fry, op. cit., p. 104.

\(^8\) e.g. D. Jones, op. cit., § 685, 'One form of φ is the sound made in blowing out a candle.' Cf. Sapir, Language, i. 37 ff.
perhaps be giving the most direct and phonetically appropriate translation if we render it by 'off-glise', as referring to the breathy transition from the vowel to silence.

In later, though still ancient, times there appears to have been a tendency for -h to extend its usage to contexts other than in pause. The earliest of these extensions was to the position before the initial fricatives $\mathbf{f}$-, $\mathbf{s}$-, where it replaced the homorganic final -$\mathbf{f}$, -$\mathbf{s}$, -$\mathbf{s}$ (indra$\mathbf{j}$ juurah$\mathbf{>}$indrah juurah, &c.). This practice was then extended to the position before the velar and labial voiceless stops: in connexion with this innovation we find mentioned the names of Āgniśya, Vālmiki, Śākalya, and the Mādhvyandina school, whilst the ancient grammarian Śākatāyana is quoted as holding to the more conservative practice.¹

These changes have been generally accepted so far as the writing of Sanskrit is concerned, and A. H. Fry in his article 'A Phonemic Interpretation of Visarga'² has suggested that the spread of -h was due to the writers of Classical Sanskrit 'operating with a phonemic orthography'. Though the term 'orthography' once again begs the vexed question of writing, it is possible that this extension had a phonological rather than a phonetic basis; but in this matter we are faced with similar uncertainties to those which enshroud the extension of anusvāra at the expense of the homorganic nasals.

2.01. Vēlar

The velar series (ka-varga) is most generally described as being produced at the jihvā-mūla, 'root of the tongue', which is, strictly speaking, an articulator and not a place of articulation: the sthāna of this series is in fact the hanu-mūla³ or 'root of the (upper) jaw'—a rather inadequate though intelligible designation of the soft palate—

In the k-series contact is made by the root of the tongue at the root of the jaw.⁶

Amongst the velar consonants is also mentioned the velar fricative $\mathbf{x}$ (jihvāmūliya),⁷ to which reference has already been made.

¹ Cf. TP ix. 5; VP iii. 10; Pāṇ. viii. iii. 36.
² Not to be confused with the ninth-century author of the Śākatāyana-Vyākaraṇa.
³ Cf. TP ix. 4; VP iii. 1112.
⁴ Language, xvii. 194 ff.
⁵ Cf. AP i. 20. jihvāmūlayām hanu-mūlam.
⁶ TP ii. 35. hanu-mūle jihvā-mūlenā ka-varga sparśayati. Cf. VP i. 83.
⁷ e.g. VP i. 65; RP i. 41; RT 4. For the general term 'velar' the Ap. Ś. uses jihvyā, 'lingual' instead of the usual jihvāmūliya.
The Indian term 'root of the tongue' has found favour with a number of Western phoneticians, amongst them Sweet and Pike.

It has to be mentioned that in the later Pāṇinean scheme, as reflected, for example, in the Siddhānta-Kaumudi, the pulmonic breathings (alias ‘glottal fricatives’) are classed with the k-series, the whole group being referred to as 'glottal' (kaṇṭhya). The unequivocal name of the fricative \( \text{jīhvāmūliya} \) preserves it from this confusion.

2.02. Palatal

No difficulty is provided by the descriptions of the c-series, which at the period described by our treatises appear still to have been true palatal plosives rather than prepalatal affricates such as are general in modern Indian pronunciations. They are described as being articulated ‘at the palate (tālu)’? more specifically,

In the c-series contact is made with the middle of the tongue upon the palate.

2.03. Retroflex

We have seen that the retroflex series involves a special process rather than a place of articulation. Since, however, the Indian scheme treats this series as parallel to the other vargas, and next in order after the palatals, it will be appropriate to consider it at this point. Though the term for ‘retroflexed’ (pratīvēṣṭita) is well attested in the descriptions given by our treatises, the general term for the retroflex series, employed by both grammarians and phoneticians, is mūrdhanya, an adjective derived from mūrdhan, ‘head’—e.g.

For the mūrdhanyas the articulator is the tip of the tongue retroflexed;

In the t-series contact is made with the tip of the tongue rolled back in the mūrdhan.

---

1 Primer, § 71.
2 SK 10. a-ku-ha-visarjanavānām kaṇṭhak. Cf. AP. S. i. 7.
3 In this imprecise usage kaṇṭhya is perhaps best rendered by the equally imprecise 'guttural'.
4 SK 10. jīhvāmūliyānā jīhvā-mūlam.
5 See also Grierson, JRAS, 1913, pp. 391 ff.
6 e.g. VP i. 66; RT 5.
7 TP ii. 36. tālau jīhvā-madhyena ca-vargae. Cf. AP i. 21; VP i. 79.
8 AP i. 22. mūrdhanyānām jīhvāgram pratīvēṣṭitam. Cf. VP i. 78.
9 TP ii. 37. jīhvāgreṇa pratīvēṣṭya mūrdhāni ā-vargae.
Commenting on the latter statement, the *Tribhāgyaratna* says,

By the word *mūrdhan* is meant the upper part of the buccal cavity;¹

But there is no evidence that the word was ever used in this special sense, and comparisons by modern commentators with Greek *oî pavos*² (lit. ‘vault of heaven’, thence applied to ‘roof of the mouth’) are hardly relevant. *Mūrdhan* means simply ‘head’ or ‘summit’,³ and the Indian terminology is reflected in the still not entirely obsolete terms ‘cerebral’ and ‘cachemical’.⁴ The term is in fact unusually imprecise, and Whitney is probably right in suggesting that it represents a traditional title surviving from a period when phonetic science was less well developed⁵ (cf. also the term *uśman* for the fricatives—1.111 above). From the historical standpoint the retroflex sounds are relative late-comers into Indo-Aryan and they consequently occupy a peculiar place in the phonological system;⁶ they are thus likely to have attracted attention even at a period when specialist phonetic analysis was unknown, and the terminology, like that of Latin in the west, is likely to have persisted into a period of more precise description.

In connexion with the role of the tongue in the retroflex series, the *Ap. S.* makes the remarkably acute observation that the contact is made not with the tip but ‘with the part next to the tip, or the under-side of the tip’.⁷

Functioning phonologically as a member of the retroflex series we have also the semivowel *r*; on the phonetic value of this letter, however, widely diverse accounts are given,⁸ ultimately depending perhaps on dialectal variation. The same applies to the vowel *r*, which will therefore be most conveniently considered in connexion with the semivowel.

The retroflex pronunciation of both semivowel and vowel is in

¹ *mūrdhā-labhītā vahtra-evavaropari-bhāgo vivaśasyate.*
² Cf. Max Müller on *RP 44.*
³ The *PS* (13), in a list of the *sthānas*, also uses the term *śiras* in place of *mūrdhan.*
⁴ Cf. Pike, op. cit., p. 123.
⁵ On *AP* i. 22, *TP* ii. 37.
⁷ *Jihvopāgrāna mūrdhanyādnam; jihvāgrādhabhaharam ev.* Cf. J. R. Firth in Harley, op. cit., p. xix: ‘The Indian *f* is not made with the tip in the English manner, but with the very edge or rim of the tip, which is slightly curled back to make this possible’. See also *BSOAS* xii, 859.
fact prescribed by the PŚ, but is exceptional elsewhere. The Prāśākhyas generally require an alveolar articulation (which agrees with the present pronunciation of Sanskrit and the general practice of the modern Indo-Aryan languages).

The AP, VP, and RT refer to the alveolar position by the term danta-mūla, 'root(s) of the teeth', a name which has been employed also by Sweet. A slight difficulty is caused by the fact that some of the treatises refer to the dental series by this same term; in such cases, however, the reference is to the junction of the teeth with the gums (Sweet's 'rim'), and the alveolar position of r is then clearly distinguished by a further description, e.g.

For contact is made by the centre of the tongue-tip behind (pratyak) the roots of the teeth, the word pratyak being further interpreted by the Tribhāṣyaratna as meaning 'within and above'. Certain authorities quoted by the RP also refer to r as 'vartsya', a hapax glossed by Uvaṭa as denoting 'the projection behind the roots of the teeth', i.e. the alveolar arch.

The prescription of alveolar articulation corresponds well with the name repha interpreted as 'tearing sound' (see 0.42 above), in that a rolled r such as this seems to imply could hardly be retroflex; excessive rolling, however, is listed as a fault by the RP, and Uvaṭa refers to this type of pronunciation as 'indelicate'. Two treatises, the RP and the RT, treat r as dental, but mention the alveolar pronunciation as an alternative.

8 pratyag ity abhyantarā upari-bhāga ity arthāḥ.
9 i. 46. repham vartsyam eva.
10 vartsa-labdhena danta-mūlād upariṣṭadd ucchānaḥ pradeśa ucyate.
11 If a special term is required to translate vartsya, 'gingival' might be appropriate—cf. Pike, op. cit., p. 122: ... alveolar arch (which might with more justice be called the gingival one, since the contact is made against the gum, not the bone ... ); Bloomfield, Language, p. 98.
12 The fricative nature of the retroflex r is clearly indicated by its equivalence to [k] in the sandhi *sarvaiṣa-gunaḥ = sarvair gunaḥ, &c.
13 xiv. 20. atispāra barbaratā eva rephe.
14 barbaratāpya asaṃkumāryam eva.
15 RP i. 44-46; RT 7-8 (dante itiḥ: repho mūle va).
The disagreements on the pronunciation of \( r \) are duly noted by Uvaṭa:

Some schools pronounce \( r \) as a 'cerebral', some as an alveolar.\(^1\)

As regards the vowel \( r \), an alveolar pronunciation is suggested by the \( TP \) in a passage which reads:

In \( r \) and \( rr \ldots \) the tip of the tongue is approximated to the 'barsvas'.\(^2\)

The \( Trībhāṣyaratna \) interprets the 'barsvas' as referring to 'the elevations behind the row of teeth',\(^3\) which is reminiscent of its comment on the semivowel \( r \) (see above). Other treatises, however, agree in allotting \( r \) to the velar class:\(^4\) this prescription is problematic, and is applied by at least one author also to \( l \).\(^5\) The latter appears only in the single root \( kl\text{p}- \), and it has been suggested that in such a phonetic context \( l \) is likely to have been articulated with 'dark' resonance, and that it is this which has caused it to be classed as velar\(^6\) (cf. on consonantal \( l \), 2.04 below). But no such arguments apply to \( r \), and indeed the Middle Indian developments point rather to a palatal resonance for both vowels.\(^7\) It is in any case difficult to believe that the Indians would have classified these sounds by their secondary rather than their primary articulations. It is just possible that in connexion with \( r \) we should interpret \( jihvāmūlīya \) as 'uvular' rather than 'velar'; it is only strange that we have no such description of the semivowel \( r \), except in so far as it is mentioned amongst a list of alternatives by the \( Varṇapāṭalām \).\(^8\)

In the retroflex series there remains only a peculiarity connected

\(^1\) On \( RP \) i. 1. \( hasyāṁ śākhāyāṁ repho mūrdhanyah hasyāṁ dantamūlīya iti. \)

\(^6\) Whitney on \( AP \) i. 20.

\(^7\) e.g. \( kilīṭa < kiliṭa, kīṣa < kīṣa, inīṣī < ṛṣi. \) The Prakrit grammarians prescribe a development to \( a \), but this is largely a Māhārāṣṭrī peculiarity (e.g. \( ghau < ghṛta \): cf. Hemacandra i. 126, and Pischel, §§ 47 ff.). The development to \( a \) (as e.g. \( mīhu < mhiṭa \)) is generally associated with a labial context. There is, however, considerable fluctuation, and Bloch, \( L'Indo-Aryan, \) p. 36, goes so far as to remark, 'La coloration de la voyelle est imprévisible.' For \( f (rr) \) we have in \( AMg. \) i or \( 4 (Pischel, § 38). \)

with the fricative s. In the Pratijñā Sūtra we find the statement,

Alone or combined with consonants (other than retroflex), s is to be pronounced as kh.\(^1\)

a statement which is repeated in a number of the later Sikṣās.\(^2\) This pronunciation of s is common in Sanskrit loan-words in some of the modern languages (e.g. Hindi dokh beside Skt. doṣa), and is traditional in Yajurvedic recitation.\(^3\) There is, however, no mention of such a pronunciation in the earlier treatises.\(^4\)

2.04. Dental

The dentals are unequivocally described as being produced 'at the teeth'\(^5\) or 'at the rim of the teeth'.\(^6\) The VP and AP go on to specify the tip of the tongue as articulator,\(^7\) the latter work further stating that the tip is 'prastiṇa',\(^8\) a word which is most naturally translated by 'spread, flat' (not, as Whitney, 'thrust forward')—a characteristic feature of dental articulation.\(^9\) The RP, however, disapproves of excessive tongue-spreading in any of the stop series.\(^10\)

I is generally treated as the semivowel associated with the dental class, and most of the treatises prescribe a dental realization. The RP includes in its list of faults an articulation 'with both ends of the tongue';\(^11\) on this rather strange statement Uvaṣa is not illuminating; and although the word anta may also mean 'side',\(^12\) Max Müller's 'mit den Seiten der Zunge' is phonetically unacceptable unless the reference is to opening and not contact\(^13\) (i.e. bilateral as

against unilateral articulation). The RP's disapproval is perhaps directed against the secondary back-raising mentioned above, which would produce velar resonance or 'dark I' [I], the typical Indian I being of clear quality.

The vowel ĵ is also generally said to be dental; a statement prescribing velar articulation has already been referred to, and an alveolar articulation is required by the TP.¹

2.05. Labial

The labial stops and the upadhmāntya fricative are described as being produced with the two lips,² or simply as 'at the lip',³ i.e. at the upper lip as sthāna. For the semivowel v, which is regularly associated with the labial series, and which has a close phonological relationship with the lip-rounded vowel u, further observations are necessary. For whilst its earlier pronunciation was doubtless as a bilabial [w], it had by the time of our treatises acquired, at least in some dialects, the labio-dental articulation [v] which is typical of many modern Indo-Aryan languages—'The learned', says the PS, 'declare v to be labio-dental.'⁴ For [v] only the middle of the lower lip is in contact with the teeth, and the observation quoted by the Ap. S., that it is formed 'at the corners of the mouth',⁵ is hence not inappropriate.⁶

2.1. Vowels

2.10. a.

In the discussions of the vowel-system considerable interest attaches to the first letter of the varna-samāmnāya, a. Mention has already been made of the tendency to group the long and short vowels into pairs designated by a single term, ĭ and ī, for example, being referred to as i-varna, 'i-colour or quality'. In the case of ĭ/i and u/uu it would appear from the phoneticians' accounts that there was no great divergence of quality as between the short and the long vowels.⁷ Phonologically parallel to the pairs ĭ/i and u/uu

⁴ i. 16–17. vahāre dantyoṣṭhyah: ykva-sthānam eke.
⁵ Cf. D. Jones, Outline, § 693: 'Indians generally replace v by a frictionless continuant v in which the lower lip touches the centre front teeth lightly and is so held as to allow the air to escape chiefly at the sides' (with Fig. 90).
⁷
is the pair a/aa; but it is evident from the ancient descriptions that the members of this pair differed considerably not only in length (kāla-bhinnā) but also in their quality or 'degree of openness' (vivāra-bhinnā)—in the modern languages in fact the distinction is more generally maintained by the qualitative than by the quantitative difference.1 aa is generally recognized by our texts as the most open (vīrāta) vowel, whilst a is referred to as relatively closer (sāmāyata).2 But the advantages of treating a and aa as members of a qualitative pair are, as Pāṇini realized, considerable; on this treatment depends, for example, the rule that,

When a short vowel is followed by a similar vowel, the corresponding long vowel is substituted for them,3 so that parallel to junctions of the type yadi + icchet = yadiiicchet and saadhu + uktam = saadhuuktam the rule is capable of embracing, e.g. na + asti = naasti, &c. Then, having based his phonological statements on the fiction of identical quality, Pāṇini cancels out the error by the phonetic admission of his famous last aphorism, 'a a', i.e.

The short a, which has for phonological purposes been treated as of identical quality with the long aa, is phonetically closer.4

This simple though ingenious device of Pāṇini's has given rise to a spate of involved and for the most part unedifying controversy; a lengthy discussion is found at the beginning of the Mbh., but perhaps all that really need be said has been said in the vārttika with which the discussion opens—

The treatment of a as open has as its purpose the inclusion of aa (sc. as the long member of the 'a-varṇa').5

Even from the phonetic point of view, however, a and aa are sufficiently similar to be considered under a single articulatory

2 E.g. AP i. 32-36; VP i. 72. savarṇava ca (Uvāja: akrārya mātrikṣaya devamātrikṣaya . . . kanātha-sthānata uktā . . . aṣaya-prayātma tu bhidyate . . . sāmyta-vāya-prayatna akrāṣa vīrāṣa-prayatna itare svardh).
3 VI. i. 101. akah savarṇa dirghah.
4 Some of the brevity of the original might be preserved by a rendering such as 'a = [ə].'
5 I. i. 2, on Pāṇ., Śīv. Sā. 1 (Kielhorn, i. 15). akrāṣa vīrāṣopadeśa akrāgra-hanārthah.
heading, viz. as *kāṇṭhya*, ‘glottal’—a term which has already been used in connexion with the voiced and voiceless ‘breathings’—

1. *a* is glottal

2. *a* and *h* are glottal

3. *a*, *h*, and *-h* are formed at the glottis.

To class the open vowels as ‘glottal’ appears at first sight an indefensible procedure. It becomes less so when we perceive the conceptual framework underlying these statements. It will be remembered that the *TP* referred to a ‘neutral’ position of the articulatory organs, in which

the tongue is extended and depressed, and the lips are in the position

for *a*.

The classification of *a* as glottal begins to make sense if we assume that it was viewed as a ‘neutral’ vowel in the sense of involving no special intra-buccal articulatory effort. Such an assumption is fully supported by a statement in the *Mahābhāṣya*:

The place of articulation of the *a*-vowels is extra-buccal: or, as some would have it, it is the whole mouth.

In other words *a* has no specific intra-buccal *sthāna* or *karaṇa*; as with *h* and *-h*, it is a case of *karaṇābhāva* (cf. p. 49, n. 1).

From this recognition we may proceed to the peculiar doctrine mentioned by the *RP*, in itself inexplicable, that all the vowels are to be pronounced with the ‘articulatory condition’ (*karaṇāvasthā*) of *a*. This statement also becomes phonetically meaningful if *a* is interpreted as ‘vocalic neutrality’ or ‘unmodified voice’, on which are superimposed the vowel-articulations involving various degrees of tongue-raising.

---

2. *PS* 17. *kāṇṭhya*va *a-hau.

4. See 1. 113.

5. Cf. Sievers, Gr. d. Lautphysiologie, p. 38: ‘Beim a ist der Mundraum durchgehends mäßig geöffnet; die Zunge entfernt sich nicht viel aus ihrer Indifferenzlage.’

6. 1. 4, on *Pāṇ* i. 1. 9 (Kielhorn, i. 61) *bāhyam hy āryāt sthānam ovarṇyaya: torva-mukha-sthānam ovarṇam eka ścchanti. Cf. Āp. S. i. 11.

7. Cf. Max Müller (on 823). ‘... sehr nichtssagend zu sein scheinen.’

9. The statement is of course nonsensical if *karaṇāvasthā* is simply interpreted as referring to the tongue-position; but the use of the term *avasthā* (not *sthāna*), a word otherwise unattested in the phonetic literature, is some guarantee of the special nature of the reference. Cf. M. Wallas, ZII v. 193 ff.
We are now in a position to understand a third problematic
document referred to the $RP$, viz.

Some say that the voice of the voiced consonants consists of $a$.\(^1\)

This last statement enables us to trace a consistent thread running
through the series of apparently eccentric aphorisms, and to relate
them precisely to the descriptive framework of the other ‘glottal’
articulations:

(a) -h is considered as ‘pure breath’, liable to modification by
the close vowels,\(^2\) and capable either of independent function
\(= visarjanya\) or of providing the appropriate air-stream
for the voiceless consonants.\(^3\)

(b) h is considered as ‘breath + voice’,\(^4\) liable to modification by
the close vowels,\(^2\) and capable either of independent func-
tion \(= hakara\) or of providing the appropriate air-stream
for the voiced aspirates.\(^5\)

(c) a is considered as ‘pure voice’, liable to modification by
the close vowels, and capable either of independent function
\(= avarna\) or of providing the appropriate air-stream for
the voiced consonants.

Artificial as such a descriptive basis may appear, it is in fact not so
very remote from some statements of the most recent branch of
phonetic analysis, ‘acoustic phonetics’; the following may be
quoted for comparison:

We therefore discuss vowel production on the hypothesis that the
glottis emits a spectrum that is independent of supra-glottal articulation,
and that the filtering which determines the ultimate vowel spectrum is
independent of the glottal adjustment; that is, the original production
and the articulatory modification of the glottal tone are entirely indepen-
dent of each other. The spectrum of the vowel as it exists in the open
air is to be reckoned, then, as the glottal spectrum multiplied for each
frequency by the transmission percentage of the articulatory filter.\(^5\)

\(^1\) xiii. 15. áhur ghoṣam ghoṣavatām uδhram eke...
\(^2\) Cf. TP ii. 47–48 (see 2.00 above).
\(^3\) Cf. AP i. 12; RP xiii. 1–6; TP ii. 9–10 (see 1.20 above).
\(^4\) See 1.20 above.
\(^5\) M. Joos, Acoustic Phonetics, p. 39.
\(^6\) For discussion of the concept of a as the ‘natural vowel’ or ‘principa vocalium’
see Sievers, Phon., §§ 197 ff.; cf. also Jakobson in Trubetzkoy, Principes, p. 376;
LETTERS

With regard to a it remains only to mention that in later treatises, owing to the extension of the term kanthyā (see 2.01 above), a (like h and -h) is grouped with the velar series,¹ thus adding considerably to the symmetry of the varna-samānnāya at the expense of phonetic precision.

2.11. i, u

The close front quality i is appropriately classified as ‘palatal’ (tālavaya),² and the TP says more specifically,

For i-quality the middle of the tongue is approximated to the palate.³

The close back quality u is classified by the lip- rather than the tongue-position, viz. as ‘labial’ (orthya),⁴ the shape of the lips is variously referred to as ‘approximated’, i.e. rounded,⁵ or as ‘long’, i.e. protruded.⁶

2.12. r, l

As to the pronunciation of the vocalic r and l, the ancient statements are perhaps not as clear as we could wish, but their general trend is easily followed. Their places of articulation have already been discussed above. In distinction from the other vowels they are referred to as ‘mixed’,⁷ i.e. combining features of vowel and

Cf. further Millet’s observations on the role of the pharyngeal resonator and its timbre—L’Articulation des voyelles, p. 3: ‘Nous considérons la bouche — comme le générateur efficace, le résonateur déterminant de la résonance vocalique; la cavité pharyngienne donne son timbre à la voix seulement qui enveloppe celui de la voyelle’; and Étude expérimentale de la formation des voyelles, p. 68: ‘Il n’est pas de timbre de voyelle qui ne soit accompagnée du timbre de la voix’. Allowing for the fact that the Indians seem not to have differentiated pharynx and larynx, we may say that their conception of a was, in Millet’s terminology, that of a pharyngeal timbre without buccal determination.

We may here note that a similar device was adopted in India with reference to nasality, anusudra being treated as ‘pure nasality’, forming the basis of all nasal sounds (RP xiii. 15. ... anusudrān anusūdhanām).

¹ E.g. Siddhi. Kaum. 10 (cf. 2.01 above). Some authorities even gave to it the title jihyā, which means specifically ‘velar’ (see Ap. Ś. I. 10).
³ ii. 22. tālau jihvā-madhyaṁ śvarne.
⁴ Cf. PS 17. oṣṭhajāv u-pā.
⁵ TP ii. 24. oṣṭhopasamāhāra uvarne.
⁶ VS 284. uvarne-prakṛter oṣṭhau dirghau.
⁷ VS 11.
consonant (r/l);¹ for this reason some writers even refused to admit them to the vowel-system.² There is general agreement that their phonetic structure is of the type: consonantal element—vocalic element—consonantal element;

² contains r (as also does the first half of rr) . . . and the r is in the middle.³

The characteristic of r is that it is compounded of four segments; of these the first and last are vocalic, whilst the central pair are consonantal, viz. particles of r.⁴

In this connexion it is of interest to compare such Avestan parallels as pārobu beside Skt. prthu, korap—beside klp.⁵ As to the quality of the vocalic element, the VP states that r and l consist of r and l blended into one unit with the vowel a.⁶

Regarding the method of combining the vocalic and consonantal elements we may note as an example of picturesqueness rather than illumination the statements quoted by the commentary on the AP, which declare that they are connected like a nail on the finger, or a pearl on a string, or a worm in the grass.⁷

2.13. e, o; ai, au

It will be convenient to consider in conjunction the guna and trddhi⁸ vowels e/o and ai/au. The latter, as the transcription suggests, are diphthongs and are regularly so described; the former also were historically diphthongal⁹ and continued to function as such for certain phonological purposes (e.g. vijnaaya—idam = vijnaayedam). But there are indications that whereas the phono-

¹ Cf. AP i. 37, 39. sampyrṣṭa-repham roournam. . . salakāram iṣvarṇam.

⁸ On AP i. 37. yathādurgulya nukham tathā śātre manir āṣṭi eva ṭeṇe kṛmira īceti ca.
⁹ See o.41 above. 
⁰ Cf. Gk. oṣa, Av. vaṭḍa beside Skt. veda, &c.
logical value of e/o was a+i/u, that of ai/au was once aa+i/u: this distinction may be illustrated by junctions of the type

\[\text{nagare+iha = nagara iha}\]

beside \[\text{striyai+uktam = striyaa uktam}\].

From the phonetic standpoint e/o are represented at a still comparatively early period by simple long vowels intermediate in quality between aa and ii/uu.

To consider now the ancient descriptions: the term for the diphthongs (including e/o) is san̄dhy-akṣara, 'compound vowel', in contrast to samānakṣara, 'simple vowel'. ai and au are designated respectively 'glotto-palatal' and 'glotto-labial'—as the VP says,

In ai and au the first mora is glottal and the second palatal or labial, both the AP and the VP point out, however, that

Although diphthongs are combinations of vowels, they are treated as single letters.

As regards e and o, the PS seems to preserve the tradition of a diphthongal pronunciation (distinct from that of ai and au):

In e and o the glottal element has a length of ½-mora and in ai and au 1 mora;

the passage continues with the words 'tayor vin̄pta-san̄mūta', literally 'in them there is openness and closeness', which Ghosh interprets as referring to the fact that, in ai and au, 'their first half or the a-element is open and the second half or i- and u-element is close'; but it is more probable that the words refer to the open aa which forms the first element of ai/au and the closer a which forms the first element of the narrower diphthongs e/o. The

1 Note, however, that the attested sandhi of both a and aa+i/u is e/o (e.g. baala=+ia=ka= baalekṣate).

3 i. 73. aikāraukārayoh kaṇṭhyān āpūc mātrā tātā-vāhāyor uttarā. Cf. RP xiii. 38-39. san̄dhyāni san̄dhy-akṣarāny āhur ehe dev-sthānataitepu tahos-bhayeṇu. san̄dhyayeṇu akāra 'rāham śāhā uttaraṃ yujor śāhā śī śaḥātāyaṇāḥ.

4 i. 40. san̄dhy-akṣarāni sanāpiṣṭa-varṣāṇy eha-varṇāvad vyāhi.

5 iv. 145.

7 For the distinction of the two varieties of diphthong one may compare the Nepali 'falling' type (ai/au), where the first element is considerably the more prominent, and the narrower ay/aw ([æ])/[ɔ], with closer and relatively less prominent starting-point—e.g. bhalle beside mayle. There is also some
latter interpretation is supported by a passage in the *Mahābhārata*, where the *samaṇta* a of *e/o* is specifically contrasted with the more open aa of *ai/au*.¹

The monophthongal pronunciation of *e/o* seems to be indicated by the *RP* when it says that they are not, like *ai/au*, heard as a distinct sequence, because of the coalescence (*samsarga*) of their parts:² as Uvaṭa goes on to explain,

> One does not observe where the a ends and the i or u begins, because the two coalesce like milk and water,³

a type of combination which Kaiyyaṭa, continuing the traditional simile, contrasts with the mixture of sand and water.⁴

There is little in the way of detailed descriptions of the monophthongal articulation of *e/o*. The *TP*, however, mentions that for *e* the lips are more spread and for *o* more rounded than in the case of *a*;⁵ and the intermediate degree of closure for *e* (between *a* and *i*) is stressed by the *Tribhāśyaratna*:

> In *e* the raising of the middle of the tongue towards the palate is less than in the case of *i*, owing to the fact that the former is mixed with *a*.⁶

It will be noted that even where the monophthongal value of *e/o* is phonetically established, the feeling for its phonological equivalence to *a+i/u* still prevails, and the basis of description is still provided by the simple framework

\[
\begin{align*}
\text{i} & \quad \text{u} \\
\text{a} & 
\end{align*}
\]

alternation of the second type with a monophthongal realization *e*—e.g. *dhara*, 'much, many; very', beside *sabha*, 'all', where the final -e and -ey are morphologically comparable.

PART III
PROSODIES

3.0. Definition
In the technique of letter-abstraction various features of the larger units of utterance are left unaccounted for. It is the reintegration of these features that forms one of the tasks of synthesis, and it is to them that the title of ‘prosody’ is here applied. The ancient accounts of these prosodic features will be considered under the following headings:

1. Features of junction (sandhi).
2. Features of syllable-structure.

3.1. Junction
The nature of our material makes it convenient to work with the following sub-divisions:

(a) Word- and morpheme-junction.
(b) Letter-junction.

The treatment of word-junction and morpheme-junction under the same heading is justified by the close parallelism of the two classes of prosodies in Sanskrit, as also by the stated principles of our treatises, e.g.

Unless directed to the contrary, one should treat the parts of a word as words.

Morphological analysis must observe the same rules of finality as apply to word-isolates.

In both (a) and (b) certain of the prosodic features are relatable to the basic processes considered in Part I; this is only to be expected in view of the fact that these processes had been arbitrarily segmented by the letter-analysis, and have to be restored in the synthesis here considered.

2 Cf. VP iii. 3: padānta-padādyoh sandhiḥ.
4 RP i. 61: uprātydmāye padavac ca padyān.
5 VP i. 153: avagrahah padāntavat.
3.10. Word- and Morpheme-junction (cf. also 0.40)

In the synthesis of the word-isolates certain of the features affecting initials and finals are capable of description in terms of letters: the fact, for example, that the junction-form of *tat+ca* is *tacca*, may be and is described in terms of a ‘replacement’ of the isolate-final *-t* by *-c*. Other features are describable, as we have just noted, by reference to an extension or transference of certain processes such as were designated ‘distinctive features’ of the various letters; this is more particularly the case with the extra-buccal processes—e.g.

| Voicing:  | aaśli + raa ja = aaśli draa ja |
| Aspiration: | labh- + -ta = labdha |
| Nasalization: | vaak + mama = vaañmama. |

The ancient methods of stating these features provide little of interest, and since it is with the statements and not with the phonology itself that we are primarily concerned, they need not be repeated here; the information is in any case readily available in the *sandhi* section of any Sanskrit grammar—Macdonell makes the useful classification into ‘Changes of Position’ (i.e. junctional prosodies of *sthāna*, such as in *tacca* above) and ‘Changes of Quality’ (i.e. junctional prosodies of *prayatna*).

One exception is provided by the prosody of retroflexion,1 more particularly in its application to morpheme-junction. Where the process of retroflexion is indicated by a non-*sparśa* letter (i.e. by *r, r̋, or g*) the process continues within the word until an interfering articulation is initiated (as e.g. in *pra-paat-ana*) or the process is ‘signed off’ by a retroflex stop (as e.g. in *pra-piḍ-ana*): if, however, an apical nasal appears in the sequence, it is realized with retroflexion and so closes the process; thus when to the verbal root *rabh-* are added the morphemes *-ya-* and *-maana*, the result is *rabh-ya-maanā*. The ancient phoneticians were aware of the remarkable nature of this prosody, and the *RP* and *VP* employ for it the special term ‘*nati’*,2 lit. ‘bending, curvature’.

The term ‘interfering articulation’ referred to above is taken from the *RP*’s discussion of this prosody.3 It refers, as Uvaṭa

---

1 See further *BSOAS* xii. iv. 939 ff.
2 *RP* v. 61. ejā natīr dantiyā-mūrdhanya-bhāvah.
3 *VP* l. 42. dantiyā a mūrdhanyāpattir natiḥ.
4 v. 56. aṣṭavatam vighna-hṛdaya rupamāpyaṁ sarva-pūrvavā yathoktaṁ.
points out, to the three middle vargas, viz. palatal, dental, and the retroflex series itself. The full appropriateness of the term will be at once appreciated by any phonetician who has been concerned with palatography; in investigating by this method words which illustrate a particular feature of articulation, one has to restrict one's examples to those cases where no interference is caused by other articulations such as would involve a further wipe-off on the artificial palate.

Certain features of word-junction were found by our authors to require description in terms other than those of processes or of phonematic units. This is outstandingly the case where, so far as the letters are concerned, a 'hiatus' (vivṛtti) is left between a final a-vowel and an initial vowel. Examples of this type of junction are—

\[
\begin{align*}
te+aa &= ta aa \\
prabho+ihi &= prabha ihi \\
paadau+ucyete &= paadaa ucyete \\
tasmai+akṣii &= tasmaa akṣii \\
sutaah+ime &= sutaa ime \\
khyaah+aa &= khyaa aa \\
vidvaan+agne &= vidvāaa agne
\end{align*}
\]

Beside these forms, however, we also find the following alternatives written:

\[
\begin{align*}
te+aa &= tay aa \\
prabho+ihi &= prabhav ihi \\
tau+indraagnii &= taav indraagnii
\end{align*}
\]

(this last is the regular treatment before vowels other than u).

In the above cases historical justification can be found for the y and v (efo < *ai/au, &c.; cf. 2.13 above), and the distribution of y and v is in accordance with the historical facts (thus we do not find tav aa or prabhay ihi). But in the phonetic treatises we find similar

2. See especially J. R. Firth, 'Word-Palatograms and Articulation', BSOAS xii. 857 ff. (p. 859: 'For the study of articulations in this way the selection of utterances is determined by knowledge that some articulations, bi-labials, for example, give no palatogram, and others homorganic or non-interfering articulations').

The fact that y, as against f, functions as non-interfering is incidentally a further argument against the Indian doctrine of a greater degree of contact for this semivowel than for the fricative; l, however, like s, functions as an interfering articulation (cf. remarks on pp. 27-28 above).
prescriptions for those cases where no such historical evidence can be adduced. Thus with reference to examples of the type sutaah + ime and khyah + aa above, we find the statement that

- h before an initial vowel > - y, ¹

suggesting junction forms sutaay ime, khyay aa, &c.: and with regard to the type vidvaan + agne,

- aan before an initial vowel > - aay, ²

suggesting vidvaay agne, &c.

But whether written or unwritten, and whether historically justifiable or not, the quality of this 'final' y or v was observed to differ from that of the phonematic letters y and v in initial and medial position. As the Pratiṣṭhā Ṣūtra says,

v has three realizations, viz. tense in initial position, medium in medial position, and lax in final position. ³

The lax articulation of these sounds is mentioned by Panini in a statement ascribed to Śaṅkaraṇyana, where they are described as 'laghu-prayatnatara', i.e. 'having a lighter articulatory process'⁴—a statement interpreted as follows by the Siddhānta-Kaumudi:

A light articulation is one in which there is a relaxation of the tip, the rim, the middle, or the root of the tongue.⁵

¹ TP ix. 10. atha suvra-paro yahāram. Cf. AP ii. 41. svare yahāraḥ. This is in fact a rather misleading way of stating the matter, and similar obliquities still mar the presentation of visarga-sandhi in modern grammars. The forms with final - h are absolute finals only, and elsewhere the starting-point for the sandhi is *-as, &c. The final *-as follows the general sandhi laws as regards voicing before voiced initials—e.g. (i) *-as + g. > *-az g.; (ii) *-as + l. > *-ați; but voice and friction being mutually incompatible in Skt. (cf. p. 44, n. 4), the syllabic patterning is maintained where necessary by the use of y or w prosodies, which in (i) provide a vocalic closure maintaining the heavy quantity of the syllable (*-ați g. > *-aဝ g. > -o g.), and in (ii) a mode of vowel-separation (*-ați > -aܗ). The w-prosody is generalized before consonants and the y-prosody before vowels, though in the former case signs of a y-closure are preserved in 'fossilized' phrases and in internal position (e.g. suure duhītas < *suuras + duhītas, sēduh < *sa-zd-uh; cf. also the Magadhi development of -ah > -e). In the case of a final retroflex fricative, the prosody is also of retroflex type (*-lגישה > *-lʐ > -lɾ, &c.), and is indicated by the symbol for the phonematic retroflex continuant r (cf. 2.03 above)—e.g. *manuṣ + naama > munurmama, *agniṣ + iva > agniriva, &c.

² VP iii. 142. athāropadhi yahāram.

³ 17. athāntyaśyāntaṣṭhānam pāddi-madhyānta-sthāya tri-cidham guru-madhyama-laghu-cittibhār uccāraṇam. Cf. 1.112 above.

⁴ VIII. iii. 18. vyor laghu-prayatnataraḥ Śaṅkaraṇyanaṃ.

⁵ 168. yasyoṣṭṛape jihvedgropagā-madhya-mālānām śāntihyyam jayate sa laghucchārayuh.
Śākaṭāyana is elsewhere quoted as referring to this articulation as 'a reduced realization or slight contact'. Various other views are reported by the TP, which, having given the orthodox doctrine of hiatus, ascribes to Ukhyya the full articulation of y/v, to Vātsapra reduced realization, to Śāṅkṛta the realization of v but not y, and to Mācākṣya the loss of y/v when followed by u or o. The RT refers to these features as 'half-elided y and v', whilst the RP gives to the v the peculiar title of 'bhugna', lit. 'bent'.

What our treatises are in fact describing is not the phonematic y/v but the y/v junction-prosodies—as Uvāta rightly says of the 'bhugna' v, it is simply a 'mode of junction' (samāhāna); for, as he elsewhere remarks of the y-prosody, 'if it were not there, how could the coalescence of the two vowels be avoided?' The weak articulation of these prosodic markers is closely paralleled by the ya-śrutī, 'y-sound' or ya-tva, 'y-ness' which serves as a syllable-divider in Prakrit, and by the y/v of, for example, the Hindi verbal forms aya, ave (infin. a-na; beside e.g. bēṭha, bēṭhe, infin. bēṭh-na).

3.11. Initiality and Finality

Closely related to features of junction are features of initiality and finality in the breath-group. On the negative side, the RP lists those articulations which are excluded from the initial or final position and so indicate non-initiality or non-finality. But positive statements are few.

Whitney, in a criticism of Lepsius, wrote,

We are not aware that the Hindu grammarians themselves—acute and

---

1 AP ii. 24. lela-cṛttir adhispardam Śākaṭāyanasya.
4 bhugnam nāma ca itat samāhānam bhavati.
5 On VP iii. 142. yadi hi vahāra vyaḥkāryo-kāryam na hṛyoḥ katham iha svaryoḥ sandhir na vyāt. In fact there are a few instances where the prosody is omitted, with resultant coalescence: in the RV this is particularly the case with the pronoun sa (sed for sa Id, &c.); the RP mentions this pronunciation as a fault (xiv. 60). Even when not indicated phonematically, the inter-word space or the non-coalescence of adjacent vowels may be considered as a mark of the junction-prosody.

9 xii. 1-2.
hairsplitting as they were in catching and noting the finest shades of sound, and much as they would have been delighted with, and made the most of, just such a nicety as this—ever took any notice of a smooth breathing.  

By ‘smooth breathing’ Whitney meant the glottal onset of an initial vowel, but this statement is probably not entirely accurate, for in the VS we in fact find the isolated and notable observation,

At the beginning of vowels which are not preceded by a consonant, the glottis is said to be the place of articulation.

It seems not unreasonable to interpret these words as referring to the particular feature of initiality in question.

There are also some remarks of interest in connexion with final consonants. The general rule is that of the non-nasal sparsas only the voiceless unaspirated stops may occur finally in pausa: but on this matter there seems to have been some divergence of opinion. The RP quotes Sākaṭāyana for the orthodox view, but attributes to Gārgya the doctrine that stops in this position were voiced, and Pāṇini permits either pronunciation. The truth of the matter may well lie in the view somewhat abstrusely stated by the AP:

Words ending (sc. according to orthodox doctrine) in voiceless stops, end according to Śaunaka in voiced stops, but they are not so treated (sc. phonologically); they have lax contact.

This observation is perhaps to be interpreted as indicating a realization as voiceless stops, but with the lax articulation characteristic of the voiced stops (i.e. as g, d, dh). Graphically they are always represented by the voiceless series. For further observations on final consonants see below under 3.120 (abhinidhāna).

3.12. Letter-junction

We are here concerned with those features of transition from letter to letter which may be considered without regard to the question whether a word- or morpheme-junction is also involved.

1. 7AOS vii. 328.
3. e.g. AP i. 6. spārśaḥ prathamottanah.
4. In recent times similar disagreements, regarding Lithuanian finals, are to be found in the accounts of Schleicher (Gr., p. 277), Kurschat (Gr., § 175), Leskien (Lesbuch, § 30).
5. i. 16. prathamamḥ Sākaṭāyanaḥ.
6. i. 15. avasāne tṛtiyam Gārgyaḥ sparman.
7. VII. iv. 55. vāvasāne.
8. i. 8-9. prathamāntiḥ tṛtiyāntānti śaunakasya pratiśkānaḥ na vṛttih: adhisparman ca...
These are principally related to various types of consonant-group. The general term for a group is samyoga or ‘conjunction’, but the term pinda, ‘ball, block’, is also used in later treatises. The various types of pinda are classified according to their composition by the Yajnavalkya-Siksha under fanciful and largely irrelevant titles such as ‘iron’, ‘flame’, ‘wool’, &c. It is of some interest, however, to note that both the YS and the Varnaratnapradipakā Siksha describe the combination stop + semivowel as a ‘block of wood’ (i.e. which can easily be broken) on account of the ‘laxity of their junction’ (ślatha-bandha); in the Greek and Latin grammarians we find groups of this type compared to a ‘mixed yoke’ (e.g. ass and ox, or ass and mule), the tractive effort of which is less than that of two similar yoke-mates. In the Western examples the simile refers to the fact that such a group optionally fails to ‘make position’ in verse: no such option generally prevails, however, in the case of Vedic or Classical Sanskrit, and there is only doubtful evidence from Buddhist Sanskrit and the statements of late metrical writers such as the ‘Prakrit Piṅgala’.

3.120. Consonant+stop (abhinidhāna)

One of the most important features noted by our treatises goes by the title of abhinidhāna, ‘close contact’. This refers to the non-release of a consonant, more particularly a stop, when followed by a stop, and parallels the French term ‘implosion’. The significance of the term is indicated by the Indian statements, e.g.

Abhinidhāna is the checking of a consonant, making it obscure,

1 Cf. AP i. 98. vyañjenday aavyacetoṇi śvaraiḥ samyogah.
2 202 (SS, p. 29). atha sapta-vaidhāḥ samyogas-pindāh. . . . See also Varma, op. cit., p. 145.

sparā upaścādāt ye cāntasthābhiḥ ca samyutāḥ
da-rup-piṇḍena te tulyāḥ ślatha-bandhāh prakārito dhāḥ.

Cf. YS 202. . . . cāntasthān da-rup-piṇḍavat.
The term ślatha-bandha is used of various other combinations by the Śatāriya-Sikṣā (72, 76).
But see Meillet, ‘Valeur des groupes -TR- en Sanskrit’, MSL xviii. 311 ff., and cf. 3. 21 below.
6 Cf. Weber, Ind. St. viii. 224 (on Piṅgala, Chandah Sūtra i. 9 ff.).
7 Cf. Grammont, Traité, pp. 36 ff. For a full appreciation see Rosapelley, MSL x. 347 ff.
weakened, deprived of breath and voice; it takes place when a stop is followed by a stop; it is also called ‘arrested’ (āsthāpta).\(^1\)

In the case of stops and semivowels (except \(r\)) followed by stops, abhinidhāna takes place, i.e. a restraint or obscuring of the sound; it also occurs in\( \text{pausa}.\)^2

The extension of the term\( \text{abhinidhāna} \) to finals in\( \text{pausa} \) is also of interest; the description of them as ‘obscure, weakened, deprived of breath and voice’ goes far to explain the divergent views quoted above regarding their voicing or non-voicing.\(^3\) The doctrine of unreleased final stops is strongly supported by the comparative evidence adduced by Gauthiot in his\( \text{La Fin de Mot en IE} ,\)\(^4\) as also by later Indo-Aryan developments.\(^5\)

In the\( \text{RP} \) we also find a description of the stop-elements of the\( \text{abhinidhāna} \) consonants which distinguishes between voiced and voiceless:

The sound which follows the closure of an unreleased (voiced) stop is called ‘\( \text{dhruta} \)’, and it continues for the duration of the stop; in the case of a voiceless stop the \( \text{dhruta} \) is not audible; and in the case of a nasal it is nasalized.\(^6\)

‘\( \text{Dhruta} \)’, lit. ‘continuance’, is parallel to the ‘\( \text{tenue} \)’ of French phoneticians.\(^7\) The Indian observation compares favourably with a modern statement such as,

While the organs articulating a plosive consonant are actually in contact they form what is called the stop. In the case of voiceless consonants nothing whatever is heard during the stop; in the case of voiced consonants some voice is heard during the stop.\(^8\)

The stop-element is, of course, not only a feature of the unreleased stops; but in other positions our authorities speak of the

contact as only 'momentaneous' and so not deserving special description; they take note, however, of the especially brief and light flap-articulation of intervocalic voiced retroflex stops.  

3.121. \textit{r} + consonant (svarabhakti)

A passage of the RP quoted above excluded \textit{r} from the effect of abhinidhāna; this exclusion finds its explanation in the following statement:

After \textit{r} standing between a vowel and a consonant, a vowel-fragment (svara-bhakti) of \textit{r}-quality is inserted.\textsuperscript{3}

This doctrine of svarabhakti, 'anaptyxis', is elsewhere restricted to the sequence \textit{r} + fricative\textsuperscript{4} (in some treatises also \textit{l} + fricative).\textsuperscript{5}

The most detailed statement is that of the AP:

Between \textit{r} and a prevocalic fricative, a svarabhakti is pronounced having the length of \(\frac{1}{2}\) or \(\frac{1}{4}\) of \(\textit{a}\); before other consonants (than fricatives) its length is \(\frac{1}{2}\) or \(\frac{1}{4}\) of \(\textit{a}\).\textsuperscript{8}

Regarding the greater length of the svarabhakti in the sequence \textit{r} + fricative, it is to be noted that manuscripts of the AV write vocalic \textit{r} for \textit{r} in such cases;\textsuperscript{7} the metre also occasionally requires the pronunciation of a vowel which is not noted in our texts (e.g. \textit{darṣata} = 4 syllables).\textsuperscript{8}

As to the quality of the svarabhakti vowel our treatises show wide variation; apart from \textit{r} we find \textit{a}, \textit{i}, \textit{e}, and \textit{u} mentioned;\textsuperscript{9} the RP also states that it may take on the colour of a preceding or following vowel.\textsuperscript{10}

\begin{itemize}
  \item[1] Cf. RP xiii. 9. śṛṣṭam anśhitam.
  \item[2] E.g. Sāñcīrīṣa-Ś. 22. dhūrṣṭāti ceti viññeva da-dhahoy vvara-madhyayoh (in the RP (see 1.110 above) da-dhṛṣṭā = ṛṣṭīṛṣṭā and is used to describe the articulation of the semivowels). Cf. also VP iv. 146. da-dhau da-śīrṣā ekṛṣṭam; RP i. 52. For a kymographic study of this feature in Gujarati see T. N. Dave, BSOAS vi. 673 ff.
  \item[3] RP vi. 46. rephūd svaropadhitād vyañjanadāydd yādra-vārnā svarabhaktir uttarā.
  \item[4] E.g. TP xxi. 15. rephoṣma-samyoge repha-svarabhaktiḥ.
  \item[7] Cf. Whitney on AP i. 102.
  \item[8] Wackernagel, At. Gr. i, § 50. In Prakrit, on the other hand, a written svarabhakti may have zero metrical value (Pischel, § 131; cf. 3.20 below).
  \item[10] Vi. 53. pūrvottara-svara-svarāpatīṃ ca.
\end{itemize}
The statement of the AP on the lengths of the svarabhakti vowels goes on to mention as being of length $\frac{1}{3}$ a an element referred to as 'sphoṭana'; from a later passage we learn that this occurs in groups where a stop is followed by another of a more back series, especially a velar (e.g. in vaṣat-krām, tad gaavyatre). Uvāṣa defines the term (which literally means 'splitting') as the (optional) separation of a consonant cluster. This would appear to indicate a type of svarabhakti, whether voiced or voiceless, the infinitesimal duration of which is suggested by the specification of a value $\frac{1}{3}$ a, in fact a minimal audible release. The mechanism of the feature referred to is perhaps the release of the front closure during the formation but before the completion of the back closure, resulting in the momentary outflow of an air-stream attenuated by the back constriction; it might then be identified with what Pike terms a 'crossing glide':

When the releasing glide of one stricture is simultaneous with the approaching glide of another, a crossing glide is developed. . . . One such audible crossing glide is the sound of open transition between two voiceless or voiced stops; in [ṣpt] a type of crossing-glise aspiration may be heard if the lips begin to open while the tongue is moving toward the alveolar arch.

Prasad in fact reports just such a transition for Sanskrit loan-words in Bhojpuri:

In the case of such sequences in the tātasa loan-words as pronounced by the educated speakers, the contact is first formed in one position and after that the organs tend to abruptly take up the position for the second consonant before the first is properly released.

If the back closure were completed before the initiation of the front release, the result would be abhinidhāna; if the front release were effected before the initiation of the back closure, the result would be full svarabhakti.

An exception to the occurrence of sphoṭana is mentioned in the case of a retroflex followed by a palatal, where a feature called karaṇa, lit 'dragging, extension', is said to take place: the term is

---

1 103. tad eva sphoṭanaḥ.
2 ii. 38. vṛgā-viparyaye sphoṭanaḥ pūrvaṇa ced virāmaḥ.
3 VP iv. 165. sphoṭanāṁ ca kakāra-vṛghe va sparit.
4 On VP, loc. cit. sphoṭanāṁ nāma pīṇḍi-bhūtasya uṣṇyogasya pythag-uccāraṇam.
7 Cf. Pike, loc. cit.
8 Examples quoted from the AV are gaṭ ca, sud jaataa.
further explained as kālavipraKarṣa, 'extension of duration'. In
the absence of more precise descriptions we can hardly attempt to
interpret this isolated statement; we may only note that the author
evidently intends to distinguish the transition in question from
normal abhinidhāna or svarabhākti. The term as here employed is
thus not to be confused with the vipraKarṣa of Prakrit grammarians,
which refers simply to anaptyxis.

3.122. Stop + nasal (yama)

Closely related to the preceding prosodies is the feature referred
to by the Indian phoneticians as yama, lit. 'twin'. The implications
of the term will be discussed after a consideration of its contexts:

Within a word, when a non-nasal spāra is followed by a nasal, it is
separated by the appropriate yama.3

Non-nasal spāras followed by nasals become their own yamar; the
yam as are in conformity with the spāras.4

After a non-nasal spāra followed by a nasal there are inserted the
appropriate nasal sounds, called by some yamar.5

The feature here observed is that generally described as nasal or
'faucal' plosion of the oral stop;6 the further statement of the VP
that

The yam as are produced by the root of the nose (nāśikā-mūla)7
may be brought into line with modern descriptions if we interpret
nāśikā-mūla as 'velum'. In this type of transition there is a slight
nasalization of the oral stop, at least in its latter portion, and so a
nasal off-glide to the following nasal.8 The Indian recognition

1 AP ii. 39. na tucargasya caturge kāla-vipraKarṣa tu atra bhave t ... tam
ādhe karṣaṇa iti.

Note also the use of kāraṇa in the Puspadātra (ed. Simon, p. 518—'Ziehen,
Verlängern einer Silbe über ihre Zeitdauer und über ihren Hauptton hinaus
durch Einschieben eines andern oder mehrerer anderer Zwischentöne'), and
similarly Uvaṣa in comm. on VP i. 124.

yamāḥ prakṛtyayāvaśa saukhaḥ.

5 TP xxi. 12-13. spārād anuttamād uttama-parād āśpúryyaṁ nāsikyāḥ; tān
yamāṁ eko.

6 Cf. D. Jones, Outline, § 586; Pike, op. cit., p. 58.

7 i. 82. nāśikā-mūlea yamāḥ.

8 Statements on the syllabication of the yama (cf. Varma, op. cit., pp. 79 f.
would seem to suggest that there was some lengthening of the stop.
of this feature has not always been duly appreciated; Whitney writes,

Phonetic analysis does not, as it seems to me, help us to recognize the yama of the Hindu grammarians as any necessary accompaniment of the utterance of a mute and nasal.\(^1\)

Max Müller refers to the Indian statements as ‘vollkommen klar und physiologisch begreiflich’; but it is only his own misinterpretation of them that is so lucid—

Sie würde eben einfach die Thatsache hervorheben, daß wo ein Nasal auf eine Muta folgt, der Muta selbst ein leichter nasaler Ansatz vorhergeht\(^2\) [my italics].

Müller, in fact, as also Regnier,\(^3\) takes the yama to be a nasal articulation preceding the stop. But the TP speaks of the yama as occurring ‘sparīḍ’, i.e. after the stop,\(^4\) and this is yet more clearly brought out by the Nārādi Śīkṣā:

If a non-nasal sparīḍ is followed by a nasal, then a yama homorganic with the preceding letter is to be inserted between them.\(^5\)

The number of distinct yamas is given by the PS,\(^6\) the Tribhāgyaratna\(^7\) and Uvaṭṭa\(^8\) as four, i.e. voiced and voiceless, aspirate and non-aspirate; Uvaṭṭa mentions and disagrees with a theory that there are twenty\(^9\) (i.e. one for each of the non-nasal vargiya letters), and states that only four types are distinguished ‘by their own qualities’\(^10\)—a statement of which the precise implication is not clear.

We have no special instructions regarding the realization of the aspirates in such contexts, and must assume that the faucal release

\(^{9}\) On VP i. 82. yamāḥ catvāraḥ. . . . Cf. on i. 74, viii. 24.
\(^{10}\) On RP i. 50. evam vimśatir yamān bhavati dhānām adhyeti ca. . . . vimśatitāḥ sūrdānāṁ dvādaśāṁ api. yamānāṁ vimśatitā-vrata-paniḥ: sa mā bhūt: catuṣṭāṁ eva yamānāṁ prathamaḥ prathamaḥ dvitīyaḥ dvitīyam evam ad pañcamam adhyeyam ity ucyate.
\(^{11}\) On RP i. 50. varisaptā catvāra eva.
was followed by an expulsion of voiceless or voiced breath through the nose; the *RP*, however, objects to the teaching of Gārgya that the *yama* is then followed by a nasal fricative; with the nasal breathing there is likely to be some degree of cavity friction, but the *RP* is perhaps only referring to some objectionable form of local friction.

Immediately after the discussion of the *yamas* the *TP* has the rule:

*After h followed by n, ñ, or m is inserted a nasal sound (nāsīkya).*

A similar rule is also found in the *AP*. If, as Whitney assumes, the reference is simply to another *yama*, it is strange that a special rule should be stated, and the *Tribhāṣya-ratna* interprets the statement, in spite of its wording, as referring to a nasalization of the *h*, an interpretation which is supported by the explicit statement of the *Sarvasamnata-Sūkṣa* and, even more significantly, by the *VS*.

Whatever the precise interpretation of the rule in question, it evidently recognizes the fact that the two processes of breath and nasality may overlap, whether partially or wholly; that this was the case in Sanskrit is strongly suggested by the so-called metatheses in Prakrit developments of the type *bambhaṇa* < *brahmaṇa*, &c., as also by Pāṇini's optional prescription of junction-forms such as *kiṃ hunte* beside *kiṃ hunte*.

As regards the figurative implications of the term *yama*, we perhaps have a hint in the statement of the *VP* that

'In a non-nasal stop before a nasal undergoes division (viccheda).*

---

3. As e.g. Pike, *Phonetics*, p. 141. 'Nasals with local friction at the velar are fricative nasals (very rare, limited almost to types of rough clearing of the nose)'. Cf. Sweet, *Primer*, § 78, referring to a 'strongly snorted' [h], occurring in 'a not uncommon and very disagreeable form of sniffling'.
5. i. 90-100. *hakārāṇa nāśikyaṃ* (sc. vyavahārāṃ bhavati).
7. 142. *hakāram uttameṣu pareṣu evam nāśikyanam ihādikham*.
8. 298, 301 (Lüders, pp. 88, 93, 101). The nasalization of h is, however, prohibited by the *Cārityārtya-Sūkṣa* (see Varma, op. cit., p. 86).
11. iv. 163. *antah-pade pañcamaḥ pañcamaṇaḥ vicchedam.*
Uvāta equates the term *viccheda* with *yama,* and it is understandable that in a sequence with nasal plosion, e.g. *[pad₃ma]*, the oral stop and its nasal release might have been considered as a division of the d into two parts or 'twins' ([pad₃ma]). In the term *viccheda* we should then have a parallel to the German 'Brechung', a description which at least two scholars have in fact applied to the *yamas.*

3.123. **Fricative + nasal**

In the sequence fricative + nasal one phonetician is reported as observing the insertion of a voiceless stop homorganic with the nasal; thus *krṣṇa, griḷṣma* would be realized as *[krṣ̄ṇa], [griḷṣ̄ma],* the oral closure for the nasal being completed before the lowering of the velum. As both Bloch and Varma have pointed out, this type of transition is strongly supported by developments in later Indo-Aryan.

3.124. **Stop + Fricative**

There are certain peculiarities connected with the sequence stop + fricative. Our treatises mention that the stop may be aspirated, an observation that is to some extent supported by Prakrit developments of the type *macchara < matsara, khāra/chāra < kṣaara,* &c. This treatment, however, is restricted by Saunaka and Bādabhikāra to those cases where the stop and fricative are heterorganic by far the most frequent group of this type is *kṣ,* and we may note the Sanskrit alternation of *kṣ- with khy- in the root *kṣaa/-khyaa-,* an identification *kṣ = khy* is also required by etymologies in the *Satapatha-Brāhmaṇa* and in Yāska’s *Nirukta.*

---

1. *viccheda* yama iti.
4. Cf. the transition common in English (e.g. *[sent’s] = sense).
5. *AP* ii. 6. dvitiyāh ta-ja-seu.
9. Cf. Pischel, § 316; Varma, p. 73. Note also *AV* rēchara beside *VS* ṭaṭāla.
We are also told of a realization as kṣ, going back as far as Gārgya. It thus seems likely that the complex which we transcribe as kṣ may in fact have been in the nature of an affricate unit not precisely describable in terms of k and ṣ. Rāmasarman, in his commentary on the Pratijñā Sūtra, points out that it is a single and indivisible letter; this statement simply refers to the fact that it is written in Nāgari with a single symbol (ਸ or ჈) which bears no evident relationship to either element ( viagra, ჈); but the results of a recent comparative study are of some phonological interest—Sanskrit kṣ, as is well known, combines the reflexes of IE *ḥs and *khp, and Benveniste has now convincingly demonstrated that on structural grounds the latter (*khp) must be treated as a single phonological unit.

3.125. Gemination

We need not here consider in detail the doctrine of krama or ‘doubling’, which occurs in most of our treatises. This refers to the lengthening of consonants in certain contexts and would be of considerable interest were it not for the fact that ideas regarding the identity of these contexts are so diverse. The matter has been discussed at some length by Varma. The most general agreement is to be found in the case of a consonant preceded by r, where both manuscripts and printed works frequently show the double symbol. The ‘doubling’ has no phonological consequences, and Pāṇini’s observations are as follows:

After r or h preceded by a vowel, and as the first member of a group, a consonant may be doubled... But according to Sākalya there is no such doubling, and all teachers agree that it is inoperative after a long vowel.

3.2. Syllable Structure

3.20. Vowel and Consonant (see also 1.112 above)

When considering the processes of articulation we encountered a phonetic criterion for the class of vowels, namely, openness of the

\[ V \text{P. iv. 167; } \text{RP. vi. 55 ff.} \]
\[ \text{Cf. also the wide variety of developments in Kafiri (Morgenstierne, Linguistic Mission to Afghanistan, pp. 58 ff.).} \]
\[ \text{On 19 (ed. Weber, p. 85).} \]
\[ \text{viii. iv. 46. aca ra-ḥbhyām ṣr (sc. rd)} \]
\[ \text{47. amaci ca.} \]
\[ \text{51. sarvattra śākalya (sc. na)} \]
\[ \text{52. dirghād śākrvyān.} \]

For discussion cf. Wackernagel, op. cit., § 98.
buccal articulators. By this criterion h and -h might also be classed as vowels, but such a possibility is excluded by the existence of phonological criteria related to function rather than to mode of articulation. This phonological distinction between vowel and consonant is made in the following statements:

A vowel forms a syllable;¹

A vowel with a consonant or even alone forms a syllable;²

A syllable is composed of a vowel, together with initial consonant(s) and, in pausa, a following consonant;³

The consonant is subordinate to the vowel;⁴

which the Trībhasyaaratna augments by saying,

A consonant is incapable of standing alone, and so is dependent, whereas a vowel is independent.⁵

Thus the vowel is phonologically defined by the fact that it forms a syllable, or the nucleus of a syllable⁶—a criterion for which western antiquity provides parallels.⁷ Indeed the statement of the Trībhasyaaratna is almost exactly duplicated by that of Dionysius Thrax.⁸ One result of this phonological interdependence of syllable (aṅkṣara) and vowel (svarga) is that the term aṅkṣara is frequently extended to mean 'vowel'.⁹

The distinction between the phonetic and phonological criteria is further exemplified by the case of svarabhakti. We have seen that from the phonetic standpoint this feature is defined as vocalic in character; our sources are careful to add, however, that from the phonological point of view it does not break up the consonant-group nor does it form an independent syllable.¹⁰

¹ AP i. 93. svarga 'क्षरम्'.
² RP xviii. 32. sva并无lesū su 'sāpi svarga 'क्षरम्'.

⁹ And thence also, like svarga, to mean simply 'letter'—cf. Mbh. i. i. 2, on Pāṇ. ŚŚ. 7-8 (Kielhorn, i. 36).
¹⁰ Cf. RP xi. 35. na svargayāṃ svarabhaktir ekaṃ; Uvaṣa on VP iv. 17. na
The etymology of the term ākṣaṇa is a matter of some doubt. Most usually it is derived from the negative prefix a- plus the verbal root kṣar-, 'flow, perish', i.e. 'imperishable'—a term which is not inappropriate as applied to its non-technical meaning of 'holy writ'. The Vaidikābharana has an interesting alternative; taking ākṣara as meaning 'vowel' and accepting the derivation from a-+ kṣar-, it interprets the verb as meaning 'to be moved as subordinate to something else' (anyāṅgatayā). The consonant was referred to in the TP itself as the 'subordinate member' (āṅga), and the implication of the etymology is thus that the consonant is 'moved' by the vowel.

Etymologies of the word for 'consonant' (vyañjana) are various. Uṣaṭa, deriving it from the verb vy-āṇj- in the sense of 'to manifest', explains that the consonants are so called 'because they manifest the meanings'. This suggestion that the consonants rather than the vowels are responsible for the differentiation of meanings is to some extent justifiable in a language where there are only three basic vowel-classes, and where one of these (a) occurs approximately twice as frequently as all the rest together; and in a notable discussion on paradigmatic lines regarding the semantic function of individual letters the Mahābhāṣya selects consonantal values for its examples (yāpa, hāpa, sūpa).

3.21. Syllabic Division

Statements quoted above treat the vowel as the nucleus of the

caitau varṇāh repha-lakBradv varṇān ca madhyā-vartinaḥ api varṇau samyoga-vigāhtag kuratu. AP i. 104. pāraṇā-vardam samyogāvighātai ca. (For exceptions see 3.121 above, and Varma, pp. 84 f.) Cf. also Firth, TPS, 1948, p. 141; K. Bergslund, Roros-Lappish Grammar, pp. 15 f.

1 Cf. Māhātmya, loc. cit. ākṣaraṁ na kṣaram vidyāt—na kṣiyate na kṣaratvā vākṣaram. The Nirukta adds a derivation from akṣa, 'axis', because it is 'the axis of speech' (xi. 12. na kṣiyate vākṣaya bhavati: vade 'kṣa iti vā).

2 On TP i. 2, na kṣaranty ākṣarani: kṣaraṁ anyāṅgatayā caśanam: tad-abhāvacī svareru akṣara-sābdo vartate.

4 On RP i. 6, vyāñjayanī prakāṣṭh kurvanti ardhān iti vyāñjanāni. Otherwise Vaidikābharana on TP i. 6. pāraṇā svareru vyāñjaya iti vyāñjanam.

5 See Whitney, Skt. Gr., §§ 22, 75. Cf. also Stetson, Motor Phonetics, p. 36; Czernak, loc. cit.

6 t. i. 2, on Pāṇ. SSū. 5 (Kielhorn, i. 30). Cf. O. Strauss, ZDMG N.F. 6, pp. 129 ff.
syllable; and they go on to describe the consonantal structure of the syllable in terms of the attachment of the consonants to the vocalic nuclei. The general rule is that an intervocalic consonant, as also an absolute initial or initial group, belongs with the following vowel, but that the first consonant of a medial group belongs with the preceding vowel, as also does a final consonant in *pausa*.

Some variation of doctrine is, however, found; the *RP* allows either the division of a medial consonant-group or its attachment in *toto* to the following vowel, and the *TP* attaches to the following vowel a group consisting of consonant+semivowel or stop+fricative.

The Indian statements are partially paralleled by those of Greek grammarians, more particularly of Herodianus Technicus in his work *Περὶ Συντάξεως τῶν Στουχείων* ('On the Combination of Letters'). The principal Greek rules are that single intervocalic consonants belong with the following vowel, and that medial groups may be divided between syllables unless they are such as could stand at the beginning of a word, in which case the whole group belongs to the following syllable (a treatment reminiscent of the Slavonic languages). Geminates are specified as being always divided, and the group stop+liquid as belonging to the following syllable. The statements of the Latin grammarians are similar to those of the Greek, stressing in particular the principle of possible initial groups.

It is to be noted, however, that these rules of the Indian phoneticians are not put to any further phonological purpose, nor can their basis in utterance be certainly established. But we may surmise

---

1 e.g. AP i. 55-57. *parasya sarasya vyanjani*i: *sanyogadi purvasya: padyam ca*. Cf. VP i. 99-106.

2 i. 23, 25. *varintare vyanjani*yu uttaran*ya: . . . *sanyogadiv* *v*.

3 *vyanjani*ya *uttarasyay*aya *svaryant*ya *tu purva-bhak*: . . . *sanyogadi ca svayam ca*. Chatterji, op. cit., § 134, suggests that the Nagari graphic system may be based on such a syllabic structure.

4 *xxi. 1-9. vyanjanam svast**a**h*am: *tat para-svaram* *uttaran* *purvasya: sanyogadi:* . . . *anuvrah svarabhakti ca: nanditadvaram asuvargam:* . . . *spartaip cama-parah:*.

7 Cf. Stretton, op. cit., pp. 84 ff.

that they were formulated with reference to the perceived termination and onset of certain prosodic syllable-features such as prominence and tone; the PS speaks of tone as a characteristic only of the vowel, but the VP remarks that it may be shared by a consonant, and the Vaidikābharaṇa makes the acute observation, which we have no particular reason to doubt, that in certain cases the final portion of a falling tone was borne by the consonant closing the syllable, which was accordingly lengthened. In any case we should hardly be justified in following the example of the Western Sceptic, Sextus Empiricus, by referring to discussions on syllabic division as 'a lot of empty linguistic nonsense'.

3.22. Length and Duration

From the point of view of syllabic structure the prosody of vowel-length is of great importance. The device adopted by the Indians for purposes of phonological description is that of the mātrā or 'mora':

A short vowel = 1 mātrā; a long vowel = 2 mātrās.

A pluta vowel = 3 mātrās.

A vowel having the length of a is short, and its value is 1 mātrā; a vowel twice as long is long, and a vowel three times as long is pluta.

The mātrā device has an evident utility in a system where the basic vowel-units are considered as members of qualitatively similar pairs each comprising a short and a long member, and where the

---

1 i. 117. vyādjanam svareṇa svarāram. Cf. Pike, Tone Languages, p. 7: 'Although the tones are usually placed on the vowel of the syllable ... a glide may end on a voiced consonant in the same syllable' (see also pp. 11, 30 n., 31). Both views are presented in the commentary on AP iii. 74. avarāṇi vyādjanān; svarasamity Anyatareṣaḥ.

4 Cf. RP i. 17-19. hravāḥ ḍirghāḥ ... ubhaye tv akṣarāṇi.

5 AP i. 59, 61. eka-mātra hravah: dvi-mātra ḍirghah.

6 RP i. 27, 29-30. mātrā hravah: dve ḍirghah; tisāḥ pluta ucyate svarāḥ.

7 VP i. 55-58. a-mātra-svaro hravah: mātrā ca; dvi tēvāṇi ḍirghah: plutaḥ trib. Cf. TP i. 31-36; Sarvasanmatta-Śikṣā, 40; Upalekha, i. 8 ff.
juncture of two similar short vowels results in the corresponding long vowel (e.g. divi+iva = diviiva).  

The *pluta* or protracted vowel mentioned above is of rare occurrence and is bound to a very limited series of contexts; it represents the over-lengthening of the final vowel of a word or phrase and is used 'in cases of questioning, especially of a balancing between two alternatives, and also of calling to a distance or urgently' (e.g. idam bhuuyaaa idaamaam iti, 'Is this more, or that?'). For most phonological purposes, however, the *pluta* vowel may be ignored; as the *RP* points out, it occurs but three times in the *RV* and it is in all cases related to the special type of speech-function.  

The statements on vowel-length are followed by a reference to the length of consonants, the general prescription being $\frac{1}{2}$ *mātra*, though the *AP* says 1 *mātra*; the *VP* is even more specific in its detail:

A consonant has a value of $\frac{1}{2}$ *mātra*: $\frac{1}{2}$ *mātra* is known as an *anu* ('moment') and $\frac{1}{4}$ *anu* is known as a *paramānu*.

But the *mātra* concept has no justification in connexion with consonants; certainly it might have been used in conjunction with the rules of syllable-division for purposes of stating syllable-quantity (see below), but in fact our treatises do not so employ it. Their statements are thus only of value as generalized prescriptions of relative duration; this unphonological approach undergoes a further degeneration in statements such as the following (from the *PS*):

1. *mātra* is equivalent to the cry of the blue jay, 2 *mātrās* to that of the crow, 3 *mātrās* to that of the peacock, and $\frac{1}{4}$ *mātra* to that of the mongoose.

Here we have an attempt to define phonological length in terms of absolute phonetic duration, a practice comparable with a modern statement in terms of centiseconds. It is gratifying, however, to find that these attempts are almost certainly late interpolations by

---

2. Whitney, Skt. Gr., § 78.  
3. I. 31. 'adhaḥ svid āsyaḥ' 'upari svid āsyaḥ' arthe plastir 'bhūr iva vindatiḥ' trih.

phonologically incompetent scholiasts: they appear in almost identical form in many of the late Śūkṣās, and it is significant that a similar verse which appears in our text of the RP² bears no comment by Uvaṭa.

3.23. Quantity

Beside the terms 'short' and 'long' (hrasva, dirgha) we find listed in the introduction to the RP and in the concluding stanzas of the TP the terms 'light' (laghu) and 'heavy' (guru). These latter terms refer primarily to the quantity of the syllable for metrical purposes; but since the term akṣara, 'syllable', is also used to mean 'vowel', the vowel rather than the syllable is regularly stated to be 'light' or 'heavy'. Whitney's statement that 'for metrical purposes syllables (not vowels) are distinguished by the grammarians as heavy or light'⁴ is unfortunately not true: but we cannot but agree when he remarks,

The distinction in terms between the difference of long and short in vowel-sound and that of heavy and light in syllable-constitution is valuable and should be observed.⁵

The failure of our authors to observe this distinction in fact leads to some confusion. The actual rules as to syllabic quantity, however, are not in any doubt:⁶

'Heavy' are:

(a) (A syllable containing) a long vowel (including a nasalized vowel)
(b) (A syllable containing) a short vowel followed by a consonant-group or by a final consonant in pausa.

'Light' is:

(A syllable containing) a short vowel not followed by a consonant-group.

¹ Cf. Ghosh, PS Notes, p. 77. ¹² xiii. 50.
² RP Introd. 5; TP xxiv. 5.
³ Ibid. Cf. Firth, TPS, 1948, p. 139.
⁴ Skt. Gr., § 79.
⁵ Cf. TP xxii. 14–15.
⁶ Cf. AP i. 51–54; RP i. 20–21; Pāṇ. i. iv. 10–12; Pingala, Ch. S. Introd. 4.
A final short vowel in *pausa* may be lengthened and so form a heavy syllable.¹

It will be noted that syllable-division and length of consonants are not employed in these statements of syllabic quantity. One exception is provided by the *RP*, which states,

(*A syllable containing*) a long vowel is heavy; and heavier if accompanied by a consonant; (*a syllable containing*) a short vowel with a (preceding) consonant is light; and lighter without a consonant.²

This suggests a series of four quantitative values, *viz.*

'Heavier' (2½ *m.*)

'Heavy' (2 *m.*)

'Light' (1½ *m.*)

'Lighter' (1 *m.*)

But this distinction has no metrical consequences, and is not otherwise mentioned by the phoneticians,³ who regularly apply the *mātrā*-concept to vowel-length and not to syllable-quantity. But a dangerous step has been taken in the statement of the *VP* that,

A (short) vowel before a consonant-group is equivalent to 2 *mātrās.*⁴

We may assume the logical background of such a statement to have been somewhat as follows:

(a) Short vowel before consonant-group = heavy syllable.
(b) Long vowel = heavy syllable,
∴ (c) Short vowel before consonant-group = long vowel.
(d) Long vowel = 2 *mātrās,*
∴ (e) Short vowel before consonant-group = 2 *mātrās.*

The phonological consequences of such reasoning are serious enough, but the greater danger lies in the temptation to take the next step, *viz.*

∴ by (a) and (e), heavy syllable = 2 *mātrās.*

And this step has in fact been taken by the metrical authorities, who employ *mātrā* in a quite different sense from that intended by the phoneticians, with the convention that a light syllable is equiva-

² xviii. 41–44. *guru dirgham: gariyās tu yadi savyaṇjanaṁ bhavet: laghu savyaṇjanaṁ hravam: laghīyo savyaṇjanaṁ ṛte.*

³ Except in an interpretational quibble by Patañjali (discussed by Konow, op. cit., p. 310).

lent to 1 mātrā and a heavy syllable to 2 mātrās.¹ That the two uses of the term have nothing in common is recognized by the author of the Vṛttamuktāvalītarāla, a manuscript work quoted by Varma, whose translation I take the liberty of reproducing:²

By a conventional tradition the quantity of a long syllable is measured as two moras, which are attributed even to the pluta vowel (that has three moras). In the same way, although the quantity of a consonant is a half-mora, a syllable ending in a consonant is measured two moras. That a consonant should not increase the quantity of the syllable is due to convention.

The last sentence is reminiscent of the remarks of the RP quoted above.

It is most unfortunate that the term mātrā should have been employed at two different but related levels of analysis. The confusion is ultimately traceable to the equation of syllable with vowel, and the extension of the single term aksara to cover both.

3.24. Tone (svara)

The Indian authorities recognize the existence of three tone-classes in Vedic:³

'There are three tones, udāṭta, anudāṭṭa, and svarīta';⁴ udāṭṭa means literally 'raised', anudāṭṭa 'unraised', and svarīta 'intoned'. These are described by the AP as follows:

In a given register a syllable with high tone is udāṭta, with low tone anudāṭṭa and with falling (ākṣipta) tone svarīta; the first half of the svarīta is udāṭta.⁵

The literal meaning of ākṣipta is 'cast down'. The description given in the VP reads:

The udāṭta is high, the anudāṭṭa low, and the svarīta a combination of the two; ... the first half of the svarīta is udāṭta and the latter part is made to fall (prāṇihanyate).⁶

¹ Cf. Pingala, Ch. S. i. 9 ff., with Halāyudha's comment.
² p. 89.
³ The TP appears further to have observed the neutralization of tonal distinctions in whispered speech (xiii. 4–11; cf. Pike, Tone Languages, p. 34).
⁴ PŚ 11. udāṭtal evaṁ udāṭṭaṁ ca svarītaṁ ca svarītāṁ trasyaḥ.
⁵ i. 14–17. samām yām kṣaram uccair udāṭtam; nīcair anudāṭṭam; ākṣiptaṁ svarītam; svarītasvādito mātrārdham udāṭtam.
⁶ i. 108–10. uccair udāṭtaḥ; nīcair anudāṭṭaḥ; ubhayavānt svarītaḥ.
126. tasyādīta udāṭtam svarārdha-mātram.
iv. 140. svarītasya cattāra deśaḥ prāṇihanyate.
and in the TP:

The udāta is high, the anudāta low, and the svarita a compound
tone... It begins at the level of the udāta and the rest is at the level of the
anudāta: so say the teachers; some say it is a continuous fall (pravana).¹

The term pravana means literally 'downhill slope', i.e.  

An exception is provided by the RP, which states,

The first ¼ or ¾ mātrā of the svarita is higher than the udāta: the rest
is anudāta.²

This statement suggests a relation of udāta : svarita : anudāta
somewhat as follows:  \( \overline{\text{udāta}} : \overline{\text{svarita}} : \overline{\text{anudāta}} \); and this is supported by the peculiar
system of tone-marking employed in the texts of the RV, where
the svarita, and not the udāta, is indicated by a vertical stroke
above the syllable;³ thus a word such as agnīnā as, where the order
of tones is anudāta—udāta—svarita, is marked agnīnā as, the
medial udāta syllable being unmarked. This peculiarity of mark-
ing is also followed by the AV and by certain texts of the YV;
elsewhere in the YV the marking is in accordance with the pre-
scribed realization, e.g. agnīnā as.

For the svarita we find various other terms occasionally em-
ployed, for example, in the TP 'devi-yama', i.e. 'of two pitches',⁴
and in the RT 'un-nica', i.e. 'high-low';⁵ the Nāradī Śikṣā says of
the svarita that it is pronounced 'between the udāta and the
anudāta' (udātān udātā-madhya),⁶ a description that is reminiscent
of the marking found in the texts of the Sāmadeva, where the
udāta is marked with a figure 1, anudāta with 3, and svarita with
2 (e.g. agnīnā as).⁷

The svaritas are phonologically divided into two main sub-
classes, the so-called 'independent' and 'dependent' (or 'enclitic').
The former is generally explained as the result of a coalescence of
an udāta with an anudāta syllable (e.g. \( \overline{\text{udāta}} + \overline{\text{anudāta}} = \overline{\text{udāta}} + \overline{\text{anudāta}} \)).

¹ i. 38–40, 46–47. uccair udātāh: nīcār anudātāh: samāhārāh svaritāh (cf.

⁴ xīx. 3.
⁵ 54.
⁶ SS, p. 412.
⁷ Cf. Varma, 'Studies in the Accentuation of the Sāmadeva', Proc. VI All-
the latter is a variant of the anudātta immediately following an udātta—as Panini puts it:

After an udātta a svarita is substituted for the anudātta.¹

The close phonetic relationship of the independent and dependent svaritas, however, is not denied,² and in some texts we find independent svaritas indicated, like the enclitics, by an udātta on the preceding syllable.³ In both cases it seems certain that its description as a 'falling' tone was justified, whether it represented the glide from one 'register' tone (udātta) to another (anudātta), or an independent 'contour' tone (to use Pike's terminology).⁴ The statements which refer to the first ½ mora as high and the remainder as low are probably speaking not in phonetic but in a type of phonological terminology that is prophetically redolent of Prague.⁵

It will have been noted that the AP, in describing the udātta as high and the anudātta as low, made the important specification, 'within a given register'; the pitches, that is to say, are relative and not absolute—a point which is specifically made by Patañjali:

The terms 'high' and 'low' have no absolute signification.⁶

To quote a modern parallel,

It is the relative height of the tonemes, not their actual pitch, which is pertinent to their linguistic analysis.⁷

Certain of our treatises attempt to give some account of the physiological processes whereby the tonal distinctions are effected. The RP's statement is as follows:

The three tones are udātta, anudātta, and svarita; they are effected by tenseness, laxness and 'ākṣepa' respectively.⁸

¹ VIII. iv. 66. udāttād anudāttaya svaritah. Cf. TP xiv. 29, udāttāt paro 'anudāttaḥ svaritam. Upālekha viii. 7. udāttād anudāttam svāratet....
² Cf. Wackernagel, Ai. Gr. i, § 249. But for various nuances, which we can scarcely hope to interpret, cf. TP xx. 9–12; VP i. 125.

⁴ Tone Languages, pp. 5 ff.
⁵ Cf. Trubetzkoy, Principles, pp. 204 ff.; Martinet, Phonology as Functional Phonetics, pp. 16 ff. ('If... we make use of the concept of mora, we can consider all melodic tones as successions of two punctual tones and thus reduce the number of distinct prosodical units...'); Jakobson, 'Die Betonung und ihre Rolle in der Wort- und Syntagmaphonologie', TGLP iv. 164 ff. On the limitations of this technique, cf. Martinet, Lingua, t. i. 51.
⁶ i. 2. 1, on Pāṇ. i. ii. 29–30 (Kielhorn, i. 207). idam ucca-nīcam anavasthitā-padmārthaham.
⁷ Pike, Tone Languages, p. 4; cf. Phonetics, pp. 27 ff.
⁸ iii. 1. udāttād cānudāttād ca svaritād ca trayāḥ svarāḥ 
dyāma-viśrambhākṣepān tā ucyante.
The term 'ākṣepa', 'casting down', has already been encountered and can hardly be related to a physiological basis: the other terms, however, are extremely suggestive of a reference to the state of the vocal cords, and this is in fact borne out by the explicit statement of the Pārī-Sīkṣā, examined by Varma, as also by the corresponding passage in the TP:

The high tone is effected by tension, hardness and constriction of the glottis; the low tone is effected by laxness, softness and widening of the glottis.

These statements are not so very remote from a modern description such as that of Forchhammer:

Im Mittelregister können wir die Tonhöhe sowohl durch Spannen wie auch durch Abschläcken bzw. Verdicken der Stimmlippen verändern, and certainly do not merit the criticism made of them by Whitney—

There is evidently much more guesswork than true observation in this rule.... There is nothing at all to commend in such a description of the way in which low tone is produced.

Even today the precise mechanism of pitch variation is a difficult and debated topic.

It should here be mentioned that in the musical treatises each octave is referred to as the 'dvīgona' or 'double' of its predecessor, and it would be tempting to conclude from this that the authors were further acquainted with the theory of vibrational frequency-ratios; this interpretation is invalidated, however, by the commentator's statement that 'double' means simply 'double in effort'.

The west is thus here in advance of the east with Euclid's observation:

Of the sound-movements some are of higher and some of lower frequency: the high frequencies produce sharp sounds and the low frequencies deep sounds.

8 *Sextio Comment. 23* (M). Tous δε κανάων αδ μεν πυκνότεραι ελκν, αδ δε ορνύτεραι, και αδ μεν πυκνότεραι δευτερον πολούσα τον δοκειναν, αδ δε ορνύτεραι βαρύτερον.
If the ancient linguists employed any graphic method of indicating tone, it has (apart from the orthographic systems of our texts) been long since lost to us; but we have something closely parallel in the manual gestures prescribed to accompany recitation of the Vedic hymns. We in fact find the terminology of these prescriptions to be related to that of the phonetic accounts. The root krip-, 'to throw', which was used in the phonetic description of the svarita appears also in the gestural terms ārdhva-kṣepa and adhakṣepa, 'throwing up' and 'throwing down', referring to the manual gestures accompanying the udātta and anudātta tones respectively: the gesture for the svarita is said in this case to consist of a combination of the two.¹ The verb prañihanyate, 'is made to fall', likewise used in the phonetic description of the svarita, again appears in the description of the gesture accompanying it.² Uvaṭa, commenting on the RP's phonetic use of 'ākṣepa', had equated it with 'tiryaγ-gamana', 'a moving across',³ and this term also appears in the gestural section of the VP, where Kāṇva is quoted as teaching that for one type of svarita the hand is to be moved 'across and downwards', i.e. diagonally downwards. It thus appears probable that some of the tonal terminology is really based on gestural movements, which are of course related in turn to the kinaesthetic and acoustic phenomena.⁴

The Vedic tonal system has left little if any trace in the modern Indo-Aryan languages.⁵ Haug, in a study of contemporary Vedic chanting, claimed to have found the ancient tonal system preserved (a svarita, for example, being sung on two notes of which the first was the higher); these claims cannot be accepted, however, without further investigation.

Greek, like Vedic, had preserved the Indo-European tonal system with considerable fidelity, and it will be of some interest to

¹ Yājñ.-Ś. 58; Rāmaśāman on Pratijñā S., ed. Weber, p. 92. Cf. Uvaṭa on VP i. 121. tatrođattē ārdhva-gamanaṃ hassetya anudattē 'dho-gamanaṃ hassetya...
² VP i. 124. rjum nihatya prañihanyate udattē.
³ On RP iii. 1. ākṣepo nāma tiryaγ-gamanaṃ.
⁴ i. 123. anudattām cet pūrvam tiryaγ nihatya Kāṇvasya; cf. i. 122. The term is also used in a gestural sense by the Abhinayadarpana (200); in a phonetic sense it appears in the SB (xi. iv. 2. 7. Mādhyā. atha haitat tiryaγ: yo 'yam vāyuṣatātottattē tātvatā nidadhyāt...).
see to what extent the parallel systems have given rise to parallel
descriptions by the native authorities. As regards the high and
low tones, the Greek writers are agreed in according to them the
titles ὀψι, 'sharp, acute', and βαρύ, 'heavy, grave', terms which are
parallel to the Sanskrit udātta and anudātta. For the compound
tone we find the terms διόνος, 'of two tones' (comparable with the
dvi-yama of the TP) and ὀψιβάρεια, 'acute-grave' (comparable with
the un-meca of the RT); the common traditional term is περισσώ-
μένον, 'bent round, circumflex', but according to a Byzantine source
this term referred simply to the graphic prosodic symbol and was
substituted for ὀψιβάρεια by the great Alexandrian grammarian,
Aristophanes of Byzantium, when he changed that symbol from
' to '; the same source also provides a phonetic description which
parallels that of the Indian svarita, viz., that for the 'circumflex' the
voice starts at the acute pitch and falls to the grave, thus constitut-
ing a combination of the two. Dionysius Thrax distinguishes
various types of 'circumflex', which are further subdivided by
Glaucus of Samos, but, as in the case of the Indian descriptions of
particular sub-categories of svarita, their precise identification is
impossible.

Regarding the physiological processes of tonal differentiation,
Glaucus provides a parallel to the Indian sources when he de-
scribes the acute as ἑπτατομένη, 'tense', and the grave as Ἀνειμένη,
'lax'. We may also note that for tone in general the Greeks use not
only the term προσωπία (‘tune’ = L. accentus, equivalent to Skt.
svara) but also τόνος (‘tension’).

The Greek sources also mention a further type of tone, the μέσον
or 'middle tone'; the identification of this with the circumflex,
as assumed by many scholars, can hardly be supported in view of
the fact that we find them mentioned as distinct categories within
individual statements. The 'circumflex' tones referred to by our
authors are those which we find marked as such in our texts,
and these are all in the nature of 'independent' tones (cf. the 'inde-

ὅτι ὅτι καὶ τὸ βαρύν ... .
3 The etymologically equivalent Skt. tāna is used only in the sense of 'mono-
tone' (cf. Uvata on VP i. 130; Rāmaśārmān on Pratiṣṭhān Sūtra 8; Weber, Ind.
St. x. 423 ff.).
dependent svarita' mentioned above); but on the evidence of Greek musical fragments Professor Turner has long since made the observation that,

When a long unaccented vowel was sung on two notes, there was a tendency... in the case of those following an accented syllable to make the first the higher. This is in agreement with what we may surmise to have been the nature of the vowels following an accented syllable from a comparison with the Vedic accent;¹

the unmarked syllable following an acute was thus equivalent to the 'dependent' or 'enclitic' svarita of Vedic. It seems reasonable to proceed, with Grammont, to identify this tone with the μέοοι of the Greek authorities:

Ce ton figure toujours à côté de l'aigu; c'est qu'on ne peut pas retomber de l'aigu au grave par une chute dépourvue de durée, mais par un état intermédiaire, qui partant de la hauteur de l'aigu arrive progressivement à celle du grave... Le μέοος est exactement l'équivalent du ton que les Hindous appellent svarita (descendant) et qui est intermédiaire entre l'udātta (haut, aigu) et l'amudātta (non haut, bas, grave).²

Sturtevant's objection that 'intermediate' would be a peculiarly inept name for an accent which contained within itself both the extremes' loses much of its force in view of the description of the svarita by the Nārādī Śikṣā (viz. udāttāmudātta-madhye) and the marking-system of the Sāmaveda (see above).³

3.3. Tempo
It will be appropriate to conclude the discussion of synthesis with a feature which is pre-eminently related to the major units of utterance. The following statement on the subject of tempo appears in the RP:

There are prescribed three speeds of utterance—reduced, medium and rapid; for repetition one should employ the rapid speed, for recitation the medium speed, and for the instruction of pupils the reduced speed.⁴

This recognition of the pedagogical function of the 'reduced' tempo (vilambita) finds an echo in Paul Passy's '...pronociation fami-

¹ Class. Rev. xxix, 1915, p. 196.
² Phonétique du Grec Ancien, p. 388.
³ Cf. also Vendryès, Traité d'Accentuation Grécoque, § 45, 'Le mot μέοος signifierait alors ici non pas intermédiaire... mais combiné des deux.'
⁴ xiii. 46, 49. tiro vyttir upadiantani vāco vilambitām madhyamāṁ ca durdān ca: abhyāsārthe durdān vyttir pratyogārthe tu madhyamāṁ sīsyānāṁ upadeśārthe kuryād vyttir vilambitām.
rière ralentie", que je tiens pour spécialement convenable à l’enseignement. But of greater interest would be a recognition of the significance of tempo as a linguistic category; in addition to important semantic functions its consequences are evident at all levels of analysis, and modern linguistics must sooner or later find appropriate measures for its description. The V S does in fact go so far as to observe that the medium speed is the basis for the establishment of phonological length-distinctions. In this, as in so many of the matters discussed, the Indian pioneers have pointed the way for future research; the details of their work are such as often to evoke the comment,

\[ \text{nihil est iam dictum quod non dictum sit prius} \]

—their principles are such as may inspire us to disprove it.
