Q. I suppose Government said that if any forest becomes reserved, you had no right, and your contention would be that at the time of your agreement these things were unreserved and you should be compensated?—A. Yes.

Q. Not alluding now to the question of the agreement, but to the point you raise that people are not allowed to work because they are reserved for game, what reason did Government give for reserving these areas? They don't say they reserve them for game?—A. They call them 'game sanctuaries' in letters to me.

Q. That is done in other parts of India, because they say that game is over-shot in certain areas and they keep certain game sanctuaries. Do they allow any exploitation of timber in those areas?—A. No, but in other reserves they do.

Q. They don't allow any cutting at all?—A. No. There are immense quantities of cane in those areas, which was stopped; cane for basket making, binding, etc.

Q. Aren't there other areas around which are equally convenient?—A. No, this sanctuary takes up the whole river frontage for about 60 miles.

Q. At the back of this area are there no other forests?—A. The main road of Assam runs on the south side, close to the Meka Hills, and practically there are no forests there; there are bamboo forests.

Q. Up and down the river from this reserve, what forests are there?—A. No first-class timber in the whole area; but there is a considerable quantity of *sal* and other trees

which would be suitable for box-making. Mr. Hill, to whom I applied, gave me sanction to cut in the reserves, but the next officer came and cancelled it, for the reason that there was a case made by the forest officers against some of my men for felling timber illegally, but that case was not proved. The Conservator then said that, pending the decision in that case, he could not grant me permission to fell timber. From that I inferred that after the case was settled, I would have received back the permission given by Mr. Hill, but it was not so.

Q. About these elephants; you say they are unobtainable owing to 'mela shikar' hunting being stopped?—A. Since that was written, 'mela shikar' hunting has been re-opened.

Q. What does this 'mela shikar' hunting mean?—A. Catching elephants by means of lassoing.

Q. In what way is that better than the 'kheddah' operation?—A. They catch in Keddahs old breeding animals with the result that it does harm to the propagation of the species.

Q. Alluding now to the rows in which your contractors are concerned, to what do you consider these rows are attributable?—A. I think the underlings in the Forest Department very often cause these rows from disappointed hopes.

Q. Is the box royalty system still going on?—A. Yes.

Q. And the trade permit system is not going on?—A. The trade permit system is not adopted by the saw mills, because the difficulties in the way are very much greater than the arrangements we have with Government for obtaining timber and paying royalty. But it would be preferable if it could be worked on more businesslike lines to have the trade permit system, because we would be free from all this interference.

Q. Is any dredging or draining of rivers, important from the business point of view, undertaken by the Forest Department?—A. I have not seen any attempt made.

Q. Have they been surveyed with a view to training operations?—A. Not to my knowledge. The snags used to be cut to admit of small steamers going up; but since they have discontinued using steamers in that river, it is choked with snags.

Q. Do you do anything yourself in the way of improving the rivers you are working on?—A. My men have had to clear it to let their rafts pass; but that is only to suit their immediate necessities.

Mr. A. Chatterton.—Q. We have not had the advantage of seeing any of the saw mills in Assam. Could you tell us what sort of equipment you have got in your saw mills?—A.—The following is a list of machinery in the Tezpur Saw Mills:—

- 30 H. P. Lancashire boiler.
- 8 H. P. Vertical boiler and engine.
- 6 H. P. " "
- 25 H. P. horizontal engine.
- 1 Breaking down saw.
- 6 Circular saws.
- 3 Cross cut saws.
- 2 Planing machines.
- 1 Saw sharpener.

Q. Do you work the boiler with the refuse from the saw mills?—A. Yes, as much as possible, using a good deal of dry sawdust.

Q. Have you to use coal?—A. A little, not a very great quantity of coal; about 5 maunds of coal a day.

Q. What does coal cost at Tezpur?—A. Annas ten and pies six a maund, Assam coal.

Q. How was the price of boxes fixed before the war?—A. There is a recognized price. We are not under any necessity to give boxes at a fixed price, but it is a practice generally adopted by other mills. There is a recognized tariff adopted from the time the mills started, and they did not alter it.

Q. What proportion of the boxes used in Assam are made locally, and what proportion are imported?—A. I should think only a very small percentage is made locally. Local boxes are considerably cheaper.

Q. Are they inferior to, or of the same quality as, imported boxes?—A. They are not as good, but they serve the purpose equally well.

Q. Why do you complain of having to pay so much for your timber from the Forest Department, when you can recover the amount by raising the price of your boxes?—A. The box business is entirely in the hands of agents in Calcutta, and they supply the gardens with the boxes they think best.

Q. Is there a perfectly free market for boxes locally made. You were turning out twenty or thirty thousand boxes a year, which is a very small proportion of the boxes wanted. If you turned out 100,000 boxes a year, would you be able to sell them easily?—A. I think so. We can turn out 100,000 boxes if we had the material.

Q. Supposing you had 100,000 country-made boxes, would you have a free market for them?—A. Yes, there would be no difficulty about selling them at low prices.

Q. But you would not be able to get anything like the price of imported boxes?—A. I don't know; I suppose if they could not get imported boxes, they would have to pay the price.

Q. The managers of tea factories are paying a higher price for imported boxes than for locally-made boxes. Are they not oppressing you just as much as the Forest Department?—

A. The reason is that they cannot rely upon the local box mills, because the timber supplies are so uncertain.

Q. You mean rely on the quantity or quality?—A. For quantity, in regard to the fulfilment of contracts, all the mills are the same.

Q. What area was covered by the leases to cut timber you were given in the four districts you have mentioned?—A. We were then allowed to cut timber within a mile of the banks of the river.

Q. How many hundred square miles would that amount to?—A. I could not say without the map. Probably about 50 square miles in one district. From the river it would be that area, but there is not much timber on that. The timber is very widely scattered.

Q. Your saw mill I suppose is on the banks of the river?—A. Yes.

Q. Have you done anything at all in the way of boat-building? Have any attempts been made to introduce better methods of boat construction than are prevalent here?—A. No.

Q. You complain that there is a royalty of 5 annas per cubic foot on first class timber. What is the value of first class timber per cubic foot?—A. I believe it is sold here at Rs. 2-4-0 per cubic foot.

Q. What timber would that include?—A. Sal, and different kinds of wood; very hard woods.

Q. In regard to the game sanctuaries, you say, "The cultivators have been expelled from these areas, and traders prohibited from operating within them." You mean that actual cultivators were turned out of areas?—A. There was a good deal of mustard grown in it. These people were all driven out.

Q. Had they got *pattas*?—A. Only annual *pattas*.

Q. What do you mean by 'traders prohibited from operating'?—A. These people take the *mahul* and obtain large quantities of cane from there, which they use for making baskets for tea gardens.

Mr. C. L. Low.—Q. Were cultivators also turned out from all forests, whether game sanctuaries or not?—A. Personally I cannot say that. I know in the Kasarunga they were turned out. I could not say, except from hearsay.

Mr. A. Chatterton.—Q. Then you complain of the Local Boards being compelled to take scantlings from the Forest Department. Do you think it unfair that Local Boards should be allowed to utilise local resources in the cheapest possible way?—A. It does not affect me personally, but I have been asked to bring this forward, and think it is unfair.

Q. You say that in most of the saw mills at the present time the "present machinery is obsolete or in an unsatisfactory condition."—A. It does not improve.

Q. Most of these mills have been established for a considerable time?—A. Yes, for over 25 or 30 years. They have been adding to the machinery, as saw machinery is susceptible of renewal.

Q. With abundant forests around you, why are you not able to manufacture boxes to meet competition from abroad; and why is it that you cannot keep your mills up to date and turn out a satisfactory article?—A. Because we cannot get the timber.

Q. What is the difficulty? You had a concession you say for cutting timber from 1900 to 1909. Is it the natural difficulties of the country or artificial difficulties introduced by the Forest Department?—A. What I complain of is the interference of recent years.

Q. I am talking of prior to recent years?—A. I had no reason to complain up to 1909. We were making a fair profit.

Q. But you did not keep your saw mills up to date?—A. I don't know what you exactly mean by that.

Q. I am taking your own statement that the mills were not up to date.—A. I simply say the machinery is to some extent obsolete, but it does not follow that it does not work.

Q. Are the saw mills owners utilising the resources they have got in the best possible way, or owing to the fact that they have got inferior machinery are they wasting a good deal of material which might be used; and consequently since they are not making a profit are they not inclined to attribute their lack of success to irrelevant or minor causes, such as the forest regulations?—A. I don't agree with you in that. The same machinery that was in vogue 20 years ago is still supplied by the manufacturers. There have not been any great alterations. The same saw that was used 20 years ago is still used, and is still supplied by manufacturers.

Q. Have you any hand saws in Assam?—A. I believe that there are two, but hand saws are not suited to our work at all. The timber we get is dependent entirely on the ability of the elephant to get it out of the jungle.

Q. You cut up your logs in the jungle?—A. Yes, we are limited to certain sizes and lengths, and if you want to use hand saws profitably, you must have long lengths of timber.

Q. One of your difficulties is the difficulty of extraction?—A. Yes. We have no roads in the forest, and we even have difficulty in getting permission from the Forest Department to make the roads and extract the timber.

Sir F. H. Stewart.—Q. You say, "Sir Archdale Earle has shown some interest in the industry, and deputed a special officer to improve timber supplies." Can you give us the name of this officer?—A. Mr. Perce.

Q. You then say, "He was succeeded by an officer from Burma". Who was he?—A. Mr. Tottenham.

Q. With reference to your remarks on the insufficiency of transport facilities, is there an engineer attached to the Forest Department in this province?—A. No, not to my knowledge.

Q. Is there anyone with commercial experience or training?—A. I don't think so.

Q. You say, "At present Darrang Division is being run by an officer with no experiences or technical knowledge. His office is situated 25 miles from the station." What station is that?—A. Tezpur.

Q. Has his office always been 25 miles from the station?—A. No, it was always in Tezpur within the last 2 years.

Q. Who is this officer?—A. Captain Neville.

Q. With reference to Mr. Chatterton's question about the area from which you are permitted to extract timber, you share that area with other mills?—A. Yes.

Q. You say that Mr. Hill permitted exploitation of forest reserves, but his successor withdrew sanction. Who is his successor?—A. Mr. Carter.

Q. The present procedure is that if you have trouble with the Forest, the appeal lies only to the Chief Commissioner?—A. Yes.

Q. The District Officer cannot intervene at all, unless he is specially deputed by the Chief Commissioner, and that you would like to see altered?—A. That has since been altered by the Chief Commissioner. He has given me an assurance that that will be done.

Q. The case you cite of the prosecution of a contractor, was he one of your contractors?—A. Yes.

Hon'ble Lieutenant-Colonel P. R. T. Gurdon.—Q. This new agreement which you speak of, under which the Boduti mill work, what is the date of the agreement?—A. I believe it is 1915.

Q. Have you got a copy of the agreement here?—A. Yes, I have a copy of the general agreement.

Q. The point is, does it convey any monopoly?—A. No, it says no monopoly.

Q. In the area where the Boduti mills now cut, any one else can cut, if they pay the royalty to the Forest Department?—A. No, the Forest Department object.

Q. You remember that when I made the enquiry into your case in March 1917, I suggested with reference to this dispute, as regards the area under which you should cut, that you should be allowed to cut as far as the Subansiri River up to the right bank of the Subansiri River, as far as the Bodeobam Tea Garden. Do I understand that you were prepared to accept the compromise I suggested at the time, in settlement of this dispute with the Forest Department?—A. It was less favourable to me, but I agreed in the presence of Mr. Tottenham to accept your decision in the matter, but Mr. Tottenham refused.

Hon'ble Sir R. N. Mookerjee.—Q. Besides yourself, are there any other saw mills that have similar complaints against the Forest Department?—A. I cannot say, but I know they are not satisfied with the arrangements of the Forest Department.

Q. They have not suggested any remedy?—A. We did get up a petition some 2 years ago, but it was not brought forward, because, as I have mentioned, the royalty was remitted. There were other points brought up in regard to the general methods of the Forest Department.

Q. Your complaint is mostly personal rather than against the general rules of the department?—A. My complaint is that the methods are not practical; that they require revision; and I think it is also impossible to expect an inexperienced and untrained officer to give sufficient attention to matters especially when he is employed as a political officer in addition to his duties.

Q. But other saw mill owners do not make that complaint?—A. I understand that question would arise, but the managers of saw mills are not inclined to have disagreements with Forest officers, because the mills are dependent on the Forest Department. I am in a

position that I can have disagreements without such fear. I know perfectly well that other people who use forest produce are simply afraid of reprisals.

Q. Have you approached your Forest officers in a friendly way, pointing out that their methods are not workable methods?—A. Some of the officers are hostile and some are friendly. As a rule we find the Forest Officer very sympathetic and willing to help us but we occasionally have some who are not so.

Q. Then it comes to this that if a good man is there, everything goes right.—A. Yes, a trained officer is a gentleman who has some sympathy with industries; otherwise we suffer.

Mr. C. E. Low.—Q. Your great competitors all the time were the makers of 3-ply boxes, like the Venesta?—A. Yes.

Q. It was claimed on behalf of those boxes that they were lighter and more approximately damage-proof than ordinary shooks. Did you ever make any attempt to compete by turning out 3-ply Venesta boxes?—A. No, because it requires immense capital.

Q. You know that Bird & Co. claim that they are going to open shortly there?—A. Yes.

In reply to a question from Sir R. N. Mookerjee, the witness stated that one reason given for the appointment of a political officer as a Forest officer was that, owing to the shortage of Forest officers, no one else could be appointed. The witness suggested that the Forest officer of Kamrup should work Darrang, as was formerly the practice, from Kamrup, when there was a shortage of officers, but that was not considered feasible. He then suggested that some of the numerous Indian officers, who were properly trained men, should be appointed. There were numbers of those men available, and one especially, Kanjilal Bahadur, acted for many years in Sibsagar. The witness thought that such a precedent was sufficient to show that that could be adopted.

Hon'ble Sir R. N. Mookerjee.—Q. What reply did you get to that?—A. No reply whatever. The present officer is inexperienced in forestry and he has got other duties of a political officer which take him away the whole year practically, and he spends very little time in the district.

Q. If I remember right, you once complained against Rai Bahadur Kanjilal?—A. It was he who stopped my cutting timber in the Kasiranga reserve. That was the only complaint I had against him, and the case that was made against some of my people for some forest offence.

Q. The Government could not possibly again put that man in charge of the forest in your working, when you complained against him.—A. That was not a serious complaint. Colonel Gurdon settled the complaint.

Witness subsequently sent in the following letter regarding the agreements entered into by him with the Forest Department.

Dated Tezpur, the 9th January 1918.

From—O. A. BYRNE, Esq., Proprietor, Tezpur Saw Mills,

To—The Secretary, Indian Industrial Commission.

I have the honour to request that favour of the following being placed before the Commissioners.

2. It occurs to me that my explanations regarding the various agreements entered into by me, with the Forest Department, may not have been quite clear, I therefore wish to place the matter beyond the possibility of misunderstanding.

3. The agreement of 1900 was executed, at the instance of the then Conservator, as he did not consider the contract with the previous owners valid, after sale of the mills to me. A new one was accordingly executed on the 25th July 1900.

4. In 1910 I was warned that, unless I executed another agreement for Inkimpur, I would not be allowed to utilise timber from that district. Under this pressure, and strong protest, and as a matter of expediency, I executed an agreement, much less favourable to my mills, on the 13th December 1910.

5. On the 13th February 1913, it was notified that the agreement of 1910 would terminate in 12 months' time, when a new form of agreement would be introduced.

6. On the 13th February 1914, I was informed the new agreement was not ready, but that I could continue to utilise timber until such time as it was.

7. In February 1916, I learnt that the new agreement had been executed simultaneously, in the previous September, by Meekla Nuddae, Sissi, Boduti, Hopewell, and Halkutta, saw mills.

I at once communicated with the Forest Department, and after several months, an agreement form was sent to me for execution. Finding the areas allotted to me were not the same as those agreed to by Mr. Perree, the Conservator deputed to arrange the timber supplies, and which had been approved of by the Chief Commissioner. I called attention to this, and to the fact, that the areas allotted to me had already been heavily exploited by the

neighbouring mills, that they contained no timber within $1\frac{1}{2}$ miles of river, which was impracticable for floating during 7 months of the year. I made repeated applications for the areas to which I was entitled, but was refused, and ordered to fell no timber unless I executed the agreement. Under the circumstances I had no other course open to me but refer to the Chief Commissioner. For adopting this procedure, which I did most reluctantly, I have been designated quarrelsome and contentious.

The Chief Commissioner ordered an inquiry by Colonel Gordon, who proposed a settlement to which I agreed, although less favourable to me than I considered I was entitled to. The Conservator (Mr. Tottenham) refused to acquiesce. The matter is consequently still pending, and in the meantime my timber supply is cut off, while only sufficient can be obtained from the other districts, to keep my mills going quarter time, when every possible box is required by the tea gardens.

8. One of the Commissioners inquired about our areas of exploitation, but as I did not anticipate being questioned on this subject, my replies may not have been as lucid as desirable. However the following should remedy this:—

In Darrang District, we have been allotted a block of about one square mile in area. This is quite inadequate, but we have been refused another block.

In the unreserved forest we are allotted the right bank of the Borelli, but as it contains no timber of prescribed size, within extractable distances from the river it does not count.

In Nowgong we have been given a block of 2,200 acres, but it does not contain a single tree within $1\frac{1}{2}$ miles of river of prescribed girth.

In the Sibsagar District we work under the 1900 agreement. There is some timber in this district, but not sufficient to give employment to the number of contractors required to keep the mills going full time.

In Lukimpur we are not allowed to work, pending a settlement with the Local Government.

This is the only district in Assam containing suitable box timber, *vide* the "notes" of Mr. Pearson, Imperial Forest Service, Dehra Dun, who toured Assam to inquire into tea box and timber supply matters. A monopoly of this district has been given to a small mill which came on the scene years after the Tezpur mills.

9. From the foregoing (which cannot be fairly disputed), it is obvious that facilities for obtaining timber, leave much to be desired, and if the intention to foster industries is genuine, it is difficult to reconcile it with the procedure and methods in vogue.

10. The comments and criticism in the Calcutta and local press show that my views, regarding Forest Department methods, are not singular and clearly demonstrate the necessity for reform and reorganisation, if any progress (industrial) is to be expected.

WITNESS NO. 401.

RAI SAHIB MONOMOHAN LAHIRI, Member, Provincial Industries Committee.

WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

I was a promoter of a Joint Stock Company which was probably the first Joint Stock Company with Indian capital in the Brahmaputra Valley of Assam and have been a director of this Company since its registration in 1896. The principal business of this Company is buying and selling imported and Indian goods; but we opened a manufacturing branch in which we made socks and stockings by power machines and made experiments to see if it was possible to improve the already existing weaving industry of Assam by the introduction of automatic looms and labour saving warping apparatus and to manufacture matches and other articles. I am now running an electric plant as a family concern for the lighting of the small town of Tezpur and a rice mill. My opinions are based on the little experience I have acquired as the director of the Company and by the experiments mentioned above in which I took a prominent part. We started as a private concern with small capital and made good profits, and we had no difficulty in raising the working capital which is at the present moment a lakh and half including the deposits. Most of our shareholders are the clerks and officers.

Government aid is absolutely necessary for the development of industries and all or any of the methods suggested in paragraph 17 of the preliminary notes may be resorted to according to circumstances. Occasional inspections of accounts and plants and machineries are all the control that the Government should exercise and nothing more, except in the case where the Government is a subscriber and in that case the shareholders if they so desire may appoint a Government officer to be a director if qualified according to the regulations of the concern.

Rai Sahib
Monomohan
Lahiri.

Raising
capital.

Government
assistance.

Technical Aid.

For the Province of Assam demonstration factories may be instituted regarding the following and on the lines suggested below :— Demonstration
Factories.

- (a) Weaving by improved looms.
- (b) Silk-reeling and if possible silk spinning.
- (c) Manufacture of matches.
- (d) Electro-plating and typing.
- (e) Sheet metal works with presses and other works that can be done without the use of prime-movers and that require only small capital.

Weaving.—Every woman in the Brahmaputra Valley is an expert weaver. With a little organization the weaving industry can be much improved and the whole Province can be made self-contained in regard to ordinary cotton textiles. The existing appliances and the processes of manufacture are very crude and if left alone the loom in time will be a mere curiosity. That the industry cannot under the present method of working be a success commercially is evident from the following figures :—

The cost of manufacture of a piece of cloth 5 yds. by 42 inches of 40's. warp and 50's. weft on an ordinary hand loom :—

Labour of sizing, reeling when wet, reeling when dry, warping, heddling, etc.

	Rs.	A.	P.
3 days of 8 working hours each at annas 5 a day	0	15	0
Weaving with pirn winding at the rate of 9 inches an hour,	0	12	6
2½ days at annas 5 a day.	1	11	6

Such a piece of mill cloth can be had for Re. 1. The loss therefore is 0-11-6 *plus* the price of the yarn and the size. Even if the efficiency of labour be twice as much, the working will not be profitable. By the introduction of automatic looms such as Hatterley's and Raphaels' the production can be increased 12 times. The preliminary processes from sizing up to heddling now cost as much as a piece of woven fabric. This can entirely be avoided by purchasing readymade warps from the mills at a small extra cost over and above the price of the yarn until a satisfactory and economical method of making warps is found out. The tension of the warp threads of hand made warps is never uniform and there is much breakage involving loss of time and the extra expense for mill made warps will be well spent.

I would therefore propose that a demonstration factory be established in Assam with automatic English hand looms such as Hatterley's or Raphaels' to be worked with ready made warps and with fly shuttle looms to be worked with hand made warps. Mill made warps of short lengths of say 100 yards each are not available now and some arrangement should be made for the supply of such warps. Men trained up in the demonstration factory may start small weaving factories with a small number of power looms driven by oil engines.

Silk-reeling.—This should be done by improved and labour saving reeling machines. Silk spinning from Eri cocoons may also be demonstrated if possible on a small scale.

Manufacture of matches.—There are various kinds of soft wood in Assam and with a little organization a business for the manufacture of matches can be developed. Machineries for the manufacture of boxes for the matches are very expensive and these can be avoided if women and children are trained up to make them. At a suitable station a small demonstration factory may be established with one decortiating, one veneer cutting and one splint splitting machine. The veneers when cut may be distributed among women and children for making them into boxes at home at a certain rate per gross. The splints may similarly be distributed for being tipped. When collected the boxes and the matches may be packed up and offered for sale. An artizan population may thus be built up and factories may be established. There are waterfalls in Shillong and vast pine forests close by and these can be very profitably utilized.

There should be a central demonstration factory with experts for higher industrial training, and the students for these factories may be recruited from the smaller provincial factories. All demonstration factories should be equipped with prime-movers.

Assistance in Marketing Products.

I know from experience that it is very difficult to sell the products of small industries. Sales agencies. Commercial emporia for the sale and display of such products will be of great advantage. These should be established in all the commercially important towns of India under the control and management of reliable persons, or Co-operative Societies. A very small margin of profit will pay the costs of management and advertisements. The hosiery factory referred to in paragraph 1 of these notes had much difficulty in disposing of its products.

Training of Labour.

Training in
demonstration
factories.

Skilled labour is dear in Assam. The ordinary rate of wages of unskilled labour is from 0-7-0 to 0-8-0 annas a day of 8 hours nominal, that of skilled labour such as masons and carpenters is from Re. 1 to Re. 1-4-0 a day; ordinary labourers have neither the ability nor the desire to learn. Boys, who have left the school after a few years' study would not touch the plough nor the hoe, but they would have no objection to work at machines. We may utilize their services in the demonstration factories. There are many women and children who would not come to a factory but would have no objection to work at home. Their services may be utilized in the way suggested in the notes about the manufacture of matches. Demonstration factories may be the training ground, no separate industrial schools are required. These should be under the control of the Department of Industries. Men from the central demonstration factory may be selected to be the supervisors.

Official Observation.

Director of
Industries.

Central Demonstration
Factory.

There should be a Director of Industries for the Province of Assam. A model Director in my opinion is one who is a businessman, a scientist, an economist, an engineer and an expert at the same time. No Imperial Department is necessary. But there should be a central demonstration factory as stated above. This factory should be a bureau of standards for the testing of manufactured articles by its experts and giving certificates, obtaining certificates for articles to be supplied to Government must be compulsory, and the Government should take those articles for which certificates have been obtained if the price be reasonable. As there is no antidumping legislation in India preference should be given to Indian manufactures though the quality may be inferior. There should be a library attached to each demonstration factory and scientific and industrial journals should also be subscribed, these should be available to the public.

General.

The tea and other industries in Assam stand in different positions in regard to freight and price of coal. Government should see if it is possible to place all the industries in the same position.

I am now running an electric plant and I think with a little Government help a business of supplying energy can be developed and all the towns of Assam can be electrified. This will give employment to many youths and facilities to small capitalists to run small mills. In time an industry of the manufacture of electrical goods may be developed.

ORAL EVIDENCE, 7TH JANUARY 1918.

Sir F. H. Stewart.—Q. You give us some of the interests in which you are engaged in 1st paragraph of your written statement. Are you a businessman by profession?—A. I am not a businessman but a pleader. I am director of a joint stock company.

Q. That is the company to which you refer in your statement?—A. Yes. It is the Assam Valley Trading Company.

Q. What is the capital?—A. One lakh.

Q. When was it started?—A. We started it as a private company in 1894 and registered it as a joint stock company in 1896.

Q. Has it been paying dividends?—A. Yes.

Q. What sort of dividends?—A. We pay now nine per cent. We earn about fifteen per cent.

Q. You are a director. Are you the managing director?—A. There is no managing director, but in fact, I am the managing director.

Q. You are running an electric plant for lighting the town of Tezpur?—A. Yes.

Q. Has that been a successful enterprise?—A. My son is a mechanical engineer and he is working it and something is left as a margin.

Hon'ble Sir R. N. Mookerjee.—Q. Are you giving light direct?—A. It supplies light to the bazars and to the people who want it and we charge.

Q. Has Government fixed any rate which you are entitled to charge?—A. No.

Q. You are at liberty to charge any rate you like?—A. Yes, but I charge at the rate of eight annas per unit.

Q. You give light to the public and Government has not interfered with you?—A. Government has given me permission.

Q. To charge any rate you like?—A. Government has not fixed a rate. I can charge any rate, but I charge eight annas a unit.

Q. How many houses are lighted by your electric plant?—A. The whole bazar and some private houses.

Q. And you carry poles through the public streets?—A. Yes.

Q. And you have got permission for that?—A. Yes.

Q. And Government has placed no restrictions?—A. No, except that the plant is inspected by the Inspector of Electricity. He sent a man the other day to inspect the plant.

Q. Is there any Electrical Engineer under the Assam Government?—A. There is one Electrical Engineer for Assam, Bengal and Bihar and Orissa.

Sir F. H. Stewart.—Q. Is the rice mill which you mention in your statement as one of your private concerns prospering?—A. Yes.

Q. Have you any special knowledge of the weaving industry?—A. I know weaving.

Q. You are a practical weaver yourself.—A. Yes.

Q. Have you any association with any co-operative societies?—A. Yes with a co-operative society at Tezpur but that has nothing to do with the weaving industry.

Q. You propose the establishment of a demonstration factory in Assam. Where would you put that?—A. In some central place,—I think in Gauhati.

Q. Communications in Assam are very difficult and would it be easy for people to come from other parts of the province and see that demonstration factory?—A. Yes.

Q. Do you think they would do it?—A. Yes.

Q. Would that be better than travelling demonstrations with simple looms?—A. I do not think that will be possible. If we have a demonstration factory we must have engines and power looms.

Q. You wish this demonstration factory to be a power loom factory?—A. With both power loom and fly shuttle hand loom.

Q. In Assam, weaving is a cottage industry?—A. Yes.

Q. And you want to preserve it as a cottage industry?—A. It is not paying commercially.

Q. Do you think that it is bound to die out?—A. I think so.

Q. Because of the competition of the power loom?—A. Yes.

Q. Really what you want to see in this province is power looms?—A. Yes.

Q. And central factories?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. Is your electric plant driven by steam power?—A. Yes.

Q. No hydro-electric power?—A. No.

Q. How do you get coal?—A. I get Assam coal. It is very expensive. This year the price is ten annas and six pies per maund and the cart hire comes to six pies and therefore eleven annas is the price of a maund. Considering the shortage in weight and also the presence of sand and stone and moisture the price comes to about one rupee a maund.

Q. You do not burn wood?—A. It is not available. There are no transport facilities and the Forest duty comes to about eight annas per cartload. There is no forest close by.

Q. Did you apply for permission from Government when you began to supply electricity outside your own house?—A. Yes.

Q. You got permission from Government to do so?—A. Yes.

Q. Before you supplied them?—A. Yes. Without the permission of Government I could not do that under the Electricity Act.

Q. Were you given any license?—A. There are two sorts of permissions—regular license and simple permission. I do not pay anything to Government. This concession Government has given me.

Q. You must work under certain rules and regulations?—A. I am bound by the Electricity Act and the rules framed under that Act.

Q. You actually applied to Government and got permission before you supplied electricity to people?—A. Yes. If I did not do it it would be an offence.

Q. In that permission Government did not fix any limit as regards what should be your charge per unit?—A. No.

Mr. A. Chatterton.—Q. What is the capital invested in this electric plant?—A. About Rs. 14,000.

Q. How many lights have you got running?—A. I cannot say the number of lights, but the peak load is about 10 kilowatts.

Q. You told Sir Francis Stewart that you wanted the handloom weaving and the associated cottage industry abolished and that you wanted to prepare the way by introducing factory organisation?—A. Yes.

Q. Why?—A. Because handloom industry is not very profitable. There are few Julaha whose earnings exceed ten rupees a month each, while an unskilled labourer earns seven to eight annas a day.

Q. They are weaving cotton cloth?—A. Yes.

Q. But up here most of the weaving is in silk?—A. Both cotton and silk.

Q. But most of it is in silk?—A. It is only in Kamrup that most of it is in silk.

Q. There are lots of cotton weavers?—A. They do not sell. They make for themselves.

Q. You suggest that Hattersley's or Raphaels' hand looms should be introduced. Have you any practical experience in working them?—A. I have got a Hattersley's loom and a friend of mine in Tezpur has got a Raphaels' loom.

Q. Do you keep them regularly at work?—A. I could not work because hand made warp was not suitable for Hattersley's. We could not make satisfactory warps in Tezpur.

Q. What kind of warps could you make in that place?—A. We had Hattersley's warping apparatus, but we could not make good warps.

Q. So you recommend looms although you have not given a proper trial to them?—A. I have given a proper trial. I had some ready made warps from England and I tried them and they were very good. I made warps myself and the breakage was tremendous.

Q. Do you find that the Assamese weaver can work these mechanical looms.—A. Yes. They are not complicated. They may require supervision.

Q. Are you working these two looms now?—A. No.

Q. How long did you work?—A. One loom had been working for three years and another for one year. Then we gave them up. It was not profitable to work with hand made warps.

Q. You recommend after three years' experience that somebody else should take them up?—A. That is why I suggested that mill made warps should be supplied. I wanted to have ready made warps but I could not get any in India.

Q. Have you any experience of silk industry in this part of the country?—A. No.

Q. What do you mean by "sheet metal works with presses and other works that can be done without the use of prime movers and that require only small capital"?—A. Tea is manufactured here and if we want to sell it we must have tin boxes. We can also press utensils from brass sheets.

Q. You want a tin plate plant set up?—A. Yes.

Q. And presses?—A. Yes.

Q. Do you think you can press in machines worked by hand with a small capital?—A. I think not.

Q. It is merely a general expression of opinion?—A. Yes.

Mr. C. E. Low.—Q. You say you were making socks and stockings by power machines. Do you still do that?—A. We have given that up because we could not compete with Japan.

Q. Did you give that up before the war or during the war?—A. Before the war.

Q. Have you tried knitting silk on those automatic machines?—A. We tried Assam silk but we could not knit because the thread was not sufficiently uniform.

Q. Have you tried to get silk thread from Bombay mills?—A. No.

Q. The trouble here as regards silk is the irregular quality of the locally made thread?—A. Yes.

Q. I have observed that the weavers use Assam waste which has been spun up in the Bombay mills. You did not try any Bombay silk mill?—A. No.

Q. As regards the idea of getting mill made warps from the mills you know that the mills make only a large quantity of one kind of warp and they do not make a small quantity of each of the different kinds of warps. Can you give them a large order for uniform types of warps?—A. Generally we want warps for dhoties and sarees of short lengths.

Q. And they are pretty uniform?—A. Yes.

Q. What mills would you bring these mill warps from, from Calcutta?—A. Yes.

Q. Would your sizing keep good all the time?—A. Re-sizing would not be necessary, I think.

Mr. A. Chatterton.—Q. Have you tried it?—A. Yes, I got warps from England.

Q. What length?—A. 200 yards each.

Mr. C. E. Low.—Q. You say at the end of your note, "The tea and other industries in Assam stand in different positions in regard to freight and price of coal." Do you mean that railways or steamers charge lower freights for tea than for other articles?—A. All stores for tea gardens are charged two-thirds of the ordinary rate by the steamer Companies.

Q. And tea itself?—A. They have a special rate.

Q. What do you mean by ordinary rate?—A. The same article if it is meant for tea gardens is charged two-thirds of the rate which it would be otherwise charged. The same thing with coal. Coal is ordinarily sold at one rupee a maund, but if anybody has a big contract for coal, whether it is for tea or anything else, they supply coal at the rate of 0-10-6 per maund.

Q. One sees here that difficulties arise when somebody tries to encourage particular industries by special freight rates. Does tea go out at a lower rate than rice?—*A.* The rate for rice is cheaper than that for tea.

Hon'ble Lt.-Colonel P. R. T. Gordon.—Q. On the first page of your evidence you suggest the manufacture of matches, and then you say that there are various kinds of soft wood in Assam and with a little organisation a business for the manufacture of matches can be developed. Can you state which are those soft woods?—*A.* Simul, xis, and kadam. I do not know the names of other woods. In forests there are other woods also.

Q. You say something about pine wood?—*A.* Yes.

Q. Would you be prepared to put up a factory, say, at Tezpur if you got wood cheap?—*A.* I have not got the capital. I made a reference and I got quotations from Germany and also samples of wood. I made also a reference to several match factories here and they are making no profit. The thing is that machinery for making boxes is very dear and it requires a very big capital. My idea is that in other parts of the world they are making a profit, and if we work on the lines suggested in my written evidence we may make a profit.

Q. You would not be prepared to put money into such a concern?—*A.* I cannot put much. I have already got a business. If it gives a good profit I can take up another.

Additional written evidence submitted after oral examination.

No. 676, dated Tezpur, the 15th January 1918.

From—Rai Sahib MONOMOHAN LAHRI, B.L., Chairman, Municipality, Tezpur,

To—The Secretary, Indian Industrial Commission.

With reference to your letter* No. 4517, dated the 10th January 1918, I beg to enclose

* Not printed.

a copy of the form of the agreement that has been entered into by the Tezpur Municipality with the

Superintendent of the Reformatory School at Hazaribagh in respect of three boys apprenticed to the Municipality.

These boys come under the Apprentice's Act XIX of 1850. They were licensed to the Municipality at first under the Reformatory School Code when they used to get Rs. 7-8-0 a month each from the Municipality for food and clothing, and Rs. 1-8-0 from the Hazaribagh Reformatory School. During the period of apprenticeship, which extends to the 21st year of the age of the apprentice, the Municipality increases the wages according to the ability of the apprentice.

Form of agreement.

This agreement made the _____ day of _____ in the year _____ between _____ of _____ and _____ of _____

Witnesseth that the said _____ doth this day _____ bind
a boy of the age of _____ years completed, son of the said _____
(or otherwise describing the relation in which _____ stand) to dwell with and serve the said _____ and
as an apprentice, from the day forth for _____ years, during all which term the said apprentice
shall duly and faithfully serve the said _____ according to his skill
and ability in all lawful business, and demean and behave himself honestly, orderly and
obediently, in all things, towards the said _____ and his family. And the said
_____ for himself and his executors and administrators, in consideration (of the
premium _____ or sum of _____ paid by the said _____

If there is no premium the words between _____ brackets may be omitted.

_____ to the said _____
the receipt whereof the said hereby acknowledges, and) of the faithful service of the said _____
doth covenant and agree with the said _____ his
executors and administrators, that he will teach or cause to be taught to the said _____
in the best way and manner that he can, the trade (craft or employment) _____
of a _____ during the said term, and will also during the said term, find and allow
unto the said apprentice good, wholesome and sufficient food clothes, lodging, washing and all
other things necessary, fit and reasonable for an apprentice, (and further, here insert any
special covenants).

In witness whereof the parties have hereunto set their hands and seals the day and year
above written.

WITNESS No. 402.

SRIJUT LAKSHESWAR BARTHAKUR, *Superintendent of Agriculture, Surma Valley.*

WRITTEN EVIDENCE.

I.—*Financial aid to industrial enterprises.*

Capital.

Q. 1.—I have had some experience in trying to raise capital for a sugar mill on a modest scale in Assam.

The main obstacle was the absence of capitalist businessmen in Assam. Then comes the shyness of small investors to go in for anything new.

Q. 2.—There is very little capital in Assam for industrial purposes. The rich Marwaris, who practically control the trade in Assam, do not seem to have any inclination to industrial enterprises on joint-stock principles.

Thus the savings of the middle class are the only resources for capital. But they require very strong inducements to be drawn out for an investment.

Financial aid from
Government.

Q. 3.—State aid in some shape or other is essential for infant industries.

(1) Money grants-in-aid may be useful in cases of such industries as require research and experiments for developing or adopting suitable methods, processes, etc.

(2) Bounties and subsidies with or without protective duties may be taken recourse to in cases of well established industries requiring some aid for foreign competition or for carrying on any improvement in methods or machineries.

(4) Loans, with or without interest, upon proper security should take the form of a first aid and should not be a bar to other forms of State aid. The principles of agricultural loans should be adopted for small industrial potentialities.

(5) Supply of machinery on the hire-purchase system does not seem to have any advantage in it, except when a pioneer or demonstration factory is handed over to a private party.

(6) The guaranteed purchase of products may be made in the cases of articles necessary for State use.

Q. 4.—In cases of (3) and (6), *i.e.*, guaranteed dividend and participation in share capital Government may have control in the management of the companies by appointing Government directors. In other kinds of State aid, Government may prescribe such standards of quality and quantity in output as will have the objects of State aid realised.

Co-operative Societies

Q. 12.—Co-operative Societies should be encouraged for the following :—

(1) Handloom weavers—

(a) Among Manipuris and Jugis in the Surma Valley and *endi* weavers in Assam.

(2) Wood turners of lac dye toys, tops, hooka stems, etc., in Sylhet.

(3) Iron-smiths in Sylhet.

(4) Bell-metal workers in Kamrup, Jorhat and Sylhet.

(5) Fruit growing industries in Sylhet.

As the classes of people concerned are backward there should be some effective Government initiative in organising and working up the Societies with substantial Government aid. High usury raging in the market and the encumbered economic condition of these people do not warrant any spirit of co-operation among themselves. And the help must come from outside either from the Government or from any financial agency.

II.—*Technical Aid to Industries.*

Industrial Surveys

Q. 25. Certainly.

The agricultural resources of the province should be surveyed as regards the following :—

1. The prospects of fruit growing, *e.g.*, the pineapples in Sylhet and oranges in Sylhet as well as the Khasia Hills, with special reference to export and preserving.

2. Improvement in the Sylhet fish curing industry and the possible utilisation of the waste offal for manurial purposes.

3. Export of hides and bones as to their bearings upon cattle diseases and the prospect of a bone-crushing mill in the Sylhet district.

4. Studies upon the quality of the available commercial oil-seeds of the province with a view to increase their oil contents.

III.—*Assistance in Marketing Products.*

Q. 28. Commercial museums are very useful institutions. But for a province like Assam they are too big things unless they form an appendage to an Educo-Economic museum with agricultural, industrial and other sections. Commercial Museums.

Q. 29. For a modest beginning Gauhati may be selected for a centre and the arrangement and the working may be left to the Commissioner.

Q. 30. It will not be practicable for the Government to undertake any sale operation. To help any minor and unorganised cottage industry Government may purchase some products to stock their museums and to supply samples to trade representatives in other centres and provinces. Sales Agencies.

Q. 31. Exhibitions are useful in their own way, specially for industrially advanced people. They should be more or less Imperial in character. Backward provinces like Assam are less likely to be benefited by them proportionately to their cost. On the other hand such provinces may more advantageously send out, at State expense, a large number of carefully selected representatives both official and non-official to visit exhibitions held in big cities. Exhibitions.

Q. 34. Trade representatives for whole of India may in time be necessary to represent India outside. But it is not the starting but the culminating point in view. The internal organisation should be developed first. Trade Representatives.

Q. 36. Yes, every province should have trade representatives in all important trade centres of India with which there are possibilities of trade connections.

Q. 37. Yes.

Q. 38. The co-operative movement should be developed so as to offer facilities in marketing indigenous products.

IV.—*Other Forms of Government Aid.*

Q. 56. Up till now there is none.

Q. 57 to 61. Leaving aside the tea and mining industries, this province appears to have very little room for an independent Director for Industries. Assam is primarily an agricultural province and her geographic position is not such as to develop manufacturing industries on any very large scale. Her industrial development shall have to remain inseparably connected with agriculture and her economic conditions necessitate an extensive co-operative organisation side by side with her agricultural and industrial progress. Such being the case the most effective arrangement will be to bring, if possible, all these three departments under one head. This officer should be assisted by expert deputies in the different departments. There should also be an advisory board constituted of both officials and suitable non-officials. This board over and above being an advisory one should have executive powers with budgetted funds on the lines of the Assam Local Boards. Official Organisation.

Q. 62. There should be an Imperial Department to correlate the separate activities of the Imperial Department; various provinces as regards industries.

Q. 64. This department should be in charge of an officer not below the rank of a member of the Executive Council of the Viceroy. It should be manned by experts whose duties will be to work in co-operation with the provincial industrial departments with a view to develop industries of both local and Imperial interest.

Q. 68. In Assam the provincial industrial organisation when created may take up the following, to begin with :— Work of Provincial Department.

- (1) Making a thorough industrial survey.
- (2) Collecting statistics.
- (3) Developing financial facilities.

Q. 71. For the purpose of technical education there should be a pronounced Imperial policy and a system of general industrial education will have to be developed before any technological research institution can be taken full advantage of. Technological Institutions.

For this purpose India may be divided into four zones, say :—

- (1) The eastern zone with Calcutta for its centre.
- (2) Western zone with Bombay.
- (3) The northern zone.
- (4) The southern.

Each of these zones should be given a full polytechnical institution. They should make specialities of the major industries of their zones and have research facilities for the same. It will be better if these polytechnical institutions are affiliated to the Universities. The following courses should be provided in each of these institutions :—

1. Mechanical engineering.
2. Electrical engineering.

3. Mining engineering.
4. Applied chemistry—
 - (a) Manufacture of chemicals.
 - (b) Tanning.
 - (c) Fermentation physiology.
5. Textile courses—
 - (a) Spinning.
 - (b) Weaving.
 - (c) Dyeing and calico printing.
6. Ceramics—
 - (a) Glass.
 - (b) Porcelain.
 - (c) Cement.
7. Minor industries of both chemical and mechanical nature, *e.g.*, matches, pencil, soap, celluloid, paper, etc.
8. Industrial economy and management of industrial establishment.

Transport facilities.

Q. 97 and 100. In the Surma Valley waterways play a very important rôle in the internal trade and it appears that there is ample room for their improvement. The water-borne trade of the Valley specially during the rains is quite voluminous. But very little attention is paid to this either by the Public Works Department or the local boards.

The improvements in the waterways from Theriaghat to Companygunj require special mention as a considerable portion of the Khasia Hill produce finds its outlet through this channel. The lime quarrying industry and the potato trade are calculated to be much benefited.

Q. 102. Nothing that I know of.

Hydro-Electric
Surveys.

With more than 400 inches annual rainfall at Cherrapunjee and steep gradients on their southern slopes, giving rise to a number of rapids, the Khasia Hills appear to possess good resources for hydro-electric installations.

Forests.

Q. 105. With extensive new clearances in the virgin forests of Assam and consequent felling of valuable timber trees, it is strange to note that very little is commercially utilised. Possibly there is some defect in the forest regulations or more probably in the transport facilities. The most wasteful methods of clearing jungles by simply burning down everything require some investigations with a view to prevent any avoidable waste by encouraging destructive distillation of wood and the manufacture of wood tar, acetone, charcoal, &c.

Freights.

Rates of freight for goods of industrial and agricultural importance in the local and provincial railways as well as in the steamer companies should be so arranged as to stand as no barrier in the development of local industries.

New In-
dustries.

Q. 113. Supply of raw materials in Assam warrants investigations with a view to develop the following :—

- Match stick and pencil chips manufactures.
- Paper pulp manufacture.
- Agar wood distillation.
- Destructive distillation of wood and acetic acid manufacture.
- Citric acid manufacture from limes and lemons of the Khasia Hills and Darrang.
- Starch making.
- Fruit canning and preserving.
- The assam silk industry.
- Hand loom weaving.
- Improved wicker work and cane and grass matting.
- Improvement in the fish drying industry of Sylhet and utilisation of its waste products for manure.
- Improvement in oil pressing by the use of hydraulic press and extraction through Solvents.
- Bone grinding for manure.
- Calcareous cement.
- Hydro-electric installations.
- Manufacture of calcium carbide and cyanamide.

ORAL EVIDENCE, 7TH JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. You are Superintendent of Agriculture in the Surma Valley?—A. Yes.

Q. Where did you learn agriculture?—A. I studied agriculture and agricultural chemistry in Japan and also studied sugar manufacture in Formosa, as a special training.

Q. Were you sent by Government or did you go as a private scholar?—A. I went with a scholarship from a private institution in Calcutta.

Q. Were you sent by the Scientific and Industrial Association, Calcutta?—A. Yes.

Q. How long have you been in Japan?—A. I had been there actually for four years.

Q. Since you returned from Japan, what did you do?—A. I tried to float a sugar company in the first instance and made some beginning as well, but for various reasons I could not make it a success.

Q. Did you actually start the sugar company?—A. I drew up a scheme and canvassed for capital.

Q. Do you mean the Gauripur Raja's company?—A. Yes.

Q. What is the real cause of that company not being promoted?—A. The first difficulty was capital. I travelled all over Assam. I went to some of the big zemindars of Bengal including the Maharaja of Kasimbazar and was promised some support; but I became disappointed later on as other difficulties cropped up.

Q. Your difficulty was mainly one of capital?—A. Yes; but that was not all. I got some promise of capital and with the assistance of the Raja of Gauripur and some other gentlemen I drew up a scheme and started planting sugarcane on a small scale to begin with. But the main difficulty came from the tea planters' opposition when the scheme was floated, to our securing lands on easy terms. I do not remember the details of the procedure, but somehow or other there was opposition, and some very severe conditions were proposed to be imposed by the Government.

Q. Since you formed your scheme there was opposition from the tea planters?—A. We applied for land from Government on a thirty years' lease. You know there is a special cultivation lease whose terms are very easy and favourable; and we asked Government to extend these special cultivation rates to sugarcane. There have been examples before of giving special cultivation leases for the cultivation of rice and mustard on a large scale and improved methods. But in this case they construed the rules very strictly and declined to accept sugarcane (on a plantation scale) as a crop for special cultivation but offered to recommend to the Government of India to make a special case of our application and give us land on a 30 years' lease subject to some special conditions. There were some four conditions laid down, but I do not remember all of them.

Q. There is no use telling what you don't remember. Do you mean that the Government of India did not sanction or was it the Local Government who did not grant concession?—A. We did not go so far as that: the conditions were so drastic that we did not dare to accept them.

Q. The conditions were laid down by the Assam Government and they were so hard and drastic that you could not accept them?—A. We were afraid that people would not come forward to put in their capital under these conditions.

Q. Was it because of these conditions that you could not raise money?—A. They scared away some would-be investors. At any rate they added to the difficulties in raising capital.

Q. What were these conditions?—A. The first condition was that the whole of the capital, namely two lakhs, should be subscribed. The next condition related to labour, namely, that we shall not employ or harbour or allow settlement of any labourer or his dependents who have been imported into Assam at the expense of any tea garden unless he has been in the province for four years without any advance agreement or bonus from any tea garden. (In other words, to be employed in the sugar concern he should be a man who has not received any advance or bonus from any tea garden for four years). This condition was a terror to us. Have you understood this?

Q. I have understood, but please explain.—A. It is this: the tea garden coolies are such that they live a hand to mouth life and cannot live, and nobody can expect them to live, for four years without getting a single rupee as advance (although worked for in due course) from any employer. That condition of remaining entirely free for four years before seeking employment elsewhere is not to be found in any other line.

Q. What is the third condition?—A. The third condition was that the company shall erect a fully equipped sugar refinery within three years of the lease.

Q. What was the fourth condition?—A. I do not remember the fourth.

Q. Are you in a position to give us a copy of these conditions or ask anybody who has got it to supply us with a copy?—A. I think the Raja of Gauripur has got the whole file.

Q. Will you write to the Raja of Gauripur? His Manager gave evidence before us in Calcutta, but I think he didn't go into any such detail?—A. I think you can get the details from Government* if you like.

Q. In which year was it?—A. This case is very well known. It was in 1911 and 1912 just after the reconstitution of the Government of Assam.

* The papers were subsequently placed before the Commission.

Q. That is why you could not raise capital for this sugar factory?—A. With the hope that we shall be able to raise the necessary capital and that we shall get the lease on easy terms we proposed this scheme. When we first approached the Chief Commissioner, Colonel Kennedy was here as Second Secretary. I saw him with some other gentlemen and they gave us all sorts of encouragement; but when it came to giving the lease, some of the tea planters objected; there was some discussion in the Tea Association and correspondence with the Government in this connection; and after that as the result, it was proposed that if we accepted these conditions Government would be prepared to forward our application for land with recommendations to the Government of India.

Q. May I take it that the Government was first willing to give you reasonable terms, and after discussion with the Tea Association, who made objections, stricter terms were insisted on?—A. Yes. The first thing was not in writing. I saw the Second Secretary when we began our movement and I formed the idea that there will be no difficulty in securing land.

Q. He told you verbally?—A. If I had been aware of this attitude on the part of these tea planters or that Government would take such a view of their demands, I would not have wasted two years or so of my life in trying to float this company.

Q. You were promised verbally that you would get reasonable terms?—A. I was not promised, but their (Governments') attitude was very sympathetic in the first instance, but when they came to give land they laid down those conditions which I very strongly believe was due to the protest from the tea planters.

Q. Have you any written document to prove that this was due to the protest from the tea gardens?—A. One thing I can tell you, of course these are—

Q. I understand your difficulty because you are a Government servant now, but as you have come to give evidence you ought to support your statements by facts.—A. As I understand, the protest came from the tea planters, I know so much. When, with the hope that I shall be able to raise more capital and to do everything, I began a small sugarcane cultivation, with some Rs. 10,000 from several gentlemen, half of which was contributed by the Raja of Garupur and was using some floating ex-tea garden coolies (who had not been attached to any tea garden), the planters objected to that.

Q. Then you took to Government service after you had been disappointed in this?—A. Yes, then I took to Government service.

Q. Then in your evidence under technological institutions you say you want technical colleges or schools for mechanical engineering, electrical engineering, mining, and so on, you have put down some six courses, but you do not seem to have provided for giving practical experience?—A. I am speaking from what I saw in Japan.

Q. Have they not got practical training courses?—A. They have engineering shops and small manufactories attached to the colleges. These workshops belong to the institutes and they work for the institutes.

Q. In your answer to question 102 you speak of possibilities of hydro-electric installations in Assam. Is it a general observation, or do you know any particular places where water power can be produced?—A. It is a general observation strictly speaking. I was travelling at the foot of the Khasi hills and I saw several hill streams coming down with sufficient water-head.

Q. You didn't go into it thoroughly with a view to preparing a scheme?—A. It was not possible. I only compared those waterfalls with what I saw in Japan.

Q. Then in answer to question 105 you say "With extensive new clearances in the virgin forests of Assam and consequent felling of valuable timber trees, etc., etc."; have you got any definite plan or do you only suggest the possibilities?—A. My idea was derived from what I saw in Japan. There they manufacture charcoal from forest wood for their everyday use. In preparing charcoal they get wood tar and other things and they take these away and manufacture acetic acid. I saw a factory there doing all these things.

Q. That is what you saw in Japan, you have not gone into the matter thoroughly here?—A. No.

Q. Then you say "Rates of freight for goods of industrial and agricultural importance, etc., etc." Can you give us particular instances where you think these rates are hindrances to the development of industries?—A. I can cite one instance from my own experience. I manufactured some *gur* from that small cultivation I started. They have special rates for *gur* transport from Chittagong to Tinsukia side; that rate is 4 annas 1 pie per maund *via* Chandpur. When I want to transport *gur* from Tinsukia to Chittagong side then their rate is 1-4-0 per maund Tinsukia to Chandpur in place of 0-4-1 which is the local rate. But if I want to transport to Dacca or some other place from Tinsukia it is 0-9-3 *via* Chandpur. So I could not sell any *gur* in selected markets owing to the variations in rates. I sent some to Dacca and I had to sell it there because the freight was cheaper. I wrote to the railway authorities, but they paid very little heed to it.

Q. Is there any other instance which you can cite?—A. No, that is the only instance.

Mr. A. Chatterton.—Q. What area were you cultivating with sugar cane in your preliminary experiment?—A. When I started I planted 25 acres, and in the second year I planted 40 acres more, but the difficulty of capital came in and I could not keep up the whole thing.

I kept only 25 acres, that is, 50 acres (25 ratoon and 25 plant) in the second year; then the whole thing had to be stopped, so I had gradually to wind up this cultivation.

Q. What sort of crop did you get? How much per acre?—A. In certain places I was getting about 80 maunds of *jute* per acre.

Q. How were you crushing it?—A. With ordinary cattle power.

Q. In answer to Question 105 you speak of destructive distillation. Do you refer to agar wood distillation?—A. No. By destructive distillation I meant manufacture of charcoal, acetone, wood tar, etc. From agar wood a kind of essential oil is prepared by simple distillation in Sylhet. They manufacture it in a very crude way by placing ordinary big copper kettles over an open fire; in consequence of that the produce is of inferior quality. I thought some improved machinery might be used.

Q. What is done with the agar oil?—A. It is exported to Calcutta and Bombay first, then to Arabia, Persia, Turkey and Egypt, etc.

Mr. C. K. Law.—Q. With regard to these conditions which you were speaking of as applied to the sugar factory which you proposed to start, are similar conditions applied to people who want to start tea gardens?—A. No.

Q. Do you realise the trouble about the question of the enticement of labour?—A. Yes, I do.

Q. And feeling is aroused I understand by the suspicion that Indian concerns wish to entice the labour of European concerns?—A. Yes, there is suspicion, but they cannot stop a new tea garden using floating labour.

Q. Do they make it a condition that a tea garden newly started should join an existing association of employers who undertake not to entice one another's labour?—A. No, there is no such undertaking.

Q. Do Government insist on any new tea garden joining an association? Probably you do not know?—A. I do not know.

The Hon'ble Lt.-Colonel Gurdon here said that Government does not make such a condition.

Q. Supposing Government did make a condition that you should import yourself a reasonable quantity of labour for your land purposes, would you have agreed to that?—A. We must have had to import; how can we depend upon floating coolies?

Q. Then supposing you had undertaken to import a certain amount of labour, that would have been a guarantee on your part that you did not intend to make a living by stealing other people's coolies?—A. Quite so.

Q. Would you not agree to a condition of that sort?—A. Yes, I should.

Q. With reference to your present work as Superintendent of Agriculture, what exactly is the nature of work going on in the Surma Valley? Have you got any agricultural farms?—A. Yes.

Q. What is the extent of the area?—A. About 80 acres.

Q. Who is in charge?—A. There is a farm manager.

Q. You are in charge of the demonstration work?—A. Yes.

Q. And of the farm?—A. I have not got anything to do with the management of the farm. The farm is directly under the Deputy Director.

Q. Then what do you demonstrate?—A. We demonstrate the effect of artificial manures and better seeds and better implements.

Q. What seeds are you demonstrating in particular?—A. Improved paddy seeds, jute seeds and others. We have been demonstrating these for the last two years.

Q. On the farm?—A. Yes on the farm as well as in cultivator's lands. In the farm we are growing them, but it is suited specially for paddy.

Q. Is it a good jute area?—A. Yes, we have some good jute soil in the farm. But paddy is the main crop and jute is of secondary importance.

Q. My point is this: are you demonstrating things which are shown to be good on the farm and are you getting the public to believe that the farm cultivation is good?—A. Paddy is the main object of the Sylhet farm but the results of the farm cultivation are not yet sufficiently advanced to advocate our own paddies. So we are till now recommending the Dacca seeds.

Q. Can you try other people's seeds on your farm?—A. Yes, we are trying that. We have got special lands for experiments in seed selection for paddy only, and experiments are carried out, but it is too early to expect definite results.

Q. Are you doing anything in the way of cotton at all?—A. No.

Q. Do you think cotton cultivation is any use here? Is long staple cultivation possible here?—A. Long staple cotton may be grown over the North Cachar and Garo Hills.

Q. I know the Garo hill cotton which has a staple of $\frac{5}{8}$ th of an inch. Can you say whether long staple cotton is grown in any other place?—A. I have seen some long staple cotton grown in North Cachar hills.

Q. Have you any idea as to what sort of yield it gives?—A. We cannot form any idea because they grow all sorts of crops mixed up in *jāmuniag*.

Q. It is a sort of hill cultivation?—A. Yes.

Q. You don't think it is a business proposition?—A. The cultivation is so uncertain with these hill people that it has not come within the scope of regular cultivation.

Q. Is any research being done by any firm or by your Department?—A. We have not been able to do anything very much in the Surma Valley, but there is an Inspector for the Khasia, Jaintia and Garo Hills.

Q. You talk about examining the quality of available commercial oil-seeds of the province with a view to increase their oil contents: is any selection going on with reference to oil-seeds?—A. This year we are trying to introduce "bold type" linseed into the Surma Valley.

Q. Is it for oil or for flax?—A. There is no flax grown here; everything is utilised for oil purposes.

Q. There are I believe flax experiments going on here?—A. Not in the Surma Valley.

Q. Is anything done in the way of studying metabolism of the oil-seeds with a view to increase their oil-contents? Is any research of that kind being done here?—A. No, we have had no research in this line.

The Hon'ble Lt.-Colonel P. R. T. Gordon.—Q. You are an officer of the Agricultural Department, aren't you?—A. Yes.

Q. Have you any experience of bone meal manure?—A. We have been demonstrating the use of bone meal with good results.

Q. Where do you obtain your bone meal from?—A. From Calcutta.

Q. You have a firm that supplies it?—A. Messrs. McKillop and Company supply us.

Q. Would it be possible to manufacture bone meal in the province of Assam?—A. I think so.

Q. Are bones readily available?—A. There will be a sufficient amount of bones for one or two mills.

Q. Where, in the Surma Valley?—A. Yes. There water transport is very convenient and cheap too.

Q. What about the Assam Valley?—A. In the Assam Valley I think it will be very difficult because there are no transport facilities. I mean cost of carriage of the raw materials will be prohibitive in the Assam Valley.

Q. How do they collect bones?—A. There are a set of people who collect bones from different places and carry them away to Calcutta.

Q. What sort of people are they?—A. They are I think low class Mahomedans.

Q. Would you not be able to get such people in the Assam Valley?—A. It will be difficult.

Q. In the Surma Valley you could get such people?—A. It will be easier in the Surma Valley.

Q. Do you think it will be any good starting a bone crushing factory say at Sylhet or some other central place?—A. It will be better to start it at a place near Ajmiriganj for instance, but the site has to be investigated.

Q. What other manures do you use?—A. We are using oil cake.

Q. Where do you get that from?—A. Locally.

Q. Is that easily obtainable?—A. Yes.

Q. Have you depôts for the supply of oil cake in different parts of the province?—A. No, we have got no depôts.

Q. Who supplies oil cake?—A. We purchase it from the *telis*.

Q. The Agricultural Department, I understand, supplies it?—A. The Agricultural Department have got a seed depôt here at Gauhati, but it will be too costly to get manure from this place.

Q. What about the Surma Valley, is there any depôt there for the supply of oil cake?—A. There is no depôt there.

Q. Or for any other manure?—A. There is no depôt.

Q. The ryots if they wish to obtain manure have to purchase it from Calcutta, is it so?—A. They only use oil cake in small quantities and they get it locally.

Q. What do the planters do?—A. They get it from Calcutta.

Q. Could it not be arranged to supply it locally?—A. Yes, if a bone meal factory is erected we can supply bone manure to cultivators locally. But I do not think there will be enough of the produce to meet the demands of the tea planters too.

Q. And other manures too?—A. For other manures such as oil cake it will be quite easy to supply the needs of the cultivators if we have a seed depôt and stock oil cake there.

Sir P. H. Stewart.—Q. In what years were you in Japan?—A. From 1905 to 1909.

Q. Where were you?—A. I went to Tokio first and remained there for five months; then I went to the Agricultural College at Sapporo.

Q. Did you have any trouble in getting admission into the college?—A. No, I did not have any trouble in getting admission into the agricultural college, but it is difficult to get admission to other colleges such as those which give engineering and industrial courses.

Q. Is there any trouble about admission to the chemistry course?—A. No. But as a rule the number of seats are limited: but they show some consideration to foreigners.

Q. Where is your home? Do you come from Assam or Bengal?—A. I came from Assam, from the Sibsagar district.

Q. Which company were you trying to raise capital for?—A. For a sugar factory.

Q. Was that to be an Assamese company?—A. I wanted to start it with the people of Assam, but we did not want to restrict it to this province alone.

Q. Do I understand that the conditions which Government laid down in writing were much stricter than those you had been led to expect from conversation with Government officers?—A. Yes.

Q. The first of those conditions refers to the amount of capital. You were trying to raise two lakhs of capital, and Government made it a necessary condition that that should all be paid up?—A. Yes.

Q. Is not two lakhs capital a very modest sum on which to start a factory?—A. We wanted to start on a modest scale.

Q. But would it be safe to try to start such a factory with less capital?—A. I think we should have required the whole amount.

Q. You could not get that condition waived on the part of Government?—A. Of course, if they viewed it in that spirit it is all right, but the other conditions were such that even, if we had been able to find the capital, we would have failed to comply with them.

Q. Is it not true that the real reason why you failed to start the factory was that you could not get the capital?—A. We looked at the matter from this standpoint. We wanted land from Government first and then we wanted to raise the capital. In Assam we have not got big capitalists, so we have to depend upon middle class men: and if Government had taken some interest and given this land on favourable terms, then it would have created some faith and we could have induced people to put money in it. That was our standpoint; but, when these conditions were harsh, we gave it up as some people actually got afraid.

Q. But don't you agree that it would have been a very unfortunate experience for the province if the factory had been started with too little capital and had failed?—A. It would not have done harm if I had not got the whole amount of two lakhs or very nearly so. I mean even if it was 4,000 or 5,000 less that would not have mattered; but if I did not even get one lakh, a half at least, I would not have ventured to launch forth.

Q. How much did you succeed in collecting?—A. I secured promises for Rs. 65,000.

Q. How much actually paid up?—A. The amount was promised in respect of the Sugar Company and as the company was not registered we had no need of calling up the amount. In the meantime, while negotiations were going on with Government, I raised about Rs. 10,000 amongst a few friends and started the small sugar plantation which we wanted to make the nucleus of the proposed company but which we had to give up afterwards.

Q. With reference to the question of labour is not labour one of the chief difficulties in the way of the development of industries in Assam?—A. Yes.

Q. When Government wanted to impose this condition did you say that you were prepared to import your own labour? Did you put that as a specific proposition?—A. No, we did not, because it did not come to that as we objected to the principle of making special conditions in our case while other industries, e.g., tea, are unhampered with any such conditions.

Q. With reference to your answers to questions 57 to 61 you say, apart from the tea and mining industries, this province appears to have very little room for an independent Director of Industries. How do you reconcile that with your answer, especially to question 113? Would not those industries afford plenty of scope for a Director of Industries?—A. In the latter part of that paragraph I have given my suggestions.

Q. Your suggestion might be more definite. Would not a Director of Industries be the right man to do all that?—A. Yes.

Q. Don't you think he will have plenty to do to go into the industrial problems of the province, and so on?—A. I have suggested that co-operative societies might do that.

Q. There is a Director of Agriculture here already, is there not?—A. Yes.

Q. Is he not a very busy officer?—Has he not got plenty to do already?—A. Now the Director of Agriculture has got to do land records work as well. Our difficulty is about capital and I should be very glad if the co-operative department also is associated with the industrial movement.

Q. What you really mean is that it would be too much work for one man and you would like to see these three officers, the Registrar of Co-operative Societies, the Director of Agriculture, and the Director of Industries to be associated in a combined department, is that right?—A. It will not be impracticable if he is assisted with expert deputies.

Q. Then you say for the purposes of technical education and research India should be divided into four geographical zones, etc. Would it not perhaps be better if you had a number of industrial research institutes divided according to groups, say, the chemical institute in one place, metallurgical in another, and so on?—A. My idea is to supply all the different branches of technical education in one institute which should make specialities of the major industries of its zone, where they will have practical facilities for studying them.

Q. *Hon'ble Sir R. N. Mookerjee.*—In connection with your proposed sugar company you strongly believe that if Government had given you reasonable terms you would have been able successfully to float the company?—A. We hoped so.

Q. Also you would have no cause to entice labour from other tea gardens?—A. Yes.

Q. You said that one of the conditions laid down by Government was that any coolie who had received during the previous four years any advance from any tea garden should not be employed by you, and it was very impracticable and could not be carried out; otherwise, you were hopeful of working your factory with success?—A. No, it was not quite impracticable. But, on principle, I do not quite see why a coolie after having served in a garden for 4 or 5 years should not be free to go and serve another man. But for these strict conditions I think we could have worked out our scheme.

Q. You think that is very unreasonable?—A. I think so.

WITNESS No. 403.

*Hon'ble Syed M.
Saadulla.*

THE HON'BLE SYED M. SAADULLA, M.A., B.L., Pleader, Judge's Court, and Member, Assam Legislative Council, Gauhati.

WRITTEN EVIDENCE.

I.—Financial Aid to Industrial Enterprises.

Capital.

Assam is a poor province. There are no moneyed men worth the name, nor are there any landed aristocracy. Hence there is hardly any hoarding which can be converted into liquid capital. Capital, if ever found, will be small collections from the poor middle class whose savings are naturally smaller. I once tried to raise a small capital to run a washing soap industry at Gauhati, but I failed to realise even the small capital that was needed. The difficulties are manifold:—(1) people are reluctant to part with their small savings in an enterprise of which they have no idea and are not cognisant of its ups and downs; (2) the rate of interest being generally very high here, ranging from 18 to 60 per cent per annum, people generally find money-lending more lucrative, and a surer business than investments in other industries; and (3) the collapse of a few joint stock companies started in these parts for pressing mustard oil, etc., has proved a dead block to any new enterprise.

Industrial banks.

The only way, in my opinion, to raise capital is by establishment of industrial banks in this province, under the supervision and control of Government, wherein Government should purchase some shares. Government connection and control will ensure credit and money will flow in and even those planters who deposit their money in Calcutta banks will divert the same to the industrial banks. These banks should work on the co-operative principle.

Government aid.

So far as my province is concerned I am almost sure that, without Government aid, no new venture will be attempted. The nature of Government aid ought to be different for different kinds of industrial opening. Guaranteed dividends for a limited period will be necessary for smaller industries, while loans and supply of machinery and plant in case of bigger ones; and guaranteed or preferential Government purchase of products for both. While another branch of industry connected with the Government forest reserves will require Government help in the shape of exemption of tax or royalty on any article used in the industry.

I think Government assistance in audit and direction will be required for all sorts of financial aid by Government to industries excepting the methods No. 7 in question No. 5 of the printed list.

Pioneer factories.

I am against Government establishing any pioneer factories in Assam for our people are too poor and too uneducated to profit by the same. Government has established a few demonstration farms in Assam which, in my humble opinion, have done no good to the country.

Co-operative societies.

Co-operative societies, if organised on a big scale, can supply capital to small industries and, to my mind, they are admirably adapted to encourage cottage industries, which are almost indigenous in all Assam households.

The limit of Government assistance which I propose is that Government aid should only be given in cases of local Indian concerns, for it appears that there is no dearth of mental assistance, capital for companies started in Great Britain or even in Calcutta.

II.—Technical Aid to Industries.

Assam is essentially an agricultural country. Ninety per cent of her population, if not more, depends upon agriculture as the main industry. Government would do well to establish a model demonstration factory in some suitable centre to show the up-to-date implements of husbandry, to exhibit the treatment of the soil and the use of manures, and the system of improving seed grains. Along with it there ought to be classes wherein the ryot's children can undergo a course of lessons and lectures in scientific agriculture.

This factory should also possess one or two experts to teach the apprentices various arts and handicrafts which require only a small capital to start with. What I mean is this: There is ample room for a small industry for canning the various fruits—oranges, lemons, citrons, pears, etc.—that are abundantly grown in Assam. A slight knowledge of the chemistry of preserving fruits, extracting juices, and making syrups, jams, etc., may be turned to a lucrative beginning in this industry. The canes of Assam may be utilised for wicker work by a knowledge of technical design. Examples can be multiplied, but I refrain from putting them up. If some technical education could be given in the demonstration factory then it will be a great help to the Assamese to take to small industries.

III.—Assistance in Marketing Products.

I have not much faith in commercial museums for the simple reason that our people are not yet qualified to grasp the real spirit of the museums. What is wanted more is a commercial emporium for bringing the seller and buyer together "for the sale, as well as the display, of the products of minor and unorganised cottage industries". They should be developed, on the co-operative principle. I would not vouch for exhibitions for, though they would give ample facilities for social intercourse, yet they would fail in their principal utilisation of imparting industrial stimulus to the people. Backwardness in education, and especially want of technical knowledge, would deprive people of getting full benefit from these exhibitions.

Government, in order to patronise Indian industries, should give the people a chance of knowing its requirements and this could best be done by publishing lists of publications, imported articles and also exhibiting samples of them in the emporia so that Indian industries may work up to the necessary finish.

Government stores should never be purchased out of India unless and until the same cannot be supplied in India. For this purpose Government should notify its requirements in the *Gazettes* and also in the papers of India.

I think banking facilities for marketing indigenous products can be best obtained by co-operative credit and industrial banks.

IV.—Other Forms of Government Aid to Industries.

To those concerns for whom I advocate Government aid in matter of finances Government-owned raw products should be given entirely free for a definite number of years and to others they may be given on favourable terms.

The land policy of Government is a check to our industrial development. The recurring settlements, with their continually increasing assessment, the want or absence of occupancy rights of the ryots, and the auctioning of Government lands required for industrial purposes, all tend to check our attempt to improve our agriculture, which is the main industry of the people.

Government should allow the use of subterranean or surplus surface water for industrial purposes if they do not interfere with the irrigation and communication of the people.

V.—Training of Labour and Supervision.

Lack of primary education hinders industrial development for it affects the labour question greatly. Labourers' skill and efficiency can be greatly augmented by primary education and also by giving them a course of handling machinery, etc., in the model demonstration factories proposed, and they should be allowed to specialise if any of them show an inclination or adaptability to a particular machinery or a special branch of industry.

Establishments of industrial schools in our province is a long-felt want but, in my opinion, a mere theoretical learning will not improve matters and, as such, these schools should be attached to the model factories, where students could be apprenticed and undergo practical training. Night classes may be advantageously established for improving labour.

VI.—General Official Administration and Organisation.

Official organisation.

So far as I am aware there exists no official organisation in Assam for the development of industries. It has been proposed and sanctioned by the Government of India to appoint an officer in the post of Director of Industries. I do not advocate the creation of a board of industries for our province, but there should be a special officer under the director to organise and encourage cottage industries. The principal cottage industry which I recommend is the Assam silk, *endi* and *muga*, and the cotton industry.

Government experts.

In my opinion there should be a Government expert attached to each sub-division of a district who would visit the principal centres of cottage industries, help the people to co-operate for the purchase of improved power-looms, and also correspond with the commercial emporia to exhibit and sell the finished articles. In short, he will create a demand and then see to its supply. He should also teach the people how to rear silkworms on scientific methods and also introduce improved breeds. He may be required to work as a go-between of the actual workers and the industrial banks proposed. He should be the medium of approaching the people by the Department of Agriculture or Sericulture.

Director of Industries.

In my opinion the Director of Industries should be a business man with some degree of technical knowledge, but his principal qualification should be his capability to mix and converse freely with the actual workers in the different branches of industry.

VII.—Organisation of Technical and Scientific Departments of Government.

Technological institute.

I do not think there is any department which is capable of giving assistance to industries in our province. There should be a technological institute for each province where applied chemistry, applied physics, and applied mathematics may be taught to fit the citizen for industrial work and development as is done in all European countries, as well as in Japan and America. One central high research institute for all India would do at present. A college of commerce may be added with the provincial technical institute just proposed.

College of Commerce.

Industrial and commercial education.

Local boards and municipalities can assist in promoting a desire for industrial or commercial education by starting their own factories and training a number of apprentices who may ultimately supply labour to industries opened.

VIII.—Government Organisation for the Collection and Distribution of Commercial Intelligence.

Dissemination of industrial information in the vernaculars can be done by the expert for each sub-division which I have proposed.

IX.—Other Forms of Government Action and Organisation.

Transport facilities.

Lack of transport facilities by road, rail, or water hinders trade, and hence industrial development, in the province greatly. For example, the prohibitive rate of freight for motor transport between Gauhati and Shillong, Rs. 5 a maund, is a check on the great potato trade of the Khasi Hills. I think railway extensions are necessary in our province for the development of trade and industry.

X.—General.

Raw material.

Government can do a lot in improving raw material, e.g., cotton, silk, and sugarcane. I understand Government tried to rear silkworms in Shillong, and a demonstration farm that sugarcane can be profitably grown on a commercial scale has been in existence at Kamrup district for about two years. Government can also introduce the long-staple cotton from other places. But to realise full success from these farms people should be taken into confidence, and the improvements in machinery, growing, and other subsidiary subjects should be explained to the people. It is no use entertaining highly paid unapproachable staff; only the expert, with Indian assistants, should be entertained in such farms.

ORAL EVIDENCE, 7TH JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. You say in the first paragraph "The collapse of a few joint stock companies started in these parts for pressing mustard oil, etc., has proved a dead block to any new enterprise". Can you give us any reason for the failures?—A. There are various reasons. It was partly due to the dishonesty of some of the partners, but mainly on account of want of power of competition against Marwari firms. These use all sorts of seed to increase the quantity of oil, whereas this company was started by some of the leading local pleaders who did not want to adulterate it. They could not compete with Marwari traders and with the imported oil.

Q. In the next paragraph you say "The only way, in my opinion, to raise a capital is by establishment of industrial banks in this province, under the supervision and control of Government, wherein Government should purchase some shares". Have you any idea what should be the capital of the bank?—A. I think we could start with 50 lakhs.

Q. What help would you want from Government if you started a bank with 50 lakhs?—*A.* Government should take at least one-fifth of the shares.

Q. You think the balance of the money will come from Assam?—*A.* Yes.

Q. In the first paragraph you say you have no money and the people are very poor?—*A.* In that case the European planters who generally deposit their money in Calcutta banks will divert their savings to this bank if it is under Government.

Q. Where would you locate your bank?—*A.* It must be in some trade centre.

Q. In Assam have you got in your mind any particular suitable place you can recommend?—*A.* I think Gauhati would be the best place because it is the centre of all the different routes and also carries a large amount of trade.

Q. In regard to the training of apprentices you say "This factory should also possess one or two experts to teach the apprentices various arts and handicrafts which require only a small capital to start with". What about their education: they must have some sort of education? If they only get practical training they would not be competent to hold positions as supervisors, or managers, or foremen of mills?—*A.* There will be no dearth of students in that line.

Q. If they go to factories at what age do you think they should enter?—*A.* Not before 18 years.

Q. For how many years do you want them to go to a factory?—*A.* Three years.

Q. You think 3 years sufficient for them to get a competent training to become foremen?—*A.* To become foremen they might stop another 3 years.

Q. Are there any factories in Assam where they can get a proper training?—*A.* Not that I know of at all, except that there are a few stipend holders from the Williamson Artisan Fund attached to the Railway Workshops at Jorhat.

Q. In the last page you say "Local boards and municipalities can assist in promoting a desire for industrial or commercial education by starting their own factories and training a number of apprentices who may ultimately supply labour to industries opened". Are your local boards so rich as to start factories?—*A.* No, there was a conference with regard to improving our communications, and it was suggested that two or three boards should combine and have engineers and a competent staff.

Mr. C. E. Low.—Q. What experience have you had in floating or dealing with industrial concerns?—*A.* As I have said, not much practical experience. There was a concern called the Kamrup Industrial Company. It was sinking. I was asked to be director for 2 months. I was director and from that experience I can speak. I also wanted to start, as I have said, a washing soap factory with Rs. 25,000 capital, but could not get the money owing to the apathy of the people. They saw that joint stock companies were not working well, and one or two collapsed, one at Gauhati and the other at Dibrugarh.

Q. Why did you think of a soap factory; was it on account of the oil mills?—*A.* Because in this ordinary washing soap they use lime as a saponifying agent and we can get lime here in any quantity.

Q. You also want oil for it?—*A.* This ordinary oil would not do; we would have to use fat and grease. On account of the lime only I wanted to start here. We could also adulterate it, if possible, with some herbaceous products, such as *rita*, used for washing flannels. *Rita* is grown abundantly in the jungles.

Q. Have you got the idea worked out as to how you are going to make the soap, to combine the materials?—*A.* We would have to take the help of experts. The Dacca people are experts in these matters, the indigenous soap manufacturers.

Q. You say "Government has established a few demonstration farms in Assam which, in my humble opinion, have done no good to the country". Why do you think they failed: in what respect?—*A.* The first that I have in view is the sugarcane farm at a place called Khagra-bari. It is far off from the neighbourhood of any locality and, moreover, it is on such a big scale that no ordinary ryot can think of competing with it, or get any benefit from it.

Q. That is not meant for the benefit of the ryot, but to try and show that sugarcane can be grown here on a big scale, in order to get a sugar factory. Are there any farms which help as demonstration farms for ryots?—*A.* There is one at Jorhat; and there was another at Shillong. I don't think many people are benefiting by them.

Q. They don't have small plots cultivated, either hired or borrowed from the cultivators, which are cultivated under the guidance of demonstration workers?—*A.* Yes.

Q. Do these do any good?—*A.* That does not do any good because nobody takes an interest, nobody goes there. Jorhat is more than 24 hours' journey from here. An ordinary ryot would not go and look, and one day's looking would not do.

Q. What about the people around Jorhat: do they go to it?—*A.* So far as my information goes they don't go to it.

Q. Why? Because it is not made known to them or, if they go, do they think the thing is not well done?—*A.* It is due to want of education. They don't know the value of different scientific manures. Sometimes these don't appeal to them. In regard to the use of fertilisers they cannot afford to put their savings into them.

Q. In many other parts of India uneducated ryots are taking advantage very largely of these things?—A. So far as my opinion goes these demonstrations are not doing any good, to people in general at least.

Q. Is that owing to the lack of technical staff?—A. There is technical staff.

Q. You say "Government would do well to establish a model demonstration factory in some suitable centre". Why do you think that would succeed when the demonstration farms have failed?—A. In my note I say the ryots' children should also be taken as apprentices. In the present demonstration farms there is no provision for apprentices nor for the ryots' sons.

Q. They don't give short courses on any of these farms for improved forms of agriculture as they do in other provinces?—A. No.

Q. You have heard of the system of short courses in other provinces?—A. Yes, I have.

Q. You speak of the auction of Government lands required for industrial purposes as a check on agricultural improvement. Is that auction carried on as a regular practice?—A. Yes.

Q. For what?—A. For special cultivation. The Assamese people, the children of the soil, are not going in for tea cultivation on a large scale on account of the competition of European planters. The present law is that whoever wants land for any special cultivation should apply to the Deputy Commissioner. That must not be for more than 600 acres. Along with his application he must deposit survey fees of 5 annas per acre. He has also to clear the jungles, pay forest valuation of the timber, and other things. He has to spend a lot without knowing whether he will get this land. Then it is advertised for sale, and anyone can put in their claims, or anyone who gets scent that so and so has applied can come and bid for the land. The one who comes in subsequently gets the advantage of the initial outlay of so many thousands.

Q. Is that outlay not refunded?—A. Yes, some time later on. All these operations take a couple of years, and all that money is locked up, and he cannot get any interest upon it.

Q. Is no special consideration shown to the local people, the Assamese?—A. Not that I know of.

Q. They don't reserve certain areas for Assamese and let them have it on fixed terms without auction?—A. No.

Q. Have any Assamese gentlemen taken up land on these special cultivation terms?—A. Some have purchased old gardens and some have opened out with great difficulty but many have failed to get land.

Q. You say "In my opinion there should be a Government expert attached to each sub-division of a district who would visit the principal centres of cottage industries, help the people to co-operate for the purchase of improved power-looms, and also correspond with the commercial emporia to exhibit and sell the finished articles". What power would you have them run by; steam, or electric, or what?—A. That would depend on the number of people and the cost of the machinery. About 10 miles from here the people are noted for their manufactures. Everybody uses ordinary looms. If all the people could combine and co-operate then most probably steam power could be used.

Q. Those that we saw were working at a very slow rate which, unless they change their system of working altogether, would not be suitable for power. You suggest that they should also have improved looms?—A. Yes, the fly-shuttle and automatic shuttles.

Q. What they apparently want is the Jacquard loom. You cannot work it quickly with any other system, not quickly enough to have power. The man I saw was only doing about 8 picks per minute?—A. That is what I have been complaining against. There is a wastage of energy, as well as time.

Mr. A. Chatterton.—Q. Do you want co-operative societies for any other industries than hand-loom weaving?—A. We have a crude system of pottery. If the potters could co-operate I think they can utilise present methods.

Q. Where would they get a market?—A. If they can produce improved tiles we could use them. Generally, we use Mangalore and Dacca tiles. Now that the cost of corrugated iron sheets is prohibitive these good tiles could have a ready market.

Q. You say "There is ample room for a small industry for canning the various fruits"?—A. For the preservation of fruits in the Khasi hills which are full of oranges, pears, etc. We have to sell them at once, otherwise they get rotten. If these could be canned I think a small industry could be run.

Q. Where would you get the market for your products?—A. They could be sent to Calcutta and also sold locally.

Q. Would there be a market in the case of a small canning industry? People generally buy canned fruit which has some reputation. It is generally carried on on a big scale?—A. Therefore, I say Government aid should be in the form of guaranteed dividends, some sort of financial aid, and, if Government give a guaranteed dividend for some time, we could compete with others.

Q. Do you grow fruit on a sufficiently large scale to start such factories at the present time?—*A.* On a very large scale on the Khasi hills; there are miles and miles of orange groves.

Hon'ble Lieutenant-Colonel P. R. T. Gordon.—With regard to your answer in connection with demonstration factories do you think there is an opening for a Government rice farm in the Assam Valley?—*A.* Yes, if Government would take any apprentices.

Q. Rice farms for improving the methods of cultivation and the varieties of rice?—*A.* Provided at least one or two students from every sub-division are taken in there. One central farm would not be of benefit to people who live at some distance. If some students are brought in there as apprentices, and know how the soil is being treated, these people would carry the lesson to their villages.

Q. Would it be a good thing to find out what would be the best kind of rice to grow in any particular locality by means of experiments?—*A.* I think so.

Q. Also as regards the method of planting? Some say the method of planting is a wasteful one; in some parts they plant rice singly; in Assam they plant in bunches.—*A.* There are certain varieties of which they say a single plant would do.

Q. Do you think the operations of the Agricultural Department might be extended in that direction?—*A.* Yes.

Q. At present I understand there is no rice farm in the province, except a small farm in Sylhet?—*A.* Yes.

Q. Would it be possible to introduce demonstrations in different *mouzas* of the Assam Valley under select persons?—*A.* It may be made over to the village authorities as it is developed, to educate people in improved methods of agriculture.

Q. With regard to the land policy would you do away with the auction system altogether in connection with the 30 years' lease operations?—*A.* Yes, if it be for the people of Assam only.

Q. You would not do away with it for others?—*A.* Not for companies that are floated in Calcutta and other places.

Q. What is your idea of a Director of Industries; who should he be; what sort of officer should he be; of what qualifications?—*A.* I have said in my note he should be a business man, with some degree of technical knowledge, but his principal qualification should be his capability to mix and converse freely with the actual workers in the different branches of industry. That is my idea of what the Director of Industries should be. To get a highly paid official who is unapproachable by the general public will be no good.

Q. Would it be necessary for him to know the vernacular of the country?—*A.* Of course. He should be such an officer as would be able to speak freely with the people when he goes out on tour.

Q. Is it a fact that in some districts of the Assam Valley silkworm weavers do not allow anybody but an Assamese to enter their houses to see the silkworms?—*A.* I don't know of any case. I have read of that.

Q. I think Rai Bahadur Basu in his report says so?—*A.* Yes.

Q. You are in favour of creating commercial emporia to exhibit and sell goods?—*A.* Yes.

Q. Where would you place them?—*A.* It must be at a place where the finished articles can have a ready market.

Q. Do you know anything about the Commercial Museum at Calcutta?—*A.* No, I have not seen that as yet.

Q. Do you think that is any good as regards Assam; does it benefit us in any way?—*A.* I could not tell.

Q. Do you think it leads to the purchase of our goods: for instance, our silk? We have some silk in the Commercial Museum in Calcutta, and the exhibits are labelled with the names of the shops and the prices. Have you heard of any sale being actuated by such exhibits?—*A.* No, I have not heard. What I say is that these articles should be placed in such a way that it would create a demand.

Q. Where would you place it; would you have an emporium at Gauhati?—*A.* I don't think a commercial museum at Gauhati would be of much benefit because the outside world would not know of it. It must be somewhere where it would create a demand.

Mr. C. E. Low.—Have you heard of the Bengal Indigenous Industries Committee for the sale of indigenous products in Calcutta?—*A.* Yes.

Q. What about trade agents in other parts of India, or other parts of the world. Have you said anything about that?—*A.* No.

Q. Do you think it would be a good thing to get into communication with trade agents?—*A.* Yes, I want Assam products advertised to the outside world so that they would create a demand.

Q. You would advertise?—*A.* Yes.

Q. Do you think sending samples to trade agents would be a good thing to other countries I mean?—A. Yes, I think so.

Q. On the last page of your evidence you talk about the prohibitive rate of freight for motor transport between Gauhati and Shillong. Is that on all articles? I thought it was Rs. 1-8 a maund?—A. During the potato season they charge Rs. 3 a maund as potatoes cannot keep long.

Q. It seems to be very high for 63½ miles?—A. Yes, that is what I object to. Potatoes are one of the principal articles of trade from the Khasi hills and should not be taxed so high. Government could fix the rate.

Q. Under what authority: under what law or Act?—A. There are Government directors in the company. It is a Government subsidised company, and Government could do it executively.

Q. Of course, the remedy for that is competition?—There is very little competition, and there should be more competition.

WITNESS No. 404.

BAKU JOGENDRA CHANDRA CHAUDHRI, *Inspector of Co-operative Societies, Sivas Valley and Hill Districts, Sylhet.*

WRITTEN EVIDENCE.

Government aid to Industries.

Hand-loom weaving industry has been developed by the formation of weavers' Co-operative Societies. From the Central Co-operative Banks capital is supplied to this class of Societies with which the weavers purchase improved looms and other accessories and work under the guidance of the weaving master employed by Government. Under the existing industrial condition of the country no one can neglect the claims of the hand-loom industry. Hand-looms are specially suited for the production of durable coarse cloth for which there is a very large demand in this country.

The result has been that there is an increase in the demand for the products of the industry.

I may note here that the yarn sold by the Indian Mills has been found, in many cases, not to be so good as yarn used by them for their own manufacture, and it would be an advantage if some co-operative spinning mills could be started to feed hand-looms only.

Co-operative Societies should be encouraged for weaving, spinning, bamboo-mat manufacturing and carpentry. The bamboo-mat manufacturers are not in direct touch with the actual consumers. This industry is almost entirely in the hands of the *mahajans* who supply the workers with raw materials and take back the finished article from them after paying them wages at a fixed rate. In every case the profits of the industry go very largely into the pocket of the *mahajans*. The result is that on an average the worker does not earn more than Rs. 3 to Rs. 4 a month and he is always in debt to his *mahajan*.

It is clear from the above that the most important help which the industry can receive will be in the direction of the readjustment of the relations of capital and labour. If the industry is to flourish we must try and improve the financial position of the people and free them from the clutches of the *mahajans*. The establishment of Co-operative Societies among this class of people would, therefore, appear to be the first want of the industry.

ORAL EVIDENCE, 7TH JANUARY 1918.

Mr. C. H. Lam.—Q. How do your Co-operative Societies among weavers work?—A. The weavers are given loans from the Co-operative Societies.

Q. To the individual weavers?—A. Yes.

Q. You don't have any system of joint purchase of a comparatively large quantity of yarn on behalf of these societies?—A. We have not adopted it yet.

Q. Have you considered the idea of purchasing several bales of yarn in a fairly wholesale way, and then letting the weavers share that, putting in a joint indent every month?—A. We are trying to do that.

Q. What difficulty do you find about it?—A. The difficulty is that we want certain concessions from the mills, and the mills will not allow us the concessions.

Q. You asked the mills to let you have it at better than the ordinary trade terms?—A. Yes.

Q. What mills are you dealing with?—A. The Bombay Mills and the Bowreah Mills at Calcutta.

Q. Who are their agents, and are they local or Calcutta?—A. Local agent, a Marwari,

Q. Won't he give you the same terms as he gives another Marwari?—No, he does not.

Q. You say, "the yarn sold by the Indian Mills has been found in many cases to be not so good as yarn used by them for their own manufacture." Have you purchased yarn from anywhere else except Calcutta?—A. No.

Q. Because our experience of mills in the west of India was that they not only gave us good yarn as anybody else, but they had it specially done up in a way to be suitable for hand-loom weavers. You will find mills in the west of India, a large proportion of whose business is with hand-loom weavers. What is the matter with this yarn; is it knotted or what?—A. The yarn is not properly sized and it is made from inferior cotton, and is not given a proper twist for warp.

Q. Do you want the mills to size it for you before you purchase? Don't your own people size it? Do you want to buy warps or yarn?—A. Yarn.

Q. Have you any Co-operative Societies at present for other industries, such as bamboo mat-making, carpentry, etc.?—A. They have not started any Co-operative Societies among bamboo mat manufacturers.

Q. Have you examined them at all from an economic point of view; do you know how many bamboos the individual members buy at a time?—A. They don't buy bamboos; the merchants supply them with the bamboos.

Q. Are suitable bamboos for mat-making very expensive?—A. Not very expensive.

Q. Yet they are too poor to buy their own bamboos?—A. Yes.

Q. Or perhaps the members are in debt?—A. They are very much in debt to the *mahajans*.

Q. There is no great difficulty experienced in starting Co-operative Societies among bamboo workers in other parts of India. Have you much difficulty in getting capital for financing these industrial societies?—A. We find considerable difficulty.

Q. What is your turnover for the whole province in the year?—A. I don't understand you.

Q. How much money is lent out every year in Assam?—A. About 1½ lakhs.

Q. For the whole of Assam?—A. Yes.

Q. Where is this capital mostly provided from?—A. The capital comes from the local people.

Q. From the deposits of members or from loans from outsiders?—A. From the deposits of members.

Q. You have not had much in the way of loans from outsiders?—A. Not very much.

Q. Have you obtained loans from central banks of other provinces?—A. No.

Q. Have you ever tried for it?—A. No.

Q. You have not asked Madras, the Central Provinces or Bengal?—A. No.

Mr. A. Chatterton.—Q. How many Co-operative Societies are there in Assam?—A. Nearly 400.

Q. How many of these are devoted to weaving?—A. I cannot say.

Q. In the Surma Valley how many are devoted to weaving?—A. Six.

Q. How many members have they got?—A. About 150.

Q. Are there central banks for the financing of these co-operative societies?—A. No.

Q. With regard to your remarks about bamboo mat-makers, you say, "this industry is almost entirely in the hands of the *mahajans*." Aren't these the men who really carry on the industry, employing the other people as workmen. If you take the business out of their hands, will it not collapse altogether?—A. It won't collapse.

Q. Do not these *mahajans* occupy the position of masters who employ a certain number of men and supply the material and give out orders?—A. They pay wages at very small rate; that is the difficulty. That is a great hardship to the people.

Q. Are the wages paid less than that for ordinary coolies?—A. Yes, less than the rate for ordinary coolies.

Q. Then why don't the men go and work as coolies?—A. Because they are always in debt to the *mahajan*.

Q. Do they rely on mat-making as a subsidiary industry?—A. Yes.

Hon'ble Lt.-Col. P. R. T. Girden.—Q. You speak about the bamboo mat manufacture, are there any other kinds of mat business than that made out of bamboos?—A. There are.

Q. Will you kindly enumerate them?—A. Sitalpati, nal reeds. These are the two kinds.

Q. Is there a good market for sitalpati?—A. Yes.

Q. Where?—A. In Calcutta.

Q. Do you find any difficulty in getting the patidol from which the sitalpati is made?—
A. No, we have not found any difficulty.

Q. Where do you get it from?—A. From the locality; from villagers in Sylhet.

Q. Do the mat workers import any from the Assam Valley District?—A. I don't know.

Q. Do you think the industry could be extended, the sitalpati industry, by obtaining more capital?—A. Sitalpati traders are generally rich people and don't require any more capital.

Q. Only the bamboo manufacturers are poor?—A. Yes.

Q. These *mahajans* that you speak of, who are they? Are they, Marwaris or local Shylocks?—A. Local people.

Q. Do you think you could work without them?—A. Yes.

Q. How? The Co-operative Credit Societies would advance the money to the workers and make all the arrangements for the sale of their mats, etc?—A. Yes.

Q. Are you quite certain that the figures that you gave Mr. Low just now, 1½ lakhs of rupees, as the total amount lent out for the whole province, is correct?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—What is the total capital?—A. 10 lakhs. They lent 1½ lakhs to co-operative societies and the rest of the amount goes to individual members.

Hon'ble Lt.-Col. P. R. T. Gordon.—Q. How many societies have you got in the Surma Valley?—A. 170 or thereabouts.

Q. Are any of those industrial co-operative societies?—A. Yes, we tried one industrial society and failed.

Q. None of those are industrial then?—A. Only the 6 weavers' societies we have.

Q. Where are they?—A. In Karimgunge sub-division.

Q. What do they weave; they don't weave silk; do they weave cotton?—A. Yes.

Q. Are they doing well?—A. Yes, they are doing well.

Q. Could you form others?—A. Yes, there is very great demand for such societies all over the district. I want to say something which I missed in my note on trade, about the co-operative dairy in Sylhet. It failed because I could not attract much capital. There was something in connection with it, about the land policy of Government. It was a piece of alluvial land which this society tried to get settlement of from Government for grazing purposes, but they could not have the lease of this land, because as the law now stands, the land should be settled with the neighbouring landholder; so the society was not given the lease for it; so for want of grazing grounds and want of capital the society failed. Of course if they could help us with grazing grounds we could have managed. There was some correspondence with Government and Government declined to let us have the land.

Hon'ble Lt.-Col. P. R. T. Gordon.—Was it Government khas land?—A. Yes.

Q. Most of the land there is permanently settled?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—If you had the land you could have started it?—A. Yes, I think the society would not have failed.

Babu S. K. Das.

WITNESS No. 405.

BABU SURENDRA KUMAR DASS, *Zemindar, Akkajia.*

WRITTEN EVIDENCE.

Capital.

I have had very little or no experience of raising capital for industrial enterprise. I was Director of the Karimgunj Commercial and Agricultural Society, Ltd., for a very short time only. It collapsed partly owing to some misunderstanding among its promoters and partly owing to the outbreak of the great war now going on which made the people somewhat shy of parting with their hoarded money. I believe, however, that for a good and honest worker, or for any reliable company there will be little or no difficulty in raising the necessary funds from our rich and educated persons who are according to the spirit of the age, more eager than before, to help local industries. I may mention, as an instance, that several gentlemen will very gladly join with me and advance money if I admit them as partners, but I prefer to carry on the business alone with the help of Government for which I have already submitted an application to the Secretary, Provincial Industrial Committee. The little hesitation which some people now feel in laying out money in new enterprises in consequence, of the failure or mismanagement of some, may be removed if the management is placed under some sort of Government control.

Government aid.

What that control should be would depend on the nature of the assistance given. Government may help the existing or new industries in any of the methods mentioned under question 5 of your letter according to the local or special needs of the industry concerned. It will be difficult to suggest an uniform method nor will it be desirable to tie the hands of

Government in any particular way. So far as cabinet-making industry is concerned, Government may, I think, give loans with or without interest on approved security or supply machinery or plant on the hire purchase system. I would myself prefer the latter. In both cases some assurance should be given that Government should according to its needs, purchase all approved articles from local factories instead of indenting for those from distant places.

Where Government assistance is given in any shape, an officer, preferably an expert, should be appointed to audit the accounts and to see that the business is conducted on economical lines and when necessary give instructions for better working of the industry. In my humble opinion, Government should pioneer such industries as are most promising and require large outlay and expert advisers or engineers for their management. For instance there are ample raw materials in this province for the manufacture of sugar, silk, tobacco, matches, paper, cotton, leather goods, etc., and I think Government may start factories for some of these industries as well as for iron and steel work. Of course such factories should be handed over to private capitalists as soon as they reach a profitable stage. At present (even) European capitalists are not forthcoming to take up any of these industries for lack of knowledge and experience. Tea offers them a very lucrative industry in this province and Indians are also following in their foot-steps.

There is no bank in this province and the time has not perhaps yet come when an Industrial Bank with branches in all important districts can be started with any degree of success. Local money-lenders charge heavy interest and the rates of interest charged even by Co-operative Societies from ten annas to one rupee per cent. per month are high enough for new enterprises. In this matter of pecuniary assistance we must for sometime come to look to Government alone. It may give loans with or without interest to members of any company or to any individual, somewhat like agricultural loans, provided that the rate of interest where charged should not be more than four per cent. and that the time of repayment should be extended from five to ten years according to the nature of the industry. At headquarters of districts and sub-divisions, such loans may be given through Municipalities or through Co-operative Societies so that constant supervision may be exercised over the manner in which the money is spent, without unduly interfering with the internal management which should be left to the promoters of the industry. I may note here also that Co-operative Societies are on the whole working well in the towns but not so well in the mufassil and I would not advocate their extension to outlying places until people are better educated in the principles of co-operation and adequate provision has been made for their efficient supervision and guidance. As there will be very few cases of loans of this kind, I think they may be given direct by Government on the report of the Chairman of Local-boards or Municipalities.

What is most needed in this province is the education of the people in the use and manufacture of various kinds of raw materials which are easily available locally. Without attempting to do anything on a big scale at present Government may start industrial schools where there is a demand for them, with qualified teachers to impart both theoretical and practical instruction to the boys in such useful industries as the Government may think most suitable in the interests of the country. I think at the commencement instructions may be imparted in carpentry, smithy, weaving and tanning of hides. Hand-loom weaving has a great future and the employment of teachers will be very much appreciated. People may also be admitted in the Government or private factories for practical training on condition of serving in the factories for a certain number of years on stipulated salaries. The railway workshops at Jorhat, Dibrugarh and Badarpore may profitably be utilised in the training of pupils.

As regards the industry in which I am engaged, the want of skilled labour is much felt and the opening of carpentry and smithy classes either in connection with my workshop or any other which may be started hereafter would perhaps supply a great want at a comparatively small cost to Government.

I have no particular complaints to make against the forest department but I would urge that the royalty on timber required for cabinet-making may be exempted altogether or reduced to a mere nominal rate as timber in Government forests in Cachar and Sylhet is becoming scarce and we have to pay very high price for their freight from the Lushai country and Hill Tipperah.

There are two saw mills at Bhanga and Lakshipur and it is doubtful if another on a big scale will be successful in this valley. For cabinet-making industry one bend saw and a turning lathe with an oil-engine will be very useful. There are some kinds of local wood which if well seasoned may be used for high class furnitures at a much smaller cost but the freight of spirit which is much used in polish is exorbitant and I would urge its reduction.

I would submit that the benefits of Co-operative Societies in the matter of court fees and income tax be extended to all small industries.

The law regarding the acquisition of land may be so amended as to enable Government to acquire suitable sites of land required for industrial schools and work-shops, as experience has shown that it is difficult to secure good sites even at a heavy cost by private arrangement.

I think there should be a separate officer preferably an expert to inspect and supervise industrial schools and workshops and generally to direct and advance new industries.

ORAL EVIDENCE, 7TH JANUARY 1918.

Mr. A. Chatterton.—Q. In the first paragraph of your note you say that you have an industrial concern going on and that several gentlemen will be very glad to join you and

advance money if you admit them as partners, but you would prefer to carry on business with the help of Government: that is to say, you hope to get money out of Government on better terms than from your partners. Is that what you mean?—A. Yes, I think so.

Q. Can you give some particulars as to what is the business which you are carrying on?—A. Cabinet-making and smith's work.

Q. Where is your factory?—A. At Akhalia, near Sylhet.

Q. Are you running this yourself?—A. Yes.

Q. What help do you get from Government?—A. At present I do not get any help from the Government.

Q. But you would prefer to get help from Government?—A. I would like to get.

Q. What form of help do you expect from Government?—A. I want machinery on the hire-purchase system and acquisition of land.

Q. You would like to get machinery on the hire-purchase system from Government in preference to increasing your capital by taking in fresh partners?—A. Yes.

Q. Is there any system in Assam by which you can obtain such assistance from Government?—A. None.

Q. For what reason do you desire that the royalty on timber for cabinet-making should be abolished?—A. In the case of an infant industry like cabinet-making in Sylhet the royalty may be diminished or altogether abolished, because we require our men to learn cabinet-making, etc.

Q. On the ground that the men should learn cabinet-making you wish to have the royalty abolished altogether?—A. Yes. Wastage is exorbitant in the hands of apprentices.

Q. What royalty do you pay?—A. Generally 3 to 4 annas per cubic foot.

Q. Do you get all your timber at that rate?—A. Not all. For cabinet-making we require first class timber and the royalty on this is 3 or 4 annas.

Q. How do you get your timber? Do you have it cut in the forests?—A. We buy from other dealers.

Q. At what rate are you now buying per cubic foot of first class timber?—A. We generally pay a rupee or 14 annas per c. ft. of round log.

Q. How many men do you employ?—A. In my carpentry works there are some sixteen mistris, and in the polishing department there are six mistris.

Q. Are they making household furniture?—A. Yes.

Q. Is that entirely for local use or do you send it away?—A. For local use.

Q. Are the carpenters you employ Assamese or are they imported men?—A. They are Punjabis, and there are some Calcutta men also.

Q. What led you to take up carpentry?—A. I learnt mechanical engineering in Calcutta at the Bengal Technical Institute.

Q. How long were you there?—A. Four years.

Q. Have you got any machinery?—A. At present I have got one machine for drilling and a small lathe.

Q. Besides carpentry, you do smith's work also?—A. Yes.

Q. What sort of work are you doing in that line?—A. I started making pruning knives, but the price of steel is much higher now, and therefore I have stopped that part of the business as present.

Q. Where did you get your steel from?—A. From Calcutta.

Q. What class of steel?—A. We bought old files.

Q. Is this smith's work going on in any other form now or have you given it up altogether?—A. I got some order from a College for laboratory apparatus, and that we are preparing now.

Q. Do you make any agricultural tools for the people of the country or for planters besides?—A. No. They generally use rough tools, and we cannot handle these things.

Q. You don't make any planters' tools?—A. No.

Q. When you were able to get steel—old files—in the Calcutta market, were you able to compete against imported pruning knives?—A. Yes, I think I shall be able if some sort of help is given by Government.

Q. Before the price of steel became high, how many pruning knives were you making?—A. I only began that work lately. I made about a thousand.

Q. To whom did you sell them?—A. To tea gardens.

Q. To Indian tea gardens?—A. Yes.

Mr. C. E. Low.—Q. What business did this Karimganj Commercial and Agricultural Society propose to do?—A. Tea business.

Q. Was it to be the business of growing tea?—A. Yes.

Q. Was it a tea garden?—A. They proposed a company for growing tea. They have not yet started it.

Q. How much capital was paid up?—A. Only about Rs. 5,000.

Q. You say there is no bank in this province. Is there no branch of a bank anywhere?—A. At present there is no branch anywhere.

Q. There are, I presume, some Indian bankers, Marwaris and so on?—A. There are bankers, but they charge high rates.

Q. Are there any loan societies, branches of any Bengal loan societies?—A. I do not know.

Q. You say under the head "Industrial schools" "I think at the commencement instructions may be imparted in carpentry, smithy, weaving and tanning of hides." Do you think that tanning of hides is suitable as a small scale cottage industry?—A. I think chrome tanning may be done on a small scale.

Q. There is a good deal of small scale tanning done in India: is it not the fact that small tanneries of that sort make exceedingly bad leather? Do you think that they can compete with large tanneries such as are springing up in many parts of India?—A. I have no clear idea but I have got friends of mine who have learnt chrome tanning in Madras and who have started small tanneries.

Q. You don't mean the kind of village tannery where the man works with his family?—A. No.

Q. You say "the railway workshops at Jorhat, Dibrugarh and Badarpore may profitably be utilised in the training of pupils." Don't they train any apprentices at present?—A. They train, but they don't give theoretical knowledge.

Q. Have they no teaching classes attached to their workshops?—A. None at all.

Q. Do you know whether they pay any particular attention to their apprentices? Have they any special officer to look after them or do they simply learn what they can in the shops?—A. Yes, if the man is intelligent he will understand something by seeing and can pick up some knowledge.

Q. Is there no systematised way of dealing with them?—A. I do not think there is any.

Q. On what is your knowledge of this question based about apprentices in the railway workshops? Have you been to the railway workshops or have you known of any boys who went there as apprentices?—A. I have occasionally visited shops at Badarpore.

Hon'ble Sir R. N. Mookerjee.—Q. If you have no objection, can you tell us what is the capital of your own concern?—A. In my concern the capital is about Rs. 15,000.

Q. What do you earn in a month?—A. Nearly Rs. 100 a month.

Q. Is that excluding your own pay?—A. Yes.

Q. Have you any idea of extending your business?—A. Yes.

Q. After the war?—A. Yes, after the war. At present machinery is not available.

Q. If you get machinery, you will extend your business?—A. Yes, that is the difficulty.

Q. Why then don't you want partners?—A. I don't want partners because I think there will be difficulty about management.

Q. You mean there will be friction?—A. Yes.

Q. I take it you are a native of Assam?—A. I belong to Sylhet.

WITNESS No. 406.

Babu K. N. Bardalaya.

BARU KESHAU NATH BARDALAYA, Merchant and Planter, Dum Duma.

WRITTEN EVIDENCE.

Assistance in Marketing Products.

If by commercial museum it is meant that it is a museum where articles of exports and imports would be kept as exhibits for the information and knowledge of buyers, sellers and likely manufacturers then I am of opinion that there should be one at Gauhati—(Gauhati being the central place) where Assam indigenous products such as eri, muga, lac, ivory, deer-horns, buffalo-horns, jute, other fibres like rhei, dye stuffs, bell-metal, utensils and brass utensils, Assamese jewellery, cloths, rubber, cocoons of eri and muga, Assamese looms and spinning machineries, articles made of ivory, etc., may be kept with list of prices. In this museum samples of articles imported by Government also may be kept with a list of prices and the places from where bought, so that intending manufacturers may readily see and derive knowledge and other useful informations for his purpose. It would also be a great and desirable thing if some of the articles made from our raw materials in foreign countries be placed in the museum.

Sales agencies.

At present in the poor Assamese ryots' cottage industries the producers get very little for their labour and time. It is the middlemen who make the most profit and hence it would be a great help and blessing if these Assam indigenous cottage products be sold by sales agencies at Gauhati and other central places just as tea is sold in Calcutta. The villagers of Assam may safely place their cottage products in the hands of respectable headmen of their villages who may pack and send the articles by train to Gauhati and other central places, the Railway giving special concession rates for freight and the articles being sold from the commercial museums. The headmen and the commercial emporia agents will levy a reasonable amount of commissions for their labour. This I hope will save the Assam ryots. The commercial museums might just be started by Government with the building of the house, appointment of men and officers for a couple of years and then handed over to private but respectable companies taking the capital and an interest at 4½ per cent. per annum.

Industrial exhibitions.

Industrial exhibitions cost a good deal of money which is almost a waste. They only bring people together socially: the furtherance of commerce is not attained. People gather and see the *tamasha*, purchase something and then disperse and soon forget the affair soon. So I am against these exhibitions. In my opinion the fairs and marts held in Kamrup on occasions of *sabhas* like the *Kochra sabha*, etc., give greater facilities to poor sellers and buyers to sell and purchase. These *sabhas* cost nothing and should be encouraged by private people everywhere in the province. I don't think there is any need for Government to establish such exhibitions at all.

Trade representatives.

Not to speak of Assam, India is not yet fit to send trade representatives to foreign countries.

I am against temporary commissions for special enquiries. Commissions are costly affairs for the Indian people. I do not recommend trade representatives in other provinces of India. Assam has very little big trade. No doubt there is coal and petroleum and tea but all these are in the hands of European companies and they know best if they should send representatives to foreign countries or other provinces.

Purchase of stores.

I don't know the rules for the purchase of Government stores nor have I criticisms to offer. All that I may humbly suggest is that when available our paternal Government would purchase Indian stores, i.e., articles made by Indians as much as possible provided these articles be of the required standards. Facilities should be given thus to Indian manufactures.

Banking facilities.

A well organised system of banking is necessary. The banks should receive support from Government, otherwise banks would not succeed. These banks may give loans to support cottage industries at nominal rates of interest say 4½ per cent. per annum on good securities. Cheap and new machineries that may make gains of cotton, eri and silk may be supplied to village people on hire or hire-purchase system just like what prevails regarding sugarcane pressing and selling of Singer's sewing machines by the Singer Co.

General.

I am a merchant dealing in miscellaneous stores and a tea planter. I have nothing to suggest on these matters.

Suggested industries.

My experience suggests that Assam is suited for a number of new industries such as (1) manufactures of sugar, (2) making paper pulp, (3) manufacture of cement, (4) making agors, (5) dye stuffs.

Sugar.

For sugarcane cultivation there is enough of land in the province. But several factors have been retarding this important industry. In the first place lands in Upper Assam from Nowgong and Darrang upwards are not given either under fee simple or waste land grants. There are no banks from which the enterprisers can get money help. People are loth to subscribe unless and until they see that the industry is favoured by Government. I know two instances. Many years ago one Srijut Debeshwar Gosain of Golaghat began on a small scale the cultivation of sugarcane in the Golaghat sub-division. He got a few acres of lands on favourable terms like waste land grants. He did not take any sharers or partners. With his own money he started the industry and by now he has been doing good business in molasses. He has succeeded so far as the concern is entirely his own. The Nepalese do sugarcane cultivation all over the province. They receive finance from the mahajans at exorbitant rates of interest and the result is that these Nepalese though they do a good business and labour hard live only from hand to mouth, all their surplus profits being absorbed by the mahajans in the shape of usurious rates of interest and compound interest. Only some six years ago another Assamese young gentleman who had training in such business in Japan made a proposal of starting sugarcane cultivation and manufacture of sugar on a large scale. He travelled from district to district asking people to subscribe, and the people put down decent sums in the subscription list. The gentleman collected a few hundreds and started sugarcane cultivation in Dibrugarh near Tinsukia. He applied to Government for land on easy terms. But the Government wanted him to subscribe to some conditions perhaps in the interest of the tea industry. To these conditions he did not agree and the subscribers then began to show unwillingness to pay up more money as the concern was not made into a joint stock company business and the subscribers found that Government was not willing to give land in Dibrugarh on favourable terms. With the few hundreds he collected he planted some canes taking lands on decennial leases. He manufactured some *gur* but when he put

the *gur* into the market for sale the mahajans nonplussed him by offering him prices which would not cover even the cost of his cultivations, and thus he had almost to give up the industry and I have been one of the losers by few hundreds of rupees. Had the gentleman got land on easy and favourable terms people would have paid up their promised amounts and the concern would have been a success and most profitable considering the rise in the price of sugar by leaps and bounds ever since the war.

In my humble opinion the forests of Assam contain enough of materials, *e.g.*, bamboo Paper pulp, and grasses of different kinds from which paper pulp may be made and papers manufactured. Research and expert advice is necessary before such an industry is started.

I think in Assam there are materials from which cements may be made.

Cement.

This industry is being done by a few traders in the Nambor forests and in the Mikir Hills. The Mikirs and other hill tribes collect these and sell to traders.

Agora.

There were Assamese indigenous dyes in former times. These have died out but a revival may be attempted.

Dyes.

WITNESS No. 407.

Babu Pavitra-
nath Das.

BABU PAVITRANATH DAS, Kavinganj.

WRITTEN EVIDENCE.

I have some experience in raising capital for industrial enterprises as I was Director of Capital the Industrial Development Company (District Sylhet) for a short time. The Indian capital, it has been often said, is shy. There is always some difficulty in raising capital for enterprises the condition and prospect of which are not known to the people. Illiteracy and lack of information are mainly responsible for what has been called the shyness of Indian capital, and to add to this, there is reckless business enterprise of people more or less unfit for the task they take upon themselves. The difficulty in raising capital peculiar to Assam is, that education and information are lacking among the moneyed classes. Those who know that a particular line of investment will pay, are generally without money to invest. This is why we have to resort to canvassing for such profitable enterprises as tea. Owing to a big jobbery and misappropriation recently revealed in the Cachar Native Joint Stock Company (an old tea company of the Surma Valley) some people will hesitate to invest money in new enterprises. To remove this sense of mistrust from the people's mind and to ensure the safety of their investments I should like to suggest that the Director of Industries should be given power to investigate the affairs of any company and to report to the Government about the mismanagement of the company, and Section 188 of the Indian Companies Act may, if necessary, be amended.

The Secretary of State has sanctioned a Director of Industries for the province of Assam. With a view to develop the cottage weaving industry in this province it is essential that the Director should be an expert weaver with knowledge of dyeing and mechanical engineering. He should also have experience in developing cottage industries of foreign countries. He must be a very practical man and intimately acquainted with the condition of industry in this province.

The weaving industry in Assam is at present greatly hampered for want of good yarn. Nowadays only the rejected yarn is placed in the market by the cotton mills; so, the finish of hand-loom made cloths are not good. To remedy this defect hand-power improved machinery should be introduced and the "old charka" system should be revived. These spinning machineries should be supplied to the weavers on the hire-purchase system, or loans should be given out for the purchase of the same. In my opinion, giving loans will be the best method of aiding industrial enterprises as the above. But no interest on such loans should be charged in any case, till the concern or industry is in a position to pay it (say, assistance for a period of five to seven years during which the industry may be expected to be in a position to pay the interest). Loans without interest will do much to revive the decaying cottage industries.

In this province there being no cotton mills, the yarn is imported from Calcutta; and as the freight charge is very high, the cost of the products of this province becomes higher than that of the products of other countries, and this renders competition with the sister provinces very difficult. I am, therefore, inclined to think that Government aid in reducing freights will facilitate the improvement of the industry. Government may for some years to come subsidise freights on the yarn brought from Calcutta, with a view to bring the cost of the Assam weavers' productions at par with that of the weavers of Calcutta, Dacca and other districts.

In order to develop the industry there should be held annually, weaving competitions with large prizes, such as may be utilised by the weavers as their capital. Improved handlooms, warping machines and drums may be awarded as prizes.

The rearing of the *cadi* silk on improved European method should be introduced in the Brahmaputra Valley and the spinning of the *cadi* silk by improved machinery should also be tried.

Commercial Museum.

I think one commercial museum at least to be necessary for every province. But in a commercial museum in Assam, only such products should be kept as actually are manufactured or possess the necessary condition of production in the province.

Weavers willing to visit the Calcutta Commercial Museum or the weaving centres of other places such as Benares, Madras, Bangalore, etc., should be allowed free passage. The railway fares should be borne by the Government as is done in the case of patients going to the Pasteur Institute.

Exhibitions.

Industrial Exhibitions should be held both in the Brahmaputra and the Surma Valleys. The aim of such exhibitions should be to bring buyers and sellers into close contact with one another. A fair should also be held along with the exhibitions.

Industrial Banks.

It is notorious that there is no Industrial Bank in the country. The fact is there is stringency in the Indian money market as the high rates of interest in different places would show. The remedy seems to be in establishing Industrial State Banks in every province and bringing them in line with the needs of the country, generally to encourage the existing banks to render adequate assistance to industrial concerns. The Government may grant certain concessions to banks or even allow them a small dividend on the total amount lent out by them, to promote industrial enterprises.

Co-operative Societies.

In Assam Co-operative Societies are few, and I think there is no reason why Co-operative Societies should not stimulate those cottage industries (e.g., handloom weaving, etc.) which require some outlay, and which it is not possible for the poor householders to start at the very first stage. Co-operative Societies may be started with the aid of the Government to buy improved handlooms, machines for making socks, etc.

Co-operative Societies should give encouragement to those industries of which the machinery, etc., are too costly for the individuals to buy, but nevertheless are essential to efficient production.

At present the system of supplying capital to the Co-operative Weaving Societies from the town banks is not at all satisfactory. The town banks are not always ready to grant loans to Weaving Societies owing to the paucity of capital. The Government should supply Co-operative Weaving Societies money at the rate of 4 per cent. per annum, when recommended by the Director of Industries.

Before the year 1908, there was no fly-shuttle handloom in the Karimganj Subdivision (District Sylhet). But in that year a young man of the Bhadrak class started a weaving factory at Sylhet, and employed some boys of the weaver class for doing the work of sizing, warping, etc. Although the weaving factory collapsed in a few months, the boys learnt enough of weaving in fly-shuttle looms and started fly-shuttle looms in their own villages.

There are at present more than 1,000 fly-shuttle looms working in the district. In my opinion a travelling demonstration of weaving and dyeing factory would be very useful for the development of the cottage weaving industry.

WRITTEN EVIDENCE.

Official organisation.

It has always appeared to me that, whatever might have been at the back of Lord Curzon's mind when he created the portfolio of Commerce and Industry, it has in practice been of little assistance to the interest it was supposed to represent.

To my mind the Member should be a medium between Government with their Departmental red tape and commercial interests and that such medium should have strong sympathies leaning towards commerce. Should any point be raised by Government deterrent to such interest it should be his endeavour to remove the objections. He should in short be a strong sympathiser with the point of view of the non-official, readily accessible to the commercial and industrial communities and ready to represent their interest in the innermost privacy of the bureaucratic fastnesses.

It appears to me that the Member for Commerce and Industry, surrounded as he is, by his permanent Government staff at once becomes absorbed in the bureaucracy.

It may well be that this criticism goes beyond the scope of your enquiries and be inadmissible but a good deal in my opinion hangs upon this.

At the Dacca Industrial Conference held in 1909 I supported the resolution urging the appointment of a provincial Director of Industries. Partly in view of the expression of opinion regarding the Member for Commerce and Industry I am inclined to revise that opinion and would prefer to see set up an advisory board something similar to our existing advisory railway and river connection board. Advisory Board necessary.

The membership of such should be by selection and nomination by the head of the Provincial Executive and their function should be purely advisory without executive powers. It should be prepared to take up the cudgels in favour of any existing or proposed industry that was in difficulties or troubles of any sort.

The questions at issue should be carefully sifted and the final conclusion arrived at should be given adequate weight by the final arbiter, be such the Provincial or Imperial Government. It is obvious that such advisory board should include departmental heads.

Many a grievance—let me say with the Forest Department and which is so common in Assam—would either be removed or cease to be a grievance, were the local conditions and arguments exposed to the cold light of discussion instead of being tied up in involved arguments of precedence or irrelevant matter so often to be found in official files.

With regard to the training of Indians to take a more active part in the industrial development of the country I am fully aware that we are treading upon difficult ground involving technical education and all that it means. To go into this discussion would be too lengthy and I will not attempt it except to express the conviction that it will have to be undertaken and it is not impossible. I would however point out cases which have occurred in this province where, to my mind, excellent opportunities presented themselves to the educational authorities for giving technical education of a very useful kind. Some years ago an experimental sugarcane plantation was started in Goalpara, similarly the fruit orchard was started in Shillong and at Jorhat a regular experimental farm was inaugurated. In April 1914 I suggested, at a meeting of the Assam Legislative Council, that advantage should be taken of such departmentally run experiments to train up sons of *Mouzidars* and such like through a system of scholarship. Nothing has been done and all these years of careful scientific study has been thrown away as a practical educative medium. It is quite true that the agricultural department issues periodic reports anent their progress but if this is satisfying to the educational authorities it is in my opinion much on a par with their general unpractical curriculum. Training of supervisors.

I have had a good deal of interesting experience in attempts to train up educated Indians to posts of responsibility involving technical work. Both in the drilling of wells and refining of oil I have always had it at the back of my mind that it was only a question of getting hold of the right stamp of man gradually to replace many men whom we have to import from Europe, by intelligent Indians. One only has to have a few years' experience with the class of so-called technical experts to realise how little experience the majority of them have had before leaving Home and even though some men may be somewhat older and have had some experience in Europe the fact of their age is a very big handicap.

These men though intelligent enough at their own particular work have not got the education, training or tradition which are so necessary to a successful career in India where habits and customs are so utterly alien to the one in which they have been brought up and in my experience this is a handicap which they are seldom able entirely to overcome. Against this the educated Indian may have greater difficulty in grasping the technicalities of the work, but in few cases should such technicalities be as difficult to conquer as is the sympathetic understanding of the country and its people.

I do not suppose there is any industrial work being undertaken in Assam which is more full of technicalities than the one I am engaged upon and yet I give it as my deliberate opinion that there is nothing in it which an educated man should not be able to master, provided he be content to start at the bottom and have sufficient patience and grit to work his way up. I must confess to frequent feelings of great disappointment though from some Indians I have had most encouraging results.

We have just inaugurated a regular system under which we offer graduates in either science or art, terms which I hope may be good enough to create a certain amount of competition. As a probationer we are offering R100 per month and such probation would, in the ordinary course of things, extend over about 9 to 12 months during which time they would be initiated into the particular technical work they are required for and at the end of such probation those who have shown intelligence are to be taken on our general staff commencing at R150 and rising up to R300 per month by yearly increments of R50.

From my experience of the average Indian he does not enter his business career with sufficient feeling of dependence upon his own exertion for his existence and it seems to me that this absence of self-dependence is due to their semi-religious sentimentality which thrusts an obligation upon them to help relations to an absurd degree. One of the lamentable results of this is the difficulty a youth experiences in accepting the principle of discipline. Also a too large percentage of them are not sufficiently patient to go through the drudgery of mastering their work and they get disheartened because they are not put into positions of trust and authority more quickly.

SHILLONG.

WITNESS No. 409.

RAI BAHADUR UPENDRANATH KANJILAL, *Extra Deputy Conservator of Forests (retired).*

WRITTEN EVIDENCE.

I.—Financial aid to Industrial Enterprises.

I have no personal experience in raising capital for industrial purposes. What I write below is based on my knowledge of the country and its people.

I do not think there is much scope for large industries in Assam, especially Assam proper, where the people have a rooted hatred for factory-work. The chief aim therefore in improving industrial conditions in Assam should be to foster cottage industries, or industries of a communal nature. The bulk of the population are agricultural and they are the only source of indigenous labour. These people work for about four months in the year on their fields and have practically nothing to do during the rest of the year. It would be a great boon to the country if they could be shown how they could utilize their spare time in turning out small articles of every day use without losing self-respect by submitting to be called "coolies." There are many villages which are inhabited chiefly by men of a single caste. In such villages an industry congenial to that caste might be introduced where the people could work jointly and share the profits mutually. No large factories will benefit the people of the soil. They will in most cases be initiated by foreigners with foreign capital and will invariably be worked by foreign labour.

For cottage industries pure and simple the only way of giving financial aid will be through co-operative banks. People will in most cases require small loans to buy tools and plant. In some cases these might be supplied to them on the hire-purchase system.

For communal industries, especially when they are of some magnitude, it may be necessary for Government in some cases to guarantee dividends for a limited period without a stipulation for refund. This will be sufficient to attract the capital that may be required. When Government will give assistance in this shape the business and its books and accounts will be liable to be periodically inspected and examined by such officers as Government will appoint or authorize for the purpose.

In order to cope with the work that will be thrown on them co-operative banks must be multiplied almost indefinitely so that eventually there will be at least one bank in each *manza*.

When the object is to introduce an industry which must be undertaken on a large scale to be successful, or which is entirely new and foreign to the instincts of the people, the establishment of pioneer industries appears to be the only feasible means. As soon as such industries begin to be productive of above a certain minimum rate of interest on the outlay, they should be offered to capitalists or companies on fair terms. They should in no case be converted into permanent Government enterprises.

Government should not as a rule assist, beyond the extent possible by the agency of co-operative banks, any enterprise which has a successful competitor in the province, for the very object which would justify direct Government aid has already been fulfilled by the existence of such a competitor. But Government would hardly be justified in giving much consideration to external trade, for India receives no consideration from the organisers of such trade which has in many cases proved prejudicial to her interests.

II.—Technical aid to Industries.

Having been connected with the Forest College at Dehra Dun for over 18 years, I have a little experience of technical and scientific education and researches. I believe the turpentine industry of Upper India has received a distinct impetus from the researches carried on at Dehra Dun, and a few other minor industries might also be mentioned.

As factory work is distasteful to the people, I am afraid demonstration factories will not be of much use in Assam. But there should be a technical school at every sub-divisional town, the crafts taught being varied according to the requirements and idiosyncracies of the people among whom each school is situated.

Assam is not likely to need a Research Institute of its own for a long time to come. It will be sufficient for the present to have one well-equipped all-round good Imperial institute in India to which all technical and research questions will be referred for solution from the various provinces.

A sort of an enquiry was held quite recently as to the available resources of the country. In view of this a further survey does not appear necessary or justifiable.

I do not think it will be necessary to appoint consulting engineers, at any rate in the near future. As I have said under VII, there will be a mechanical engineer in the staff of the Director or Inspector-General who will be able to help industrial enterprises by technical advice and to supply plans and estimates when asked to do so. As far as possible all purchases

Government
assistance.

Pioneer factories.

Limitations to
Government
assistance.

Research
institutes.

Consulting
engineers.

should be made by the parties requiring machinery and plant under advice, when necessary, of the mechanical engineer. The system of purchase through somebody else has always a bad odour and should be avoided as far as possible.

III.—Assistance in marketing products.

Commercial museums are very useful institutions, and at least one such museum should be established at a central place, say, Gauhati. In this museum samples of the principal raw materials available in the province as well as of all finished articles prepared from them should be collected for exhibition. Industrial exhibitions are expensive undertakings and are more or less ephemeral in effect. A large proportion of visitors to such exhibitions are village folk for whom the chief attractions are the gaieties which are always provided, and as to those few persons who attend really in quest of information, they would much prefer to go and gather it from the much quieter rooms of a well organised museum. Commercial Museums.

I do not think trade representatives in Great Britain or elsewhere will be of much use in the present state of India's trade, nor is this province ready yet to have such representatives in other provinces of India. Trade Representatives.

The present rules which make it obligatory to obtain certain articles through the Secretary of State should be abolished without delay, local authorities being empowered to purchase everything that may be required for a public purpose either locally or in the open market. Officers charged with the purchase of stores should be in close touch with the Directors of Industries of the various provinces, and a room should be set apart in each museum where articles generally required for Government use should be exhibited to enable manufacturers to try to turn out similar articles. Government patronage.

IV.—Other forms of Government aid to Industries.

In the case of raw materials which usually go to waste in vast quantities either through want of knowledge of their use or of enterprise, Government would be justified in supplying them on easy terms to persons or firms who might come forward as pioneers to utilize them for the first time. But as a rule monopolies should not be granted excepting for very short periods.

With the exception of only two districts, Government is the sole proprietor of all lands in Assam. The procedure of land acquisition is therefore much simpler here than in most other provinces. All lands required for *broad file* industrial purposes should be acquired by Government for the organisers at their cost, and the Land Acquisition Act, if necessary, should be so amended as to make this possible.

V.—Training of labour and supervision.

As I have said before under I, large factories do not exist in this province nor are they likely to come into existence in the near future. A large class of labourers therefore is as yet unthinkable. For the training of craftsmen for cottage industries industrial schools will be the best means, and there should therefore be plenty of these, so that the learners may not have to go far for the training they will seek. The apprenticeship system has many good points, but it can only be resorted to where large factories or workshops exist.

Technical schools ought to have nothing to do with the Education Department and should be entirely under the control of the Department of Industries when such a department comes into existence in this province, or under the Deputy Commissioner until it does so.

VI.—General official administration and organisation.

At present there is no organisation in this province for the development of industries. To begin with it will be sufficient to have a Director with one or two Assistants and a number of Inspectors. When industries have sufficiently developed it will be necessary to have a Deputy Director in each of the valleys with an Inspector in each district and a Sub-Inspector in each sub-division. The Director must have executive powers and full control of all funds budgetted for the development of industries with perhaps this exception that the funds that will be required to start co-operative banks should be controlled by the Director of such banks. I do not see the use of an Advisory Board. When an Imperial Department of Industries is formed the chief controlling officer will probably be called the Director or Inspector-General of Industries, and his functions should be of an executive nature in regard to his staff of experts and their offices, but only of an advisory nature in his relations with the provincial Directors of Industries. The Director of Industries of a province should be a business man with sufficient education and ample local knowledge. In course of time the best men would be promoted Deputy Directors, who in their turn have worked for some years as Inspectors. Graduates of Commerce would probably be the best recruits for Inspectorship. The ideas of experts are liable to be one-sided inclining towards their own hobbies, and non-expert officials are often given to theories and platitudes.

The relations between the Director of Industries and the Provincial Government should be very much the same as in the case of the Director of Public Instruction. The technical schools will be entirely under the Director of Industries and his staff. Correlation of work of provincial departments.

The correlation of the industrial activities of the various provinces will obviously be one of the chief functions of the Imperial Inspector (or Director) General of Industries. When industries are fully developed in all the provinces, it should be exceptional for raw materials of one province being exported to another.

VII.—Organisation of Technical and Scientific Departments of Government.

The only two departments in this province that can directly assist industries are Forest and Agriculture including Veterinary. But as hitherto it has not been any body's business in particular to trouble about the development of industries, there is practically no organisation for the purpose. The Agriculture Department has, I believe, done something towards the introduction and improvement of sugarcane cultivation and also of sericulture and weaving; and following the example of the Forest Department some landholders of Goalpara have placed their forest estates under more or less effective conservancy. It has besides been supplying raw materials of various kinds which give employment to large numbers of men both within and outside the limits of the province. The potentialities of the Forest Department are however immense which are only waiting to come into play gradually as industries spring up and flourish.

Imperial Department
of Industries.

An Imperial Department of Industries will become inevitable, with the Inspector or Director-General at its head. But it does not follow that an Imperial Service is also required. The chief equipment of an officer of this new department will be his knowledge and appreciation of the idiosyncracies of the people among whom he will work, and the confidence and respect he will command from them. If he lacks knowledge of technical matters he might be given opportunities to replenish it by touring in foreign countries.

The Inspector-General would require to be assisted by a staff of experts, such as a chemist, a metallurgist, a mechanical engineer, a sericulturist, a botanist, a mycologist, and so forth, each with a well-equipped laboratory and with all up-to-date books and appliances. The provincial Directors of Industries would refer to the Inspector-General all technical matters too tough for solution by themselves, and his staff ought to be able to solve them all satisfactorily. These officers will practically form an institute of Technical Sciences. To start with, one such Institute will be sufficient for the whole of India. In course of time each of the larger provinces may need an Institute of its own which will then work in unison with the Imperial Institute.

Seconding of expert
to provincial depart-
ments.

An expert loaned by the Imperial Department of Industries to a provincial Government should be under the orders of the provincial Director of Industries in administrative matters, but under those of the Inspector (or Director) General of Industries in technical matters.

The existence of the Indian Science Congress is scarcely known in Assam, and I am not aware if it has so far done any good to this province.

Study of foreign
methods.

Facilities may be given to experts to study methods and conditions in other countries, by paying their travelling expenses during furloughs or granting them additional furlough on condition of their submitting reports on their experiences and such reports being approved by the Inspector-General of Industries.

Reference libraries.

There is at present no reference library in the province. There should be one such library with the proposed museum at Gauhati, and the Director of Industries, if his headquarters be not at Gauhati, should be given perhaps a smaller one in his office for use of his staff. I have felt the want of scientific books very much in connection with my own work.

Besides libraries there should be an organisation for dissemination of knowledge by the publication of pamphlets and tracts in the two principal vernaculars of the province. The Director of Industries should control this organisation, perhaps jointly with the Director of Public Instruction. Government should bear the cost of publication, and the books should be sold at only a nominal price. They must not be distributed free, as people do not value what they do not pay for, and have generally a distrust for free publications.

College of commerce.

It will probably be a long time before Assam will require or be in a position to maintain a college of commerce of her own, but no doubt she will do so eventually. In matters administrative such a college should be under the Director of Public Instruction, the University prescribing the curriculum of studies. The Director of Industries will submit to the University through the Director of Public Instruction annually or periodically a report as to the quality of the education received by the graduates of the college serving under him, and the course of instruction will no doubt be varied from time to time in deference to his opinions, especially when supported by the Director of Public Instruction.

A commercial college will disseminate commercial knowledge, the want of which has so often been the root cause of failure of many an industrial enterprise; and it will supply recruits for the Industrial Department.

VIII.—Government organisation for the collection and distribution of Commercial Intelligence.

I have no personal knowledge of the system followed either by the Director of Statistics or the Director-General of Commercial Intelligence and have therefore no criticisms to offer.

The "Industrial and Trade Journal" is a fairly useful publication, but I would suggest that arrangement should be made to publish some of its articles, especially those likely to be of interest to the less educated men engaged in trade or industry, in the vernaculars of the parts of the country concerned. (*Vide* my remarks under VII.)

The Forest and Geological monographs are no doubt store-houses of valuable information which are bound to prove of immense value as soon as people will wake up from their lethargy, and commercial and industrial education is given the impetus it deserves. In the present state of knowledge some of these publications are beyond the comprehension of men of average education, and have therefore not been productive of much real good. A number of articles of forest produce have received attention from commercial concerns owing to the publication of forest memoirs.

Special monographs.

IX.—Other forms of Government action and Organisation.

The want of transport facilities is much felt in many parts of the province and hinders industrial development to a serious extent. There are many forest areas which although well stocked with good timber are either not worked at all or not worked to the extent they might be, owing to want of transport facilities. The following railway projects are suggested:—

Transport facilities.

1. A line joining Dibrugarh, Khowang, Sibsagar, Jhanji and Amguri.
2. A line linking Silghat with Jorhat and eventually extended to Jhauji.
3. As soon as (2) is constructed, if indeed not earlier, the Jorhat State Railway should be reconstructed on metre gauge in order to make through running possible between No. (2) and the Assam-Bengal Railway.
4. A railway from Tangla through Tezpur and North Lakhimpur to Dulongmukh with possibility of extension eventually to Pasighat together with a number of feeder lines extended up to the foot of the hills.
5. A line connecting Gauhati with Mahendraganj and possibly Bahadurahad, with branches to tap the Garo Hills.
6. An extension from Silehar to a point opposite Lakhimpur with a branch to Monier Khal via Narsingpur and Dhalai.
7. An extension from Sylhet to Theriaghat.

Simultaneously with the construction of the above railways a well-devised system of cartroads should be made converging to the stations and touching as many forest areas and potential centres of industrial activities as may be possible.

I am not aware if anything has yet been done in this province to develop hydro-electric power. There are very good facilities for it along the southern slopes of the Khasi Hills and also round Shillong. I think it would be possible to light Sylhet, Shillong and Gauhati by harnessing a few of the streams and falls, besides making power available for other industrial purposes.

Hydro-electric power.

I do not think there is much fault to find with the general policy of the Forest Department. It is the butt of much vilification in the press and sometimes even from officials of other departments, but in most cases the criticisms arise out of ignorance of the aims of the department which are entirely for the good of the people. It will be a very long time before the village folk who live in the vicinity of forests will learn to subordinate their individual interest to that of the public and to resist the temptation of taking what does not belong to them. In a country like Assam where there is forest in each district, it would be well if the text books used in the primary schools contained a few lessons explaining in simple words why forests should be conserved. The ignorance in this respect even in otherwise well-informed circles is appalling. I fully believe that if this elementary knowledge is well spread in the country, the angle of vision will undergo a material change, and the aims and endeavours of the Forest Department will begin to be appreciated.

Forest Department.

So much for the *policy*. But in actual working many defects creep in, which are due to the lower ranks of Forest Subordinates being almost incredibly underpaid and the upper being generally undermanned. I know of men who are educated to the extent of being able to keep office and to carry on correspondence in English, but who have been kept on the poor pay of Rs. 20 for as many as 15 years and most of this time holding more or less independent charges. These men have a family to maintain, very often a number of children to educate, and are expected to keep up a certain amount of respectability, and all this on Rs. 20, which is scarcely enough in these hard days for a domestic servant. It is nothing short of insanity to expect these men to keep straight and to interpret by their own actions the benevolent nature of the general policy of their department. Then again supervision has in many cases been slack owing to paucity of supervising officers, so that those underpaid officials have very generally a free hand in most matters. I cannot too strongly urge that these matters be looked into without delay, for I fully believe that when these defects are remedied the unpopularity of the department will disappear.

Although otherwise rich the Assam forests have the great defect of being very mixed, that is to say, hundreds of different species of trees grow together indiscriminately of which perhaps not more than half-a-dozen have at present any marketable value. This points to the urgent necessity of making extensive plantations of only the more valuable species of trees.

As forests take many long years to grow to maturity this work should be taken in hand without delay. Plantations are doubtless costly undertakings, but the matter has become so urgent already and will be so much more so when industries receive the impetus which they deserve, that Government will be fully justified in absorbing all the surplus income of the department in making plantations for the next 30 years or so.

Methods of forest transport generally adapt themselves to the configuration of a country and the habits of its people. In Assam the chief means are elephants and buffaloes. Elephants generally drag logs, and buffaloes do that as well as draw carts laden with timber. It is therefore plain that a system of paths and cart tracks is the first desideratum for forest exploitation. These are still generally wanting in many forest tracts and should receive due attention.

It may here be mentioned that railway authorities are generally found very unwilling to provide temporary sidings where their lines traverse forest areas. This seems a very short-sighted policy on their part, for many forests are not worked at all for want of this facility, and the railway loses the freight which would have many times covered the cost of the sidings asked for.

Jail competition.

I think the jail industries are a useful institution in many ways. The jails have served to keep alive many industries which might have otherwise died out, and convicts must have some useful work to do. I am not aware if jail competition has affected any industry to an appreciable extent.

X.—General.

I cannot claim to have ever been actively concerned in any particular industry, although I had had opportunity to do something in a small way to develop timber and cane trade in one of the districts of this province. I have already said in the foregoing section what appears to me necessary for the development of timber trade.

Assam seems particularly suited for the following industries :—

1. Sericulture.
2. Handloom weaving industry.
3. Manufacture of rugs and cheap blankets from indigenous cotton.
4. Manufacture of dyes.
5. Oil-seed industry.
6. Paper-pulp industry.
7. Manufacture of cement.
8. Glass making.
9. Brass and pewter foundry.

1. Sericulture is by no means a new industry in Assam, but for various reasons it is not in a flourishing condition now. It has almost unlimited scope for expansion, for the forests of Upper Assam have an inexhaustible stock of the food plants of the *Muga* and *Eri* silk-worms.

2. Closely connected with sericulture is the weaving industry. Unlike the other provinces of India, weaving is not a caste industry in Assam. Time was when the women folk of every family in Assam wove all the articles of clothing that it required. Ladies of the highest families used to weave for recreation and to take great pride in the fineness of the fabric they used to turn out. But this is scarcely the case now. This industry therefore wants to be revived. Introduction of the fly-shuttle loom is one of the obvious ways of improving this household industry, and many other ways will doubtless suggest themselves to investigators and experts.

3. The indigenous cotton of the hills of Assam has got a woolly staple which makes it very suitable for the manufacture of cheap rugs and blankets. Before the war vast quantities of this cotton used to be exported to Germany and to return to us in the form of grandly coloured coolie blankets. There is no reason why such articles should not be locally manufactured. Rugs of the Miri type could be easily manufactured by people outside that tribe, and I am sure no race of men will have any objection to make them if only they are shown how to do so.

4. Many dye-yielding plants are indigenous in this province and all of them could be very easily cultivated if demand rose for larger quantities than are at present brought into use. With the aid of tinctorial chemistry dyes of much better quality than what is obtained by the more or less crude indigenous methods would no doubt be produced.

5. Assam produces vast quantities of mustard seed as well as sesame, the bulk of which is exported to other provinces. It would be to the advantage of the province to retain these oil seeds by establishing oil-crushing factories at suitable centres.

6. The vast savannah areas along the banks of the Brahmaputra and its larger tributaries are almost an inexhaustible source of paper-pulp stock which ought to be utilised. Also there are hundreds of species of soft-wooded trees in our forests which are not suitable for use as timber but would be excellent for paper-pulp.

7. Along the southern scarp of the Khasi Hills there are outcrops of lime-stone deposits. The lime is of a hydraulic character having the necessary admixture of clay. It therefore ought to be very suitable for the manufacture of cement. If a factory is established near the foot of the hills it could very easily use water power for its mills as well as plenty of water for its tanks. This matter deserves a careful investigation.

8. In many parts of the Khasi Hills there are strata of soft white quartzite, which, I think, would be suitable for glass making.

9. This also is by no means a new industry for Assam, but owing to outside competition and especially to want of knowledge of scientific methods, it is now in a moribund condition. Pewter workers labour under many absurd superstitions which must be dispelled by demonstrating to them how any amount of heat can be obtained without using rotten water-logged wood as fuel.

ORAL EVIDENCE, 9TH JANUARY 1918.

The Hon'ble Sir R. N. Mookerjee.—Q. There are one or two points on which I should like you to tell us more fully, first as regards what should be done to improve village industries: can you suggest any methods as to how that should be done?—A. Improved methods of weaving might be introduced, that is one thing. Improved methods of pottery might be introduced. There are men of the potter class in parts of Assam who live in villages almost entirely by themselves. They don't know even the use of the wheel for making pots, they do it all by hand, and they sometimes make beautiful things.

Q. In the next paragraph you speak about the financing of cottage industries; do you think that co-operative banks will be sufficient to finance all these cottage industries?—A. They will, I think, be sufficient in most cases.

Q. What is the amount of capital in your present co-operative banks?—A. I have no knowledge of that, but I know that the present banks are inadequate.

Q. They cannot go outside their co-operative societies; that is, unless one belongs to a co-operative society they cannot advance money to him?—A. I think I have said somewhere in my note that there should be co-operative banks, one in each *mouza*, if possible.

Q. That will take some time, but at this stage don't you think that Government could lend money like what they call *takkavi* loans recoverable in instalments?—A. Yes, that could be done.

Q. It will take sometime, will it not, before co-operative banks could be established throughout Assam?—A. I do not mean that they should be established all at once, but gradually; the aim would be to increase the number of co-operative banks. At present there are very few in Assam, the sub-divisional towns have not got any so far.

Q. There is one other point I would like to have cleared by you: we received a complaint from Mr. Byrne about the forest regulations; it would seem that you are closely connected with that complaint; in fact he had made some charges against you. Would you kindly let us know what was the exact nature of the complaint?—A. There were two or three complaints. One was about the privilege of felling trees in the forests without having them previously marked as is the custom: he would simply send his men into the forest and let them cut whatever they wished and take them away without let or hindrance from the forest, and that was objected to. He had been given a monopoly to fell *simul* trees in Darrang and Nowgong, but his men were felling in Sibsagar; that was another ground for objecting.

Q. What I particularly want to know is whether according to your rules you could not have been a little more lenient and allowed his work to go on, without losing the revenue of the Forest Department, instead of having a hard and fast rule and thereby compelling him to close his workshop?—A. Unless ordinary precautionary rules are obeyed, it is quite impossible to preserve the forests.

Q. But in a case like that there may be some relaxation?—A. In his particular case I should say that he had no grounds to enter the Sibsagar district. That was my idea because his agreement did not include Sibsagar. I had previous correspondence with him and it was stipulated that he should send his permits to me so that I might check them. He did not do that, that was the difficulty.

Mr. C. E. Low.—Q. On the other hand he complained that the Forest Department took a tremendous lot of time to mark the trees that he wanted?—A. So far as I was concerned I waived the right to mark his trees provided he cut only the trees which he was given permits for, and had them marked with his own hammer by his own men, so that my men might check the number of trees actually taken out under those permits and make sure that people did not steal trees from the same area.

Hon'ble Sir R. N. Mookerjee.—Q. Of course you are conversant with the Forest rules and also this complaint: do you think that some alteration should be made in the rules to allow

these commercial people to go on with their work without stoppage? *A.* Certainly it is done in certain other divisions and in favour of traders and others who have a *bona fide* complaint to make; for instance in Cachar and Sylhet people generally go into the forest and cut the trees they want provided that they produce permits; something might be done that way; but Mr. Byrne agreed to do certain things, but, so far as my Division was concerned, never did so.

Q. Apart from Mr. Byrne's case what we understand from his evidence and other evidence is that a little relaxation from the present rules would enable people to transact their work to the advantage of both themselves and Government?—*A.* Yes, as I just said, in Sylhet and Cachar the rules are relaxed.

Q. In this case it was not relaxed?—*A.* The rules do not apply to him because he did not comply with the request of the Forest Department. He was asked to send his permits to the Forest officer, but he did not do that.

Sir F. H. Stewart.—Q. You said just now that a little relaxation is possible?—*A.* Yes, in particular places of course where no danger of abuse of such relaxation is apprehended.

Mr. C. E. Law.—Q. Can you say what the general departmental policy in Assam is? Have you got working plans framed here for all or most of your forests?—*A.* No, we have got working plans for very few of the forests here; that is owing to want of a sustained demand; there is not a large demand excepting for a few things, and even the few working plans that have been framed are not wholly workable.

Q. Your forests are not fully exploited?—*A.* When a working plan is framed, there will be certain rules and restrictions placed on the working, which the people generally find too irksome owing to the nature of the forests. In Assam our forests are very mixed; there may be several hundreds of species composing one forest of which only one or two may have a marketable value, and to find these out people have to travel from place to place; when one tree is felled, they have to go half a mile to find out another tree of the same kind; that is very difficult, they do not like to do that, I mean to say on a large scale.

Q. Do you auction coupes?—*A.* It is only in one case that it was possible under a working plan that I had made, namely, in Sibsagar, where we used to sell coupes for two or three years. That was the only instance in Assam of selling coupes standing.

Q. Do you have any departmental exploitation of any forests?—*A.* We began also in Sibsagar to exploit one species, namely, *njhar*; we began with *nahor*, but the railway people did not like to have much *nahor*.

Q. I suppose it is very largely a question of means of transport?—*A.* Yes, of course in Assam it is very difficult owing to the mixed nature of the forests to exploit with much profit on a large scale.

Q. Generally is your forest very well served by waterways? Are there waterways through most of your forests?—*A.* Floatable waterways abound in Sylhet and Cachar, but in the Brahmaputra Valley there are not very many, and another thing is that our timbers are mostly too heavy to float. In Cachar for floating down heavy timbers they have got this advantage, that there are plenty of bamboos for rafts to float the timber, which we have not got in Assam.

Q. Has any survey been made of existing waterways to see whether they could be improved by removing snags?—*A.* This is done under contract in Cachar.

Q. But has no definite survey been made in any particular case to see whether it could be done?—*A.* No.

Q. Have you any hill forests which require ropeways or anything of that sort?—*A.* Yes, in the Khasia hills we have many hill forests, also in the North Cachar hills, and also in the Lushai hills.

Q. What do you think of a scheme to appoint forest engineers to consider this kind of question?—*A.* For Assam or for the whole of India?

Q. With special reference to Assam.—*A.* In Assam there would not be work for more than six months. In six months or at the most a year the forest engineer ought to be able to know what things are possible; so a permanent man would not be necessary.

Q. Not necessary?—*A.* No. The Forest officers are engineers to a certain extent; they know forest exploiting work fairly well; they only require occasional advice.

Q. But it is rather a specialized type of work, for instance ropeways, isn't that so?—*A.* Ropeways have been put up and successfully worked by Forest Officers in the North-West Himalayas without any assistance from experts. I therefore think that if there be an expert for the whole of India, he could make occasional tours and advise local forest officers on works of a very special nature; that would be quite sufficient so far as Assam was concerned.

Q. The Forest Department had an unfortunate experience in engineering in the Central Provinces; they were asked to make tanks for the supply of water for animal grazing, and most of the tanks that the Forest Department made refused to hold water; they then said that they wanted the Irrigation people to do it?—*A.* That is a special kind of work that has

not been particularly taught in the Forest College or at Cooper's Hill; for such particular kind of work occasional advice from an all-India man would be sufficient, I think.

Q. Are there any particular places where you think ropeways could be put down with advantage?—A. Yes, I should mention the Bhurban hill.

Q. Where is that?—A. In Cachar.

Q. I am not concerned with a particular place; but are there many such places?—A. There are not very many. There again the fault lies with the nature of our forests; the forest is very mixed; you fix a ropeway at one place, the work there will be over say in about two months, and then you have to shift it on again to some other place.

Q. What is your view on the subject of plantations especially of *simul* wood for tea boxes?—A. Yes, that is a good thing.

Q. Do you think it is practicable?—A. Oh, yes.

Q. I understand *simul* grows very rapidly in these areas?—A. Yes, in favourable localities *simul* will grow about 5 feet a year in length and two inches in diameter.

Q. What is the reasonable growth for tea boxes, 4 to 5 feet?—A. Four to 5 feet would be too small perhaps. I mean to say that it would be rather wasteful to fell trees of that size.

Q. How much then?—A. For *simul* I should think not less than 8 feet.

Q. How long do you suppose it will take to grow *simul* up to that size in alluvial areas?—A. In Assam about 50 or 60 years.

Q. Is the local *simul* wood suitable for matches?—A. I did not try the local wood, but elsewhere it is very suitable, and I do not think there will be any difference in quality.

Q. Did you hear of the trouble about the Bareilly factory when you were in Dehra Dun?—A. I had not gone into the details of the Bareilly factory, but I know the *simul* areas in its neighbourhood.

Q. Probably smaller trees would do for tea boxes?—A. The tea box industry would not refuse to have small trees, but it would be very wasteful for the department to fell small trees for that purpose; anything above 9 inches diameter would be quite sufficient for tea boxes.

Q. In your note in speaking of an Imperial Department of Industries perhaps consciously or unconsciously you rather follow the analogy of the Forest Department, with an Inspector General and a technical staff; but you will, I think, admit that there are certain differences in kind between industries and the work of the Forest Department, in that industries, especially large industries, are much more alike all over India than forest problems are; forest problems are different in different places, and therefore in the matter of large industries there would probably be more a case for an Imperial Department, while in the case of cottage industries the problems probably are more local; would you accept that position?—A. Yes.

Q. With regard to large factories they could be investigated, and, if necessary, experimented on by an Imperial Department with a good deal of saving in running because the problems are much more similar in all parts of India?—A. But could not they assist local people with their advice and instructions? They need not experiment in every province, but they might gain their experience in one province, and apply it to other provinces through the local officers.

Q. That could no doubt be done, but there would probably be provincial difficulties?—A. I do not know, but I understand that the provincial people are sometimes rather impatient of interference.

Q. I put to you one particular case—the case of the glass industry: you don't want one single expert; no single man can be expert in all the questions that have to be taken up in investigating glass; you want a man to be a chemist to deal with raw material, and you want somebody to consider the question of the cost and movement of the raw materials, and of the manufactured article to where the markets are; you want another man for furnace work, another in charge of the crucibles, and another man for blowing, and so on; it would be very uneconomical for each province to have all of them, so that, if, as you suggest, a single province took it up before they had made investigations, they could not find out in which province the prospects are most favourable?—A. I quite follow, but what applies to glass won't apply to forest produce. I would restrict my views to forest produce alone.

Q. You are referring to an Imperial Department of Industries and you propose a staff of experts with an Inspector General, such as a chemist, a metallurgist, a mechanical engineer, and so on; it struck me that you are following the analogy of the Forest Department; of course one naturally confines oneself to what one knows?—A. Yes, quite so. As I believe, the Forest Research Institute, so far at least as its organisation is concerned, has not yet been found fault with.

Mr. A. Chatterton.—Q. In the last paragraph of your note you say that brass making is not a new industry in Assam?—A. I am referring there to pewter.

Q. What is this pewter work?—A. They make vessels, utensils and other things for local household use. It is brass work of a sort.

Q. I am not speaking about brass but pewter: What is this pewter for?—A. For making vessels and household plates.

Q. Is it a mixture of lead and tin?—A. Tin and copper I think; it is what they call *kansa*.

Q. Is it bell metal that you are referring to?—A. Yes. I am sorry for the misapplication of the word.

Q. What are the methods of extracting timber which they employ in the areas which are worked by the saw mill companies?—A. In the division where I was, that is in Sibsagar, there was no saw mill, but in Cachar, as I have already said, the timber logs are floated down to the mill.

Q. How do they get the logs into the river?—A. They are dragged by elephants.

Q. Do they cut the trunk into small logs?—A. Yes, into manageable sizes. No particular size is prescribed, but they cut it into convenient sizes.

Q. What do you call a convenient size?—A. 15 to 20 feet long.

Q. How many cubic feet?—A. It may be about 20 to 60 cubic feet each.

Q. Are elephants freely available for dragging timber?—A. They make use of elephants in Cachar.

Q. Do you call that method efficient?—A. They might adopt a more efficient method, but then again the forest is at fault: you cannot make a sledge or any such thing because you will then have to shift it from place to place at short intervals.

Q. You said that it would take 35 to 50 years to grow *simul* wood suitable for tea boxes: is there a sufficiently large stock of *simul* wood in the Assam forests to supply the tea industry?—A. At present I do not think there is. The present stock is not sufficient.

Q. Is there any possibility of *simul* plantations being started?—A. Yes, in the North-East Frontier district they have, I think, been started already.

Q. Have you any knowledge of the saw mills that are working in the Assam Valley?—A. Not a very intimate knowledge because saw mills are only found in two districts and I had never held charge of those two districts.

Q. You don't know whether they have up-to-date plant or whether their working is inefficient?—A. I could not give any opinion on that point. I think I have laid some stress somewhere in my note on the Forest Department beginning extensive plantations. I have said somewhere that I consider that very important from an economic point of view.

Sir P. H. Stewart.—Q. How long have you been in this province?—A. Off and on I have been about 34 years now.

Q. Of which you have been for 18 years in Dehra Dun?—A. Yes.

Q. Do you think there is any possibility of the Assamese ever taking to factory labour?—A. They are very averse from work in the factories as coolies.

Q. Do you see any prospect of that being overcome gradually, or do you think that will remain?—A. That will remain for many years to come, I am afraid.

Q. Do you see any prospect of these cottage industries like weaving and so forth being preserved and developed so as to give the workers a fair livelihood?—A. Yes, they have a great liking for the indigenous industries, but owing to outside competition, they are dying out. They have natural aptitude for these and are only lacking in organisation. Weaving of course is not restricted to any particular class; in Assam it is resorted to by the women of all castes and stations in life.

Q. Do the Assamese work on the tea gardens to any extent?—A. Not as coolies.

Q. Do they object to work as coolies?—A. They do not like to work under control; they don't like to work as coolies, and they have got a rooted hatred for the outside coolies that are imported for work in Assam, and to be mixed up with these people on the same level they cannot tolerate.

Q. You say that all lands required for *bond fide* industrial purposes should be acquired by Government for the organisers at their cost, and the Land Acquisition Act if necessary should be so amended as to make this possible: do you think that any special amendment is needed?—A. I did not consult the Act, but in Assam all land belongs originally to Government and there are some temporary holders of these lands; some rules might be made probably under the Land Acquisition Act to meet the claims of these intermediate holders.

Q. What sort of claims?—A. I mean to say they ought to compensate them in a suitable way; they have cut out the jungle and levelled the lands for cultivation purposes; so some compensation might be made for that; that of course would be done in any case.

Q. You are in favour of having a local Director of Industries in Assam and you don't see any use in an advisory board: is that because there are not people who could serve usefully on such a board?—A. There is not sufficient scope for that.

Q. There are a great many industries or possible industries, you mention a lot of them, which a Director of Industries can busy himself with: would not an advisory board help him a good deal?—*A.* But could he not get advice from the Imperial Board, the Board of the Indian Government? It is only occasional advice that he and his assistants would require.

Q. It has been put to us at some other place that an advisory board might be specially useful perhaps in helping to maintain and develop these cottage industries: what do you think about that? If they are people interested in weaving or something of that sort, they might give the weavers valuable information and suggestions as to what way they should go about their work and so on?—*A.* Village people would be best approached by local Inspectors and other officers under the local Director.

Q. You think it would be better to have all of them officials?—*A.* Yes.

Q. With reference to the work of the Forest Department you strongly hold that the subordinates are very badly underpaid?—*A.* Certainly.

Q. And in the higher grades the service is very much undermanned?—*A.* Yes.

Hon'ble Sir R. N. Mookerjee.—*Q.* Do you think that the subordinates of the Forest Department are more dishonest than the subordinates of other Government Departments?—*A.* I have not got a very intimate knowledge of subordinates of other departments.

Q. In your own department unless the man who wants trees tips one or two rupees there is great difficulty about felling his trees, and all sorts of difficulties are put in his way, is that not so generally?—*A.* I do not think it is quite so bad as that; but the Forest officer in Assam has got rather a very extensive charge and he cannot be present everywhere; there again the nature of the forest is at fault; a man has to travel miles and miles to mark one single tree, and there may be times at which there are several people wanting trees, and to meet all their demands he would have to walk miles and miles in opposite directions.

Q. In your long experience have you received complaints, and have you made enquiries to find out whether it is true?—*A.* Very rarely from outside.

Q. Or you would not take notice of such complaints?—*A.* I had only two cases of such complaints from outside. They were, however, not proved to my satisfaction, and in one case I introduced some changes in the method of working and transferred the man complained against to a different kind of work in another part of the district, and in the other case I reprimanded the subordinate concerned.

Sir F. H. Stewart.—*Q.* You speak about many dye-yielding plants that are indigenous in this province: have you made experiments with these plants?—*A.* I did not do them myself.

Q. Have any been made in this province by Government or by private individuals?—*A.* People use a lot of indigenous dyes still; for instance on the Manipur side the Nagas dye their cloth blue and red. No experiments have been made yet to my knowledge. They should be made by a trained chemist.

Mr. C. E. Low.—*Q.* A witness who has not appeared before us as yet, the proprietor of a saw mill in the Surma Valley, has made the following remarks:—"In the past there were many saw mills in the Surma Valley all of which had to obtain their supplies of logs from small traders, and with the exception of two mills all mills had to be closed down. All these failures were due to excessive royalties payable to Government on the timber extracted, and consequently to their inability to keep to their contracts through no cause of their own." I suppose the witness means that the small traders from whom he got logs could not keep to their contracts?—*A.* Yes, I think so.

Q. And then he goes on to say "the royalties charged by Government on this class of evergreens is simply iniquitous. The royalties payable on the timber extracted amount to about 14 to 57 per cent. of the actual cost price of logs." What have you to say about these statements?—*A.* He does not mention any particular kinds of timber. In Sylhet and Cachar they have got various qualities of timber, so if saw-mill owners want to use superior kinds of timber for tea-boxes of course the price becomes high.

Q. What he says is that the royalty is too high: owing to high royalties the mills have been closed; and he goes on to say that these royalties bear a very high proportion of the cost price, whatever that means, of the logs: of course the royalty is the cost price of the logs; do you consider, generally speaking, that the royalties charged to saw mills are too high?—*A.* I was in charge of the Cachar division for only a short time, but taking the general timber market into consideration the royalty charged in that division did not strike me as too high.

Q. I am not referring only to the Surma Valley, I am referring to Assam generally?—*A.* In Assam the rate so far as tea boxes are concerned is fixed at so much per box; there has been no complaint; the box rate is one anna per box; that is low enough.

Q. What is the selling price?—*A.* About 14 annas. A man could not get a box of that kind at less than 14 annas in the bazar.

Hon'ble Sir R. N. Mookerjee.—*Q.* Have you any idea of the cost of making it?—*A.* It won't be very much, scarcely four annas a box.

THE ASSAM PROVINCIAL INDUSTRIAL COMMITTEE.

ORAL EVIDENCE, 10TH JANUARY 1918.

The following members of the Committee were present at the conference :—

1. The Hon'ble Lieutenant-Colonel P. R. T. Gurdon, C.S.I.,
2. The Hon'ble Mr. J. R. Cunningham,
3. Mr. J. McSwiney, I.C.S.,
4. Mr. F. E. Bull,
5. Mr. A. W. Blunt,
6. Mr. E. P. Gilman,
7. The Hon'ble Mr. A. W. Botham, I.C.S.,
8. Mr. A. R. Edwards, I.C.S.
9. The Hon'ble Rai Ghanasyam Barua Bahadur,
10. The Hon'ble Syed Abdul Majid, Khan Bahadur,
11. The Hon'ble Maulvi Syed Saadulla, Bar-at-Law,
12. Rai Sahib Monomohan Lahiri, B.L.,
13. Rai Bahadur Kanak Lal Barua, B.L., and
14. Mr. S. N. Mackenzie, I.C.S.

The discussion was based on the Resolutions passed at the second meeting of the Assam Provincial Industrial Committee held at Gauhati on the 15th November 1916.

Resolution I.—That a station or stations for the supply of good seeds of the different varieties of silk should be opened by Government under expert local supervision which should have available the advice and guidance of an Imperial expert in Sericulture.

In reply to the President (Sir R. N. Mookerjee) the Hon'ble Mr. Botham said that nothing had been done in the direction suggested by the first resolution owing to want of funds and of an industrial officer. In reply to Sir Francis Stewart he said that they had not decided where to open the seed station or stations pending the appointment of the industrial officer.

Mr. McSwiney said that he was not in favour of a central station in connection with silk because they would have to have, as Mr. Lefroy had recommended, different stations for the different kinds of seeds. Mr. Lefroy himself had suggested Shillong as a suitable place for *pat* silk and for *eri* and *muga* silk either Nongpoh or some other place.

The Hon'ble Mr. Botham at this stage drew attention to the wording of the resolution which ran as follows, "a station or stations."

The Hon'ble Rai Bahadur Ghanasyam Barua said that he was very much in favour of establishing one or more stations because the silk industry was a very promising industry in Assam and there were certain varieties of silk which were not available anywhere else. *Eri* and *muga* were not available anywhere else and they promised a very wide field for action, but were suffering a great deal for want of good seed. He thought that it was essential for the advancement of the silk industry in Assam that stations scientifically run and aided by expert advice should be established for the supply of seed and for the improvement of the industry under expert advice.

The Hon'ble Syed Maulvi Saadulla did not think that the mere supply of seed would do. He saw from the report of the Special Officer that the mulberry tree in Assam suffered very badly from the attack of a borer, and unless they could tackle that pest mere establishment of stations for the supply of seed would not do.

The Hon'ble Mr. Botham said that that applied to *pat* only and did not apply to *eri* and *muga*. *Eri* and *muga* worms were afflicted with disease and in order to stop that they would have to start a central station for the distribution of disease free seed and the mere fact that the borer played upon the mulberry tree would not affect the point.

The Hon'ble Maulvi Syed Saadulla said that his point was that they should not rest content with giving good seed but they should try to tackle the diseases. In reply to Mr. Chatterton he said that shrub mulberry was not grown in Assam though it used to be grown before in Shillong.

The Hon'ble Rai Ghanasyam Barua Bahadur was strongly of opinion that the establishment of this station should not be delayed and that some beginning should be made. At present all the available cocoons were exported and there was a large field for development.

Resolution II.—That a central weaving school or schools should be established for teaching improved methods of spinning, reeling and weaving and introducing improved looms and other machinery.

In reply to the President, the Hon'ble Mr. Botham said that no effect had been given to this resolution.

The Hon'ble Manvi Syed Saadulla thought that the establishment of such schools was an imperative necessity and they should be started at once.

Mr. Low asked what were the improved methods that the proposed schools were intended to teach. The Hon'ble Mr. Botham replied that that was one of the things on which they wanted a special officer to advise them. He could not say whether these improved methods were known anywhere else in India.

The Hon'ble Rai Ghanasyam Barua said that spinning and weaving in Assam were done by hand.

Sir Francis Stewart asked what sort of special officer they wanted, whether he should be a business man or an expert or what.

Mr. Low said that they might pick up a kind of expert who would deal with the most important local industry for the time being and make him the special officer, because if they had an officer of the Assam Government on special duty he did not add anything to the existing knowledge but if they had an expert with administrative abilities he would be all that could be desired.

The Hon'ble Rai Ghanasyam Barua wanted either an expert or a local man who could go into the villages and show how to develop the cottage industries.

Mr. Low said that they could train local men eventually by having some junior local men in the local industrial department and when they learnt enough about the industry they could take higher posts in the department. He asked whether there were any Assamese experts at present. The Hon'ble Manvi Syed Saadulla replied that they had not any but they had a peripatetic weaving inspector who was a Bengali.

Mr. Low said that they saw his demonstrations and they were not quite sure whether he was learning or teaching weaving.

Mr. McSwiney said that that demonstrator was employed by the local board and not by Government. In reply to Lieutenant-Colonel Gurdon he said that the weaving master was employed by Government but the demonstrator by the local board.

In reply to a question whether it was not possible to get an Assamese as weaving master and train him up at Serampore and why it was found necessary to employ a foreigner, Mr. McSwiney said that they could not get an Assamese and half the population of the Province was not Assamese.

Rai Bahadur Kanak Lal Barua said that the demonstrators were trained for some time at Serampore.

Mr. Low thought that it was very important that they should have Assamese demonstrators for an industry which is run by Assamese.

Rai Bahadur Kanak Lal Barua said that his idea was that they ought to have a school at least to train demonstrators because at Serampore the training given was only with regard to cotton weaving whereas silk weaving was a speciality in Assam and was not to be learnt at Serampore.

Mr. Chatterton asked whether it would be any use to send a man to Serampore for a course of weaving which would result in merely the acquisition of a superficial knowledge of the craft.

Mr. Low was of opinion, speaking from his experience in the Agricultural Department, that it was very much better to have no demonstrator at all than to have a bad one, because a bad demonstration would evoke prejudice which would take years to overcome.

Rai Sahib Monomohan Lahiri said that a man was sent from the Tezpur local board to Serampore to be trained and when he returned after six months he could not do anything.

Lieutenant-Colonel Gurdon said that that pointed to the necessity of having a weaving school in Assam or in Gauhati.

Mr. Edwards was of opinion that a certain amount of research as to the best means of weaving and reeling was necessary before they began to teach it.

Rai Bahadur Kanak Lal Barua thought that the research portion could be done by the Imperial Department.

Mr. Chatterton said that there was no difficulty about reeling *muga*, but when they came to weaving with *eri* silk and spinning of *eri* silk it was quite a different matter. It would be an advantage to the province to have a spinning mill up in Assam for dealing with the large quantity of *eri* silk cocoons.

Mr. Low said that it would be objected to because that would interfere with the existing industry of the Bombay mills.

Rai Bahadur Kanak Lal Barua said that it would reduce the price of yarn in Assam.

Resolution III.—That carpentry, smithy and similar established crafts should be encouraged by a system of small stipends to apprentices in approved shops subject to certain conditions as to inspection and supervision by Government.

In reply to the President the Hon'ble Mr. Botham said that apprentices were being given stipends. The President also asked whether there were any night schools or any school where they could attend. The Hon'ble Mr. Botham replied that there were none partly

because the apprentices were very few in number. He thought that five or six stipends were given in a year and the apprentices were sent to different places and it would be difficult to organise any sort of a night school for them.

Rai Bahadur Kanak Lal Barua said that the apprentices went into the various railway workshops and after the course—as far as he knew—they were absorbed in these shops. The stipends lasted for three years.

Mr. Low asked whether the stipends were given only to men who had had a small amount of primary education. The Hon'ble Mr. Cunningham said that no qualification was laid down. Mr. Bull also thought that there was no educational qualification laid down as a condition to the stipend. The Hon'ble Mr. Cunningham said that it was a very small thing, that the Williamson Endowment Fund stipends were scarcely worth consideration and that it was not taken up as a part of a general system. It might be possible to make primary education a sort of condition for the grant of the stipends but he was doubtful whether, if any educational qualifications had been insisted on, they would have trained any artisans at all.

The President said that in all the other provinces the apprentices were required to have had a certain amount of education.

Mr. Low said that in the Central Provinces they insisted on primary education for intending carpenters and blacksmiths.

The Hon'ble Mr. Cunningham said that there was a difficulty in introducing such conditions. They had, for example, sub-overseer classes many years ago at Jorhat and the qualification required was the entrance examination or an examination even short of that, but those classes had to be closed for want of pupils although stipends were granted. Things were changing of course and if the organisation of the apprenticeship system were practicable with reference to the market and the prospects of employment he had no doubt that an educational standard could be insisted on as a preliminary to the apprentices getting these stipends.

Mr. Low asked whether an apprentice was likely to be of any good or become anything more than a mere mechanic of the poorest type if he did not know to read and write.

Rai Sahib Monomohan Lahiri said that the apprentices of Tezpur knew to read and write. He saw an apprentice after his course, at one of the tea estates working as a mechanical engineer.

Mr. Bull stated that for a certain scholarship the literary qualification required was the middle vernacular which he believed was not very high, but pupils possessing that qualification did not come forward, and therefore the scholarship was given up. The only people that they could get now were supposed to be men who are working with their hands.

Mr. Low said that in the Central Provinces they insisted on the 4th standard as the preliminary qualification.

Mr. Gilman was of opinion that if possible all apprenticeships should be on English lines and should be for, say, three years, with nominal pay till they became proficient and able to do a fair day's work.

Rai Sahib Monomohan Lahiri said that the apprenticeship system was not a success. When the apprentices left the shops they had no work to do. In the tea gardens the proprietors managed with cheap coolies. The apprentices were simply taught turning and foundry work and they could not do anything when they left the workshops. They must be taught to manufacture articles of cutlery, knives and all those things; there was a great demand for knives because every Assamese required a knife. The apprentices are not taught these things but they were attached to big workshops where they use machinery which they could not find anywhere else in Assam. There were no factories except the railway shops in Assam.

In reply to Mr. Low who asked whether all the apprentices were sent to the railway workshops the Hon'ble Mr. Botham said that some were sent to a private engineering firm, that of Messrs. Eds. Bros., and also to the motor works.

In reply to the President whether Government keeps any supervision over the apprentices during their periods of training the Hon'ble Mr. Botham said that there were regulations for their supervision. The Hon'ble Mr. Cunningham said that there was a yearly report to the Public Works Department so far as he could remember, from the shops to whom the apprentices were sent.

The President wanted to know whether if a student did not work properly he was deprived of the stipend or whether he was first given a warning.

The Hon'ble Maniwi Syed Sandulla said that the stipends did not come from Government but from a fund known as the Williamson's Endowment Fund. It was a private fund out of which the stipends were given and it was not Government money. The grant of stipends was decided by the Government.

The Hon'ble Mr. Botham said that there was a set of rules regulating the grant.

Rai Sahib Monomohan Lahiri said that even in the first year of the course the apprentices were paid because labour was very dear in Assam.

Mr. Low asked the committee whether they would consider that there ought to be some system of compulsion for apprentices or whether there ought to be some law preventing other people from taking them into their employment during the period of apprenticeship.

The Hon'ble Mr. Cunningham stated that the whole question related to employment. Even with regard to such few industrial ventures as Europeans had attempted in Assam, the difficulty was to find employment for the men afterwards. The stipends should be made more attractive.

Rai Sahib Monomohan Lahiri said that there were no openings for the apprentices. In fact, only Rs. 7 was paid as stipend. In his own factory whenever he took a man he paid him Rs. 14 in the beginning when he did not know anything. A cooly earned eight annas a day and worked only six hours.

Resolution IV.—That Mr. Keventer be invited to visit Sorbhog with the object of establishing a dairy there and that he be invited to give evidence before the Commission.

Colonel Gurdon said that a dairy has been established more or less at Sorbhog but nothing else has been done by Mr. Keventer. So far as Mr. Keventer was concerned, Colonel Gurdon thought he was very disappointing.

Resolution V.—That in the case of gold and silver work and similar crafts encouragement should take the form of stipends to apprentices.

Rai Bahadur Kanak Lal Barua said that some stipends had already been granted by some local boards. The apprentices were sent to Calcutta.

As regards the suggestion of the committee for an iron industry the President asked whether they wanted an iron industry in Assam. It would require a very large outlay of capital, not less than four crores of rupees.

Rai Sahib Monomohan Lahiri said that they wanted it for cutlery and implements.

The Hon'ble Manvi Syed Saadulla wanted to know whether smithy included cutlery. He thought that there was a great field for some trade in cutlery in the Surma Valley. When the matter was placed before the last Committee the wording of this resolution stood in the way of having a demonstration factory in iron and steel in Sylhet. The committee was opposed to a demonstration factory for improved cutlery and implements on the ground of the third resolution. He was not in the committee before and therefore he did not know what it meant when it passed the resolutions.

The Hon'ble Syed Abdul Majid said that some *kamats* in the Sarma Valley could turn out very good things and if improved methods were introduced they could make their own machinery instead of seeking for employment elsewhere.

Rai Sahib Monomohan Lahiri said that when he first came to Assam forty years ago he saw ordinary knives made by the Assamese people sold in the bazaar but they were not to be found now. They were ousted by German cutlery.

Resolution VI.—That the Committee regard the following as promising fields for new industries in Assam :—

- (a) *Sugar manufacture.*—An interesting experiment in the cultivation of sugarcane on a commercial scale is now in progress in Kamrup.
- (b) *Paper manufacture.*—Experiments are being made by Messrs. Pearson and Hols in the manufacture of paper from Assam reeds and grasses.
- (c) *Portland cement.*—The raw material, good lime, and clay, exist in Assam and there is reason to suppose that an important industry might be created.
- (d) *Manufacture of matches and match boxes.*—The supply of timber in Assam indicates the possibility of inaugurating this industry. Export enquiry, however, is necessary.
- (e) *Manufacture of vegetable dyes.*—A great wealth of raw materials exists in Assam. Export enquiry is necessary here also.
- (f) *Glass making.*—The existence of quartz, limestone and coal in Assam renders it worth while investigating the suitability of local materials.
- (g) *Manufacture of turpentine and resin from pines.*

As regards timber for matches, in reply to Mr. Low, Mr. Blunt said that he did not think that there were many suitable species. Those that were suitable were all required for tea boxes. He also said that steps were being taken to increase the supply of *Bombax* by plantation and it was promising. They were able to get fairly large homogeneous areas for its plantation. It would take about 20 or 25 years to grow to the size which was likely to be required.

With reference to Portland cement, in reply to the President, the Hon'ble Mr. Botham said that there was coal available for the production of cement at Cherrapunji. Mr. Ball said that there was coal up in the Khasia hills but the difficulty was climate. It has not been ascertained whether it was possible to manufacture Portland cement in the damp climate where the essential things are found. If it had been a commercial possibility it would have been undertaken by private enterprise before. Generally nothing had been done to ascertain whether it was possible to combat the Assam climate.

The President wanted to know the annual consumption of cement in Assam itself because after all if they manufactured cement in Assam they might not be able to compete with the cement coming from England, Katol and other places. There must be a good field in Assam itself before they thought of launching on such a big enterprise.

Mr. Bull said that if it was possible to manufacture cement at Katni and bring it to Calcutta at great cost, there was an opening for it certainly in a place nearer Calcutta.

The President remarked that transmission facilities from Katni to Calcutta were easier than from Cherrapunji to Calcutta. Mr. Bull replied that there was river transport all the way from Cherrapunji to Calcutta. As regards the Mikir hills where the climate was probably much drier, Mr. Bull stated that there was no clay there. The great advantage of the Assam country was that they have lime, coal and clay near one another. In reply to Sir Francis Stewart he said that the clay had not been yet tested as to its suitability. Nothing had been done in the matter of investigation. It was only a question of possibility. He imagined that if the question were taken up it would be a question of funds and nothing else. They had not got any expert. The lime had been tested for other purposes than for the manufacture of Portland cement. There was no question about the value of the lime. It was the same sort of limestone that was used for the manufacture of cement at other places.

The Hon'ble Maulvi Syed Saadulla drew attention to paragraph 3, Section III of the Special Officer's Report where it was said that a certain gentleman had made experiments in the direction of making cement. The Hon'ble Mr. Botham said that it was done on a very small scale. All the items referred to in this Resolution needed expert advice at first.

Resolution VII.—That the Committee approve of the Local Administration's proposal that an officer of the Provincial Service should be appointed as a Superintendent of Industries working in close touch with the Registrar of Co-operative Societies. That they also approve of the proposal, which has been made that, pending the issue of orders on this proposal the present Special Officer should be retained on a temporary basis to carry on the work of investigating and encouraging local industries.

In reply to Sir Francis Stewart the Hon'ble Mr. Botham stated that this resolution endorsed the Government's proposals up to date.

The Hon'ble Maulvi Syed Saadulla stated that from the people's point of view he did not think that there was a necessity for two officers, one the Superintendent of Industries and the other, the Director of Industries.

The Hon'ble Mr. Botham explained that the creation of a Director of Industries was a different proposal altogether. The original proposal of the local Government was that there should be a single officer as Registrar of Co-operative Societies and Director of Industries. But after the publication of the Co-operation Committee's Report the Chief Commissioner accepted the view of the Committee that a whole-time officer was absolutely necessary for co-operation and then he proposed that the Registrar should be a whole-time officer but under him one branch of his work should be looked after by an officer who might be the Superintendent of Industries. The Registrar of Co-operative Societies was not a whole-time officer now but he had the excise and registration departments under him. Formerly the proposal was that the Registrar of Co-operative Societies and the Director of Industries should be the same person.

Sir Francis Stewart remarked that proposals had been made in other parts of India that the Registrar of Co-operative Societies should come under the Department of Industries if possible and not as the Hon'ble Mr. Botham suggested.

The Hon'ble Mr. Botham said that the Superintendent of Industries would be entirely in connection with small village industries and the principle of co-operation would be his principal means of working.

Sir Francis Stewart asked whether it would not be preferable to have a department of industries which would take up the development of both the village industries and the larger industries. The Hon'ble Mr. Botham replied that the point to which the Assam Government looked was what was immediately needed in the province to look after the cottage and village industries, and at present the larger industries were getting on quite as fast as the province was able to supply labour and other things. They would leave the various industries mentioned in Resolution No. VI to private enterprise.

The Hon'ble Rai Bahadur Ghanasyam Barua said that the people's view was that industries should be developed in a very thorough manner and not merely cottage industries. Asked whether there was any difference of opinion among the committee on this subject, the Hon'ble Mr. Botham replied that so far as he remembered there was not any when the resolution was passed. Rai Bahadur Kanuk Lal Barua said that the impression left on the members of the last committee was that the Co-operative Societies and Industries should be quite separate and that the Superintendent of Industries would work in close touch with the Registrar, but now the proposals seemed to be that the former would be subordinate to the latter. The Hon'ble Mr. Botham said that the idea of Government was that the Superintendent of Industries should be in subordination to the Registrar.

The Hon'ble Maulvi Syed Saadulla said that the Superintendent of Industries was suitable for improving cottage industries but they wanted to go a step higher and have a higher officer, whether an expert or a business man, who would advise means for the development of the resources of Assam.

The President said that in the bigger provinces it is proposed to have a Director and a Deputy Director, the Director to look after the bigger industries and the Deputy Director to look after the cottage industries, and inquired whether if financial help were forthcoming

from the Government of India the Assam Government would accept such a proposal. The Hon'ble Mr. Botham replied the proposal contained in the resolution in question was intended to meet an immediate necessity, and that they would welcome the proposal of the bigger provinces.

Asked by Mr. Low whether that officer would be an expert or an administrative officer, the Hon'ble Rai Bahadur Ghansyam Barua suggested that he should be an expert in one or two industries, and on questions relating to industries on which he was not an expert he would ask for expert advice from the Imperial Government.

The Hon'ble Mr. Botham stated that the idea of the Local Government was that the Superintendent of Industries would be under the Registrar of the Co-operative Societies. So far as his work was naturally on co-operative lines he would actually be directly under him, but so far as it was apart from co-operation his subordination to the Registrar of Co-operative Societies would be purely formal. The Superintendent of Industries would be an officer of the Provincial Service and he would get a local allowance as such. His pay would range between Rs. 800 to Rs. 1,000. If they had a higher officer as Director of Industries he would have to be paid from Rs. 1,500 to Rs. 2,000.

Resolution VIII.—That the establishment of an Imperial Department would be most desirable. For Assam expert advice would be required in connection with sericulture, dyes and dyeing, glass making, and paper making, amongst other industries.

(*Resolution VIII.*—Was not separately discussed.)

Resolution IX.—That the organization of a Provincial Advisory Committee to include non-official members is desirable.

Sir Francis Stewart wanted to know how the Provincial Advisory Committee would be organised, and whether it would be by Government nomination. The Hon'ble Mr. Botham thought that Government nomination was probably the only way at present. Questioned as to how many members there would be on the committee the Hon'ble Rai Bahadur Ghansyam Barua said that the details had not been discussed. In answer to Mr. Chatterton, the Hon'ble Mr. Botham said that the members of the committee would not be paid, but they would be given travelling and halting allowances.

Sir Francis Stewart enquired about the location of the offices of the Director or Superintendent of Industries and the Provincial Advisory Committee and whether they would be at Shillong. Colonel Gurdon said that Shillong was not only a hill station but the head-quarters of the Government. The Committee might meet at convenient stations. The Hon'ble Maulvi Syed Saadulla was of opinion that Gauhati would be a central place.

Resolution X.—That the relations between the Provincial and Imperial Departments should be modelled on the existing relations between the Provincial Agricultural Department and the Imperial Agricultural officers at Pusa. Advice should be available freely, but there should be no direct executive or administrative control.

Was not separately discussed.

Resolution XI.—That the formation of sale agencies in different parts of India and elsewhere is desirable for the display and sale of Assam silk goods.

Asked by Mr. Low whether they had availed themselves of existing institutions like the Swadeshi Stores in Bombay or the Home Industries Committee in Calcutta, Colonel Gurdon replied that there was no one in Assam to do the business and that they were awaiting the Superintendent of Industries. The Hon'ble Mr. Botham said that they had got into touch with the Home Industries Committee in Calcutta and that they had promised to assist them. The President said that the Bombay Swadeshi Stores were a private limited company whereas the Calcutta Home Industries Depot was not a profit making company, and therefore they should be in touch with the Calcutta Depot rather than with the Bombay Swadeshi Stores. The Calcutta Depot always desired to get into touch with the manufacturers and improve the articles when they did not find them up to quality, by sending a man to show how to do the thing. Rai Bahadur Kanak Lal Barua thought that the co-operative societies should help in the matter by collecting the articles and sending them over to the depôts. Mr. Low remarked that the Bombay Stores were working through the ordinary middlemen and trying to get at the individuals themselves if they could but they never gave any advances.

Resolution XII.—That a system of Government certificates regarding the quality of products would be feasible and useful in the case of silk, and possibly of other products of unorganized industries.

The Hon'ble Maulvi Syed Saadulla wanted to know who would issue the certificates and pass the quality of the goods. The President remarked that it would not be done by the Department of Industries. Mr. Low said that it was done in quite a number of places by the trades themselves. In the case of piece goods there was at Nagpur a market committee with which the Government had nothing to do, and that committee passed the cloth which then found a market but without its seal they would get no buyers. The Hon'ble Maulvi Syed Saadulla was of opinion that the matter should be left to the trade itself, and if the article was not up to the standard quality it would not have any market.

Resolution XIII.—That the Local Government should be given a very free hand to assist industries in any of the ways mentioned in paragraph 17 of the preliminary note, or in other ways. It is impossible to lay down hard and fast lines on which alone assistance should be given, and each case must be considered on its own merits.

In reply to Sir Francis Stewart how Government help would be given, the Hon'ble Mr. Botham stated that it would be given on the recommendation of the industrial officer but no doubt the advice of the Advisory Committee would be taken. That would mean that they should have a fairly senior and responsible officer as Industrial officer.

In reply to Mr. Low, the Hon'ble Mr. Botham stated that they had done nothing to help small industries on the *takkari* line, because nobody asked for it. As regards *takkari* loans they were restricted to agriculture. Rai Bahadur Kunak Lal Barua said that money loans were given by co-operative societies to small industries. Mr. Chatterton asked whether loans were given to individual weavers or to co-operative societies. The Hon'ble Mr. Botham replied that he did not think that Government loans would be required for co-operative societies who would get them in the ordinary loan market. Mr. Mackenzie said that Government had stopped giving loans to co-operative societies.

Mr. Low asked if there was anything to stop Government giving loans for the improvement of weaving outside the Agriculturalists' Loans Act, if the amount had been budgetted for. The Hon'ble Mr. Botham said that the Comptroller might object, and that allotting a sum in the budget for the purpose would not affect him. The Comptroller would say that it was unauthorised expenditure. There were certain rules in the Account Code governing the issue of advances of Government money. The Comptroller might object to any advance given except under the Agricultural Loans Act. There was the question of recovery of the advance made. Under the Agricultural Loans Act there was a regular procedure for recovery of the advances made.

Colonel Gurdon said that loans to weaving societies had to be given and if Government had not got the power it was necessary that it should take power for the purpose. The Hon'ble Mr. Botham said that any loan to private persons was outside the purview of Government unless it was authorised by some special Act. He promised to find out the exact position by consulting the Comptroller and let the Commission know about it.

Resolution XIV.—That in all cases in which financial assistance is given by Government without adequate security some control should be imposed, but the form and Government degree of control should be left to be decided by the Local Government in view of the circumstances of each case.

The Hon'ble Maulvi Syed Sandulla said that when Government renders financial assistance there should be Government control as regards audit as well as the directorate by having one or two Government officials as directors.

Resolution XV.—That the Committee endorsed the views expressed at the Gauhati Conference that the apprentice system offered the most promising means of training artisans, but that experiments in this direction should not necessarily exclude the trial of Industrial Schools.

The Hon'ble Mr. Botham said that nothing had been done since the passing of the resolution for the establishment of industrial schools.

Mr. Low desired to know what the Committee thought of having the system of apprenticeship made compulsory, by a law to the effect that if an apprentice entered into an indenture with his employer it would be binding on him and employment of the apprentice by any other employer would be penalised. Rai Sahib Monomohan Lahiri said that there is an Act already in force which is an India Council Act and that the apprentices in the Hazaribagh Reformatory School were under that Act. Mr. Low remarked that there was an Act of the fifties which was a dead letter. Rai Sahib Monomohan Lahiri replied that it was not a dead letter but that it was applicable to reformatory apprentices only. The apprentices could not run away, and if anybody else employed them he was liable under the Act.

In reply to Mr. Chatterton, Rai Sahib Monomohan Lahiri stated that the boys of the school were not apprentices while under police supervision, but after the imprisonment expired they became apprentices under the Apprentices Act. The Hon'ble Mr. Cunningham stated that they were then placed under the supervision of the Education Department. Rai Sahib Monomohan Lahiri promised to send a copy of the indenture and other papers, if any, bearing on the point.

In reply to Sir Francis Stewart it was said that the establishment of industrial schools was waiting for the industrial officer and for money. If they were started, the Hon'ble Mr. Cunningham personally would not care whom they went under so long as they did not come under him, because anything that he had seen in the way of an industrial school had been entirely futile. Asked by Mr. Low if he had any views on the question of principle whether they should be under the Director of Industries or of Public Instruction, he thought it was almost immaterial at the present stage though it might develop into a matter of importance later.

Hydro-Electric Power.—In reply to Sir Francis Stewart, Mr. Bull said that so far as enquiries went the only sources of power were so far away from any place where power could be utilised that it was not considered worth while going into the matter in great detail. The power was available on natural falls of rivers in the foothills. There was a scheme to light Shillong. It could not be done on a commercial scale because the rate per unit would be exorbitantly high and there was no business factory near, and it was not worth while starting the thing in the hope that business might develop. In Shillong the price of coal for private consumers was fourteen annas now while in the plains Rai Sahib Monomohan Lahiri said it was ten annas six pies per maund, and the actual quantity of coal would be only

thirty seers in a maund after making allowances for shortage, sand and stone. Coal was very dear in Assam.

Asked by Mr. Low whether the dearness of coal was due to the special conditions under which the coal mine was worked or due to labour or transport difficulties, Mr. Bull stated that it was due to the monopoly of the people who owned the carts to bring the coal out. The mine depended on carts for transport and there was no railway to the mine. He had no information whether the Margherita Coal Company was in difficulties in obtaining labour. Colonel Gurdon said that he was told that there was a great amount of coal but that the company could not get enough labour for extracting it. Rai Sahib Monomohan Lahiri stated that last year the price was Re. 0-9-6 per maund while this year it is Re. 0-10-6. It was a question of monopoly. The steamer companies who were the agents of the Coal Company would not carry coal for less than five annas a maund from Calcutta and there could not be any competition, from outside. Colonel Gurdon said that the Assam Railways and Trading Company was paying a dividend of five per cent after allowing for eight per cent preference. Mr. E. P. Gilman said that the company did not pay high dividends.

Resolution XVI.—That there is a promising field for the use of co-operative principles in connection with the weaving, brass-work, and gold and silver work industries in Assam.

In reply to Sir Francis Stewart, the Hon'ble Mr. Botham said that a few co-operative societies had been started in connection with weavers. Asked by Mr. Low, Rai Bahadur Kanak Lal Barua said that they had no co-operative societies in connection with brass work. With regard to gold and silver, Mr. Mackenzie did not think that sufficient workers in gold and silver could be found to form one co-operative society. Asked by Mr. Low whether co-operative credit for gold and silver workers would not be risky, the Hon'ble Mr. Botham said that it would be only on a very small scale and the articles would only be made to order.

General.—As regards transport, the Hon'ble Maulvi Syed Saadulla brought to the notice of the Commission that the monopoly given to the Gauhati-Shillong Motor Transport Company was very hard upon the people. The Company was raising the rates every now and then. He wanted to know why a monopoly as regards passenger traffic and an *interim* monopoly on goods traffic had been given to Gauhati-Shillong Motor Transport Company.

Mr. Bull stated at the outset that the two questions were separate. The Gauhati-Shillong Motor Transport Company was started to enable people and goods to get to Shillong quicker than they did in the past when they had been dependent on tongas. Motor transport was started before the war. Since the war, as everybody knew, it had been very difficult to get materials for repairs, tyres and other things. There was no monopoly. The Local Government were not in a position to give a monopoly. The road was narrow and winding. It was not possible to allow more than a certain number of motor vehicles on it with safety, and they had very elaborate regulations to enable the traffic to move. The Motor Company had promised to run so many passenger vehicles and so many goods vehicles and in addition to that permission had been given for ten heavy vehicles belonging to private owners to carry goods. No proof had been put forward by any of the petitioners up till now that traffic was impeded or held up, that is to say, that traffic was prevented to be carried but refused, nor was there any proof that passengers applied for seats but did not get them. General statements were made but no proof had been given. The statement had not been challenged that the service that used to run daily, now only ran twice a week because the average of passengers who travelled in the Company's service for a certain period was one per day. Under those circumstances, on the advice of the Motor Standing Committee the service was reduced to two days a week.

The Hon'ble Maulvi Syed Saadulla replied that his question was why the Gauhati-Shillong Motor Transport Co. alone was allowed to carry passenger traffic and the other private companies who used to carry passengers before had not been allowed to do so during the last six months.

Mr. Bull stated that there were ten lorries apart from the motors run by the Motor Transport Company which travelled on the road. They were not allowed to carry passengers because the Government had not the same control over them as over the Motor Transport Co., and there was nothing to show that the facilities afforded by the Motor Transport Co. for passenger service were not sufficient. The Motor Transport Co. had paid on an average $4\frac{1}{2}$ per cent and last year it paid no dividend at all. It might be very simple for outsiders to open another company and cut freight, but they could not possibly make any money. There was a company already existing and no proof had been put forward that they did not meet the necessities of the public as regards passenger traffic. In reply to the President, Mr. Bull said that there was no non-official on the Motor Standing Committee. It was open to the public to make complaints either to himself or to the Executive Engineer in Shillong if they could not get seats. They had vague applications from various people that they could not get accommodation, but there was only one instance quoted of a man having failed to get a seat. On that day there were $3\frac{1}{2}$ seats vacant and it was not understood why he did not get a seat. He lives at Gauhati and it was not possible to correspond with him. He did not make the statement himself but others made it for him and he did not even sign the application. No definite complaints had been made by people of not having been able to get seats. In those circumstances the Motor Standing Committee with the advice of the Chief

Commissioner considered that no further facilities were necessary for passenger service in the interests of safety.

The Hon'ble Maulvi Syed Saadulla made a suggestion as regards as the working of forest laws. He said that for the development of indigenous industries there should be some sort of concession given to indigenous people. In the interests of the Assamese, Government in their auctions should give some concession. They might put an upset price and if an Assamese gave it he should be given preference over the people from outside. The President replied that he was told by the Chief Commissioner that the Assamese would get preference. Colonel Gurdon stated that other things being equal they always tried to help the Assamese as far as possible. The Hon'ble Maulvi Syed Saadulla said that the people had not seen it in action in many cases.

Rai Sahib Monomohan Lahiri complained that royalty on timber was very heavy. It was six rupees a tree before but now it was five annas per cubic foot. The price of first class timber was now Rs. 1-5-0 per cubic foot. The sawing charges were between nine and twelve annas and the cost of transport was four annas and the margin left to the dealer was very small.

Mr. James Blair.

CALCUTTA.

WITNESS No. 411.

MR. JAMES BLAIR, *Managing Director, Surma Valley Saw Mills, Ltd.*

WRITTEN EVIDENCE.

Financial aid.

I have had experience of the raising of capital for industrial enterprises. Provided any scheme has commercial possibilities, and the persons behind it are men of stability and experience, it can hardly be said there is much difficulty about raising the necessary capital. The bulk of the capital for industrial enterprises is provided mainly from European sources. Indian capital is not so readily obtainable, mahajans, land-owners, and bankers having a more remunerative use for their capital. Another matter which militates very much against the raising of Indian capital, has been the past large numbers of failures of Swadeshi industrial companies and banks. This, in my opinion, has done more to retard industrial progress than anything else, and it will take years to obliterate the memory of these failures. To increase the supply of capital for industrial enterprise, would seem to lie in the gradual development of co-operative banks, and by the establishment of agencies and sub-agencies by the existing Joint Stock Banks and Agency houses.

I have had no experience of Government financial assistance, but I am opposed to the idea. Such assistance has the tendency to lead to unsound undertakings by relying on the fact of Government support, and the artificial prosperity thereby created collapses on the withdrawal of such support.

Pioneer factories.

If Government at any time start pioneer factories, the result should be made public and the factory offered for sale, as soon as there is reason to believe it has reached a profit-earning stage. I would strongly urge, however, that where no political reasons enter into their calculations, Government should not, under any circumstances, convert any such factories into permanent Government enterprises, except, of course, in case of industries of national importance,—munition factories, for instance. Pioneer factories should only be undertaken by Government when private or public interest cannot be obtained. Regarding the limits of Government assistance, I am entirely opposed to Government competing with private enterprise in any shape or form. Besides being very unfair, it can only have the effect of retarding private enterprise.

Research.

In my opinion, provision for research is an essential preliminary for any forward industrial policy. As an example, I should like to point out the benefit the timber and other sundry industries have derived from the Dehra Dun Forest Research Institute. I favour, however, an Imperial Research Institute as being more likely to be adequately staffed and equipped, prevent unnecessary overlapping, and more efficient, than a small number of independent Research Institutes spread all over the country. Only in special cases private firms might be allowed the services of experts, and if such services were paid for, the result of their researches should be considered private. The Research Institute should be put in a position to give sound and practical advice to private enterprise. Directors of Industry I favour being appointed to every Province. They should collect and publish commercial statistics, answer enquiries, enquire into the possibilities of starting of new industries, help by giving all the latest results obtained from the Imperial Research Institute, and by co-ordinating and supporting the wishes and requirements of industry and keep the Imperial Commerce and Industry Department regularly posted.

Industrial surveys.

As regards surveys for industrial purposes. A complete survey of all the forest resources would be of the greatest possible value. There is a fair idea as to the quantities of the principal species of timber, but little is known of the other species, or of the minor products.

So far as my experience goes, model factories are of little use, and the results obtained from them are often very misleading and unreliable.

Two essential things for progressive industrialism, are cheap raw material and good communications. Without good communications, the necessary raw material cannot be cheap, or possibly not available at all, so that it therefore becomes imperative to look far ahead with regard to communications and transport facilities, in order to encourage the development of industries. Roads, railways and waterways.

The Provinces of Eastern Bengal and Assam possess a magnificent network of waterways, and by putting these waterways under proper control and giving them proper attention, it would undoubtedly help very materially and economically as a transport for industries. In Eastern Bengal and Assam the rivers are used to a very large extent in the development of the country, in moving agricultural produce, minerals, and forest produce, and the present condition of the waterways seriously hinders development. The want of proper facilities for transshipment of the heavier material during the cold season is another obstacle. Transshipping heavy packages by coolies, besides entailing unnecessary delay, is expensive and makes competition difficult against other countries properly equipped. Waterways in a province like Assam are bound to play a very important part in the development of the country, so the development of the waterways would be a practical and a real assistance to industry.

On the Railways, encouragement might be given in the way of specially low freights on raw material for manufacture, and outward on the manufactured stuff. Whatever may be the position of freights at places near Calcutta, the freights upcountry, where small industries are concerned, are capable of revision. What seems to me desirable is that the Railway Board should have greater powers in settling rates and enforcing uniformity of practice. On a complaint to the Board they should have powers to remedy any obvious defects or remove anomalies. Large industries with powerful associations can look after themselves, but the tendency with small individual industries upcountry is to treat them sometimes as if they were of no consequence. The Railways upcountry do not in my opinion encourage industry as they should.

Roads and bridges in Assam are capable of considerable improvement. I would strongly urge Government to adopt a liberal policy towards the matter of roads and bridges, for without them no real progress can ever be made. Most of the roads and bridges in this Province are *kutchas*, and it is no uncommon thing for a road to be closed for weeks, sometimes months, on account of the bamboo bridges collapsing during the rains. In fact, there is a case in the Surma Valley district where the main trunk road between Sylhet and Cachar districts has been closed to wheeled traffic for several years. A small part of the road slipped into the river, and although a short diversion of the road, which presented no difficulties, could have put the matter right, the road has remained closed, on the grounds that there were no available funds.

There are many places where Railway bridges might be utilised to advantage for light traffic. It will be many years before some of the rivers are bridged, but where a Railway bridge is near, I can see no reason why it should not be utilised to improve communications.

To my mind—so far as this Province is concerned—what industrial development requires is not so much financial aid as that Government develop the country by giving good communications and create the other conditions necessary for the successful prosecution of industries, then private enterprise will be found to do the rest.

The forests are capable of almost indefinite expansion, but before this huge indigenous Forests. industry can be pushed along to compete with foreign timbers,—imported from countries many thousands of miles away,—important and sweeping changes in forest administration are necessary. There is obviously something wrong when a country like India with its 250,000 square miles of State forests, has to depend to a very great extent on foreign countries for its enormous annual timber, sleeper, and tea chests requirements. The proper working of the forests would assist materially and economically towards industrial development but more elasticity is essential than is obtainable under the present system. Whatever the forest rules may have been in the past, they are now unsuitable for the present conditions, and are the cause of most of the trouble experienced.

The forests are provincial, that is, their income is taken and their expenditure controlled by the Provincial Government. To begin with, a province has no control over capital funds, so that for forest development, the Forest Department has to rely on whatever share they can obtain from the free balance, estimated each year by the Financial Secretary. As the allocation of the free balance is being influenced more and more every year by the Legislative Councils, and there being no popular demand for forest development, progress under such conditions is difficult, especially in a province like Assam, where the whole of its income may be required for current needs.

Further, the Conservator of Forests is not able to press the claims of the Forest Department in person in the Legislative Council—same as heads of other large Departments—so that it is utterly absurd to suppose that under such circumstances, that funds will ever be forthcoming for real forest development. Under any such policy, there seems to be little use for the highly trained and skilled Forest Staff, with no development, and very little exploitation work has resulted in a highly trained staff being retained for little more or less than royalty collecting.

For some reasons, the Forest administration in the past have not encouraged the giving of long leases or concessions, resulting in the forests being exploited by large numbers of small petty contractors, most of them working with capital borrowed at very high rates of interest. Absurdly high rates of Government royalty are charged, with the result that all the accessible timber along the banks of the river has been extracted and the more inaccessible timber left. With such large numbers of small traders working all over the forests, practically very little or no control is possible by the Forest Department, and the same blocks are worked year out and year in, giving no period of rest for forest regeneration.

The custom for a trader is to obtain a forest pass, and then go and fell timber where he pleases, and then, as often happens, not extract the logs he has felled, but leave them in the forests to rot. Mostly all the forest streams are choked full of snags of all kinds, and in their present state make the extraction of timber impossible. This state of affairs has happened because it's no one's duty to see that the rivers are kept clean. The Forest Department get little or no funds to enable them to do the work, and on the other hand the small trader, having paid a very high rate of royalty for his logs, could not be expected to do the work. Until quite recently no timber firm or saw mills held any concession or leases from Government, all the timber for the saw mills being obtained through traders. Advances were usually given by the mills and rates for the supply of logs fixed, but if the bazar rate when the logs arrived happened to be higher than the rate made with that of the mills, the logs were often sold elsewhere, and advances handed back, and, as very frequently happened, the advances were not even returned.

In the past there were many saw mills in the Surma Valley, all of which had to obtain their supplies of logs through small traders, and with the exception of two mills all the mills had to be closed down. All these failures were due to excessive royalties, payable to Government on the timber extracted, and secondly, on account of their inability to keep the contracts, through no cause of their own. It is no uncommon thing for a mill to be closed for several months every year, through the holding up of logs, and through other causes which might easily be removed.

Government in the past may have been justified in charging high royalties, but if Indian firms are ever to compete against foreign supplies, Government must realize the economic force behind the question of royalties, and should at least put royalties on a footing which would enable Indian firms to compete on equal terms with imported timbers.

The forests of this valley are mostly all evergreen forests, and the royalties charged by Government on this class of forests is simply iniquitous. Royalties are payable on the timber extracted at rates varying from 144% to over 57% of the actual cost price of the logs, and in no other country, class for class, are such absurd royalties levied. The same remarks apply to minor productions.

The destruction of forests is another matter. The amount of forests with good timber which are destroyed annually for *jhumming* is enormous, and for many reasons a very serious problem. There may be some difficulty about stopping this awful devastation of hill forests that goes on every year, but it can at least be brought under control and confined to areas where there is now no good standing timber. The same remarks apply to forests being deforested for the planting of tea. The custom in such cases is sinful waste, for the timber is felled and burned. No attempt is made to extract the timber, for which there is a ready market, and no royalty is paid for it. Wasteful destruction of this kind is unnecessary, and there is no reason why the party should not pay for its value, same as any person extracting the timber for sale would require to do. The rules, as they now stand, have the effect of putting a premium on the destruction of the timber. The loss of the forests is bad enough, but the loss of the timber through deliberate destruction is outside all bounds of reason.

The Forest Department staff is hopelessly inadequate, and the subordinate service badly paid and dishonest.

The difficulties of controlling and supervising forest work and very numerous small traders spread over large areas are very great indeed, and it is much to the credit of the Department that they have been able to do so much. Most of the staff, however, is employed in collecting royalties, so I should suggest for a start that this duty be handed over to the civil authorities, to allow of the Forest staff looking after the real work for which it is trained and for which it is very badly wanted.

My experience has been, that the development and exploitation of the forests cost very heavy outlays of capital, and are only possible by large organisations. Large amounts of capital will have to be sunk into the forests, and to induce this capital, I should suggest that Government grant long leases to approved firms; for unless leases are given for long periods, there can be little hope of any advance being made, over the primitive methods of exploitation. A reduction on the present scale of royalties, I consider imperative. The royalty should be reasonable, and should be such as to enable Indian firms to compete with foreign timber imported into India. Royalties placed on a business footing would mean the extraction of more timber and of all the timber now left to rot, and the exploitation of the forests being placed on a firm and sound basis.

The indiscriminate felling of timber all over the forests at any and every time should be stopped at once, if the forests are to be preserved from destruction. Schemes should be

drawn up for every forest, whereby each forest would be marked off into blocks, and so many of these blocks opened and worked under a system of rotational fellings, and thereby allow of the worked blocks having a period of rest for regeneration. The marking of trees before felling should also be instituted all over, and no tree should be felled until it was marked and recorded by the Forest Department. This will require a fairly large forest staff, but as already indicated, a fairly large forest staff would become available, if they were relieved of royalty collecting at centres no way near their forests.

The forest rules should be brought up to date. They should be made very elastic, so as to allow of each Province making rules to suit its own special conditions. This seems to me to be essential, for the Indian forests are so extensive and so varied that in no two provinces are conditions the same.

Under the present financial system, it is evident Conservators of Forests cannot safely enter on an extensive or even a steady policy of forest development. The remedy for this appears to be to put productive forest development on the same footing as productive irrigation works. The Imperial Government could easily raise the necessary capital as part of its annual loan and the provinces could be charged interest on the capital provided for their requirements.

In conclusion I should like to say that the Government's technical officers seldom fail to render every assistance and help within their powers that their rules allow.

The land laws are not all that could be desired, especially those relating to leases, and are a great hindrance to industrial development. Something should be done by Government to ensure that leases issued by Government in respect of minerals and land should be clear and that the lessee should be saved the expense of litigation in defending his leasehold. Government should also put themselves in a position for the acquisition of land for industrial purposes. Land policy.

ORAL EVIDENCE, 14TH JANUARY 1918.

Sir F. H. Stewart.—Q. You say in your statement that Government should not, under any circumstances, convert pioneer factories into permanent Government enterprises, where no political reasons enter into their calculations. By 'political reasons' you mean if the industry is one of national importance you would not have any objection?—A. That is right.

Q. Then you say that you derived much help from the Dehra Dun Forest Research Institute, and arguing from that you would like to see a general Imperial one?—A. Yes.

Q. If you had an Imperial one, would it not be too large or too unwieldy?—A. No, I think it would be better.

Q. The suggestion has been made sometimes that there should be 3 or 4 in different parts of the country, each dealing with its own particular local subjects; one at Dehra Dun, dealing with forest problems, one elsewhere with chemistry, another elsewhere again with metallurgy, etc. Don't you think that would be preferable?—A. No, there would be a tendency to overlap in cases of that sort. You would probably find two of them dealing with the same subject. An Imperial Institute would also likely be better equipped.

Q. Could you not provide against that by central control?—A. If you had central control, yes.

Q. In that case you think it would be better to have more than one?—A. Yes, assuming there was central control and they were properly equipped.

Q. You discriminate between the services of experts and advice, and think that these Government experts should be there to give advice to anyone asking for it?—A. Yes.

Q. But their services you would not grant the use of except in exceptional circumstances?—A. Yes.

Q. Then they would be paid and you think the result of their work should be kept private?—A. Yes, if paid.

Q. Do you think that would be right, considering that they are Government servants?—A. The firm is paying for their services and is entitled to the results of their researches.

Q. The firms no doubt are entitled to protection, but would that not be met by saying that the results of their work should be kept private until a fairly definite period had elapsed?—A. If their services are paid for, the results should be kept private.

Q. Then you refer to waterways; have you any specific suggestion as to what could be done to make better use of them?—A. The rivers might be put under the control of somebody, a Waterway Trust or something of that sort.

Q. Comprising both officials and non-officials?—A. Yes; similar to the Calcutta Port Trust.

Q. Is anything at all done for them in Assam?—A. Very little by the Government; all by the steamer companies.

Q. Whom do they come under—the Public Works Department?—A. The rivers? I think some do, but am not sure about that. I know they keep the records of water erosions and water levels, etc.

Q. Supposing you had a Trust of that sort, where would you locate it?—A. It is difficult to say. I should say for the central controlling body the most convenient spot might be Calcutta.

Q. You mean that there may be one Trust to deal with all the waterways, not a separate one for Assam and another for Bengal?—A. No that would be too big a proposition at the present time. I favour a Trust for each province with a central control, say, in Calcutta.

Q. Then you speak about railway rates: you think the Railway Board should have greater powers in settling rates and enforcing uniformity of practice. What do you think of the suggestion made to us that there should be a Committee which would meet perhaps twice a year, including commercial men, who would go into the question of these rates, and have power to settle them?—A. I think the suggestion very good.

Q. Railway rates are very intricate; do you think even a good business man would be sufficiently acquainted with them in detail to be of sufficient use?—A. I should think, so far as local rates are concerned, he would.

Q. You give a case in the Surma Valley district where the main trunk road between Sylhet and Cachar districts has been closed to wheeled traffic for several years. Has it been put right now?—A. No, it has not; it has been like that for several years.

Q. Have you not had the Chief Commissioner going round?—A. No.

Q. Is this road looked after by the Public Works Department?—A. Yes, it is a trunk road.

Q. I suppose representations have been made about it?—A. Yes, for a long time.

Sir D. J. Tata.—Q. You mean to say the road has been closed for several years?—A. Yes.

Sir F. H. Stewart.—Q. You are Manager of these saw mills?—A. Yes.

Q. Do you have any particular trouble in your capacity as Manager with the Forest Department?—A. I am afraid a great deal.

Q. Is it, so to speak, their fault, in your opinion, or because of the rules and regulations?—A. Principally the rules and regulations.

Q. It is not a personal matter; you find them willing to help as far as they can?—A. Not the subordinate staff.

Q. You refer to the subordinate service being badly paid and dishonest?—A. Yes; the Divisional Forest Officer usually gives as much assistance as he can in his power.

Q. You say the collection of royalties should be handed over to the civil authorities. Would that be a practical proposition? The Forest Department would have to supply all the rates?—A. Yes, but leave the collection of royalties to the civil authorities. That would set the forest officer free to do his own work.

Q. Do you find the Forest Department efficient in dealing with commercial matters?—A. No, I am afraid they look upon it too much from the revenue point of view.

Q. Do you think it would be a good thing if a special forest officer was given a certain amount of business training and put in to deal with such matters?—A. I think it might be a good thing.

Mr. C. E. Low.—Q. Would he let the public have the wood any cheaper if he had a business training?—A. No, but he might be able to come to arrangements better with business firms. They don't grasp the business side of a proposition as a rule, but only look at it from the revenue point of view.

Sir F. H. Stewart.—Q. Another point put before us is the great need for the services of Forest Engineers. Do you agree with that?—A. The difficulties, of course, are enormous. I certainly think that any man with engineering skill would certainly be an advantage.

Q. The difficulty would be rather whether these men should be members of the Forest Service, or whether they should be recruited separately?—A. It is difficult to say. I should think you could probably get men outside and better men.

Q. Would you get good men for any pay and prospects you could be likely to offer?—A. I think you could.

Q. I don't understand what you mean by 'the actual cost price of the logs' in the sentence reading, "Royalties are payable on the timber extracted at rates varying from 14½ per cent. to over 57 per cent. of the actual cost price of the logs."—A. That is the cost, extracted and landed at the mills but without royalty.

Q. The royalty is really the actual cost price?—A. No. We simply pay royalty to Government which I consider is excessive. I think it will ultimately run up to possibly over 90 per cent. when better forest appliances are installed. The cost price is the cost of felling, extracting and floating to mills.

Sir D. J. Tata.—Q. The total cost of the logs is royalty plus freight, felling and extraction charges?—A. Yes. Supposing the cost was 4 annas per cub. ft. at the mill, and Government charged 4 annas per cub. ft. royalty, that would be 100 per cent. over the actual cost of the logs extracted and delivered at the mills.

Q. With regard to forest administration, do you propose that Government should manage everything, and sell timber to the saw mills, rather than give up the forests to ordinary traders and leave them to deal with the mills?—A. The forests are so big that I don't think Government is likely to give them entirely over. Let the Department work the forests if they wish in their own way, but give concessions on long leases to approved firms; but not to small traders, because they simply destroy the forests.

Q. What is to prevent firms getting these leases?—A. Nothing. They would not be much under Forest Department control. They would be allowed to fell trees in any place inside a given area. In this case a big firm might find numerous small contractors in the same area and even in the same streams. The small contractors' method of working makes the position impossible for any respectable firm.

Q. I don't understand why Government will not deal with firms, and will only deal with individual traders?—A. I cannot tell you. There certainly have been objections to it for some time. They are considering a concession to my firm now.

Q. So that you can deal with the area yourself, Government marking the trees and you felling and extracting the timber yourself?—A. Yes. At the present time there is no restriction at all. A man takes out a pass and goes to any forest he likes, and fells any timber he likes. The timber is not marked. He pays the royalty, and anything he does not want can lie there. There is no compulsion to extract it.

Mr. A. Chatterton.—Q. You say that, so far as your experience goes, "model factories are of little use, and the results obtained from them are often very misleading and unreliable." What are you alluding to there?—A. Several I have had in my own experience.

Q. Can you give us some details about this?—A. One was an oil mill, another was a sisal hemp factory.

Q. These were run by Government or by private enterprise?—A. Private enterprise.

Q. As demonstrations?—A. Yes, but the results obtained from them were entirely different from what we were able to get on a commercial footing; the results obtained were very misleading.

Q. How did that happen?—A. One was an hydraulic oil plant and the small machinery gave a much higher efficiency than what we could get on bigger machinery, a difference of 5 per cent. in results in the percentage of oil extracted.

Q. How do you account for that?—A. Simply on account of the smaller cake and the greater cake pressure with the smaller machinery. The bigger machine with bigger cakes did not get the same efficiency.

Q. What seed was crushed in these oil mills in the Surma Valley?—A. Mustard, linseed, &c.; practically all kinds of small seeds.

Q. Was the industry started so that you might get oil cake for the tea plantations?—A. We want the oil. Oil is the principal thing; oil cake is a by-product.

Q. Is the oil used locally or exported to Calcutta?—A. Used locally.

Q. In regard to the sisal hemp?—A. It was disastrous.

Q. I think we have heard of that before?—A. It was in a bad position when I took it over.

Q. And so far as you know it is still being cultivated?—A. No, it has been given up entirely.

Q. We have not had the opportunity of visiting any of these saw mills in Assam. Could you tell us exactly what kind of equipment you have got in your mill?—A. The whole place is now being re-organised. Machinery has been delayed on account of the war. At the present time we use nothing but circular saws. The American style of cutting is as efficient a system as you can get for our class of work.

Q. Are these comparatively new mills?—A. No, old mills, and the machinery is fairly old, but quite efficient.

Q. You don't use hand saws at all?—A. No.

Q. They are not used in Assam at all?—A. They are in one place.

Q. Are they as satisfactory as circular saws?—A. So far as box making is concerned, the band saw is quite efficient or where you are cutting planks; but our business so far as hard wood is concerned is to a great extent in sawn squares, and our machinery is more efficient for that work.

Q. You mean you are just facing up logs?—A. We simply square them as they do in Burma, and they are shipped to Calcutta and other places. In Assam in one mill they use band saws, they are only cutting tea chests. They failed to cut hard timbers, and in England they had difficulty over them.

Q. Do you only deal with hard woods?—A. No, we are making tea chests too, we are also putting down machinery to make 3-ply veneer chests. We are doing away with the manufacture of local wooden tea chests.

Q. With this Vanesta system of working you get much more economical utilization of your timber?—A. Yes.

Q. Would you be able to use younger timber for tea boxes?—A. I don't think so.

Q. What girth of wood would you be able to put into Voursta lathes?—A. We work with a minimum girth of 6 ft. trees. The upper parts of the trees would be less than 6 feet.

Q. Cannot you deal with anything smaller than that?—A. You can, but the timber is not good enough.

Q. In your note here you say that all the mills have had to be closed down; is that closing down due to difficulty in carrying on the business, or is it due largely to the inefficiency of the equipment of the mills, and to the difficulty of competing with foreign tea boxes?—A. Do you mean the closing down of the mills entirely, or the closing down annually? The saw mills in the Surma Valley have almost been wiped out.*

Q. Was the closing down of these mills due to the inefficiency of the arrangements in getting timber; or to the inefficiency of the arrangements for working up the timber?—A. It was due to excessive royalties, and the logs being withheld. The timber was entirely in the hands of small traders, who did as they liked. They did not hesitate in closing the mills down if they thought they could get bigger rates. One big mill went down for I think about 3 lakhs of rupees. It was a very well equipped mill.

Q. Why could not the managers of saw mills get licenses to cut timber in the forests themselves?—A. How could they with other two or three hundred people going for timber felling where they chose to work? Every one took a permit. If you worked on that system, all the timber could get mixed up or stolen. There would be no development and would end in a rush being made for all the accessible trees near to the rivers.

Q. Was the permit given to cut timber indiscriminately from the forests?—A. Yes, and any man could get a pass and cut timber wherever he liked.

Mr. C. E. Low.—Q. A man is allowed in a certain wide area to cut at his discrimination?—A. Yes.

Mr. A. Chatterton.—Q. What you complain of is this indiscriminate felling in the area?—A. Yes, he simply fells trees alongside the river and pays his royalty. That is all that is done. There is no control of the small trader in the forest; absolutely none.

Q. You go on to deal with administrative questions. What do you put down as the most crying need for a reform?—A. I should say forest control, and working of the forests on scientific lines.

Q. In what way?—A. Let the Forest Department run the forests. They don't at the present time. They know very little about them.

Q. How do you mean?—A. I say they don't control the work of felling and extraction and look after the regeneration of the forests.

Q. Who does control it then?—A. They control the royalties when the stuff comes to the royalty collecting station; nothing more.

Q. You imply that they simply give leases and take no further interest in the matter?—A. Until the stuff comes to the royalty station, they take practically no interest.

Q. You mean there is no control over the actual felling of the timber inside the forests?—A. None whatever, except in the areas where we are working, which we initiated in order to save ourselves, and the forests from destruction that we hoped to obtain a concession from Government to develop and exploit.

Q. What are you doing?—A. In the area we have got we insist on the Forest Department marking trees to protect ourselves and protect the forest.

Hon'ble Sir R. N. Mookerjee.—Q. To avoid prosecution in the case of cutting trees not marked?—A. Yes, if any of our men are caught felling unmarked trees we are fined.

Sir F. H. Stewart.—Q. What you insist on is the Forest Department marking these trees, so that you are sure of getting the right timber?—A. Yes, so that immature timber is not felled, and so that all marketable trees are extracted which are accessible.

Mr. A. Chatterton.—Q. You make the Forest Department select your timber for you?—A. That is right. (Witness here gave confidential evidence.)

Q. You say you propose to sink money in the forests and develop them?—A. Yes, by clearing the rivers, blasting rocks, making roads and railways and by removing accumulations of the last 60 years which the Forest Department ought to have done.

Q. You are going to improve the waterways for your own transport, but how are you going to develop the forests, if you are going to cut all the timber in the forests?—A. There are certain trees left to regenerate the forests; everything is not cut down. Only trees of 6 ft. girth and over are felled, all smaller trees are left.

Q. Your improvements will be of such a permanent character that they will really develop the forests?—A. Yes; our intention is that we will work a certain number of blocks and when these are finished, close down for a period of 10, 12, or 15 years to give the forest a chance of regenerating. At the present time blocks are worked year after year, and young trees are killed; there is no chance of the forests re-establishing themselves. (Witness here gave confidential evidence.)

Q. You complain of these royalties which other people complain of too; but all the figures which are furnished to us are always given in the form of percentages. What we would like to have are actual figures showing what the amount of royalty is, because 14½ per cent. on the cost of extraction does not seem to be very much in the way of royalty.

Mr. C. E. Law.—Q. We would like the figures showing up to the exploitation point, and the figures on the converted timber?—*A.* That can be furnished to you. I can give you all the royalties now, which we are paying on the actual rough material, 5th class logs are 1 anna per c. ft., 2nd class 3 annas, 1st class 4 annas, in the rough.

Q. What percentage of the rough timber becomes saleable timber?—*A.* You can take 2 cubic ft. timber from the rough to make 1 cubic ft. sawn scantlings. Our royalty is 8 annas on the manufactured stuff for 1st class timber.

Hon'ble Sir R. N. Mookerjee.—Q. What is the value of that wood there, and for how much can you sell it there?—*A.* It varies a great deal. At the present time first class timber is Rs. 2 per c. ft. but it is sold sometimes at as low as Rs. 1-8 per cubic ft.

Q. That is the average rate from Rs. 1-8 to Rs. 2 for which you have to pay 8 annas royalty?—*A.* That is first class timber. On a second class log royalty is 3 annas. First class would be 5 annas per c. ft., on the manufactured timber.

Q. And for which you can get Rs. 1-8 to Rs. 2 if you were to sell it?—*A.* Yes, but Rs. 2 per c. ft. has only been reached quite recently and since timber imports were shut off.

Q. What would be your other expenses for bringing that into a condition to sell it?—*A.* You are coming to trade secrets now.

Mr. A. Chatterton.—Q. The cost of extraction and of bringing it into the market depends upon your own efficiency?—*A.* Yes, and efficiency depends upon control. At the present time we have very little control over the forests except working under a concession.

Q. What do you want in the forests in the way of control?—*A.* I want reduced royalty and a long lease to firms of approved standing, as short leases are useless.

Q. Then you say that the "indiscriminate felling of timber all over the forests at any and every time should be stopped at once, if the forests are to be preserved from destruction," and you suggest that "schemes should be drawn up for every forest, whereby each forest would be marked off into blocks." Are there no working plans at the present time?—*A.* No.

Q. None at all?—*A.* I don't think so. The only working plan I know, so far as the Surma Valley is concerned, is our own which at the present moment is not complete. (*Witness here gave confidential evidence.*)

Q. The last paragraph of your note about land laws. What is in the back of your mind when you write that "something should be done by Government to ensure that leases issued by Government in respect of minerals and land should be clear, and that the lessee should be saved the expense of litigation in defending his leasehold"?—*A.* At the present time I am controlling a syndicate which is boring for mineral oil. We put in an application for land on the opposite side of the river. The land was held under a redeemed lease and Government have offered me a lease, provided I would guarantee them against action by third parties, practically inviting me to have trouble because Government would not give me a clear lease which other people could not dispute. This was a redeemed lease in which Government say that the minerals do not belong to the lessee. I asked them to give me a clear lease, which they have not done up till now.

Mr. C. E. Law.—Q. These cases in which the Government's title to minerals is obscure, I should imagine are very rare; aren't they?—*A.* I do not know. From what I learn from some of the big oil companies, they are not rare at all.

Q. Have you not something in your mind, namely, the case where Government has no title at all?—*A.* No, it is the case of redeemed leases where Government have declared they hold the mineral rights.

Q. What are these redeemed leases exactly?—*A.* Where Government has taken back land at some time and given it out again under a modified lease or on different terms. Government has decided that under the redeemed lease the lessee had no mineral rights.

Q. These cases do not exist in any other parts of India?—*A.* I will send you the correspondence* on the matter.

Q. I suppose in these leases land is given out under the old arrangements where Government either lease or give away the fee simple?—*A.* No, there is a difference between the titles and fee simple. Fee simple land carries mineral rights. In redeemed leases it was not mentioned in the leases whether the redeemed leases carried mineral rights. But Government have declared and claim that redeemed leases do not have mineral rights. They claim mineral rights belong to Government.

Q. You don't accept it from us that these cases are very exceptional?—*A.* So far as land leases are concerned they are not exceptional; in fact it is rather the rule with Government leases.

* See Appendix B.

Q. I am speaking of titles to minerals only.—A. I think if Government is going to give a lease they ought to make it clear before handing it over.

Q. This has nothing to do with the rules under which Government gives out minerals, but has to do with Government's title in that particular place, which is another matter.—A. Why?

Q. In apportioning responsibility for this sort of thing, it is no fault of the people who have to administer mineral rules, but the fault of the people who deal with the record of the Government title in that place.—A. That is quite right.

Q. Turning to your second paragraph, you say, "I have had no experience of Government financial assistance, but I am opposed to the idea." Does that include guarantee?—A. What kind of guarantee are you referring to?

Q. A guarantee to pay dividends, for instance?—A. No, I don't think it is sound.

Q. Even in the case of railways?—A. That is quite different, that is an undertaking of national importance.

Q. Supposing you had an industry which was of national importance, and which served a great many other industries on a peace basis, what do you think of a guarantee?—A. I have already said where there were no political reasons enter into their calculations, I am opposed to Government financial aid.

Q. Take the case of sulphuric acid. India relies on outside sources for its sulphur. Sulphuric acid is required for a great many industries. Apart from the political side, it would be of great advantage to dozens of industries if we had a reliable source of cheap sulphuric acid. Would you object to a guarantee in such a case?—A. I don't think guarantee dividends are sound at all. There are specific cases where it might be a good thing, but taken generally I don't think it is a good thing.

Q. As a general principle you are opposed to it?—A. Yes.

Q. Under the head of "Research" you point out the benefit the timber and other sundry industries have derived from the Dehra Dun Forest Research Institute. Could you point to any specific instance?—A. What about?

Q. Of the benefit which the timber industry has derived from the Dehra Dun Research Institute?—A. I know of a great many instances. We have had many benefits both as regards timber and the treatment of timber. At one time we had very much trouble with certain classes of timber used in tea chests flavouring the tea. They practically solved that question, and also showed us how to treat timber so as to prevent insects destroying it. They have also given us considerable assistance in the treatment of sleepers, which has been of considerable advantage. There is also a matter of treatment of bamboos and certain grasses for paper making.

Sir F. H. Stewart.—Q. Which branch is that?—A. Mr. Pearson's, the Forest Economist.

Mr. C. E. Low.—Q. About this question of freights, in many places we have had complaints that a mill or factory up-country has been charged a higher rate for raw material than is charged for raw material to a port. Have you any views on that point?—A. I can give you a case of timber, in the case of traffic between Assam and Cachar over the hill section. At one time a fairly good business was done there in timber shipped down to Cachar from Assam. We ourselves wanted to start it. The railway put up the rates* and the whole thing absolutely stopped on account of the rates being too high.

Hon'ble Sir R. N. Mookerjee.—Q. Did you represent the case to the railway authorities?—A. Yes. Here are letters on the matter.

Q. They lost their own traffic and still they would not do anything?—A. When it is a Government subsidized show you can do anything. That is why I object to Government guarantees and subsidies. I don't see what necessity there is to worry when you have got a guaranteed dividend. There is no competition.

Q. Did you go up to the Railway Board on appeal?—A. No, I don't think there is any appeal to the Railway Board at the present time, I should like to put it up. This is not an individual thing, but it is a matter for the whole district. It is a case which is affecting many people; at the present time timber is in very great need by the Government, but they are not helping things a bit.

Mr. C. E. Low.—Q. You say you want more money spent on roads and bridges in Assam. Have you any suggestion as to where the funds should come from?—A. That is hardly a point for me to suggest. I think if I had a free hand, I could quickly get funds by raising a local tax to get good roads and communications.

Q. The tax must fall on the land only; you cannot tax the people?—A. Why should they not?

Q. What is your idea?—A. Why should not the Imperial Government raise money and lend it to the Provincial Government and charge them interest on it? Undoubtedly if you had

good communications, industries would spring up and the province would become richer. It means employment for people and revenue to Government.

Q. You mean an undeveloped province like Assam should be dealt with by capital expenditure on improvements?—A. Yes, let them raise it in the annual budget as a loan to the Provincial Government. The roads are disgraceful in Assam; very little is done to them. For the money expended they don't get a quarter of the value they ought to get.

Hon'ble Sir R. N. Mookerjee.—Q. Have you ever put that question before the Provincial Government?—A. If you do that you get little change. They simply tell you they have no money.

Mr. C. E. Low.—Q. You refer, of course, especially to the case of an undeveloped province or area?—A. Yes. You don't want a thing like that for Calcutta, but Assam at the present time is not too well off. If they cannot get the money inside, it is necessary to get it outside. A province that could not raise the necessary capital might easily pay the interest on any such loans obtained from the Imperial Government.

Q. Speaking again of the bad condition of these forest streams, it is impossible for you to give an estimate, but what sort of a thing is it: is it a very expensive business?—A. It is very expensive; sometimes, it depends. If a river has been much worked there is a large accumulation of timber lying at the bottom.

Q. Heavy timber that has sunk?—A. Hard timber which falls into the river in a flood; sometimes logs. It takes weeks for logs to come out. Hard wood is floated by bamboos, and sometimes the logs sink. All these rivers are full of snags. In the following year you will find a huge sandbank forming and a few years later you find the river taking a new course.

Q. Heavy timber will float for a few hours until the air gets out of it.—A. Not green timber. We are trying to do away with the floating of timber with bamboos by ringing the trees before felling. None of the heavy timber at the present time floats; it sinks immediately.

Q. It is really an expensive business. What sort of length of river? These are side streams I suppose?—A. Some streams are 60 or 70 miles long. My point is that no small trader can do anything to develop the forests. In an area of, say, 500 square miles there might easily be several hundred miles of streams and rivers. (*Witness here gave confidential evidence.*)

Q. Do you think it is a business proposition?—A. We are taking it up, so must say we think it is.

Q. The Assam Government informed us that they had boats for drawing these snags, but as fast as they were bought they were commandeered for Mesopotamia.—A. The boats never came to the Surma Valley. They might have had them in Assam.

Q. You say, until quite recently no timber firm or saw mills held any concession or leases from Government, all the timber for the saw mills being obtained through traders. That applies, I understand, only to the Surma Valley; the position is different in Assam?—A. Yes, only one concession was given in Assam to the Naharkuti Timber Company which closed down. (*Witness here gave confidential evidence.*)

Q. The policy has been to get definite areas assigned to definite mills by the Forest Department. We were informed that the Inspector General of Forests in 1909 laid this down as a desirable policy, but that Government has tied themselves down with loosely-worded leases to certain individuals, which made this impossible in the Assam Valley. You support that policy of assigning definite areas to definite mills?—A. I do. The Assam mills have areas allotted them; there is no signed agreement with Government. They don't have further concessions there, as far as I am aware. They are simply allowed to cut box wood, nothing more.

Q. That area should be run on the ordinary working plan system pursued in every part of India. There should be some form of selection?—A. I think so.

APPENDIX A.

No. R-86, dated Chittagong, the 6th March 1918.

From—The Traffic Manager, Assam Bengal Railway Company, Limited.

To—The Managing Director, Surma Valley Saw Mills, Limited, Bhanga.

With reference to your enquiries I note below for your information the rates on timber

unwrought or logs during the years 1914-15-16 and at present from Badarpurghat to the undermentioned stations.

Badarpurghat—

Mileage basis—

4-Wheeled wagon or truck per mile	Rs. 4. 2. 6
Bogie wagon or truck per mile	0 4 6

Rates per 4-Wheeled wagon or truck.

Actual mileage.	Stations.	In 1914 and 1915 rates at Rs. 0-2-6 per wagon per mile.	In 1916 rates increased due to the introduction of terminal charge.	Present rates with double full mileage.	
		Rs.	Rs.	Rs.	Mileage.
160	Manipore road	25	28	45	275
189	Barpathar	30	32	50	304
198	Jamguri	31	32	51	313
201	Oating	31	34	52	316
204	Furkating	32	34	52	319
<i>Rates per Bogie Wagon or Truck at Rs. 0-4-6 per mile.</i>					
160	Manipore road	45	50	83	275
189	Barpathar	53	58	91	304
198	Jamguri	56	61	93	313
201	Oating	57	62	94	316
204	Furkating	57	62	95	319

APPENDIX B.

No. 3708-R., dated Silchar, the 12th March 1918.

From—W. L. SCOTT, Esq., I.C.S., Deputy Commissioner, Cachar,

To—J. BLAIR, Esq., Bhanga Bazar.

I have the honour to acknowledge the receipt of your letter No. P.-153—5, dated the 2nd February 1918, and to say that no such letter as referred to by you can be traced in this office. Government actually does claim mineral rights in all land given out under the Rules of 1854, whether the land revenue has been redeemed or not, provided that no special stipulation to the contrary was made in the particular lease under consideration.

No. 6058-R., dated Shillong, the 21st December 1917.

From—C. S. GUNNING, Esq., I.C.S., Under-Secretary to the Chief Commissioner, Assam,

To—The Commissioner, Surma Valley and Hill Districts.

I am directed to acknowledge the receipt of your Memorandum No. 8399, dated the 5th December 1917, regarding the grant of a prospecting license to Mr. J. Blair over an area of 114.3 acres in the district of Cachar and to say that the Chief Commissioner accepts the recommendation of the Deputy Commissioner that the application should be struck off, if Mr. Blair cannot see his way to accept the terms offered within three months. Mr. Blair may be informed accordingly.

No. P.-46-5, dated Bhanga Bazar, the 10th November 1917.

From—J. BLAIR, Esq., Bhanga Bazar P. O., Sylhet District,

To—The Deputy Commissioner, Cachar.

In continuation of my letter No. P.-10—5 of 8th ultimo.

On enquiring further into the matter of indemnifying Government against any claims by third parties in respect of a prospecting license over 114.3 acres, part of Dholdipur and Chandpur grants. I find now that it would be impossible to raise capital on any such terms and I, therefore, suggest that Government clear up the matter and give me a clear prospecting lease.

It is unreasonable for Government to expect me take up an unlimited risk as suggested. I am writing, therefore, to say that I cannot agree to the conditions without further consideration of the matter.

No. P-10-5, dated Bhanga Bazar, the 8th October 1917.

From—J. Blair, Esq., Bhanga Bazar P. O.,

To—The Deputy Commissioner, Cachar.

I beg to acknowledge receipt of your Memorandum No. 1725-R. of 4th September 1917, and in reply beg to say that I agree to indemnify Government against claims by third parties denying the title of Government to dispose of the underlying minerals under the area of 1143 acres falling within the Chandipur and Dhalidpur grants.

No. 4166-R., dated Shillong, the 20th August 1917.

From—The Hon'ble Mr. J. E. Whanger, C.I.E., I.C.S., Chief Secretary to the Chief Commissioner of Assam,

To—The Commissioner, Surma Valley and Hill Districts.

I am directed to refer to the correspondence resting with your letter No. 4599, dated the 22nd June 1917, regarding the grant of a prospecting license to Mr. James Blair over an area of 1143 acres in the district of Cachar falling within the Chandipur and Dhalidpur grants originally settled under the rules of 1854 but subsequently redeemed.

2. In reply I am to say that the Chief Commissioner is prepared to grant a prospecting license to Mr. Blair as proposed provided that he undertakes to indemnify Government against possible claims by third parties denying the title of Government to dispose of the underlying minerals. I am to request that you will be so good as to submit a draft prospecting license, in the revised form prescribed by the Government of India, for the approval of the Chief Commissioner if Mr. Blair agrees to give such an indemnity.

WITNESS NO. 412.

Mr. D. Ferguson.

Mr. D. Ferguson, Tea Planter, Sylhet, representative of the Surma Valley Branch, Indian Tea Association.

WRITTEN EVIDENCE.

Financial Aid to Industrial Enterprises.

So far as the tea industry is concerned, there is no necessity to arrange for any capital for the development or encouragement of it in any way. The necessary capital awaits anyone who wishes to run on business lines.

The help to new industries should be carefully extended so as not to interfere with existing industries, or the extension of ordinary cultivation, which the Government of the Province have been doing all in their power to extend.

The indigenous labour is quite inadequate for the ordinary paddy and similar cultivation, in fact, the enticement of imported labour from Tea estates, for ordinary cultivation, has had to be seriously considered already.

The above remarks on capital practically cover this question also. Circumstances might Pioneer Factories easily occur where these could be established with great advantage.

The Assam Government's experiment in Kamrup with sugar growing is a case in point. So far as the labour question is concerned it seems to be quite satisfactorily answered.

The results of this experiment tend to show that this extension of sugar cultivation can only be made by capitalists as the cost of steam cultivators, etc., show that the ordinary cultivator is not likely to do much here.

With a large central factory established, there is no reason why the ordinary settler should not grow the canes for sale to it.

I know of no case locally where co-operation has helped any scheme along.

Co-operation is in its infancy amongst us.

Co-operative Societies.

Technical aid to industries.

There is no doubt that technical instruction is a most important matter in all industrial development. Technical Instruction.

I doubt, however, whether such technical instruction as our limited provincial opportunities could afford would be much good.

I fear that as in the past we must send to Calcutta or some other centre for this form of training.

Given good foremen in our factories, in Assam, we could very soon train up youngsters as the opportunities in our factories are not to be despised, given the expert teacher. At present our training is as a rule of the crudest. Even in the case of engineers imported from

abroad they are as a rule young men without any experience, except the most ordinary bench work.

Research and
Demonstration.

Research in England cannot benefit us, I fear, except in certain cases where the person or firm requiring it would at once get the information or assistance they wanted direct. Demonstration factories could be of the greatest use if the necessity for them were clearly indicated.

There has been nothing of the sort in our province but I have seen efforts of this sort in the United Provinces which did much to help industrial development. Sugar for example. There was also the oil mills at Cawnpore, which the Home Government nearly paralysed by their abrupt and absolutely unnecessary withdrawal. It, however, had made such progress that European firms were tempted to take it up.

Assistance in marketing products.

Assistance in
marketing products.

This is as essential as financial assistance and is closely bound up with freights by rail, way or steamer.

To illustrate this, I must again refer to the Experimental Cotton Seed Factory at Cawnpore.

On visiting the factory I was told that I could have cotton cake at a very low price as they had in the early stages of the experiment no market for their produce. On my return to Sylhet I enquired from the different transport companies for a through rate for the cake. The rate quoted was 300 per cent. more than the price of the produce. Of the best agencies for this purpose I know nothing.

Training of labour and supervision.

General remarks.

There is no training at present of any sort worth mentioning in our province. For mechanical work there is nothing to beat the old apprenticeship arrangements. The complaint is very general that no scientific training makes up for the want of a persistent practical training.

The difficulty in the initial stage I have already referred to. I have run a night school for 21 years on the factory on which I am employed. In the first place a night school must be well lighted or it is a severe strain on the eyes. We use an ample electric light and the bright cheerful light makes it very popular. I would not like to say that the night school makes much difference. I would, however, not like to stop it.

No training school should be under the Educational Department.

Training schools under the control of engineering firms or railways are very successful outside that, perhaps, it would be well not to refer to them.

General official administration and organisation.

An Imperial Depart-
ment necessary.

I have very decided opinions on this subject. With the Commerce and Industry Department in touch with the commercial life of the country I should like to see all effort concentrated in this as a strong Imperial Department, with responsible representatives in each province and in each industrial centre. This department should include control of, and information regarding, all labour conditions. It should also include all experts for enquiring into and advising on all industrial and commercial matters.

A strong department like this would tempt the right stamp of men to remain in the department and be satisfied with the promotion within it.

Without the experience that long training gives we cannot hope to have that high trained efficiency which alone can compete with foreign enterprise.

Provincial effort is too narrow, too confined to tempt the brilliant man except as a temporary arrangement.

This department should be recruited from the most brilliant experts whether already Government servants or not.

This is a Utopian ideal which I fear will not be realised.

Reference Libraries.

This if possible would be appreciated by all. Even the publications under Government control would help considerably if they were supplied at some centres convenient to the general public.

Government organisation for the collection and distribution of commercial intelligence.

Official publications.

I fear that but few are aware of the existence of this department.

The *Indian Trade Journal* is less widely known than similar papers of foreign origin.

Monographs of different departments contain a good deal of information though as in the Forest one it is of a negative kind.

Other forms of government action and organization.

Lack of transport
facilities.

Roads, railways and waterways. In all these essentials we are deplorably handicapped. Perhaps we should also include our shipping port at Chittagong, which gives none of the

facilities which such a port should have. The jetties which belong to the Assam Bengal Railway Company are excellent, and have modern facilities for shipping but alas the waterway is deficient. We should not require the facilities for detention of cargo so much, as the facilities for despatch. The railway is also under the incubus of a crushing capital.

The only thing that could have helped it was liberal extension of feeder lines. This, however, requires still further capital, so we have to await the time when this is realised.

Recent misfortunes have further handicapped them.

River Steamer Traffic has made enormous strides but they seem to be hopelessly handicapped with the natural conditions on the bulk of our waterways.

The extension of our feeder railways would seem to be a sore point with our steamer companies as soon as any extension scheme is mooted, they claim certain headway in the bridges which increases the cost to a prohibitive extent.

I fear that generally the matter is looked upon as one only for the railway and steamer companies. There is, however, a further and a much greater interest and that is the public interest, and anything that hampers public expansion should be very carefully handled. We have also to bear in mind that in our minor extensions the steamer companies have only an interest for a very limited portion of the year.

I fear that our Governments hesitate in the matter, not always giving the public side of the question the attention it deserves. I would suggest that in matters—postal, railway and shipping companies—there would seem to be an opinion quite generally accepted that their interests come a long way before public interests. Our communications generally are deficient and our port will not permit of loaded steamers leaving. There would seem to me to be something here of considerably more interest than the encouragement of further industrial development.

This department has sat to my knowledge for over forty years watching the wanton destruction of the most magnificent forests the eye of man ever saw. On the complete destruction of all that was worth having they step in and save the grass from the cultivator and add to the miseries of his humble life, by impounding and harrying him until he thinks it unbearable, especially after the years of wanton rioting amongst everything worth protecting. If the Government does not mean to plant the forest areas why not lease them out to be some good? Forest Department.

In this direction there seems to me to be room for almost endless expansion. Our hill tribes have an inclination towards this sort of work due in a great measure to their being in the past, isolated communities, and therefore self-dependent. The Manipulis are much the same, weaving and dyeing being their chief forms of industry. Their weaving arrangements are of the most primitive kind and I am sure that they will welcome any assistance given. There is of course the attitude of suspicion due to their not crediting that the Government can be disinterested in any matter. Time alone will cure this but meanwhile strong efforts are I know being made by our Government to help them along. This is a direction in which opening out markets will be of the greatest benefit. Not only to open new markets but to suggest new designs which would meet with ready sale. Many of the things at present produced are bought for their curious style, but the purchase is not repeated. There is nothing to prevent designs being encouraged that would meet with a heavy demand. This comes within the scope of our Art Department and should be one of the branches of the Commerce and Industry Department. Cottage Industries.

This department might well try to influence all production.

ORAL EVIDENCE, 14th JANUARY 1918.

Mr. C. E. Low.—Q. What artificial manures do you particularly require in the Surma Valley?—A. We are using a lot of rather concentrated ones, but generally we use oil cake; and in phosphates we have been using particularly basic slag. There is a scarcity of that now. We now use an inferior kind of slag. We also use ground limestone which is not a manure but which is required for putting the soil in appropriate condition: it renders the soil alkaline.

Q. Do you use any nitrates?—A. Yes, we do. I have been using nitrates occasionally, but not often; these salts are so easily removed by heavy rains that we use them as little as possible.

Q. Do you use saltpetre?—A. I have been using some saltpetre this year, and I think it is about the best that is to be obtained in the market now.

Q. Do these manures arrive in satisfactory quality? Is there any guarantee?—A. None whatever, that is a serious difficulty; but it ought to have been removed by our own Tea Association. The quantity that we use is so much that we should have established a standard ourselves which the sellers should conform to.

Q. You are very big consumers, I suppose?—A. We use a large quantity.

Q. You are the main consumers for a large proportion of certain types of manures in India?—A. Yes, that is so.

Q. You are speaking of the expansion of the sugar growing experiment in Kamrup; sugar and tea are grown in pretty much the same kind of land, aren't they?—A. No, there is one thing about sugar. Sugar grows in alluvial soils.

Q. You can grow tea pretty well anywhere, but not sugarcane?—A. Exactly. In this experiment in Kamrup, the first experiment was made very near the banks of the river; it was a failure and then they moved it on much higher and where tea would grow almost as well as sugar.

Q. Do you think there is likely to be any conflict between the claims of tea and sugar growers?—A. I think Government have answered that question very successfully so far as that goes, but that method need not be continued. Such pioneer sugar factories as Government undertake may be given out to private enterprise; they can be run successfully, there is no doubt about that.

Q. Looking to Assam as one of the probable main sources of supply of white sugar in this country, do you think any arrangement should be made at this stage to mark out the areas respectively for tea and sugar?—A. I should say so, because there is such a huge area in Assam lying waste and it is not likely to be required for growing tea, as we have such large surplus lands already in our hands for tea. Only about one-fourth of the area we have taken is under tea.

Q. How will the labour proposition from the sugar point of view work in with the labour proposition from the tea point of view?—A. Well, as regards labour for tea you want almost an equal supply all the year round; for sugar in the early months when the soil is prepared and planted you want a large labour force and then there is a long interval when you let the force out for other cultivation; then when you begin sugar making you of course want a large force again, so that sugar would work with the ordinary rice crop quite well, growing the rice crop in between two sugar seasons; rice would take up the labour set free by sugar.

Q. Sugar labour would come on from about the end of November till about March or April?—A. Yes, from that time they would come upon the land for rice cultivation and planting for the next year.

Q. Then the season for sugarcane ceases and it won't clash with tea more than any other crop?—A. Yes, but on the lines which Government have run that, there would be likely to so spring up a lot of small holders of sugarcane land, which—if they sell their canes to the central factory—would answer the purpose of Government. Their labour could also occupy the lower rice lands which though unsuitable for sugarcane are excellent for rice cultivation, that is on the low lands nearer the river.

Q. Speaking on the question of labour in factories you say "Given good foremen in our factories in Assam, we could very soon train up youngsters as the opportunities in our factories are not to be despised, given the expert teacher. At present, our training is as a rule of the crudest." What type of men have you got in mind? What sort of pay do these foremen get?—A. For ordinary work we get the Punjabis. The highest pay they get is Rs. 50 or 55. I am getting these men for out-door work as overseers, and for in-door work I am paying Rs. 30.

Q. Who are those men, are they mechanics, or do they control labour?—A. They come in as mechanics, but I want them to train themselves as foremen.

Q. For controlling labour?—A. Yes.

Q. You don't mean expert mechanics?—A. An expert mechanic gets Rs. 50; we pay up to Rs. 80 for a real mechanic.

Q. Where do you get that type of man from?—A. I have got three mechanics for my factory within the last three months; there were two of them from Calcutta, they had no knowledge of mechanics whatsoever; there is an absolute scarcity of mechanics at present owing of course to Government necessities.

Q. Of course war position is quite different, but what was the position before the war?—A. Then we were getting them from Calcutta; but they were not really so efficient as the men available in the mofussil.

Hon'ble Sir B. N. Mookerjee.—Q. What class of men are they?—A. I have some Eurasians, some Hindus but at present mostly Mussalmans.

Q. Are they educated men, are they students of the engineering colleges?—A. No; we cannot get any of these classes.

Mr. A. Chatterton.—Q. Do you know what is understood in England by a mill-wright?—A. Oh, yes.

Q. Are these men whom you just mentioned mill-wrights?—A. They are not as good as that. Some of them are Chinamen; they are good and they can sketch.

Q. Where do these Chinamen come from?—A. There are numerous Chinamen up there; without the Chinamen we could not get on. We have Chinamen also as engineers.

Mr. C. E. Low.—Q. Are you speaking of the Upper Assam Valley, not Cachar?—A. Of the Surma Valley.

Mr. A. Chatterton.—Q. Are you employing largely Chinese mechanics as carpenters?—A. Well, we employ them for works, such as buildings. I have four of them putting up a

house from last year, and I am now arranging to take up a new house and I may have to take Chinamen with me.

Q. Do you employ them only as carpenters?—A. Also on iron work.

Q. Are these Chinese wandering about the district from shop to shop?—A. Yes, when they complete work at one place, they go to another.

Q. How do you pay the Chinese?—A. An ordinary mistri, as we call them, gets about Rs. 80 a month; and in the case of mechanicians who know engineering we pay them 100 to 120.

Q. You are paying these Chinamen more than you pay the natives of the country?—A. Yes. We cannot get men. I sent for men from the Sibpur College with some technical knowledge. I got some, but they had no inclination to go into the mofussil.

Q. Do you know where these Chinamen come from?—A. I could not tell you.

Q. Where do they get their education?—A. I do not know. They are very clever draftsmen; with a big pencil they will sketch anything you want in a minute for you; I should think they are taught.

Mr. C. E. Low.—Q. You have a night school for 21 years in your factory. Are you teaching the children of the coolies?—A. Yes. The day school is under Government; the night school is under my control; the Manipuri children and the Bengali children go to the day school but it is not a large school, sometimes it dwindles down to 12 or 14, but in the night school there are 60 to 70 almost.

Q. Are these children of the coolie class?—A. They are all children of the coolie class with agricultural knowledge. The Labour Commissioner was enquiring into the educational conditions; he came to my place; mine was the only school of that sort in the province at the time; he stayed for two or three days with me and examined the school, and he was astonished at the intelligence of the coolie children compared with the Manipuri or Hindu children; only up to a certain period they make rapid progress, and they do not go further.

Sir D. J. Tata.—Q. Are these children working in the workshops in the day time?—A. Yes, they will not sit idle. But I have been trying to convert the night school into a day school at the request of the Educational Department because they got a report that the night school was interfering with day schools; so I had a day school but it dwindled away.

Q. What are their hours of work in the factory?—A. It varies. They begin at about 8 o'clock in the morning and go on till about three in the afternoon.

Q. So they work on the average for about 6 or 7 hours in the factory?—A. Yes.

Q. Then they attend the night school afterwards?—A. Yes.

Mr. C. E. Low.—Q. What is your idea of running a night school?—A. So that they may be available for agricultural employment during the day.

Q. How many stick to agricultural employment?—A. As soon as they have learnt enough to read figures in English they are promoted to Sirdars.

Q. Do you give any industrial teaching in the night school?—A. Not at all. We have no teacher. The difficulty always is a good teacher, the man I have is an excellent man, but we want another man similarly equipped; it is too much for one man.

Q. On the question of headway in the bridges, you say that "generally the matter is looked upon as one only for the railway and steamer companies; there is however a further and a much greater interest and that is the public interest." How would you propose that the public interest should be represented in such a matter as headways?—A. You see most of our rivers are small streams; in many of them there is water only for two months in the year, but they require an enormous embankment to be drawn up which adds to the cost of the light railways so heavily that they are impossible in small districts.

Q. Supposing there is a dispute as between the railways and the steamer companies about headways: is the local Government or the District Board consulted?—A. Yes. The District Board always sides with the railway in regard to the lowering of the bridge because the too big steamers that we now have take a lot of headway, and if the bridges have to be constructed to suit the height of the steamers, the whole thing collapses owing to the enormous weight on the banks. Of course it is quite possible that some larger steamers want this headway.

Q. Do you think that these things have been decided too much in favour of steamer companies?—A. I think so. They probably advocate their own interests, but I don't see why they should not do so.

Q. Who is the official deciding authority in such cases?—A. I fancy it goes up to the Railway Board eventually.

Q. Do they realise the value of swing bridges at all?—A. No. I fancy that there has been some discussion about the branch line from Budderpore to Lala Bazar which crosses several streamlets; of course they insist on a high headway which adds very considerably to the cost, but which is not necessary so far as the depth of the water is concerned.

Q. Have you any specific suggestion as to the authority which should decide these questions?—A. I certainly think that it ought to be a scientific one. You must have engineers

who could consider it carefully. If we have not got them here, we could get them from outside, but it is far better to use our own provincial men because no one outside the province has any idea of the local conditions.

Q. Have you any suggestion as to who should be the authority, who should settle these questions?—*A.* I should say that the local Government should appoint a committee who have experience of the subject.

Mr. A. Chatterton.—*Q.* In your note you speak about cottage industries. Has anything at all been done in the direction of improving cottage industries?—*A.* Nothing. There is plenty of work in our district for the expert weaver.

Q. I know Government have done nothing, but has anything been done by private bodies or individuals or missionaries?—*A.* Yes, something has been done in the Karimganj subdivision in weaving; it has been started, probably, by one of the witnesses before you; he is one of the landholders in Beani Bazar; they have a little weaving school amongst the weavers to teach improved methods.

Q. Who started this?—*A.* His name is I think Pabitra Babu.* He started it with a view to benefit the weavers merely, but now a Government expert has been going round regularly and they promised me in January last that they would send this expert to improve the cottage weaving industry in Dakshinbag which is of a slightly higher grade, particularly the silk weaving by the Manipuris who manufacture very fine cloths though they have got very crude implements.

Q. Are there any missions working among the weavers?—*A.* There is one at Karimganj and there is also one in Moulvie Bazar, of course they teach a good many things which you cannot call scientific; they teach knitting and so forth.

Q. They have no regular industrial schools?—*A.* No, they leave nothing of that sort. The Manipuris are entirely Hindus and they don't go near these missions but they have always been great weavers.

Q. Have you any practical experience of silk rearing or silk cultivation?—*A.* No except what I have seen in Assam. I have been through all the silk places at Shillong with Rai Bahadur B. C. Basu when they were under the control of these German missionaries. Beyond that I know nothing.

Q. What did you see at Shillong, was it a silk house?—*A.* Yes. The last time I was there it was entirely conducted by the German missions and they had a lot of Khasi girls feeding the worms.

Q. Can you tell us something more about it? This is the first time we hear about this silk house in Shillong.—*A.* It was part of an abandoned fruit garden.

Q. Was it in the upper plateau?—*A.* In the upper wing of the lower plateau; about half way up; there was another fruit garden. I know every inch of the place because it was on my advice that Sir A. Earle closed it down as it was too exposed to the winds.

Q. It was a fruit garden and this house was part of the arrangements; then the house was made over to the German fathers, and they used it for rearing silk; they planted nearly the whole of that fruit garden area with mulberries for the feeding of silk worms?—*A.* Of course it was under the control of the German fathers, but I believe that part of it has collapsed. I have got the last year's report on it and I find no mention of them.

Sir F. H. Stewart.—*Q.* Have any suggestions to make about the policy of the forest department as the result of your long experience?—*A.* I do not know that I have. Mine is merely a general experience, I have no expert knowledge; but when I first came to Kachar over forty-three years ago the whole country was a most magnificent forest, you could ride from one end of the valley to the other through trees, but they have gone gradually back now. From my bungalow you can see over the hills quite 100 miles and there is now no tree left; then bamboos grew on it and the Forest Department cut and sold them.

Q. Is this due to the policy of the Forest Department, and in what way?—*A.* Yes.

Q. Do you think that the rules and regulations should be revised?—*A.* I think so. Something should be done. They are producing nothing now. This area is all full of grass for cattle now.

Sir D. J. Tata.—*Q.* With reference to monographs you say that the forest one is of a negative kind; what do you exactly mean?—*A.* They give us information which is of no value whatever to us, not even for the Forest Department. I have got one on tea boxes with me; well I can extract nothing from it except the deplorable fact that there is no wood for boxes. It does not matter very much to me because I have never used country boxes. I use Russian boxes.

Mr. A. Chatterton.—*Q.* I think you stated in answer to Sir Francis Stewart that formerly round your house it was all covered with dense jungle and that was all cut down?—*A.* A great deal was cut, all nearest the river was used for building and box-making.

Q. Then came the era of bamboos, the bamboos flowered and they all died?—*A.* Yes and the young shoots were destroyed by cattle, and gradually the whole thing disappeared.

WITNESS No. 413.

MR. JAMES LAURIN, *Tea Planter, Narsinchara.*

WRITTEN EVIDENCE.

The possibilities of the cultivation and preservation of certain fruits in the Surma Valley has long been recognised. The pine apple does exceedingly well in the district and is a cultivation peculiarly well suited to the small cultivator. It does not require a large plantation before it becomes profitable. A cultivator can profitably cultivate a few *muils* and can always be increasing his area by annual propagation of his plants without interfering with the supply of fruit. The cultivation of the pine apple requires no particular skill beyond that already possessed by the native cultivators of the district who already cultivate large quantities of inferior varieties. The Assam-Bengal Railway running as it does the full length of the valley, has created conditions well suited for establishing a successful pine apple growing and canning industry by having a central factory erected at a given central point such as Srimangal Station. Unfortunately all my statistics on the pine apple industry in other parts of the world have been accidentally destroyed by fire but the conditions obtaining in the Surma Valley for growing and canning pine apples are equally as favourable as the most suitable countries where they are grown and more favourable than the majority of them. A canning factory could be usefully employed during the pine apple off season by marmalade making.

As a rule I am not in favour of having an industry artificially bolstered up by Government aid beyond being at all times able to supply information upon all points regarding the industry concerned. In regard to the particular industry with which I am concerned, Government aid might be usefully employed so far as distributing superior varieties of plants to cultivators without creating an artificial prosperity which would collapse upon withdrawal of support. The inferior varieties of pineapples now generally cultivated in the Surma Valley should be replaced by the best varieties procurable. The latter are now procurable at comparatively cheap rates. This kind of aid could have no ill effects as it would merely be supplying the cultivator with the wherewithal to propagate and cultivate and it would be left to himself to quadruple the numbers of his plants annually. I have lately been in correspondence with the Agricultural Department, Hawaii, and also that of the Philippine Islands. The latter only started pineapple canning 4 years ago but is progressing rapidly. The Hawaiian annual output of canned pines amounts to six million dollars and the fresh fruit sold as such amounts to 50,000 dollars which produce is used up by the American market. I have been promised more practical information on the subject which I will give in my oral evidence before the Commission.

The pine apple industry in Hawaii is, next to sugar growing, their most important industry and the area under cultivation is increasing annually.

ORAL EVIDENCE, 14TH JANUARY 1918.

Sir F. H. Stewart.—Q. Have you made any experiments on a commercial scale in the growing of pine apple?—A. Yes.

Q. With what results?—A. With very encouraging results. I have sent them all over India.

Q. You have studied the subject in other parts of the world too. You say you have a lot of literature on the subject?—A. Yes.

Q. It is a large industry in Florida?—A. More especially in Honolulu, Hawaii.

Q. Do they export from Honolulu in tins or how?—A. In tins mostly. Canned pines amounting to six million dollars and fresh fruit to 50,000 dollars are exported from Honolulu.

Q. During the off-season you suggest that the factory may be employed on marmalade making?—A. Yes.

Q. Have you also made marmalades successfully?—A. Yes.

Q. You are not in favour of Government help in most cases. You think that in this case Government should start a small model factory?—A. They might do so and afterwards they could sell it, but I do not think it would be necessary for Government to do so. I think it would not be difficult to raise capital and build a factory.

Q. Is it a pursuit which would appeal to the people of the Surma Valley? Do you think that the Indians there would take it up? Would the people of the place grow pines for you willingly enough?—A. Yes. They are keen on it, but hitherto they have had no outlet.

Q. You would like Government to distribute pine apples of a better class?—A. They might do so, and help ryots in that direction. It could be done cheaper in the Surma Valley than elsewhere.

Q. Is it a crop which would be liable to sudden failure in case of bad hailstorm? Would that destroy the crop altogether?—A. I have not experienced it. Hailstorms would destroy it but not permanently.

Q. Could you insure against damage by hailstorms for instance?—A. That might be accomplished in time. It is a very young industry now and it has not been tried.

Q. Are you proposing to develop it yourself or to take it up yourself on a larger scale?—A. What I intended to do was to run a factory at a central place like Suiyangal station on the Assam-Bengal Railway, and up and down the line right up to the end of the valley to grow fruit and can it ourselves. There are seven acres now.

Q. Would seven acres be sufficient for a factory?—A. It would be a very good start.

Q. What is the yield per acre?—A. About 14 to 20 tons per acre.

Mr. A. Chatterton.—Q. How long would the pine apple season last?—A. It depends on the kind of pine apple that you grow. If you have "Queen," it will last about six weeks, from June to end of July. There is what is called "Smooth Cayenne" also known as "Kew Giant" which comes on in succession.

Q. You could have pine apples growing for four or five months?—A. Five months with pine apples.

Sir F. H. Stewart.—Q. Would you grow pine apples continuously or would you require rotation of any sort?—A. Not necessarily if you manure properly. One pine apple plantation could go on from 10 to 14 years, but that is with rational manuring and attention paid to thinning.

Q. Would you combine it with other fruit growing?—A. Yes, I could combine it with other fruit growing. I would keep the factory employed all the year.

Q. What sort of fruits?—A. Oranges, lemons, etc.

Q. Would you grow limes?—A. Yes. Lemons more than limes.

Mr. A. Chatterton.—Q. In Sicily they grow lemons?—A. Yes.

Q. Very largely, for the manufacture of citric acid?—A. Yes.

Q. Can you do the same in Assam?—A. Most decidedly. We can grow fruit as cheaply as they do. In the Surma Valley we can compete with any part of the world so far as lemon growing is concerned, or orange growing or pineapple growing. It is better situated than many other countries for pine apple growing.

Q. Can you grow bitter oranges such as are used to make marmalade?—A. Yes. But they are not grown at present.

Q. Can you grow citrons for candied peel?—A. Yes.

Q. What manure do you use for pines?—A. I have been using oil cake and phosphates and sulphate of potash. But oil cake is a good manure and you can use it.

Q. With the heavy crops that you get do you want to use much manure?—A. Not very heavy manuring if you use proper manure.

Q. Have you got information as to what it will cost to set up a factory?—A. Yes, 15,000 American dollars to deal with 50,000 cases containing 24 tins each annually.

Q. Does that include a tin making plant?—A. It includes everything the factory requires, all machinery.

Q. What do you expect that you would make on an investment of half a lakh rupees on the factory?—A. About 20 per cent at the least judging from growers' reports.

Sir F. H. Stewart.—Q. You want to pay a good profit because it is a risky enterprise?—A. Not on account of its being a risky enterprise. It has been considered from every conceivable point and no risk has been discerned.

Mr. A. Chatterton.—Q. In an industry of this kind the difficulty would be in advertising the products and building up a market. What other capital do you want for cultivating pine apple besides the factory and the machines?—A. You want to know the capital required to bring into bearing an acre of pine apple independently of the factory? That would mean the cost of the plants. If I buy plants from Australia, or the Philippines or Honolulu, the actual cost there is 6 dollars per thousand for the "Queen" or the "Giant Kew." These are the very best kinds that you can have for canning or any other purpose. To bring the plants here it will cost as much if not more again.

Q. Have you got a sufficient number of these plants on your own estate to develop it?—A. Yes. Besides the seven acres I have got, I have sufficient plants to plant twenty to thirty acres.

Q. How many plants do you put to the acre?—A. 10,000 plants.

Q. What price would you be prepared to supply 10,000 plants at?—A. At a very low price. I will supply them less than they can buy either in Australia or elsewhere, that is, I will supply them at one anna each plant. But that price is only for native cultivators of the Surma Valley to encourage the establishing of the industry there.

Q. Could you bring a plantation into bearing for Rs. 1,000 per acre?—A. Rs. 1,000 per acre would cover everything. The selling price of an acre of "Queens" in Queensland is £150 to £200, but it costs at least three times as much there to bring an acre into bearing.

Q. How many acres would you want to keep your factory going?—A. It depends upon the size of the factory.

Q. This 50,000 case factory for which you have estimated?—A. Multiplying 50,000 by 24 it comes to 1,200,000 fruits.

Q. Would you get 10,000 fruits from an acre?—A. The yield depends upon so many factors that it is difficult to make a definite statement. 75 to 85 per cent. of plants may be expected to grow fruit but Florida growers get even 95 per cent.

Q. What is your experience in the matter? What percentage do you get?—A. I have got about 70 to 75 per cent. My section has not been in full bearing hitherto. I have been extending it.

Q. At least you can get 60 per cent. ?—A. Yes.

Q. You arrive at this result. Taking it at 60 per cent. which I prefer to take as the safe figure you want 200 acres to keep your factory going for 50,000 cases?—A. Yes.

Q. What could you sell a case for?—A. Honolulu wholesale price is sixteen shillings (4 dollars) per case.

Q. Could you get four annas a tin for it at the factory?—A. Yes, by all means. They get more in the Philippines.

Q. You have no experience as to what the cost of canning would be?—A. I do not know. I could not say that. The cost of canning is at the present time very prohibitive.

Sir D. J. Tata.—Q. If you can the fruit now where do you propose to get the tin cans? You cannot get anything now?—A. Not now, till the end of the war.

Mr. C. E. Lee.—Q. How much are the cultivators willing to accept as a price for pine apples? Have you any idea?—A. About one anna each.

Q. Is there a large sale of pine apples on the spot by cultivators in the *kats*?—A. There is a great demand for the "Queen" pine apple and the "Smooth Cayenne," otherwise known as "Giant Kew."

Q. Of course, a man growing a large quantity would probably accept a less price from a factory taking large regular supplies?—A. He will reduce the price. But I can sell all my crop locally wholesale at the present time for 12 annas per dozen.

Q. Have you any idea as to railway freights? Most of your market would be Calcutta?—A. Half the ordinary rate, that is, Rs. 1-8-0 per maund to Calcutta from our place. The rate per ton, I think, is much less, or, at least, ought to be.

RANGOON.

WITNESS No. 414.

BURMA CHAMBER OF COMMERCE.

Burma Chamber of
Commerce.

WRITTEN EVIDENCE.

Financial aid to Industrial Enterprises.

Q. 1.—A few years ago a great deal of capital was raised in Rangoon for various industrial and mining concerns. No difficulty was then found in getting money. The financial conditions brought about by the war have so altered conditions since this question was framed that it is difficult to give any authoritative answer; but we think money would still be forthcoming for any sound proposition that was properly introduced and under good management.

Q. 2.—Money was raised locally and in India for most of the concerns floated locally.

Q. 2 (a).—Before the war there would have been advantages to India generally in attracting more capital from the United Kingdom. But the home investor is much more cautious than the Indian. He would only invest in more or less proved concerns introduced by first-class people. It is probable that for some number of years after the war there will be employment found at home for all the available capital, and it is doubtful if the financing of new ventures in India will hold out much attraction to the home investor, especially now the Indian income-tax has been raised, and if the double collection of income-tax at home is still persisted in.

If the Indians can be educated to entrust their savings to banks instead of hoarding or converting their wealth into gold and silver ornaments there would be an immense increase in the funds available for extending and furthering the country's industries. Better education of the masses would contribute towards this. Unfortunately, of late years *swadeshi* banks, run by men of no previous banking experience, were allowed to spring up, with the result that there were failures which further tended to destroy the public confidence. Recent legislation has, however, placed restrictions on such institutions.

Q. 3.—In Burma the rice-milling industry has been much overdone. There are more mills than paddy to go round, and the mills can handle the crop far quicker than the paddy can be brought in. In normal times the mills only work at full pressure for a few weeks—

at the very outside four to six weeks, often less—and the rest of the time they only work at half-pressure and often for many months lie entirely idle. This applies both to Rangoon and the outports—a noticeable instance is Moulmein, where there are many derelict mills, and the remainder only work a few months in the year.

Q. 4.—None.

Government assist-
ance.

Q. 5.—Of the suggestions for aiding new industries No. 8 (exemption from taxes) is the one that appeals to us most, and this might be of use should occasion arise. Except in special circumstances and, speaking generally (in Burma), we think little Government assistance is required for existing industries. As regards new industries see reply to No. 8. We would lay down that no grant-in-aid or other assistance should be given to a new concern that would compete in the same line with already established concerns, unless it were shown that the existing concerns were quite incapable of carrying out their industry ^{and} unwilling themselves to take aid to bring it to a state of efficiency.

Q. 6.—Is a question for Government to decide. If they lend money they must look after the security of it themselves.

Q. 7.—No experience.

Pioneer factories.

Q. 8.—The greatest industry in Burma, though we are not certain if it comes under the scope of this enquiry, is agriculture. There is a crying need for increased expenditure on Government Agricultural Farms, in the improvement in the tools and methods of agriculture, and mainly in the production and selection of improved seed. This has been started, but on too small a scale. What has been done with wheat in India can be done, and done ten times, over in the case of paddy.

There would also appear to be openings for sugar and pulp and paper factories and jute growing and manufacture.

If for any reason private capital be not forthcoming Government should start pioneer factories for any new industry that holds out reasonable hope of success.

Once a new industry is shown to be commercially practicable there should not be any lack of private capital to exploit it, and Government should turn over their pioneer factory to private hands directly they can do so on reasonable terms. Under no circumstances should Government compete with private enterprise.

Q. 9.—We do not know of any sound well-managed concern being hampered by methods of finance.

Financing agencies.

Q. 10.—The extension and development of co-operative credit banks should receive every encouragement from Government. The existing banks, such as the Presidency, Exchange, and Joint Stock Banks, are quite sufficient to meet the demands put upon them. These banks are not slow to open new branches or extend their influence when any good opening presents itself. The native shroffs and bankers do an immense business in centres where the large banks have not opened.

Q. 10 (a).—The banking law at present in existence seems to be adequate.

Co-operative societies.

Qs. 11 & 12.—We have little experience of Co-operative Societies in Lower Burma, but we know they have started on improved methods of agriculture and selection of grain, which is a step in the right direction and should be encouraged. Banking has also been taken up and this should also be of great advantage to cultivators and small industries.

Q. 12 (a).—None—the Co-operative Societies take the place of these to a certain extent.

Qs. 13 & 14.—See replies to questions 5 and 8.

Technical aid to industries.

Technical aid in
general.

Qs. 15 & 16.—We understand the Geological Survey of India has been of great assistance in the development of the mineral resources of the province. The development of the rubber industry also received great help by the exploitation of the Mergui Crown Rubber Estates by Government.

Q. 17.—We think private firms or companies would prefer to employ their own experts. The best expert opinion has recently at times been brought to India in connection with the oil and mining industries and rubber but, under certain circumstances, a Government expert's opinion might be valuable.

Q. 18.—If a Government-paid expert is loaned to a private business his report should be treated as confidential, otherwise there would be absolutely no demand for the services of a Government expert.

Qs. 19 & 20.—No suggestions regarding demonstration factories.

Q. 21.—Have no personal knowledge.

Research abroad.

Qs. 22 & 23.—Under certain circumstances it might be advantageous to conduct research in England, but we can name no specific case meantime.

Q. 24.—We have no knowledge of the system.

Surveys for industrial
purposes.

Qs. 25, 26, & 27.—The existing surveys for agricultural, forest, and mineral areas are at present incomplete. We understand that they are being extended, especially in connection

with the Forest Department, and, when completed, the information, with maps, should be published and made available to the public.

The surveys should be organized with a view to making a resurvey of those areas of the province where the developments of recent years have demonstrated the probability of developing successful agricultural, forest, or mining ventures and to defining other specific areas where successful results are likely to be obtained.

In this connexion we would suggest that further research be made in connexion with coal.

Q. 27 (a).—We have no experience of consulting engineers appointed by Government.

Q. 27 (b).—We do not think Government engineers should be allowed to undertake the purchase of machinery and plant for private firms. There is a large number of engineering firms in India who not only undertake the purchase of machinery, but its erection and the thereby implied guarantee to see it successfully running. We think private firms would rather purchase themselves, or through such engineering firms, rather than through a Government engineer, who would have no responsibility.

Assistance in marketing Products.

Qs. 28 & 29.—We have no experience of commercial museums. If the principle of Commercial the necessity and/or the advantage of commercial museums is accepted we should press for museums. the one in Rangoon, with libraries of reference, assay offices, etc., attached.

Q. 30.—Not necessary for Burma at present. The minor and unorganized cottage indus- Sales agencies tries, in the majority of cases, appear to find an unaided outlet for their products.

Q. 30 (a).—Travelling exhibitions would, doubtless, be of advantage; they should be on Exhibitions. educational lines in the matter of agriculture and improved methods of production.

Q. 31.—The pioneer industrial exhibition, held in Rangoon in 1916, was a great success; and, if made an annual or bi-annual affair, would, doubtless, lead to improved manufacture and marketing. We strongly advocate the continuance of these.

Q. 32.—Government should certainly take measures to hold and encourage such exhibitions—their measures should be both advisory and financial.

Q. 33.—The exhibitions should be popular in character, otherwise, at any rate to begin with, they would not be a success.

Q. 34.—Trade representatives should be appointed to represent the whole of India, in Great Britain at any rate, in the same way as the Colonies are now represented in London. Re- Trade represent- tives. presentation in the Colonies and foreign countries as a permanent measure might be held over meantime, but it should be made sure that India is fully represented at the fairs and exhibitions that are certain to be held in allied countries after the war, and which have already been started in France at Lyons.

A radical alteration in the Consular Service would, to some extent, take the place of trade representatives abroad.

The representatives should have a good commercial knowledge. Their duties should be to attract interest in, and push the sale of, all products and produce from India, especially in what promises to be new fields of off-take, in which Indian exports are not well known.

Q. 35.—Possibly; when any special occasion arose.

Q. 36.—Not necessary; the Indian traders are in the closest touch with trade in all the provinces throughout the Peninsula—let alone the European business houses.

Q. 37.—The proposal might be of advantage.

Q. 38.—The purchasing methods of Government might be considerably improved, Government patron- age. and far more things of local manufacture purchased, especially from local engineering works. Indian industries should be supported wherever possible.

Q. 39.—The banking facilities for ordinary trade purposes are amply sufficient. See also Banking facilities. answer to Questions Nos. 10 and 10a.

Other Forms of Government Aid to Industries.

Q. 40.—As a general condition every facility in the way of grants or leases should be given to those wishing to work Government-owned raw materials. Supply of raw materials.

Q. 41.—We think not; the rules for granting land for mining and planting have Land policy. recently been satisfactorily amended and, so far as we know, there is no difficulty in acquiring land for industrial purposes.

Q. 42.—All land concessions should be made on the principle that the industrial development will result in increased commercial activity and benefit to the State.

Qs. 43 & 43(a).—We have no experience.

Training of Labour and Supervision.

Q. 44(a).—Primary education can scarcely fail to be beneficial to the labouring classes, and thus of direct benefit to industrial development.

We suggest that the principles of hygiene might suitably form a branch of primary education for the labouring classes.

Q. 44(b).—The industries themselves, such as oil and rice, and timber mills and engineering shops, form a practical school of apprenticeship in which the more intelligent workmen quickly become proficient in their trades.

In addition to this, a system of apprenticeship exists in most of the industries named, from which satisfactory results are obtained.

Q. 45.—Practical experience which labourers receive is perhaps the best teacher but, as stated above, we consider that a system of primary education would do much to improve the intelligence of workers and their general efficiency.

Q. 46.—See reply to Question No. 44(b).

As regards apprentices in the local engineering shops their career is difficult to follow for they are not much given to lengthened periods of service. A number of men are employed as engineers who have qualified locally and obtained their 2nd class engineers' certificates here.

In one of the oil companies better class apprentices are being experimentally trained for responsible and well-paid positions in the laboratories.

Q. 47.—The only school of which we have any experience which might come under the heading of an industrial school is the "Government School of Engineering and Technical High School". This has hardly been running long enough to give practical results, but we understand it is well attended, and the boys who study there and complete their course by practical apprenticeship should certainly be more efficient than those who do not study.

Q. 48.—Whatever the system adopted, practical apprenticeship should form a considerable part of it, at any rate for the main industries now existing in Burma.

Q. 49.—So far as we are aware day-schools for short-time employees do not exist in Burma.

There are, however, numerous private night-schools in this town, run and supported by different native communities, for the benefit of the lower classes.

Instruction in these schools is given both in the vernacular languages and in English. Fees, where they exist, are merely nominal, and the teachers are, for the most part, voluntary.

The schools seem to be well attended, and the education received appears to be of material benefit to the students.

There are also in this town several private day- and night-schools for better class students, which provide education in commercial subjects, e.g., book-keeping, shorthand, and typewriting.

Fixed fees for each course are charged in these institutions.

Further, there are two private boarding-schools, under Burmese management, for instruction in English of better class Burmans of more mature age from the districts.

Day pupils are also taken in these schools.

Fees are charged and the instruction is given by paid teachers.

Q. 50.—They should be under a department that is run by practical men, and in whom the practical element is largely represented.

As the Burman has a natural aptitude for engineering and similar manual occupations it may not be out of place to suggest here that, as a branch of ordinary education, subjects such as elementary engineering, carpentry, etc., might, with advantage, be taught in schools.

Promising pupils might follow this up by a course of training in these subjects in an industrial school, encouraged perhaps by Government aid in the form of scholarships, etc.

Q. 51.—Experience and consequent promotion by fitness in factories is the only method of training for the superior grades at present. A course in a Government technical school would greatly accelerate and improve the process.

Q. 52.—We think masters of industries will take care to see that such industries are carried on under the best advice, and that Government assistance is not necessary in the manner suggested.

Q. 53.—Depends entirely upon the nature of the assisted industry. If Government assist they can name their own terms.

Q. 54.—So far as we know the standard of examination is uniform, and a ticket granted in one province in India holds good in any other.

Q. 55.—Engineers in charge of prime-movers in this province must have a special certificate (ticket).

General Official Administration and Organization.

Q. 56.—Practically none; except perhaps the Weaving Institute at Amarapura, which, we understand, has been most helpful to the silk-weaving industry.

Q. 57.—We do not think a Board of Industries is necessary for Burma. There is already a large number of rich commercial concerns fully capable of developing any promising industry. The large number of recent developments of new industries in the province

Apprenticeship
system.

Industrial schools.

Training of
supervisors, etc.

Mechanical
engineers.

confirms this (e.g., oil, rubber, mining, match factories, soap works, rope works, all of which have been started and carried out under the best expert advice).

A Director of Industries to carry out inquiries and improvements in many of the smaller industries, in a similar way to the improvements brought about in the silk-weaving industry, would, doubtless, be of the greatest assistance and help to the industries of the province in general.

Qs. 58—62.—Answered by above.

Q. 62 (a), (b), (c).—See answer to Question No. 80.

Cheroot-making might perhaps be called one and, in this connexion, a private company is *Cottage industries* already taking steps to improve the quality and curing of tobacco. Umbrella-making is another, and the manufacturers of these find a ready market locally. Weaving of both in silk and cotton exists throughout the province as perhaps the most important cottage industry.

Organization of Technical and Scientific Departments of Government.

Q. 63.—We think not; unless the Government experimental farms and the Saunders' General Weaving Institute may be included among them. As regards the weaving institute we have not sufficient knowledge to make any criticisms. As regards the experimental farms lack of funds has held their development, and consequent utility, back for many years.

Q. 64.—For Burma we do not think that at present the formation of any new Imperial scientific and technical departments is necessary. We have recommended the fostering of industrial exhibitions and, under certain possibilities, the establishment of pioneer factories, and, beyond this, we think it is not necessary to go meantime.

Qs. 65—74.—All depend on the establishment of scientific and technical institutions and it is not, therefore, necessary for us to go into these questions.

Qs. 75 & 76.—We have no experience of the Indian Science Congress.

Q. 77.—See answer to Questions Nos. 65—74.

Q. 78.—There are no facilities; one has to secure one's own books of reference.

Q. 79.—Government might supply a set of technical and scientific works of reference to *Reference libraries*, some of the free libraries. There would, doubtless, be a demand for these from students and people who have difficulty in procuring their own books of reference.

Qs. 80 & 81.—We do not recommend a College of Commerce as being necessary for this *College of Commerce* province. A commercial course might form one of the departments of the new Burma University.

Government Organization for the Collection and Distribution of Commercial Intelligence.

Q. 82.—The present system of collecting statistics is, we consider, satisfactory; *Statistics* unfortunately, sufficient interest is not shown in these by the commercial community as a whole. Statistics taken from Government figures are, however, now more frequently published in the local and financial papers, and also circulated by the Chamber of Commerce—they are thus becoming better known, and it is not the fault of the Statistical Department if the figures are not more availed of. We have no changes to suggest.

Q. 83.—We have no criticisms or modifications to suggest.

Q. 84.—The "Indian Trade Journal" frequently brings to notice matters of commercial and trade importance. It is a most useful publication.

Q. 85.—The trade and financial journals of India, so far as we know them, are well able *Trade journals* to support themselves, and we think assistance is not necessary. We think persons either European or Indian who are actively engaged in industries take very good care to keep themselves in close touch with conditions that govern their industry, and this can easily be done from the existing trade journals and market circulars published either here or at Home, and many of which are republished in the local press.

Q. 86.—When a demand for information in the vernacular exists we think a source of supply will very promptly be found in the small local presses. Witness the number of brokers' rice and paddy circulars in Burmese which are spread broadcast over the country during the paddy and rice seasons.

Qs. 87 & 88.—The publication of monographs on any subject is most beneficial to those *Other publications* interested in such enterprises. Copies of the publications should be obtainable at the headquarters of the district with which they deal.

Other Forms of Government Action and Organization.

Q. 89.—In Burma every trade arranges for its own surveyors, either through the *Certificates of* Chamber of Commerce or mutually among themselves. Certificates from such surveyors are accepted without question by both buyers of produce and sellers of piece-goods and at Home. There would seem, therefore, to be no need for Government certificates. The conditions of contract and the custom of trade determines for what goods certificates are compulsory and for what voluntary.

Q. 99.—The present organization is entirely voluntary and has grown to meet the various requirements of individual trades. Certificates are granted after personal inspection, and on technical knowledge acquired after long experience.

The above two answers apply to industries and trades at present extant in Burma. If other industries should expand, such as the manufacture of soap, glass, paper, sugar, etc., perhaps conditions might alter our views as to the advisability or otherwise of having a Government certificate for such special commodities.

Adulteration.

Qs. 91 & 92.—Not so far as we are aware; food-stuffs in the bazaars are, generally speaking, heavily adulterated, but the new Anti-Adulteration Bill, which is in course of becoming law, will provide for this.

Misdescription.

Q. 93.—The Customs regulations provide for correct descriptions (where one is necessary) on imported goods, but there is no provision of this description for goods of local manufacture.

Trade-marks.

Q. 94.—We are of opinion that British trade interests in India require either (i) some system of compulsory registration of trade-marks in India based on that obtaining in England; or (ii) that, at any rate, measures should be immediately taken to amend sections 51 and 57 of the existing Act in such a manner as to ensure that particulars of trade-mark registrations are accessible to the public.

Patents.

Q. 95.—We consider that the Indian Patents Act of 1915 and the rules thereunder are ample to safeguard British interests and do not think further special legislation of patents and designs is necessary.

Registration of partnerships.

Q. 96.—It is most desirable from every point of view and quite practicable that a system of registration and a disclosure of partnerships be introduced. This should be made compulsory by law and introduced as soon as possible.

Transport facilities.

Q. 97.—The lack of transport facilities, by road especially, has for many years past been a crying scandal, and hindered the development of the province in every way. The matter is such a large one that it is impossible to go into it here in any detail, but a committee has been appointed by the Lieutenant-Governor, on which all interests in the province are represented. It has been at work for some time past, and it is hoped its preliminary report will be issued at no distant date. The chamber is fully represented on the committee, and will have the opportunity of criticizing the report and recommendations, and we are content to leave the road programme in the hands of the committee. The only recommendation we have to make is that, as the funds available are quite inadequate, they should be largely increased if Burma is to be properly developed.

Q. 98.—We have no suggestions to make.

Q. 99.—The railway system can be usefully extended in many directions. We fear funds will have a retarding influence for some time, but among the most urgent projects are the completion of the Southern Shan States Railway and the railway connection with India. The latter will do more to bring in labour, of which Burma is in such need, than anything else.

Q. 100.—The extension and improvement of waterways come under the scope of the Committee for Communications. See answer to Question No. 97.

Q. 101.—As a general rule, in ordinary times, no.

Hydro-electric power surveys.

Q. 102.—Nothing, so far as we are aware; if there are any possibilities of such power being made available this should be an opportunity for a special Government expert or commission.

Q. 102(a).—No.

Mining and prospecting rules.

Q. 103.—There are no insuperable difficulties, provided these rules are sympathetically administered.

Q. 104.—We do not view with favour Government working mines themselves. It is wise to appeal to capitalists and offer them encouragement.

Forest Department.

Q. 105.—The Forest Department is, we believe, termed a quasi-commercial department. If this is really to be so the methods of recruitment to the service should be different and it should have two departments, scientific and commercial, with two separate cadres. The present method of training does not fit them for dealing with commercial problems, and a very large portion of their time, which is badly needed for the scientific upkeep and improvement of forests, is spent in revenue work, which is probably not attractive to them.

It should also deal with lessees and licensees and devote its whole time to the very many problems that arise if forests are to be worked to the best advantage. We do not propose to go into any detail here as details will, doubtless, be adequately dealt with by the separate representations of the timber firms; but we consider that it is outside the sphere of the department to enter into commercial competition with timber firms in the sale of converted timber.

Q. 106.—The cost of extracting forest produce could possibly be reduced by constructing district roads.

Q. 107.—This is a question for a forest officer with a special training.

Q. 108.—Except such as are introduced and paid for by lessees and licensees, there are no arrangements for forest transport in Burma.

In recent years the Forest Department has done a little in the way of opening roads for use in the touring season, but this is all that is done.

Q. 109.—We leave this to the Trade Association.

Jail competition.

General.

Q. 110.—Answers to previous questions have already covered this.

Q. 111.—The salt industry is one that occurs to us as being capable of development in Burma under scientific methods. Also pottery and porcelain. There are, doubtless, others.

Q. 112.—We have no knowledge of this.

Q. 112(a).—For many years the surplus paddy husk has been wasted. Many experiments have been made with a view to utilizing it, but without success. This is perhaps a matter that a Government expert might take up.

Q. 112(b).—This has also been referred to in answer to previous questions. The increased efficiency of agricultural experimental farms should lead to the improvement of raw materials generally.

Q. 112(c).—The Burma Chemical Company is, we think, to a great extent, dependent upon supplies of raw materials from abroad. We do not know of others.

Q. 113.—Salt, china clay, increased sugar production, paper and pulp material might all come under this heading.

ORAL EVIDENCE, 22ND JANUARY 1918.

The BURMA CHAMBER OF COMMERCE was represented by :—

1. THE HON'BLE MR. E. O. ANDERSON.

2. MR. W. BUCHANAN.

Hon'ble Sir R. N. Mookerjee.—Q. This written statement represents the views of the Burma Chamber of Commerce?—Hon'ble Mr. Anderson.—A. Yes.

Q. You say in reply to Question No. 1, "The financial conditions brought about by the war have so altered conditions since this question was framed that it is difficult to give any authoritative answer; but we think money would still be forthcoming for any sound proposition that was properly introduced and under good management". Do you mean locally?—A. No; a certain amount will come locally, but not much.

Q. In your experience have you ever received any money from any Burmese?—A. Personally, I have never tried to raise money from Burmans. Some years ago a good deal of money was got from them but I do not think that can be done again.

Q. Do you believe now that if any sound proposition is introduced money would be forthcoming from the natives of Burma?—A. From some of the wealthy natives of Burma.

Sir D. J. Tata :—Q. What do you mean by 'natives'? Burmese or Indians?—A. Indians.

Q. You have a large colony of Indians who are fairly well off?—A. Very well off.

Q. Do they take any interest in industries?—A. They do.

Q. They are the principal people who run all the things?—A. Yes; like Mr. Jamal and several others.

Hon'ble Sir R. N. Mookerjee.—Q. In reply to Question No. 2 you say, "Unfortunately of late years swadeshi banks, run by men of no previous banking experience, were allowed to spring up, with the result that there were failures which further tended to destroy public confidence. Recent legislation has, however, placed restrictions on such institutions". You think the present legislation about banking does not require any modification?—A. Yes.

Q. You do not think that any more safeguards are wanted?—A. No; we have recommended that co-operative banks should be extended.

Q. In answer to Question No. 27 you say, "We do not think that Government engineers should be allowed to undertake the purchase of machinery and plant for private firms". What is your reason for this?—A. There are so many engineering firms in the country already. It would interfere with private enterprise.

Q. In answer to Question No. 40 you say, "There are also in this town several private day, and night-schools for better class students which provide education in commercial subjects, e.g., book-keeping, shorthand, and typewriting". Are these schools recognized by Government?—A. There is one, so far as I know, which is recognized by Government to some extent.

Q. Have you any experience of any students coming out from these schools? Have the members of your chamber employed any of these boys?—A. When I visited one of these schools there were thirty people from one of my own mills there—all sorts of people—learning to read and write so as to keep accounts.

(Mr. Buchanan.—In my office, too, a course of study in these night-schools has been found to be of great advantage.)

Q. What are the prospects of these students?—A. They probably rise to Rs. 100 or Rs. 120 a month, or higher.

Q. Are they Burmese, and not Indians?—A. Both; I am talking of Burmese just now. *Hon'ble Mr. Anderson.*—The people I am speaking of are Indians.

Q. You do not think that a Board of Industries is necessary here? *Hon'ble Mr. Anderson.*—A. No; we think we may start with a Director of Industries to begin with.

Q. You say, "The large number of recent developments of new industries in the province confirms this, e.g., oil, rubber, mining, match factories, soap works, rope works, all of which have been started and carried out under the best expert advice". Are these all European concerns?—A. One match factory is an European concern, the soap works is an Indian concern, a big paper mill has been started by Indians. One match factory is Chinese-owned.

Q. They are not Burmese? But for the Burmese do you not think that a Board of Industries and a Director of Industries are necessary for the development of industries to be run by Burmese?—A. Eventually; to start with, I think the Director of Industries will be sufficient. (*Mr. Buchanan.*—With an adequate staff and an advisory board.)

Sir F. H. Stewart.—Q. You say that you do not think that any further banking legislation is necessary?—(*Hon'ble Mr. Anderson.*—A. I do not think so.)

Q. Have you any trouble here about bogus or unsound banks?—A. No; one has disappeared, but it was not a bogus bank.

Q. Has the Bank of Bengal a local board of directors?—A. No.

Sir D. J. Tata.—Q. You say in reply to Question No. 2(a), "Unfortunately of late years *swadeshi* banks, run by men of no previous banking experience, were allowed to spring up, with the result that there were failures which further tended to destroy public confidence". Just now you said that there were no *swadeshi* banks?—A. We were speaking of India then, and not of Burma. They had rather a bad effect—the *swadeshi* banks of India. The Burmese do not like them.

Sir F. H. Stewart.—Q. I understand that co-operative credit societies are doing well in Mandalay. Is the co-operative credit system spreading in Burma?—A. Yes.

Q. Do you know anything about the working of it yourself?—A. No; I attended a co-operative credit society's meeting in August or September last and the movement was well talked of there and seemed to be very actively supported by the Burmese.

Q. In reply to Questions Nos. 91 and 92 on the subject of adulteration you do not think that any special action is necessary and there you speak of a new Anti-Adulteration Bill. Is it a local Bill for Burma?—A. It is not local.

(*Hon'ble Mr. H. Thompson.*—We passed a special (Hse) Enactment the other day.)

Q. So far as food-stuffs and drugs are concerned you would support the Bill?—A. We have supported it.

Q. Do you think that anything is feasible in the matter of prohibiting the adulteration of articles of export?—A. Here they are not adulterated very much.

Q. Is it not a fact that the matter has been referred to the chambers of commerce and that the general opinion has been that it would not be practicable?—A. We say that it would not be needed for this province at all because there are very few things here that could be adulterated at the time of export.

Q. With reference to Government certificates of quality you do not think that they are necessary?—A. The trade here has adapted itself without that.

Q. That is in things like timber?—A. I cannot speak of timber, but of rice, beans, and produce generally. I do not know the custom in the timber trade.

Mr. C. E. Low.—Q. Is there no rice-milling association here?—A. No; at any rate not of European millers.

Sir F. H. Stewart.—Q. With regard to the registration of partnerships you say, "It is most desirable from every point of view, and quite practicable, that a system of registration and a disclosure of partnerships be introduced". Would there be any opposition from the Burmese so far as you know?—A. Probably some opposition, but there is the voluntary registration system already in force.

Q. Who register?—A. The native firms, and it is done voluntarily.

Q. Do they do so largely?—A. I think so.

(*Mr. Buchanan.*—These are more or less native bazaar piece-goods, etc., dealers that *Mr. Anderson* is speaking of.)

Q. Do they get any privileges for doing that?—A. Yes; the members of the Import Association will only give credit to firms so registered—to firms not registered the firms in the Import Association only sell on cash terms.

Q. It has been put to us that one of the principal difficulties in the registration of partnerships is the small trader?—A. That is a difficulty.

Q. Can you make any suggestion to overcome that? Would you exempt him from the provisions altogether, or would you apply them, for instance, to certain areas only?—

(*Mr. Buchanan.*—*A.* It can scarcely be limited to an area I think. I think that some system of leaving out the very small trade may be evolved.)

Q. You could not yourself make any definite suggestion?—*A.* It is a very difficult thing. *Hon'ble Mr. Anderson.*—I think it would come more or less voluntarily.

Q. Another difficulty which is raised is the Hindu joint family system.—*A.* That does not apply here.

Q. The third difficulty is with regard to single ventures, whether they should be included or not. A single venture may be a thing of considerable size and, therefore, it would be desirable that it should be included, and also it might develop into further ventures. Can you suggest any means of dealing with that? Do they have such ventures here as they do, we understand, in Bombay?—*A.* I do not think that that question would arise here at all.

Q. The gist of your knowledge on the subject is that it is very desirable that partnerships should be registered?—*A.* Yes; there must be some little opposition from the people who refuse to submit to anything but compulsion?

Q. You think that it should be made compulsory straight off?—*A.* Yes; we have not recommended that here, but we have recommended it to the Provincial Committee which went into the question of trade after the war.

Q. Have you got a Stock Exchange here?—*A.* There is an association of brokers which was started in the boom time. It still exists, but it is very small.

Q. If it were feasible to start a Stock Exchange in big centres, say, Bombay, Calcutta, Rangoon, and Madras, do you think it would tend to regularize and increase dealings?—*A.* No; I do not think it is a practical suggestion. I do not think it will have any effect at all here.

Q. As regards the compulsory registration of trade-marks that is a matter you have taken up once or twice?—*A.* Yes.

Q. You hold rather different opinions from some of the other chambers?

(*Mr. Buchanan.*—*A.* I think the Bombay Chamber holds a rather different opinion from us.)

Q. Could you tell me what sections 51 and 57 of the Act are?—*A.* I could not tell you now offhand.

Q. With reference to apprentices you say, "In one of the oil companies better class apprentices are being experimentally trained for responsible and well-paid positions in the laboratories". What is that company?—*A.* The Burma Oil Company.

Q. Is there a regular system of indentures or something of that sort?—*A.* Yes; there is a system of indentures. These are better class boys and they are put on a special apprenticeship system. It is only experimental so far, but it seems to be promising quite well.

Q. Do you pay them?—*A.* Yes.

Q. How much?—*A.* I do not think it is very much to start with, but it may lead to good berths for them as chemists and so on.

Q. How long has this system been in existence?—*A.* Not very long.

Q. Who are these better class of apprentices? Burmese or Indians?—*A.* Burmese.

Q. Have they got any gift that way, or aptitude for chemistry?—*A.* I do not know that the average Burman has any particular gift in that line. In other lines he has natural gifts.

Q. What sort of pay do they rise to?—*A.* They start, I believe, on about Rs. 80 or Rs. 100, and may rise to Rs. 300 to Rs. 400 or more, according to qualifications.

Q. You suggest that further research should be made in connection with coal. Have not researches been made already fully?—*A.* I think they have been, but that is private enterprise, and I have not heard of any research made by Government.

Q. When you suggest that further research should be made you mean by Government?—*A.* Yes.

Sir D. J. Tata.—*Q.* You say in answer to Question No. 8, "There would also appear to be openings for sugar and pulp and paper factories and jute-growing and manufacture". Have you a suitable soil in Burma for jute-growing?—*Hon'ble Mr. Anderson.*—*A.* Samples of jute grown in some of the up-country districts were sent to the Bengal Chamber of Commerce who gave a very good report on them.

Q. It was thought that Bengal was the only place where you could grow jute?—*A.* This is quite recent. I believe there is a gentleman who is prepared to erect a jute mill but he is waiting normal times.

Q. In answer to Question No. 10 you say, "The existing banks, such as the Presidency, Exchange, and Joint Stock Banks, are quite sufficient to meet the demands put upon them". In India we have heard complaints that the Exchange, Joint Stock, and Presidency Banks did not give facilities to Indians readily, and that they more or less always financed European firms. As soon as I came here I made inquiries, and there was the same complaint that Indian firms could not get the same facilities as European firms. Is there any ground for complaint of that kind here?—*A.* The banks lend a great deal to Chetties and Shroffs and I think to Indian firms too.

Q. I was told yesterday that Indian firms which wanted to develop industries did not get the sort of support and encouragement that they should get?—*Mr. Buchanan*.—A. I do not really think there is anything in that.

Q. In Bengal, Madras, and Bombay, whenever we put this question to the Indians, as far as I remember, with one exception, they always said that they never got the same facilities as European firms.—*Sir F. H. Stewart*.—All the Indians did not give evidence to that effect.

Sir D. J. Tata.—Q. Do you think that there is occasion for any such complaint here also?—*Hon'ble Mr. Anderson*.—A. No; a man of standing would always find support.

Q. In answer to Questions No. 15 and 16 you say, "The development of the rubber industry also received great help by the exploitation of the Mergui Rubber Estates by Government". Will you tell us something about this exploitation?—A. Government started an experimental rubber station and when the people saw that rubber would grow they came along immediately and took up rubber-growing.

Q. And there is a certain amount of rubber-growing in that district?—A. Yes; it is a very large industry. Mr. Thompson had said that it was going to be a larger industry than the rice industry.

(*Hon'ble Mr. H. Thompson*.—I did not say that; I said it was going to be a big industry.)

Sir D. J. Tata.—Q. In answer to Question No. 16 you say, "If a Government-paid expert is loaned to a private business his report should be treated as confidential, otherwise there would be absolutely no demand for the services of a Government expert". Why do you say that?—A. I say that if the report is not to be treated as confidential there would be no demand.

Q. Would not firms be only too glad to get some assistance, rather than get none, even if the report were not to be treated as absolutely confidential?—A. My idea was that if the person had any good thing he would prefer to get his own man's report on the thing or wait till he could afford to get a man of his own, rather than give it into the hands of a person who would not keep it confidential.

Q. If the services of the Government expert are lent to any private firm is he not paid from the public revenues?—Yes.

Q. And would it not be rather unfair that any report that he might make should be kept entirely from the public?—A. A reasonable time-limit may be fixed during which it should be kept confidential—say, two years, or something of that sort.

Q. In answer to Questions Nos. 25, 26, and 27 you say that the surveys should be published and made available to the public. In what way? By publication in the newspapers, or by publication in the *Government Gazette*, or what?—A. By some such means, or by pamphlets or monographs. It will be known to the papers that it is published; it will be sent to the Chamber of Commerce, the Trades Association, or something of that sort.

Q. The local papers perhaps reach a larger public than the *Government Gazette*?—A. If it is notified in the local papers that such and such a survey has been held and the report on it is available you will find that people interested in it will go to it immediately.

Q. About the services of Government engineers being lent for buying machinery you think perhaps that it should not be done. But are there not some small Indian firms who would not know about these private engineering firms, and don't you think that a Government engineer would be of help to them in giving advice?—A. I think it is more likely that the man may know about private engineering firms who have travellers all over the country.

Q. You have private engineers who go all over the country?—A. Yes.

Q. You say, in answer to Question No. 33, that exhibitions should be popular in character. By that you mean that there should be side-shows, and they should be made a little attractive, i.e., make the exhibition a sort of fair?—A. Yes; the Burmese are very fond of such sorts of things.

Q. In answer to Question No. 34 you say, "A radical alteration in the Consular Service would, to some extent, take the place of trade representatives abroad". What sort of alteration do you suggest?—A. To take a more active interest in publications and other things.

Q. Is it not true that at present Consuls are mostly concerned with dealing with sailors and merchant vessels, and that a great part of their time is taken up in that way?—A. I think they are mostly foreigners. Some of them are not really interested in British trade at all.

Q. You would divide the Consular staff into two sections, one of which would be concerned with looking after British subjects, especially sailors, most of the Consuls being in the ports; that work takes up a good deal of their time? Then you would have another section which would look after trade? Is that the idea?—A. Yes; the Consuls should have sufficient staff for both duties.

Q. In answer to Question No. 34 (b) you say, "In addition to this, a system of apprenticeship exists in most of the industries named, from which satisfactory results are obtained." Is there any definite system, or is it only just the ordinary way in which a

workman is trained?—*A.* We have engineering works and for some years past we always have had a certain number of apprentices.

Q. Indentured?—*A.* Yes; some of them do not stay long, but others do get on.

Q. There is a system of apprenticeship in the workshops?—*A.* The Flotilla Company has also some.

Q. You say also, "In one of the oil companies better class apprentices are being experimentally trained for responsible and well-paid positions in the laboratories." They rise to Rs. 100, you said?—*A.* They rise to more than that.

Mr. Buchanan.—They probably start on Rs. 80 to Rs. 100 and are trained for superior positions; they then might rise to about Rs. 250 to Rs. 300 or Rs. 300 to Rs. 400 or more, according to their qualifications. Advancement really depends upon the man's own ability and application. Having proved himself capable and industrious, he is practically on level terms with the European after his apprenticeship.)

Q. About the Government School of Engineering and Technical High School in Burma you say, "It is well attended and the boys who study there and complete their course by practical apprenticeship should certainly be more efficient than those who do not study." Do these boys find employment? Is there a large demand for boys turned out by this school?—*A.* Yes.

Q. In answer to Question No. 48 you say, "Whatever the system adopted, practical apprenticeship should form a considerable part of it." Then you say, in answer to Question No. 44(b), that practical apprenticeship already exists. Do not those two statements appear rather contradictory?—*A.* In answer to Question No. 44(b), we say it exists, and then, in answer to Question No. 48, which is, "On what lines should these two systems of training be developed and co-ordinated?" we say, "Whatever the system adopted practical apprenticeship should form a considerable part of it." I do not see any contradiction.

Q. At the bottom of page 8 you speak of night-schools. Who are the people that take advantage of these night-schools? Burmese?—*A.* Indians.

Q. The Burmese do not go to these?—*A.* No; they go to the higher classes—book-keeping and other things. We met one or two in the higher night-schools, and not in the elementary schools.

Q. The Burman has a natural aptitude for engineering and he wants to go in for it?—*A.* Yes.

Q. I understood that the Burman was not a very energetic man, and that he would get somebody else to do the things for him, as far as possible.—*A. Hon'ble Mr. H. Thompson.*—It is quite a mistaken impression. They are very good engineers and make very good motor drivers.

Q. In answer to Question No. 64 you say, "For Burma we do not think that at present the formation of any new Imperial scientific and technical departments are necessary." Then, in answer to Question No. 112 (a), you say, "Many experiments have been made with a view to utilising it, but without success. This is perhaps a matter that a Government expert might take up." Practically, you admit that scientific and technical departments may be useful?—*A.* But that would not make it necessary to have a scientific and technical department for Burma.

Q. But there may be several other questions of the same kind requiring solution?—*A.* Personally, I do not think that the problems in Burma are sufficient to warrant such an establishment. They may go to India or Home.

Mr. A. Chatterton.—*Q.* I understand that you are in favour of the appointment of a Director of Industries in this province?—*Hon'ble Mr. Anderson.*—*A.* Yes.

Q. And your main idea is that he should deal with the smaller industries, the cottage industries, in this province?—*A.* To begin with, at any rate.

Mr. Buchanan.—Our idea is that the matter of cottage industries is one which should be taken up in earnest by Government here and a thorough investigation made into the subject. At present, they are in a backward state. The people are poor and ignorant and their methods are crude, and they require help in these, as also in the marketing of products. I am particularly referring just now to cotton and silk-weaving.)

Q. Would the people be amenable to instruction? Would they be willing to take up improvements in their methods of working at the present time?—*A.* I should imagine they would if you pointed out the thing and explained it to them. They may not take to it at once. I am talking of Burmese principally.

Q. Something in this direction appears to have been done at Amarapura. Has that spread outside Amarapura itself?—*A.* It has, round about the Mandalay district.

Q. You have no personal knowledge about the extension of the influence of a school of this kind?—*A.* We only know that it has been of very considerable value to the industry in Amarapura.

Q. In what way has it made its effect apparent?—*A.* I think the outturn has improved considerably; the manufacture has improved, and it is quite apparent both in style and texture.

Q. Is that inside or outside the school? Have the weavers who have been taught in the school set up the improved types of looms in their own houses and worked them?—*A.* I suppose they do. I have no personal knowledge.

Q. What I wanted to know was whether you personally, or as members of the chamber, have any knowledge of what is going on in this connexion.—*Hon'ble Mr. Anderson.*—A. We have had no personal knowledge.

Q. Besides these cottage industries what position should the Director of Industries occupy in relation to Government? Do you want him to be the channel through which the chambers of commerce and other bodies should make their representations to Government?—A. He will represent to Government after inquiring on the representation of other bodies what has got to be done.

Q. It was not clear to me from the answers that you gave whether you desire the Director of Industries to be assisted by a board or not.—A. Assisted by an advisory board.

Q. What would be the composition of this advisory board in Rangoon?—A. Merchants and people who are interested in the lines that are going to be taken up.

Q. Would you prefer to have a board of two or three men, a small board, or a comparatively large advisory board?—A. A small board, which can always get information through the chamber and other bodies.

Q. The idea is that this board should meet at frequent intervals and give, in an advisory capacity, advice on the schemes going on in the director's office?—A. Yes.

Q. This would involve a considerable amount of work to the members of the advisory board. Would you pay them?—A. I do not think so. The director would do all the current work, and the advisory board would advise him on what lines he would develop the industries.

Q. Would not that involve a considerable amount of work on their part?—A. I do not think so.

Q. Do you think that you will get first-class men on the board?—A. I think so.

Q. How will a composite board of this kind deal with cottage industries? Where will you get men who can really advise in these matters?—A. I think the director would be the head of it and there are people interested in up-country trade who have their houses up-country. You can get men from among them.

Q. Is there any export from Burma of the products of cottage industries?—A. *Mr. Buchanan.*—A. Nothing practically.

Q. Are they simply consumed locally?—*Hon'ble Mr. Anderson.*—A. Some of them come down to Rangoon. If you go and see the Rangoon bazaar you will find the products of up-country. You will see lacquer work, cane work, pottery work.

Q. In answer to Question No. 3 you say that the rice-milling industry is very much overdone. Whom do the majority of these mills belong to?—A. The larger mills to Europeans and the smaller ones to Burmese and natives.

Q. How did it come to pass that the supply of mills is so much in excess of the demand for them?—A. *Mr. Thompson* in his report said that it is due to the speculative element that exists in the rice trade. If a Burman gets a certain amount of money he must start a rice mill.

Q. Is that due to the fact that there is a very limited knowledge of the ways in which money can be employed in industries with the result that everyone wants to imitate a successful venture?—A. As soon as a Burman has made some money he wants to set up a rice mill.

Q. The mills which you speak of in Moulmein—are they small mills?—A. Some of them are, and some are not. I have got some figures and, if you like, I shall show them. (The witness handed over a tabulated statement.)

Q. Where do they get their fuel supply?—A. They use paddy husk.

Q. For instance, take the Electric Supply Company. Where do they get fuel?—A. They use coal.

Q. Where do they get it from?—A. From Calcutta.

Q. What is the price of coal?—A. It was about Rs. 16, but now it is Rs. 41 or something like that.

Q. In the rice mills there is a very large surplus of paddy husk. What is done with it?—A. It is thrown into the river.

Q. Would it be practicable to use that husk for generating steam for other mechanical plant besides rice mills?—A. It is too bulky to move.

Q. Would it not pay with coal at Rs. 41?—A. I think it might, possibly with some people, but, generally speaking, it would not pay to cart it. It is too bulky to move.

Q. In connexion with this statement have new rice mills been put up, or is the matter gradually righting itself with regard to competition?—A. No new large mill has been put up for some years. A number of small mills has been put up in the districts because it is always the Burman's idea to have a rice mill.

Q. In reply to Question No. 8 you say, "What has been done with wheat in India can be done, and done ten times over, in the case of paddy". What is it that you want to be done?—A. Improve the methods of agriculture, and, more particularly, the quality of the grain.

Q. Have you got anything more definite than that?—*A.* When I was in Mandalay the Deputy Director of Agriculture told me that the Burmans, when transplanting, planted five seedlings together, whereas he had proved by experiment that actually a better result was obtained by transplanting the seedlings separately, thus using only one seedling instead of five. He told me that the Burmans round about the farm were beginning to adopt this practice. It is only comparatively quite recently that the experimental farm had started doing anything in this direction, and everything that they are doing is turning out successfully.

Q. You want improved methods of cultivation and improved seeds?—*A.* Yes.

Q. As regards irrigation is there any difficulty at all in Burma?—*A.* I do not know about that. I believe not. I cannot pretend to speak on that.

Q. In answer to Question No. 27 (b) you say that Government engineers should not be allowed to undertake the purchase of machinery and plant for private firms. Are there any private consulting engineers in Rangoon?—*A.* Yes.

Q. Supposing there is a Burman who wants assistance in putting up a rice mill?—*A.* There are people who import machinery from Home or manufacture it here, and they have consulting engineers.

Q. They are manufacturing firms?—*A.* Yes.

Q. Are there people who are not connected with manufacturing interests who are prepared to give disinterested advice?—*A.* There are people who are quite prepared to put up machinery and show how it is to be run. We have put up very many rice mills. We give guarantees and there is no trouble about that.

Q. You are prepared as consulting engineers to give guarantees regarding the work generally?—*A.* Yes; we are prepared to give the man what he wants and guarantee it.

Q. With reference to your answers to Questions Nos. 54 and 55, relating to the employment of engineers, do you agree that it is desirable to have this examination for men in charge of boilers and prime-movers uniform, or would you be rather free from restriction in employing them?—*A.* We would rather be free from restriction, but I do not think there is any hardship entailed by it. Naturally we do not like to be restricted. We have a superintending engineer—a qualified engineer—who is in charge of things.

Q. Do you think there is any advantage gained by these certificates?—*A.* For small mills, yes. It does not affect Europeans because they have a proper staff.

Q. What is the advantage accruing to the small mill except that the manager has to pay double wages to the driver who has got a certificate?—*A.* It will be in more qualified hands.

Q. Are there any Burmese with these boiler certificates?—*A.* I cannot say. I think there are a good number. We have one or two Burmese men.

Q. What do you pay them?—*A.* If the man has got a certificate he gets Rs. 250.

Q. But if he has not got a ticket?—*A.* He is much lower down the scale. Any man who can be in charge of our boiler will start on Rs. 250.

Q. How many classes of certificates have you got?—*A.* There are only two.

Q. The small native mill up-country—could it afford to pay Rs. 250 to a man in charge of the boiler?—*A.* I cannot tell you.

Q. Do they employ certificated men?—*A.* They must. I am not exactly aware of the terms of the Boiler Act, but I think they must have a certificated man.

Mr. C. E. Low.—*Q.* I would like to take up the last question that Mr. Chatterton put to you. You say, in answer to Question No. 54, that a ticket granted in one province in India holds good in any other and, possibly, that impression—which is quite wrong—may have affected your answers to some extent. There are numerous provinces which do not recognize one another's certificates or there is a difficulty about it. Do you recognize the certificates of other provinces of India in Burma? *Hon'ble Mr. Anderson.*—*A.* I think no. I am not sure.

Q. I should like to clear up that impression on your part?—*A.* I think we do.

(Mr. Buchanan. I remember making inquiries the other day and I was informed that they do recognize them.)

Q. Here you recognize the certificates of other provinces?—*A.* Yes; I understand so.

Q. Of course, in certain provinces they do not have such certificates at all—in Bengal for one and I think in Madras also. In India there are three classes of certificates. The third-class man is usually a man who is in charge of small installations of 30 or 40-h. p., and probably gets about Rs. 50 or 60?—*Hon'ble Mr. Anderson.*—*A.* He is called a driver. These are the men who are in charge of our launches.

Q. Turning to your answer to Question No. 2 (a) about banks you are not in favour of restricting the use of the word 'bank' or 'banking'? You say that recent legislation has, however, placed restrictions on such institutions. You are, no doubt, alluding to the Companies Act and its audit provisions especially. You do not suggest any further legislation—you said so in answer to the President—in respect of banking?—*A.* We have been advised not.

Q. You are not in favour of any restriction on the use of the word 'bank' or 'banking'?—*Mr. Buchanan.*—*A.* In what respect?

Q. It had been suggested in many places, long before the Commission started, that no man should use the word 'bank', or 'banking', or 'banker' unless he had the concern registered as a limited company and submitted also to certain further restrictions in respect of publicity and so on?—A. The question has not arisen here.

Q. Are you in favour of making it compulsory on a person who starts a bank to put in a deposit like the insurance companies have to, or to have a certain amount of paid-up capital or something of that sort?—A. I regret we have hardly considered these questions.

Q. In your answer to Question No. 3 you say that there are more mills than paddy to go round. We were confronted by the same position in reference to cotton gins in the Punjab and small rice mills in Madras. In the Punjab a number of people pressed very strongly that the number of gins should be limited according to the cotton crop. Would you agree with that suggestion?—A. No; either the excess mills will shut down, or people will adapt themselves and increase the production of paddy by improved agriculture. That is the biggest thing in Burma. The thing will right itself.

Q. Is there any difficulty about the amount of manure available for the paddy?—A. There is very little manuring. I was told in Mandalay that the best manure was burnt paddy husk—ashes.

Q. You say that exemption from taxes as a means of aiding a new industry appeals to you most. Do you allude particularly to income-tax or octroi and other taxes?—A. Income-tax is practically the only tax. We have got no octroi.

Q. The more profit a company makes the more income-tax it pays and the less profit it makes the less income-tax it pays and, therefore, remission of income-tax does not aid a new concern much—it is not a very substantial form of aid?—A. There is a very high income-tax.

Q. Those persons that are paying very high income-tax are, presumably, making substantial profits?—A. You know it has occurred in connexion with the rubber estates which have come into bearing.

Q. Do you mean the excess profits tax at Home?—A. Yes.

Q. That is another matter. You say that no difficulty is found in getting money for new industrial concerns, speaking, of course, in the general way. What do you think of the idea, for instance, of a central sugar factory, with a sugar-growing estate. Does that not appeal to the enterprising commercial public here?—A. It will appeal.

Q. Why do you think it has not been done so far?—A. They have not produced raw sugar in the country up to date.

(Mr. Buchanan.—That is one of the lines on which we would like a pioneer factory, first and foremost in sugar.)

Q. You would like Government to demonstrate that it is commercially practicable? That would have a good effect? Have you followed the Assam experiments? Do you think that if action of that kind had been taken by Government in the past it would have enlisted the support of the public?—A. Yes.

Q. You think that money would have been forthcoming?—A. Yes; take rubber estates. It was pioneering.

Q. That was purely agricultural. I am asking about agriculture and industry combined together. Government has been ready to take up an agricultural proposition hitherto, but it has been shy of industrial propositions?—A. They have started the growing of rubber.

Q. Take, for instance, another matter. It is in the interests of national security that we should be, as far as possible, able to manufacture our rubber. Why has rubber manufacture not appealed to the commercial public hitherto?—Mr. Buchanan.—A. The industry is probably too young, and it depends if enough rubber be forthcoming.

Q. Do you think that rubber will be forthcoming?—A. I should think there is a prospect of it.

Q. My point is this:—Have not the public been rather inclined to go on certain existing lines and shut their eyes to new possibilities, and are there any ways in which Government could help them to strike out any fresh lines?—Hon'ble Mr. Anderson.—A. That is one thing that a Government expert may give advice on.

Q. How do you think that Government could assist in a matter of that sort?—A. By an expert adviser studying the conditions.

Q. Everybody knows the conditions under which rubber is manufactured.—A. In other industries, like the Burma Oil Company, they manufacture the whole of their products and, probably, when the industry here gets sufficiently big, that will be done. I do not know why it has not been started in places where there is a large quantity of rubber.

Q. In the loan of the services of a Government expert there is one difficulty which has not been touch so far. Supposing I am a Government expert and I am lent to you and I work out a certain line and am in possession of some results which I am supposed to keep confidential and your friend also applies to the department under which I am working and asks for my services to work out the same subject what am I to do? Should I pretend to go through the whole thing over again, or might I utilize the results previously obtained?—A. I do not think it should be published if I had applied first. I would like to go to somebody who would not give out the results. That is why we say that if the report of the

expert lent to a private business is to be published there would be no demand for his services.

Q. Have you any experience up to date of any business with the Indian Trade Commissioner in London?—A. I have referred our people at Home to him.

Q. He has been working for the last three or four months?—A. I have already had two or three things from him and I think he will be a very useful man.

Q. The conditions in which he is now working are purely war conditions?—A. Yes.

Q. Have you any views on the subject of the appointment of British Trade Commissioners in Bombay and Calcutta, on the understanding that the other British Trade Commissioners all over the Empire will be at the disposal of people here?—A. We think it would help to bring trade much more together.

Q. Do you think it will be useful to India?—A. I think so.

Q. With reference to your answer to Question No. 38 it has been suggested to us that one way of dealing with the stores difficulty might be to continue, after the war, on the present lines of working of the Indian Munitions Board by which all Government indents would go through the local and Imperial Departments of Industries who would take care that everything that could be made in the country was obtained here—exactly what the Munitions Board is now doing on priority certificates. What do you think of the idea?—A. That would be very useful to firms out here.

Q. You think that it would be of assistance to manufacturers here?—A. Yes; especially to engineering.

Q. With reference to apprentices do you think that it is desirable to give a statutory basis to apprenticeship by which a man who employs an apprentice during the period of his indenture with another would be liable to fine on summary conviction? It has been put to us that the apprenticeship system is a farce because, as soon as a boy learns something, somebody else pays him a trifle more than the original master and trainer and he, therefore, never learns his job completely. It has been suggested to us that there should be a legal basis to the apprenticeship system by which, if an apprentice leaves the man to whom he was indentured before his time is up, then the other person who employs that apprentice will be liable to fine.—A. I do not think that any necessity for that has arisen. I would be against that.

Q. There is not much tempting away of apprentices here?—A. No; as a rule we take apprentices more as a matter of grace than otherwise.

Q. They do not become so markedly skilled during the period of their apprenticeship that there is a serious competition for their services?—A. No.

Q. Not even from the bazaar?—A. No.

Q. Are you in favour of the idea, which has been suggested in another place, that large railway or engineering workshops should, with Government assistance if necessary, have classes for training apprentices attached to them, the apprentices or pupils getting their practical training in the shops under shop conditions, and getting their theoretical training in these classes?—A. If the works were big enough I should think it would be a good thing.

Q. Do your railway workshops do that?—A. I cannot say. In the Government School here they have classes and, after six months or a year, the pupils have to go out as apprentices for a time, as part of their training course, but, if you had shops which were big enough, they could do the theoretical and practical simultaneously.

Q. You have presumably a fairly large railway shop?—A. Yes.

Q. You say that it is a very valuable training-ground?—A. If the works are large enough.

Q. With reference to the collection of statistics what particular figures are you speaking of in your answer to Question No. 82?—A. Movements of paddy, rice, and that sort of thing—crop reports all over the world.

Q. Prior to the restriction on the publication of sea customs figures, owing to the war, was the system here satisfactory?—A. Yes.

Q. Did you get weekly figures?—A. Yes; in fact daily figures.

Q. Are they published by the Customs Department or the chamber?—A. By the Customs Department.

Q. Is the paddy forecast nearly correct?—A. It is marvellously correct. I have compared it with the Bengal crop reports. For many years it has been very correct.

Q. What do you think its correctness is due to?—A. The success is due to the District Officers.

(Hon. Mr. Thompson.—I should attribute it to the correct surveys.)

Q. There are surveys of areas under crop in most provinces in India. How far do you rely on the trade up-country for their information?—A. There is no trade up-country. They are cultivators. The whole of these cultivating districts lives by paddy, and paddy alone.

Q. The forecasts are so correct that one would like to know, if possible, what the reason for this unusual accuracy is.—*Hon. Mr. Thompson.*—A. The forecast is not the result of a mere mechanical process, but of intelligent observations and surveys.

Q. With reference to your remarks about the absence of adulteration is Cutch exported from here?—A. It is a small thing.

Q. Is it not adulterated?—A. At one time it was, but that has been stopped. There was a great shortage of Cutch at one time and it was adulterated. They have now got the position well in hand.

Q. Are there many firms exporting it?—A. Half a dozen probably.

Q. Where does it go mostly?—A. London and Liverpool.

Q. One witness whose evidence we have read has stated that Cutch is heavily adulterated?—A. The chamber took up the case and represented it to the Forest Department who were asked to stop the adulteration and it has done so to a certain extent.

Q. Is there any export of groundnuts from here?—A. Yes.

Q. Any trouble about adulteration of groundnuts?—A. Not particularly I should say.

Q. It has been said that machine-shelled groundnuts which are superior are mixed with hand-shelled groundnuts which are bad. Is it so?—A. I do not think there has been any particular trouble, nothing of any importance.

Q. In answer to Question No. 94 you say, "British trade interests in India require some system of compulsory registration of trade-marks in India based on that obtaining in England". Supposing one man has a trade-mark in India, and another man has the same trade-mark in England, which is a common state of affairs I understand, how would you deal with that?—A. I do not know how this Act applies.

(*Mr. C. E. Low.*—There is a considerable body of opinion among the Chambers of Commerce in India the other way; in fact, perhaps the majority of opinions is against your proposal.)

(*Sir F. H. Stewart.*—It is a question which the Burma Chamber of Commerce has taken up.)

Mr. C. E. Low.—Q. They, presumably, have excellent reasons for doing so?—A. More detailed information will be found in the report of the provincial committee on problems after the war.

Q. The only way of registering trade-marks at present is to register the trade-mark as a miscellaneous document in proof (within certain limits) of priority.—*Mr. Buchanan.*—A. It is of no practical use at all, as it is at Home. At Home trade-marks are open to inspection. If you want to register a trade-mark you go to the registration office and look through all the books.

Q. Before you get to that position you have got to register every trade-mark in the country and the title thereto has to be proved if it is impugned. You will require a sort of doomsday book of trade-marks or a record-of-rights for the whole of India?—A. It is a very big question. What has happened has happened and we could not very well go back to the beginning and make everyone prove his existing right; could we not start from now? Unless a mark were affected by the rights of a prior user that would serve our purpose here. Possibly, you may have a certain mark on one class of goods and I may use it on another. It may also happen that both use it on the same class of goods but in different grades in that class and it is very confusing.

Sir F. H. Stewart.—Q. Do you not usually come to an amicable agreement about that with the other people?—A. I believe so, in most cases.

Mr. C. E. Low.—Q. With reference to the salt industry, which you speak of in answer to Question No. 111, what is the position of the manufacturer of salt in Burma at present? I understand that they do not pay duty on salt, but so much on each salt refinery.—A. I do not know.

Hon'ble Mr. H. Thompson.—Q. Is it not possible that one reason for this overabundance of mills that is described by the chamber is the fact that some years ago rice milling was very largely seasonal and now it is carried on throughout almost the whole year? Where you have a seasonal trade you must have more mills. Is that not the real explanation of the overabundance of mills?—A. It has some bearing, but not the main bearing.

Mr. C. E. Low.—Q. How is it that the season has spread out, or ceased to be entirely seasonal?—A. The Burmese hold up the crop. There are now more godowns up-country than there used to be.

Hon'ble Sir R. N. Mookerjee.—Q. If Government is satisfied with the success of a pioneer factory have you thought over the matter as to how to hand it over to a private firm or person?—A. The Mergui Factory was put up to tender by Government. Government need not accept the highest tender provided a respectable person tendered for it—somebody capable of carrying it on—that is all Government would look to.

Sir F. H. Stewart.—Q. With reference to your answer to Question No. 105, about the Forest Department, that represents the general idea of your chamber?—*Hon. Mr. Anderson.*—A. Yes; it is their note.

Q. Similarly, would the same answer apply to engineering problems?—A. Yes.

Q. Are there any engineers attached to the Forest Department?—A. No.

Q. You think it would be a good thing if they were? They might help to solve questions of transport?—A. I think there are Forest Officers who have such knowledge. You have one witness coming from the Forest Department.

Q. Your remedy for the want of help to deal with commercial problems is to have a separate cadre?—A. Yes.

Q. Would that work? Would it give a sufficient opening for good business men? The alternative that has been suggested to us is this:—to select certain Forest Officers and give them a certain amount of business training.—A. It requires the consideration of people who have first-hand knowledge in the matter. I have not. This note was put up by people interested in forests.

Q. You are the President of the Chamber of Commerce here? What is the system of electing your members?—A. By firms.

Q. How many members have you?—A. About 78.

A. Have you any Indian or Burmese firms?—A. Indian firms and Chinese firms.

Q. Is there much Chinese labour in Burma?—A. In some districts there is some Chinese labour.

Q. Is it increasing?—*Mr. Buchanan.*—A. It was not very satisfactory to start with. We look more to India for a satisfactory solution of labour problems here. I should like also to emphasize the desirability of establishing pioneer factories in connexion with new industries holding out reasonable hope of commercial success, *e.g.*, sugar, jute, rubber manufacture; and demonstration factories, where considered advisable, for the improvement of methods in existing industries, *e.g.*, pottery and porcelain, soap-making, and also for a closer investigation into the position of the cottage industries, silk, and cotton-weaving, etc.

Q. I wish to know, on the question of disposing of pioneer factories, whether you would put these pioneer factories to auction, or whether it would be better to associate some business firms in their management from the start and then dispose of the factories to them?—A. I rather think that this would give the particular firm a preference, and the other way would be better.

Q. You would not be any better off though if the factory got into the hands of people who could not run it?—A. Government need not accept the highest tender. Government must take care of it. The best plan would be to put it to tender.

WITNESS No. 415.

Hon'ble Maung Po Tha.

HON'BLE MAUNG PO THA, *Member, Burma Legislative Council, and Head Broker, Messrs. Steel Brothers, Rangoon.*

WRITTEN EVIDENCE.

1.—Financial Aid to Industrial Enterprises.

Q. 1.—There are no Burman capitalists to speak of and the various Burmese industries Capital are being run on a small scale with the respective proprietor's own or borrowed small capital. A combination between these small proprietors is not possible owing to their mistrust of one another and, so long as this mutual mistrust exists the development of any Burmese industry on a bigger scale is out of the question. To remove the mistrust Government aid and control, preferably through the Registrar of Co-operative Credit Societies, will be necessary for a time.

Q. 2.—Chetties and other unscrupulous money-lenders whose rates of interest are exorbitant.

Q. 2 (a).—The banks in Burma are European concerns and these will never think of financing any native industry. If Burmese industries are to be developed as they ought to be, under the aid and control of Government, the Government Treasury should be the source from which the initial capital may be drawn. When the industries have been placed on a firm footing the Upper Burma Co-operative Bank and other co-operative Burmese banks should open industrial banking branches to finance them or act as their bankers.

Q. 4.—There is no Government aided industry so far as Burmese industries are concerned. *Government Assistance.*

Q. 5.—For hand industries without machinery Government loans without interest and guaranteed dividends for a limited period will be a great boon. In others with machinery the supply of machinery and plant on the hire-purchase system, with provision of part of share capital on the same basis as public subscriptions of capital, will, be sure of success.

Q. 6.—In all methods of Government assistance there should be a Government director and auditor until industries are on a firm basis.

Pioneer factories.

Q. 7.—Though I have no experience of Government pioneer factories I am in favour of them and, so far as I know, there have been no such factories in Burma. The policy of having Government pioneer factories for working chrome leather and aluminium prevails at Madras, and it should be followed with advantage in Burma. Capital and skilled labour are required, and the promotion of local industries should be linked on to the co-operative movement.

Q. 8.—It would be a great boon to Burmans if Government pioneer industries are started and handed over to Burmese companies as soon as they are on a sound footing.

No such industries ought to be converted into Government enterprises. Such a benevolent act on the part of Government will go a long way towards fostering the imperial idea and feelings of loyalty among Burmans.

Co-operative
Societies.

Q. 11.—Yes; Amarapura weaving industries. The exact means adopted and the results obtained are known to the Registrar of Co-operative Credit Societies.

Q. 12.—All Burmese industries in which co-operation is required.

The organization and special objects of each society will depend on the nature of industry for which it is established.

Limits of Govern-
ment assistance.

Q. 13.—There are no private Burmese enterprises, nor will there be any such new enterprises with which Government aid would compete.

Q. 14.—There need not be any limitations on Government aid to a new enterprise to avoid competing with an established external trade the interests of which will, no doubt, be looked after by the Government of the country concerned.

II.—Technical Aid to Industries.

Q. 15.—I believe that the technical and scientific aid provided by Government in agriculture is proving to be a boon to agriculturists in Burma. What is urgently required in Burma is agricultural schools at different centres, with an agricultural college at Rangoon.

Q. 16.—I believe some researches made by the Agricultural Department are proving a benefit to agriculturists in Burma.

Q. 17.—For a time the loan of Government experts to Burmese private firms and other enterprises should be made free of any charge by way of encouragement.

Q. 18.—No hard-and-fast rule need be laid down. Each case of research may be decided on its own merits.

Demonstration
factories.

Q. 19.—Demonstration factories may be adopted for the following industries on the lines of pioneer factories:—

- (1) weaving,
- (2) sugar,
- (3) oil pressing and refining,
- (4) pottery,
- (5) dried fish and *agapi*, and
- (6) salt.

Special attention should be given to the manufacture of cloth, sugar, and oil for domestic consumption. The Burman, male and female, should be dressed from head to foot with articles manufactured in this country. Their articles of food should also be manufactured locally. If this is effected large sums of money now spent on foreign imports will be saved.

Research abroad.

Q. 22.—Provision for research in special subjects in the United Kingdom might be advantageous in attracting enterprising capitalists there.

Research in India.

Q. 24.—There may be an Advisory Council in Burma, as in the United Kingdom, for referring research problems to colleges and other appropriate institutions in India.

An industrial or technological research institute should be attached to the projected Burma University.

The manufacture of paper, soap, and dyes should be first considered.

Q. 25.—There should be a technical institute for Burma, and the Government Departments of Geology, Forest, Agriculture, etc., should send to this institute specimens of economic interest for investigation as to their utility for any particular purpose. No separate survey need be organized and the existing establishment of the Chemical Examiner, with such additional staff as may be necessary, should form the working and research staff of the technical institute, in addition to what they at present do.

Q. 27.—A commercial museum should be attached to the technical institute for exhibiting the results of research.

Q. 27.—(a) No such consulting engineers in Burma.

Consulting
Engineers.

(b) The services of Government consulting engineers, if any, may be given free of charge.

III.—*Assistance in marketing products.*

Q. 29.—Please see question 27. At present there is no commercial museum in Burma. Commercial When the one to be attached to the Technical Institute at Rangoon has fully developed, Museums— branch commercial museums should be opened at different trade centres.

Q. 30.—In my opinion there should be co-operative sales agencies for the sale as well as Sales agencies the display of the products of minor and unorganized cottage industries.

Q. 30.—(a) Travelling exhibitions of industries would not only be instructive but Exhibitions, would also lead to multiplication of such industries and new demands for their products.

Q. 31.—The value of industrial exhibitions is inestimable and there should be such exhibitions every year at Rangoon and Mandalay.

Q. 32.—Yes. Government should hold such exhibitions as in the past and offer prizes.

Q. 33.—Exhibitions should be such that they will not only bring buyers and sellers in contact but they will also be instructive and popular in character.

Q. 34.—Burman trade representatives in Great Britain and other foreign countries may Trade lead to Burman traders becoming direct importers and exporters. Such representatives should Representatives, be qualified in the Burma trade and their duties should be to promote the interests of the Burmese trade.

Q. 35.—Commissions for special enquiries are costly without corresponding benefits and their recommendations will not as a rule satisfy all concerned.

Q. 36.—So far as Burma is concerned no trade representative in other provinces of India is necessary.

Q. 37.—Government departments which use imported articles should publish not only Government a list of these articles but should also exhibit them in commercial museums. patronage.

Q. 38.—No change to propose in rules for purchase of stores.

Q. 40.—Government forest products may be supplied to such Burmese industries as Supply of raw require them at their actual cost. materials.

Q. 41.—The Government policy of letting land on a term of lease is unpopular and Land policy, land required for industrial purposes should be granted in perpetuity and free of land revenue for at least ten years, and at the end of this term the rate of land revenue assessed should not exceed rupees three per acre a year.

Q. 34.—(a) By sinking artesian wells with pipe lines or by irrigation from adjoining Supply of water, river, etc.

V.—*Training of labour and supervision.*

Q. 44.—(a) Most Burmans who cannot afford English education have Burmese primary Lack of primary education in Phonyi Kyongs and other Burmese Lay Schools. English primary education education, would no doubt broaden their mind and ideas which would make them more fit for industrial employment.

(b) Training from boyhood in industries would improve the labourers' efficiency and skill. Apprenticeship Boys of 10 or 12 years of age should be employed as apprentices on suitable allowances in system, factories to make them efficient and skilful labourers later.

Q. 45.—During their apprenticeship, elementary and technical instruction relating to the industries in which they are employed may be given by the employers. Their standard of living should be kept at the proper level by a sufficient rate of pay, good housing and agreeable recreation.

Q. 50.—Such schools may be under the joint control of both the Departments of Control of technical Education and Industries, by an arrangement to be settled by these departments. education.

Q. 51.—By establishing high technical schools.

Q. 53.—Technical experts where required may be trained at the cost of the industries Training of Super- concerned. visors.

VI.—*General official administration and organization.*

Q. 56.—Except the Co-operative and Agricultural Departments the duties of which are Existing organiza- to develop co-operation and agriculture, there is no organization in Burma for the general tion, development of industries.

Qs. 57—61.—In Burma the Burmans are only in need of encouragement and pecuniary Director and Board assistance, as they have not, like other nations, the necessary capital and combination at their of Industries, back, vide question 1.

In my opinion a Director of Industries should be appointed for Burma with an Advisory Board of Burmans before which all questions of industries and their encouragement should be placed for consideration. The Director's action should be guided by the advice of the Board generally, but if he disagrees with the advice of the Board in any particular matter he should refer the fact to the Local Government for orders.

Q. 62.—There is already the Imperial Department of Commerce and Industry to correlate the separate activities of various provinces in industries and no other machinery is required for the purpose.

Q. 62.—(a) The Director of Industries should work in conjunction with the Registrar of Co-operative Societies for assisting cottage industries.

VII.—Organization of Technical and Scientific Departments of Government.

Q. 63.—I think the Forest, Agricultural, and Chemical Examiner's Departments can give certain assistance to industries.

The Local Government is in a better position to recommend what changes should be made.

Q. 64.—A new Imperial Scientific and Technical Department may be advantageous to the development of industries but for what subjects or natural group of subjects it should be created I cannot state. It is for scientific and technical officers to recommend.

Qs. 65—70.—These are for Government to decide.

Q. 71.—No technological institutions in Burma.

Q. 71a.—I think each province should have a technological institute to develop as an independent unit.

Q. 72.—Each institute should deal with a limited group of related subjects.

Q. 73.—Each institute should be open to Government inspection.

Q. 74.—Yes; but it is for Government to arrange for co-ordination and prevention of overlapping.

Q. 80.—A College of Commerce in Burma will no doubt be a boon to the province. Its organization is a matter for Government to decide after consultation with experts.

Q. 81.—Such a college will produce men qualified in commerce and their activities in export commerce will be a great stimulus to the industrial development, and their advice to men engaged in industries will be useful.

Q. 81.—(a) By affording such facilities as are in their power the municipalities and local boards can assist in promoting industrial and commercial development.

VIII.—Government organization for the collection and distribution of commercial intelligence.

Q. 84.—I do not read the *Indian Trade Journal*. It must be useful to men engaged in trade.

Q. 85.—It will be a boon if Government will establish a general industrial and commercial journal for free distribution to persons actively engaged in industries.

Q. 86.—By distributing the general industrial and commercial journal in English and Burmese. It need not be translated in other vernaculars.

Q. 87.—Special monographs on industrial subjects or publications like those of the Forest and Geological Departments will no doubt be instructive. I have no personal knowledge of the advantages that may have followed the issue of such special monographs and I can therefore offer no advice.

IX.—Other forms of Government action and organization.

Q. 89.—The time for a system of Government certificates of quality of products may come later so far as Burma is concerned. At present such a system is unnecessary.

Q. 90.—A Burmese committee may be appointed to test each class of products and grant certificates when the time comes.

Q. 91.—Penalties should, I think, be imposed for adulterating all cooking oils and ghee.

Q. 92.—A Committee might do.

Q. 94.—The present Indian Law regarding trade marks and trade names seems good.

Q. 96.—I do not think such a system is necessary.

Q. 97.—There is already a local committee to advise on the subject.

Q. 98.—The present rates of railway freight are high. It will be a boon if they can be reduced in favour of industrial products.

Q. 99.—Yes. For details the existing local Committee on the subject will furnish.

Q. 101.—Both the external trade and internal industries are handicapped owing to want of more roads and high rates of shipping freights.

Q. 102.—I do not think anything has been done to ascertain the possibilities of developing hydro-electric power.

Q. 103.—Mining and prospecting rules are rather strict.

Q. 104.—Yes, wolfram.

Q. 105.—Forest Rules are rather strict and a relaxation will be a boon to the people of the country.

Imperial Department.

Technological Institutions.

College of Commerce.

Local bodies.

Trade Journals.

Other publications.

Certificates of quality.

Adulteration.

Trade Marks.

Registration of Partnerships.

Transport facilities.

Hydro-electric power.

Mining.

Forests.

Q. 106.—By the Forest Department collecting and transporting them to different trade centres and selling them at cost value.

Q. 107.—This question is for the Forest Department to answer in detail.

Q. 108.—Roads are the deficiencies in the Forest Transport and the Local Committee who have gone into the matter will make suggestions.

Q. 109.—No jail industries are instructive to convicts most of whom become good Jail Industries workmen after release.

X.—General.

Q. 110.—Roads to the wolfram mines in the Thaton district are badly needed.

Q. 111.—Yes. The manufacture of rubber tyres of all kinds and all classes of rubber New Industries articles that are imported.

Q. 112.—There is an abundant supply of wood of various kinds which are used for making boxes for packing rubber but this trade has declined owing to the Japanese competition.

Q. 113.—(c) I do not think any Burmese industry in Burma is dependent on the importation of raw material, etc., from abroad.

ORAL EVIDENCE, 22ND JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. Do you deal largely in rice?—A. Yes, rice and paddy.

Q. How do you finance your business?—A. We borrow from the Chetties.

Q. Don't you get any help from the European banks here?—A. I get help very seldom and very little.

Q. Did you try?—A. Yes, I have tried.

Q. In which way? Were you willing to give any security just as other European merchants do?—A. If I give security for about two lakhs I get about one lakh with difficulty.

Q. Is it because that you are a Burman that you find difficulty in getting money from the European Banks?—A. Yes.

Q. Is it the same with other Burmans also?—A. Yes, the same.

Q. In answer to Question 8 you say "It would be a great boon to Burmans if Government pioneer industries are started and handed over to Burmese companies as soon as they are on a sound footing." Are there any Burmese companies to take up big industries like that?—A. Yes, there are Burman rice millers.

Q. Are they engaged in any other industry?—A. They are traders who do their business individually.

Q. You say that it will be a great boon to Burmans if Government pioneer industries are started and handed over to Burmans. If Government starts a pioneer industry, say, paper-making or manufacture of rubber, are there any Burman companies who would be willing or who would be able to undertake such industries?—A. Yes, they will be very glad to undertake them.

Q. In answer to Question 1, part I, about financial aid, you say that money should be given from the Government Treasury to provide the initial capital for industries. Can you give any reason why Government should finance from their Treasury?—A. I mean the Bank of Bengal.

Q. Perhaps you are not aware that the Bank of Bengal cannot advance money on industries, the Bank rules are against such advances?—A. I have taken advances several times to the extent of one lakh 50,000 for the last 15 years. I have taken advances from the Bank of Bengal.

Q. On personal security?—A. Yes.

Q. But you say in answer to Question 2 that the Government Treasury should be the source from which the initial capital may be drawn?—A. Government should help a bank to help industries.

Q. Do you mean that there should be a separate bank assisted by Government?—A. Yes, to assist industries.

Q. In answer to Question 27 (a) you say "No such consulting engineers in Burma." Is there no machinery manufacturing firm who could advise about machinery?—A. There are, but they won't show the way how to do.

Q. Is it not in their interest to show the way, being sellers of machinery?—A. These firms have not got people who could advise.

Q. Are there not agents of machinery firms here?—A. They of course generally show the way how to use machinery, but they don't give full instructions.

Q. Their interest is to sell machinery and they must therefore give people their advice?—A. They don't.

Q. You say in answer to Questions 57 to 61 "In my opinion a Director of Industries should be appointed for Burma with an Advisory Board of Burmans." Do you want only Burmans, and nobody else?—A. There ought to be both Europeans and Burmans.

Q. Are there Burmans willing to serve on such a Board and who have some knowledge of business?—A. Yes, there are.

Q. Why don't they themselves do business then?—A. Because they don't know how to employ machinery.

Q. But if according to your suggestion the Advisory Board should consist only of Burmans, how will they be able to advise on the question of machinery?—A. The Board will consist both of Europeans and Burmans.

Q. You have no objection to have Europeans or Indians on the Board?—A. No objection.

Mr. C. E. Low.—Q. You say in answer to Question 2(a) "The banks in Burma and European concerns and these will never think of financing any native industry." But where do you get your finance from? From the Chetties?—A. Yes, from the Chetties.

Q. Where do the Chetties get their money from?—A. They get their money from their country.

Q. Do they get any money from the banks?—A. By handi they get money from the banks.

Q. Why do the banks assist the Chetties and not assist Burmans?—A. It is beyond my power to say.

Q. In answer to Question 15 you say "What is urgently required in Burma is agricultural schools at different centres with an Agricultural College at Rangoon." Do you want agricultural schools for teaching the cultivators or for teaching people to teach cultivators?—A. Both cultivators and others.

Q. Also for people who would teach the cultivators?—A. Yes.

Q. Is there very much done at present in the way of showing cultivators improved methods? Are there many officials of the Agricultural Department who show improved methods to cultivators?—A. They do so already, but the number of officers is insufficient. If there are more officers, it will be better.

Q. In answer to Question 11 you say "The Government policy of letting land on a term of lease is unpopular and land required for industrial purposes should be granted in perpetuity." Is land for agriculture given out on lease, or land for industries in the towns? Which do you mean?—A. I mean land in the jungle. Village lands and town lands also are leased.

Q. For how long are leases given for town lands?—A. 10, 15 or 20 years.

Q. Don't you get leases for 99 years?—A. That is given only for house building purposes.

Q. Supposing a man wants to put up a mill on a piece of town land, which is the property of Government, will Government give him a lease for 99 years or longer?—A. In the case of town lands only a 30 years' lease is given.

Q. Is it so also in the case of a mill?—A. Yes.

Q. In answer to Question 28 you say "The present rates of railway freight are high." Is there any competition between the steamers and the railway?—A. Yes, there is a little competition.

Q. Which is the cheapest, the railway or the steamer?—A. The Railway make more money.

Q. You mean the railway charges more?—A. Yes.

Q. Is there only one steamship company or are there more?—A. Only one.

Q. Do they charge very high? Do they charge what they like?—A. They charge as before; they have not raised.

Q. With reference to what?—A. With reference to pre-war rates.

Q. Is there any agreement between the railway and the steamship company as to rates?—A. Not likely.

Mr. A. Chatterton.—Q. Have you any experience in handling paddy?—A. Yes.

Q. Have many godowns been built recently in the districts to store the paddy crop?—A. Yes.

Q. How is the finance of the paddy now stored arranged for?—A. They take money from the Chetties.

Q. What rate of interest do they pay on that?—A. From 15 to 18 per cent.

Q. Is this building of godowns going on extensively?—A. Yes.

Q. Do you know the origin of this? Why they are doing this?—A. Because they want to make money; they are holding out for higher prices.

Q. In the paddy season as it formerly existed were there specially seasonal rates for carrying paddy in the steamers?—A. They charge the same rate all the year round.

Q. With reference to your answer to Question 109, what jail industries do they carry on in jails in Burma?—A. Furniture and cane ware.

WITNESS No. 416.

Mr. J. Meikle.

MR. J. MEIKLE (*Honorary Secretary*), representing the Lower Burma Planters' Association, Northern Division, Rangoon.

WRITTEN EVIDENCE.

The Association considered the questions submitted by the Commission at a meeting held on the 7th instant and instructed me to reply as follows to a few which more immediately interest this Association:—

III.—Development of Official Administration.

This Association consider that attention might be drawn to the Annual Forest Report (Burma) in which no reference is made to rubber except at the end of paragraph 3 on page 3 of the Resolution, also on page 19 where a reference is made to preparations to meet the demand for packing-cases for rubber plantations. They are of opinion that details as regards the acreage taken up for rubber, acreage actually planted, also in bearing in the province and the annual production might be published with advantage in this book. Statistics and Commercial Intelligence.

In the Report on the Administration of Burma year 1915-16, page 72, there is a casual mention made that—"Shipments of rubber aggregated 1,285,984 lbs. valued at Rs. 30.69 lakhs, an increase of 298,592 lbs. and Rs. 10.54 lakhs over the figures of the previous year," and on page 53 of the same Report, end of paragraph 81, the following appears—"There was practically no expansion in rubber cultivation."

In the Season and Crop Report for Burma for year ended 30th June 1914, at foot of page 5, there is a short paragraph devoted to rubber which to some extent gives the particulars this Association desire, and in the same report for the following year, i.e., 30th June 1915, rubber is again disposed of in a few lines in paragraph 16, top of page 6, under heading "Other Crops."

"This Association have reason to believe it is the desire of the Local Government to see the rubber industry in Burma very largely extended and in the opinion of this Association it is desirable that such statistics as have been indicated should be more readily available in one book instead of scattered promiscuously through several."

This Association understand a scheme is now under consideration by the Local Government to establish in Rangoon a commercial museum and they take this opportunity to express their cordial support to same and strongly advocate the holding of periodical industrial exhibitions on similar lines to the one recently held at the Jubilee Hall during the visit of His Excellency the Viceroy. Commercial Museums, etc.

The exhibition referred to brought to light many provincial industries of which a great many visitors probably knew nothing or little about before. If such exhibitions are held more frequently they must exercise a beneficial aid not only in improving the products but in creating a demand for same.

With expanding rubber cultivation for instance there will be a very large demand for latex cups and large coagulating jars which local pottery makers might cater for and secure a large share of, with slight improvements in their methods of manufacture.

IV.—Government aid to Industries.

Here again it is known to this Association that the Local Government have a scheme under consideration to extend the cultivation of rubber in this province which contemplates giving financial assistance to rubber planters on reasonable terms. This Association considers this a progressive step in the right direction and they hope the scheme referred to may be completed and brought into effect as early as possible. Loans and money grants-in-aid.

V.—Technical and Scientific work.

Hitherto Government researches in the Agricultural Department have been directed to produce other than rubber with the exception of a mycologist who was sent to Burma for a short time a year or two ago to study the "Black Thread" disease, from which some rubber plantations suffer so much during the wet season. The recommendations of this gentleman are now being tried on at least one of the largest estates. What noticeable benefits have local industries received from researches conducted by Government Department.

This Association consider much more might be done by deputing a qualified man to study more closely the various other diseases affecting rubber in Burma. It would also be of great assistance to the rubber planting industry if the services of a qualified chemist who could advise upon improved methods of manufacturing rubber were available.

Such technical advice as has hitherto been obtained has had to be sought in other countries, such as the Federated Malay States, Java and Ceylon and only the larger companies have been able to afford this.

Quite a large number of smaller estates are springing up owned by Burmese, Chinese and others and the advantage of technical and scientific advice being readily available locally to them is much to be desired.

The bulk of the rubber hitherto exported from Burma is the produce of the large and well managed estates and enjoys a good reputation in the different markets to which it is sent and it is desirable that precautions should be taken to maintain this reputation by having technical and scientific advisers readily accessible to all local Planters.

Oral Evidence, 22nd January 1918.

(N. B.—Mr. MEIKLE was accompanied by Mr. A. E. C. FENOULHET, for oral evidence.)

Mr. C. E. Low.—Q. What is the area and the number of people concerned in your Association?—A. (Mr. Meikle). We have at present about 33 members in the Northern division; the total area is about 15,000 to 20,000 acres.

Q. Is it all rubber area?—A. Yes.

Q. What districts is it concerned with?—A. It is concerned with Rangoon, Twante, Toungo, Shwegyin, Thaton, Moulmein and Amherst also Bhamo in Upper Burma.

Q. What is the southern division concerned with?—A. It is concerned with Tavoy and Mergui up to Victoria Point; they have got their own Association in their own division.

Q. Has the question of the manufacture of rubber in Burma ever been considered by your Association?—A. You mean manufacture on a commercial scale?

Q. Yes.—A. No, not yet. I did hear of a certain local firm who considered taking up a rubber factory after the war with a capital of £20,000.

Q. Is anything of that sort done in the Straits?—A. Not that I am aware of.

Q. Are there any special difficulties connected with the manufacture of rubber in the tropics which do not exist in temperate climates?—A. No, I do not think so.

Q. From the point of view of national security the manufacture of rubber is important, is it not?—A. Yes.

Q. And from a war point of view also?—A. Yes, of course.

Q. It is advantageous to the country to export some reasonable proportion at any rate of your rubber in the form of manufactured articles, and thus more money will stay in the country?—A. There will be an advantage, I think.

Q. And the manufacturer would thus also be working in direct contact with the producer of rubber who would thereby get information as to the way in which his rubber can be improved to suit the markets?—A. Quite so.

Q. Is there any way in which you think Government can assist towards that end?—A. Yes, I think Government might encourage the establishment of a factory by offering to purchase all their requirements of manufactured rubber from that factory; for instance, the Military Department would require a certain amount of rubber tyres for transport cars, and also electrical appliances.

Q. Turning to what you say about research, as you know probably, there have been discussions regarding the establishment of what I may call a tropical Pusa which I believe certain officials and non-official witnesses put forward, namely, that an institution in a suitable portion of Madras might be started to investigate problems relating to purely tropical agriculture, among which rubber of course stands the first: how would you regard an idea of that sort, or would you press for a purely local show?—A.—I think that we should have an institution of that sort for some years to come in Burma.

Q. Where do you get information from at present regarding technical difficulties in rubber growing, insect pests and so on?—A. We have to send our managers once a year to Ceylon, and the Federated Malay States and Java.

Q. Do you get any information from the Government agricultural station at Peradenia in Ceylon?—A. Yes, we get the agricultural bulletins and literature.

Q. I believe they also do research work in connection with rubber and other tropical products at the Government station at Peradenia?—A. (Mr. Fenoulhet). Yes, but a lot of delay takes place if you send specimens there.

Q. Is there any similar tropical agricultural station in the Malay States?—A. For rubber?

Q. Yes, for rubber?—A. Yes, at the head-quarters of the Malay States Rubber Growers' Association they do research.

Q. Is that a private affair, or is it under Government?—A. No, I do not think it is under Government.

Q. You don't know of any Government research station for rubber and similar things in the Malay States?—A. The Government agricultural department sent round an expert to examine soils for instance. The question of manures has been considered and the Government sent a specialist to the Straits and he took away samples of the soil.

Q. Do they investigate insect pests?—*A.* I do not know whether the Government do that or not.

Q. Are they very keen on rubber cultivation?—*A.* Yes, they are.

Q. Is it the case that the actual area under rubber in Burma and in South India is very small compared to that in the Malay States?—*A.* Yes, at present it is true.

Q. You speak about the large number of smaller estates springing up owned by Burmese, Chinese and others: do you apprehend any difficulty from them in this way, that they may put a lower style and quality of rubber on the market and spoil the name of Burma rubber?—*A.* Yes, I think they do to a certain extent, because they don't employ machinery at all, the smaller ones do not employ machinery, and they turn out inferior rubber.

Q. Do they adulterate it?—*A.* No, I do not think they adulterate it.

Q. The competition of the trade is a sufficient safeguard against that?—*A.* Yes.

Q. Do you think that it would be of advantage to the industry generally if those men had the requisite advice available?—*A.* Yes.

Q. How do these small traders market their rubber?—*A.* They sell mostly locally.

Q. Whom? To the larger estates?—*A.* Yes. *A. (Mr. Meikle)* The larger estates export to London or to the Straits.

Q. Are they largely companies registered in the United Kingdom?—*A.* Registered in the United Kingdom and in Burma.

Q. And they make their own arrangements for finance and shipment?—*A.* Yes.

Mr. A. Chatterton.—*Q.* Have you much difficulty here in connection with labour in the rubber estates?—*A. (Mr. Meikle)* We had difficulty at the beginning of the industry, not now.

Q. Where do you get your coolies from?—*A.* Most of our coolies come from the Coromandal Coast, they are Telugus and Uriyas.

Q. Are all these larger estates owned by Europeans? Are they properly equipped with preparatory machinery?—*A.* Yes. There are five large estates with up-to-date machinery.

Q. Do the owners of the smaller estates get their rubber prepared for the market in the factories of the larger estates?—*A.* In one or two cases they do, not all of them.

Q. Compared with, say, the Federated Malay States is the cost of production of rubber higher in Burma or is it about the same?—*A. (Mr. Fenoulhet)* It is, I should say, a little higher.

Q. Do you apprehend any danger of over-production here and a consequent slump in price?—*A.* Not at present.

Q. You have a large margin?—*A.* Yes.

Q. As regards materials imported by the rubber estates, do you import manure?—*A.* No. I do not.

Q. Do other planters?—*A.* I do not think they import much in Burma except on a very small experimental scale.

Q. What manures are you using?—*A.* The only manure I use is green manure.

Q. Do you use acetic acid for coagulating?—*A.* Yes.

Q. Where do you get your acid from?—*A.* From Japan since the war, previously from Europe.

Q. How much acid do you want for a pound of rubber?—*A.* One gallon of acid would coagulate 1,200 lbs. of dry rubber.

Q. Do the owners of the larger estates sell their rubber in London or in Colombo?—*A. (Mr. Meikle)* In London.

Q. You say that you have had a provincial exhibition which brought to light many provincial industries about which a great many visitors probably knew little or nothing before: that would be true of the first exhibition, but would it be true of a second exhibition, a repetition of the first?—*A.* Of course it would: commercial exhibitions are of great value and one would expect to see improvements or something new.

Q. How often would you hold these exhibitions?—*A.* Every three or five years.

Q. Where do you get your latex cups and coagulating jars from now?—*A.* At present we import them.

Q. Are they made of metal?—*A.* We have tried tin lined cups. At present we are using glass cups.

Q. Do you get them from Japan?—*A.* We get them from Holland.

Q. Have you tried to get them from India?—*A.* Not glass; we have tried aluminium cups from the Aluminium Factory in Madras.

Sir F. H. Stewart.—*Q.* Referring to your paragraph III, Development of official administration, I am not quite sure what your point is: do you want to make out that Government has not had sufficient knowledge or has not given enough attention in the past to rubber

plantations?—A. No; as a matter of fact since writing that letter the information which the Association really want has been discovered in the appendices to the season and crop report, namely, details of acreage in the different districts under rubber, etc., on the lines on which the Association would like it, but the feeling is this, that any one coming to Burma to take up rubber would not in the ordinary course refer to the season and crop report, but that as rubber is a forest product would refer to the Forest Administration Report where he would expect to find all these details, and the feeling of the Association is that all these details should be confined to one book.

Q. Do you want the information published separately?—A. Yes.

Q. Then you refer to a scheme which the Government have under consideration for extending the cultivation of rubber, including financial assistance: can you tell us—if you like in confidence—what that scheme is?—A. They are now negotiating about that scheme. In the first place the idea is that Government will have suitable waste lands selected and reserved exclusively for rubber cultivation; if investors in rubber come along and apply for any of these lands, they could get them without delay and if they require financial assistance to bring them all under cultivation, Government would be prepared to advance Rs. 100 on every acre that they have planted at a reasonable rate of interest until the cultivation reaches the earning stage. At present one of the difficulties in Burma is to get money advanced for rubber cultivation where it is very hard to get a return before a considerable number of years.

Q. How many years would it be?—A. It would be about 8 years before the first year's planting begins to pay.

Q. Is that an adequate security to offer for the advances?—A. Yes, I think so, as long as the scheme is under proper State supervision.

Q. Would it necessitate expert supervision on the part of Government to see if the estates are properly cultivated?—A. No, I do not think so. I think any Forest official would be quite capable of supervising.

Q. But the Forest Department deal with other problems besides rubber questions?—(Hon'ble Mr. H. Thompson) It is dealt with in the Revenue Department.

Q. Then with reference to the question which Mr. Low was asking, is it your suggestion that Government should start a pioneer factory for the manufacture of rubber articles?—A. No, it is not part of my suggestion at present, but I think that it might be a very good thing if Government could encourage private enterprise.

Q. Do you think that a Government pioneer factory would be useful?—A. I think a rubber factory would be a very useful one.

Q. Who was the mycologist who was sent to Burma to study the 'the black thread' disease and so on?—A. His name was I. F. Dastur, B.Sc. *

Q. Had he special knowledge of rubber?—A. I do not think so.

Q. Your Association has not got an expert of its own?—A. No special experts.

Q. The Tea Association of India for instance has its own experts; you have nothing of the same sort here?—A. No.

Q. And you think that it would be a good thing if the Government would entertain such experts?—A. I think from the point of view of the small estates a Government expert would be desirable.

Q. Do rubber problems in Burma differ materially from rubber problems elsewhere in the Straits or in Ceylon or in Southern India for instance, or are they much the same?—A. (Mr. Fennelket) I should say they differ. I think we get here the 'black thread' which is developing into a form of canker; I think that is worse in Burma than it is in any other country owing to the heavy rain.

Q. Then you think it really would be useful for Burma to have a special expert?—A. I do certainly.

Hon'ble Mr. H. Thompson.—Q. Could you give us any useful information regarding advances on rubber and the manner in which capital has been raised hitherto for rubber cultivation, and the future possibilities?—A. (Mr. Meikle) Hitherto it has been mainly financed from Home, not much local capital.

Q. Did you try to get capital locally?—A. No, I have not tried myself.

Sir F. H. Stewart.—Q. From whom do you get your capital, from capitalists who are already in the rubber business?—A. I get generally from people who are connected with the promotion of companies here. But I have been told on the one occasion I have tried to raise capital here that people here would not care to tie up their money in a rubber plantation for 8 years without getting dividends; that is the difficulty we have locally.

* See Department of Agriculture, Burma, Bulletin No. 14 of 1915.

WITNESS No. 417.

MR. T. COUPER, I.C.S., *Director of Agriculture, Burma.*

WRITTEN EVIDENCE.

Working capital is the great need of the cultivator, and Government has admitted this by its promotion of co-operative credit societies. Very inconsistent with this admission is the collection in Lower Burma of capitation tax, a poll tax of five rupees on adult males, in August, at the time of sowing the rice crop when the cultivator is in urgent need of ready money. The amount of the tax, inclusive of the land rate which is levied in lieu in certain towns, was in 1915-16 over fifty-seven lakhs, of which seven-tenths were paid by agriculturists. Though the balance is not taken from the cultivator, he is affected by its collection in so far as it makes borrowing more difficult and raises the rate of interest.

Hindrances to agricultural development arising from law and administration.

The result of collecting the tax in August is to reduce the outturn of the land. Transplanting increases considerably the yield of paddy, but the daily labour which it requires has to be paid in cash and this is ear-marked for the tax. So the cultivator is driven to broadcast his seed and to reap a smaller crop. If the broadcasted area is flooded or part of the seed fails to germinate, he cannot command cash, except at an unduly high rate of interest, to pay workers to patch out seedlings. Similarly he is unable to procure labour to maintain the exterior embankments which protect his holding from inundation or to keep in repair the interior bunds which regulate drainage. He has to purchase food for his ploughmen on credit and therefore at a greater cost. He has frequently to advance the tax for his seasonal labourers, often by borrowing, and if labour is scarce, the tax falls really on his profits. In these ways the cost of labour is swollen, outturns lowered and profits reduced.

The evils arising from the operation of the tax would be mitigated if collection were made after harvest and not in August. It is said that to collect the tax at the same time as the land revenue would prove inconvenient. This is open to question. Headmen would have to pay only one visit whereas now they must make two at least, and frequently they make many more, for collection in the rains is irksome and protracted. In any case administrative inconvenience is no valid excuse for levying the tax at a time when it works so much harm.

The tax, however, is so unfair that it would be better to abolish it altogether. It operates without discrimination: the man with an income of nine hundred rupees pays no more than the labourer with ninety. Similarly unequal is the incidence as between different localities. In parts of Kyaukpadaung where a ploughman is paid a daily wage of five annas it takes sixteen days' work to pay the tax whereas in Hanthawaddy five days are sufficient.

If capitation tax in Lower Burma is abolished, the *Thathameda* tax in Upper Burma would probably have to go at the same time. It is assessed on households and in 1915-16 amounted to thirty-nine and a half lakhs. In so far as it is collected in January after harvest, it is less open to objection than capitation tax. But though it is aimed at income from non-agricultural sources, it is commonly supposed to fall in part on agricultural income and its incidence is often found to be inequitable, allowing the rich man to escape too lightly.

The total sum collected in capitation and *Thathameda* taxes was in 1915-16 ninety-seven and a half lakhs, and it is incumbent on anyone who suggests the removal of these taxes to show how an equivalent could be raised. My submission is a house tax and additional customs duty.

The number of houses in Burma at the last census was 1,958,296. If the rate of increase since the census has been the same as between 1901 and 1911, the number now exceeds 2,800,000, and taxation at the average rate of three rupees a house would bring in seventy lakhs. Such a tax would be assessed and collected at the same time and by the same agencies as land revenue. If levied on the superficial area covered by the house, it would in effect be a graduated tax on income, and the labourer would pay much less than at present. It would admit of differentiation between the trading town and cultivating village so as to allow of greater equality in the taxation of trade and agriculture. Under its operation the farmer would pay less for labour and he would have money available to procure it at the time when he requires it.

In 1916-17 the value of the imports into Rangoon from foreign countries and from India was Rs. 11,74,00,000 and Rs. 9,02,00,000 respectively. An *ad valorem* duty of one and a half per cent. over and above the duties now levied would yield thirty-one lakhs, more than the sum required to make up with the house tax the amount now collected by the capitation and *Thathameda* taxation. Such a customs duty, with exceptions in favour of raw material such as silk and tobacco, is justifiable as being in the nature of a sumptuary tax. The extravagance of the province as compared with India is notorious, and can be proved from trade statistics. It has several times been pointed out in the annual reports of the Chief Collector of Customs, for example in 1913-14, "Whereas the proportion of the population of Burma to the combined population of India and Burma is but 3.8 per cent. (according to the census of 1911), Burma's share of the following luxuries into British India was—salted fish 85 per cent., milk, condensed and preserved, 65 per cent., biscuits and cakes 42 per cent., canned and bottled provisions 42 per cent., cigarettes 39 per cent., silk piece-goods 34 per cent., boots and shoes 30 per cent., farinaceous foods 25 per cent., and liquors 25 per cent."

The imposition of additional customs duty might result at first in temporary reduction of imports. But if the contention be correct that the present taxes hamper cultivation and that their removal will make a permanent addition to productive power, then any fall could be only temporary, for increased purchasing power must mean increased imports.

In 1908 when the area under paddy was 9,330,000 acres exports of cargo rice were 2,430,000 tons. In 1915 when the area had risen to 10,050,000 acres and after Upper Burma as the result of extended irrigation had begun to grow paddy for export, the cargo rice shipped from the province amounted to only 2,410,000 tons. These figures, though they cannot prove, yet support the opinion that wide areas are becoming less fertile. It can hardly be otherwise, for at least 3,000,000 acres are cropped continuously without anything being put back into the soil. These 3,000,000 acres are in Lower Burma and are cultivated by tenants on yearly leases. Even if the tenant sits on the land for several years, he does so at the will of the owner who at no time gives him more than a year's lease. The consequence is that the tenant will not manure the land. That, he contends, would mean the raising of the rent against himself, for the effect of any manure is not exhausted in one year. This is in accordance with the manurial experiments of the Agricultural Department; the operation of farmyard manure can be traced for three years or more, the immediate profit obtained from bonemeal does no more than pay its cost and any advantage derived from its use lies in the residual effect, while superphosphate is thought to form compounds which afford plant food for nine or ten years.

It is therefore useless over three-eighths of the rice-growing area in Lower Burma for the Agricultural Department to teach the cultivator how best to conserve farmyard manure or to demonstrate the use of such artificial manures as may be within his power to purchase. Suggestions have been made for increasing the outturn through extension of cultivation as by throwing open reserved forests. But in the long run exports can be increased only by better cultivation of old land. This will not be attained under present conditions. The remedy appears to be an Agricultural Holdings Act which will ensure that a tenant on quitting his holding receives the value of the unexhausted manures, as well as compensation for disturbance when the owner terminates the tenancy without good and sufficient cause and for reasons inconsistent with good agricultural management.

The administration of the Village Act is a serious hindrance to successful agriculture. If he is to obtain the best return from his holding the cultivator should live on it all the year round. But this is forbidden to him. In the cultivating season he is allowed a temporary hut on the land, but this must be vacated, if not dismantled, after harvest. This rule makes for bad cultivation. It prevents the folding of cattle on the land and necessitates the carting of manure from the village, which is often several miles away. It hinders the repair of old, and the construction of new, bunds in the dry weather. It renders impossible the erection of permanent buildings and equipment. The rule is thought necessary to keep down crime. But what fosters crime is the existence of isolated huts where criminals are unwatched. If the country were covered with farm buildings, the movements of criminals could be more readily traced.

Government should take power to drain areas of rice-growing land at the cost of the owners. In many parts drainage is at present chaotic. In place of erecting embankments round their holdings so as to keep out salt water land-owners construct large bunds or a series of large bunds in the streams which should carry off the rain, with the result that the channels silt up and the drainage of wide tracts is ruined. Legislation should be undertaken to enable streams to be unsilted and kept free of obstructions and if necessary to permit of new drainage cuts being dug, all at the expense of those whose land will benefit.

The staff of the Agricultural Department comprises at present two Deputy Directors of Agriculture to each of whom is attached an Assistant Botanist, an Agricultural Chemist to Government who has five assistants for work in the Laboratory, and an Assistant Entomologist who works under one of the Deputy Directors. An Agricultural Engineer has recently been appointed as an experiment for one year. Lower Burma with part of the dry zone is in charge of one Deputy Director, northern Burma with the rest of the dry zone and two farms in the Shan States forms the circle of the other. In the Southern Circle there are two experimental farms each in charge of an Agricultural Assistant. There are also six seed farms, each under a District Agriculturist. In the Northern Circle are five experimental farms, two of them under Agricultural Assistants, the others under Overseers or District Agriculturists.

The Deputy Directors have found improved strains of rice and early cotton, and these are being multiplied for distribution. They are at work on wheat, sesamum, late cotton, gram, *arhar dhali* and other crops. Manurial experiments have been conducted for many years. The Agricultural Chemist is making an analysis of typical soils in the province and is working on the Rangoon bean to try to find a strain which shall be free from prussic acid.

Deputy Directors are frequently asked for advice. They have published numerous leaflets dealing with crops and methods of cultivation. It is not thought that these do much good though there is a demand for them, more often from landlords living in the towns than from actual cultivators. Demonstrations of improved methods of cultivation are occasionally given outside the departmental farms. Every year a few members of co-operative societies receive a short training on the farms.

It is impossible for Deputy Directors to deal adequately with areas so large as their present circles. In the Southern Circle there are 15,000,000 acres of cultivation. A third

Deputy Director and an Economic Botanist have been sanctioned, but it is difficult to get these posts filled at present. The Local Government is considering a scheme for the enlargement of the department. It has been proposed to raise the number of Deputy Directors to eight and to recruit a sufficient number of Agricultural Assistants to allow of one being posted to every two districts as Superintendent of Agriculture.

Agricultural assistants are at present sent to the Agricultural College at Poona for training. But it is doubtful whether that college will be able to receive so large a number as it is proposed to recruit and it may be found necessary to entertain lecturers to train the assistants locally.

In Lower Burma more seed farms are required. One in each township would not be too many to grow pure improved seed under local conditions and gain the cultivator's confidence. The cost should be met from provincial funds and not from the District Cess Fund as at present, for if the cultivator makes larger profits so that a greater revenue may fairly be taken from him, it is provincial funds which will mainly benefit.

If Geological Survey discovered phosphatic iron ores or phosphate deposits which could be profitably worked and would furnish cheap artificial manures, the outturn of paddy would be considerably increased. It is hoped that the Agricultural Engineer will make a survey of sub-soil water in the dry zone as soon as the necessary plant can be procured.

Sugar and gunny bags are imported in large quantities. A sugar refinery has recently been erected in the Toungoo district, and the Local Government has given assistance by promising to assess sugar-cane cultivation in the neighbourhood at favourable rates for a term of years in order to ensure at the beginning an adequate supply of cane for crushing. The area under cane cultivation is 17,000 acres, scattered throughout the province and could be largely extended so far as soils and climate are concerned. The Government of Bengal has lent the services of a jute demonstrator so that it may be ascertained whether jute can be grown at a profit in Burma.

(Mr. Couper did not give oral evidence.)

WITNESS No. 418.

Mr. C. W. Law.

C. W. LAW, BARRISTER-AT-LAW, *President of the Tenasserim Progressive Association, Moulmein.*

WRITTEN EVIDENCE.

Financial Aid to Industrial Enterprises.

The only experience I have had of the raising of capital for industrial enterprises is in Capital connection with a small motor car company that with the assistance of a few friends I established in 1907, to run between Moulmein and Mudon (19 miles) and that was wound up in 1912 owing to our inability to make it pay.

That and another small company of the same description—started about the same time—and that was amalgamated with the first before both failed—had no difficulty in raising, locally, the comparatively small capital required. I also know that the Moulmein Rubber Plantations—a promising enterprise—had no difficulty in obtaining the necessary capital in Burma and India. Since the failure of numerous companies started in Rangoon I do not think it would now be so easy to raise capital, without Government assistance, for any new industrial enterprise.

Beyond the fact that the Local Government assisted the late Mr. George Dawson in an Government inland river service (the Salween Steam Navigation Company) by granting him a monthly assistance subsidy, I have no experience in regard to the question asked. Mr. Dawson's enterprise was a success and after his death the business in question was taken over by the Irrawaddy Flotilla Company whose launches are still running and of proved public utility.

Government aid might, I think, be given in the shape of subsidies; guaranteed dividends Government aid in the case of new railways for a limited period; or provision of part of share capital in case of new industrial companies and by helping to establish provincial hypothec banks.

In the case of new railways or public companies by appointment of Government directors and in other cases by audit and recurring inspection of business to which loans or subsidies have been granted.

I have no experience of Government pioneer factories but I am of opinion that Govern- Pioneer factories ment might establish pioneer factories in connection with "Kapek" and cotton in the Amherst district and sugar in the Thaton district, say at Bilin, where the cane grown is of a superior quality. The experimental farm at Khagrabari in Assam (Appendix A) appears to be an undoubted success. The cultivation of coffee, cocoa, the castor oil plant, pineapple, agave and camphor and in parts of the Mergui district spices, for all of which the climate of Tenasserim is specially suitable also deserve special encouragement. As it is very desirable that Great Britain should become independent of America for its cotton supply, I would advocate that Government should take up the question of cotton growing in the Tenasserim provinces, at any rate in the Amherst district. Both Pernambuco and Caravonica silk cotton, hardly perennials, grow easily in this district in the poorest soil. Specimens of the former, grown in and near Moulmein and sent home by Miss Haswell (a missionary lady) and others, was

pronounced by both the British and French Commissioners at the Franco-British Exhibition of 1908, to be of excellent quality and suitable for weaving. A Diploma of Honour was granted for this Exhibit. Attempts to cultivate this class of cotton have been spasmodically made in the early days of our acquisition of Lower Burma and since, and within the last few years a plantation, on a very considerable scale, was started in the Attaran district. That none of these experiments met with success was owing, I believe, to want of experience and defects of management. There is I think a great industry to be effected in this commodity if Government would only give a lead in the matter by starting an experimental plantation.

I would hand over the pioneer factories to private capitalists or companies as soon as the new industry was shown to be commercially practicable.

Technical Aid to Industries.

Industrial surveys.

Undoubtedly surveys are required. Want of communications and incomplete survey of the Tenasserim division has greatly retarded its development. It would be advisable to appoint a geologist to go over the ground traversed by the late Dr. Hoffer in 1837-38 whose interesting report as to the resources of these provinces is of great value.

Assistance in Marketing Products.

Commercial museums, etc.

My opinion of commercial museums is that they are of much use in educating and stimulating effort. The recent industrial exhibition held in Rangoon aroused widespread interest, and having regard to the mineral richness of the Tenasserim provinces a section containing properly labelled specimens of all minerals would have been most useful. A collection of such in each of the six most important towns in Burma would, in my opinion, be exceptionally valuable.

Other forms of Government aid to Industries.

Banking facilities.

Industrial and hypothec banks such as are described by Mr. R. R. Ghose in his article in the December 1916 number of the *Modern Review* would probably be found of very great assistance (Appendix B).

Land policy.

I am of opinion that the agricultural development of the country is much retarded by the avowed policy of the Imperial Government to prevent the introduction into Burma of a landlord class. The country is sparsely populated, its extent enormous and the evils attendant on a permanent settlement do not exist. Under these circumstances it appears to me that for the advancement of the country the proprietorship of large tracts of land by well-to-do owners is desirable. Provision could be made in the grants to prevent rack renting or other injustices on the part of the landlord. Further the present policy is largely futile. We have a good many large landowners in the Amherst and Thaton districts, men who have bought out smaller owners who, in many cases, have become tenants of the purchasers. Then the rules preventing the sale by a grantee of the land granted to him by the Government without the permission of the Deputy Commissioner until the expiration of five years after the land has become assessable to revenue is, I think, an unnecessary check on the free transfer of land—which, so long as a transfer is registered, should be as easily disposed of as any other form of property.

Other forms of Government action and organization.

Transport facilities.

It is impossible to say to what extent but it is obvious to any one residing in the Tenasserim provinces that industrial development is greatly hindered owing to want of communications.

I would strongly recommend the taking in hand, without further delay, of the construction of the Moulmein, Ye, Tavoy railway which, I may add, has been noted by the Board of Communications appointed last year as one of the railways to be constructed within the next ten years.

APPENDIX A.

*Cutting from the "Indian Review," Volume XVIII, page 72, January 1917,
Sugar Cultivation in Assam.*

The Chief Commissioner of Assam visited the Government experimental sugarcane farm at Khagrabari, near Nalbari, in the district of Kamrup, recently. It may be remembered, says a contemporary, that three years ago this experiment was initiated, it being considered that the soil in North Kamrup was suitable for the cultivation of sugarcane on a large scale which, if successful, would admit of a considerable enterprise being started in the province of Assam.

Anyone now going to the farm will see a magnificent expanse of 270 acres of sugarcane of the finest quality in full bearing. It has been said in connection with this farm by an expert that Assam is now the possessor of what every country growing sugarcane desires, but not another country possesses, that is to say, a Government experimental sugar industry

station working on a commercial basis. The expert, in question, says that our great competitor Java has tried for years to attain this object, as also Mauritius, Cuba, Hawaii, Jamaica, South Africa, Brazil, etc., and that all have failed in what Assam has succeeded.

APPENDIX B.

Cutting from the "Modern Review," December number, article on Hypothec Bank of Japan by Mr. R. R. Ghose.

The lines on which the business of this bank is transacted are as follows.—

"To make, on the security of immovable property, loans redeemable in annual instalments within the limit of period of not more than fifty years; to make loans on a similar security, redeemable at a fixed term of not more than five years, provided the total amount of such loans does not exceed one-tenth of the total amount of loans redeemable in annual instalments (the amount of loans made on the security of any immovable property may not exceed two-thirds of the value thereof as appraised by the bank); to make loans without security to prefectures, districts, cities, towns and other public bodies organized by law; to take up the mortgage debentures of local hypothec banks; to accept the custody of gold and silver bullions and negotiable instruments. The bank is authorized, when at least one-fourth of its nominal capital is paid up, to issue mortgage debentures up to an amount not exceeding ten times its paid up capital, provided the amount of such debentures does not exceed the total amount of outstanding loans redeemable in annual instalments and the debentures of local hypothec banks in hand. These debentures shall be redeemed at least twice a year by means of drawings in proportion to the total amount of redemption of loans redeemable in annual instalments in the same year and the debentures of local hypothec banks in hand. Besides for each issue of debentures premiums of various amount varying from ten to one thousand yen (one rupee nine annas approximately) are allotted to a certain number of the debentures determined by drawings."

This attracts smaller capitalists to subscribe for the debentures of local hypothec banks. The Government guarantee profit for ten years from the founding of the bank, to the amount of 5 per cent. on the paid up capital.

Local Hypothec Banks.

These run almost on the same lines with slight modifications.

"They make loans redeemable within thirty years instead of fifty, and on security redeemable in a fixed term of five years, provided the total amount of such loans do not exceed one-fifth of the total amount of loans redeemable in annual instalments (loans made on the security of any immovable property may not exceed two-thirds of the value thereof as appraised by the banks); they do not make loans to prefectures and districts; make loans without security, redeemable in a fixed term of not more than five years to more than twenty persons combined with joint liability, who are engaged in agriculture or industry and whose reliability is recognized. Besides, the banks may be entrusted with the receipt and disbursement of the public funds of prefectures. Each of these banks is authorized, when at least one-fourth of its capital is paid up, to issue mortgage debentures to an amount not exceeding five times its paid up capital. Such debentures may not however exceed the total amount of outstanding loans redeemable in annual instalments. The debentures shall be redeemed at least twice a year by means of drawings, in proportion to the amount of the redemption of the said loans. In accordance with the provisions of the Law for giving support to the local hypothec banks, the Government gave over to the prefectures funds with which to subscribe to the shares of the respective local hypothec bank."

(Mr. Law did not give oral evidence.)

WITNESS No. 419

Maung Chit Pe.

MAUNG CHIT PE, Pleader and Land-owner, representing the Tenasserim Progressive Association, Moulmein.

WRITTEN EVIDENCE.

In Burma, people cannot go in for industrial pursuits for want of—

Government assistance.

- (1) Adequate capital;
- (2) Technical, industrial and commercial education and expert advice; and
- (3) Government help and encouragement.

They will not be able to do anything in the way of industrial development unless the Government take the initiative and give them full support in the following ways:—

- (1) The Government may establish a department in Burma to collect information as to existing indigenous industries, their needs and the possibility of improving them; to carry on investigation as to which industry is best suited to what part of the country and to introduce new industries;
- (2) The Government may import technical experts and pioneer some useful industries in order to give a practical demonstration of the earning capacity as well as processes and methods leading to success and may afterwards hand the industries over to some industrialists; preference should always be given to indigenous industrialists. Suitable men should be trained in these pioneer factories to enable them to start similar factories;

- (3) State banks may be founded in each province with the objects, amongst others, of assisting indigenous industries by giving short as well as long term loans of public money repayable by instalments;
- (4) Bounties and subsidies may be given at times in order to provide against keen foreign competition;
- (5) Machinery, tools and appliances may be supplied on the hire-purchase system to cottage industries as well as to factory industries and the Government should guarantee the efficiency and suitability of such commodities; and
- (6) The Government should send every year about a dozen promising young men from Burma to Europe for training in technical and industrial education to be received in workshops and factories as well as in schools and colleges.

Citronella oil.

I have also several other suggestions to make which I will do in the following account of the citronella oil industry in which I am actually concerned.

I own a citronella grass plantation measuring about 100 acres in the Amherst district, Tenasserim division. It is covered by leases obtained from the Government. It appears to me that some of the revenue officers are rather reluctant and even jealous to exercise their powers in granting sufficiently large areas of land though the applicant may be a native of the country with a certain amount of means at his command to carry on the industry. Besides, on a sentimental ground of objection on the part of the neighbouring villagers, such application is liable to be rejected. Government should make it a rule that to a *bona fide* applicant who is a native of Burma and who has fairly good means to carry on the work, sufficient areas of land should be given for industrial purposes and his application should not be rejected unless there is a very good reason shown against it.

There is a vast area of jungle land between Amherst and Tavoy in the Tenasserim division and for want of transport facilities by road, rail or water it is not exploited although it will be very suitable for industrial and mining purposes. Government should open a railway line from Moulmein to Ye or Tavoy as soon as possible. In the meantime in order to attract enterprising industrialists the Government should allow them the use of the land in that locality for industrial purposes free of revenue assessment. In Burma the citronella oil industry was started in Amherst district only a few years ago and it is still confined to Amherst and Thaton districts of the Tenasserim division. There are only a few plantations yet. My plantation is being worked by two fireheated copper stills of the capacity of 100 gallons each. Other plantations are also being worked by the same kind of stills. Copper stills cost nearly Rs. 2,000 each. To work with these stills of rather a primitive nature is very tedious. Only six cookings can be had during twelve hours from each still and each cooking yields a little over one pound of oil. A pound of the oil fetches in England about two shillings and six pence. We want steam stills to work with in our plantations. It is said that the consumption of fuel will be very much lessened and the produce of oil greater by using steam stills. The drawbacks are that it is very costly and it demands some practical knowledge. Ceylon and Java, I understand, use steam stills in their citronella plantations. The Government may supply steam stills to the promoters of this new industry and the payment may be made by instalments and the Government may import an expert either from Ceylon or Java to show us for a short time the working of the same: or the Government may start in that locality between Amherst and Tavoy a pioneer citronella oil factory to be worked by a steam still for purposes of demonstration. I believe it will be a paying concern and the Government will readily find private individuals to take it over after a time. Another important point I wish to press upon the Government Forest Department is to allow the owners of the citronella oil industry to use the fuel without any charge from the existing fuel reserves. The Government may also form new fuel reserves expressly for this industry. Unless this concession is granted this nascent industry will soon meet its death.

We have to send our oil by rail from Moulmein to Rangoon and from there it is shipped to England. In this respect also the Government may see their way to arrange with the railway and shipping authorities to give special concession rates to this industrial product and also to give every facility for the transport of the same.

Our agents in London dispose of the oil for us. It will take at least six months to get remittances from our agents. This greatly handicaps the carrying on of our work. If there is a State bank or an industrial bank aided by the State in the province, we may be able to draw the price of our oil at the time of shipping on the bill of lading by paying a small discount.

Prior to the advent of our oil in England the Java oil was considered to be the best in the English market. Our agents informed us that Burma oil is equal to the Java oil in quality and we are now competing with it. Buyers at Home may be reminded that Java is a foreign country and Burma is British and that preference should always be given to Burma oil.

So as not to be crippled by competition the Government should give us the different forms of help suggested above.

(Maung Chit Pe did not give oral evidence.)

WITNESS No. 420.

MAJOR D. N. LEITH, *Divisional Commander, the Salvation Army, Rangoon.*

WRITTEN EVIDENCE.

The Salvation Army Work has only been opened in Burma within the last two years, Industrial
 so I shall not be able to speak as fully as our officers could regarding our work in India, experience in
 but no doubt they have already spoken fully regarding industrial conditions there. Burma.

As you will know, our industrial experience since we commenced our work in Burma has been confined to juvenile adult criminals, who have been handed over to us by the Government and the jail authorities, and who are to complete their sentences under our auspices, and regarding whom I now especially write.

The three trades which we have started in the Institution and are now developing are furniture-making, carpentry, and all kinds of cane work. We have already proved that though the Chinese (we have had some in the Institution) may be superior to the Burmans, which may be due to a certain extent to the innate independence of the Burmans and their unwillingness to work; yet we have proved that the Burmans are teachable and given the opportunity to learn can be made into very capable workers. We have also proved in our Institution that the work of the Burmese workmen, under European supervision, is very good in quality and can compare very favourably with the great firms at Home. No doubt, you will say that the men whom we have in our Institution have come from the jail and have learned their crafts there under jail discipline; but in the Salvation Army there is a certain measure of discipline enacted; yet the Burmans have proved and do prove their ability to be good craftsmen and can compare with other nationalities if they can have proper instruction and wise pressure brought to bear upon them as a nation. I have no doubt in saying the future of the Burmese may be an industrial success. We have proved by the work which is being done in our Institution that it is equal to any of the work made by the great firms, not only chair making, but office and household furniture and carpentry work of any kind. They have only got to have a design placed before them and under proper supervision, will have it carried out. The same can be said regarding all kinds of cane and basket work.

Therefore, after nearly two years' close observation of the Burmese race and Burma, I respectfully state my opinions as follows:—

It would be wise that the education of the province of Burma should be placed under the Control of
 charge of Local Boards combined with a good staff of teachers who could teach both the education by
 necessary Anglo-vernacular curriculum of schools and industrial instruction. This could be local bodies.
 worked on the basis of Napoleon's maxim "that every soldier has a marshal's baton in his knapsack,"—i.e., if a boy shows an especial ability to a proper and a complete education as supplied by the Director of Public Education, well and good; therefore this should be judged by either the Local Board, or a technical board deputed by them, to decide the boy's future. This technical board should consist of teachers of the ordinary routine of schools and the industrial instructors who would decide upon the abilities of the boy.

Then in the case of the boy students, when it is seen wise that they should receive an industrial training, he should have only the necessary Anglo-vernacular education which is necessary; then for them to be transferred for his industrial training according to the bent of his ability and natural aptitude, or both trainings to run concurrently.

For instance, if he is chosen to be a carpenter, he should be taught geometry, as that is essential to the making of a good carpenter. So hence the same principle applies to any other trade which helps to form the industrial world of Burma.

It would be wise to have certain rewards and incentives to encourage the boys in all industrial courses, the same as is usual in all educational institutions.

Therefore, I believe, if these Local Boards were wisely formed in the centres throughout Industrial
 Burma, then the ordinary education as decided by the Director of Public Instruction could education.
 work harmoniously with the industrial education of the boys.

In my remarks I am trying to speak not so much regarding the higher but the lower forms of technical education, which would embrace the lower classes of the people of Burma.

It will have to be borne in mind that suitable instructors will have to be found. At the least two or three thoroughly efficient instructors, as it is a mistake to think that a man can teach any particular trade, unless he himself is efficient.

The Industrial Commission will be cognizant of the Leed's Technical Institution, and other Institutions of that class at Home, which combines the ordinary school and technical training.

If funds are obtainable I would suggest that the Local Boards carry out on a modified scale a combined education upon similar lines to the Leed's Technical Institution, throughout Burma, and I think good could be done.

I understand that at present there is a stigma throughout Burma that if a Burman is a good craftsman, he has learned his trade in jail; but if there are these Institutions formed

throughout Burma, the stigma will, at once, be removed; then with the proper incentives Burma may become with its fine mineral and forestry resources a first class industrial country.

The Insein Government School for Engineering, although primarily concerned with the training of young engineers in civil and mechanical engineering, is doing a good work, and if it could be extended and if other schools on a similar basis could be formed, it would greatly benefit the country.

As it will be expensive to have European instructors for the different branches of technical education throughout the country, a scheme such as the Insein Government Engineering School, for the training of local instructors would be very good.

Government
assistance.

There is one difficulty regarding local workmen in carpentry throughout Burma, the lack of seasoned timber especially in other woods besides teak (and teak is not by any means the best of Burma woods for furniture, as, generally speaking, the minor merchants and furniture dealers cannot afford to stack timber for some years until it is properly seasoned). This difficulty might be solved by some kind of help from Government or Local Boards given to merchants in particular districts to enable them to have the wood stacked and seasoned for some years.

Apprentice-
ship system.

No doubt when the different crafts are established in Burma, then the training of apprentices might be left to the different established firms, as at home. But that is not yet. Then many successful firms do not want to be worried with apprentices.

After thought I have decided not to speak on the silk industry, as far as Burma is concerned, although I believe that it is an industry which might be developed and made of great use for the people. As the Industrial Commission no doubt have interviewed our silk experts throughout India, they will have received better knowledge than I could give them regarding Burma. Then again Mr. Hurst, Principal of the Saunders' Weaving Institute, Amarpura, was one of our silk experts in India and I believe he thoroughly understands the silk industry and its adaptability for Burma, and I am given to understand that he is to speak before the Commission; therefore, he will be able to speak with knowledge.

Our patented hand-loom is being made and sold in Burma, which is so made to enable the peasantry to do their weaving in their own homes.

I am enclosing * some of the Annual Reports on Silk Centres of the Salvation Army in India and Ceylon; also the Report on Seven Years' Work done by the Salvation Army on the Tata Silk Farm, Bangalore City, which probably will be beneficial to the Industrial Commission.

I may also say that, as Burma is largely an agricultural country, agriculture might be taught technically and scientifically by the Local Boards, in different parts of Burma, which might be suitable, and it would very probably be made to pay after the initial outlay.

(Major Leib did not give oral evidence.)

Mr. D. C.
Ludington.

WITNESS No. 421.

MR. D. C. LUDINGTON, Superintendent, Meiktila Technical School, representing the Indian Union Mission of Seventh Day Adventists, Lachawo.

WRITTEN EVIDENCE.

Financing of
industries.

Q. 9.—Tanning of hides could be made a paying enterprise, in the Meiktila District, if capital could be obtained. At present hides are tanned by a local process using bark which is very plentiful in this district.

Limits of
Government
assistance.

Q. 13.—After Government aid has been received to the extent of causing the enterprise to compete with existing enterprises the aid should be reduced or withdrawn altogether.

Q. 14.—External trade should not govern the limits of aid to home industries, but home industries should control external trade.

Exhibitions.

Q. 31.—Industrial exhibitions are a fine thing and should be encouraged by Government. Local exhibitions at the heads of districts or divisions would be good.

Apprenticeship
system and
industrial and other
schools.

Q. 46.—All boys in this school (Meiktila Technical School) are compelled to take one or more trades.

Q. 47.—I have observed that the people generally are taking a greater interest in industries than a few years ago. Many of the highest people of the land are anxious that their sons should learn a trade of some kind in addition to their school qualifications.

Q. 50.—Technical schools should be under a Department of Industries, but it should work with the Educational Department in the controlling of schools where they are both concerned.

Training of
superior staff
and technical staff.

Q. 51.—Managers who show talent should be sent to other countries to study conditions and methods until suitable experts could be obtained to train men in this country.

(Mr. Ludington did not give oral evidence.)

WITNESS No. 422.

ENGINEER-LIEUTENANT W. A. WILLIAMS, Commander, R.I.M., Engineer and Shipwright Surveyor and Superintending Engineer, Government of Burma; Secretary, Burma Boiler Commission; Chairman, Board of Examining Engineers, Burma Boiler Commission; Examiner of Engineers and Engine Drivers under the Inland Steam Vessels' Act and also under the Merchant Shipping Act; Inspector and Licensing Authority for Vessels carrying oil in bulk, Rangoon.

WRITTEN EVIDENCE.

Undoubtedly Burma is industrially backward and its people, at first sight, seem to be extraordinarily apathetic, but there appears to me to be no adequate reason why the country should not develop at a great pace if Government will treat the matter seriously and kill the existing vagueness about industrial desiderata for the people. Industrial Government.

I think the chief aids to Burma's progress lie in new education, new communications and the creation of an industrial office for the whole of India, including Burma, but this would be more or less futile unless a sound policy is provided in each case and duly popularized. Public appreciation and enthusiasm are most necessary and these can only be obtained by the declaration of simple policies, a guarantee of their continuity, and an attitude by Government less diffident and vacillating than usual.

Regarding finance to develop the former policy, Government should be fearless as it can always feel that all money so spent is really merely in circulation, as, but for the little which would go to teachers from Home, the whole money would remain in the country, and, if not in the pockets of Peter would be in those of Paul. This war with its enormous expenditure has distinctly shewn that the old estimate of national wealth in terms of metal was hopelessly wrong and that all future financial formulae, to approach the truth, must contain a multiple in terms of circulation and this being so, there should be no hesitation in placing new indirect taxation to provide generously for the carrying out of this policy the apparent cost of which, however great, must return to the public almost immediately and must remain insignificant when considered in terms of national prosperity.

In considering this subject in its relation to an industrial population we dare not do so without first ascertaining the needs of such a population. Firstly, and always, we must admit that every workman should be in a position to contemplate marriage at the age of 21 and that he should be able financially to do so is in the best interest of national prosperity and social contentment. Secondly, that in acquiring his industrial skill he must pass through a period of at least five or six years before he can be considered useful or reliable enough to warrant his employer paying him anything like a sufficient wage. Thirdly, his work and its usefulness must be judged by the best world standards which we may generally assume to be British. Fourthly, that mathematical and mechanical teaching in the vernacular is a definite handicap for a pupil, as his knowledge, at best, must be secondhand and limited, and of little help to him in serving a non-vernacular master. Policy of industrial education.

The above four conditions should, I think, form the boundaries of, and provide the light for, a sound industrial educational policy which when created should no more be deprived of generous funds than a garden of ample water.

If we accept the above, the syllabus of all the big schools in Burma should be most carefully designed so that the youth of fourteen might, with little effort, leave a day school thoroughly grounded in all that is necessary to commence an industrial life. (See Appendix A wherein the question of teachers is also dealt with.) This syllabus need in no way adversely affect the education of those pupils wishing to go in for the leisured professions but on the contrary should logicise their minds to their great advantage. I would recommend that the new system should commence in all the big schools of Burma, and that the Rangoon Municipality should build and maintain a well equipped technical school, chiefly for afternoon and evening classes for the boys at work during part of the day. This school should be run almost entirely from municipal funds, without any income beyond Rs. 2 per year from each student, and should conform strictly to the rules of the Science and Art Department of South Kensington, whose certificates they should issue. My experience as an examiner goes to show that there is an almost unsuspected wealth of application amongst the many peoples resident in Burma and that results can be anticipated easily comparable with those at Home. I am fully alive to the difficulties of poverty, distance, and meals, but these difficulties all fade before judicious generosity of time and money. Half-time schools.

Well equipped subordinates appear to me to be the foundation of industrial success and I think there will be found in their ranks a sufficiency of brilliancy, which can be easily brought to the managing grade, so that a dearth of sound managers need never be feared. The policy, I recommend, is really not experimental as the technical heads of the British Admiralty have, for the greater part of the last century, nearly all come from the bottom scale and been similarly trained.

Whilst on the subject of education I would like to record my feeling of alarm at the University project of a University for Burma which appears to me quite unable satisfactorily to absorb a education.

large number of graduates. To cover Burma with unemployed or ill-paid and dissatisfied graduates appears to me directly opposed to the peace and contentment of Burma's peoples and must, in my opinion, directly lead to social and political unrest with consequent industrial difficulties and disadvantages.

In concluding my remarks on industrial education I should like to add my idea that the Burma public is shy, and almost without a public opinion, and that therefore educational spoon feeding, and the active support of her few public men, is more necessary in Burma than in the other provinces of India.

New Communications.

Transport
facilities.

Communications are many times blessed; they bless those that use them, those that make them, those that erect them, those that finance them, those that work them, those that repair them, those that find education possible through them, those that do business through them, those that find health through them, those who make wealth through them, the state which becomes conglomerate through them, society which gains liberty through them, industry and commerce which is accelerated through them, etc. etc. etc.

An Industrial Office.

Department of
Industries.

I consider the creation of an Industrial Office for all India (including Burma) as of great importance. Its head should be a Member of Council with great discretionary powers, able to aid industry by bearing expenditure on reasonable experiments and to indicate and encourage new industries. He should never be handicapped by lack of funds and should not be too rule-bound, as no two industrial cases are likely to be similar. An Industrial Office, interesting itself in all affairs industrial, must pay for itself many times over and must beget a confidence amongst investors well worth while. A natural outcome of such an office would be that the spectacle of many firms seeking the same object, each indulging in expensive experiments, would be abolished and general information, other than patent processes, would be available for all such firms.

APPENDIX A.

School Syllabus.

*Object (1).—*To provide adequate educational equipment for the youth of Burma to commence an industrial life at the age of 14.

*Object (2).—*To break down a general aversion to manly work involving dirty toil, and to inculcate some idea of discipline and the dignity of labour.

*Object (3).—*To make sure of a supply of healthy clean-minded manly men who are also qualified and capable as school teachers.

Object (1)

Age 4-8.—To become thoroughly familiar with English reading, writing, and speaking and to be master of such things as multiplication and weights and measures tables.

Age 8-14 (a).—To be master of elementary practical arithmetic including that of familiar things such as the thrown stone, the falling stone, the difference in striking a wood and a steel wedge, the power of levers and screws, etc. etc.

- (b) Elementary Geometry.
- (c) Elementary Algebra.
- (d) Very Elementary Trigonometry.
- (e) Mensuration.
- (f) Elementary Physics.
- (g) Elementary Chemistry.
- (h) English.
- (i) Orthography.
- (j) Simple Geography.
- (k) History (not an examination subject).
- (l) Physiography.

Object (2).

Boy scouting and games (at least several hours weekly and at least one month a year in camp at State expense).

Object (3).

The Local Government should build a handsomely equipped college in beautiful grounds in the best climatic part of Burma and should there train its teachers, carefully selected from suitable applicants, of ages between 16 and 18. The course should be not less than two years nor more than three years, and the entire cost should be borne by the State.

Teachers' salaries should be made attractive.

Rangoon Technical School.

Cost and maintenance entirely borne by the Rangoon Municipality.

	PAY.
Principal from Home	Rs. 800 to Rs. 1,200
Vice-Principal from Home	Rs. 700 to Rs. 800
Secretary from local teachers	Rs. 450 to Rs. 650
Remaining teachers variously from local teachers and European Engineers and draftsmen locally employed	Rs. 100 to Rs. 300

Extra General remarks on "Questions".

Q. 7, 19 & 20.—Pioneer Factories. Under this heading I should like to place the question of "Smoke Nuisance." It appears to me that the matter is of such public interest that in Burma, where paddy and saw-dust fuel costs nothing, no one firm can be expected to eradicate the nuisance and I think it Government's business to solve the problem as suggested by the Burma Boiler Commission. When paddy husk is burnt smokelessly a great deal less of it will be used per horse power and the big remainder will have an appreciable commercial value as fuel.

Q. 38.—There is, I think, no need to alter any of the rules relating to the purchase of Government stores. The main issue is one of quality and if Indian stores are comparable with those from Home, they are, as far as I know, always purchased.

Q. 54.—I think each province should recognize each other's general certificates to the extent of granting a new certificate of similar grade (without examination) to the holder of a certificate granted by another province. I think the issue of a new certificate necessary in order that the owner should be properly registered in the new province in which he elects to work. I should also like to see all certificates bear the photograph of the owner as I am afraid there has been a traffic in certificates not bearing the owner's photograph.

Each province would of course retain its right to issue special certificates for special conditions as for instance the special certificates issued to drivers in the Burma oil fields.

Q. 89 & 90.—I think manufacturers of material used for boilers and shipbuilding should be able to obtain certificates of quality similar to those obtainable at Home from the Board of Trade. These could be issued by the Local Governments over the signature of their present trained Engineer and Ship Surveyors, or, later on, by special inspectors under the Commissioner of Industries.

Regarding the remaining questions not touched by me, it is because I have no useful information on the subjects. I am strongly of opinion that the Industrial Office, elsewhere recommended for creation, should place itself in a position to answer all such questions authoritatively, and that the Commissioner of Industry, in his discretion, and on the advice of his technical staff of experts, should not be afraid to spend both time and money if the question appears to be important.

I think all experiments carried out by the Commissioner of Industries should have their results published every six months for public information and also that any individual or firm should be at liberty to address the Commissioner on the subject of initiating such experiments without having his identity published.

(Engineer-Lieutenant Williams did not give oral evidence.)

WITNESS No. 423.

Maung Po Pa.

MAUNG PO PA, Chairman, Central Co-operative Bank, Pakokku, Burma.

WRITTEN EVIDENCE.

I.—Financial aid to industrial enterprises.

Q. 5.—I think Government aid may be given to the existing or new industries by issue of loans on small interest and by guaranteed Government purchase of products for limited periods. Government assistance.

Q. 6.—The methods of Government assistance should be by issue of suitable rules and regulations for Government control or supervision and by appointment of Government directors with defined powers.

Q. 10.—By existing banking agencies and by formation of new Thamawayama banks at places away from the existing banks. Financing agencies.

Q. 10 (a).—Yes.

Q. 11.—Yes. The cultivators who in the past years had loans for purchase of plough, bullocks and seeds for seedling on high rates of interest have by formation of societies been Co-operative societies.

drawing advances to the amounts required on small rate of interest from co-operative banks. The reduction in rates of interest have given good results as it is known that those in the districts who have dealings with the co-operative banks are better off than the others.

Q. 12.—The industries for which co-operative societies should be encouraged are—

- (a) Forming of commercial centres.
- (b) Groundnut oil mills.
- (c) Weaving.
- (d) Financing industries with loans.

Q. 12 (a).—I suggest that the following State encouragement should be made for industrial development:—

- (a) Issue of freehold lands for industrial purposes.
- (b) By appointment of Directors for control.

Q. 14.—Yes.

II.—Technical aid to industries.

Demonstration
factories.

Q. 19.—Yes, I suggest Government demonstration factories should be adopted for the following industries:—

- (a) Weaving.
- (b) Oil-grinding.
- (c) Manufacturing cigarettes.
- (d) Sugar manufacturing out of jaggery.
- (e) To manufacture dyes out of plants the juice of which can be utilized for the purpose.
- (f) Knitting.
- (g) Spinning with small machineries.

III.—Assistance in marketing products.

Sales agencies.

Q. 30.—Yes. The products of cottage industries are sold through sales agencies at commercial centres. For development I suggest Thamawayama Societies should be formed at each town for the sale of these products.

Exhibitions.

Q. 30 (a).—Yes.

Q. 31.—The exhibition of umbrellas of the Burma industries has advanced the trade of these umbrellas which are now used throughout the country.

Q. 32.—Yes. To have exhibitions in large towns, encourage exhibitions by paying rewards and to bring purchasers of other countries in contact, should the articles be found useful in other countries.

Q. 33.—They should be popular in character and bring sellers and purchasers into contact.

Trade
representatives.

Q. 34.—Yes. The representatives should be influential and respectable traders. Their duties are to follow the regulations of the Trade of Commerce.

Q. 35.—Yes.

IV.—Other forms of Government aid to industries.

Q. 42.—Concession should be given free of rent for the period the industries exist both for the establishment of new and for existing industries.

XI.—General official administration and organization.

Q. 56.—None.

Board of Industries.

Q. 57.—I recommend the introduction of motor traffic. A Board of Industries should be established and the functions of the Board should be merely advisory.

Q. 58.—By selecting experienced persons with an influential Member as its Chairman.

Director of
Industries.

Q. 60.—Yes. A technical specialist should control industries and should be a reliable person.

Cottage industries.

Q. 62 (a).—Yes.

Q. 62 (b).—By establishing Thamawayama Societies.

Q. 62 (c).—Weaving, mat-making, palm leaf *hopas*, baskets, and blacksmith cottage industries.

VIII.—Government organization for the collection and distribution of commercial intelligence.

Q. 85.—Government should establish industrial and trade journals.

Industrial and
Trade Journals.

Q. 86.—Dissemination of information of this kind through the various vernaculars should be done by Government.

IX.—Other forms of Government action and organization.

Q. 89.—Yes. Certificates should be compulsory for products for human consumption and for other products voluntary.

Certificates of
quality.

Q. 90.—By establishing Testing Boards consisting of experienced members for testing products and to grant certificates by Government on their reports.

Q. 91.—Yes. The adulteration of cotton seed oil into groundnut oil, groundnut oil into filseed oil, and Indian corn flour into wheat flour.

Adulteration.

Q. 92.—By establishing Boards as suggested against Question No. 90.

Q. 94.—Satisfactory.

Trade marks.

Q. 96.—To introduce a system of registration is desirable.

Registration of
partnerships.

Q. 97.—Lack of transport facilities by road hinders industrial development in the Pakokku District. A rail connection from Gangaw to Pakokku via Pank and along the western bank of the river connecting it with Kyangin Branch would develop industry.

Transport facilities.

Q. 98.—Yes. Freight should, I consider, be reduced, and risk should be borne wholly by the railway department.

Q. 101.—Yes. I am aware that there are disadvantages as regards shipping freights as they are high and I consider the present scale should be reduced.

Shipping freights.

Q. 109.—No.

(Maung Po Pe did not give oral evidence.)

WITNESS NO. 424.

Mr. T. T.
McCreath.

MR. T. T. MCCREATH, Joint Manager, Indo-Burma Petroleum Company, Limited (Managing Agents—Messrs. Steel Bros. & Co.), Rangoon.

WRITTEN EVIDENCE.

Technical Aid to Industries.

The only experience I have had of technical and scientific aid provided by Government to industrial enterprise is the assistance given by the Geological Survey on the development of the petroleum industry in Burma and India.

Technical aid.

The Geological Survey discovered the Singu oilfield which is now being worked very profitably by the Burma Oil Company. The Geological Survey has since indicated other favourable areas which have been tested by ourselves and others. Their maps have been of considerable use to us in guiding our own prospecting.

I doubt if Government experts can be lent to private firms or companies without unduly benefiting one or two companies to the detriment of others. If Government experts are lent they should be lent to all companies operating at one and the same time.

Loan of experts.

There are a great many problems in the geology of Burma which still await solution and only the Geological Survey can do any really continuous work towards their settlement. I would suggest the formation of a special Geological Survey for this province only.

Industrial Surveys.

Such a special survey should be made by three or four geologists who might be available, in the course of their systematic work, for consultation by the working companies.

The precise objects would be to make a deliberate and complete geological survey of Burma and a statistical study of the results at Yenangyaung and other places. Their main end would be to ensure the complete development of the mineral resources of the country on the most economical lines.

Its results should be published firstly as a continuous record of work done by means of annual reports; secondly, as special papers on economic and scientific questions, giving the results of individual researches.

The only method available for the training of the supervising and technical staff in the oil industry is to arrange for visits to other oilfields ^{and} _{or} refineries. If Government can assist in any way towards this end they would certainly be doing a great service to the industry.

Training of Super-
vision.

The Geological Survey party in Burma consists of two or three men under a superintendent. Proper accommodation should be made for a resident geologist at Yenangyaung who would

Needs of
oil industry.

confine himself to oil problems. A representative collection of Burma fossils should be available for reference, if possible, in Rangoon or Yenangyaung.

Indian Science Congress.

The Indian Science Congress is a valuable institution, in that it affords an opportunity for meeting and discussion of the technicians and scientists working in any one province. Much of the scientific work which is done by technicians employed by companies is at present buried in office files, and if the opportunities similar to those afforded by the Indian Science Congress were more general or more widely known the benefits to science might be considerable. The Congress should be brought more directly to the notice of technicians and more freely advertised than it is at present.

Research abroad.

Study leave should be granted to members of the Geological Survey with provision for travelling expenses to enable them to visit oilfields in other parts of the world.

Reference Libraries.

Our staff have constantly made great use of the Geological Survey Library at Calcutta and I would suggest that a similar library of technical works and periodicals should be available in Burma.

Government publications.

Publications of the Geological Survey have been referred to in a previous heading. These we regard as of the greatest importance. All the work of the department, even if it be purely of scientific interest, should be published in full. The work of the older surveys in the Punjab (which at the time they were published seemed of purely scientific interest only) has been very useful in guiding our prospecting in that part of India. At present I have heard that the Geological Survey does a certain amount of work which is not published. If this is so I suggest that the publications of the Geological Survey should represent all the work done in that department as fully as possible.

Assistance in Marketing Products.

Commercial Exhibitions.

Exhibitions with awards for exhibits are useful for bringing articles before the public generally and also for advertising the products of exhibitors. They foster a healthy spirit of competition and should be encouraged by Government.

Exhibitions should be held in the principal towns in the province and while exhibits be allowed from all parts I suggest that the exhibition held in a particular district should primarily encourage the products of that district by special awards for same.

Sole agencies.

As regards marketing I doubt if Government can usefully assist in this respect. Agents can be procured for the sale of any goods which are saleable and agency charges would probably be lower than Government actual working charges could be.

Museums.

I consider a museum of commercial exhibits is of value and that Government should publish a list of articles exported for use of different Government departments and also exhibit samples of these articles, with approximate prices.

Land policy.

The present Land Acquisition Act only authorizes Government to acquire land provided it can be proved that such acquisition is for the benefit of the public generally or a section of the public not connected with the persons or firm or company for whom acquisition is sought.

This is a distinct check to industrial enterprise.

(Witness here gave confidential evidence regarding the leasing of Government land for drilling a water well.)

My company recently wished to purchase a piece of barren land of about 4 acres at Yenangyaung for the purpose of erecting an electric power station. The land is of no value at present to owner and brings in no revenue. It is not likely to be of any value in the future as no other company wish it for a similar or other purpose. The owner asks for Rs. 2,500 per acre. Government land alongside is rented at 0-4-0 per acre per annum, yet Government cannot acquire the land in question on our account, and could not if it were the only suitable piece of land in the district.

(Witness here gave confidential evidence regarding the Indo-Burma Petroleum Company.)

I recommend that Government be given the power to acquire even where the public are not beneficiaries, provided that in this case owners of land are more fully recompensed than in the other case.

Mining and Prospecting Rules.

Rule 30 (I). Duration of Prospecting License.

One year renewable for further two years under certain conditions.

My experience in oil mining which extends from 1908, shows that a period of 3 years is quite inadequate for the proving of an oilfield and some provision should be made in the rules whereby prospecting licenses over areas which are being tested should be renewable for so long as the active work of testing is being proceeded with.

Even after oil has been struck in one or even two wells, it is not possible to fix the actual limits or boundaries of the productive areas, and this knowledge is necessary before a mining lease can properly be applied for.

There is no purpose served in applying for an abnormally large area under mining lease to safeguard the position as under rule 45 prospecting developments elsewhere might suffer.

My company have been and are being favoured with renewals of prospecting licenses in extension of the 3 years period but nevertheless I consider that a rule such as above suggested would give more confidence to prospectors and thereby be an aid to the development of the country.

Rule 45.—Limitation of Mining Lease area to 10 square miles.

It is generally assumed that *bond fide* operators would receive the Local Government's support in an application to the Secretary of State for an extension over 10 square miles, provided that such a grant could be adequately worked by the applicants.

I am of opinion however that the wording of this rule should be amended to operate only in so far as it may be necessary to prevent the creation of monopolies which is apparently what the rule was intended for.

"The undernoted example shows a possible interpretation of the rule as it is worded at present and, if so interpreted, it becomes a distinct obstruction to the development of the resources of the country."

We will assume that the principal business of a company, say "A", is copper mining and it holds a mining lease over 5 square miles. Another company, say "B", is similarly interested in tin and holds a mining lease over, say, 6 square miles. "A" wishes to join "B" in a new venture, say, in oil and they are jointly prepared to take up and test an area, but this rule precludes their securing a mining lease over any area as they already hold jointly 11 square miles under mining lease.

Even if "A" and "B" only hold jointly, say, 6 square miles in their respective businesses, it is unlikely they would wish to forego their respective rights to acquiring mining leases up to 10 square miles in their principal and, we will assume, profitable businesses, by taking up a mining lease in another speculative venture.

I suggest that the Mining Lease and Prospecting License Rules for India be revised and that special provisions be made for oil as apart from other minerals. Such different minerals as oil and precious stones should not be dealt with along exactly the same lines as at present.

I suggest that it be made a definite Government order that Government officers of all grades from the sub-divisional officers upwards should give every assistance in their power to explorers and companies whose object is to develop the resources of their districts along legitimate lines. Such assistance is generally to be had for the asking but not invariably, and such a definite order as suggested above would do a great deal to simplify the relations between the explorers or companies and the departments with which they might have business. Our geologists have informed me that even members of the Geological Survey sometimes have great difficulty in securing transport and supplies and that there are cases in which the Deputy Commissioners have refused any assistance or responsibility.

Other suggestions to assist development.

(Mr. McCreath did not give oral evidence.)

WITNESS No. 425.

Mr. W. H. C.
Prideaux.

MR. W. H. C. PRIDEAUX, *Inspector of Factories, Burma.*

WRITTEN EVIDENCE.

Before dealing with the questions asked by the Indian Industrial Commission, I wish to call attention to a "Note on Burma Industries" which has just been circulated and which, in my opinion, gives a wrong and pessimistic impression of the present industrial state of the province. People have been told so often that Burma is an agricultural province, that the fact is entirely overlooked, that there are at present 512 factories registered here, and that Bombay is the only province in India with a larger number; owing to the small size of many of the mills here the actual number of operatives is comparatively low but the number of both factories and operatives increases every year. In the last two years an alteration in the methods of preparation of rice (i.e., the manufacture of par-boiled rice) has led to a very large increase in the number of Burmese women employed in the district rice mills. Burmese women are extensively employed in the cotton ginning factories but elsewhere Indian labour is made use of almost without exception; Burmans are sometimes found at work in saw mills. The table appended to this evidence shows the distribution of factories between the various classes of the community and the trades carried on. Two points to which I should like to draw attention are that, with the exception of one Burmese sugar factory, all the pioneering appears to have been done by European and Indian firms and that considering the much higher development of industry at home than in India the pioneering by European firms has been less, and that by Indians more than might have been reasonably expected.

Pioneer factories.

The extraordinary way in which the paddy boiling business has been extended in the Prome and Tharrawaddy districts chiefly by Burmans shows that this community is not so wedded to old customs as to be unwilling to break from them if a more profitable business is shown them. For this reason I think that much good would be done by Government experimental and demonstration factories. I would suggest that the Director of Industries should by means of inquiry determine what industries would be likely to be profitable, and that he should then start a factory in a suitable place. If, at the end of two or three seasons, it seemed unlikely that the business would be a success it could be closed down and the cost written off, but, if successful, young men of means desirous of starting in the industry would be allowed to work in the factory for a year in order to be trained. The introduction of one really satisfactory and new industry to the country would pay for several failures. At present there are too many rice mills and many have to remain closed for a large part of the year; fresh ones are being erected continually. It is most desirable that some other outlet should be found for capital.

Official
organisation.

Beyond the examination of boilers there is no assistance given to industry in this province, so far as I am aware. Since it appears likely that for many years to come the more important industries here will be closely connected with agriculture and its products, I am in favour of the formation of a post of a Director of Industries who would be subordinate to the Director of Agriculture. This officer would devote his time to industrial problems solely and I do not think a technical man is necessary since no one can be an expert on several different trades. A man with a good all-round scientific education would be most suitable for the post. Technical men trained in a special subject could be brought out on short contracts to supervise the erection and working of pioneer factories. In addition to examining what new industries appear to be promising, the Director would have power to communicate directly with British Consuls abroad or with trade representatives, if such were appointed as suggested in Question 34, and he would also supply manufacturers of machinery at Home with information as to the kinds of plant required in this country. He would also assist co-operative societies and other industrial workers to find agents for the sale of their products at Home and elsewhere.

Government
assistance.

As regards direct help from Government, private experimental factories might receive land free for a term of years, and in certain cases forest duties might be remitted where a new industry in connection with forest produce was being started. I believe that in some cases firms have hung back from starting new industries owing to the fear of competitors coming in before the supply of raw material was sufficient to support two factories. In such a case the Government might have power to grant a monopoly over a certain area for a period. Under such circumstances a minimum price to be paid to cultivators for the raw material might be fixed as well.

If, as is sometimes assumed to be the case, the selling of an article costs from 50 per cent. to 100 per cent. of the actual cost of production, it would appear that an undertaking by Government to purchase goods from factories in this country would be a valuable concession to the manufacturer while—provided that the goods were as suitable for use as those produced at Home—it would have the advantage of costing Government nothing.

Advisory Board.

The question of an Advisory Board to assist the Director of Industries is a difficult one. The fact that rice and saw mills account for 427 factories out of a total of 512 seems to indicate a reluctance on the part of capital in this country to experiment. In some cases the articles of association may prevent firms from beginning new trades, but I think that at the bottom of everything is a feeling that what is being done now pays very well and that it is not worth while to branch out into something new, which may or may not prove remunerative. Moreover, I understand, but I speak subject to correction by gentlemen with fuller knowledge, that the remuneration of the Rangoon heads of the large firms depends on the profits earned while in charge out here. It seems to me that this must have a tendency to make men in authority unwilling to expend money on experiments which may diminish the present profits even if in the end these experiments might be expected to lead to a paying industry. Assuming the above to be correct it would appear that these circumstances might produce such a habit of mind in those gentlemen who would be most likely to be selected to the Advisory Board as to render them somewhat pessimistic and likely to throw cold water on any scheme put forward by the Director, and this should, I think, be avoided.

(Witness here gave confidential evidence regarding the acquisition of land.)

Transport facilities.

I have no doubt that many witnesses will draw attention to the lack of transport in this province as a hindrance to development and I propose to touch on one point only. The inland navigation of this country is almost entirely in the hands of one important company. Some years ago a River Transport Company was started to run in opposition to them and from time to time small Burmese and Chinese firms start running launches between towns on the various waterways. The River Transport Company expired before I came out here and I am not acquainted with its history, but in many of the other cases the opposition has been broken down by cutting fares to a ruinous extent and running launches immediately before and after the opposition launch. It does not appear desirable that this monopoly should be allowed to continue and I would suggest that Government should take powers to fix minimum

rates for goods and passengers and to fix times for sailings when in its opinion such a course is necessary in the public interest.

Class of Factories.	European.	Burmas.	Chetty.	Indians other than Chetty.	Chinese.	Total.

* At several of these cotton seed oil and groundnut oil are prepared.

† Two of these have flour mills.

SUPPLEMENTARY WRITTEN EVIDENCE.

Note on the Boiler and Prime-mover Acts.

It seems desirable that these Acts should be under a central control for the following reasons:—

The Acts may be divided into two parts: one relating to the inspection of boilers and the other to the licensing of engineers and engine-drivers. As far as the first part goes there does not seem to be any reason why boilers in different parts of India should be subject to different rules; if a boiler is unsafe in Bombay it is equally unsafe in any other province. Moreover it would be a convenience to importers to have uniform regulations so that any boiler could be sold anywhere without having to trouble about local rules. An examination of the present Acts and Rules shews that the Provinces do not at present agree as to what constitutes a boiler or a prime-mover, and this might be changed with advantage.

The second part deals with the certification of engineers and engine-drivers. Here again it seems that a qualified man ought to be able to obtain employment anywhere without having to sit for a fresh examination. I think that this has been recognised recently for engineers under the Inland Steam Navigation Act, and these certificates are available all over India. This involves uniformity in the rules relating to the practical experience required from candidates and in the examinations themselves. This indicates again that the rule-making and possibly the examining authority should be with the Government of India. In any case there would have to be local examiners for the oral part of the examination even if the written work was sent to the Central Authority.

In this province three classes of certificates are granted, and before criticising the rules one may inquire what duties the holder of a certificate may be expected to perform.

In the lowest grade—that of engine-driver—the name explains itself. Nothing beyond a practical knowledge of the working of engines and boilers can be expected and the rules are if anything too stringent. A man employed as a fireman for less than five years would be

quite competent to act as an engine-driver, and if he has obtained a certificate from a recognised technical institute after three years' instruction, etc., the examination is unnecessary.

There are two grades of engineers, first and second class. The latter may be in control of any number of engines and boilers belonging to the same owner, provided they are situated within a radius of 500 feet. This limit does not apply to a first class engineer which is a little illogical as the certificate does not enable him to be in two places at once. Power may also be given to a first class engineer to examine and report on a boiler, and this report is accepted in place of a Government inspection for licensing purposes.

A good deal more should be required from an engineer than from an engine-driver. His employer will expect him to advise on working the mill and keeping it efficient. For this reason I think that certificates based on sea or river service only should not be granted as provided for in Rule 67, and an elementary knowledge of electricity and of the transmission of power by belts and gearing should be added to the list of subjects in Rule 77. The five hundred feet limit should be done away with, and also the power to report on boilers for licensing purposes at present possessed by first class engineers. The latter is most objectionable. If this were done the actual powers of first and second class engineers become identical and the only advantage of obtaining a first class certificate would be evidence of greater knowledge of the science which the holder possessed. It would in fact be similar to the extra first class of the Board of Trade, and as his work would be on land, marine certificates should not be recognised as entitling the owner to a land certificate. The syllabus of subjects would have to be revised to bring the examination more into accord with land practice.

Attention was called by the Public Services Commission to the objection to having representatives of boiler owners on the body responsible for the administration of the Act. The individual interests are sufficiently protected by technical assessors sitting with a magistrate to hear appeals.

ORAL EVIDENCE, 23RD JANUARY 1918.

Mr. C. E. Low.—Q. Is the up-country manufacture of par-boiled rice seasonal or continuous?—A. It is seasonal. It does not go on throughout the whole year but it is spread over a part—for about seven or eight months.

Q. Where does the labour come from?—A. Up-country, chiefly Burmese come. They come from the surrounding villages.

Q. Are they employed on agriculture the rest of the year or what?—A. I made enquiries, and so far as I can make out, some of them are engaged in agriculture and some of them do nothing the rest of the time.

Q. What are the wages?—A. Six annas a day approximately, sometimes a little more and sometimes a little less.

Q. There is not much Indian labour up-country?—A. There is no Indian labour on boiled rice manufacture up the Prome line. Between Pega and Moulmein and Rangoon it is almost entirely Indian labour on boiled rice.

Q. And on other rice?—A. It is almost all Indian labour everywhere.

Q. And what wages do they get?—A. About eight annas a day.

Q. Are these boiled rice mills factories under the Act?—A. Yes. The Act in this province applies to all factories in which more than twenty persons are employed.

Q. Do you have much difficulty about the employment of women for too long hours?—A. No. Their work scarcely comes under the Act. It is not inside the factory itself.

Q. What about the employment of children? Are there many?—A. Practically none.

Q. What does the supervising staff of these rice mills consist of?—A. There does not seem to be any. There is the owner who usually looks after the whole thing. He is not an expert in rice milling, and there is no staff to run it.

Q. Is the mill run on paddy husk or wood charcoal?—A. All the paddy mills are run on paddy husk.

Q. Where do these certificated engineers who are in charge of the boilers come from?—A. The majority of the small mills have engine drivers.

Q. Third class?—A. They are called engine drivers.

Q. What corresponds to the third class certificate in other provinces?—A. I think so.

Q. That is the lowest kind of recognised boiler mechanic?—A. You cannot look upon them as mechanics.

Q. They can drive the engine?—A. Yes. That is all they can do.

Q. Who are they? Are they Burmese?—A. I should say there are not more than half a dozen Burman drivers in the province. When a Burman takes up that kind of work he generally manages to get a second class certificate. The Burman does not very much like doing the same work as Indians. The Burman would think that it would not be quite a proper thing to do the work which an ordinary engine driver does. There is a certain amount of that sort of dislike on the part of the Burman.

Q. Where do the Burman certificated mechanics come from?—*A.* There are some engineering shops in Burma and they get their training there chiefly.

Q. Railway workshops or private shops?—*A.* Bullock Brothers have a large engineering works and they go there. There is a comparatively small place in Bassein in which there are several apprentices. Some of them come from there and some from the Railway shops.

Q. You know, of course, that a comparatively large proportion of men with mechanical knowledge in India have had their training in the Railway workshops?—*A.* No doubt some of them are trained in the railway works here, but I think most of them are trained in the general engineering works. In any case there are comparatively very few engineers who have been trained in the country at all.

Q. You do not have any Government institution which trains 1st and 2nd class certificated engineers?—*A.* There is an engineering school at Insein and I believe there is some arrangement between that school and the Boiler Commission, that so many years' instruction counts. I do not know the details. I believe there is some such system. The Boiler Commission may be able to give more information on that point.

Q. Is the question of housing labour in Rangoon or in any of the other large towns acute?—*A.* No. It is in the small mills scattered about in the jungles. Where there are municipalities, housing is fairly good. Where there are mills dotted along in the delta, housing accommodation is frequently very poor.

Q. The state of affairs in India in organised industries is practically this, that, if an industry is started in the country away from any town of any size at all, employers more or less largely by force of circumstances put up accommodation, and if it is a decent industry very good accommodation too.—*A.* The Burma Railways have just started a new town not very far from Mandalay. They have got excellent accommodation for work-people there. I think in the case of small rice mills where they employ 40 or 50 people the houses in which the coolies live are not good.

Q. They are worse than in their own villages?—*A.* I would not like to say that.

Q. In Rangoon, for instance, is there congestion, overcrowding and so on?—*A.* No.

Q. Are there many lodgers in a ten feet square room?—*A.* It is difficult to say how many people are living in one room. There is plenty of accommodation in the factory premises for these people, but sometimes they overcrowd.

Q. Are the houses put up by the firms who employ large quantities of labour? Do they put up buildings for operatives, or do the operatives live in the ordinary houses put up by outsiders?—*A.* In Moulmein the operatives live in privately owned houses. In all the other towns with very few exceptions—very few of them may live out,—nearly all live in accommodation provided by the employers.

Q. On the employer's premises?—*A.* Yes. Quite close to the mill. Occasionally a little further away.

Q. Is there a relatively low or high proportion of female labour employed in these Rangoon factories here?—*A.* Very little indeed. If there are 50 male coolies you may see 3 or 4 females.

Hon'ble Sir R. N. Mookerjee.—*Q.* The houses are built by the factory owners?—*A.* By the factory owners except in Moulmein.

Q. What is it in Rangoon?—*A.* The factory owners supply accommodation.

Q. Do they build houses or hire houses for them?—*A.* They are in their compound.

Mr. A. Chatterton.—*Q.* They build a sort of barracks in each compound in Rangoon?—*A.* Yes.

Q. And the men are practically all single men and they live so many in a room?—*A.* That is the idea.

Q. And these are all under whose inspection?—*A.* In the municipalities, the municipalities inspect them.

Q. Do you inspect them?—*A.* No. I do not myself take any action when I find crowding, but I report to the municipality. I do not take any direct action.

Q. I saw some of these barracks in connexion with the saw mills this morning and they struck me as particularly clean. Is that the general character of the housing accommodation which is provided in Rangoon?—*A.* I do not think housing accommodation is at all bad in Rangoon. I have no experience of Indian factories.

To the President.—These factories are under my control, and also under the control of the municipality, but as it is undesirable to have dual control over these I do not take any action directly but I report the matter to the municipality.

Mr. C. E. Low.—*Q.* Have you any statutory powers in connection with housing, or is it merely an administrative question?—*A.* They are considered as forming part of the factory.

Mr. A. Chatterton.—*Q.* They live 30 or 40 in a room?—*A.* Sometimes they have long rooms where they all live together and in some other places they are divided into compartments.

Q. It is very much like military barracks?—A. In Upper Burma you have small mat houses where Burmese live.

Q. Are these imported coolies? The Burmese have separate houses?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. Has the municipality any rules as to the area that each man is to occupy?—A. There are regulations about the space, ventilation, and accommodation.

Q. Is there any inspector to see how many people live in one house?—A. If there are very many people I suppose the municipality will see that its conditions are complied with.

Mr. A. Chatterton.—Q. The men pay no rent?—A. No. Not actually.

Mr. C. E. Low.—Q. At the beginning of your note you call attention to a "Note on Burma Industries." What is the note about? I have not seen it.

(Hon'ble Mr. Thompson explained that it was a note written by Mr. Morris giving an account of the present position of the various industries in Burma. It was circulated for the assistance of witnesses who wished to give replies to the several questions sent to them. It was not a note expressing any opinions of any kind, but merely gave an account chiefly of local industries so that witnesses might have such information as Government could give them to assist them in answering the questions.)

Q. Turning to this question of engineer certificates again, you consider that the system of engineer certificates should be maintained, but they should be homogeneous and interchangeable, and the same thing with regard to boiler certificates. In certain provinces, for instance, Bengal and Madras, there is no system of licensing engineers, and the Bengal Inspector of Factories has told us that he had no more accidents than anywhere else, in fact rather less. Do you think the idea of engineer certificates is necessary at all?—A. You can look at the engineer certificates from two points of view. One is the safety point of view, and it certainly does seem probable that accidents are less likely to occur in provinces in which the man has been trained than elsewhere. There is also another point. A great many small millowners in this country have no engineering knowledge at all and are not really in a position to form an opinion whether the man whom they wish to employ is an engineer who could look after their mill, whether he is suitable or not, whether he has any experience or not, and I think that the system of licensing or certifying engineers is probably of assistance in that way.

Q. There is another point of view which has been put to us by some who have had personal experience of it that the 3rd-grade engineer, or engine-driver especially, has to be paid an artificially high wage because of the existence of this system of certificate, that the Bengal engine-driver is just as good or as bad a man, but that he can be had cheaper because there is no necessity for him to take a certificate?—A. It is to give the factory-owner some idea as to the experience and training the man has had. This will apply equally to all classes of engineers.

Q. If a man has a factory which is big enough to require the certificate of a 1st or 2nd-class engineer he must have knowledge, either himself or have access to knowledge, which will enable him to make up his mind as to whether the man is worth to be employed or not?—A. Yes; I am not quite sure they always have. Some of these mills are in the hands of persons who have no knowledge of the business at all. I am not thinking so much about the large European firms who are quite big enough to look after themselves, but I am thinking about the small Burmese millers.

Q. You are in favour of the formation of the post of Director of Industries who would be subordinate to the Director of Agriculture. What is your reason for thinking that he should be subordinate to the Director of Agriculture, instead of parallel?—A. I think you get more co-ordination in that way. I am not a believer in the multiplication of departments, but I would concentrate, as far as possible, in one department. The industries in this province, except mining, are very closely dependent on agriculture.

Q. The Director of Industries would be concerned with questions of commercial and industrial intelligence, of local purchase of stores, and assisting in starting new propositions?—A. That point particularly would be closely connected with agriculture.

Q. Are there not other ways of co-ordinating beyond merely subordinating?—A. I think that is the best way. I think that is the most satisfactory way.

Q. Don't you think the Director of Industries should be a man of fairly good status and position, much like the Director of Agriculture?—A. Any work requiring communications with Consuls abroad would be carried on in the name of the Director of Agriculture.

Q. After all, that is a very small part of his work. Supposing you have a fairly large scheme for putting up small power plant for pumping and things of that sort, supposing there is a question of assisting factories like match factories, and so on, presumably the Director of Industries would be the man with a technical department under him whom you would look to?—A. Yes; but still so many industries in this country depend upon the utilization of agricultural products that I think it is desirable that they should all be under one department. Take the question of Banana fibre. That is a most promising industry and you must have the Agricultural Department working out the improved plant for fibre, selecting which plant is suitable, and the Industrial Department working out the machinery for preparing fibre.

Q. Why do you consider that the mining department should be kept apart from industries?—A. I did not say that.

Q. You said just now that, apart from mining, his main business would be industries allied with agriculture. Would not mining be an important sphere of his work?—A. It would be. There might almost be a special mining man. I have not thought about it.

Q. Is it not just as important to keep cottage industries in touch with co-operative credit as to keep in touch with agriculture?—A. I think so. That is the intention at present; to keep the Director of Agriculture very closely connected with the co-operative department.

Q. How would you do that by means of subordination? Don't you want parallel co-ordination for that purpose, rather than putting one under the other?—A. Personally I would rather have subordination than parallel co-ordination. I believe that you should have one man who will be able to secure co-ordination. There is always jealousy springing up when you have three parallel departments.

Mr. A. Chatterton.—Q. I understand that the list of factories which is appended to your note is a list of factories employing more than 20 hands?—A. Yes.

Q. Are there many rice mills which do not come under this classification.—A. Practically 30 or 40 in the whole country, not more.

Q. That is the very outside figure?—A. It includes nearly all.

Q. What type of machinery do they employ in the small mills?—A. Some of them are big mills in miniature, but others have self-contained plant which the Germans pushed into the country.

Q. In any of these small mills do they use oil or gas engines?—A. I only know two or three where they use them. They get paddy husk free and they burn it in the boiler. If you use oil you have got to buy kerosene oil.

Q. The small amount of paddy husk is not sufficient to drive the plant especially on the Engleberg system?—A. I have never found it insufficient, except on boiled rice. They found it difficult to work on boiled rice only and they used to do a certain amount of boiled rice and a certain amount of ordinary rice. When they used it on boiled rice alone they did not find it sufficient.

Q. Are oil engines used in Burma?—A. In cotton-ginning.

Q. In the factories which are included in this list which you have furnished us we may take it that the great bulk of them are steam plant?—A. The great bulk.

Q. Dealing with these smaller plant, and not the large European plant, in what sort of condition do they keep their machinery?—A. It turns out rice all right. The whole thing is shaking about. It depends upon the building itself. The German plant and machinery is mounted on girders separate from the walls, but the ordinary plant and machinery are attached to the main posts of the building and the whole building shakes about. I think, considering everything, it is rather wonderful how good the foundations are. They do not seem to have trouble about it.

Q. Before the war were many of these rice mills fitted up with German machinery?—A. Yes; it was coming in largely.

Q. And, as regards saw mills, had the Germans any business in that direction, or was it all British machinery?—A. All British, I think there are a few American saws. The machinery on the oilfields is chiefly American.

Q. Does this list of factories include the oilfields?—A. No. Only refineries.

Q. Do you inspect the plant on the oilfields?—A. No. They have a few workshops and I inspect them. I do not inspect the machinery in connection with the wells. All the boilers and engines on the oilfields are under the Boiler Act under the Inspector of Boilers.

Q. In reference to your suggestion that the Director of Industries should be subordinate to the Director of Agriculture, what do you think should be the qualification of the Director of Industries? Should he be an engineer, or a business man or an administrative officer?—A. It is desirable that he should know very many different things and have had a wider experience in many directions. It is probably impossible to find a man possessing all the qualification which might be useful to a Director. I think it would be better to get a man who is keen on the development of the country and tactful. I think that is more important than engineering knowledge or business experience although both of them are very valuable.

Q. Do you think that a man without any special qualifications, such as you propose the Director of Industries should be, would be a useful adviser to the Director of Agriculture?—A. I think he would study the subject. I think he ought to be on that job permanently.

Q. What subjects do you think he should study?—A. He ought to go about the country and make enquiries as to what use is being made of any indigenous products on a very small scale, and then to see whether that small scale is capable of becoming large.

Q. He will deal with cottage industries?—A. He will try to form them into large industries.

Q. Take the one that seems to be a matter of some importance now. Take the question of the utilisation of waste paddy husk?—A. That I think is a subject for an expert in all probability.

Q. You will get out a man from home as a chemist to be put upon a job like that?—A. I do not think that particular job is promising, but in similar cases I would.

Q. If you have a man without any technical qualifications and subordinate to the Director of Agriculture, don't you think that it is probable that a great many very promising propositions might entirely escape his notice?—A. I think it is probable that a great many might escape his notice, but he will probably find a good many on which he could work. This country is abundant with propositions. The man should have so many different qualifications that all of them cannot be found in one man.

Sir D. J. Tata.—Q. I do not quite follow the answer that you gave to Mr. Chatterton just now with reference to this paragraph, I do not quite understand its meaning: "If, as is sometimes assumed to be the case, the selling of an article costs from 50 per cent. to 100 per cent. of the actual cost of production it would appear that an undertaking by Government to purchase goods from factories in this country would be a valuable concession to the manufacturer while—provided that the goods were as suitable for use as those produced at home—it would have the advantage of costing Government nothing?"—A. Supposing Government wants to buy a certain article and the price of imported article is one rupee and you can buy the same manufactured in this country for one rupee, it does not matter to Government whether it buys the imported article or the local one, but it will be of value to the Indian manufacturer.

Q. What do you mean by "The selling of an article costs from 50 per cent. to 100 per cent. of the actual cost of production?"—A. The cost of selling to the public includes the cost of advertising and commercial agents and all that. If your article can be profitably manufactured for a rupee the actual cost to the public may be two rupees owing to the charges which have to be borne by the article on account of advertisements and travellers' charges and the other expenses in connection with retail sale. If Government purchased an article of this type direct from the makers at the open market price of two rupees, Government would be paying no more than at present while the maker would be getting a high rate of profit.

Q. In the first part of your opening sentence you say: "People have been told so often that Burma is an agricultural province that the fact is entirely overlooked that there are at present 512 factories registered here." Have you any idea of the capital employed in agriculture and the capital employed in these factories?—A. No. Land is chiefly Government land I believe.

Q. Have you formed any idea of the relative importance of these two—how much capital is employed in the one and how much in the other?—A. I have no idea. Agriculture is far and away the biggest industry.

Q. The mere fact that there are 512 factories does not help us in forming an idea, because the capital employed in them may be comparatively very little?—A. It is possible.

Q. There is one more question that I should like to ask you. You say in connection with pioneer factories, "But, if successful, young men of means desirous of starting in the industry would be allowed to work in the factory for a year in order to be trained." Is there any desire on the part of the Burman to go in for industrial work of this kind and to be trained? Would he apply himself, and would he work with his hands?—A. Yes. There is no reason why he should not.

Q. There is no difficulty here in making the Burmese to take up manual work; to take to industries where they have to work themselves?—A. I think they would be willing to do that. They make good engineers.

Sir F. H. Stewart.—Q. Is most of the land on which labour is housed round Rangoon within municipal limits?—A. Nearly all.

Q. Has there been any difficulty between the employers and the municipality as to the terms on which land is leased out for housing labour?—A. The land belongs to the employers usually.

Q. Do the employers sometimes consider the municipal regulations harsh?—A. No doubt they do. That occurs in all municipalities all over the world.

Q. You do not think there is anything particular in that complaint?—A. I do not think so.

Q. You think the municipal regulations are reasonable?—A. Yes.

Q. You consider housing conditions round here are satisfactory?—A. Yes.

Q. Who are the body responsible for the administration of the Boiler and Prime Movers Act?—A. The Burma Boiler Commission.

Q. Under which you are the executive authority?—A. I have nothing to do with it. The District Magistrate of Rangoon is its Chairman.

Q. And I suppose there are representatives of the mills and other people on it?—A. They consist of the District Magistrate of Rangoon as the Chairman, the Marine Engineer to Government as Secretary and executive member, and three others who are engineers of firms or members of firms.

(Witness here gave confidential evidence.)

Mr. C. E. Low.—Q. Has there been any other attempt at river transport besides the Irrawaddy Flotilla Company?—A. Yes. There have been a lot of small Burmese and Chinese launch owners.

Q. They have all proved a failure?—A. I know one or two launches running up and down a part of the delta now.

Q. Do those small concerns constitute serious competition?—A. No serious competition.

Q. And is there any agreement between them about rates?—A. None that I have heard of.

Q. How are rates by river and rail if you compare them?—A. I do not know. The Chamber of Commerce will tell you. I have heard complaints of high rates from the Railway.

Q. Is the Railway at all a very serious competitor with the river transport? Does it tend to keep rates down?—A. Myingyan, Prome and Mandalay are practically the only towns that are served by boat. There are a few more. Between Rangoon and Mandalay, Myingyan is the only station on the river which is served by both railway and river. They do not touch much. Mandalay to Rangoon is the only real length where there is competition.

Q. And there are not many railways in the delta?—A. None whatever.

Q. Is rice sent from Mandalay to Rangoon?—A. Milled rice, and not paddy.

Q. Is there any competition for transport of goods between Mandalay to Rangoon between the railway and river transport?—A. There is a certain amount.

Q. Are the existing steamer rates too high in your opinion, or before the war were they too high?—A. I could not say. You may get more information from the Chamber of Commerce.

(Witness here gave confidential evidence.)

Witness subsequently submitted the following supplementary note.

The rates for freight between Rangoon and Mandalay are shown in the following table, extracted from the published schedules of the Irrawaddy Flotilla Company, Limited. It is stated that the rates refer to "Goods by weight or by measurement at carrier's option per ton of 20 cwt. or 50 cubic feet." The distance of the stations from Rangoon in miles is shown in the second column. Stations served by both the Railway and the river are shown in *italics*. Attention is invited to the jump in the rates between Prome and Thayetmyo.

A table extracted from the schedules published by Messrs. the Irrawaddy Flotilla Company, Limited.

WITNESS NO. 420:

MR. H. L. ALLAN, *Assistant Works Manager, the Burma Oil Company, Limited, Rangoon.*

WRITTEN EVIDENCE.

Technical aid to industries.

Technical aid in general.

In the refining of petroleum in Burma there has not been any aid of a technical or scientific nature afforded by Government or, on the other hand, sought by the refining companies. I do not think that such aid could be arranged, because an expert, of any real value, would command a much better salary and prospect in private employment than Government could possibly offer.

I have had no experience of any aid afforded by the Scientific and Technical Department of the Imperial Institute, but have derived, personally, great benefit from the bulletins of the work done in the laboratories of the American Bureau of Mines.

I am of opinion that much valuable research work could be done in Burma in a properly equipped technical institute on the lines adopted in various American technical and scientific colleges. Such an institute would, for instance, embrace Mining, Mineralogy and Metallurgy, Agricultural Chemistry, the Chemistry of the Forestry Department, Petroleum, etc., and the various branches of Engineering and Chemical Engineering as found necessary. With able men directing the research department, it should not be difficult to obtain grants for research scholarships from the large manufacturing concerns in Burma for research in connection with their respective industries. Such grants are very common in the United States of America and have been of great advantage to all parties concerned. The proprietary rights in all discoveries or inventions are held by the donors of the scholarships concerned for a period of five years or such further term the governors of the institutes may consider necessary and equitable, the results can then be published as the said governors may direct. The student participates according to the value of his research.

The Burman Assistant Chemists, whom the Burma Oil Company have employed to date, are not sufficiently advanced to undertake this work even under very skilled direction, but the Burma Oil Company have not been able to get the best of the Rangoon College students, as the latter prefer Government service (Forestry) which so far offers better terms than the Burma Oil Company have done and has the additional inducement of pension or provident fund and a better social position. The latter especially carries great weight with the Burman. I consider, however, that a post-graduate course, including the holding of a research scholarship, ought to fit the Burman to compete with the European in the scientific side of industry. The Government departments can only take a limited number of recruits yearly and the balance would be more willing to accept the remuneration offered by a commercial life as the number qualified to do so increases. Again the commercial and manufacturing firms requiring scientific assistance would no doubt pay larger salaries when they are assured that value can be obtained; at present they can obtain well trained Europeans for very little more than the educated Burman demands and the former has much better control over labour.

Research abroad.

Advantages.

I presume that research abroad would mean London or other of the large cities and would be conducted in one or other of the technical institutes. The advantage is, that very highly trained men can be obtained to do the work there at much less remuneration than they would require abroad and their energies are not sapped by the climate. The advantages in library resources are overwhelming, and in many other respects, such as the designing and manufacture of special apparatus, dictated by research; the experience, craftsmanship and plant are to hand saving time and the breaking of the train of thought, which, waiting for apparatus or material entails.

Disadvantages.

In London and possibly in other cities legislation forbids the storage within Municipal boundaries of large quantities of material such as petroleum. As large quantities are required for technical research, this is a handicap. It is also desirable to conduct the research in the climate in which manufacture is to be conducted or that those conducting the research should have knowledge of the conditions, climate, labour, etc., under which their processes or plants will require to be operated. The disadvantages do not, in my opinion, discount the advantages.

Assistance in marketing products.

This does not come within my province, but I suggest that in colleges and schools or technical institutes, the various manufactured products produced in India and Burma be shown, the firm manufacturing to gift the cases and exhibits and copies of a small brochure describing the process of manufacture and the uses and application of the products. This is done in certain educational institutions in Britain, and I have noticed, on many occasions, its advantages to manufacturer and consumer.

Training of labour and supervision.

Lack of primary education is a very great hindrance to industrial development: the education required, in my opinion, is sanitation, the three R's and practical workshop instruction. The former is essential before progress can be made, the latter would tend to inspire an intelligent interest in manual labour and pride in its successful accomplishment. One notices this lack in plant controlled by the native where machines have bright parts, they are neglected or painted at the first opportunity. They are careless with tools and do a great deal of damage by their primitive methods of overcoming temporary difficulties. Where a native of India has attracted more than the ordinary attention of his European supervisor and the latter has given a little extra attention and instruction to him, I have noticed very marked improvement for comparatively little effort on the instructor's part. Lack of primary education.

Vernacular schools have, in the neighbourhood of the refineries of the Burma Oil Company, taught a few men who saw advancement in a slight knowledge of figures, simple addition and subtraction, but the recipients of this instruction learn just enough for that purpose and are, in general, too old for further education, otherwise nothing has been done to improve the labourer's efficiency and skill beyond the reward of advancement at their work.

Education in simple sanitation and mode of cooking and living, simple elementary education, reading, writing, arithmetic and practical training are required.

Better housing conditions are necessary, and this should not be exacted from the employer; it is not appreciated. I have the experience, with such labour as the Burma Oil Company house, that they will do nothing to improve sanitary conditions and are very destructive of house property. Low standard of comfort.

Of our own employees, the bulk send, at least, half their earnings to support homes and families in India; the result is a poor class of house in the neighbouring village or municipality, low rateable values and no money for municipal development. Recently the Burma Oil Company built barracks at a cost of Rs. 1,20,000 to accommodate 2,000 coolies, charging 12 annas per month per head with copious water supply, septic tank latrines, cooking accommodation, etc.: after two years there are about 700 living there, the bulk are living within municipal boundaries in *dunny* huts with mud floors and surface drainage water supply for all domestic needs, rent Rs. 8 per month. They prefer such contaminated water to artesian well water because the latter has no taste (*verò sap*). The only remedy I see here is the encouragement of imported labour to make their homes and bring their families here. Such encouragement would take the form of cheap land with garden plots and encouragement to labour to become householders. I quite see the difficulty of accomplishing this: it means large areas for sanitation, water supply and policing, but it seems to me the best remedy.

Apprentices are trained in Burma Oil Company mechanical workshops; they develop into quite satisfactory fitters but have neither technical knowledge, training, nor the elementary education to take advantage of the latter if it were available. Apprentice system.

The Burma Oil Company are employing gradually better class Anglo-Indians as shift engineers and find them, on the whole, satisfactory. They are not fitted for the superior posts and do not control labour as efficiently as the European although they have an advantage over the latter in their knowledge of Indian languages.

I have not had experience of night schools for short-time employees and, with the exception of a vernacular one, such do not exist in Syriam or the District. I am not aware of any in Rangoon but, if such were established, their certificates would be of considerable value to employers in estimating the value of employees or candidates for employment. Night-schools.

I have recently had several applications from clerks, who wished to learn short-hand and typewriting, that they may be allowed leave to go to Rangoon tutors for the purpose. These applications have been granted and advances from salaries made to pay fees. In each case it meant a loss to the Burma Oil Company of half a day for each lesson. Night schools in the neighbourhood would render such loss unnecessary and would encourage larger numbers to improve their knowledge.

There are several schools in the neighbourhood of the Refineries which, if liberally supported by Government, could, I think, easily run night classes: these schools are run by Missions of various denominations. This would be the least expensive method of initiation of such a scheme and would afford data, in the shortest time, of the likelihood of a more elaborate system being appreciated or necessary.

I am of opinion that, in the event of Government giving grants-in-aid to such schools for the development of night classes in commercial and industrial subjects, that control be exercised by a Department of Industry: the latter, being in touch with industrial requirements, would be more sympathetic of such requirements and, therefore, better able to advise on the subjects and methods of instruction.

The night schools should be quite distinct from the day schools as in many parts of Scotland, the teachers being paid per lecture or attendance whether they are on the day staff or not. The night schools simply use the schools and fittings (certain classes drawing monthly salaries of Rs. 50 and over would, of course, pay for instruction, clerks, mechanics, etc.).

Supervisors and
Managers.

In petroleum refining, supervisors and skilled managers are all Europeans, trained in Europe; their training is usually general, whether in chemistry or engineering and in most cases their knowledge of refining and petroleum in general is gained here. The general training and experience in manufacture at home, not necessarily in petroleum or allied industries, is indispensable and our experience is that the training gained subsequent to University or technical college for, say, two or three years in a home factory, more than doubles a man's value.

The Anglo-Indian or native of India is not yet able to compete with the European for these posts and, in my opinion, will not do so for a long time yet. They are not so self-reliant, dependable in emergencies, and have seldom any initiative. Further, they have many undesirable habits, not peculiar to India, but more marked here than at Home, of which the most reprehensible is the exaction of money from subordinates and the consequent lack of control or the proper kind of influence over the latter.

Government could give very valuable aid to supervisors, managers and technical experts to study conditions and methods in other countries by accrediting such to their consulates, embassies or any organization instituted before or after the war for the furtherance of Empire trade. I spent seven months in Germany, Galicia, Roumania and Austria before the war studying petroleum refining in these countries. They were very much more advanced in their methods than we are here or in America, especially in the Austrian State refineries. We are rapidly overtaking them and would, probably, have been up to their standard but for the difficulty of obtaining new plant and material during the war. Their labour is much superior, one man being equal to six here and sometimes to ten. They had the great advantage when building their refineries of building for a definite output and therefore erected units of great capacity whereas we have a large number of units added from time to time as the business developed.

I consider the advantages of such tours in other countries of inestimable value and more especially for men employed in India. The feeling here is that one gets out of touch and such a tour makes one realise how much this is so.

Mechanical
Engineers.

There is no lack of uniformity in the standard of examinations in this province, in my experience.

General official administration and organisation.

I have no experience justifying comments under this heading, but I have no doubt that a Board of Industries would more than justify its existence and am of opinion that it would be difficult to find a Director of Industries who would, in his own person, be able to advise on both the business and technical side and therefore believe that a Board of Advisers with an official Director or President would be the better method.

Organization of Technical and Scientific Departments of Government.

Technological
Institutions
for Burma.

There is no scientific or technical department in this province which can advise in petroleum refining and the only department which could do so efficiently would be a technological institution capable of conducting research and advising on new products to be obtained or new applications of such or existing products.

Such an institution would at the same time train the men required for the development of industry.

There is, for instance, a probability of materials for dyes and high explosives, etc., being obtained economically from petroleum but such development will be impossible without a plentiful supply of skilled labour such as a technological institute or college would produce. I think Burma with its vast resources would justify the establishment of such an institution of its own because with the development of its communications, there will be large numbers of new industries requiring technical assistance and India is too far away to be of such assistance as will be required.

Reference libraries.

For my profession, literature of any value is unobtainable in local libraries. As it is a specialised subject appealing to a limited number and as the books go out of date very quickly, it is perhaps impossible to expect libraries to have such on their shelves but with a technical college or technological institute such books would be necessary. It would be a great advantage if copies of patent specifications and bulletins of special subjects issued by industrial bureaus and laboratories of allied and foreign countries could be consulted in reference libraries; these afford much more up-to-date and useful information than the bulk of books or works of reference.

Colleges of
Commerce.

This would be the logical and necessary development in course of time of the technical college and the industrial and commercial education in day and night schools; meantime it would probably be premature.

General.

The business of petroleum production and refining being in the hands of large companies, the development is pushed as far as markets will permit. Its dependence on foreign supplies such as iron and steel, tin plate and general machinery will decrease as Indian sources of

supply become available. The distribution to the consumer in bulk should be encouraged as much as possible. It is the least dangerous form of transport when properly handled and, had it been more largely employed in India pre-war, a vast amount of tonnage and money would have been saved with the added advantage of a lower price to the consumer.

Addendum.

In my remarks anent the better housing of labour, I note the employees send about half their earnings to India. The amount sent from the local Post Office in Syriam Village is about half a lakh* monthly. If this money were spent locally a great deal would accrue to the Municipality. I would suggest to the Commission that, as the bulk of the labour in the Province is Indian, this drain is going on in all parts of the Province and is surely a very strong additional reason, to the many cogent ones advanced by various people in recent years, why Burma should be allowed to retain her total revenues for her internal development.

ORAL EVIDENCE, 23RD JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. You say in your note under the heading "Low standard of comfort" that "better housing conditions are necessary and this should not be exacted from the employer etc." Do the employers out here provide houses for their workpeople?—A. No, not for all, only for a certain number, that is, for those whom we require in the factory night and day and whose work is continuous to them we give free quarters. Quite recently in the case of these barracks which I mention in the note we have taken away the charge altogether, and we are putting the men up there free, and they are coming in gradually. But the objection they have is to be compelled to live in organised barracks; they do not like that.

Q. Why do they object to live in better quarters?—A. They object to the discipline of living in quarters inside the fence where they are not allowed to bring in strangers or to make disturbances.

Q. What remedy do you suggest for that?—A. The municipality at the present moment with a little finance can do much to improve the housing conditions; their own coolies live in the worst hovels, and only the municipality can remedy that. I do not think you could expect other people to do it, so long as municipal property is clearly not up to the standard, the municipality exact from other people, although they are improving gradually. Private proprietors are doing more than the municipality who have not got funds to do it.

Q. But supposing private proprietors get land from Government on easy terms, do you think they would be willing to build suitable houses for these workpeople?—A. Yes; there are a certain number who have built quite good class houses for workpeople, but there the water supply is not efficient; the municipal water supply requires better means of distribution.

Q. Are these within the municipal limits?—A. Yes. A plentiful supply of good potable water is in existence, but there is no system of distribution. The source here is an Artesian well 400 feet deep drilled with the assistance of the Burma Oil Company, it yields over 80,000 gallons per 24 hours and is on the outskirts of the municipality necessitating long carry.

Q. Cannot the employer compel the municipality to supply water for these people?—A. The people who come there are not so badly off as they are in other places, but the water supply has to be brought from some distance and in the hot weather the supply fails (i.e., from dug wells).

Q. You speak about the system of apprentices in the Burma Oil Company; do you take apprentices there?—A. Yes.

Q. What class of people are they?—A. Burmans.

Q. With what standard of education?—A. Mostly the Intermediate examination of Calcutta University, and some of them up to the B. A. final.

Q. What are their prospects?—A. Well, this is just a new venture on our part, we commenced this about a year and-a-half or two years ago; the intention is to try to train them sufficiently to be able to take up the places of Covenanted Europeans. The European is drawing up to Rs. 500 or 600, and we are endeavouring to train them to do work which entails supervision of distillation plant or refrigeration plant; they have to be responsible day and night, probably in three shifts, one man would be in charge of 50 or 60 or 100 men. We give them chemical training first, as their business is a scientific one and is becoming more so every day.

Q. Do you think that this plan will be successful?—A. I have got 8 of them just now, they are doing very well.

Q. From Burma or from Bengal?—A. All from Burma, this is only an experiment, and we do not wish to have too many kinds of people at one time; we prefer usually to take Burmans.

Q. Besides their aptitude for chemistry, have they aptitude for mechanical engineering?—A. We have not had young men with similar educational standard in the Engineering Department but have had others who, trained in the country, are doing quite well. None, however, have shown themselves capable of taking the higher posts so far.

Q. Do you think they can qualify themselves to be supervisors or foremen?—A. Yes, quite certainly they would in time.

Sir F. H. Stewart.—Q. You are the Works Manager and you are also the Technical Chemist?—A. Yes.

Q. Where did you study?

A. In Glasgow in the laboratory of the City Analyst for five years, and then I was in a technical college in Glasgow, and also in the University.

Q. You have not studied in America?—A. No.

Q. How many years' experience have you out here?—A. I have been out here now almost 15 years.

Q. Have you had any experience of the Imperial Institute?—A. No.

Q. Have you had any correspondence or any personal dealings with those American Institutes which you mention?—A. Not personal.

Q. Do you know who are the governors of those institutes in America and how they are appointed?—A. Do you refer to the American Bureau of Mines or any particular Institute?

Q. The institutes you mention with reference to the publication of research results.—A. There is a Metallurgical and General Institute in Pittsburg controlled for many years by late Robert Kennedy Duncan whose publications such as the "New Chemistry" have been useful to many in as much as their perusal has enlightened many people of the scope and profit to be expected and attained by well conducted research even in well established industries. The bulletins referred to are issued by the Bureau of Mines, etc.

Q. This system that you describe about proprietary rights in all discoveries or inventions being held by the donors of scholarships for a period of five years or such further term as the governors of the institutes may consider necessary and equitable and the publication of the results as the governors may direct; do you think people out here will agree to that?—A. I do not see why they should not. Of course I refer to some of the big manufacturing concerns in America who offer scholarships some times for 10,000 dollars for development of particular processes. In a very little time they recoup that and five years would not be required in most cases.

Q. Who will decide as to the period of time for which the donors will hold the rights of any discoveries?—A. I should say it will rest with the governors of the college in question entirely. There will probably be business-men among them.

Q. You are training Burmans in chemistry now with some prospect of success?—A. Yes, with great prospect of success.

Q. What pay do they attain to?—A. We have been starting them on Rs. 120 a month rising by 20 rupees increments to Rs. 160; after that further promotion entirely depends on each man's work.

Q. What pay do really good men go up to?—A. If the men are equivalent to the men we get from Home, they get the same. They will go up to Rs. 250 to 300, and from here if they can do the work the European does, as efficiently, they would rise with them, and I see no reason why they should not reach Rs. 700—800 per month.

Q. On what pay do the Europeans start?—A. Probably Rs. 300. In fact they get less than that; but they have free quarters and they have a certain number of servants; they have a home payment and a bonus in addition to pay.

Q. If you get an equally satisfactory Burman, would you give the same pay?—A. Provided they can control labour. The great trouble with the Burman is that he desires continual holiday, has usually a large number of domestic bereavements which entail holidays, in addition to fetes, etc. This means he cannot be relied on for a generation or so and will be his greatest handicap.

Q. Do they come with scientific training?—A. They have not had much laboratory training.

Q. Is your labour mostly from China?—A. There are Chittagonians at the Distillation Plant and Ooriyas and Koringhee coolies also, Hindus mostly as labourers; in the soldering and tin making department there are Hindu and Burman tradesmen; in fitting and boiler making there are Bengalis and Punjabis.

Q. Is your Indian labour mostly migratory? Are they frequently going forwards and backwards to their homes?—A. Not much more than the European. It is only a question of going to their country after four or five years; otherwise they do not much change—with the exception of casual labour.

Q. And are your clerks all Burmans?—A. Chiefly Burmans and Chino-Burmans.

Q. Do your workmen attend any night schools?—A. Yes, some of the Chittagonians have been trying to get up a small night school of their own for their younger ones, but they have not had very much encouragement. So far they have a school in the village, I believe which teaches writing and reading of their own language.

Q. In other parts of the country night schools do not seem very useful, the labourers come to the school tired?—A. I think labour should not be tired. Labour works too long.

Q. What are the hours of the labour here?—A. In the refinery labour comes at 6 in the morning; they practically work 12 hours; they get off for an hour in the morning at 10 A.M. for breakfast, resume at 11, and thereafter work till 6-30 P.M. they are not constantly at their work all their time; they get spells of 10 minutes, there is not a great deal of strictness as regards the men being off for a little while, we have places for men to sit and smoke. If it were possible to get labour to put in a fair amount of work in a shift, we could divide up the number we employ now into 8 hour shifts. Our experience is that on Company's pay we get about 50 per cent. of the work that a contractor maistry gets out of the same men.

Q. When you say with reference to research abroad, where do you mean?—A. I mean of course research in England where there are very much better facilities than there are here; but research up to a certain extent can be done in India.

Q. That does not preclude you from recommending research institutes in Burma?—A. Not at all.

Q. But you are strongly in favour of referring problems to research institutes at Home?—A. There would be later developments at home and probably you can employ better men at home.

Q. Supposing such an institute was started to deal with special tropical problems, do you think Burma will be a suitable place?—A. In preference to where?

Q. In preference to Southern India for instance.—A. Well, speaking for Burma I should certainly think so. I could not speak for India.

Q. But then what would be an advantage from the point of view of Burma might be the reverse for Southern India?—A. The thing is, every communication from India takes four or five days to reach Burma, everything has to be sent over by sea, because there is no overland route. Also, it is a great advantage if problems can be discussed *vis-a-vis*; reams of correspondence are saved and altogether it is more satisfactory; very often probably months of useless or unprofitable work are avoided.

Mr. A. Chatterton.—Q. Are you in favour of establishing a Technological Institute in Rangoon?—A. Yes, it would be a development of the Rangoon College.

Q. Would such an institute be of any assistance to the Burma Oil Company?—A. Yes.

Q. Apart from training chemists?—A. It would not be of immediate assistance; it would require to be developed till you have trained people to do research work.

Q. Have you research chemists at work in Rangoon?—A. Yes, we do a certain amount of research, but we have been doing a great deal of what I would call, for instance, analytical work in research, as distinguished from synthetic research. A research institute here can assist chiefly in trying to separate the constituents of oil and so forth and not only for synthetic work.

Q. The work done in your laboratory is, I understand, analytical work and not synthetic?—A. Not synthetic at all.

Q. Have you any arrangement at home for getting problems worked out?—A. We have a technical staff in London.

Q. You have scientific experts?—A. Up to now nothing synthetic has been done.

Q. Are you manufacturing synthetic dyes or is it only laboratory work?—A. Merely laboratory work so far.

Q. You speak in the first paragraph of your note about the better pay and prospects in private employment compared with Government service. Do you think then that if a private expert can get so much larger income as a specialist, you are likely to get much useful work done by a general technologist here in a Government College?—A. He will attract a great many to the institute. If we have a research laboratory with a great number of trained men in it whom he attracts, I think there is some chance of getting something done.

Q. That research would be more or less purely scientific?—A. Yes, purely scientific.

Q. He would not be able to do any technological research?—A. I think it would form a foundation. Institutes for technological research would require a generous endowment, but anything new from the laboratory which seemed promising would no doubt be largely aided by the industry concerned.

Q. Can you give us an idea of the amount of money which is sometimes spent on these technical researches?—A. They vary very much. It might be £100 or £100,000. The Germans spent over 2 million in the production of indigo and contact sulphuric acid.

Q. Are there any examples of that kind in connection with the oil industry?—A. Yes, but very few of them entailed really large sums because they were usually merely elaborations of or new designs of plant. The process for cracking of oils has cost a good deal in various parts of the world, but speaking generally this phase of oil development has not cost much.

Q. In regard to the position of British industries, that is, industries in British Possessions and Colonies, is the greater part of the research in connection with this particular industry

done in Germany or America?—*A.* A great deal of research work was done by Dr. Engler; the book he published is about the best one on the petroleum industry, but usually German books are compilations of other men's work and Engler is not an exception.

Q. In one of your notes it was stated that the methods employed in Burma till the outbreak of the war were not up to date?—*A.* Yes, that is in my note.

Q. And that since the war broke out you had been rapidly bringing them up to date; is that the result of research work out here or research work in England?—*A.* It is due partly to my experience when I was abroad. I saw in the Austrian State Refineries plants that we had not been accustomed to here. I saw that large units were possible and that they could be built in such a way that the chances of fire are almost negligible. We have also developed new methods of our own in Burma.

Q. Then, referring to the question of training Indians for the technical side and to control industry, do they come from the colleges with the ordinary University degrees first?—*A.* We have men with the B.A. and others who failed in the final.

Q. Are they from the Rangoon College?—*A.* Yes.

Q. You have not taken chemists from any other part of India?—*A.* No, I have not so far.

Q. Is there any large opening for these people here? How many of these Indian chemists could you employ?—*A.* Well, possibly in time we may manage to get 20 or 25 of them into different departments; it all depends on the development of the business; we shall probably reduce inferior labour very largely, and increase technically skilled labour.

Q. How many chemical engineers are employed out here?—*A.* We have chemists and engineers entirely separate, quite distinct, but our chemists usually have gained a great deal of experience in engineering in home industries probably in steel work or such other kind of industry at home.

Q. Do chemists do designing?—*A.* General designing. The chemist indicates the nature of the plant required probably the materials advisable for its construction, etc., the engineer designs and builds it always in close collaboration with the chemist.

Q. In the case of your company are designs for new plant and apparatus made out here, or are they sent out from England?—*A.* They are made out here.

Q. Can your designs of plant be made in your own workshops in sufficiently large numbers to meet your requirements?—*A.* We can make distillation plant, but engines, refrigeration plant, etc., we import.

Sir D. J. Tata.—*Q.* Have you got your own foundries and workshops?—*Yes.*

Mr. A. Chatterton.—*Q.* In regard to labour, do the coolies who come over from the Coromandal coast remain permanently in the service of the company going home occasionally on leave?—*A.* If the men are continually employed the whole year round, they go to their country every three or four years.

Q. Do you give them leave?—*A.* We don't give them leave. We pay them off; when they come back and present their certificates, they are taken on; there is no question of leave because they go for months and frequently stay for years. It is impossible to give them leave.

Q. Do they all speak one language?—*A.* They speak many, we have six or seven different languages, but they all manage to get along in the usual Hindustani.

Q. In regard to applied chemistry do you manufacture chemicals on the spot besides petroleum products?—*A.* No.

Q. Do you get anything from India, any chemicals that you want?—*A.* We buy carbonic acid gas from a supplier in Madras for refrigeration purposes; sulphuric acid we obtain locally.

Q. Do you manufacture candles?—*Yes.*

Q. Where do you get your stearine from? From home?—*A.* From America; it comes from other sources also; but at present it is entirely from Europe or America, more from America than from Europe.

Q. Do you get any supply at all from India?—*A.* No. We tried samples, but they were not up to the required colour.

Q. Is the quantity that is required in Rangoon by the oil industry very large?—*A.* Yes, it is. I could not tell you the exact quantity that we use at present, but we probably use 60 or 70 tons a month, sometimes more. It all depends on the candle business; it is not so flourishing as before the war, but it is quite enough to manufacture in the country.

Q. Were there many Germans employed in oil industry before the war?—*A.* None, unless you include the American-Germans working in the fields.

Q. Not in the chemical part?—*A.* None at all.

Q. In connection with the Technological Institute you speak about the probability of materials for dyes, etc., being obtained from petroleum, is there any possibility of manufacturing dye stuffs out here?—*A.* I do not see why we could not.

Q. Could you make aniline oil here?—*A.* We could make aniline oil here, there is no difficulty about it.

Q. From petroleum?—A. Yes, we can do it, it is only a question of a profitable method for extraction of the aromatics, they are all present in Burma petroleum, and more or less in all petroleum, sometimes more and sometimes less.

Q. Is there any asphalt?—A. Yes, the crude is not an asphaltic crude, but we produce asphalt of fair quality.

Q. Is what you make here used locally?—A. Yes, the demand is greater than the supply.

Mr. C. E. Low.—Q. Referring to the third paragraph of your note about research grants of the American type, you suggest there, I understand, the preservation of secrecy for three years; there is not here any question of the actual proprietary rights or patents being held?—A. It will require an alteration of the patent law; otherwise secrecy is impossible out here, at least we find it so.

Q. Are you referring to actual proprietary rights, the patents?—A. Yes.

Q. Not the retention of the information as secret?—A. The information would be published, but the public would not be allowed to use it until the people who have been through the expense of paying the scholarship are recompensed.

Q. In what you say about research abroad, you are alluding of course to research in your own material?—A. Yes.

Q. And I think you will agree that yours is a very special case?—A. It is a very special case.

Q. In some respects of course you want to make trials and so on?—A. Yes.

Q. A very large proportion, far the greater proportion of research problems that arise out here, as you are no doubt aware probably relate to organic material?—A. Yes.

Q. But perishable material and so on, especially agricultural, are liable to changes on the way from here to London?—A. Unless specially packed.

Q. That covers rather a wide range of items from the point of view of this country?—A. Yes.

Q. For instance, supposing you had to do research as to the formation of sugar which was at one time rather important, by the time you get your cane to the Imperial Institute it will probably change so hopelessly as to make research absolutely impossible?—A. That is perfectly true, but what I really mean is it will take quite a long time before you will be able to develop any research institute locally so far as to afford any improvement either of facility or apparatus or anything else.

Q. So far as your particular industry is concerned, I can admit it, but as regards research in agriculture and forest products, especially agriculture, we are pretty well equipped in this country?—A. I am afraid I am not sufficiently acquainted with that.

Q. You are on a little more familiar ground probably as regards mineral research?—A. I think we are very well equipped in this country.

Q. You mean the Geological Survey Department?—A. Quite so.

Q. The reason why I am pressing this point is this, that there has been a great deal of talk at home about certain research problems which in India means mostly agricultural and forest material and minerals, not being capable of accomplishment in India?—A. I cannot admit that.

Q. As regards your business?—A. My point is, even when it comes to ordinary chemical problems such for instance as the analysis of petroleum, no one has written or knows what petroleum is composed of; even in the case of the simple petroleum sold in the bazaar there is no one who knows how many different hydro-carbons there are in any given sample; it will take years to investigate that.

Q. You mean fundamental mineral problems?—A. Yes.

Q. Have you thought of making carbon, e.g., for electro-metallurgical process by dry distillation?—A. We can produce the carbon required but have not the experience of plant for its consolidation into blocks or rods. As it is, we do not carry the distillation to carbon preferring to stop while the residue is still mobile enough for liquid fuel or pitch. We used to make residual carbon or coke for the old Rangoon Steam Cars.

Q. Supposing on the other hand it was decided to take up any electro-metallurgical process in this country as a matter of national safety, would it be possible to get carbon?—A. Yes, quite.

Q. You get your men as chemists and you train them as chemical engineers?—A. Yes.

Q. I mean the Burmans that you are getting?—A. They have been educated here in Rangoon College and they have done one or two years in chemistry and probably physics and a little mathematics; we get them and train them ourselves.

Q. What sort of training do they get?—A. Laboratory training and subsequently in the works in the running of plant and handling labour.

Q. Have you any idea of making chemical engineers of them?—A. Yes.

Q. Have you any technical institute or something of that sort to give them training in chemical engineering?—A. Well, those that come to us from the college possess only general

scientific education; they have no idea of the technical side and they have not very great experience of experimental work, I mean laboratory work.

Q. The point of my question is this: that in India it has always been objected that a purely chemical training gives to Indians an unpractical bias which is very undesirable; it is desirable to give them a definite practical bias as far as possible.—A. We have also experienced that.

Q. In the case of the Britisher he is naturally a practical minded man and his theoretical education has a less injurious effect on him, but how is that with the Burmans?—A. I agree with that opinion and it is rather early to be dogmatic about the results of the training we are giving our men. I am of opinion however that if they had had a workshop training of any kind before coming to us, our task would be considerably lightened. Their training has been too academic, too much on the modern side of the college and not sufficient of practical and applied science.

Amarapura Weaving
School.

I have some experience of the working of the Saunders Weaving School, Amarapura, where weaving is done under expert instruction.

- (1) I find that as much is done in two days as could be done in eight with the old appliances and the old methods.
- (2) By increasing the number of heddles a great variety of patterns is obtained. These are popular and sales have improved.
- (3) A large number of pupils have passed through the school and besides learning what is then taught some of them have made ingenious modifications in the looms there in use, whereby with simpler and less costly appliances the same results are obtained.
- (4) Owing to the foreign imports, the number of weavers in Burma fell from 277,774 at the 1901 census to 151,358 in 1911—a decrease of 45 per cent. I believe that the instruction given at Amarapura will gradually lead to an increased prosperity in the weaving trade.

Pioneer Factories.

In view of the success of the weaving school I suggest that the following pioneer factories should be established:—

- (i) For the production of cotton yarn. This might be suitably placed between Meiktila and Myingyan.
- (ii) A sugar refinery. To be situated in the sugar-cane growing area such as Kyaukse, Pyinmana or the Mön canal tract in Minbu.
- (iii) A pottery. Probably no very elaborate machinery must be set up. Minor improvements such as have been introduced in the process of weaving at Amarapura should lead to a quicker out-turn and better work. The pottery should be established at one or more of the following centres—Kyaukmying in Shwebo district, Pyinmana, Twante, Pegu.
- (iv) A paper mill. To be situated in an area where bamboos and other materials are plentiful.

The establishment of such pioneer factories was recommended by Sub-committee No. 6 at the Agricultural and Co-operative Conference of 1915.

When the factories have proved themselves successful, they could be handed over to Co-operative Societies or to Burman companies formed under the Companies Act.

Co-operative
Societies.

Co-operative Societies benefit an industry in various ways.

- (i) Capital can be borrowed at a moderate rate of interest.
- (ii) Raw material can be bought cheaply in large quantity by the Society.
- (iii) The finished goods can be kept by the Society for retail sale instead of being sold at a low price to middlemen immediately on completion. As the middleman is usually a money-lender his inclination benefits the industry in more ways than one.
- (iv) Association together as members of the same society improves the general standard of skill and intelligence.

The following industrial societies are now in existence:—

Basket makers of Bodigon, Mandalay.
Cabinet makers of Hemamala, Mandalay.
Slipper makers, Mandalay.
Potters near Kyaukmying.

The development of these societies has been retarded by the war, which broke out just about the time of their foundation. But their members are indisputably more prosperous than individual workmen not belonging to a society.

Government assistance to industries shall take the following form:—

- (i) Formation of co-operative societies for workers in the same or allied industries in any locality.
- (ii) Government advances to these societies of workers (through the Registrar, Co-operative Societies) *cf.* advances made by Government to agricultural societies.
- (iii) Assistance in placing certain products on foreign markets.

Government
assistance.

Combination of working societies in a sale society with a shop in Mandalay and a branch in Rangoon. The sale society would require no capital for the purchase of goods. Articles would be held for sale at a price fixed by the workers' society, and would form security for loans to members. Prices would be altered by the society according to the state of the market, to which the selling agent would direct the societies' attention.

Sales agencies.

The measures above outlined would have the effect of advertising the goods and the societies which manufactured them; of bettering the condition of the workers and increasing public confidence in co-operation. They might be applied to the undermentioned industries: Joinery, basketwork, Sitsi and lacquerwork, leather work of various kinds, leather and cloth work, umbrella-making, pottery, brass and iron work, cheroots (*Sebyin leik*), embroidery and work in which timber, paper, cloth are combined.

I do not recommend direct help to industries either by the existing banks or by a new bank founded for the purpose.

- (i) The workers must create confidence and security by forming themselves into co-operative societies.
- (ii) Arrangements must be made to secure the best market for their goods.
- (iii) When they have shown that they understand and are able to benefit by sale facilities and (in case of delayed sale) loans for capital expenditure, they would be allowed to deal either with the existing co-operative central banks or with an industrial bank specially adopted to their needs.

My recommendations are based on my experience of the early development of Agricultural Co-operative Societies in Burma. In 1905-06 Government granted a loan without interest for three years and at four per cent. for ensuing ten years. It was not necessary, however, to draw on Government to the full extent of its offer. Mr. R. C. J. Swinhoe, Solicitor, Mandalay, acting as agent for private investors, was able to obtain funds from private investors. This agency system lasted for three or four years, after which the bank was founded.

So industries should be financed in the first instance by Government and, later, by private investors and persons wishing to purchase their goods. It is only in the final stage that the bank can help them. I approve the appointment of a Director of Industries. He should be a Government official. A non-official would not be able to discharge the functions of the office or have sufficient influence over the workers. He should be well acquainted with the conditions under which they work and live. He should, with the Agricultural and Co-operative Department, be under the Rural Development Commissioner, when appointed.

In conclusion, I am of opinion that two measures are of supreme importance for the General development of industries in Burma—

- (i) Improvement of method, by instruction in technical schools. The artistic tradition—the arrival of which in Burma so impressed His Excellency the Viceroy—can only be preserved by the teaching of quicker methods of manufacture, as without these many of the arts are doomed to extinction, *e.g.*, formerly a man weaving a *paso* received three rupees and had to work eight days to finish his task: with an improved loom he can do the work in two days. If he is paid Rs. 2 only, he gets one rupee instead of 6 annas a day and *paso* can be sold Rs. 1 cheaper.

Technical schools may be necessary for the instruction of those employed in the pioneer factories.

- (ii) The law conferring on Burman Buddhists testamentary power. Without them a business is liable to too many vicissitudes.

(Witness did not give oral evidence.)

WITNESS No. 428.

MR. F. J. WARTH, M.Sc., *Agricultural Chemist to the Government of Burma.*

WRITTEN EVIDENCE.

Manurial requirements of soils.

Regarding Upper Burma I have at present no remarks to make.

The variations are very great and until more work has been done the position cannot be gauged.

The accompanying table shows the composition of six typical Lower Burma soils. Figures for Pwinbyu and Tatkon farms are included for comparison.

	Tantabin. B.	Hmaewbi. A.	Dabein. A.	Pyin-bongyi. B.	Yeda-sha. B.	Kyan-gong. A.	Tatkon. A.	Pwin-byu.
Insoluble Residue	77.24	63.87	66.85	84.05	81.66	84.37	79.40	62.67
Soluble Silica	8.51	15.36	12.99	5.51	8.32	6.08	7.55	12.90
Ferric Oxide	3.65	3.63	4.98	1.63	1.85	1.81	3.17	6.41
Alumina	5.88	10.07	9.64	4.51	4.67	4.65	4.90	10.61
Lime28	.29	.16	.05	.14	.12	.48	.56
Magnesia46	.29	.08	.05	.17	.09	.27	.33
Potash46	.57	.51	.24	.37	.24	.33	.77
Soda29	.36	.28	.18	.15	.18	.32	.52
Sulphuric Acid07	.08	.06	.07	.04	.03	.06	.07
Phosphoric Acid09	.03	.03	.02	.01	.01	.06	.13
Carbondioxide01	.02	.05	.01	.00	.00	.04	.12
Org. Matter Combined Water	3.06	5.53	4.37	3.08	2.62	2.42	3.36	4.91
TOTAL	100.00	100.00	100.00	100.03	100.00	100.00	100.00	100.00

The analyses show that the Lower Burma soils are generally thoroughly leached out and contain only small quantities of alkalis and alkali earths. Almost all these soils are strongly acid.

It has been found that paddy generally grows well on acid soils, but it is possible that in unfavourable years the soil reaction plays a part in reducing the yield to an extent which would not otherwise occur. This question is under investigation.

From the above analyses the relative poverty of the Lower Burma soils is made clear and it is not surprising to learn that while the Pwinbyu soil can produce 80 baskets paddy per acre, many Lower Burma soils produce no more than 20.

Besides the general poverty of the soils, another serious matter is the lack of available P_2O_5 in many cases. The analyses given above show that many of the soils contain very small amounts of this constituent.

The availability of the P_2O_5 in these soils is not readily estimated by analysis.

To do so I have been carrying out during the past three years an extensive enquiry involving soil analysis, pot cultures, and plant analyses.

The methods employed are given in detail in Bulletin No. 13 of this department.

By this means the lack of P_2O_5 in a number of soils has been proved to be serious and the need of phosphatic manuring conclusively proved.

Phosphatic manure in the form of bone is available in considerable quantity, but unless it can be sold at a much lower price than was current before the war it cannot be profitably employed for paddy.

Crushed bone can be produced now with profit at Rs. 60 a ton, and at this rate it could be used for paddy. But if the export market is open and freights normal the material would not stay in the country at this figure.

The available bones are certainly also not collected as carefully as they might be.

In a "Note on available manures" (Government Press, 1912) I have made estimates of the readily available manures in the province.

That large areas of land which are favoured with abundant rainfall and a suitable climate should continue to yield low crops is a matter to cause some anxiety.

It has still to be pointed out that nothing but a drastic change in the agricultural practice of these tracts of the country will make it possible to bring the land up to the high state of fertility of the Pwinbyu farm for example.

The difficulties under present circumstances are :—

1. There is not enough farm-yard-manure available in the area even if it were perfectly conserved and utilised.
2. The area grows practically nothing but paddy, and its low market price makes it almost impossible to manure this crop profitably.

I am not surprised that many cultivators say they cannot afford to conserve and cart their cattle manure.

Experiments and demonstrations would no doubt prove that more can be done in this matter, but it must be realised that the economic solutions will generally not be easy and in some cases it will probably be beyond the means of small cultivator. The department with the small means at its disposal has made excellent progress in production and distribution of superior seed which would give a distinct if small increase in outturn. We have however not been able to even make a start in soil improvement which must be done if the outturn is to be materially increased.

It is probable that soil improvement will involve the introduction of other crops as well as manuring.

This problem really raises the question of the scope of the Deputy Director's work. This officer will always have a full share of executive duties to perform and cannot generally without help do justice to a large question of this nature.

The matter would be best dealt with by a Committee of the department. An expert or perhaps two experts in collaboration will then be in a position to draw up a scheme of work.

A senior officer of Government should be in touch with the committee and experts while the work is being planned in order that he may be in a position to advise Government when the scheme is submitted.

Storing and transport of Agricultural produce.

It would no doubt be of interest to study the storage and transport of all the main products with a view to the prevention of loss and deterioration. I can only give my experience regarding paddy.

In a note on "The Rice Industry of Burma" published in the *Agricultural Journal* in 1912, I have described some of the heaps of paddy exposed to sun and rain which can be seen along the railway line and at wharves.

Since then matters have improved considerably. Dealers and brokers have put up sheds to accommodate a good deal of the produce as it comes in. But either much more cover is still necessary or arrangements must be made to remove the produce at such a rate that the godowns are not overtaxed.

It is doubtful whether any other agricultural product suffers so seriously as paddy when it is wetted.

This point will be brought out by the following considerations :—

The paddy is milled before marketing. During milling the chief loss is caused by breakage of the grain.

The broken grain has to be separated from the whole seed and is sold at a much lower price.

The value of the paddy to the miller and the price he can afford to pay for it to the cultivator depends therefore to a considerable extent upon the amount of breakage taking place during the milling process.

I have been engaged for some time in determining the factors which affect the fragility of the rice grain, and though I am not yet in a position to give exact figures I can say that without doubt wetting and drying the grain increases the fragility more than any other factor examined.

The grain also frequently becomes discoloured which further reduces its value.

It is a serious matter that the chief agricultural product of the province should be so liable to deterioration before it can be put on the market.

Sugar-cane.

I have on several occasions pointed out the value of the sugar-cane crop both economically and agriculturally to the province.

There are undoubtedly many areas in which sugar-cane will thrive excellently.

In 1911 I showed that the Mohnyin valley offered excellent prospects for this crop.

Now that a farm has been opened in this area—to test wheat mainly—it has been found that sugar-cane is very suitable and probably the most profitable crop if a reasonable market can be procured for it.

The Tatkon area and the Pwinbyu irrigated area have also been shown by the department to grow very good sugar-cane crops.

It has also been grown on the Hmawbi farm (Lower Burma) on paddy land.

The last is a notable success when considered in conjunction with the soil requirements of this area.

It is scarcely necessary to point out that sugar-cane can only be satisfactorily marketed after it has been converted into jaggery or sugar.

Government has agreed to the proposal for construction of jaggery-making plant at the Tatkon farm.

I should like to emphasize that all the actual and the many important potential sugar-cane-growing areas can make no progress whatever, and it is little use testing cane on other areas until we know how to convert it into a marketable product.

I am inclined therefore to lay a great deal of stress on the proposed work at Tatkon which would supply information for the whole province. It should be commenced with this wide object in view as soon as convenient and on a liberal scale.

Irrigated tracts.

I have called attention to the opportunities that lie before us in the irrigated tracts if only a greater variety can be introduced into the agriculture of these areas. At present the tendency is for these areas to grow nothing but paddy.

In Kyaukse sometimes early sesamum precedes paddy, but whenever water supply is sufficient the cultivator prefers two crops of paddy. The reason being that as at present grown, paddy is the more certain crop.

In the Mandalay canal tract the cultivators are generally very poor. They use the water practically solely for paddy and have no other crops to fall back upon.

I have noted in this tract that the Pyauing crop (Sorghum) raised on unirrigated patches is frequently more valuable than the paddy to which expensive irrigation water has been supplied. Irrigation experiments on this and other crops are therefore at least worth trying.

The following small experiments carried out by me at Mandalay shows another opening :—

Instead of growing a single long lived paddy crop, a short lived paddy was grown and this was followed by gram. The result was that in addition to a normal yield of paddy of 2,000 lbs. per acre a crop of gram weighing 650 lbs. per acre was obtained.

It is quite clear that no single paddy crop of the most highly selected seed could on this soil show returns equal to the above.

There are two random examples to show that the agriculture of the irrigated tracts requires to be fundamentally changed to produce satisfactory results.

To carry out changes of the nature intended, it would be necessary to lay out elaborate cultivation experiments to study economic, drainage, grazing and other difficulties, and to investigate financing and legislation which might be required. This work cannot be undertaken by a Deputy Director alone. The department, as a committee, would have to take it up and as powerful backing by Government would be necessary, a senior officer of Government should be associated with the Committee from the commencement.

From these notes I conclude that—

(1) More might be done to study agricultural needs from the Provincial point of view.

The scheme for dividing the province into charges each under a Deputy Director is suitable as far as executive work is concerned, but it must involve weakness of policy in cases where the whole force of the department and of Government is required to bring about considerable changes. An expert as Director would, I believe, further this object, but progress is only possible if it is understood that a very important part of the work of all the experts must be consultative in distinction to executive.

(2) To obtain the whole-hearted support of Government it is necessary that a senior officer, *i.e.*, a Commissioner from the innermost council of the Government, should be in intimate contact with the experts during their deliberations.

(Witness did not give oral evidence.)

Mr. A. McKerrall.

WITNESS No. 429.

MR. A. MCKERRALL, Deputy Director of Agriculture, Southern Circle, Burma.

WRITTEN EVIDENCE.

Note on manures and soil fertility

The fact that Burma is a country which is continually exporting the bulk of its agricultural produce while at the same time its imports consist mainly of materials which cannot

find their way into its soils makes the question of the maintenance of fertility an extremely important one. The main agricultural areas of the province are (1) the great plain of Lower Burma growing almost entirely rain fed rice; (2) the unirrigated dry zone country producing cotton, sesamum, groundnut and various kinds of pulses; (3) the irrigated tracts of the dry zone where rice is also the principal crop; and (4) the northern wet areas.

Of these the first is the most important, and the evidence for the necessity of manuring which is given here is derived from experiments performed on typical Lower Burma rice soil at the Hmawbi Agricultural Station.

These experiments have been conducted during the last four years and the figures given below are averages for that period.

The plots were 100 in area, and each had its own unmanured control. For the period 1912-16, over which the experiments were conducted, the average yield per acre of grain for the unmanured plots of the experimental block was 1,250 lbs. The land before acquisition by Government had been cropped for at least 50 years without any manuring except that given to nurseries, and judging from the yields of rice on virgin soils in other parts had probably, during the period of cropping, fallen from more than double its present yield. The yield of 1,250 lbs. per acre is in fact the minimum yield possible, and a balance has now been struck between the yield got and the annual accretion of fertility due to natural causes. This decline in fertility is, of course, not only due to exhaustion of plant food, but has been hastened also by loss of physical texture due to continued puddling of the upper layers.

The effect of various manures on such a soil, which is typical of many of the worn out areas of Lower Burma, will be seen from the following statement which gives the actual figures got at Hmawbi:—

Kind of Manure.	Increase over unmanured plot.
1. Cattle manure to supply 30 lbs. nitrogen per acre	65 per cent.
2. Cattle manure to supply 70 lbs. nitrogen per acre	71 per cent.
3. Cotton cake to supply 50 lbs. nitrogen per acre	38 per cent.
4. Bone-meal to supply 20 lbs. phosph. acid per acre	28 per cent.
5. Superphosphate to supply 20 lbs. phosphoric acid per acre	40 per cent.
6. Potassium sulphate to supply 20 lbs. potash per acre	23 per cent.
7. Sodium nitrate to supply 30 lbs. nitrogen per acre	7 per cent decrease.
8. Ammonium sulphate to supply 30 lbs. nitrogen per acre	69 per cent.
9. Nitrolim to supply 30 lbs. nitrogen per acre	36 per cent.
10. Ammonium sulphate to supply 30 lbs. nitrogen per acre	} Gave 77 per cent. increase in grain yield over the unmanured plot.
Superphosphate to supply 20 lbs. P_2O_5 per acre	
Potash sulphate to supply 20 lbs. K_2O per acre	

With the single exception of nitrate of soda, which gave a decrease, all the manures applied have given increases, in some cases so considerable as to be very striking. We may comment on the above as follows:—

- (1) Cattle manure in Lower Burma is available for the nurseries only and not for the transplanting fields. During the year 1915-16, all the cattle manure conserved at the Hmawbi Agricultural Station was weighed and showed a total of 204,000 lbs. for 32 bullocks. This works out at approximately 3 tons per animal per annum and allowing one pair of bullocks to ten acres of land (the usual rate in Burma) it will be seen that the amount available per acre of cultivated land is only about three-fifths of a ton. As the virtue of cattle manure depends mainly on its action as bulky organic matter on the texture of the soil this amount would be quite insignificant. Hence campaigns to conserve cattle manure will not furnish a solution of the problem.

- (2) Oil cakes. These are far too expensive to be capable of extensive use. A side experiment was performed in 1915 with sesamum, cotton, and groundnut cake to supply 50 N. per acre, but in all cases a net loss varying from Rs. 25 to Rs. 42 per acre resulted from the use of the material.
- (3) The highest yield got was in the plot which received a complete dressing, although the use of ammonium sulphate alone is also striking. But none of these substances can be economically applied. Trials made in 1915 with smaller quantities all resulted in losses varying from Rs. 6 to Rs. 8 per acre as a result of the application of the manure.
- (4) Bones. The amount applied in above scheme is small and further trials were made on large plots to test this substance. In the case of bonemeal and dissolved bones it was found that profits of Rs. 5 and Rs. 6 per acre respectively could be got from their application. The cost of the manure per acre was Rs. 11. This profit, however, is liable to fluctuation, and last year bonemeal which cost Rs. 80 per ton in Calcutta barely paid for itself. There is no doubt about the value of bonemeal for exhausted paddy land, and all that is required is to be able to purchase it cheaply enough. Its use is at present unknown among paddy cultivators, although the amount of bones produced in the country must be very large and the pre-war export was considerable.
- (5) The results got from the application of nitrolim (atmospheric nitrogen calcium cyanamide) are not comparable to those got from sulphate of ammonia. This is probably due to the fact that under the conditions of swamp paddy soils much of the nitrogen in the manure escapes into the atmosphere either as free gaseous nitrogen or ammonia, but this aspect of the matter requires further attention.

From the above it will be seen that the position in Burma with regard to manure is one that calls for immediate attention. Green manuring is not possible to any extent, because by reason of the abrupt fall of the monsoon a green manure crop cannot be raised in time to be ploughed in before the main crop, and this holds not only for paddy but also for all the rain crops of the dry zone. The position may be summarized as follows. Artificial manures and oil cakes are too expensive. Cattle manure is not available in quantities sufficient to manure more than one-tenth of the rice area. Green manuring is not possible. In the case of bonemeal the price is also too high, and hitherto it has been exported, mainly, to Japan and Germany. Yet this manure ought to be available in the country, and if obtained at from Rs. 40 to Rs. 50 per ton would in most cases be a valuable manure. Our recommendations are as follows:—

- (a) An attempt should be made to retain in the country bones, horns and other products of an animal nature. The exports of these in 1913-14, the last pre-war year, were as follows:—

	Amount.	Value in Rs.	REMARKS.
Horns, horn tips and horn meal	5,798 cwts.	1,63,351	Exported mainly to France.
Bones	1,681 tons	1,06,949	Exported mainly to Japan and Germany.

- (b) Government should either promote itself, or subsidize a company to begin an internal trade in the above materials. Prior to the war, bonemeal was made in Rangoon by a German firm, Messrs. Mohr Brothers, who, it is well known, made enormous profits in this business. A Rangoon firm has this year erected a bonemill at Thazi and are prepared to sell at Rs. 65 f.o.r. Their product and this kind of bonemeal has not yet been tested. Besides it is almost certain that Rs. 65 will prove to be much too high a price for its use in paddy cultivation. Mohr Brothers bought bones from the Rangoon Municipality at Rs. 20 per ton, and it should not cost more than Rs. 10 to convert a ton of bones into bonemeal. Allowing another Rs. 10 for profit it should be quite possible to sell bonemeal to cultivators at Rs. 40 to Rs. 45 per ton, and at this price good profits could be got from its application. The amount of bones exported must be a mere fraction of the amount available, and every effort should be made to organize collection and extend the industry.
- (c) A survey of the possibilities of Burma with respect to supplies of fish manure should be made. This material, which is got from prawn refuse, is made mainly in the Mergui district and is almost all exported to the Straits and Hongkong. In 1913-14, 5,029 tons of the value of Rs. 3,56,939 were so exported. In America there is a very large trade in fish-oil and fish-cake, and it is possible that a similar industry might be started in Burma, where the Coast line is large. This would require scrutiny by a fisheries expert. An industry of this kind has recently been started in Madras.

- (d) Attention is drawn to the great waste at all the large municipalities in Burma. In Rangoon the blood of animals is entirely lost and carried by a drain to the Rangoon river. All the sewage of the city meets a similar fate. Enquiry should be made as to whether it would not be possible to render these substances available for manurial purposes.
- (e) The possibility of making atmospheric nitrogen should be a subject of serious enquiry. The Shan States plateau would seem to afford good facilities for hydro-electric power, and the manufacture of nitrogenous compounds by this means, is, apart from its agricultural importance, a matter of common prudence for every province of the British Empire. Unfortunately the Agricultural Department has not yet been able to undertake properly experimental work on the dry zone soils, but there can be little doubt that either calcium cyanamide or calcium nitrate would give even better results there than on rice soils.

The Agricultural Department in its relation to Industrial Development.

The growing of sugar-cane and the manufacture of either jaggery or white sugar are industries which in Burma are capable of very considerable expansion. The Agricultural Department has not had as yet any station specially equipped for sugar-cane work, but a good many trials in various parts of the province have been made. My own experience has been limited to Lower and Central Burma, but I understand that in certain parts of Northern Burma the crop also can be made to grow well. From the trials which have been made by me I have drawn the following conclusions:—(1) that on ordinary swamp paddy soil in Lower Burma sugar-cane cannot be made to grow well and yield a paying profit. This is due to the difficulty of working these soils and to the fact that drainage is not under proper control. (2) That scattered all over the country there are patches of higher well drained rice land on which sugar-cane can be made to grow well. (3) That the small streams which are very abundant in Lower Burma flowing east and west from the Pegu Yoma usually have a strip of well drained and fertile soil along their banks which is very suitable for cane cultivation. (4) The newly opened Môn Canal system in the Minbu district possesses large areas of land which give high yields of cane. The Agricultural Department opened four years ago a small farm at Pwinbyu for the introduction of cane in this area and the cultivation is slowly increasing. It wants, however, the stimulus of sugar or jaggery industry to enable more rapid extension to be made. In 1913 a Rangoon firm proposed to conduct experiments here with a view to beginning white sugar manufacture in this tract, and Government made arrangements to contribute Rs. 10,000 towards the cost of the experiments, the firm to contribute an equal amount and bring planters from Java to work the crop according to Java methods. With the beginning of the war, however these arrangements fell through. During the present year a Mahomedan merchant of Rangoon is erecting a small white sugar factory at Zeyawaddi in Toungoo district. The factory is meant, I understand, to turn out about 4 tons of white sugar and 2 tons jaggery per day, and the owner has been given rebate of land revenue for a certain number of years.

Sugar-cane.

To extend the jaggery industry I consider that the most helpful method will be by means of small pioneer factories to deal with 100 acres or so, the surrounding cultivators being at the same time organized co-operatively. When the factory has been made to pay it might be taken over by the societies and worked by them. This method, however, should be tried experimentally at first and great caution used. When one factory had been made a success it might be possible for societies to find the necessary capital and erect their own factories without Government intervention.

Jaggery.

In the case of white sugar the difficulties are much greater. To run a white sugar factory of even medium size, several thousand acres of land must be under the control of the factory, and for the owner to trust simply to the word of cultivators that cane would be grown where it was not grown before would be an extremely rash policy on his part. I do not see how such large areas can be quickly put under cane except by direct governmental interference, and the only method would seem to be to demarcate suitable areas approach commercial firms on the subject and, in the event of their being willing to undertake the enterprise, to use such legal machinery as already exists or to provide new legislation in order to ensure that difficulties are not placed in the way of the creation of an important industry by the owners of the land. Some method whereby the land became the property of Government and was then leased out to the firm would be what was required. The owners of the land would become *ipso facto* tenants of Government and would be required to conform to such regulations regarding cultivation as Government might prescribe. This policy has not been adopted in Burma on a large scale, but it would appear to be the only alternative to a system of 'laissez-faire.' The alternative would of course be for the firm to purchase the land directly from the owners, provided the latter were willing to sell and it is just the uncertainty regarding their willingness that gives rise to difficulties. I do not consider that pioneer or demonstration factories for white sugar are desirable or feasible. The work is too technical and on too large a scale to be done by Government and can best be done by private individuals. The real difficulty in this case, is, as has just been pointed out, the control of the supply of cane.

Sugar.

During the last ten years the Agricultural Department has submitted a large number of samples of various product for evaluation to the Imperial Institute. These consisted of

Imperial
Institute.

cotton, tobacco, rice, pulse and other materials. I consider that the Institute fulfils a very useful purpose and is capable of giving substantial help to Agricultural Department. Its main function, so far as the latter are concerned, is as a clearing house for information. Being in a position to examine products from all over the Empire its staff is necessarily in possession of wider information than the Agricultural experts in any one province and is able to supply valuable information in connection with crop varieties or in the introduction of new crops. It conducted important analyses for the Agricultural Department here in connection with prussic acid in Burma beans and suggested the Madagascar bean which is at present being experimented with here and was previously unknown to us. It is also the best and indeed the only competent agency for procuring new varieties and has supplied us with rice, maize and pulse varieties from many parts of the world. It is also a valuable agency for bringing agricultural departments into touch with the needs of commercial firms in Europe, and in this connection has recently obtained for me a very valuable series of valuations of Burma rice varieties. Its obvious disadvantage of course is that it cannot be in touch with the local conditions and cannot conduct enquiries where a knowledge of these is of first importance. For example, although it can supply varieties for trial it cannot possibly say which will succeed. This must be determined on the spot.

Agricultural
surveys.

Q. 25. When the Agricultural Department was started here in 1907 agricultural surveys of districts were included in the programme of work and a few were carried out. They had, however, to be stopped owing to insufficiency of staff and pressure of other work. I consider that such surveys are of much importance, but the real difficulty in conducting them lies in getting men possessed of sufficient knowledge to carry them out efficiently. To be of any use they must be carried out by superior officers who have either had the necessary experience to guide them or have at their disposal the advice and guidance of their seniors. Deputy Directors of Agriculture would naturally keep a full diary during their tours which would form the basis of such a survey. It would, however, be better to have the work done systematically, each expert doing one district per annum, the results of the survey being published as a Departmental bulletin. The objects of such a survey should be to ascertain (1) indigenous methods and practices, (2) whether cropping systems should be changed and whether new crops can be introduced, (3) whether improvement in practice is possible or not, and (4) whether there are any indigenous products worthy of attention with a view to their exploitation. With regard to the last I would remark that in a country like Burma which has many little known indigenous products it would be worth while to make a careful examination of these, and for this purpose a special experimental garden, under the charge of one of the plant breeding experts, should be provided. At present attention has to be concentrated on species which have been cultivated for ages and which have an established market. There are, however, doubtless many kinds of fibres, root crops, medicinal crops, etc., now growing wild which might possess economic value if cultivated and improved.

Assistance in
marketing products.

I am of opinion that it would be useful to have a museum of agricultural products in Rangoon, probably to form part of a larger commercial museum. A complete collection of products would form a useful means for junior members of firms getting to know these products and would provide a useful standard of comparison with regard to purity and quality. New crops or improved varieties could also in this way be brought easily and quickly to the notice of firms interested in them. Such a museum should contain samples properly labelled and named with the systematic and Burmese names, and also the name by which each is known commercially, of all the important cereals, pulse, oil seeds, fibres, etc., produced in the province properly arranged and catalogued. It should be under the charge of a Deputy Director and there should be one English speaking subordinate, preferably a graduate, to supervise it.

Need for trained
supervisors.

There is at present in Burma an almost complete dearth of Burmese mechanics capable of being placed in charge of prime movers or of taking charge of small industrial outfits for cotton ginning, oil pressing, and cane crushing. The mechanics employed are mainly Indians. In the cotton ginning industry mechanics are often brought from Bombay for the season and paid good wages. This may be partly due to the disinclination of Burmans to take up this work and to the fact that they can find other employment. It is, however, a state of matters capable of being remedied, and which ought to be remedied. Within recent years Co-operative Credit Societies have expressed themselves as eager to take up oil pressing and cotton ginning, and the absence of trained mechanics is undoubtedly a bar to this. Some time ago it was proposed to institute a class for agricultural mechanics at the Engineering School, Insein, but nothing more has come of the proposal. I believe that such a course would be a great help and enable a beginning to be made in the training of the kind of man wanted, and I would suggest that a trial be made of this scheme. Until something is done the demand which undoubtedly exists for oil engines, power pumps, power fodder choppers, small oil pressing plants, etc., by Co-operative Credit Societies cannot be properly met. There is also a serious lack of blacksmithing skill which is militating against the efforts of the Agricultural Department to introduce improved cultivation implements. Blacksmithing should accordingly find a place in the course. It is probable that, with the development of agricultural education, district agricultural schools, attached to district farms, will be founded. It would be easy to provide a course of smithing at such schools, and the Insein Engineering School could confine itself to producing men competent to act as instructors at the agricultural schools.

Q. 102. I do not know whether the possibilities of the Shan plateau as a source of hydro-electric power have been examined, but, if not, a survey should certainly be made at an early date. In a separate note on manures, the poverty of Burma in these materials has been

Hydro-electric
power.

shown and the manufacture of atmospheric nitrogen compounds provided the process can be cheapened rapidly in the near future would be of the greatest importance to the agriculture of the country.

In a country which produces so much cheap rice as Burma the questions of beginning General industries dependent on rice as a raw material seems worth considering. It is not possible at present to say anything definite on this subject, and the detailed data for estimating the possibilities of such industries would have to be left till such time as a Director of Industries is appointed or be worked out by a commercial firm possessing the requisite knowledge. Those that suggest themselves to me at present are—(1) the brewing of light beer such as Japan is now producing in large quantities, (2) the manufacture of industrial alcohol and (3) manufacture of starch, glucose and special food products such as the Americans have excelled in during recent years. These suggestions are merely given for what they are worth and for the reason that anything which will enhance the present low price of rice, will be a benefit to the province. In the case of starch, Messrs. Colman's representative visited Burma a few years ago in order to consider the possibility of acquiring land in the province so as to make the firm independent of violent fluctuations in price. It would appear that a firm working on the spot and contracting with Co-operative Credit Societies or other cultivators would be in a more favourable position than one thousand of miles away and having its raw material passing through the hands of several different middlemen. To encourage firms in this respect it would appear that the services of a trade representative would be useful.

(Witness did not give oral evidence.)

WITNESS No. 430.

Mr. A. R. H. Ady.

Mr. A. R. H. Ady, Broker and Mine owner, Tavoy.

WRITTEN EVIDENCE.

I.—Financial aid to Industrial Enterprises.

I have had a little experience in raising capital for industrial enterprises which is Capital. — confined almost entirely to Rangoon.

The greatest difficulty I have met with is that the local capitalists are very seldom willing to subscribe to local enterprises. To remove this difficulty, I would suggest steps being taken to place industries on a sound commercial footing so as to attract *bond fide* investors to take them up.

- (1) Capitalists or *bond fide* investors,
- (2) Speculators, and
- (3) Outside Capital.

Sources of Capital.

Possibly the masses or poorer classes would be induced to put their small savings into industries if they were assured that they would be sound investments.

I have no knowledge or experience of financial aid by Government to industrial enter- Government Assist- prises, but I think that all or any of the methods mentioned would prove helpful to those ances. industries that have been proved commercially sound.

Wherever Government assistance is applied there should be Government supervision; such control to last till the assistance has been rendered unnecessary or discontinued.

As far as I know there are no Government Pioneer Factories in this province.

Pioneer Factories.

I think such factories should be established all over the province to deal with the natural products of the country. These factories should be closed as soon as they are found to be unprofitable or made available to the public as soon as they are proved to be commercially sound. These factories should on no account be turned into permanent Government enterprises or they would defeat the object for which they were started.

Financing agencies are generally a failure. I attribute this to the want of expert Financing agencies. advice and the lack of proper management. The only financing agencies I know of are syndicates or groups of capitalists who take up certain industries such as Mining, Sugar, Cement, Paper, Shellac, Crockery, Glass, Tinning Fruit, etc. I have been personally interested in a good many syndicates of this nature which have proved failures for the want of—(1) expert advice and consequent underestimating of the capital required, and (2) good management after the venture has started operations. The starting of Government pioneer factories would enable such syndicates to take up and carry on with assured success any enterprise that has been proved commercially sound and for which expert advice is available.

If all Government pioneer factories were made available to the public and the conversion Limits of Govern- of such enterprises into permanent Government establishments prohibited, there would be no ment assistance. fear of such aid competing with established external trade.

II.—Technical aid to Industries.

I believe demonstration factories can with advantage be started for the following Demonstration industries:— Factories.

- (1) The manufacture of Cement. The raw material is to be had in abundance in the province, which has been found by a syndicate originated by me to be capable

of being turned out as high class cement; (2) Dyes, (3) Fibres, (4) Lac, (5) Pottery, (6) Paper, (7) Sugar, (8) Tobacco, etc. etc.

Surveys for industrial purposes.

I should say that the existing knowledge of available resources of the country:— agricultural, forest, mineral, etc., is not what it ought to be, and a liberal policy in regard to surveys, especially agricultural and mineral, would be of immense value.

III.—Assistance in marketing products.

Exhibitions.

I think exhibitions of all kinds should be started and encouraged by Government. They should be popular in character and as a natural sequence would aim at bringing sellers and buyers into contact.

IV.—Other forms of Government aid to Industries.

Supply of Raw Materials.

Government owned raw materials should be made available on the most favourable terms possible in order to encourage the establishment of new factories.

Land Policy.

The land policy of Government is certainly a check on the agricultural expansion of the province. There is, I understand, a desire on the part of the Government to prevent the landlord class from predominating. It is very good in theory to have only agriculturalists owning land, but such a policy is possible in theory only. There are a good many ways through which the small holder can and does pass his land on to the landlord class, and it is done in the majority of cases whether such a practice is sanctioned by Government or not. After all who are the landlord class but people of the country who have become rich through their own exertions?

To try and compel the lazy man to become industrious is an impossible task and giving him land or compelling him to hold his land will not mend matters. To allow no one but the agriculturist to acquire and hold land would do a great deal of harm to the country by retarding the development of land and extensions in agriculture notably with reference to paddy lands.

I think encouragement should be given to any one willing to develop land either for agricultural or industrial purposes.

I think the present law in this country for the acquisition of land for Government purposes is quite sufficient.

IX.—Other forms of Government action and organization.

Transport facilities.

Roads, railways, and waterways are very much neglected in this province. A great deal can be done to open up new agricultural and mining districts by constructing more roads and railways and making existing waterways navigable.

A railway connecting Moulmein with Tavoy is of vital importance. A survey has already been made and it is understood that there are no insurmountable difficulties. This line would open up a long tract of country known to be well mineralised and in parts very suitable for plantations. The Tavoy communications with Rangoon are at present very bad.

Mining and Prospecting Rules.

So far as the Tavoy District is concerned, where I have mining interests, I have no criticisms to offer on the working of the Mining and Prospecting Rules.

(Witness did not give oral evidence.)

WITNESS No. 431.

Mr. H. Walkem.

MR. H. WALKEM, Superintendent, Government Reformatory School, Insein.

WRITTEN EVIDENCE.

Pioneer Factories.

My opinion as to the utility and necessity of Government pioneer factories is based on acquaintance with the rubber plantation which under the management of a Forest Officer the Government established in Mergui and eventually sold to a private company during the rubber boom of 1909-10. The plantation before it changed hands accomplished the purpose for which it was established for—(1) it demonstrated that the soil of Lower Burma was suited to the cultivation of rubber as a profitable business, and (2) enabled novices to obtain within a short period all the knowledge necessary to run a rubber plantation.

Only those industries for which raw materials and labour can be obtained in the province itself should be pioneered by Government by the institution of pioneer factories. The adoption of these two conditions is suggested for the following reasons:—(a) There are extensive tracts of virgin soil waiting to be utilized for the cultivation of jute, cotton, etc. As these tracts are opened out factories could be started and thus a twofold sphere of suitable employment would be provided for the children of the soil, a fair and vigorous proportion of whom for want of suitable work are now in the provincial jails. The Burman loves to live on the land if it will maintain him and his family.

There are many reasons why the Burman in his own country should, in the opening stages of industries, be protected against the importation of cheap labour from India. It

should be possible to overcome the difficulty of skilled labour at the start by sending picked Burmans across to India to acquire the requisite knowledge in up-to-date factories which it is intended to reproduce in Burma.

(b) When pioneer factories begin to pay their way and yield dividends (considering they will be started and maintained from provincial funds) they should be sold only to those companies that employ a large proportion of local labour and capital and are willing to take in apprentices for whom Government might conveniently give scholarships. It will be necessary in this and other ways to guarantee the supply of skilled labour in increasing numbers if industries are to expand and become an asset of the province.

Since industries in which Government interests itself are established for the general good as opposed to private gain, Government should reserve to itself the right to retain permanently any factory, the utility and purpose of which in its opinion would suffer if transferred to private management.

Demonstration factories to teach locally how to manufacture rubber goods should be adopted as the supply of raw material will be steadily on the increase. Demonstration factories.

Commercial museums should be established in the business capital of the province with branches in important industrial centres under the control and management of an industrial committee. Once these are established the value of exhibitions would wane. Commercial museums.

The labourer to begin with should be given a sound primary education which should include such subjects as will train the hand and eye to work with speed and accuracy. Government vernacular schools should be semi-industrial in the primary stage, but altogether industrial above that standard. (Purely literary education might well be left entirely to Buddhist Monks.) In these schools the very best and most modern tools and machinery should be employed and scrapped as soon as they become out of date. Training of labour.

A boy who has passed through an industrial school when compared with one who has only passed through an ordinary school is—standard for standard—more intelligent and self-reliant than the latter and is able to get fairly good employment more easily.

Supervisors, etc., who have proved their efficiency and worth ought at intervals to be allowed to attach themselves for a maximum period of six months on full pay to any factory, which in the opinion of the head of the department is ahead of all others as regards equipment, plant and methods of work. When such hands visit Europe on furlough they should be allowed travelling allowance to enable them to visit works similar to those in which they themselves are employed. Practical training of Supervisors.

(Witness did not give oral evidence.)

WITNESS No. 432.

Mr. J. D. McNeillage.

MR. J. D. McNEILAGE, Technical Instructor, Government Engineering School, Insein.

WRITTEN EVIDENCE.

Training of Labour and Supervision.

I was trained in the workshops of the Clyde Navigation Trustees at Dalmuir, Scotland, serving an apprenticeship of seven years and attending the evening science classes at Clydebank. Since completing my apprenticeship I have had experience in workshops at Home, at sea, in saw mills, rice mills, etc., and for the last ten years have been engaged here as Technical Instructor. I left the British India Steam Navigation Company in 1893 for work ashore in Burma so that I have been over 28 years in this province. As the result of my experience here I beg to submit the following:—

Q. 44. (a)—Yes, particularly in the case of pattern makers, engine fitters, machinemakers, blacksmiths, carpenters and cabinet-makers. To be efficient in these trades men should be able to understand plain drawings and written instructions; when they do not, the European in charge has to see to every petty detail and this wastes time, adds to the cost of production and reduces the output. Whether lack of primary education hinders industrial development.

Q. 44. (b)—Nothing.

Q. 45. (a)—In most trades there is too great a gap between the highly trained European and the men he controls. They can learn little from him as he has not time to correct defective methods, and, as the master, or native foreman, is simply a higher paid native workman, his methods are the same. An intermediate class of foremen is required who would be with the men on the work, improving their methods and directing them when drawings or instructions were not understood. Such a class is now being trained in the Government Engineering School at Insein, and with a few years' experience these lads should be able to improve the men working under them and produce much better results than are now obtained. This applies to engineering in all its branches, but is true also of other industries. Steps to improve labourer's efficiency.

Q. 45. (b)—In all branches of engineering and kindred trades, *viz.*, pattern making, machining, engine fitting, moulding, carpentry, cabinet making, plumbing, etc., an apprenticeship of five years should be required, during which period the apprentice should be under the special care of the best workmen in the shop and under the supervision of the type of foremen mentioned in 45 (a).

With such an apprentice system it would be necessary *gradually* to shut out from these trades all who had not served such an apprenticeship, for if men are permitted to work without the worry and expense of an apprenticeship why should others serve one?

When men without proper training are permitted to work with trained men and more so with apprentices, they lower the standard of work, introduce slipshod methods and ruin apprentices. They can be got at lower wages, but they are never cheap. To-day any Burman who can muster a saw, a plane, an axe, two or three wood chisels and a pencil calls himself a carpenter, even when he cannot read a common foot rule. These men have no training, there is no chance of a training for the Burman in carpentry as Chinamen monopolise the trade. During the troublous times that preceded and followed the annexation of Upper Burma, no one cared to have Burmans about him with their axes and other edge tools, and during this time the Chinaman got a footing that he has since maintained and extended.

If Government would exclude from their list of contractors all workshops and contractors who failed efficiently to train apprentices belonging to the province, we would soon have a very much improved type of workman.

Q. 46.—No special knowledge, unless the fact that I have served an apprenticeship of seven years, along with dozens of others who were doing the same and among hundreds of workmen each one of whom had served his time, can be classed as such:—

In mechanical engineering the apprentice system of training in force in Scotland seems to be considered satisfactory, if one may judge by the number of Scotch engineers found in all parts of the world. In Scotland with the Trade Union Spirit Strong, every workman feels it his duty to teach apprentices working with him and apprentices consider they have a right to expect instruction from the men. Here, in Burma, the men try to keep all information from the apprentices who are not of their own caste, race or creed, hence my remarks at the beginning of 45 (b). Prentices here are allowed to drift as they may, the Europeans have not the time to bother training anyone, and the workmen will not and often cannot train or teach anything. Large workshops here are managed—not by engineers—but by the office and the office is concerned *only* with this year's dividends and bonuses, not with the training of the men of ten years hence.

Qs. 47 & 48.—I know nothing of industrial schools.

Q. 49.—The nearest to "day schools for short time employes" that I have any experience of is the Engineering School here. With us, students meaning to follow mechanical engineering enter the school in June and study there till December. In January they are sent to selected workshops and work there till June, back then to school till December and this programme is repeated for three years, after which the student continues in the workshop till he completes his full five years apprenticeship. These lads are much above the average workman and are really engineering students, the class referred to in 45 (a).

We have also an apprentice class getting the training I recommend in 44 (a); they are being taught drawing and simple estimating and must go through a short course in carpentry, smithy work and fitting before they are allowed to select, or before they are selected for one of these; their fitness for one or other is soon seen and they are then kept at that for the rest of their time. I cannot speak of results yet as our oldest apprentice is only in his third year, but they are very promising.

As for night schools, they suited us in Scotland, but whether they would succeed here at present is another question. In small workshops at Home the foremen pressed the lads to attend the science classes at nights and usually put them to work during the day on parts that they were studying in the classes at night. Had we the type of foreman here that I refer to in 45 (a) he could do much to make such schools a success, by encouraging lads who attended them.

Q. 50.—Technical schools should be under a Department of Industries as this department would have information of a practical nature as to the needs of the country, be able to assist lads in the choice of a trade and be competent to say what should be taught and how it should be taught. It would keep in touch with the lads trained, watch their progress after leaving the school, then correct mistakes, alter and extend the training given so as to produce the training required.

In the matter of two departments working together in controlling industrial or technical schools, I am of opinion that technical schools should be under the Industries Department only. I cannot see where the present Educational Department could be of any service in such affairs and it is quite possible that much harm might come from dual control, but in the matter of ordinary education, the two departments should draw up a course of study suitable for lads intending to enter a technical school. To spend a third of a boy's time on Latin, French, Greek and literature generally and then thrust him into a technical school, weak in mathematics and utterly ignorant of physics and chemistry is common practice to-day, but it

Apprenticeship
system.

Co-ordination of
systems.

Control of technical
schools.

is an awful waste of time, energy and opportunity. Latin, Sanskrit, etc., are studied for years, then forgotten in a few months, they are never used and during the rest of his life the man wonders why he was compelled to waste time on these things and yet never entered on studies of real importance. We require a course commencing at about the 5th standard that will lead up to the training in the technical schools. Physics and chemistry form the basis of practically all technical training, the schools should take these subjects up thoroughly and drop the study of dead languages in this live age.

Q. 51.—First of all, trades should be clearly defined so as to distinguish between trades and branches of these trades. A civil engineer is—among other things—a trained surveyor, but a surveyor, however well trained, is not a civil engineer. A mechanical engineer should be equal to any fitter in engine fitting, but a fitter is not a mechanical engineer, so if men for the superior grades are to be trained they should be trained as far as possible in all branches of that trade. These lads should have an education equal to the "Entrance" but without the burden of Latin, Pali, etc., and including physics and chemistry. They should then enter a technical school, study part of each year there and part with some firm carrying on the work the student intends to follow, serving a five years apprenticeship in all.

Training of Supervisors and Managers.

As for training "Managers," I fear that cannot be done, the best training possible will not fit a lad to manage or conduct work on a large scale; capacity for managing comes to those who have the natural aptitude for it, through technical training and experience, experience being by far the greatest factor.

Q. 52.—None, unless Government intends to take over and work the industry. If private firms, that are to benefit by their workers studying methods in other countries, do not consider the gain worth the cost, why should the province be asked to pay for it. We have firms in Burma paying dividends of about 50 per cent. that do not spend a rupee on training anyone.

Assistance to private employes to study abroad.

Q. 54.—In marine engineering there is; we have the Colonial and the Local Certificate; the Colonial certificate declares the holder qualified to have charge of engines in any sea, but the Local certifies him capable of taking charge of the same engine only on the coast of Burma. In the Indian Empire, Calcutta, Bombay and Singapore issue Colonial certificates, so an engineer sailing between Rangoon and Madras or any other port save the three named, has no chance of examination save for the useless Local Certificate. Rangoon in this matter is treated as a place of no importance and this has been complained of by marine engineers for over 20 years to my knowledge. Board of Trade examinations are held in Glasgow and in Greenock, towns only 19 miles apart, with good railway connection, but Rangoon over 600 miles from the nearest examining centre, is not yet considered of sufficient importance to have examinations for Colonial certificates.

Mechanical Engineers.

In the examination for land engineers, there was a want of uniformity, whether that is so now I cannot say. These tests should be the same not only for the various provinces of India but for the British Empire.

If the Board of Trade can standardize examinations for marine engineers so that certificates issued in New Zealand, Australia, Singapore, Glasgow, Belfast and London have all the same value and are all accepted throughout the Empire, surely the same can be done with land certificates. The skill and training required to take charge of boilers and engines is the same no matter where the boiler and engine may be erected and any certificate issued by the British Government should hold good throughout the Empire.

On many of the other questions I have opinions but without experience to give them weight, or me confidence to express them.

(Witness did not give oral evidence.)

WITNESS No. 433.

Mr. S. S. Halkar.

MR. S. S. HALKAR, B.A., LL.B., Pleader, Chief Court, Rangoon.

WRITTEN EVIDENCE.

I.—Qs. 1 to 14.—I started a company to manufacture acetic acid from wood distillation. The difficulty in raising the necessary capital arose from the people's diffidence as to the success of the business. People would invest capital if Government guarantee proper management and successful and scientific organization of the business.

I am sure supply of machinery and plant on the hire-purchase system would encourage many industries.

Financial aid to industries.

Provision of part of share capital, guaranteeing dividends or purchase of products may be necessary in dubious industries but not in all cases.

Government control may be necessary to create confidence in the proper conduct of the industries even where Government assistance is not taken up. Government should pioneer industries which are new to the provinces and which people would not easily take to being unfamiliar; joint-stock banking is practically non-existent in India.

Including head offices and branches, there are approximately 354 banking offices located in various parts of the country giving little more than one banking institution to one million of the population.

1. Tap the hidden wealth of India.
2. Create confidence of people in banks so that they may take their money to them and place it there, Government should guarantee these investments and deposits and dividends.
3. State financing need not necessarily mean helping from funds belonging to the State. It can be done in a manner which would procure the capital from the industrial enterprises themselves, e.g., by giving credit facilities to industries at opportune moments.
4. In some cases Government may play initially an important part and pioneer new industries and hand over the same to syndicates formed by the people at cost price or at a premium. The industrial banks should give free credit to the registered industries; credit is capital.

Industrial co-operative societies may be formed in each taluk and district to control and encourage minor cottage or home industries. Proper management should be guaranteed by the Government.

Answer to question 14 is in the negative.

Technical aid to industries.

II.—Qs. 15 to 27.—There should be one scientific and technical research institute in every province, maintained partly by the State, partly by the municipalities and people of the respective province. The experts from such institutes should be freely available to new industries until established, only on payment of the travelling and boarding expenses of the expert and nothing more. Permission of the private concerns would suffice to publish results of research. Demonstration factories should form part of such institutes.

Research abroad may be necessary in highly intricate matters of inventions not in ordinary industries in which Japan and Germany are exploiting India.

Question 25, etc.—Existing survey reports being written in English technical terms are not within the easy reach of the masses. They should be published in simple vernaculars and should be amplified in many places; they are imperfect now.

Assistance in marketing products.

III.—Qs. 28 to 39.—Commercial museums such as those in Calcutta should be established in every province side by side with the demonstration factories and the science and technical institute. Products of minor and unorganized cottage industries may be sold by auction once in a quarter or six months and the traders or merchants may purchase and sell at other provinces at a profit. For some things which would fetch proper prices at distant markets, Government may establish sale agencies and trade representatives; banking facilities should be offered very freely. See II.

Land policy.

IV.—Qs. 40 to 43.—The present land policy, at any rate in Burma, requires a thorough change. I purchased about 4 acres of land on the other side of Pazundaung Creek from a Burman who held an agricultural lease of it; I wanted to have my Acetic Acid factory there being close to the river, but I could not do so as I would have had to pay an enhanced tax of about Rs. 800 per acre instead of Rs. 4 per acre. I cannot even put a small building on it. Such policy discourages industries. Every concession regarding land should be given to the industries, provided the industries are situated in industrial zones, i.e., not injurious to the health of the people.

Training of labour and supervision.

V.—Qs. 44 to 55.—I personally worked in a Bombay cotton mill after graduation as an apprentice with a view to pick up the subject and become the manager. The then manager would not freely teach me; I fiddled up all the parts of the machinery; still I did not understand it thoroughly; my experience is that theoretical training co-ordinated with apprenticeship would be better than apprenticeship alone.

The hereditary system, I mean son following the father's occupation from the very childhood, is very useful training, e.g., as a carpenter, smith, engineer, labourers should be compelled to attend night schools at least for an hour a night and employers should be compelled to arrange for the same even by deducting a rupee or so from their monthly wages and promising promotion or better prospect as an encouragement and reduction on failure to learn.

Official organization.

VI.—Qs. 56 to 62.—Certainly there should be in each province a Board of Industries attached to the science and technical college and demonstrative factories previously referred to. This Board should not only be advisory but itinerant and missionary—I mean should tour round the province, hold lectures, preach to the leading and middle classes in vernacular and English about the prospects and investment in particular industries and wake up the people, e.g., a chemist or a geologist instead of lying in his laboratory or house must go round and demonstrate to the people of different districts and localities, and organize necessary companies to start the industries; then they should foster the industries by occasional advice and inspection. In some cases they might require to be managing directors till others are trained. There should also be an expert official Director of Industries with necessary assistants and accountants who should see to the management of all registered industrial concerns in the province. This Board should have executive powers and should have power to recommend State financial help when necessary.

VII.—Qs. 68 to 81.—*Education*.—The whole system of education requires a drastic change. It should be compulsory science and economic education, commencing right from the elementary classes and not rivetted to the university or post-graduate stage as is done in the 'Tala's and other institutes. The texts should be of the series known as Science Readers instead of Royal Readers, Fables or Novels. Economic lessons should be interspersed in the science readers and these readers should be translated into vernacular readers to be taught in vernacular classes which would be repeated in English classes but in greater detail and with better performance of experiments. The books should be taught with interesting experiments to the boys who would take greater interest in observing than in the present system of mechanical cramming dry verbose strings of words. They would attract larger number of children to schools, so the curriculum of vernacular, Anglo-vernacular and College studies should be consistently based on this scheme and the subject should be made attractive by organizing lectures in vernacular impressing the practical application of science to life and to economic developments. This system would revolutionize the present deplorable state: 95 out of every 100 are illiterate: 75 out of every 100 go without chance of attending school, 999 out of 1,000 pass through the world without even elementary instruction in science and only about three in a lakh go through an ordinary regular course in science and as a result our average life's span is not more than 23 years whereas in advanced countries it is 45 to 50 years.

Organization of scientific education.

Unless some such scheme to train the students from the beginning is devised it will be difficult to find intelligent and promising students to take up technical subjects. There should be institutes of science with technological departments in every province; of course in the most advanced ones on a large scale. An imperial one may be one in the whole country; but there should be provincial ones also; subjects of experts' research of study would depend on the natural resources to be developed in each province.

Reference Libraries and College of Commerce must be added to the Main Institutes previously referred to. Everything should be within the easy reach of the students without travelling over to other provinces which very few can afford to do.

I have seen the Indian Institute of Science at Bangalore; it helped the organization of the sandal wood Oil Factory there; it can help the start of hundred other industries if only the professors and students tour round and approach and enlighten the leaders of the people about promising industries and investments rather than confine themselves to their quarters and wait for the invitation from people.

VIII. Qs. 82 to 88.—These publications should be by way of cheap directories in vernaculars and they should occasionally appear in the ordinary local newspapers. The journals should be in vernacular and the itinerant missionary experts should make use of these statistics to impress on the people advantages of their respective industries. At present very few people know where to get the necessary commercial intelligence though there is a Director General of Commercial Intelligence.

Official publications.

IX. Qs. 89 to 108.—The Registration certificate, Patents and Company Registration should be made as attractive and cheap as in Japan. People should be initially helped by the Government to have their own companies of steamers, as at present, owing to want of competition, people have to pay heavy freight, and their trade and industry are handicapped. Care should be taken to see that larger companies don't kill the smaller companies by foul means.

Other means of Government assistance.

Q. 102.—Government should float companies, and after giving the people fair chance of investing their moneys by purchasing the shares, Government should make up the deficiency by loans and make use of all the rivers and waterfalls useful for such purpose and demonstrate to the people the utility of such power to various industries; Indians of the present day would be very slow to take the initiative unless the Government preach and get them to start such things as has been done in the case of Agricultural Co-operative Societies.

Q. 103.—I have spent and lost a large amount in my Wolfram Concession at Tavoy and I know many of my friends have also suffered. This would not be the case if the Government geologists and experts were freely available to the people whenever necessary at a small cost of bearing their travelling and other incidental expenses. People's impression at present is (though they may be wrong) that their help is not available at all. In fact some of the Government geologists hesitate to see the Indian concessionaires at Tavoy and Mergui. I would say the Government geologists are treating their investigations as great secrets from the mining adventurers with the result that thousands of rupees are lost by the people in working wrongly or at places where they ought not to have worked. Government have engaged one geologist for advising petty concessionaires, but their impression is that he came to their mines to report against them rather than to help them. The ground rent and the initial license fees should be altogether abolished, increasing the royalty on the output if necessary.

X. Qs. 110 to 113.—I have been Chairman of the Board of Directors of the Nathsingh Oil Company for the last four years more or less. If the Government would guarantee proper honest and intelligent management of the registered companies, people will form new Oil Companies. All the goods, toys, glassware, etc., imported at present from Japan are producible in India and Burma. The dyes can be made from the natural resources here with sufficient knowledge of Chemistry.

General.

Sugar industry on a large scale would be successful. There is ample field for several more companies like Tata Iron and Steel works. India is self-contained as regards raw material even regarding coal or any such fuel.

Considering the fact that the State Forests in British India aggregate nearly 250,000 square miles or more than one-fifth of the total area under English administration, and the fact that the Revenue which India draws from the forests is put at about a million sterling annually after all the expenses are paid, which works out at the ridiculously low figure of less than two annas an acre, I would say that there is ample scope for development of Indian forest industries.

Wood distillation, dyes, tans, gums, resins, camphor, grasses for paper pulp, bamboo industry, etc., should be started and rapidly developed. For this purpose forest development should, like irrigation, education, etc., be made imperial instead of provincial.

(Witness did not give oral evidence.)

Mr. J. D. Clifford.

WITNESS No. 434.

Mr. J. D. CLIFFORD, Deputy Conservator of Forests and Director, Burma Forest School, Pyinmana.

WRITTEN EVIDENCE.

II.—Technical Aid to Industries.

Large areas of forest land still require to be surveyed. Surveys (4"=1 mile) should be made as quickly as possible for (1) all forest reserves, and (2) important unclassified forests. This work is best carried out by the Forest Survey branch of Indian Survey Department, and for it to be carried out within a reasonable period a considerable increase of trained staff will be necessary. The cost should be borne by the Forest Department, but no immediate increase of revenue can be expected. Not until such maps are available is it possible for reliable forest working-plans to be made and without such working-plans timber cannot be extracted to the full capacity of the forests without detriment to their capital value.

F.—Training of labour and supervision.

Lack of primary education hinders development of forest industries, such as—

- (i) felling and extraction of timber,
- (ii) cutch boiling, and
- (iii) charcoal manufacture.

The methods at present in vogue are extremely wasteful, were most of them practised before the annexation of Upper Burma, and scarcely no improvement is perceptible in the last ten years.

Technical education.

My experience of technical education extends over four years only and is limited to the Burma Forest School. This institution is more in the nature of a training school than a technical one. It is directly under theegis of the Chief Conservator of Forests advised by a Board of Control, which has for one of its members an officer of the Indian Educational Service. The latter is purely advisory. I am unable to suggest any better method of control. There are two courses of instruction in forestry and cognate subjects, one entirely in English and one entirely in the vernacular. I regard the vernacular training as very important even though it has to be very largely imparted by forest officers whose mother tongue is English. The English theoretical course is more advanced than the vernacular, but the practical training with a few exceptions is identical. The latter training is spread over the whole two years' course and extends over seven months in each year.

In my opinion a great deal might be done by Government to assist primary education by establishing well organized vernacular training schools. They should be directly staffed by selected imperial and provincial officers of experience.

IX.—Other forms of Government action and organization.

Transport facilities.

Lack of properly graded forest cart-roads prevents extraction of large quantities of valuable timber other than teak. Such timbers as pyinkado, in and kanyin, and many other valuable species whose timber will not float, in order to be placed on the market cheaply, are dependent on extraction roads as mentioned.

The Forest Department should be allowed to spend more money annually on this work, regardless of increase of revenue which, however, would, undoubtedly, take place within a few

years of the completion of connected schemes of road construction. I consider the Forest Department should bear the cost only of those roads actually within unpopulated forest areas, all connecting roads outside these limits being paid for by district funds.

As regards timber I am of the opinion that more extensive use of mechanical appliances should be made in order to avoid expensive elephant power. The latter cannot be entirely superseded but should be restricted to work in floating streams and small depôts. Block and tackle extraction with the aid of buffaloes might be greatly extended, even in the hilly forests, as has been done in parts of the Pyinmana forest division and, I understand, in the Prome division. Assembling raw products.

Portable tramways, skidders and jacks are not used by lessees to the extent that they ought to be, and no doubt would be, were competition more keen and large profits in timber extraction not so easily made.

Planting of teak could be carried out by the Forest Department on a much more extensive scale, but not with advantage unless staff and expenditure be increased. No appreciable financial return from teak plantations need be expected for the first fifty years, and it is by no means certain that the amount spent in the costs of formation could not be more profitably spent in other ways such as increasing the growing stock of this species in existing natural forests. As yet no teak plantations have reached maturity in Burma, though from experience in Java teak can be profitably grown there in artificial forests. Concentration of special kinds of trees.

Timber for special industries such as matches and packing cases should be grown in extensive experimental plantations forthwith. Fuel plantations of considerable area are desirable in certain localities, and the question of making these a form of communal or village forest, I believe, is still under consideration. Experiment in these is, however, badly needed and might avoid much waste of expenditure in future. It is impossible for the research officer to carry such out on a commercial scale, and I recommend the appointment of a special officer for such work advised by the Forest Research Officer.

(Witness did not give oral evidence.)

Mr. M. Hunter.

WITNESS No. 435.

Research.

MR. M. HUNTER, M.A., C.I.E., F.C.S., Principal, Rangoon College, Rangoon.

WRITTEN EVIDENCE.

I think it may be taken for granted that a considerable extension of research work in connection with raw materials in Burma is urgently required, and under present conditions it seems hopeless to expect any such extension except by direct Government enterprise and control. Three main lines of research seem indicated: (1) agriculture and agricultural products, (2) forest products and (3) minerals and mining. The present Agricultural Department is Provincial, but requires large extension to cope with all the work required in the Province, the Forest Department is Imperial and the members in Burma are engaged in administrative not research work, while the Geological Survey Department, which has done so much for the development of the Province, has to cater for the whole of India and cannot give that attention to detail which the Province demands.

On the whole I am in favour of Provincial experts in various subjects as against Imperial ones, and as a corollary Provincial departments rather than Imperial ones. It is true that the member of an Imperial service may take a wider view than the member of a Provincial one but the balance of advantage in favour of the Provincial expert lies in his continual presence in his Province, ever ready to take up any subject which may be mooted, his familiarity with the language, customs and habits of the natives of the Province and his natural feeling that the development of the Province is to him a matter of personal concern. The local experts ought to be able to get into touch with workers in the United Kingdom whose work lies on similar lines, (possibly the Sub-Committees of the Advisory Council of Research might be the advising medium) as in many cases they will be working more or less alone and without access to good libraries, hence difficulties may arise which can be easily settled by reference to experts who are in a position to command the use of extensive libraries and to discuss problems with men engaged on more or less similar work. Provincial experts necessary

I am not in favour of loaning a Government expert to a private firm in the sense that he should be a servant of that firm. If a firm applies for help from a Government expert and such help is given the results should be the property of Government which should decide whether it would or would not be desirable to publish them. Publication of results of researches of Government expert with private firms.

As regards Technical and Industrial schools (as distinct from Technological Colleges or Institutions) I think that the Department of Education should control them, there should however be members on the Visiting Boards or Governing Bodies of these schools representing the Department of Industries to prevent the almost inevitable tendency of the Education Department to make the courses too theoretical. Control of technical and industrial schools.

I think it desirable to establish in Burma a Board of Industries with executive powers and budgeted funds. At the start the Director should be a non-expert official with an Board of Industries.

extensive knowledge of the Province and good administrative ability, later on a technical expert from the staff of the Board might well be made head. The duties of such a Board might well be—

- (1) To direct the technological College or Colleges;
- (2) To collect information regarding present industries and to suggest methods of development and carry out research on points connected with these industries.
- (3) To collect information regarding the raw products of the Province, undertake research work on them and suggest and encourage the establishment of new industries in connection with these products.
- (4) To collate the work of Government experts not attached to services already established.

The Board should be the medium of communication between the experts employed and the Boards in other Provinces and also provide the channel for referring questions to authorities in the United Kingdom.

Technical aid.

Apart from the Agricultural Department there is no technical or scientific Department (exclusively confined to Burma) which can give technical aid to industries.

Provincial experts.

I have suggested above a Provincial Board of Industries rather than an Imperial one. The Local Government should have, as it has now, its own agricultural experts attached to the Department of Agriculture, it should have also experts for mineralogical survey and mining engineering, for examination and research on forest and other vegetable products and most important of all trained research and technical chemists. The research work should be done in a Technological College or Institution (see below). The experts themselves should be permanent Government servants, their pay should be liberal and the prospects good in order to attract capable men, it is, however, no use expecting to obtain men of long experience and wide reputation as such men will not give up their chances in the United Kingdom. The Technological College or Institute might well be modelled on the Manchester Municipal School of Technology, as a teaching institution with proper administration and equipment will, as a rule, do better research work than a purely research institution.

Technological
Institute.

The main feature of the administration of such a school or institute should be that the heads of the different branches should not be overburdened with routine teaching as is the case in practically every Arts College in India, they must have ample times for research and opportunities for introducing their own students and, when suitable, students from other colleges to methods of research and for teaching such students to give them help in the various researches they are conducting.

Indian Science
Congress.

I have no personal acquaintance with the Indian Science Congress, but it seems to me that it can give important help in developing the technical research described above by providing at its annual meetings a common meeting ground for the workers in the different Provinces. The scientific experts of each Province should be encouraged to attend the meetings and a short resumé of the work done in the different Provinces should be given. If this is done overlapping of research work in different Provinces can be avoided and no special Board need be established to prevent it. Apart from this, such meetings will have a stimulating effect on the expert workers. Not only will they learn what work is being done in the various centres, what difficulties are being encountered and how they are being met, but also they will have an opportunity of discussing the different aspects of their work with others engaged on more or less similar lines and such discussions cannot but be beneficial.

Reference Libraries.

Here in Burma the absence of a good technical library with sets of journals as well as standard technical works is much felt. Such a library should be established in Rangoon as a branch of a large free library which should receive ample support both from Government and from the Municipality of Rangoon.

(Witness did not give oral evidence.)

WITNESS No. 436.

Tavoy Chamber of
Mines.

TAVOY CHAMBER OF MINES, Tavoy.

WRITTEN EVIDENCE.

Preliminary report to the Indian Industrial Commission.

The Chamber has had under consideration the circular entitled "Preliminary Note on the Scope of Enquiry by the Indian Industrial Commission" and a report has been submitted by the Sub-Committee appointed to consider the circular. Examples and specific instances to support the opinions of the Chamber will be given when required but for the present the points raised have been dealt with in a general way.

With the exception of one or two matters which are of interest to the Tavoy district it was decided to confine attention to questions bearing on mining, and in particular to those relating to the wolfram industry.

Introduction.

Of the points raised in the introduction in the Circular, clause (d) was the only one on which the Chamber expressed their opinion. This was to the effect that any arrangements by which information of what was being done in other mining fields, and in particular of the most economical methods of extracting wolfram concentrates, would be of great advantage. The Mining Adviser of Tavoy, having familiarised himself with the literature of other wolfram mining fields, could send occasional notes to the Chamber for circulation and these could possibly prove very helpful. The Chamber, in conjunction with the Advisory Board, has arranged a series of lectures which will probably prove profitable in this direction to the mining community.

Collection of Preliminary Information.

The Chamber is of opinion that most of the information likely to be required by the Commission is now available and could be imparted (1) by answering in writing specific questions put by the Commission, (2) by replying through a representative appointed by the Chamber to appear before the Commission if that is found necessary, or (3) by replying in writing and through its representative.

It was decided that should any members of the Commission pay a visit to Tavoy the Chamber would do everything in its power to supply all information required, and to arrange visits to the mines of the district.

Development of Official Administration.

The opinion was expressed, when considering paragraph 11 under this section, that it was desirable to institute a Mining and Metallurgical School to form a part of the present Engineering School at Insein and to grant diplomas for proficiency in these subjects. The training should be largely practical and part of the students' time should be spent on mines in the Tavoy district. Scholarships should be granted under a scheme that would safeguard the interests of Burman students.

Mining and Metallurgical School.

Pottery and silk-weaving are two Tavoy industries that might be added to those enumerated under paragraph 11.

Pottery and silk-weaving.

Under paragraph 15 (b) the opinion was expressed that an annual publication, dealing with the Tavoy wolfram industry and edited by the Chamber in collaboration with the Mining Adviser, would be very useful and would help to focus attention on the district.

Under (b) the Chamber desired to record their appreciation of the publications of the Geological Department of India and to state that certain members had found them most helpful to the mining industry in general.

Geological Department publications.

Under (c) it was the opinion of the Chamber that periodical industrial exhibitions, such as the one held at the end of 1916 in Rangoon, are a great success.

Industrial exhibitions.

Under (d) the Chamber wished to record their opinion that the present law for acquisition of land on behalf of industrial companies required revision especially in respect of the rights conferred and the limitation of the areas.

Land acquisition.

Government Aid to Industries.

It was the opinion of the Chamber that occasions arose when small owners should receive financial help and that the Advisory Board could advise Government in such case.

Financial assistance.

Under (d) the opinion expressed was that Government should be prepared, in certain emergencies, to cope with sudden and temporary difficulties, such as occurred at the outbreak of war. A neighbouring Government was able to save its country from disaster by fixing a minimum price for tin-ore and buying large stocks when the price reached this minimum.

Technical and Scientific Work.

Under (a) the Chamber was of opinion that much could be done to improve the labourers' efficiency and skill generally, and that the Government should be more ready and willing to take the advice of mining experts of wide experience, and more prompt to carry out suggestions which would be helpful.

Labour.

The Chamber was of opinion that opportunities should be given to Government officials in charge of Mining districts and technical experts of private firms to study conditions and methods in other countries, and that only Government officials with special mining knowledge should be allowed to act as Inspectors of Mines. The practice of appointing non-technical

Study abroad.

men as Inspectors of Mines was harmful to the industry and placed the Government in an undignified position.

Advisory Council
for Research.

Under (f) the Chamber was of opinion that an Advisory Council for Research for India on the lines of the Council appointed lately in the United Kingdom, could prove of great usefulness.

General.

Under (e) the Chamber expressed the opinion that local difficulties had been noticed under the mining and prospecting rules referred to.

SUPPLEMENTARY WRITTEN EVIDENCE.

Q. 25.—In respect to minerals, yes.

Q. 26.—(1) Can be best replied to by the Survey Department who have considerable experience of organisation and conduct of surveys.

(2) To supply maps of country hitherto unsurveyed, an officer of the Geological Survey should accompany the party. Topographical information could then be augmented by geological data and the two published simultaneously.

Q. 27.—By publication. A stock of all Burma maps issued should be kept in Burma for sale, say, by Government Printing Depot.

Q. 40.—So far as Tavoy is concerned, all timber on mining concessions cut in connection with mining operations should be free to concessionaires.

Q. 42.—*Mining Industry.*—Government should satisfy themselves that concessionaires will carry out Government requirements with regard to the working of areas. The present limit of 5 square miles is inadequate.

Q. 43.—(a) Government could assist small mine-owners by financial assistance in respect to the construction of surface water courses for sluicing purposes on the recommendation of the Mining Adviser.

Q. 57.—(1) Are of value in disseminating useful information.

(2) None.

Q. 103.—With regard to mining rules, a draft of rules made for Tavoy is at present under consideration by Government and the Chamber of Mines have discussed these rules and forwarded recommendations.

Q. 104.—*Wolfram.*—Government should carry out experimental underground research work with the object of ascertaining proof of the existence or otherwise of wolfram at depth in various parts of the district.

Q. 105.—Refer to reply under Question 40.

ORAL EVIDENCE—24th JANUARY 1918.

The TAVOY CHAMBER OF MINES was represented by—

1. MR. E. J. HOLBERTON.

2. " C. M. P. WRIGHT.

Hon'ble Sir R. N. Mookerjee.—Q. I want to ask you a few questions about the Forest Department. From your experience do you find any difficulty about the present rules of the Forest Department for commercial purposes? Mr. Holberton.—A. I think the rules under the Forest Act are all right when they are reasonably administered. It depends upon the administering officer really. On the whole, I should say that we have found no really serious trouble. The trouble you get is in the matter of details which probably would not interest you. Forest operations are frequently held up because the Forest Department subordinate staff do not go round and mark the logs. Really our greatest trouble with reference to the Forest rules is that logs cannot be moved until they have been marked by a forest official, and he sometimes keeps us waiting two or three weeks or even months and holds up the whole of our European assistants until he arrives. He is a man on probably 12 or 16 rupees a month.

Q. And this matter was represented to the officers of the Forest Department?—A. We have often complained about it locally and we have discussed it with the leading men in the Forest Department, but we never made very great fuss about it. On the whole, the Forest Department treat us well. These small matters of delay are merely a little annoyance, but the Department do not seem able to remedy them.

Q. Is any particular area given to any particular firm or are two or three firms allowed to cut trees in one area?—A. Under the present system of allocation of forests working rights are either given to a firm or taken up by Government. You do not get two or three firms working together.

Sir F. H. Stewart.—Q. Are the leases permanent or only for a given number of years?—A. I am talking of teak leases. They are 15-year leases with an option to renew, subject to an agreement on certain points, for a further period of 15 years.

Q. Lessees' option?—A. Option on both sides. You have to agree on certain points.

Hon'ble Sir R. N. Mookerjee.—Q. Is the royalty you pay reasonable? There is no complaint about the royalty they charge?—A. Royalty has gone up, but so has also the price of timber.

Q. Does the royalty go up and down according to the market?—A. No. In the last lease we paid a considerably less amount than we pay at present. There has been a proposition put up by the Chief Conservator of Burma for a sliding scale, that is to say, to alter the scale of royalties during the course of a lease according to the rates obtaining at Government auctions here, but speaking of my own firm personally we are very much against that because we like to know where we are for a period of years.

Q. That is not yet in force?—A. It is only under discussion.

Sir F. H. Stewart.—Q. It has been suggested to us that the Burma Forest Department is very weak on the commercial side and it is recommended that there might be a commercial cadre introduced into it. Would you subscribe to that opinion?—A. It very largely comes from me. Speaking of the forests administered by firms, the divisional forest officer has not only to look after his silvicultural and other work but he has also to supervise the work of the lessees and when you get higher up, all these subjects of discussion about the terms of the lease are almost purely commercial questions and sometimes have to go through him. We maintain that he ought to be a silviculturist and there should be another man to whom purely commercial work should be entrusted.

Q. It has been put to us elsewhere that in the senior grades the Forest Service is very much understaffed. Would you agree with that?—A. I should most certainly, in Burma.

Q. And your remedy would be to relieve the senior officers of the commercial side of their work?—A. Yes.

Q. How would you do that? Would you recruit commercial men for that particular work, or would you select some forest officers and give them a certain amount of commercial training?—A. Either you would recruit your commercial assistants to begin with, or you would do exactly as they do in the civil department, that is, after a man had been a couple of years in the Forest Service you would put him either on the silvicultural side or the commercial side.

Q. If you recruited a commercial man pure and simple you might not get a good enough man because his prospects would not be good?—A. That is why I should like to favour the other alternative.

Q. Similarly about the engineering side, we have been told that the Forest Department is very weak in engineering problems and proposals have been made in certain places that engineers should be associated with the Forest Department.—A. I have heard that view very strongly expressed by the present Chief Conservator of Forests and also by another senior Conservator, Mr. Leate, who has great engineering leanings himself, and I have heard both of them say that they are hampered by lack of engineering assistance in their staff.

Q. Are there any engineers associated with the Forest Department now?—A. No. I think none.

Q. Do you have difficulties in the way of transport of your timber?—A. Transport from the forests to Rangoon the whole way?

Q. Yes?—A. Difficulties vary with every different area. On the whole we manage to evolve ways out of difficulties without professional engineering.

Q. You solve the difficulties yourself, but is there anything which Government could do to help in the way of removing these transport difficulties and in the improvement of waterways?—A. Outside Rangoon, Mandalay, Maymyo and a few leading towns there are no roads at all in Burma and the movement of timber by road is along the road made by oneself.

Q. And in your own forests you make your own roads yourself?—A. Yes and we have spent thousands of rupees on the improvement of waterways for floating and on blasting operations.

Q. You are quite content to do that yourself and you do not think that Government ought to do it for you?—A. We do not think we can call upon Government to go into the recesses of the forests, but when you come to the more populous parts Government should have more roads.

Q. Do you use aerial ropeways?—A. We have not got any yet. We had them under consideration but we have not got them yet.

Q. Then there is a complaint that the Forest Department interferes to a certain extent with private enterprise and competes with it. Have you any remarks on that subject?—A. If you talk to some of the forest officers they will tell you that the whole of the forests of Burma ought to be worked commercially by the State. You naturally would not expect timber firms to agree to that, nor do I personally think that it is at all a sound commercial proposition because the sums involved on it would be much greater than Government would be justified in risking.

Q. Have you suffered from Government competition in that way?—A. When you say 'suffered,' no. They work a certain amount of the forests of the country and I do not think that any of the timber firms have any particular point to make against that at all so long as it is not unduly extended. The Chief Conservator has been trying to help us.

Q. You are satisfied with the things as they are?—A. Yes.

Mr. C. E. Low.—Q. With reference to the question of communications, taking the point at which Government assistance on communications might come in, which you would put outside the forests or outside what you would call the recesses of the forests, do you think, speaking quite generally, roads or light railways, portable railways or removable railways are the best things?—A. I am perfectly certain that in the not so distant future when all these woods in Burma are being really exploited there will be a network of light railways which would probably be put up by mutual co-operation between the exploiters and Government. I should think that is the way in which they could assist most by light railways.

Q. And you think, speaking quite generally, that light railways would be a more suitable line to go in for than roads?—A. For the actual extraction of timber roads are not of very much use. I should think that light railways would be much more useful because heavy timber traffic would be too great a strain on anything but the very best *pukka* roads.

Q. In fact, where the traffic does not warrant a light railway, it is scarcely worth while having a road for the extraction at any rate of heavy timber?—A. No, that is to say, you do not want more than the *kacha* sort of road that is made.

Hon'ble Sir R. N. Mookerjee.—Q. Taking, on an average, Rs. 30,000 per mile of light railway do you think it would pay to have a light railway?—A. My figures do not agree with yours. I think I could put it down cheaper than that.

Q. Only carrying logs?—A. No passenger accommodation but carrying logs. Our figures show something like half the price you mention.

Q. What section of railway do you propose to put up there?—A. We have not built any. We have only prepared plans. We had got a lot of estimates before the war.

Sir D. J. Tata.—Q. Have you given any thought to a monorail for bringing stuff out?—A. We once had a lot of experiments in connection with a special type of monorail invented by one of our men but he did nothing. But I would not condemn monorails for that.

Mr. C. E. Low.—Q. It is usually a case of small ridges or hills, 200 or 300 feet high, or is it big hill side slopes of 2000 or 3000 feet altitude?—A. Though usually the ridges are not more than a few hundred feet high we do work in forests where they run up to 3000 feet or more.

Q. There would not be much scope for ropeways?—A. There is a really not, and also when you come to teak the amount of timber that you have to move over any particular track is small. Teak is so sporadic. You get a few on one little hill and a few on the next so you cannot afford to put up your light railways to transport these few logs.

Q. Do you lose very much by having to cut down your timber in length?—A. Commercially we lose very little. If you mean loss in cubical contents of timber you might say it is practically nothing, and if you say commercial loss it is also practically nothing.

Q. Do you get timber very big in girth?—A. The girth of the biggest teak log I ever saw was 23 feet.

Q. One witness whose written statement we have seen was objecting to the amount of check exercised by Government on floating logs having to be pulled into different stations and detained unnecessarily. What is your opinion of that complaint?—A. We can only say that we personally have not been seriously hampered by it.

Q. With reference to any scheme of Government improvement of forest communications of the more or less permanent type, do you think that it would be desirable for Government to do that as a case of capital outlay by loans instead of, as at present, out of revenue?—A. You mean entirely in the areas exploited by themselves?

Q. Yes. Supposing they pay anything to you or do it themselves, then should it be taken up as a piece of capital expenditure and financed by loans which would be repaid within the period within which the improvement would hold good?—A. We should do it that way ourselves if it were a big outlay.

Q. Supposing it were a question of putting up a certain length of removable railways you would deal with it as capital expenditure?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. In reply to Question No. 27, you say, "A stock of Burma maps should be kept in Burma for sale, say, by Government Printing Depot." It is always done everywhere in India?—A. It is not done here. You have to write to the Map Office, Calcutta. I believe I am right in saying that quite recently, perhaps after this was drafted they have opened a map office in the Secretariat. We have had to write to Calcutta for all the maps that we want.*

Q. In reply to Question 40 you say, "So far as Tavoy is concerned all timber on mining concessions cut in connection with mining operations should be free to concessionaries."

* Vide Correspondence printed as Appendix.

ires." Does it include valuable timber like teak and other timber?—*A.* The present position is that they give us free all timber excepting a few reserved trees.

(*Mr. Wright.*—The best timbers would naturally be reserved teak, etc.)

Mr. C. E. Low.—*Q.* Do you find, as a matter of fact, that in respect of these reserved species the Forest Department holds you up by delay in getting work done?—*Mr. Wright.*—*A.* They invariably delay. The staff is not sufficient.

Q. In particular, in mining propositions?—*A.* We personally had no trouble at all with the Forest Department, but I believe the Deputy Conservator has been given instructions to leave us alone to a large extent and there is practically no teak at all in Tavoy.

Q. Because you are working under special war conditions?—*A.* Yes. These would apply after the war also.

Hon'ble Sir R. N. Mookerjee.—*Q.* You say in answer to Question 42 that "the present limit of five square miles is inadequate." Generally is it not ten square miles?—*Hon'ble Mr. H. Thompson.*—Five square miles in the case of wolfram.

(It was stated that this question had better be discussed in the conference with the Provincial Industrial Committee.)

Hon'ble Sir R. N. Mookerjee.—*Q.* In answer to Question 43 you say "Government could assist small mine owners by financial assistance in respect to the construction of surface water courses for sluicing purposes on the recommendation of the Mining Adviser."—*Mr. Wright.*—*A.* The cost will not be great. Suppose Government wished a larger output of wolfram. The smaller mine owners have to a certain extent taken out some amount of wolfram in the concessions already given and I do not think that many of them own capital and if Government wish to get out more wolfram, the extraction of wolfram is held up on account of want of capital and it would be necessary to assist them.

Q. Would it not be necessary to cancel such concessions?—*A.* Then there would be no wolfram coming out of them at all.

Mr. C. E. Low.—*Q.* Wolfram is being worked under entirely special conditions and things have been done both by Government and mine owners which will not be tolerated in ordinary times, simply because we want to get as much wolfram during the war as we can?—*A.* My suggestion is simply in order to increase the amount of wolfram which the Government requires during this war period, because the question of assisting mine owners in that way is a general question which we do not propose to deal with.

Hon'ble Sir R. N. Mookerjee.—*Q.* Did you represent the matter to the Local Government to have a mining school as a branch of the Engineering School at Insein? After all it is a reasonable and simple request.—*A.* So far as I am aware I think it is the first suggestion to Government.

Mr. C. E. Low.—*Q.* Are concessions taken up on the pegging out system?—*A.* How do you mean?

Q. The mining rules provide that in areas declared by the Local Government, instead of putting in a map you may peg out on the ground?—*A.* No. It is done in the usual way. A map ought to be supplied.

Q. In Tavoy district I understand that there was a great deal of delay on account of the difficulty of getting maps?—*A.* The trouble was that many concessionaires applied more or less for the same ground and surveyors were not available to map the ground, and there was also a great deal of delay in the Deputy Commissioner's office and there was considerable confusion and delay in starting work.

Q. Which is the basis of your application, map or a mark on the ground?—*A.* Map and description.

Q. And until you get a map your application does not take priority?—*A.* That I cannot tell you.

(*Mr. Holberton.*—My opinion is that notice is taken of your prior application.)

Q. A proper map is the starting point?—*A.* I think that is so. Practically the two are supposed to go in together.

Q. Have you had any difficulties about rights to water power?—*Mr. Wright.*—*A.* None. The Deputy Commissioner, so far as I am aware, has been fair and just.

Q. Do you get applications which involve competition for limited amount of water power?—*A.* So far as we are concerned, we have divided it up fairly and we have come to an equitable agreement and work under that agreement.

Q. You do not use water power for anything else except hydraulicing?—*A.* Nothing so far. There are some projects now using Pelton wheels for raising water.

Q. Do you think that anything is required beyond what is stated in the Mining Rules with regard to disputes about water power between individual concessionaires? You know that difficulties have arisen in South Africa, and blackmailing concessions have been taken up.—*A.* I understand that Government reserves the right to dispose of water rights.

Q. When these mining rules were drawn up it was recognised that there might be trouble in the future and it was thought desirable to reserve power to deal with it when it came along. At present the thing is not acute?—*A.* No.

Q. It is very likely to become acute after the war?—A. In time, possibly. But the question of water also involves the disposal of tailings, and that is already beginning to appear and it should be dealt with in some way.

Q. You mean dumping tailings outside a man's own area?—A. Yes. It has already come up.

Q. How do you make your flumes?—A. They are either iron flumes or wooden flumes. In one of our concessions we have made 8,000 feet of flumes of which 3,000 feet is iron and 2,400 is wooden.

Q. Is local timber suitable and available?—A. Quite, on some concessions.

Q. What do you think of the idea of pegging out, that is to say, making a mark on the ground and then getting it surveyed by a Government surveyor afterwards? Do you think that it is practicable in Tavoy?—A. It is a very jungly country and pegs are not irremovable.

Q. If you lop a tree, for instance, it is difficult to remove that without leaving a mark?—A. I think so.

Q. It will last long enough for a Government surveyor to come along?—A. It is a question of priority of marks. There will be disputes between different people and you will have to decide them.

Q. It occurs in most countries of the world?—A. It does, but not such a conflicting number of people to deal with. You have Chinese, Japanese, Telugus and others. They would not respect one another's rights particularly if they wished to quarrel. It would not affect the larger areas taken up but the smaller areas.

Q. In most countries it is recognised that a man is expected to protect his own works to a certain extent?—A. Yes.

Q. Are you prepared to give any views about this suggestion of a mining and metallurgical school? It is rather a large order?—A. Speaking personally for myself I am not representing the views of the Chamber at all and I do not know what led them to make this suggestion, it would be better to have a central school in as much as you would have a larger number of people and you could afford to have a better staff and work under better conditions. You would put in so much time on theoretical work, and so much time on practical work might be put in Tavoy, or Bangalore or wherever people would go to.

Q. What sort of man do you think that such a school would try to produce, at any rate in the first instance?—A. It depends on the school. With a first class staff I do not know why you should not turn out first class men.

Q. You know what is being done in the coal fields by night classes and so on. They are practically training the sub-manager type of man, and there is already a scheme before the Government of Bihar and Orissa with the idea of having, in conjunction with Messrs. Tata's Steel Works at Sakchi, an institution there for the purpose of training men in metallurgy up to the type of sub-manager. Would there be any scope here for metallurgy?—A. Yes.

Q. Do you think there is a reasonable prospect of their taking up high speed steel manufacture here?—A. That is rather a financial question and I am not quite prepared to deal with it.

Q. If you say metallurgy what sort of metallurgy do you mean?—A. Chemists in connection with mines and small smelting industries in the province.

Sir D. J. Tata.—Q. Have you any iron ore here?—A. There is a little in the country.

Q. Have you any idea of the quality of the ore? What is the percentage?—A. From 40 to 50 per cent. I understand.

Mr. C. E. Low.—You say, "The Chamber wished to record their opinion that the present law for acquisition of land on behalf of industrial companies required revision especially in respect of the rights conferred and the limitation of the areas." Taking the question of mining, do you have any trouble about the acquisition of surface rights?—A. In Tavoy it is all Government forest.

Q. Have you any views on the subject of acquisition of surface rights?—A. I think that Government should certainly reserve the right if they have not got it to take up land for genuine industrial businesses including mining on the same terms as they do for the purposes of general utility.

Q. It was put to us by the Bombay Industrial Committee that the difficulty had always been hitherto in utilising these powers under the Land Acquisition Act for the companies and that there was no criterion as to when it was advisable to interfere on behalf of an industrial proposition, and their suggestion was that if an industry could not be started without this assistance and if the starting of such an industry was to the public advantage then it would be legitimate for Government to acquire the land?—A. That is quite reasonable.

Q. Turning to the acquisition of surface rights in mines, do you find any difficulty in other provinces where Government own the minerals?—A. I have not had any difficulty about access in any province in which I worked. The district officer has invariably sanctioned or given access. I have had no trouble with private owners.

Q. The Chamber says, "The practice of appointing non technical men as Inspectors of Mines was harmful to the industry and placed the Government in an unglorified position."

In respect of mines, of course, you know that the man is appointed to administer the Mines Act for the safety of workers and so on. Are there any Inspectors of Mines in Burma who are non-technical men?—*A.* I do not know what was in the mind of the chamber. As a matter of fact, I do not quite understand the drift of that.

Q. Is it possibly the case that owing to the special war conditions and the difficulty of sending our regular mine inspecting staff to Tavoy some local arrangements have been made for temporary purposes?—*A.* I understand that Mr. Coggin Brown is the present inspector. He is a geologist, and not a mining engineer.

Q. He has had some training as a mining engineer, the same as the ordinary geologist gets?—*A.* Except the training that he had in the practical course I do not think he had any other training. This remark has no reference to Mr. Coggin Brown personally, who is everybody's friend.

Q. You say, "The chamber expressed the opinion that local difficulties had been noticed under the mining and prospecting rules referred to". What are the particular difficulties which you would like to be recorded about the rules?—*A.* I am sorry I do not know. Most of my time is spent out in the district and I do not spend much time in Tavoy.

Q. Have you anything to bring forward yourself about the Mining Rules?—*A.* No.

Sir F. H. Stewart.—Q. What about this question of experimental underground research? Is that not being done at all?—*Mr. Holberton.—A.* I am afraid I cannot answer that question at all. I do not know what the chamber means by it. I do not see how we are to expect Government to do our underground research for us.

Sir D. J. Tata.—Q. Does it not mean diamond mining?—*A.* Possibly; I do not know what they mean.

Q. They are driving at the fact that it is the duty of Government, rather than that of the firm?—*A.* I do not know. As a matter of fact, at the first meeting that was held by Sir Harcourt Butler when he started the wolfram campaign in November 1915, I myself was present and I asked him that very question. I said, "Supposing that our firm go into mining at your request and spend a good deal of money on this thing and get nothing, will Government give them any compensation", and he said they would. I do not think he committed himself at all definitely.

Sir F. H. Stewart.—Q. What is this chamber? How many members are there?—

Mr. Wright.—A. Practically everybody is a member. The council has sent up this written statement without a general reference. I do not remember ever having seen this.

Q. Who is your Mining Adviser?—*A.* Mr. Coggin Brown, Mining Adviser and Inspector of Mines and Explosives.

Q. He is down there and he helps you?—*Mr. Holberton.—A.* Yes; he is extremely useful.

(Mr. Holberton.—"We cannot understand the reason of the five-square-mile limit when you have got practically an industry down there prepared to spend money to develop the thing, because you are placed in a difficulty in this way if you are limited to five miles. You, first of all, take up three miles and you find one of them is very good and perhaps another is feasible. You cannot apply an another three-mile area because you have only got the possibility of two more miles. Why is it desired to limit people who desire to get wolfram and have the money to spend on it, why is it desired to cut them down? You cannot tell exactly where your proposition is going to develop. You do not want to give up all the land except the particular portion or portions which you are actually working and so your leases cannot, as far as my opinion goes, be confined to the actual bits which you are exploiting at the moment in wolfram.")

*Mr. Wright.—*You would have to retain a certain area for water, a certain area for buildings, and a certain area for forests and these areas might be covered and you would have to exceed the limit of five miles. You would have to keep a certain amount of dead ground for the purposes of the mine.

Mr. C. E. Low.—Q. Do you think that five square miles would be sufficient if you excluded what I may call accommodation ground and you also gave an opportunity to the man to reduce his mining lease area once or twice during its currency?—*A.* To reduce the area down strictly to the mining portion of the area and exclude the rest of the area.

Q. Give him an accommodation lease outside his mineral areas?—*Mr. Holberton.—A.* I think nobody is going to exploit wolfram at one time over five square miles in the country, but they are bound to have a lot of extra property.

Q. What do you think of the question generally, which is rather an important one, of having your accommodation land outside your mineral lease area from the point of view of this maximum limit? Do you think it is a fair idea?—*Mr. Wright.—A.* Of course, it would meet the objection to Government giving a large area and the objection to people working a small area.

Q. Your objection arises, to a large extent, out of this question of accommodation land?—*A.* Quite so.

Q. A difficulty would arise in this way; supposing you wanted to mine in your

accommodation ground, that area would have to go over into the mineral area?—*A.* Yes.

Q. But there is also this difficulty. You may take up more accommodation ground simply to get it ultimately into the mineral area? How do you get over that?—*A.* I do not think there is any way of getting over that.

(*Mr. Holberton.*—We consider the limit rather unnecessary. We cannot quite understand the point in it when you have got responsible people really engaged in exploiting there and who have sunk their money there.)

Q. Has any representation been made giving the facts which you have now put forward, or sent up to the Local Government?—*A.* I think not.

Q. You say that five square miles is still small and you would be content with ten?—*A.* Yes.

Hon'ble Sir R. N. Mookerjee.—*Q.* You said just now that no limit should be put to the area?—*A.* I should very much personally prefer that Government should limit people by judging of their capabilities. I do not see why a person who is capable of exploiting fifteen square miles of mineral country in Burma should not be allowed to do so.

Q. In that case, take the case of oil. You would be perfectly justified in giving the Standard Oil Company the whole area of Burma, assuming they are an eligible company? Does anyone wish to ask any further question?—*Mr. Wright.*—With your permission I should like to make a statement. I think the working of the rules depends so much on the Deputy Commissioners concerned that I am very strongly of opinion that the Deputy Commissioners should be made clearly to understand that the mining business is just as much a part of their work as any other part of their work. In many places—I do not say I have met with opposition, I have never met with opposition and I have the kindest feelings towards the district officers—there is a certain amount of indifference to mining which I think is quite unwarranted, and all district officers should be made clearly to understand that the mining welfare is just as much a part of their work as any other part of their work.

Mr. C. E. Low.—*Q.* Is that largely due to the fact that mining is a comparatively new thing?—*A.* Possibly; I could express my own feeling that some officers have met me half-way and others did not at all meet me.

Q. The letter of the rules is perhaps observed more strictly than is necessary?—*A.* It is not so much that. They carry out the letter of the rules and their spirit also once they understand that rules have got a spirit. The mining man is a nuisance to them.

Hon'ble Mr. H. Thompson.—*Q.* It has been suggested that the mining rules which provide for the grant of short-term prospecting licenses or thirty-years' mining leases are not altogether suited to mining conditions in Tavoy and Mergui where you have got deposits which will, in the ordinary course, be worked through in five or ten years?—*A.* Under the rules we are allowed to relinquish land by giving notice.

Q. It has been suggested that the elaborate terms of the lease, the detailed survey that is needed, and the elaborate conditions which are provided are not altogether suited to some of the concessions?—*A.* That is rather a side question really. It depends upon the position of the people who hold the ground and so forth. It also depends up on the question whether the ground is worth troubling about. Personally, I think that the title should be made as good as possible which involves a regular mining lease, a regular survey, and a regular everything.

Q. Of course, the difficulty is there, that prospecting licenses cannot be granted for more than three years in all, which may not be sufficient to complete working?—*A.* That is one of the points in the mining rules which might be left to the discretion of the district officer, with the consent of the Local Government.

Q. Is extension beyond three years impossible?—*Mr. C. E. Low.*—It is done in the case of oil companies.

Hon'ble Mr. H. Thompson.—At the end of three years it must be thrown open to the public. If the period is not sufficient the man may be allowed to take up the thing afresh under a new license, for one year in the first instance, which may be extended, but it must have been made in the meantime public property.—*A.* *Mr. Wright.*—My firm has an oilfield which it tried to open up in three years, but the three years was not sufficient. Three years is not enough certainly in the case of such areas. *Mr. Holberton.*—As regards rubber, so far as Tavoy is concerned, *Mr. Thompson's* idea is that it should be immediately planted, and I think his words are, "As soon as possible steps should be taken to get this land taken up". The consequence of that will be, I think, that the Chinese will dash in and get all the plots except those reserved by Government. The other companies at the present moment are pretty full up. We have got the wolfram business and we are not now prepared to take up this line, and my own personal view is that *Mr. Thompson's* policy on that point, as advocated in his note, is, at all events, disputable.

APPENDIX.

No. 271-B, K. S., dated Rangoon, the 25th January 1918.

From—R. W. BISHOP, Esq., Superintendent, Government Printing, Burma.

To—E. J. HOLMES, Esq., Manager, Bombay-Burma Trading Corporation, Ltd.

With reference to your statement made before the Industrial Commission regarding a stock of Burma maps being kept at the Government Book Depot for sale, I beg to say that a stock of the modern survey maps of Burma, on the scale of one inch=one mile, is available at the Government Book Depot for sale to the public. A copy of the Book Depot catalogue, corrected up to the 1st January 1918, showing the maps available, will be sent to you shortly.

Dated Rangoon, the 29th January 1918.

From—E. J. HOLMES, Esq., Manager, Bombay-Burma Trading Corporation, Ltd.,

To—E. BATTLE, Esq., Curator, Government Book Depot.

With reference to your No. 271-B, K. S., of the 25th January, may I refer you to the official letter which you sent into our office on the 4th January this year in reply to our No. B-19 of the same date? You will see that you tell us therein that the maps we asked for are not obtainable in Rangoon and referred us to Calcutta who immediately fulfilled our requirements by return.

WITNESS No. 437.

Maung Shway
Thwin.

MAUNG SHWAY THWIN, *Advocate, Moulmein.*

WRITTEN EVIDENCE.

Qs. 1-5.—The source from which capital is principally drawn for industrial enterprises is Capital from chetty money-lenders who are generally very reluctant to lend money except on good security and at a very high rate of interest—never lower than 12 per cent per annum. Any industrial enterprise is looked upon by these money-lenders as a very risky speculation. Unless either the co-operative societies or Government will render financial aid no industrial enterprise (unless started by large capitalists) is likely to flourish as banks do not lend money to assist industrial enterprises. I would suggest the following methods of Government financial aid to industrial enterprises, namely:—

- (a) loans, with interest, like the agricultural loans;
- (b) supply of machinery and plant on the hire-purchase system; and
- (c) guaranteed or preferential purchase of products for limited periods.

There will then be no need for Government control or supervision, which will mean a large item of expenditure.

Q. 12.—Cottage industries, such as weaving, mat-making, and bamboo basket-making. Co-operative Societies.
The special objects of these societies should be to find a market for these articles.

Q. 19.—Weaving, pottery, glass-ware, sugar manufacture, leather tanning, and making Demonstration factories.
butter, cheese, jam, and jellies on a small scale so as to teach the people.

Q. 20.—Yes.

Qs. 25 and 26.—Yes; the object of the survey should be to find out what lands, which Industrial Surveys.
are now periodically subjected to inundation, can be reclaimed.

Q. 28.—I think they are very useful. We should have one in Rangoon.

Commercial
Museums.

Q. 30 (a).—Not only travelling exhibitions, but exhibitions of industries would be of Exhibitions.
great advantage. In this respect, villagers should be encouraged (and not hindered, as at present) to expose for sale their own produce or articles of their own manufacture at any railway station free of charge. There should be a reserved carriage attached to the middle of every day-train for the accommodation of persons who carry their produce or articles of local manufacture for sale and no charge should be made for one load, i.e., as much as a passenger can carry on his head or shoulders. In this way, people when travelling not only can do little buying and selling, but it will also serve as an advertisement.

Q. 31.—My opinion is that these exhibitions are very useful.

Qs. 32-33.—Government should take measures to hold such exhibitions once a year at Rangoon and these should be held at about the time of the Tabanng festival. The admission fee to such exhibitions should be moderate, say, an anna. They should aim at bringing sellers and buyers together, but must be made popular. On the days of the exhibition all spare space might be utilized for the disposal of local produce and articles of local manufacture like the weekly bazaars held at several places in Upper Burma and the Shan States.

Q. 34.—Yes; their duties should be to collect samples of all articles manufactured in Trade represent-
Burma and to find purchasers and to keep sellers and purchasers in touch and also to dispose atives.
of articles on commission sale.

Q. 36.—Yes (see answer to Question No. 34).

Supply of raw
materials.

Q. 40.—The definition of "forest produce" in the Burma Forest Act is, in my opinion, too wide and includes every conceivable thing to be found in the forests. There are certain forest products which, if left free to the villagers to collect, might be collected in large quantities, and could be disposed of on favourable terms. Government can impose a duty when such products are exported. The present system of selling the right to collect certain forest products is objectionable because it prevents many villagers from collecting, and the monopolist cannot do it effectually.

Land policy.

Q. 41.—Regarding the land policy of Government I strongly oppose the policy of having only small landholders and of keeping it in the hands of only agriculturists. This policy has never succeeded, and will never succeed. In course of time the lands go into the hands of capitalists. We must have capitalists, and also the labouring class. It is impossible, by any Government rules or regulations, to make labourers into capitalists. Labourers who are thrifty and industrious can, in course of time, become capitalists. The present policy of giving out only small plots of land, and only to *bona fide* cultivators, does not attract capitalists, and the want of capitalists prevents the introduction of modern implements.

If small plots of land were granted to *bona fide* cultivators then they should be allowed to dispose of it freely, instead of restricting them from disposing of it until after the expiration of a certain period from 5 to 10 years. Many of the *bona fide* cultivators cannot afford to wait until the land yields an outturn because they have no other means. Why should they not be allowed to dispose of the land at any time they like? One might like to dispose of the land after clearing, another after laying it out, and another after planting it out.

Training of labour.

Q. 42.—On the principle that no revenue shall be assessed for ten or fifteen years.

Q. 44.—(a) Yes.

(b) Nothing.

Q. 45.—By the establishment of industrial schools.

Official organisation.

Q. 56.—None.

Q. 57.—There should be a board of industries. The board should have executive powers, with budgeted funds.

Qs. 59-60.—The board should consist of seven business men, with a Director of Industries, who should be a technical specialist. The board of industries and the Director of Industries should be somewhat like those of the members and president of a municipality.

Q. 63.—None.

Technological
departments.

Q. 71.—(a) There should be a technological institute for each province. They should be fitted into a general development scheme for the whole of India with a Central Research Institute.

Q. 72.—Each institute should be general in its activities and interests.

Q. 73.—There should be provincial Government control for each province.

Q. 77.—A method somewhat similar to the study of foreign languages, such as Chinese in other countries, might be adopted.

Q. 78.—We have no reference libraries.

Q. 79.—I think we should have one attached to the Bernard Free Library in Rangoon.

Q. 81.—(a) Municipalities might assist in holding agricultural and industrial exhibitions annually, giving prizes for good exhibits and by allowing exhibitors to dispose of them at the exhibition.

Q. 84.—I have never seen a copy of the "Indian Trade Journal".

Trade Journals.

Q. 85.—The Government should establish or assist industrial or trade journals for general industries.

Q. 86.—The best way of dissemination of information of this kind is to publish, in the form of leaflets, and give a copy, free of charge, to those who visit the annual provincial or local exhibitions.

Transport facilities.

Q. 97.—To a very great extent I would recommend the construction of cart roads, which can be ascertained from township officers and village headmen.

Q. 98.—Regarding railway freights I think special facilities should be given for transport, and reduced rates, charged on country produce of a perishable nature, such as fruits, vegetables, etc., for which a special carriage may be attached, with proper ventilation. The same remarks apply also to articles of local manufacture.

Q. 99.—Yes; extensions to Ye and Tavoy and to Myawaddi (Kawkaik township).

Q. 100.—There are plenty of waterways which (not to speak of either construction or extension), even if slightly improved, would not only afford facilities of transport, but would also have the effect of reclaiming large areas of land now subject to periodical inundation.

The assistance of the township officer and headman may be obtained in the following manner. We have periodical "pagoda" festivals in every township at which most of the villagers are present. The township officer should be made to attend every pagoda festival not only for the purpose of keeping order, but also for the collection of information regarding the wants of villagers for new road and waterways, and improvements of existing roads and waterways. The township officer should, on receipt of reliable information, inspect the different

sites for roads and waterways, and recommend such as he thinks fit to the Deputy Commissioner, who can then depute a Public Works Department officer to report. Upon receipt of a report and estimate the Deputy Commissioner can direct the township officer to make arrangements with the villagers to carry out small works, such as those which would not cost more than Rs. 500 at a price not exceeding the Public Works Department officer's estimate. A Public Works Department officer or township officer can inspect and report to the Deputy Commissioner whether the work is properly done; I am sure that in such a case villagers will be willing to contribute as charity a certain portion of the cost.

Q. 102.—None; I think further investigation should be made in this matter as we have many waterfalls.

Q. 103.—I think more facilities might be given for the granting of approval certificates. Mining and prospecting rules. In fact, an approval certificate should be given to every applicant who pays a fee of Rs. 100 and a renewal fee of Rs. 25 every year. Prospecting licenses might be given on easier terms but for a shorter period, say, six months at a time, instead of one year, subject to renewal every six months on payment of surface rent. Licensees should be permitted to transfer their licenses, except to certain persons or class of persons specially prohibited by Government. In this manner villagers will be encouraged to search for minerals, especially when they know that they can dispose of the result of their labour to large capitalists or European firms.

ORAL EVIDENCE, 24TH JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. You are an advocate in Moulmein?—A. Yes.

Q. Have you any practical experience in industries?—A. I have experience in industries; I am the first person who started the citronella oil industry in Burma. I have got a rubber plantation also.

Q. Have you found any difficulty in raising capital?—A. Yes.

Q. Have you found difficulty in respect of these two companies which you are interested in?—A. Yes.

Q. How?—A. We have to borrow from the chettis.

Q. What is the usual rate of interest when you borrow like that?—A. One per cent, but generally more.

Q. One per cent per month?—A. Yes; one per cent per month on good security.

Q. What is your complaint about the present land policy? Is it that all lands should be given to landlords, depriving the cultivators of their rights?—A. Not that; what I suggest is that there should be large landholders and small landholders also, and the policy of Government, I think, has been simply to encourage small landholders, and not large landholders.

Q. Do you mean that the present Government policy is to encourage small cultivators? (Here the Hon'ble Mr. Thompson intervened and said:—"Under the ordinary waste land rules the area which the Collector or Deputy Commissioner may grant is restricted; the area may vary in different parts of the province; but anything beyond that he must refer to higher authority; in that way the rules restrict the grant of waste land to any one person at any one time").

Hon'ble Sir R. N. Mookerjee.—Q. Is that what you mean?—A. What I mean is that the Government policy is not to encourage large landowners, and lands are granted only to bona fide cultivators, limited to so many acres—10 acres or 25 acres.

Q. And that land cannot be transferred?—A. Yes; for instance, during the period of exemption, you cannot transfer it and, after the period of exemption, you must pay revenue first for five years, and then only can you transfer; that is, there is restriction on transfer, at any rate for five years, and sometimes for many more years.

Q. But large landholders will do nothing to cultivate land; they will again sub-let the land to smaller cultivators?—A. Even if they sub-let to cultivators they get a certain earning from the lands. The cultivators are what are called the labouring classes and the landholders get a certain fixed earning from them; in this way the cultivators themselves practically become the landholders.

Q. Would not the cultivators be better off if they take land direct from Government, instead of having to pay additional rent to the landlords?—A. Well, they will be better off in one sense, that is, provided they can bring the land under cultivation but, in many cases, they are not able to bring the land under cultivation as it is expensive.

Q. How will the large landholders help them?—A. We have not got a zemindar class here; we have got some private landowners who let out lands to cultivators and make advances for putting them under cultivation; without the help of the landowners most of the cultivators are helpless.

Q. There is a co-operative society here, is there not?—A. Not on this side of Burma; it has been started in Upper Burma; they are trying to extend it to Lower Burma.

Q. Will that not meet this difficulty here?—A. Yes; to a certain extent.

Q. Then this paragraph in your note about land policy is not necessary?—A. My contention is that there are some lands which require reclamation which is not within the

power of the ordinary cultivators; these should be given to the landholder class; for instance, by cutting a canal and so on, 100 or 200 acres might be reclaimed which the ordinary cultivators may not be able to do.

Q. Have you represented this matter to Government?—A. Well, I made an application, and my brother made an application some years ago, for the grant of a large area to reclaim it, but we did not get any encouragement; in fact, the thing was simply pigeon-holed, and we have not heard anything further; and, not very long ago, I think about 2 years ago, I applied for the grant of about 120 acres for a citronella plantation; the Deputy Commissioner said, "We are not going to give more than 25 acres"; it was not worth while going in for 25 acres for a new industry, so I refused to take the grant of 25 acres; it does not pay to get such a small area. Of course, I may say this; later on, when another Deputy Commissioner came, it was given to a third party after I had given up my idea of not taking 25 acres.

Q. So it appears as if it depends not on the Government rule, but on the method of application of those rules by the Deputy Commissioner?—A. I think, to a certain extent, it might be said.

Q. In answer to Questions Nos. 59-60 you say, "The board should consist of seven business men". What sort of business men will you get here?—A. I should rather say they would be selected from among the merchants.

Q. From Europeans, or Indians, or Burmans?—A. Not confined to one particular community, but from different communities.

Q. In answer to Question No. 98 you say, "Regarding railway freights I think special facilities should be given for transport, and reduced rates charged on country produce of a perishable nature, etc.". Are there not special rates for fruits, vegetables, etc.?—A. I do not think so. They charge according to weight.

Q. But every railway has got special rates for fresh vegetables?—A. So far as my experience goes, I do not think in this side of Burma, especially in the Pegu and Martaban lines, which I know, there is any special freight and I do not think there is any reduced rate charged. Of course, I do not know the rates in other places.

Q. Have you represented the matter to the railway authorities here?—A. Not yet.

Q. You have not done that?—A. No.

Sir D. J. Tata.—Q. They charge according to class; fruit might be under a special class, carried cheap?—A. What I suggest is that a special carriage, with proper ventilation, might be provided for the transit of these fruits, instead of mixing them with all sorts of goods in one truck.

Q. Is there enough of these fruits, etc., to justify a special carriage?—A. I think there is a great deal of traffic.

Sir F. H. Stewart.—Q. In reply to the President you said that the chetties charge one per cent a month on good security; what security do the chetties insist upon?—A. The first security they want is jewellery, which is the best, and, secondly, houses, and so on.

Q. Land and buildings?—A. Yes.

Q. Your answer to Question No. 103 about prospecting licenses; don't you think that if the plan which you recommend were followed you would be creating a class of speculators in licenses?—A. Speculators in this sense that people will go out and try to find someone who can work the mine, but, generally those persons who come across these mines first give information to someone who has got an approval certificate; the man who gets an approval certificate can very seldom find minerals. It is these jungle people who actually find the minerals, but they won't arrange for approval certificates, and they come and ask the certificate holders how much they are willing to pay, and so on.

Q. Who is this township officer whom you refer to in answer to Question No. 100?—A. We have got a township officer for every township.

Q. Is he appointed by Government?—A. Yes.

Q. Is he a permanent official?—A. Yes; they are permanent officials.

Q. Is he a Burman?—A. Generally, Burmans. (Here the Hon'ble Mr. Thompson said that the township officer has charge of a small unit of administration, not of a district.)

Q. What is the headman? Is he a similar sort of person? Is he also appointed by Government?—A. Yes. (Hon'ble Mr. Thompson:—"He is selected by the villagers; he is not a Government officer".)

Witness:—He is practically appointed by the Deputy Commissioner; of course, the recommendation of the villagers, I think, influences the Deputy Commissioner to a certain extent.

Q. I do not quite understand your reply to Question No. 77; the question is, "What encouragement should be given to Government technical and scientific experts to study conditions and methods in other countries", and you say "a method somewhat similar to the study of foreign languages, such as Chinese in other countries"?—A. What I mean is simply that rewards should be given to those who pass those examinations, say, Rs. 1,000 or Rs. 2,000.

Sir D. J. Tata.—Q. With regard to your answer to Question No. 1 about capital don't you borrow from any banks here when you want to raise capital?—A. I do not know about

Rangoon banks, but we have got only one at Moulmein; so far as I know, they do not lend out, except on what is called easily realizable security, such as timber or paddy.

Q. What is the name of that bank?—A. Bank of Bengal, Moulmein. It does not lend out money on the mortgage of immovable property. We have only that bank in the Amherst district.

Q. Do I understand that the bank won't lend because you cannot furnish the security it requires, and the Chetties will only lend on the security of jewels and landed property?—A. They want landed property in towns; they do not particularly care for property in the district.

Q. Where do the Chetties raise money from?—A. They bring some money of their own and they also borrow from banks at a lower rate of interest.

Q. Have you any idea of the security which the Chetties offer when they borrow?—A. I do not think there is any security offered by the Chetties. In some cases, they pass on what they call the *laingras*, which are Government warrants, for the timber which the timber traders hold; these are just like bills of lading or delivery orders; on the mortgage of the *laingras* the banks lend to the Chetties and sometimes they take the signatures of two Chetties.

Q. Is it two or three?—A. As far as I understand, generally two: one man signs and another endorses.

Mr. A. Chatterton.—Q. Am I to understand from your remarks on land policy that you would like to see created a class of large cultivators?—A. What I suggest is that large cultivators, as well as small cultivators, should be created.

Q. Do you want land grants to be made to individuals on the understanding that they will cultivate the lands themselves?—A. No; he might sub-let, and also if he has got a large holding he might be able to import improved machinery to be used on the lands which he sub-lets. Although the policy of Government is to keep small holdings in the hands of cultivators what I urge is this:—that they do not succeed because those people who apply for, say, 10 or 15 acres, have not got means of their own to subsist for three or four years without looking to the land for earning, and, knowing that they cannot transfer it without sanction, they make some intermediate arrangement with some capitalist for borrowing and, after a certain time, the land eventually goes into the hands of the person who advanced the money. Thus, the man holds the land only nominally for a time, but for the eventual benefit of the capitalist. What I beg to suggest is this:—that land should be given freely to these cultivators, and they should be allowed to transfer freely. For instance, one man may like to take up a piece of land for 20 acres; after clearing it, and before he could plant it, if his means are exhausted, he should be allowed to transfer it to some other person who has got the means of improving it further; otherwise, after working a year or so, if Government want to resume it one year's labour is lost.

Q. You said you had a rubber estate; have you also got a citronella plantation?—A. It is a rubber plantation in which citronella is grown as a catch crop.

Q. Are you exporting citronella oil?—A. I have been exporting it to England for the past three years.

Q. What is the area of your rubber plantation?—A. The rubber plantation is about 5 or 6 years old. I have got about 200 acres under rubber and citronella.

Q. How much citronella oil do you produce?—A. I have exported about 200 drums during the past 8 months.

Q. How much does a drum hold?—A. About 36 to 40 lbs.

Q. How do you extract the oil?—A. By distillation.

Sir D. J. Tata.—Q. What is citronella oil?—A. (Witness handed over a phial of oil to Sir Dorabji, and said:—"It is used for medicinal purposes; it is a strong antiseptic in case of wounds and cuts.")

Q. How much per pound of oil?—A. Before the war I got as much as 4s. 3d., but since the war it has gone down to 2s. 8d.

Mr. A. Chatterton.—Q. What technical assistance did you get at the start?—A. It was my brother who tried it on a small scale; we sent samples to London; they found the oil satisfactory; so we extended the operations.

Q. Is your brother a chemistry graduate or trained in any of the chemical institutions?—A. No; he was not trained in any chemical institution. He has always been taking some interest in different industries and has been also studying books. He started his first experiment on a small scale, and when we found the quality of the oil satisfactory we extended our operations. This oil is far better than Ceylon oil.

Q. How do you market this oil?—A. I send it to my agents in London through Messrs. Thomas Cook & Son.

Q. And they dispose of it for you?—A. I ship to my agents direct to London. I got several enquiries also from America—from New York and Boston.

WITNESS No. 438.

MR. B. BANERJEE, M.Sc., *Chief Chemist, Rangoon Soap Works, Rangoon.*

WRITTEN EVIDENCE.

Surveys.

Q. 25. A complete survey of forest products and minerals of Burma should be made at an early date. The present reports should be supplemented by further surveys.

Industrial exhibitions.

Q. 31. Industrial exhibitions open the eyes of the people and give an impetus to industries. The manufacturers also get an impetus for the improvement of their products.

Q. 32. Government should hold and encourage such exhibitions. The exhibition held here last year was not encouraging at all. The poor manufacturers spent much on their expenses, but earned very little. Even sometimes their names were not correctly written in the published report. This was the case with Mr. V. M. Gannay. If matters go on in this way the exhibition, instead of encouraging industry, will rather discourage it.

The Government policy should be as follows:—

- (1) The exhibition committee should consist of Government officials, traders, manufacturers, and scientists.
- (2) The manufacturers should be requested to exhibit their manufactured products along with raw ingredients.
- (3) They should be requested by the exhibition committee to submit a full report of their factories, stating additional capital necessary for the further development of their industries.
- (4) The exhibition committee should grant certificates to those manufacturers whom the committee thinks are able to bring their business to a successful condition if they get sufficient capital.
- (5) The exhibition fund should be utilized by helping the above certificate holders with money at a low rate of interest.
- (6) Government should also help the manufacturers with loans at a low rate of interest.
- (7) The committee should prepare a full report of the exhibits, with details of the products and addresses of the manufacturers, and Government should get it published through all the newspapers in different languages.

Reference libraries.

Q. 78. Here there is one Government library containing a few old scientific books. Industrial books are not available. I suggested buying some new industrial books, but to my surprise the answer was, "Government has not enough money to buy new books now". An up-to-date scientific library is essentially necessary for public use.

Q. 85. Industrial and trade journals of real value should be started and encouraged by Government.

Q. 86. Journals of the above kind should be published in different languages, as far as practicable.

General.

Q. 110. The industry in which I am actively interested is the manufacture of soaps in Burma. After studying the properties of available ingredients necessary for soap-making I began my experiment in the latter half of the year 1916 and, after a series of experiments for a year, have come to the conclusion that the manufacture of all kinds of soaps, is quite possible here.

The soap factory of Mr. V. M. Gannay, where I was making my experiments is the biggest factory in Burma. It is only for want of soap experts and sufficient capital that the factory has not yet been able to make any marked progress. For the same reason all the necessary apparatus has not yet been bought.

The series of experiments made by me for the recovery of glycerine from the wastelye of the Rangoon Soap Works seemed to be very costly. The better method to be adopted at present for the manufacture of glycerine in Burma is to separate it from the animal and vegetable fats first, using the fatty acids left for the manufacture of soap. The soap prepared from the stuff is very good in quality. The fats used in Burma are tallow, coconut oil, and cotton seed oil, of which the first contains about 10.8 per cent and the second 11.4 per cent of glycerine. The price of glycerine has risen from about Rs. 0-14-0 to Rs. 5-8-0 per lb.

After separating glycerine from tallow the fatty acid left, when properly purified and decolorized, is also highly suitable for toilet soap-making. Another field for the fatty acid is that stearine, used in candle-making, can be prepared from it. The crude glycerine prepared from wastelye can be used for lubricating purposes while the pure glycerine has an extensive demand from medical firms.

There are about half a dozen soap factories here, and it seems that their progress is not satisfactory for the same reasons stated before.

The Government help necessary for the development of this industry is:—

- (1) Helping the soapmakers by giving loan at a low rate of interest.
- (2) An up-to-date laboratory should be established under the Government. Some active scientists should be appointed there. Provisions should be made for sending some of them to Europe to have training in factories there. Some of them should be sent to different parts of the province to investigate the presence of raw materials in the province. Demonstration lectures on soap along with other products should be delivered.
- (3) Complete botanical and geological surveys of the Province are expected to help this industry by way of getting information about many raw ingredients necessary in soapmaking.
- (4) The report of the surveys, rates of the materials and the way of communication should be published yearly for public information.
- (5) The Provincial Government should encourage the manufacturers by buying the manufactured goods of the provinces for the Government use.
- (6) Arrangements should be made to send a few B.Sc. and M.Sc. passed students (having special aptitude in the subject) to English factories for better training.
- (7) The manufacturers should get their raw ingredients duty free.
- (8) The Railway and steamer freights should be reduced and the manufacturers should be helped in the same way as Japan, Germany and the other Governments do.

III. (1) *Sugar Manufacture*.—Sugarcane is abundant in Burma. It is abundantly cultivated in Pyinmana and some other parts of Burma for jaggery manufacture. Most of the ingredients for purification are available here. The only necessity is now for up-to-date scientific machineries. This industry should be immediately taken up by the Government and as soon as it comes to a successful state it should be developed to double its extent, by selling shares to the public. Help by way of advice should be given to those interested in the manufacture. The *begass* should be utilised as manure and its pulp should be tried for papermaking along with other ingredients while its ash containing about 20 per cent. of potash carbonate should be utilised by the soapmakers for soft soap manufacture. New Industries for which Burma seems to be particularly suited.

(2) *Starch*.—Can be manufactured at a very cheap rate as rice is very cheap here. The principle of manufacture is simple and very costly machineries are not wanted. As regards its manufacture the rice is first cleansed by powerful fans and covered with warm water of 140° F. to which sulphur dioxide is frequently added making a solution of 1 degree Baume. After about 12 hours the water is run off and the softened rice is perfectly washed, crushed, washed several times and dried.

(3) *Straw Board*.—Straw is abundant here. For preparation of boards the straw should be boiled with a small percentage of caustic soda. The waste board and waste paper should be utilised in the straw board manufacture. It has a big demand in Burma.

(4) *China clay*.—Different samples of china clay obtained from Pyawwe, Thaton, and other places prove that a porcelain factory can be started here. At the start electric insulators, dolls, toys, jars, galipots, filters, etc., should be made. Samples examined by me are highly suitable for above purposes but for high class pottery better stuff of Kaolin should be searched for in Burma.

(5) *Rosin and Turpentine oil*.—Rosin is one of the most important ingredients necessary in soapmaking. It is left as a bye-product after distilling resin—gum of pine—and condensing the turpentine oil. Rosin can be obtained in good quantity in Burma. The price of English rosin has risen from Rs. 80 to Rs. 100 per 100 viss or 360 lbs. The method of manufacture is simple.

(6) *Manufacture of Common salt*.—Common salt is one of the most important thing in every-day life but unfortunately we are to depend mostly on Liverpool. Will the Provincial Government be kind enough to encourage the local salt manufacture (from sea-water) in every possible way? Its manufacture in big quantities will enable us to prepare Hydrochloric Acid, Sodium Sulphate, Soda Ash and Caustic Soda at very cheap rates.

(7) (a) *Refuse of Aerated Water Factories here*.—The biggest aerated water factory here is of Hon'ble Mr. Du Bern. Carbon Dioxide necessary for this water is prepared here by treating soda carbonate with sulphuric acid. After getting the gas the refuse liquid is drained off, thus losing an important chemical necessary in good quantity for medicinal purpose. In the above-named factory about 3—4 cwts. of soda are used every day. I procured a few lbs. of liquid and prepared samples of soda sulphate which is highly acceptable in the Rangoon market. The method of preparation is simple:—The liquid was neutralised by treating it with Burma chalk, filtered and concentrated. The colourless crystals of soda sulphate were thus deposited. The crystals were then dried and kept in bottles. Usefulness of the refuse of some factories here.

(8) *Manufacture of oxalic acid*.—Possibility in Burma. It was formerly prepared from sugar and molasses by treating them with nitric acid but now-a-days it is prepared from sawdust by treating with a small quantity of a mixture of caustic soda and caustic potash. The sawdust is made into a paste with a concentrated solution of a mixture of potash 2 parts and soda 3 parts and heated in iron pans at 240° C. Afterwards the mass

is treated with water, the solution of potassium and sodium oxalates thus obtained should be boiled with lime, the insoluble calcium oxalate is thoroughly washed with water and treating with dilute sulphuric acid we get oxalic acid solution which is then evaporated to crystallisation.

In Burma an abundant quantity of sawdust is obtainable. The cane bagass should also be experimented for the preparation of oxalic acid.

(9) *Distillation of Oils*.—Possibility in Burma. I studied the distillation of essential oils on an industrial scale while I was sent to British Baluchistan in 1915 for this purpose. From my own experience I have come to the conclusion that the following cheap raw ingredients will be much useful in distillation work in Burma:—

- (a) Rinds, seeds and leaves of lemon and of citron much available here for lemon and citronella oil.
- (b) *Lemon Grass*.—Abundant in Burma. The distillation is being carried on in Moulmein. The work should be developed on big scale (lemon grass oil).
- (c) Peppermint in Upper Burma.
- (d) Rinds, seeds, and leaves of orange abundant here—(Orange Oil).
- (e) Camphor from Northern Shan States—suitable communication necessary. The camphor distilled by the Shans in crude way is not perfectly white or colourless. When it is redistilled it gives good camphor.

At present Japan is the first place as regards camphor production but in the near future Burma is expected to stand at least the second if the Government is ready for industrial development.

- (f) *Wood distillation*.—Pine wood available in Burma—giving turpentine oil, wood tar, etc.

Hard wood—abundantly available in Burma giving acetic acid, wood tar, charcoal, etc.

- (10) Slate pencil can be prepared from Burma kaolin.

- (11) Gypsum is abundantly available here and plaster of Paris can be prepared at a cheap rate.

In conclusion I beg to suggest that our Government should establish new factories for the manufacture of materials which are not prepared here at present and help sufficiently for the development of the already established factories. A demonstration factory will also be useful to the public.

WRITTEN EVIDENCE.

(Witness submitted a confidential written statement. He did not give oral evidence.)

Mr. T. O. Foster.

WITNESS No. 440.

MR. T. O. FOSTER, F.R.I.B.A., *Government Architect, Burma.*

WRITTEN EVIDENCE.

Pioneer Factories. Q. 8.—In one way by bringing before the public particulars of the needs of Burma and how these needs are now being met and the possibilities of Burma supplying them herself if she does not at present do so.

Industrial Surveys. Qs. 25, 26 & 27.—I am not aware that full particulars have ever been obtained as to (1) Building Stone—Brick earths, limes and cements, at least if they have, then a means should be found of making such information public.

Commercial Museums. Q. 28.—A Commercial Museum in Rangoon would be invaluable.

Q. 29.—I think for Burma one in Rangoon should be sufficient for the present, it should be placed conveniently near a business area and should be made a place of interest to all, whether in search of special information or not. In fact the Museum should be built with a view of encouraging people to visit same, in other words should be a "live Museum."

Q. 30.—I see no reason why the Museum should not be used by people as a means of advertisement of their wares; this would particularly apply to the village industries, people away in the beyond who have an art or craft which otherwise would never come before the public.

Exhibitions. Q. 31.—Should be held as often as people can be attracted to same.

Q. 32.—Yes, should offer prizes for workmanship, etc.

Q. 33.—They should be both popular in character and also a means of bringing buyer and seller together.

Q. 35.—Yes.

Q. 37.—Yes.

Q. 45.—The building trades are sorely in need of being taught. Workmanship is accordingly at a low level here. Master workmen should be brought from Home as instructors and also with a view of inspiring pride in the various trades.

Q. 49.—I am not in favour of night schools out here—day schools are wanted. The General Engineering School at Insein could be developed to meet any ideas on the subject. Generally I am of the opinion that Government should take steps to see if Burma can be self-producing in Building materials—Cements and limes are imported here at high costs at present.

An expert in Brick clays is also wanted. I am under the impression that Burma could produce first class bricks if such an expert were made use of—also tiles, fire-clays and earthenware.

(Witness did not give oral evidence.)

WRITTEN EVIDENCE.

Training of Labour and Supervision.

It is essential that primary education should be on a sound foundation in every country seeking industrial development. Without such education, the link between the organiser or master together with his assistants and the workmen is missing, and the knowledge which the leaders possess is consequently reduced in value. Necessity for primary education.

In certain classes of industries in India chiefly those in which mechanical or electrical appliances are used, excellent workmen are to be found, but in far too many cases these men, if taken away from their regular routine and put to new work (for which no greater skill is really required) will be found wanting, because they failed, through lack of simple knowledge of the three R's, to thoroughly understand their teachers. In other words the ground must be prepared generally.

Comparatively little has been done as far as I am aware to effect real improvement in the Indian labourers' skill and efficiency; the improvement, if any, has been chiefly brought about by themselves aided by scraps of information picked up from Europeans or Americans sent out specially for some work.

It is, I believe, true that the majority of trades must at the present time look to Europe or America for the really skilful and efficient workmen, that is to say, men who are able not only to continue in the way they were taught but who are also able to think out new lines for themselves. Necessity, due chiefly to competition, and so called education appear to be the leading factors in this, and until education in India is organised in such a manner that the working classes may utilize it to assist them in their work, Indian artisans as a whole, in spite of all necessity, cannot hope to compete with others who are in close touch with technical books, papers, night schools and instructors.

Education coupled with instruction by master tradesmen from Home would no doubt lead to an improvement, but the question of language presents some difficulty. Men brought out from Home would not be in a position to instruct immediately on their arrival in this country except through an interpreter. Further they would use technical terms which no interpreter could interpret; the difficulty of getting men together for instruction has also to be met, and the cost of schemes considered.

The question of the purely primary schools I must leave to others, as it is beyond the scope of these replies except in so far as that they (the schools) appear to be essential for the following scheme which might prove worth considering.

The scheme above referred to is the establishment of central instructional depôts throughout India and Burma to which skilled artisans from Home could be appointed as instructors for short periods only, say, three years. Industrial demonstrations.

The class of instructor selected would of course be varied to suit the requirements of the province or district but in nearly every case mechanical engineers, bricklayers or masons, and smiths would be required. These instructors should hold practical demonstration classes on works when possible but always with proper appliances to an audience composed of—

(1) Junior Foremen or leading hands in the employment of firms and Government Departments, who have a sufficient knowledge of English to ensure that they will thoroughly understand their instructor.

These men should remain in the pay of the firms or Departments to which they belong during a term, say, of three months, and should be required to pass an examination at the end of that term.

As it is to them that the country would have to look for the real improvement in skill and efficiency of the workmen they would afterwards be required to teach, a certificate or diploma carrying with it some standing should be granted them, say, after having done two terms or six months at the dépôt, passed the required examinations and been favourably reported on by the firm or Department employing them not earlier than six months after the instructional courses have been completed. Such certificate to be endorsed if further periods of instruction, etc., are gone through with credit or cancelled in the case of misdemeanour by the holder.

(2) Any person on payment of a fee.

(3) The students of an engineering or technical college.

In the first instance these instructional dépôts would probably be attached to Engineering Colleges where facilities to a certain extent already exist for demonstrating, but later on they may take a different form and classes might more readily be held on works or in factories; but, in any case it would, I think, be necessary to ensure that nothing but useful matter was taught and that the teaching of the original masters reached the right quarter, that is to say, the workmen of the country.

In order to attain this end the demonstrators might be encouraged to make inspections of the works, etc., where their pupils are engaged and in this way they would come in close touch with the requirements of the country and at the same time they would be able to see for themselves whether their instructions were being properly carried out.

It is somewhat difficult to estimate the cost of such a proposal as I do not know what facilities already exist in India for the establishment of central dépôts but, I should think, that a sum of Rs. 1,00,000 per annum per establishment would cover the entire cost including interest and depreciation charges also passages for the instructors.

With regard to the training of managers and those in charge of commercial undertakings, the qualifications of such men are, I think, recognised to be—

(1) General business capacity, including a knowledge of Home and foreign markets.

(2) Knowledge of the capabilities of the artisan and machinery under their control.

(3) A thorough knowledge of the wants of the people to whom they are about to supply articles.

As far as my knowledge of the country goes at least two types of men are required. In both types it would be necessary to ensure good general education coupled with the ground work of commercial education: this is doubtless being already arranged in connection with the schools and colleges of India, and again in both types it would be a distinct advantage if the men after leaving college, etc., could serve for a short time, say two years, in business houses here in order that they may form some idea of their own as to the conditions and requirements of the country.

After that comes the splitting of the ways into men for businesses intending to compete in the markets of the world and men for purely local industries. It is the former of these types that the country would require for the development of new industries and the latter for continuance of the local work and its organisation.

With regard to the first type of men it is clear that little or nothing can be learnt by them in this country about industries which as yet do not exist here unless of course at considerable expense to themselves. It is also, I think, clear that many Burmans, Indians and Eurasians, though thoroughly capable men would never be able, through lack of funds, to obtain training in any special industry until that industry came within easy reach. There seems, therefore, to be only one way open should Government desire to provide capable managers, etc., from the inhabitants of this country and that is for Government to take the training of men in hand and place them in such positions that during their training they are in close touch with large industrial centres.

This is again a costly scheme and a difficult one to estimate, but £250 per annum per man should more than cover all expenses with tuition, board and residence.

With regard to the selection of men for this special class of training, I have already stated that it might be an advantage to select men that have already had some experience of business in this country. Now it is probable that as many of the new industries will be started by firms already well established in this country little trouble would be experienced in getting the right men as the firms would see to that, and financial aid would doubtless be forthcoming in these cases, but others would have to be provided and, perhaps, the students of technical or commercial schools would make the best reserve either immediately upon leaving the college or after a period has elapsed. Competitive examination would be necessary here, and also a selection by the student as to what line he wishes to take up.

The second type of man although of great importance to the local industries does not need the same training and would probably learn their business better in this country assisted by technical and commercial schools.

It seems preferable that technical education for the special purpose of industrial development should be under a Department of Industries rather than under the Educational Department.

As far as my experience goes the Educational Department is not in close enough touch with the requirements of the country to guide or control such education.

General.

Very little information has been accumulated regarding the possibilities of hydro-electric power in Burma. What little information exists is due chiefly to private firms. Some 10 or 11 years ago, the Government of India suggested that investigations should be made but the cost of efficient surveys proved, I believe, to be too heavy and the matter was dropped.

Although accurate surveys of the country, as a whole, are still practically impossible some useful information might be obtained annually at Government expense, if an indication could be obtained as to the area in which such power would be of real service in the near future.

This might be done for a start by advertising the fact in the papers, etc., that certain rough surveys will be made of any area which any person or firm would indicate as containing a probable source of power for any industry they may be interested in. Government, of course, reserving the right of making preliminary investigations to ascertain whether it is worth while making a rough survey. It seems probable that in this way one small survey party, with the indirect assistance of the Executive Engineer of the Division concerned, might place some valuable information at the disposal of Government or industrial companies.

Up to the present, in Burma, the Indian Electricity Act does not seem to have had much effect on the province's industrial development, as the uses of electrical energy are not sufficiently known. I do not think that the Act itself stands in the way but the administration of it requires care in order to prevent its terms becoming too severe on petty schemes likely to demonstrate the value of electrical energy for industrial purposes.

Local encouragement, and, to a certain extent, advice by Government Officers would doubtless assist in development, and in overcoming any fears of contravening the terms of the Act which intending users may have.

(Witness did not give oral evidence.)

WITNESS NO. 442.

Mr. B. W. Bishop.

MR. B. W. BISHOP, Superintendent, Government Printing, Burma.

WRITTEN EVIDENCE.

V.—Training of Labour and Supervision and VII.—Organisation of Technical and Scientific Departments of Government, with special reference to the printing industry.

My experience has been confined to the printing industry. In this industry a great deal has been done to improve the labourers' efficiency and skill by practical and technical instruction in the course of their daily work (44b). Their efficiency and skill could be still further improved by a regular system of instruction in technical schools. I am of opinion that the standard of skilled labour in India is on the whole very inferior, especially in detail, and that if it is to be developed so as to place it in a position to compete with the skilled labour of other countries in its own markets it must have encouragement and opportunity for instruction. I think, therefore, that some scheme of instruction in technical schools for the leading industries should be instituted in the industrial centres (45). I have experience of the training of apprentices in the printing industry, both at Home and in India. The apprenticeship system in force in the Burma Government Press provides for the training of suitable boys practically at Government expense (46).

The particular advantage following the establishment of technical schools is that apprentices who have attended these schools become better qualified workmen owing to the initiative and confidence that proper training inspires, and consequently are of greater value to their employers. It rarely happens that apprentices have the opportunity of learning every branch of their business in the workshop, and by attending technical schools they can supplement the training received in the workshop and thus acquire a wider knowledge of their business (47). I think therefore that the training of apprentices in the workshops should be supplemented by a course of instruction in technical schools, which should be encouraged by Government and private employers, and every facility should be given to apprentices to attend them (48). Technical schools should be under the control of a Department of Industries in each Province with an organising expert as Head of the Department. It should be distinct from the Department of Education and there should be no question of dual control (50). It should be a compulsory part of the training of supervisors and skilled managers that they attend and qualify at technical schools. They should not be regarded as qualified to give instruction unless they possess certificates for the various subjects and branches of their profession (51).

Study abroad.

Every encouragement should be given to Government and private technical experts to study conditions and methods in other countries. This could be done during periods of leave, and travelling and other expenses should be allowed to those who are willing to spend a portion of their leave on their employer's business. The policy of Government in the past, so far as its technical experts are concerned, has been a very narrow-minded one in this respect (52 and 77). The Government Printing Department in Burma is capable of giving assistance and does render assistance from time to time to private firms engaged in the printing industry. The assistance given is generally in the shape of loans of type and material used in printing (63).

Assistance in marketing products.

As regards assistance in marketing products I see no objection to the publishing of lists of imported articles, which, in my opinion, would be more advantageous than exhibiting them in commercial museums (37).

Reference libraries.

No serious difficulties have been experienced by me in consulting technical works of reference, as there has been a fairly well-equipped technical library in existence in the Burma Government Press for some years past (78 and 79).

(Witness did not give oral evidence.)

Major T. F. Owens.

WITNESS No. 443.

MAJOR T. F. OWENS, I.M.S., *Chemical Examiner to the Government of Burma.*

WRITTEN EVIDENCE.

VII.—Organisation of Technical and Scientific Departments of Government.

The Chemical Examiner's Laboratory.

The Chemical Examiner's Department gives assistance to industries to a limited extent. The Department is primarily intended for carrying out Medico-legal and general analytical work required by Government. The Chemical Examiner is allowed to execute tests for firms and private individuals as long as such work does not interfere with his legitimate duties. The assistance that this Laboratory gives to Industries is limited to simple analytical work. We have neither the equipment nor the time to devote to research work. I am not sufficiently familiar with industrial concerns to form any opinion as to whether a Technical and Scientific Department is required. As regards my own work, there does not seem to be much demand for research in Industrial Chemistry. During the eight years that I have been a Chemical Examiner, I have been asked on four occasions only to undertake such work. Concerns in which chemical processes are of great importance such as the oil industry, will always employ their own experts.

(Witness did not give oral evidence.)

Mr. H. E. W. Martindell.

WITNESS No. 444.

MR. H. E. W. MARTINDELL, *Joint Secretary to the Government of Burma, Public Works Department.*

WRITTEN EVIDENCE.

I spent the early years of my service in the Public Works Department in doing pioneer engineering in the Northern and Southern Shan States and Kachin hills and the later years on irrigation works in the dry zone. Till I became Chief Engineer I knew nothing of Lower Burma and very little of Rangoon, its chief port. I have been pressed to reply to the 113 questions forwarded and therefore endeavour to comply.

II.—Technical aid to Industries.

18. The advantages of unrestricted publication are well known in the Medical profession. The advantages in Commerce and Industry have become so apparent in England during the present war that the fetish of secrecy is already dead and co-operative action holds the field.

22. I think it must be obvious that provision for research on special subjects in the better equipped laboratories of the United Kingdom would be advantageous to India.

25. The present poor progress in the province indicates the necessity for further surveys. I fancy I was not singular in being struck by the great prospects of Burmese timber and forest produce as exhibited in the Forest section of the last Arts and Crafts Exhibition.

26. A matter for experts to decide.

27(a). I know of no Consulting Engineers in India beyond the Inspector-General of Irrigation.

III.—Assistance in marketing products.

Q 36.—Yes.

Q 37.—Yes.

Q 39.—We might with advantage study the German system of Trade Banks and apply what is suitable to Indian conditions. The English system is out of date.

Banking facilities.

F.—Training of labour and supervision.

The lack of primary education decidedly handicaps industrial development, that is, the Lack of primary education.
 alumni of the Insein Engineering School suffer in efficiency owing to the fact that they are admitted without a sufficiently good primary education. Much has to be taught them at the school that they should know before they enter and they are unable to assimilate much of what they are taught. After leaving the school they suffer as they find it difficult to follow the instructions of those over them who have neither the patience of trained teachers nor the same personal interest or time to make them understand. I have had no experience in training apprentices, but I have myself had years of training in workshops both in India and England and gained invaluable experience from that training.

Industrial Schools should be under a Board of Industries and not under the Department of Education. The latter Department has little knowledge and consequently little sympathy with such training and should not control the Industrial Education of the country. The standard of examination for Mechanical Engineers should be the same throughout India and the certificate of one province should be recognised by all the others. Mechanical Engineers.

FI.—General official administration and organisation.

The institution of a Board of Industries with a Director at its head with executive powers and budgeted funds for each Province under the Government of India would tend to general improvement as it would then be someone's business to attend to the progress of industries. Official organisation.

FII.—Organisation of Technical and Scientific Departments of Government.

The only institution I know of is the Government Engineering School, Insein. This school has been designed on too small a scale, it is understaffed and ill-equipped. I recommend its reorganisation on, say, the lines of the Madras one.

Provincial Technological Institutes should be formed and co-ordinated by a scheme for the whole of India with a Director General of Industries in charge. In the present state of India, Government control would be necessary. Every assistance should be given to such Government experts to study the conditions and methods of other countries. Study leave should be granted as is done for the Indian Medical Service. Technological Institutes.

IX.—Other forms of Government Action and Organisation.

97. The most outstanding want of the province is the improvement to its communications. I consider the main line of improvement called for with our limited funds is the construction of systems of light railways. If the land be acquired and the formation be designed so that as soon as each light railway proves a success and its carrying capacity is reached or exceeded it can be converted by change of rails to the metre gauge and be absorbed into the general Railway System, no loss of money will ensue as the permanent-way and rolling stock and bridges can be used again elsewhere. Transport facilities.

In my opinion the lack of suitable cheap road metal makes the original cost and maintenance of systems of metalled roads so formidable a proposition that light railways even if they do not actually pay will still prove a cheaper proposition for the finances of Burma and be greatly more efficient in distributing the produce of the country. If a light railway scheme is considered on a suitable scale without waiting for private enterprise, it will be found that the people who use and benefit by them will pay for their maintenance while the whole charge in the case of roads has to be borne by the general tax-payer.

The waterways in Lower Burma should be developed to their full limits. Individual views as to their desirability should be brushed aside. There are already printed reports on many schemes and I need add no more.

102. Practically nothing has so far been done to develop the hydro-electric power available. Full investigation is desirable. Hydro-electric power surveys.

(Witness did not give oral evidence.)

WITNESS NO. 445.

Mr. S. A. Smyth.

MR. S. A. SMYTH, B.A., I.C.S., Deputy Commissioner on special duty, Burma.

WRITTEN EVIDENCE.

Experience.—I have served on the Burma Commission for 16 years of which 3 years were spent in the Secretariat and 3½ years on Settlement. In 1909 I officiated as Director of Agriculture for 3 months and in 1914-15 spent nearly 4 months on special duty in connection with an industrial survey of the province. Of these 4 months, a month and a half were spent on gaining an insight into co-operative methods and the remaining 2½ months on enquiry on the spot into the circumstances of various indigenous industries in Upper Burma. As I was required for other work early in 1915, the knowledge which I gained regarding industries in Burma is necessarily very partial and incomplete, and is scarcely sufficient as a

basis for general conclusions. It is therefore not possible for me to reply in detail to the questions; and perhaps some information regarding a few typical industries is the best form which my evidence can take.

Foreign industries.

Industries in Burma may be divided into two classes, Indigenous and Foreign. The foreign industries consist usually of large enterprises such as the extraction of petroleum in Yenangyaung, etc., wolfram mining at Tavoy, rice milling in Rangoon and other large centres, extraction of timber by European firms, etc. Most of them are financed by European capital and run on European lines, generally with European assistance. Of late years, however, a number of enterprises, such as rice and saw mills in the smaller towns, cotton ginning mills in the Myingyan and Meiktila districts, etc., have been undertaken by Indians and Burmans, generally on Indian capital; and there is a tendency for such enterprises to increase in number. There are also a number of smaller foreign industries, such as the manufacture of mineral waters, carried on in towns; usually by Indians and other immigrants. Burmans, however, take a large part in some, e.g., the manufacture of European furniture.

Indigenous industries.

Indigenous industries are usually financed by local capital or by Indian capital obtained from the local *chetty*. Foreign methods of working have made little or no impression on them; but in many of them imported materials are largely used. Practically no organisation has been introduced into the method of supply of these materials, which are generally obtained from local shop-keepers; nor has practically anything been done in the way of organising the distribution of the finished products. A few of the industries are centralised at localities where conditions are specially favourable. To this category belong the manufacture of Pegu jars in the Shwabo district, lacquer work at Pagan, Kyaukka, etc., and mat making near Alon. Other industries are centralised for historical reasons. Thus the silk weaving at Amarapura and Sagaing owes its origin to Manipuris who were taken captive during the Burmese régime and settled at these places. But the majority of the industries exist more or less all over the country; and the extent to which they are distributed is to a large extent governed by the capacity of the land to maintain the population on it. In districts where crops are abundant and comparatively certain, industries are, as a rule, confined to the large towns; whereas in districts like those falling within the dry zone of Upper Burma where agriculture gives a scanty and uncertain income, industries are scattered throughout villages. The majority of the indigenous industries are not whole-time employments but are subsidiary to agriculture; and the amount of industrial work done in any year tends to vary with the crops. There are, however, a number of whole-time village industries on which those who engage in them are entirely dependent.

Pottery.

To this last category belongs the pottery industry at the three villages of Nwensain, Shwegun and Shwedaik on the right bank of the Irrawaddy near Kyaukmyaung in the Shwabo district. Here the large jars known as Pegu jars and used for storing oil, grain, etc., all over Burma, are manufactured. The existence of the industry is due to the fact that clay suitable for making very large jars is found in the low hills close to the villages. The largest sized jar will hold 150 viss of oil and cannot, apparently, be made in any other part of Burma. The materials required in making jars are earth obtained from the hills close to the villages, lead glaze from the Shan States and firewood obtained both from the local jungle and from the drift wood which comes down the Irrawaddy during the rains. The plant consists of a bamboo and thatch shed in which the jars are made and partially dried; potters' wheels made of teak wood; and a furnace built of brick in which the jars are burnt. The shed costs Rs. 150 to construct and the furnace Rs. 300. About seven potters' wheels costing, when new, Rs. 5 each, are required for each shed. The other implements, consisting of shovels, pounders for the glaze, implements for scraping and ornamenting the jars, etc., are of local manufacture and small cost. Practically all the inhabitants of the three villages are engaged in the industry. The principals, who are called *Sayindaings* and number about 50, own the sheds, furnaces and other plant, purchase the earth, glaze and firewood and employ the potters and their apprentices and all the other labour required for the production of jars. Practically all the *Sayindaings* work on capital borrowed from local lenders at four per cent. per mensem interest. The *Sayindaing* who has no capital of his own has to borrow about Rs. 500 during the first three months of the year for repairs to plant, purchase of materials and advances to his employees and the collectors of drift wood. This carries him on only until the first two furnaces of pots have been burnt and disposed of in September. From the proceeds of these two furnaces he is able to go on until the end of the season. The jar making season lasts from June until February. In the hot months the jars dry too rapidly and crack. Most of the distribution of the jars is done by middle-men from Magwe, 360 miles down the Irrawaddy. These middle-men come up to the potteries from August on, buy the jars from the *Sayindaings* and raft them down the river. The earnings of the *Sayindaings* are substantial as, the following account of the cost and selling price of a furnace of jars will show:—

Cost—						
	Earth	Rs. 3 8 0
	Glass	18 0 0
	Firewood	44 0 0
	Hire of potters	40 0 0
	Hire of other labour	21 8 0
	Total	127 0 0

Proceeds—

			Rs.	A.	P.
80	150-vine jars	.	240	0	0
12	100-vine "	.	18	0	0
12	50-vine "	.	7	0	0
12	25-vine "	.	5	0	0
	Smaller jars	.	5	0	0
Total			275	0	0

Allowing for breakages, there is a profit of about Rs. 130 per furnace. About six furnaces can be burnt in each year, giving a total profit of Rs. 780, from which has to be subtracted about Rs. 40 for repairs to plant, leaving a net profit of Rs. 740. But as the *Sayindaing* has to pay interest on Rs. 500, borrowed capital, for 8 months at four per cent. per month, his profits are reduced by Rs. 160 to Rs. 580 a year. As a matter of fact, he makes less than this because he is generally burdened by old debts. Master potters make Rs. 25 per furnace of jars and apprentices earn Rs. 15 per furnace. The remainder of the labour hired by the *Sayindaing* is paid for at coolie rates. The middle-man from Magwe makes large profits. A raft consists of 350 large jars costing Rs. 1,050 at the potteries. The cost of constructing the raft and of the hire of the raftsmen to Magwe is about Rs. 150; so that the total cost of the raft of jars at Magwe is Rs. 1,200. If sold there, an average price of Rs. 4 per jar can be obtained; so that the profit is Rs. 200 a raft. Much larger profits can be obtained by taking the raft to Lower Burma, where the jars sell at Rs. 4.8 to Rs. 5.

This industry can be assisted only through the *Sayindaings*, who are the agency by means of which all the persons engaged in the industry and in the industries subsidiary to it (collection of earth and firewood) are financed. The profits of the *Sayindaing* can be increased in two ways: first, by providing capital for him at a reasonable rate of interest; second, by enabling him to take his jars for sale to Magwe or to Lower Burma. Provision of capital on co-operative rates would save about Rs. 110 a year. The reason why *Sayindaings* are now unable to raft their jars to Magwe is that they cannot, for financial reasons, refrain from selling their jars until they have accumulated the five furnaces of jars which are required to make a raft. If they could do so, their profits would be increased by about Rs. 250 a year. The relief in these two respects would, therefore, enable them to increase their profits from Rs. 580 to Rs. 940 a year, an increase of more than 60 per cent. The above represents the state of the industry at the end of 1914. Since then a co-operative credit society has been established for the provision of capital, but it is understood that co-operative sale has not yet been organised, and that the jars are still rafted to Magwe by middle-men.

The Kyauknayung industry is the most important pottery industry in Burma and differs in many respects from the ordinary potteries. A fairly typical example of the latter is found at Ayadaw village in the Lower Chindwin district, where pots for collecting toddy juice and boiling jaggery are made. The potter takes out a license at Rs. 5 for excavating earth and collects and carts the earth himself. His only plant is a potter's wheel together with a few instruments for dressing the pots after burning. The pots are burnt in the open air with straw and firewood, locally collected by the potter, and sold to villagers from 8 or 10 miles round who come to buy them. The industry is subsidiary to other occupations and lasts only from the middle of November to the middle of February. Practically no capital is required and very little hiring is done, the potter being assisted by the members of his family. About Rs. 80 is made in the season. Occasionally two men combine to take out a license for extracting earth and share expenses and profits equally.

Another example of a whole-time indigenous industry is found in the manufacture of Saddlery. Burmese saddles at Kyeihmon and Monywa on the Alon Branch Railway in the Lower Chindwin district. These saddles are used all over Burma; and Kyeihmon is practically the only place at which they are made. About 250 families are dependent on the industry, but the principals number only about 70 families. The materials used are flannel, most of which is imported from Holland or Germany, goat skins imported from India, coarse cotton cloth woven in Burma or calico made in India, cotton yarn imported from India and England, imported silk yarn from China, imported woollen yarn, locally made cotton yarn and locally obtained materials for stuffing the saddles. About half the imported materials are bought in Mandalay and half from the local shop. Practically all the local shop transactions are on credit and about half the Mandalay transactions are on credit, interest in both cases being recovered in the form of an increased price. The enhancement in Mandalay is about 10 per cent. and the local credit prices are about 20 per cent. above the Mandalay cash prices. The saddles are made of several qualities and the following shows the average cost of manufacture and profit per 100 saddles:—

Goat skin saddles.		Rs.	A.	P.
Cost of materials	.	107	0	0
Cost of wages	.	44	0	0
Total	.	151	0	0

	Rs.	A.	P.
Selling price	175	0	0
Profit	24	0	0

Lowest grade flannel saddles.

Cost of materials	98	0	0
Cost of wages	78	0	0
Total	176	0	0
Selling price	200	0	0
Profit	24	0	0

Medium grade flannel saddles.

Cost of materials	183	0	0
Cost of wages	160	0	0
Total	343	0	0
Selling price	400	0	0
Profit	67	0	0

First grade flannel saddles.

Cost of materials	233	0	0
Cost of wages	328	0	0
Total	461	0	0
Selling price	550	0	0
Profit	89	0	0

The making of reins is a separate industry. They are also made in several grades and the profit varies from Rs. 14 to Rs. 142 per 100 reins. Bridles, cruppers, ornamental tassels, girths, stirrup ropes, and *nundaks* are sometimes made by independent workmen and sometimes by workmen hired by the principals in the saddle-making business. Stirrup irons, bits and the rings used for fastening the girth are bought ready-made in Mandalay or from local shops.

The industry is financed through the principals in the saddle-making business, the rein-makers being comparatively unimportant and requiring little capital. The saddle-making capitalists are known as *konskins* and procure all the materials, employ the labour required and sell the saddles. They are financed partly by means of loans, running up to Rs. 1,000, taken at Rs. 2-8 per cent. per mensem from privately established local credit societies; but mostly through the expedient of purchasing materials on credit. It is estimated that about Rs. 50,000 a year is spent in the local shops on the purchase of imported materials and probably nearly as much more is spent in Mandalay. Capital is turned over about twice during the year and it is estimated that, on the basis of cash payments for materials, the profit on capital is about 20 per cent. at each turn-over if the saddles are sold on the spot. The distribution of the saddles has not been organised. Some are sold to traders who come to the places of manufacture from Mandalay and elsewhere. Some are taken for sale to Lower Burma by the *konskins* themselves; and some are hawked round by middle-men from Kyeikmon and the surrounding villages who take the saddles from the *konskins* on credit and sell them in the neighbouring districts or in Lower Burma. If a *konskin* takes his saddles to Lower Burma and sells them himself, he can make an extra profit of about 30 per cent. on his capital; but few *konskins* can spare the time to hawk round saddles. The above profits are estimated on the basis of cash price for materials. As a matter of fact, most *konskins* work very largely on credit and their profits are reduced by anything from one-third to one half on that account. The hire of workers employed in the industry is very small. Owners of sewing machines can make Re. 1 a day and upwards; but others seldom make more than eight annas a day and in some cases as little as two annas a day is made. The prospects of the industry would be considerably improved by the provision of adequate credit facilities and by the organisation of distribution. It is also probable that considerable relief could be given by the wholesale purchase of materials. But as there was no opportunity of investigating the cost of materials at Rangoon, the extent of this relief cannot be stated. The price of flannel is the most important item in the cost of materials. It varies from twelve annas to Rs. 2-8 a yard for cash at Mandalay according to quality and even the best quality used seems to be very inferior.

Sandals.

Another whole-time industry is the making of Burmese sandals at Kanbya, a group of villages 7 miles north-east of Monywa in the Lower Chindwin district. Four villages here contain 80 principal sandalmakers, 200 hired sandalmakers and 16 hawkers. Four resident traders buy flannel for the sandals in Mandalay and sell it to the principal sandalmakers. The materials required are—flannel bought from the four village traders; sole foundations,

made of the sheaths of maize husks and the fruit stem of the betelpalm, which are known as *Pawabon* and are bought ready-made in Mandalay through the village traders; strips of the sheaths of toddy palm leaves; buffalo hides obtained from the agent of Messrs. Fabricius & Co. at Monywa; sewing cotton made in Bombay and bought at Monywa; German dyes for dyeing the cotton; local cotton yarn; and rice paste. The flannel part of the sandal is pasted on the upper surface of the *pawabon* or sole foundation. To the lower side of the *pawabon* is affixed the strip of toddy palm sheath and the whole is sewn on to a sole of the buffalo hide leather and furnished with a toe strap made of flannel stuffed with local cotton yarn. The manufacture of these sandals is highly specialised and the various processes are performed by different workmen. For example, the preparation of the sole of buffalo hide consists of 6 processes, of which one is done by home labour and the remainder by hired labour; and the preparation and affixing of the toe straps consists of 6 processes of which two are carried out by home labour. Sandals are made in two sizes for men and in one size for women; and for each size there are several qualities according to the quality of flannel used in the manufacture. There are four sorts of superior flannels, two sorts of medium and two sorts of inferior flannels. The economical utilisation of the buffalo hides requires that sandals of all three sizes should be made by the same sandalmaker so that the calculation of expenses and profits is rather complicated. One hundred viss of hide is sufficient for 100 pairs of large sized men's sandals, 200 pairs of small sized men's sandals and 350 pairs of women's sandals; and the cost and profit on the sandals made from this quantity of hide with flannel of various grades is shown below.

<i>Superior flannel.</i>		Rs. A. P.
Cost of materials		300 0 0
Cost of labour		82 0 0
	Total	392 0 0
Selling price		440 0 0
Profit		48 0 0
<i>Medium flannel.</i>		
Cost of materials		272 0 0
Cost of labour		80 0 0
	Total	352 0 0
Selling price		370 0 0
Profit		18 0 0

For inferior flannel sandals, the pieces of hide, which cannot otherwise be utilized, are used. The profit cannot be exactly calculated, but is said to amount to Rs. 1-4 per 100 pairs. The sandals are sold in the village to pedlars who take them all over Burma, but chiefly down the Irrawaddy as far as Prome. Great numbers are also taken by bazaar sellers at Pagoda festivals in the dry zone. The principal sandalmakers are the persons through whom the industry is financed. They obtain all the materials, hire the labour and sell the sandals. For buffalo hide cash must always be paid. Other materials can be got on credit, the usual system being the payment for the materials last purchased at the time the next purchase is made. Flannel is bought in this way from the village traders, and the village traders buy it on the same system from the Mandalay traders. The pedlars also get the sandals from the sandalmakers on the same system. The result is a general enhancement of prices. Thus superior flannel which costs Rs. 26 for 10 yards for cash in Mandalay is sold at Kanbha for Rs. 29 for 10 yards; and medium flannel which is bought for cash at Mandalay at Rs. 19 is sold in at Kanbha at Rs. 22-8. Inferior flannel bought in Mandalay at Rs. 7-4 is sold at Kanbha at Rs. 9. It takes pedlars about two months to do a selling tour so that the sandalmaker is a long time out of his money and so is the flannel seller. Loans have, therefore, to be taken, as well as purchases on credit; and a principal sandalmaker, paying cash for hides only, requires about Rs. 300 or Rs. 400 capital on which to get along. Rates of interest are fairly low and a substantial man pays only from Rs. 2 to Rs. 2-5 per cent. per month. Capital is turned over about 3 times during the year and there is a profit of 6 or 7 per cent. at each turn-over. The substitution of cash for credit purchases of materials would increase the profits by at least one-third. Hired workers earn on an average about eight annas a day for men and four to six annas a day for women. The owner of a sewing machine can earn Re. 1 or more a day. In spite of credit difficulties, the industry has brought considerable prosperity to the villages, which have increased from 180 to 461 households during the last 20 years. It would be greatly benefited by the establishment of a Co-operative Society for the provision of capital and the co-operative purchase of materials. It would probably be found that materials could be purchased much more cheaply in Rangoon than in Mandalay. The formation of a Society would, however, be met by considerable initial difficulties because the system of credit has resulted in the sandalmakers having fallen completely into the hands of traders in flannel.

The above are given as concrete instances of the manner in which village industries are carried on in Burma. If desired, further examples can be given. I shall now endeavour, as far as possible, to give a general account of the Co-operative Societies.

as possible, to answer the questions so far as such industries are concerned. I have no useful knowledge of what may be called foreign industries and the remarks which are offered do not apply to them. As regards financial aid, I think the only feasible method of assistance is by means of Co-operative Credit Societies. The persons engaged in village industries usually form, more or less, an organised community and possess the intimate knowledge of each other's circumstances which is favourable to successful co-operation. The capital required is usually not very large and is not beyond the means of the present co-operative organisation in Burma to provide. Societies could be easily established on practically the same basis as Agricultural Co-operative Societies as regards credit; but, in addition to providing credit facilities, it is probable that in most cases either co-operative sale or co-operative purchase of materials or both should be an object of the Society. As a preliminary to the formation of such societies, a survey of the indigenous industries of the province is necessary in order to ascertain, in regard to each industry, the probable benefit of a society, the objects for which it should be formed, the approximate amount of the average loan which should be given to members, the times at which capital is required and should be repaid, and the type of society which would be of most benefit. Capital for the societies would come from the central co-operative banks in which investments are made by people of all classes. In the course of time each society would be able to accumulate capital of its own. I do not think that any financial assistance except the organisation of Co-operative Societies should be given by Government to indigenous industries. As regards technical aid, the greater number of the indigenous industries in the Province do not require it. Their products do not enter, in many cases, into competition with imported goods and the methods by which they are produced are peculiar to the country and are not susceptible of improvement by the introduction of foreign methods. To this category belong lacquer work, Burmese umbrellas and the making of Pegu jars, etc. But in regard to industries, such as silk weaving, the products of which have to compete with imported goods and which are carried on by methods more or less similar to those employed elsewhere, technical aid is required and the best sort of aid, in my opinion, is the demonstration of improved methods by experts. A beginning has already been made in this direction in the establishment of a weaving institute at Amarapura with good results.

Technical aid.

Marketing facilities.

I do not think that any continuous assistance has been given by Government in the past in the direction of providing marketing facilities for the products of indigenous industries. The Arts and Crafts Exhibitions held annually at Rangoon bring indigenous products mostly of the curio class spasmodically to the notice of the European community; but probably effect no permanent improvement in marketing. Markets for ordinary products are as yet entirely unorganised and the method of sale is quite haphazard. I think that the survey of indigenous industries, which should be undertaken, should have, as one of its objects, an enquiry into the present systems of marketing, and that, when the facts have been ascertained, such measures as may be practicable should be undertaken to improve the marketing and to bring the buyers into more direct connection with the manufacturers. It is certain that, with the present system, or want of system, an unduly large proportion of the profit is absorbed by middlemen; but until further enquiry has been made, the lines on which assistance in marketing should be afforded cannot very well be indicated.

Land policy.

The land policy of Government is probably not favourable to industrial development generally. Industrial development presupposes the existence of persons who have some capital or the means of commanding capital, and who desire to apply their capital to industry. The small holding land policy of Government, however, is unfavourable to the accumulation of capital and, combined with the Burmese law of inheritance, tends to keep the maximum population on the land at the minimum standard of living. Co-operation is only a partial means of correcting its defects. Whether the land system is, or is not, a discouragement to industry, there can be no doubt that industries are becoming more and more necessary as means of livelihood subsidiary to agriculture. The uncertainty of crops in the dry zone of Upper Burma has always forced the agriculturist there to supplement his agricultural income either by engaging in industry, or in labour subsidiary to agriculture in the more favoured parts of the province. In Lower Burma, the agriculturist can, with comparative certainty, obtain a crop; but, with the enormous rise in the cost of cultivation which has taken place inside the last 10 or 15 years, the margin of profit left for the subsistence of the agriculturist tends to become smaller. Although crops are fairly certain in Lower Burma, the amount of crop varies from year to year within wide limits; so that the margin of agricultural profit, after deducting cost of cultivation, is an extremely uncertain quantity and may be double in one year what it is in the next. The uncertainty which the increased cost of cultivation has brought about in agricultural profits has hitherto been obscured by the progressive rise in the price of rice, but this rise is not likely to go on indefinitely. It is, therefore, necessary to encourage industries, and especially village industries, with a view to mitigating the effects of short harvests even in parts of the province which have hitherto been considered as the most favoured agriculturally. The increase of population and the fact that the extension of cultivation in Lower Burma is approaching its limit point in the same direction. Lower Burma is now practically a one-crop country. If the population while largely increasing in numbers, as it is certain to do, remains entirely dependent on rice, the possibility of distress owing to the partial failure of the crop will, as time goes on, become more and more evident.

Official organisation.

At present there is no organisation in the province for the development of industries. As already indicated, I think that the development of indigenous industries should be one of the

objects of Government and that an organisation for fostering this development should form a part of, or work in close connection with, the existing co-operative organisation. The first main function of the organisation should be the accurate ascertainment of present conditions with a view to affording adequate credit facilities and improving the methods of purchase of materials and distribution of products. For these purposes technical experts are not required. The survey of existing conditions which should be carried out, would probably indicate the industries in regard to which the demonstration of improved methods by experts is necessary.

The most feasible means by which Municipalities and Local Boards can assist in promoting industrial development is by the grant of assistance to persons who desire to study improved methods at central demonstration stations. Assistance from local bodies.

Communications in Burma are in a backward state and there is no doubt that this has hindered industrial development as well as other sorts of development. The question of the improvement of communications is now being considered. As regards railways, considerable annoyance and expense are caused to consignors of goods by the impossibility of obtaining trucks except on irregular payments to subordinate railway officials. Transport facilities.

(Witness did not give oral evidence.)

WITNESS No. 446.

MR. W. B. BRANDEN, M.A., I.C.S., Deputy Commissioner, Tavoy.

Mr. W. B. Brander.

WRITTEN EVIDENCE.

Note on certain problems connected with the development of Mining and other industries in Burma.

I have been Deputy Commissioner of the Tavoy District, the main wolfram-producing area in Burma, since May 1914. For the period from October 1915 to February 1917 I was on special duty in connection with the effort made to increase production. In this effort I had the good fortune to be associated with Mr. J. Coggin Brown of the Geological Survey of India as Technical Adviser. Wolfram.

The results are indicated in the following statements :—

Agricultural year.	Ton.	Cwt.	Qr.	Lbs.
1910-11	721	13	2	16
1911-12	1,407	3	2	17
1912-13	1,453	2	1	13
1913-14	1,669	11	1	20
1914-15	1,644	10	0	34
1915-16	2,346	10	2	7
1916-17	3,487	7	1	10

For the development of mineral production in Burma as well as of such other industries as rubber, cocoanut, tapioca, tea cultivation, etc., the first essential is that Government should know where minerals are likely to be found and where these products can best be grown and should have experts to advise on the best methods of development. No systematic geological survey of the whole of Burma exists. No attempt has so far been made to publish, to firms interested, the potentialities of particular districts in the matter of rubber and cocoanut plantations. When I came to Tavoy I discovered that great areas were most suitable for cocoanuts and have at last interested one firm which is shortly sending an expert to examine the areas recommended for the cultivation of the product. Surveys for industrial purposes.

If the resources of Burma are to be exploited, the first essential then to my mind is that a special department should be immediately constituted whose duty it should be :— Department of Industries.

- (a) to collect statistics of the existing production of important industries;
- (b) to co-ordinate the work done by existing departments such as the Forest and the Agricultural Departments and a Mines Department to be created;
- (c) to examine systematically the potentialities of the province;
- (d) to provide information for those desirous of exploiting a particular product;
- (e) to advise Government on the best methods of development.

Had such a department been in existence when the need for wolfram was first recognised, the difficulties, pioneers in the industry had to face, would have disappeared.

Transport facilities

The next essential to my mind is that the province itself must be opened up. No other district in Burma has had so much money spent on road making within the last two years as Tavoy. Experience here has proved that roads can be made quickly and well even under climatic and labour conditions adverse to rapid and efficient construction.

Roads have enabled areas previously undeveloped or unexamined to become important producing centres, have permitted the exploration of tracts hitherto inaccessible, have made for quickness of transport and for the introduction of mechanical devices and have promoted effective Government control. I am convinced that new roads in Burma will quickly pay for themselves owing to the increase of revenue and the reduction of costs.

Technical expert aid.

In organising a new industry or in developing an existing industry, Government must in a province like Burma be prepared to provide a certain amount of technical advice free of cost. I do not advocate fostering an industry which has no likelihood of ever reaching the stage at which it can support itself, unless, of course, very strong political reasons exist in favour of establishing or retaining any particular industry. In the early stages of mining industries, however, technical advice may save not only those initiating the new venture, but Government itself, much money and trouble. Between, I think, February 1914 and October 1915 no Government technical adviser of any kind visited Tavoy, with the result that during the first six to nine months after the demand for tungsten became known most of the Technical Advisers' time was taken up in visiting concessions and advising on the best methods of securing an increase of output. Much valuable time was spent in rectifying errors, in pointing out schemes which should have been put in operation months before and in giving elementary advice on geological features and methods of mining.

In many cases, the advice had to be forced on concessionaires in a way which only the requirements of the moment could have justified.

Provincial Mines
Department.

I have referred in paragraph 1 of this note to the creation of a Mines Department to be created as part of a Department of Industries. In my opinion a department of this nature is essential in all provinces in which mineral wealth exists. This department should be under the control of the Local Government and should be no more part of the Government of India than the Education or the Medical Departments. It should be divided into two sections, one made up of experts who have specialised in economic geology and the other of experts in pure mining. The former would be advisers on all general problems connected with the development of the mineral resources of the province, the latter would act as a Mines Department for the purposes of the Indian Mines Act and advise on purely technical matters. The organisation of the department, the differentiation of functions and the division of control are problems which would quickly solve themselves when the scheme was in working order. The existing form of centralisation whereby the Government of India practically controls all the highly trained technical services has hampered development and made for stagnation.

Mining and
Prospecting Rules.

If centralisation in the matter of experts has been a hindrance to the development of mining, no less so has the formulation of one set of Mining Rules for the whole of India. A detailed criticism of the rules would be out of place here but I may note on one or two provisions. My chief idea is to make the rules as little cumbersome and as simple as possible.

The Certificate of Approval appears to me to be a useless formality, if the conditions of the Prospecting License are properly enforced and slightly amended. The value of the Priority rule (23) is open to question. Under the new Mineral Directions (Burma) all applications for Prospecting Licenses which the Collector proposes to issue or renew have to be forwarded to the Financial Commissioner or Local Government for sanction. This procedure may result in serious delays which will tend to retard development. My experience in Tavoy has been that by speeding up the disposal of applications, much more country is prospected and the industry expands more quickly. I should, however, restrict the area a Collector may grant to 1,000 acres, the Financial Commissioner to 2,500, and the Local Government to 5,000, and I should not allow any one firm or person to hold more than 5,000 acres in all under Prospecting License or Mining Lease at one time. I have seen so much effort dissipated when large areas are given that I am convinced that the policy of the unrestricted grant of areas under Prospecting License should now cease.

I should also provide that a Mining Lease shall be applied for before the end of the 2nd year [rule 30 (i)]. I know of no area in this district of which its possibilities cannot be determined within 18 months.

I see no reason why Government should not levy fees during the period between the expiry of the last renewal of the Prospecting License and the issue of a Mining Lease. Either the Mining Lease should date from the expiry of the Prospecting License or the fees payable during the last renewal should continue to be paid up to the date of issue of the Mining Lease [rule 30 (ii)].

The royalty rates might, in my opinion, be more elastic [30 (iii)].

Options with a working agreement should explicitly be declared to be transfers [30 (vi)]. Sub-section (x) of rule 30 is much too wide because it requires the submission of every petty dispute to the Local Government.

I do not think that any right to a renewal of a Prospecting License or to the grant of a Mining Lease should be conferred on concessionaires by rule. I believe that mining development has been hampered by the fact that areas have been frequently taken up as speculative ventures. No work is done on these concessions. They remain undeveloped and even unprospected. Powers should be conferred whereby renewals of Prospecting Licenses and the grant of Mining Leases may be refused should the development be deemed insufficient. I do not believe that this procedure would hinder legitimate enterprise.

Rule 50 (*viii*) should be made to apply only to leased areas which have not previously been held under Prospecting License.

Once during the tenure of the lease permission might be given to a lease-holder to reduce his area with the previous sanction of the Local Government.

Even the amendment, however, of the Mining Rules does not appear to me to be sufficient to meet the demands of a progressive policy. I should prefer to allow each Local Government to frame its own rules either under a special enactment or with the sanction of the Government of India. Each province has to face its own problems in mining development, perhaps more than in any other phase of its activities and rules, to suit its own needs, are in my view a necessity: nearly every mining field evolves on lines of its own and the imposition of a fixed code for all centres seems to me the negation of efficient administration. I am not sure that the Indian Mines Act would not also be the better of being made a provincial enactment.

Certain subsidiary suggestions may be made with a view to secure the rapid growth of General suggestions.
industrial (particularly) mineral development—

- (a) Technical schools should be opened at centres of industrial life. A mining school in Tavoy which might be part of the University of Burma would be of great assistance in training the future Mines Managers.
- (b) In addition to the geological survey of areas known to be likely to contain mineral deposits, the formation of prospecting parties for specific minerals, such as tin, would not be outside the scope of Government's effort. Their discoveries should be made public and applications called for. The licensee would of course be required to pay part at least of the cost of the party.
- (c) Good topographical maps are essential and every effort should be made to ensure that the one-inch survey of Burma is completed as soon as possible.
- (d) Every assistance should be given to those who are prepared to utilize water power. If the scheme involves the destruction of timber, I should be prepared to waive all claims to royalty thereon, provided that the scheme had been approved by the Mines Department.
- (e) Special arrangements might be made for the utilization of convict labour on road-making, quarries and initial schemes of development, when other labour is unobtainable.
- (f) Some concession in the shape of a rebate of revenue for a specified number of years might be given to those introducing a new industry or commercial product.
- (g) A section of the Department of Industry should be devoted to the examination of the commercial uses to which such common products, as *dhani*, mangroves and bamboos, may be put.
- (h) When an industry has attained a sound footing, every effort should be made to secure co-operation between those engaged in the industry and Government officials intimately connected with its development.
- (i) Co-operative societies might be formed amongst those engaged in such industries, as rubber planting, with a view to procure expensive mechanical appliances as for clearing scrub jungle.

(Witness did not give oral evidence.)

NAMTU.

WITNESS No. 447.

Mr T. E.
Mitchell.

MR T. E. MITCHELL, Resident Manager, Burma Mines, Limited.

WRITTEN EVIDENCE.

Q. 25. Yes, particularly as regards mining.

Industrial surveys.

Q. 26. This survey should be organised with a view to making a re-survey of those areas of the province where the developments of recent years have demonstrated the probability of developing successful mining ventures.

The survey should be directed toward defining specific areas where profitable mineral deposits are most likely to be developed. The correlation of field results by a Mining Geologist of wide experience would materially enhance the value of the work.

Q. 97. The result should be published in pamphlet form, preferably a pamphlet dealing with each separate district.

Supply of raw
materials.

Q. 99. In unsettled areas forest products should be supplied free of revenue to prospectors in the development stage and to *bona fide* agriculturists, for it must be borne in mind that the Company or individual who undertakes the development of a prospect or the agriculturist who settles in a new district is engaged in a venture that should be given all possible Government support; for it is in the development stage when possibilities are unknown factors and finance is most difficult; it is thus that Government assistance is most required; this can best be afforded by a liberal forest policy.

Land policy.

Q. 41. Mere prompt action on applications for land for industrial purposes, and where permission is granted an applicant to occupy land definite rules governing maximum rental should be stated.

Q. 42. All land concessions should be made on the principle that the industrial development will result in increased commercial activity and the benefits to the State are vastly more important than any revenues to be derived from land rents.

Government should proceed on the principle that once they are assured of the *bona fides* of the Company or individual and are satisfied as to the soundness of the industry in which they propose to engage time is an all important factor.

In the construction or development stage the ground rents should be moderate, and when the productive stage is reached the rents should not be higher than that of surrounding or other similar land.

Q. 87. The publication of monographs on any subject is most beneficial to those interested in such enterprises. However, for the most part the monographs published are too academic, and when dealing with commercial features run too much to theory.

Copies of the publication should be obtainable at the headquarters of the district with which they deal. At present there is considerable time lost in trying to obtain maps and publications. If it were possible to obtain at Mandalay publications and maps dealing with Upper Burma, at Lashio publications dealing with the Northern Shan States, and at Taunggyi publications dealing with the Southern Shan States, valuable time would be saved to Companies or individuals operating in these fields.

Mining and
prospecting rules.

Q. 103. In this section no material difficulties have been experienced, but an arrangement should be made whereby once a prospecting license is granted over an area the timber—other than reserved trees—immediately becomes available for development purposes without further reference to the Forest Department.

The annual ground rent should be a minimum, but a clause compelling development might be advantageously added.

The rules governing the use of explosives in development work should be altered, and while the present is not the time to legislate as regards explosive rules, it is essential that in quarrying work and in the development of prospects, rules permitting the use of explosives by the better and responsible type of gang would greatly facilitate operations.

Q. 104. I do not think it necessary or wise to develop minerals wholly at Government expense. A better way would be to legislate to protect and ensure the production of finished products of tungsten, antimony and other ores required to produce metals necessary for industries of Imperial importance and to facilitate the work by giving Government moral assistance and, if necessary, subsidies.

(Witness here gave confidential evidence regarding the Forest Department.)

Q. 106. The first necessary step towards reduction of cost of extraction is the construction of public roads. Burma is as a whole and especially so in the forested regions a "Roadless Province." Firms working the forests are obliged to construct their own roads entirely and in doing so they naturally seek their own interests, which are frequently of a passing nature. Judged from the point of view of the province as a whole, this means a great waste of expenditure and of opportunity. Close co-ordination between the Government and private firms, coupled with a liberal and helpful policy on the Government side would soon result in the construction of much road mileage, which would serve not only for extraction of forest produce—the first objective—but which would remain in perpetuity an asset to the province, reducing the cost of every branch of administration and assisting largely in the intercourse and enlightenment of the people, especially so of those tribes who, living in the remote forested regions, are now of a very low order of humanity and practically useless as citizens. A liberal policy of "Assisted Roads" then is the first requisite.

The services of the State Engineers should be placed fully and free of cost at the disposal of firms making roads and survey should be made gratis with advice.

In certain select instances branch railways should be equally assisted if they meet the same general objects aimed at in the case of roads.

The next suggestion is the improvement of rivers for flotation purposes by the removal of obstructions, construction of locks and side channels to avoid falls, etc. Private firms cannot undertake any large expense in this direction nor is it fair to expect them to bear the cost alone, as every such improvement is an asset to the Province as a whole and rivers are public highways.

Again the Forest Department could do a great deal in the way of assisting private firms by adopting an educational policy. The experiences and observations of their officers and of all forest works should be printed and issued free of cost in the form of pamphlets similar to those by the Board of Agriculture and Fisheries in England. These pamphlets should be made as comprehensive as possible, and not too theoretical.

An Advisory Bureau, with a good library of standard works catalogues of manufacture, and some samples of tools should be established at a central point and a Forest Engineer appointed to advise on all questions; his aid and advice should be available and his visits to the localities obtainable by private firms free of cost.

Q. 107. This query, as worded, is a matter of pure forestry. The only suggestion that I can think of is that the present system of a fixed rate of royalty for specific species should be altered to one of varying rates, these to be so regulated as to bring cost of working in accessible areas down to more of an equality with those more easily extracted from. Under the present system of equal royalty for any timber—say teak—regardless of how situated leads to easy areas being worked out and others left. This, together with a sound policy of roads, would do much to facilitate general forest working.

Q. 108. See answer to question 106.

ORAL EVIDENCE, 28TH JANUARY 1918.

Note.—Mr. A. F. Kuehn accompanied Mr. Mitchell.

Hon'ble Sir R. N. Mookerjee.—Q. I have a few questions to ask on points which are not touched in your written statement: how many years have you been here?—A. Four years.

Q. How many years as manager?—A. Two years.

Q. Have you experienced any difficulty in the supply of labour?—A. Last rainy season for four or five months we did but there was no numerical shortage: we were doing more work than in previous years.

Q. Otherwise normally you have no difficulty?—A. Normally, none.

Q. What class of labourers do you get here, I mean what class or nationality?—A. About 80 per cent. of our labour is Chinese. With Chinese I include Maingthas (Chinese Shans) and Kachins; of the latter there are a very few. The maingthas is our best class of labour and constitutes about 90 per cent. of our underground men, 80 per cent. of the men employed at the smelter and 100 per cent. at the mill.

Q. And the remaining 20 per cent. who are they?—A. The remaining 20 per cent. is composed approximately of 3 per cent. Burmans and 17 per cent. Indians.

Q. How do you house all this labour?—A. We have standardised on houses of adobe brick, of which we built 19 last year, and have 38 more in course of construction which will be completed within a month. These houses vary from 108' to 121' in length by 16' wide.

Q. How many are there now?—A. With those in course of erection 73. These houses will accommodate all but a few of our men; those men will live in bamboo houses pending the completion early next dry season of sufficient brick barracks for their accommodation.

Q. Are these bamboo houses built by the Company?—A. Yes.

Q. Do you charge them any rent?—A. No rent is charged either for the bamboo or for the brick houses.

Q. What is the superficial area, roughly speaking which each man occupies?—A. Our standard rooms are 12' by 12'; these rooms are occupied by two single men or one family. We have a few rooms 20' by 12'; these are occupied by four single men. We also have a few rooms 30' by 14' for some classes of Chinese who prefer living together in larger numbers; these rooms are occupied by ten single men. The superficial area averages about 70 square feet per man.

Q. Does your sanitary authority approve of the crowded system?—A. This is permitted only in a few cases during the dry weather when larger numbers of Chinese who come from the same villages insist upon living together. A close sanitary control is exercised over all these buildings.

Q. Do they keep the doors open?—A. Usually.

Q. Do you give them any compound around their quarters?—A. The houses are not enclosed at all, there is plenty of room.

Q. Do they have any vegetable garden?—A. So far very few of them have.

Q. What arrangement have you got for their education? Do you give them any education?—A. At present we have no public school, but for a considerable time we have

been negotiating with Government for the establishment of an Anglo-Vernacular School to which the Company offered liberal contributions towards its erection and maintenance.

Q. Has that question been finally settled?—A. We have just recently been assured that such a school will be erected in the near future.

Q. So you have in contemplation the opening of schools for them?—A. Yes, in the very near future.

Q. Do you take any apprentices in this mine of yours?—A. A few.

Q. What class of men are they?—A. Almost exclusively Punjabis.

Q. Generally speaking they are not educated?—A. A very few are; but I can give you some statistics relating to this point if you wish.

Q. Kindly send a spare copy* to the Secretary because it will save time now. What police arrangements have you got to preserve peace here?—A. We have both State and civil police.

Q. Do you contribute anything towards the cost of that?—A. An allowance of Rs. 100 a month is paid to the Circle Inspector of Police by agreement with Government. The Company also erected their present barracks and maintain them.

Q. Government keeps police here?—A. Yes.

Q. Do they come inside your compound?—A. They have access to all our works.

Q. They have nothing to do with the Company; to guard your lead or silver? You do not want them for that?—A. No. We applied to the Government for the use of the Inspector and some of his constables to guard our silver in transit to Rangoon, but this was refused. However, negotiations are now being carried on with Government for the establishment of Military Police at Namtu.

Q. What are those negotiations and what was your proposal?—A. Negotiations were for a Company of Military Police to be stationed here, of which the Company would engage 43 for guarding purposes. Our proposal was to pay an annual amount of Rs. 10,000 for the Military Police, also an allowance of Rs. 1,200 a year to the Inspector, and contribute £500 towards the erection of barracks. It was the intention of Government that these men should replace the present State and Civil Police with a few exceptions.

Sir F. H. Stewart.—Q. What State?—A. Tawngpeng, one of the Northern Shan States.

Hon'ble Sir R. N. Mookerjee.—Q. Can you tell us what is the total amount of expenditure? You pay Rs. 10,000 and the Government pay Rs. 10,000, altogether Rs. 20,000; is that the total?—A. I cannot say what the total cost of maintaining a Company of Military Police at Namtu would be.

Q. Who would control them?—A. Government.

Q. These men will be just like your durwans here?—A. Yes. The 43 men referred to would replace about 30 durwans.

Q. Will they carry out your orders or Police Officer's orders?—A. They will carry out the orders of the police, and any complaint which the Company has would be made to the man in charge.

Q. You have not heard anything about the final orders?—A. That proposition was not accepted.

Q. Have you heard any other?—A. No other has been submitted.

Q. So far the police here do not interfere in any way with your labour?—A. Not at all.

Mr. C. E. Low.—Q. With reference to this special police, do you know the arrangement that Government have with railways about railway police officers? It might possibly serve as a guide.—A. I do not.

Q. In your answer to Question 42, you say "In the construction or development stage the ground rents should be moderate, and when the productive stage is reached the rents should not be higher than that of surrounding or other similar land." Do you mean here the surface rent apart from royalty?—A. Yes.

Q. Is that not at present the same as the land revenue rate?—A. No; the land rent varies.

Q. For the same land?—A. We are paying a certain rent for the Mine area of Rs. 1 per acre; this, however, is deducted from the royalty paid on mine production. On our other concessions we are paying a rent of Rs. 5 per acre, while the indigenous population, I understand, get similar land without rent, except the *thathameda* tax which of course is paid by all our permanent employees. In addition we pay a surface rent of Rs. 2 an acre on that portion of our Mine area occupied by buildings and plant.

Q. There is a minimum dead rent fixed, and the surface rent is the assessed revenue payable under the land law of the province, or if no such law is applicable, arrangements have been made by Government subject to a maximum or a minimum: do you know the reason why these rents are fixed in that way?—A. I presume it is because they consider certain land more valuable.

Q. No, it is to ensure a certain amount of material being won. In certain cases does not royalty include dead rent?—A. Yes, in the case of a mine it does.

Q. It includes dead rent but not surface rent. You also speak of a certain amount of development work being insisted upon as a means of ensuring *bona fide* exploitation; do you know whether it is practically insisted on in America?—A. In the United States the mining laws are that to locate a claim, which is composed of 20 acres, a hole 10 feet deep must be sunk exposing a vein. Each successive year in order to hold the claim \$100 (dollars) worth of work is necessary. When a total of \$500 (dollars) worth of work has been done on the claim a patent may be applied for. After a patent is granted the property is then subject to ordinary land taxation which is very light.

Q. You suggest that timber other than reserve timber should immediately become available without further reference to the Forest Department; what is the existing practice here? Are these forests here under the control of the Forest Department?—A. Yes, we have a forest reserve of about 96 square miles.

Q. Is that disposed of on terms?—A. Yes.

Q. What rent do you pay?—A. We pay no land rent but a royalty of 5 annas per 100 cubic feet on fuel, and on timber amounts ranging from Rs. 4 to Rs. 35 a ton.

Q. But your answer I take it refers to the forest standing on the actual mine area?—A. What I meant was that when a prospecting license is taken out over a certain area, the timber on that area except reserved trees ought to be placed at the disposal of the person who has taken out the license for prospecting or development work without further reference to the Forest Department.

Q. In the case of say a metal like manganese in a teak forest, would you pursue the same system?—A. Teak is a reserved tree.

Q. Have you any definite forest rules for mine areas? In some provinces they have a very definite set of rules which apply to the use of the forests in concession areas, are there such rules in regard to forests in Burma?—A. Prospecting licenses permit of the conversion of unreserved trees of small size; permission to use the larger ones must be obtained from the Divisional Forest Officer. Royalty is paid on all timber cut.

Hon'ble Mr. H. Thompson.—There are mining regulations which declare to what extent concessions can be granted. I am afraid my mining manual is not with me; it is all laid down there; I cannot say whether they apply to the Shan States or not, they apply to Burma generally, but one has to study the whole thing to find out what particular rules apply to the Shan States.

Mr. O. E. Low.—Q. As a matter of fact, is timber allowed free for development?—

Hon'ble Mr. H. Thompson.—It is allowed for actual mining operations.

Mr. O. E. Low.—Q. Your answer to Question 104, you would legislate to protect and ensure the production of finished articles and of tungsten, antimony and other ores required to produce metals necessary for industries of Imperial importance and to facilitate the work by giving Government moral assistance and if necessary subsidies, what form of legislation have you in mind?—A. The most difficult time in the development of any enterprise is of course when it is in its early stages, and as I consider all minerals of Government importance. I should think that a subsidy for the development of the enterprise would be a good thing, especially in the case of minerals that are of the greatest Government importance, for oftentimes it is extremely difficult especially for a poor man to develop a property at his own expense; there are many mining failures as the result of it.

Q. But a development of this kind is not a poor man's proposition?—A. I think you will find that most prospecting and early development is done by men without much means usually miners.

Q. Well, it is possible, but that of course requires very little in the way of capital outlay?—A. Prospecting, which is the first step, requires very little capital, but any amount of development does.

Q. Don't you always get a number of people interested in mining operations ready to put up a certain amount and bring them up into a marketable proposition?—A. The usual procedure is that the prospector discovers the mineral and develops it to the extent that justifies either the formation of a new company or it being taken over by an operating Company. Very few Companies will have anything to do with a prospect unless it has either unusual promise or is opened up to the extent that sufficient ore of a high enough value is exposed to justify the expenditure necessary to determine its value as a mine.

(Witness here gave confidential evidence.)

Q. Your answer to Question 106 regarding construction of public roads; I suppose you would include also small railways? A. Yes, if they meet the same general object aimed at as in the case of roads.

Q. As a matter of fact your line I suppose is a private line and cannot carry public traffic, I mean your line from the metre gauge up to here?—A. We have no equipment for the carriage of passengers. This, however, does not prevent people from riding; no fares are charged.

Q. Do you carry goods for the public?—A. Yes.

Q. Have you had any request to carry timber?—A. Not to my knowledge.

Q. Do you know if much timber is carried along this metre gauge railway?—A. With the exception of that purchased by this Company in Mandalay and intermediate stations, I do not think a large amount of timber is handled on the Lashio branch.

Hon'ble Sir R. N. Mookerjee.—Q. Do you carry public goods?—A. Yes.

Q. Have you got any fare tariff given to you by the Government?—A. No. Originally freight charges on packages were instituted in order to cut down the number of passengers who travelled on our line for trading purposes only.

Q. You charge as you like?—A. Yes, but the charges are reasonable and no attempt is made to fix the rate at the maximum the traffic will bear.

Q. There is no rule given to you by the Government?—A. No, but on being informed in 1912 that the only goods carried in addition to Company's stores are stores required by the Company's employees, the Local Government granted us permission to make a charge for the carriage of these articles.

Q. And the Railway Board know that you carry public goods?—A. It is presumed that they do, as the subject has been referred to in the Junior Government Inspector of Railway's reports.

Mr. C. E. Low.—Q. To what would you attribute the failure of the Burma metre gauge railway to carry timber from above these hills?—A. Probably because no great amount of suitable timber is tributary to the line.

Q. But there seems to be a good deal of forest here?—A. Most of the accessible timber is of inferior quality.

(Mr. Kuehn here gave confidential evidence regarding railway freights.)

Mr. C. E. Low.—Q. Have you in mind the construction of any railway purely for forest purposes which would pay interest on the outlay more than what it would cost the Government to borrow?—A. Do you mean a road built by a Company through a forest purely for the extraction of timber?

Q. I am alluding to a system of forest railways which would pay 4 or 5 per cent on the outlay?—A. I have no specific case in mind.

Q. This line here is your own line for your own purposes; would a metre gauge branch here suit your purposes equally well?—A. Better.

Q. Have you ever considered the idea of approaching the Railway Company?—
Mr. Kuehn: A. Yes, that was done by our Board of Directors in 1914.

Hon'ble Sir R. N. Mookerjee.—Q. Do you think that apart from your goods traffic there exists anything else from outside for a metre gauge branch?—A. The development of the agricultural resources of the country; also the probability of the development of new mining and other industries.

Mr. C. E. Low.—Q. To what extent could your mining capacity be increased?—A. To at least 2,000 tons of ore daily to the Mill and the resultant products out.

Q. And there will be consequent increase in the traffic?—A. Yes.

Sir F. H. Stewart.—Q. Referring to Mr. Low's question about forest roads, do I understand you to argue that such roads would pay interest on cost of construction? Do you consider it the duty of Government to provide such roads?—A. Yes, to assist in the erection of such roads as would serve the purpose of Companies exploiting the forests and be of service to the local population.

Q. Has Government any policy of "assisted roads" at all?—A. Not to my knowledge.
(Hon'ble Mr. H. Thompson: There is no regular policy in the matter).

Q. You would like to see an industrial survey made, particularly as regards mining, do you mean a survey carried out by the Geological Survey Department?—A. Yes.

Q. But you think the Geological Survey Department is doing useful work?—A. Yes, most useful work.

Q. Does that Department devote sufficient attention to Burma?—A. I think the number of Geologists ought to be augmented by at least three or four.

Q. Do you want three or four men permanently for Burma?—A. Yes, under the supervision of a capable and experienced geologist.

Q. Would that be sufficient? You don't press for the formation of a separate Geological Survey Department for Burma?—A. I think it would be better to keep the Burma branch under the Indian Geological Survey.

Q. I do not quite understand the first line of your answer to Question 40 where you say "In unsettled areas forest products should be supplied free of revenue to prospects in the development stage, etc." Do you mean timber for development?—A. Yes, for development purposes only.

Q. And then you say in answer to Question 41 "More prompt action on applications for land for industrial purposes, etc."; what is the procedure at present supposing a man wanted to take up land for industrial purposes?—A. As a rule there is considerable delay in obtaining leases.

Q. To whom do you make your application?—A. The application is made to the local authorities.

Hon'ble Mr. H. Thompson.—It would be to the Superintendent of the Northern Shan States. There is no Deputy Commissioner here.

Q. (To Hon'ble Mr. H. Thompson) Has he got power to deal with such applications?—Hon'ble Mr. H. Thompson.—A. The Local Government will deal with them.

Q. (To witness) Do you think serious delay is caused thereby?—A. That has been my experience, especially in obtaining leases and special renewals of prospecting licenses.

Q. Speaking of industrial monographs you say that "copies of the publications should be obtainable at the Headquarters of districts with which they deal. At present there is considerable time lost in trying to obtain maps and publications, etc." You don't get them in Rangoon either, do you? Is it not the case that they have to be sent for from Calcutta?—A. Most monographs published by Government have to be obtained from Calcutta.

Q. You would like to see these stocked in Burma, if not in Mandalay, at any rate in Rangoon?—A. It would be a great convenience.

Q. Turning to your answer to Question 103 with reference to the rules governing explosives you think they should be altered and you say that explosives should be allowed to be used by the better and more responsible type of gang? What are the difficulties at present that you would like to see removed?—A. At present none but Europeans are allowed to handle explosives, and only those in possession of licenses.

Q. You mean individual licenses?—A. Yes.

Q. That is probably a temporary restriction?—A. With the great difficulty of getting Europeans at the present time, it makes it very difficult while prospecting in isolated places, I think there are some Indians and Chinese who are entirely reliable.

Q. But in normal times, that is, in pre-war time, wouldn't they be able to get license?—A. I do not think so, but I have had no experience in the matter.

(Mr. C. E. Low.—The Deputy Commissioner can grant licenses for any quantity up to 60 lbs.; you can keep up to 10 lbs. or something like that without any magazine precautions. Probably Mr. Thompson will know better.)

(Hon'ble Mr. H. Thompson.—I am not an explosives authority.)

Mr. C. E. Low.—Q. You can keep 10 lbs. without any difficulty; if you keep more than 10 lbs. you require a magazine is that the rule?—A. Yes.

Sir K. H. Stewart.—Q. I do not quite follow the idea that you suggest in your answer to question 104: you say "I don't think it necessary or wise to develop minerals wholly at Government expense, etc." Could you explain briefly what you mean?—A. The principal reason for my suggestion is that I think private mining concerns can do it better and probably more cheaply and more quickly.

Q. With regard to the improvement of rivers for floatation purposes, does Government do anything in the way of removing obstructions, construction of locks, etc., which you suggest?—A. Not to my knowledge.

Q. Has Government a man in its service to do that kind of work?—A. I do not know of any.

Q. Do you know if the Government has made any hydro-electric survey in Burma?—A. Not to my knowledge.

Q. Has any scheme of yours received any help from Government? Have you met with any obstacles?—A. We have had no help rather the reverse owing to very long drawn out negotiations.

Hon'ble Mr. H. Thompson.—Q. In connection with your answer to question 40, I understand that, as regards prospecting licenses, you think it is sufficient that the holder of the license should have all the timber which he needs for prospecting purposes and for use in the development of his prospecting operations, that is to say, he should have permission to cut down any timber within the area relating to his license: these are the existing rules; do you consider them to be sufficient?—A. Are they the existing rules in the Northern Shan States?

Q. They are the existing rules for Burma generally. I am speaking of the province as a whole; I think you may take it they do apply to the Northern Shan States so far as I am aware. Then you also speak of the supply of timber to *bonafide* agriculturists: at present a portion of Burma represents crown lands, more than half of which is under inferior cultivation; the condition under which it is held is that so long as it serves any commercial purpose the holder must pay royalty, but otherwise it is entirely free of charge; is that not satisfactory, or do you think anything more is necessary?—A. Such rules, I think, would be quite satisfactory, but I do not think they—especially as regards mining apply to the Northern Shan States. I am under the impression that the holders of prospecting licenses are permitted to cut trees of small sizes only, for sizes necessary for most mine requirements.

written permission would have to be obtained from the Divisional Forest Officer, and royalty paid upon all timber cut.

Q. There is a further point in connection with forest roads or railways: you are aware that forests are often worked in cycles, that is to say, timber is taken out from a forest for 10 years and then that forest is closed and timber is taken out from some other different area: have you considered the construction of forest roads with reference to this aspect of the matter?—A. As stated in my reply to a question by Sir Francis Stewart, I consider that Government should assist in the building of such roads as would serve the Companies exploiting the forests and be of service to the local population. The location of such roads could be better arrived at by close co-operation between Companies' engineers and engineers of the Public Works Department, for there is no doubt that in many cases forest roads that would be of equal or nearly equal benefit to the Companies could be diverted to a more suitable location from Government standpoint.

Mr. A. Chatterton.—Q. In regard to metallurgical matters do you want any assistance from the Government of India in the way of research institutions in places where you have got metallurgical problems to work out?—A. Such institutions would be of great advantage.

Q. In connection with these metals—lead and zinc—which you are mining here, is there scope for any local research work?—A. In an enterprise of this kind a research institute is indispensable. We have a small one now in operation and contemplate the erection of a larger and more complete one in the near future.

Q. Is there much prospecting going on in these hills?—A. In the Northern Shan States I think there is very little prospecting outside what is being done by this Company.

Q. Do they find minerals which require a metallurgical research institute to deal with?—A. The treatment of almost all minerals is a more simple matter after tests on them have been carried out in a research laboratory to determine the most suitable process. As regards analysis, we constantly receive samples from outsiders for assay.

Q. Have you any educated Indians or Chinese employed in the technical management of your concern?—A. We have three Chinese engineers—one a graduate of the Royal School of Mines, London, the other two graduates of the Montana School of Mines, United States. We have several technically trained Indians who are employed as draftsmen and surveyors, and another *en route* from England.

Q. What salaries do these men get?—A. The Chinese engineers started on Rs. 250 a month. The English trained man is now receiving Rs. 450. The Indians receive from Rs. 150 to Rs. 300.

Q. Who is the Indian coming out?—A. His name is N. S. Sandhu, a Punjabi Hindu, I understand he went to England seven or eight years ago, received some technical training and was in the employ of an English Railway Company.

Q. Is he a mining engineer?—A. He is a railway engineer. The three Chinese are mining engineers.

Q. Is it practicable to do anything here in the way of training men for this kind of mining work?—A. Do you mean giving them technical or practical training? We have a large number of well-trained men for practical work—men who are trained here—such as expert miners, smelter men, mill men, engine drivers, etc.

Q. Are they Chinese?—A. All the miners and mill men, and some of the smelter men are Maingthas.

Q. Are there any Indians employed on such work?—A. We have no Indians underground, but some of the men on technical work at the smelter are Indians and almost all our engine drivers.

Q. Have you got any Indians who have had some kind of engineering education?—A. We have a number of such men.

Q. Have they come from engineering colleges in India?—A. Yes.

Q. What are they doing here?—A. Some of them are draftsmen, some surveyors.

Q. Have they any general knowledge of mining work?—A. None, but one man who is draftsman at the mine.

Q. Is he a Bengali?—A. Yes.

Q. Is he from the Sibpur Engineering College?—A. Yes.

Q. Have you got any in the metallurgical section?—A. None with technical training. A number are holding positions as supervisors and are doing quite well.

Q. That sort of work does not require any metallurgical knowledge?—A. It requires a certain amount which is only obtained by experience.

Q. When they come to you, they do not possess any technical knowledge?—A. No.

Q. Would it be possible to take apprentices here and put them through a regular course of mining and metallurgical instruction?—A. Yes. A class has been receiving instruction in mechanical engineering at Bawdwin under the tutorship of our Mine Mechanical engineer.

Q. I would like you to tell us, if you would be so good, what is the general procedure in America by which men become managers and heads of mining concerns?—A. About 90 per cent. of American Mine Managers and heads of mining concerns are graduates of mining colleges, the remaining 10 per cent. are practical men who by study and perseverance have fitted themselves for promotion to the higher positions. The usual procedure by college men is that during the vacation between the first and second years at college the time is usually spent in surface and mine surveying; the vacation between the second and third years in mine surveying and actual mining, for instance, shovelling, tramming, drilling, timbering, etc.; the vacation between the third and fourth years is usually spent in getting more mining together with milling and smelting experience. After graduation, if a man intends following mining, he gets a position in a mine as a miner, receiving promotion on his merit. If he chooses any other branch, such as geology, metallurgy, milling, assaying, etc., he seeks positions in those branches, working his way up as in mining.

Q. Have they to work as ordinary workmen?—A. Absolutely, they start at the bottom.

APPENDIX.

Extract from letter dated the 29th April 1918, from T. E. Mitchell, Esq., Resident Manager, Burma Mines, Limited, to the Secretary, Indian Industrial Commission.

* * * * *

With regard to the statistics requested by the Commission I beg to say that we have 42 Indians who have been educated in Anglo Vernacular Schools. These men are working in the following departments:—

Drafting Office	3	Machine Shop	7
Railway Department	4	Construction Department	5
Smelter	3	Carriage and Wagon Department	5
Blacksmith Shop	3	Boiler Shop	2
Mechanical Department	4	Loco Shop	1
Pattern Shop	4	Electrical Department	1

MANDALAY.

WITNESS No. 448.

MR. L. H. SAUNDERS, I.C.S., *Judicial Commissioner, Burma.*

WRITTEN EVIDENCE.

The Commission's questions appear to contemplate a much wider and more systematic assistance of and interference with commerce and industry than has been the case in the past. No indication is given of the principles by which the Commission or the Government of India will be guided, or how far preconceived ideas or the principles which have been acted on in the past have been or are to be abandoned. I am not in any way qualified to discuss or to offer an opinion on this important matter, but one's views in matters of detail are, or should be, guided to some extent by general principles, and it seems desirable therefore to preface one's answer with a statement of these as I understand them. Whatever opinion may be held of the value and virtues of private enterprise or an individualistic theory of society and Government, there can be no doubt that it has left a magnificent record in the seventeenth, eighteenth and at least the first half of the nineteenth century. We owe to it, mainly, if not entirely, not only our pre-eminence in industry and commerce but we also owe to it the British Empire beyond the seas. It is certainly desirable therefore that this system should not be lightly abandoned. Admitting that the results produced by it in the last fifty years or so have not been entirely satisfactory, admitting that enterprise in other countries, and especially in Germany whose organisation has come into especial prominence through the war, has produced results rivalling and even surpassing those of the British Empire, it does not follow that the system is suffering from incurable defects, or that one of those defects is the failure of the State to interfere directly in organisation and control.

It would not be difficult to enumerate some of the causes, social and political, which have hampered British industry in recent years in its competition with younger rivals. It is inconceivable that they will remain untouched by the war and its effects. If wise counsels prevail it seems to me that the war will be followed by a period of prosperity and enterprise at least equal to anything of the kind in the past. In that case public opinion in the United Kingdom will make it clear whether, where, and to what extent State aid and State interference are called for, and the Government of India, which is naturally influenced by and reflects to a great extent the opinion of the mother country, will not be left in much doubt as to the steps to be taken in India.

If, unfortunately, matters take a different course, it is impossible to conjecture what results may be, but it is at least probable that they may be disastrous, not only to the United Kingdom, but also to its great dependency.

I think, therefore, that it is very desirable to emphasize the fact that the work of the Commission is being undertaken, if not during a period of transition, at least at a time when principles are being called in question which a short time ago were almost universally accepted, and that it is impossible to prophecy what effect the war may have upon the conduct of industry and trade in the future. While, therefore, in common with every one who has been for any length of time in the country, instances where industrial or commercial opportunities have been neglected or misused have perhaps come to my notice, I should hesitate to recommend Government interference upon the general principle, which I believe to be still sound in relation to the British people, that private enterprise in matters of industry and commerce is most successful when least subject to state interference.

History and position
of India.

The demands which have arisen in England for increased interference by the State in these matters, *e.g.*, for the State acquisition of railways and mines, and which have generally been put forward by labour or by theorists, I believe to be due to ignorance of the real problems in issue, which arise from a variety of causes of which the fear of unemployment, a failure to appreciate the nature and position of capital, lack of education, and of a due share by labour in responsibility in industry, are among the most important. These and the changes in the centre of gravity in political matters are probably the main causes which have operated to restrict the success and energetic development of private enterprise in recent years. If these causes continue to operate it appears to me that private enterprise will continue to be weakened, and, if industry and commerce are to continue and expand, the Government will either have to undertake the part of entrepreneurs, either directly or indirectly, to a very much greater extent than any one would at present think possible, or will have to trust more and more to foreign enterprise until such time as the native of the country is able to take a much larger part in business than he does at present.

I think these remarks are necessary because the history and position of the Government of India differ in important particulars from those of the Government of the United Kingdom. The Government of India has never taken the extreme individualist view which for long prevailed at home, but in its assumption of the control of land, of forests, etc., and in its construction of railways and canals and in other ways has recognised the principle that the function of Government extends beyond the maintenance of order. I think, therefore, that there is a greater danger in India than there is in England of the adoption of a theory favouring State interference in industry as a remedy for the comparative failure of private enterprise, and of the ignoring of the fact that, while State interference may be successful in Germany, for example, where it is in consonance with the spirit of the nation, it is not likely to be so successful in a country whose traditions are those of greater freedom. It is true that experience of State interference and State control is greater in India than in the United Kingdom, and that such experience does not promise the somewhat Utopian results which are sometimes apparently expected by theorists in England; but in a time of stress like the present the danger appears to be real and should be guarded against.

While it is clearly impossible to say at present what effect the present war will have on trade and industry, it has undoubtedly had already one very important effect in causing an examination of our methods and of the principles which governed them. It has undoubtedly brought into the light the political factor in economic problems. Admitting, for example, the economic soundness of free trade, the fact that such a vital industry as agriculture may be ruined by it is not only a political factor of the first importance, but it may react on industry in such a manner as to make even its economic soundness questionable. Similarly, while economic laws may encourage free intercourse between different bodies politic, it may be found that the political result of such freedom has proved disastrous to the economic welfare of one or more of them.

Applying the general principles referred to above, to concrete instances the rice trade of Burma may be taken as a good example.

Rice trade of
Burma.

This important industry which consists in the collection of the unhusked rice from the cultivator, the removal of more or less of the husk, and the shipment and sale of the husked product, began in a very humble way by the collection of the husked rice from the cultivators in small parcels, and its shipment in bulk. By the private enterprise of British firms it developed into a great business, paddy being purchased in large quantities by brokers on behalf of the milling firms, and turned into all descriptions of rice, from the finest white rice shipped to South America for eating purposes, to the roughly milled grain used in manufactures. The partners or heads of firms who had built up this business in the country retired to England (or Scotland) for fortunes, but continued to keep the control of the business in their own hands. The same enterprise and acumen which had built up the business were not displayed in carrying it on. German firms appeared on the scene, and, though the condition of the big English firms may not have been as precarious as has been alleged at the time war broke out, there can be no doubt that the control of the industry had passed into German hands, prices were governed by the Hamburg market, the methods of the British firms were bad, and they were not able to retain the position which had been built up for them.

Now, I think, it is the case that the Government of India did nothing to assist the establishment of this great business, that the men who started it did not expect and possibly would have resented offers of assistance, and that, equally, when the industry failed to be as profitable as it had been or threatened to pass entirely into German hands, Government could not and would not have interfered.

Take again the wolfram industry of Tavoy. I do not know whether this valuable mineral *Wolfram* was discovered and its existence made known by private enterprise or by the Government Geological Department. I believe that the deposits are rich, and that for years after the industry of recovering the wolfram began, no attempt was made to prove them, or to do more than a little random mining. Little or no capital was forthcoming for the enterprise, and little or no scientific skill was displayed in dealing with it. The ore was, I believe, all shipped to a foreign country, because the means to extract one of the most important ingredients in one of the most important industries of the north of England were entirely wanting in India or England. Is it expected that Government will have more enterprise than the firms engaged, for instance, in the manufacture of high speed tools, and will undertake to deal with wolfram ores?

Or take the case of the Bawdwin mines, one of the most important mineral deposits in the Indian Empire. There is, I believe, plenty of capital behind the company which is developing these mines, but so far, though the deposits have been known for nearly 30 years the enterprise is still in its infancy and the problem of dealing with more or less refractory ores of zinc, copper, etc., is still unsolved. I understand that American labour is replacing Australian and possibly the capital is American.

The labour at the oil fields is almost entirely American. Is Government prepared to develop the resources of this country by or for the benefit of foreign countries? The refusal to allow the Standard Oil Company of America to acquire rights in the oil field seems to show that a preference may be allowed to British firms but here there was an important British Company in existence. Where this is not the case is Government prepared to stifle an industry which foreign firms might be willing to develop in the absence of British competition?

It is obvious that the manner in which the questions of the Commission are answered must depend to some extent at least upon what the answerer thinks the policy of Government will be or ought to be after the war.

So far as I am concerned I will endeavour to answer them on the assumption that in India there will be no change.

There are two main divisions into which it appears to me that the problem falls: The first deals with all those activities with which the Government has directly concerned itself or for which it has made itself responsible in the past. These include the development of the forests, of minerals, of agriculture (outside the area of the permanent settlement), education (with certain reservations, *e.g.*, where there are private or unaided schools), communications and the like.

The second is concerned with all the trades and industries, and falls naturally into two classes, large and small.

As to the former it appears to me that the Government of India is in the position of the proprietor of a great estate who is, or should, be ready and anxious to develop it to the best advantage and for the benefit of the persons living in it.

Obviously the first thing to do is to ascertain as fully as possible its resources and possibilities. In certain directions if this test is applied good progress has been made, in other directions a beginning, in others hardly that.

As far as Burma is concerned it is, I think, generally admitted that the inadequacy of *Roads and railway communications.* communications is one of the greatest stumbling blocks in the way of development. The difficulty of ascertaining what is to be found in any given area, to say nothing of making use of it, is obviously increased when it is only possible to get to that place with considerable difficulty, delay and discomfort. The necessity for roads is recognised and it is hoped, I believe, to make a beginning in laying them out. The absence of any systematic geological survey or examination of sources of stone metal is a good example of how things should not be done. A Chief Engineer who had been in the province a year professed complete ignorance of the local prices of stone metal, and astonishment at its high price and inferior quality, but no further curiosity on the subject. In one district in which I served in which stone metal had actually been collected and paid for, it was condemned and not put on the roads, because, although, at the price, it was decidedly superior to the burnt brick locally used, it was not good stone metal, which it was certainly not. In the same part of Burma the Commissioner of the division refused to entertain any complaint of the absence of roads in one district and the shocking condition of those which did exist, on the ground that in the dry weather carts could go across country, and in the rains the bullocks were required for ploughing. It is hardly surprising when views like this are allowed to exist that the country has remained undeveloped. It is unfortunate that the only railways in the country are metre gauge. Burma is a long country of no great breadth, if the Shan States are excluded, and the time occupied in travelling from one end of it to the other in trains proceeding at 12 to 20 miles an hour is a serious obstacle to development.

The absence of hotels outside Rangoon and of *dāk* bungalows, in which food can be supplied keeps away many visitors, of whom some at least, it may be presumed, would have

an eye to business. Officials are generally accustomed to travelling with their own servants, or have means of accommodating themselves not open to the general public. The Railway Company and the local Government would probably be well advised to improve these facilities for travel.

That the Southern Shan States should only have been connected with Burma proper by railway very recently, and that that railway should have ended where it does is an instance of the difficulty of opening up communications which might be repeated almost *ad nauseam*.

The history of communications in Tenasserim and Arakan—the two oldest divisions of the province annexed nearly 100 years ago—is enlightening, and I submit not creditable to those responsible. But it is, I think, unnecessary to enlarge upon this theme. Here as in other directions where money could have been profitably spent upon development there is no doubt that the country has suffered from lack of funds and there is probably no province in India which would have repaid expenditure more rapidly.

It is usual to condemn the Government of India inasmuch as the country provides most ample funds and if the surplus available were more largely devoted to local development, there would be plenty of money for the purpose. Burma is, I believe, by far the most heavily taxed province of the Indian Empire per head of population.

It seems to me that there are faults on both sides. I was informed not many years ago that the view prevailing in the India Office was that Burma produced a surplus revenue which she could not profitably spend. I believe at the time of the Annexation of Upper Burma the Government of India were prepared to give whatever sums were asked for for development. Fifteen years later it was notorious that balances were accumulated and that they were not spent because it was said that establishments were inadequate. But, on the other hand, it would appear that if the Government of India had been acquainted with the conditions of the province there would or should have been, not merely a readiness to assist in its development, but an insistence upon proper measures being taken for the purpose. It is clear that in the last 20 or 30 years very large sums of money have been invested by the United Kingdom not merely in the Colonies but in foreign countries, and if money has not been available for the development of an admittedly rich province of the Indian Empire the cause was presumably ascertainable and removable.

Forests.

Among the most valuable assets of the Indian Empire, the control of which has been retained by the Government, are the forests. It would appear that the Forest Service has been recruited until recent years almost exclusively with a view to the extraction or supervision of the extraction of timber. Burma, which I believe, provides about half the forest revenue of India finds over 90 per cent. of this from the extraction of teak. The forests are of course generally inaccessible by road or rail and the department would appear to have been generally starved. A percentage of appointments might be given to botanists, chemists and other specialists with a view to the application of those sciences in the work of the department, the technical side of the industry being attended to not only in the field but in the institutes of which Burma ought certainly to have not the least important, and which might be co-ordinated under an Imperial or Central Institute. Such questions as the extraction of commercial products, turpentines, etc., as well as the strength and adaptability of timbers require attention.

Geological and
mineralogical
surveys.

It does not seem necessary to go in detail into the development of other departments. It would seem desirable to have a geological and mineralogical survey of each province in some detail and for this purpose each province should apparently have its own staff working under or in connection with the Government of India staff. Experts in fact are required in much larger numbers than are available in India at present. In my opinion they should be controlled by non-experts but should receive adequate, that is, substantial emoluments.

Scientific education.

One of the reasons why the United Kingdom has not made the progress in industrial matters which might have been expected would appear to be that the people generally have failed to realise the importance of what are known as scientific attainments as compared with merely general knowledge or mechanical skill. Education has apparently been too much in the hands of persons trained only by a literary education and while, I think, it has been found that what is called a classical education is the best foundation for any form of specialization, and the lack of it is possibly at least as much responsible for the failure of the scientists to convince the country of the importance of scientific specialization, both in education and industry, it seems clear that here, as elsewhere, the Government of India has merely reflected home methods. But while in England private benefactors and public opinion have largely shaped the course of education, in India it appears to have followed the usual bureaucratic methods with the passing of examinations and clerical employment as the two most important objects to be aimed at.

Agriculture.

In agriculture the Government has done excellent work in certain directions, e.g., in the development of irrigation and of co-operative societies, which in Burma are mainly agricultural and owe whatever success they have achieved in the first instance and very largely to Government initiative. These societies appear to me to offer one of the most promising guarantees for the future successful development and progress of the country, and the absence of co-operative effort in England except in the direction of buying and selling is a sign of weakness in the national life.

The Agricultural Department in Burma is young but promising. It requires funds for its development and appears to be working on right lines.

As to important industries I do not think I have any useful suggestions to offer. 'The will to succeed,' as the Germans would say, would probably remove most of the difficulties they encounter. Provincial Governments should have expert knowledge and advice at their disposal and there should be close intercourse between Provincial and Imperial Departments. It is no doubt desirable that Provincial Governments should be subordinate to the Imperial Government but I think it has been the case in the past that the local Government of Burma has adopted the attitude of expecting criticism and rebuke from the Government of India rather than sympathy and advice. No doubt that is not now the case but it is not easy to understand how a Government whose members spend part of the year in Simla and the rest at Delhi and upon which Burma has no effective representation can expect to have the knowledge of local requirements from which effective help alone can arise.

The Mining Rules in the past appear to have contemplated a state of development which does not always exist in parts of the country where minerals are frequently found. Fairly accurate maps and demarcation are, for instance, called for from people undertaking work. In Tavoy in order to facilitate compliance with the rules with reference to wolfram, I understand that a detailed survey was prepared by the advice of the Survey Department upon a scale which proved quite unsuitable and the money spent on the survey was to a great extent wasted. A visit by a qualified expert of 2 or 3 months duration should have put the Governments of Burma and India in possession of the facts and have been sufficient to safeguard the interests of the State. Mining Rules.

Similar expert advice would be most useful in many directions. I understand that the Government of Burma proposed to send an Indian Civilian to the Straits for six months to acquire a knowledge of the tin mining industry with a view to advising them on his return. Such a deputation and a similar deputation of officers to enquire into the rubber industry, into the state of communications, etc., would probably have been most useful if the Government had also had at its disposal scientific experts qualified to advise in matters of detail.

With reference to small industries I think there is a wide field open to Government. Small Industries. There are numerous handicrafts and village industries in Burma, some of which are extensively carried on, and serve or used to serve, the needs of the people throughout the province, while others are more local in character. Such are weaving, pottery, slipper making, umbrella making, lacquer ware, jaggery boiling, and a number of others. Many of these are efficient in their own way, but they are carried on in ignorance of what western knowledge has achieved and many of them are threatened with extinction by competition with articles of western or Japanese manufacture. It seems desirable that, wherever it can be done, the craftsmen should be put in the way of learning such western methods and improvements as may be of assistance to them. They are all village industries and though some, if not all, are capable of concentration in large factories, it is in the direction of maintaining their present character that I think Government help should be given. The question of markets cannot be lost sight of—as the ordinary villager is not capable of advertising his wares by modern methods, of accumulating stocks or developing new markets, Government assistance is probably necessary for these purposes. Here co-operative societies offer a means of development which may be of the greatest value.

I have had some experience of handloom weaving. This industry was, before we annexed Weaving handloom. the country, practically universal, the clothes worn by the people being entirely locally woven. The industry, except in a few centres, has almost died out in Lower Burma and is threatened with extinction in Upper Burma owing to the competition of foreign goods, mainly from Manchester and Japan. The former exports very large quantities of cotton fabrics for coats, etc., and printed cottons for *longgis* or waist cloths. Japan exports large quantities of light and flimsy but attractive silk goods especially for turbans. But the Burmese cotton and silk fabrics, though rough and comparatively dear, are not as a rule adulterated in any way, and are extremely durable. I have read lately articles on silk weaving in an "Indian Trade Journal" in which methods of loading silk fabrics are described, and the silk industry in England and Japan seems to consist largely of putting goods upon the market with the minimum of silk and the maximum of adulteration.

It appeared to me desirable that the weavers of Burma should have some instructions in western methods since their looms though extremely serviceable in some ways were old fashioned and often roughly made and the weavers' knowledge, *e.g.*, of pattern weaving and of weaving wide widths, was extremely limited. I aimed only at improving mechanical methods though it was obvious that if success was obtained in this direction other questions would arise.

About 1907, when Deputy Commissioner of Shwabo, I bought a fly shuttle loom and showed it to the weavers of whom there were two large colonies, but the loom which came from Calcutta was not a very good specimen and the weavers themselves took little interest in it. The weaver at that time usually worked for a contractor who by supplying the silk on credit and buying the finished product managed to keep his workpeople in a state of bondage and neither he nor they saw any advantage in new methods. When I left the district I gave the loom to the S. P. G. Mission school which purported to teach weaving and was described by the Education Department as a technical school on this account (the only one of its kind), though nothing was taught but indigenous methods and the teacher had never heard of a fly shuttle. In 1909, when Deputy Commissioner, Henzada, I got a much better fly shuttle loom from the Director of Industries, Madras, and got a local weaver to teach himself the use

of it and gave it to him when I left. This man subsequently became a pupil of the Amarapura school.

When on leave in England, I got an English handloom without fly shuttle and had the warp set up by an English weaver. I brought this to Mandalay in 1911 and got another fly shuttle loom from Madras of the same kind as I had obtained in Henzada. Amarapura, near Mandalay, is the largest weaving centre in the province, silk cloths being woven there in considerable quantities. A co-operative society had been recently formed there, mainly with the object of improving the weavers' financial position. In this it had attained some success, and when I sent for the Chairman to show him these looms he at once had them taken down and removed to Amarapura, and, without any further help or advice, ordered the wood and iron work for six more looms from local sources. The local weavers were, however, unable to obtain locally such parts as pickers, reeds, healds, etc., and I had to get these for them from Bombay. The Chairman and members showed a good deal of enterprise in copying and learning to work the looms, but the English warp was too fine for the local weavers. Hearing that there was to be a weaving competition in Rangoon I advised them to send a man there to see if he could pick up any hints. He noticed the Salvation Army picking attachment and on his return copied it. This proved popular and the interest taken in the looms increased considerably. As I knew nothing about the technical part of weaving and demands for explanations, assistance, etc., threatened to increase it was proposed to obtain the services of a qualified man. The weaver whom I saw at home told me he had been offered Rs. 300 a month, I think, by the Government of India to come out to India for a year to give instructions in weaving, and that he had declined the offer, partly because it would not pay him to leave his business on these terms for a year, and partly because Government apparently expected some knowledge of spinning and dyeing which he did not possess. This gives some idea of the requirements and limitations of working class instructors from England. It was decided to endeavour to get a suitable instructor from India and the services of Mr. Husst from Saharanpur were obtained. The local Government has displayed considerable interest in the work and has provided, I believe, all the funds asked for. It has been necessary to start work from the beginning, to build a weaving shed and store, to lay in a supply of silk, to purchase looms, etc. Pupils receive scholarships from the Education Department or from Local Funds where necessary, and they can buy looms when they have learnt to use them, on the instalment system. The more intelligent pupils who wish to do so are taught designing and go through a course which will enable them to instruct others. Iron Hattersley looms have been obtained, and when I left Burma a Jacquard was on order but there was a difficulty in obtaining delivery owing to the war.

It is unfortunate that the attempt to help this industry has synchronised with the war and while the price of raw silk which is imported from China has become almost prohibitive the demand for silk goods has decreased. In the circumstances attention has been given to cotton fabrics for which there is a good demand in the province, and, if the industry survives, there should, I think, be a good future before it. Co-operation has given the weavers a brighter outlook and an incentive to work in improving their financial position, and it also makes it possible for them to spend more money on their implements.

Dyes.

But to put the industry on a thoroughly sound basis, I think that a good deal remains to be done. At one time the dyes in use were all locally procurable and largely vegetable dyes. Practically all, except the yellow used for *pongyi* robes, have been displaced by chemical dyes. It would seem desirable to have an examination of the vegetable dyes made by a botanist and a chemist with a view to ascertaining whether it is worth reviving them. The methods of dyeing with chemical dyes are easy and the results for the trouble spent on them are good, but an expert in dyes could give much help though it would be necessary to discriminate between dyeing and the other processes common in England, which aim at producing an attractive and sellable rather than a durable article. Raw silk from Kashmir deserves more attention as an alternative to the Chinese article and it is possible that in time the country may be able to produce its own raw silk, but under present conditions this can only be done effectively if Government is prepared to undertake the supervision and financing of the work. I believe that Mr. Lefroy was anxious to ascertain whether the production of a suitable silk was possible in Burma and was prepared if it was found to be so, and if the Government of India was prepared to undertake the supervision of silk production throughout the Empire, to recommend the adoption of measures of investigation on a fairly large scale.

silk.

Sales Agency.

For the marketing of these and other village industries some agency appears necessary. If a co-operative society or a collection of societies interested in village industries would undertake to set up a central sale depot it is probable that this would be found a profitable step.

Technical school.

It appears to me that measures similar to those adopted in the case of weaving could be and should be adopted for other village industries. A scheme was drawn up at the time of His Excellency the Viceroy's visit to Mandalay for the institution of a technical school in Mandalay, which in the first instance should give instruction in masonry, pottery, carpentering, and tanning, and the existing weaving school could probably be added to it with advantage. The initial cost was estimated, I think, at 2 lakhs and the annual expenditure was estimated at (7) 50,000. If such a school were in existence it would form a nucleus to which could be added other subjects, or, as it would be admittedly experimental, unsuitable subjects would be dropped.

I am strongly of opinion that there should be in this province a Director of Industries ^{Director of Industries} who should probably be a civilian, though the choice would require some care. What is ^{leaves} required is common sense and a practical turn of mind. The expert whether in business or anything else is generally an expert because he has devoted himself to one subject to the exclusion of others, "the noise of the hammer and of the anvil is ever in his ears and his eyes look still upon the pattern of the thing he maketh." Except in exceptional cases therefore he is not likely to make a good director of other experts.

I think also that there should be a Board of Industries, which should have executive ^{Board of Industries.} powers with budgetted funds and a free hand, subject to control as to the general lines upon which it should work and the objects to be aimed at. The Board should consist probably of such Government officers as members of the agricultural staff, the head of the engineering school, Insein, representatives of any other industries in which Government decides to display an interest and probably representatives of large industries selected, e.g., by the Chamber of Commerce and Burma Railways.

It would certainly seem desirable to correlate the activities of the various provinces by ^{Correlation of Provincial Departments.} bringing them within the scope of an Imperial head, e.g., the Member for Commerce, who might be assisted by a Board of Trade; but the position of Burma undoubtedly would make it difficult for such a department to keep in touch with Burma's requirements and it would probably be to the economic advantage of Burma to obtain complete independence from India in return for a substantial contribution in money, of course not as great as its present contribution.

ORAL EVIDENCE, 31ST JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. You have got no experience in connection with the development of industries since you arrived in this country?—A. Nothing except silk weaving in a small way.

Q. In the first paragraph of your written statement you say, "The Commission's questions appear to contemplate a much wider and more systematic assistance of and interference with commerce and industry than has been the case in the past." I think you have misunderstood the intention of Government in appointing this Commission. It is not to interfere with any existing industry.—A. Well.

Q. Then you say, "The Government of India which is naturally influenced by and reflects to a great extent the opinion of the mother country..." It does not necessarily follow, because India is quite different from England as far as industrial development is concerned?—A. Yes, possibly.

Q. The object of this Commission, as far as I know, is principally to encourage Indians to develop industries.—A. I have not seen the terms of reference to the Commission.

Q. And these questions have been framed accordingly. I may tell you that its object is not in any way to interfere with or cry down British enterprise which has done so much good.—A. I do not imagine that was the object. After all, assistance is interference, I imagine.

Q. Will you explain a little more clearly how you take it as an interference if the Government assist the development of industries here?—A. It is a beneficent interference I should say.

Q. But don't you think that it is the duty of every Government to try and develop the industries of the country?—A. Well, it depends—It is a large question.

Q. You are in favour of appointing a Director of Industries?—A. Yes.

Q. And also a Board?—A. Yes.

Q. But that is also helping to develop industry.—A. I say that they are perhaps to some extent open questions. I do not say that Government should not do it. I say that in the past Government—I think that is the sense of what I have written—have abstained from interference and the development of industries has been considerable in certain directions and it is a question how far Government should interfere by assistance. I do not mean to restrict industries at all. The whole thing is in the melting pot at present. That is the object of the first paragraph of my note.

Q. What is your reason for saying that it is in the melting pot?—A. The war is affecting every thing. The effect of the war has been felt considerably in India and Government has already taken steps, which they would not have taken before, by the appointment of the Munitions Board and so on for the development of industries, but I do not think it is quite clear because this Commission has been appointed that steps should be taken in the future.

Q. The Munitions Board was appointed after this Commission had been appointed and had done half of its work and the Board is only an off-shoot or rather an adjunct of this Commission.—A. Is it so?

Q. In your own opinion do you think that this Commission and the trouble that it has taken are not wanted at all?—A. No. I do not think so at all.

Q. Do you think what the Government of India has done hitherto for the development of industries is quite enough?—A. I do not think so. I do not think that is the meaning of my evidence.

Q. We read it in that light—A. That is not my intention. There is no doubt that industries in India have followed the lines of English industries very largely in the past. They have been left to the public without Government interference but I point out that in certain respects Government has not followed the same lines in the development of forests, railways and so on. I point out also that the question of how far Government should interfere is a matter which I think depends to a certain extent on the decision of statesmen at home.

Mr. C. E. Low.—Q. You say on the first page of your written statement, "I should hesitate to recommend Government interference upon the general principle which I believe to be still sound in relation to the British people that private enterprise in matters of industry and commerce is most successful when least subject to State interference." Assuming that this principle is sound in relation to British people under the present conditions, do you consider that that necessarily follows with regard to the Indian population?—A. No. I do not think so.

Q. Under the head of wolfram, you say, "Is it expected that Government will have more enterprise than the firms engaged, for instance, in the manufacture of high speed tools and will undertake to deal with wolfram ores?" Might it not be a question of something more than enterprise? Would not India be in a dangerous position in the event of a future war if it could not produce its own high speed tools and might it not be arguable that Government should undertake the manufacture of high speed tools even at some loss which no private firm would naturally contemplate?—A. Yes.

Q. You say, "The problem of dealing with more or less refractory ores of zinc, copper, etc., is still unsolved." Do you mean that they do not know how to do it or they have not done it?—A. I believe they do not know how to do it.

Q. From what we understood from our conversation, with the Burma Mines' people the reason why they have not done it is simply because of the existing position they could not do it.—A. There is no doubt that they could do it in time, but I know nothing about it myself. I have talked with mining engineers and I understand that there are problems peculiar to every mine and the problems in connection with this particular mine have not been solved.

Q. Not in practice, but perhaps on a fairly large experimental basis?—A. That I do not know.

Q. Then you say, "These include the development of the forests, of minerals, of agriculture (outside the area of the permanent settlement)." Why do you think that the development of agriculture should be confined to the temporarily settled areas?—A. I do not think I say so. I say that Government has concerned itself in the past in these things.

Q. But has not Government concerned itself for some years past in the development of agriculture in Bengal?—A. In the permanently settled areas? Possibly it has.

Q. Speaking quite generally, do you think that it is a good thing for a country like India for her population to be so essentially unindustrial?—A. I certainly do not.

Q. Is it not unsafe?—A. I think so. Indeed very unsafe.

Q. In the same page you say, "That the Shan States should only have etc."—A. It should be Southern Shan States. It is a misprint.

Q. As a matter of fact where was the Railway supposed to go along to?—A. The Nyaunggye valley.

Q. Then you say, "The absence of hotels . . . kept away many visitors. . . . The Railway Company and the Local Government would probably be well advised to improve these facilities for travel." You think that the Railway Company might put up, as, for instance, the Bengal Nagpur Railway have done, railway rest houses open to the public?—A. Yes. But not merely rest houses: hotels also.

Q. Something of that sort you think would help?—A. Yes.

Q. Under the heading of Mining Rules, you say, "In Tavoy in order to facilitate compliance with the rules with reference to wolfram, I understand that a detailed survey was prepared by the advice of the Survey Department upon a scale which proved quite unsuitable and the money spent on the survey was to a great extent wasted." What was the scale that was used?—A. What did happen here was that the survey was made on one inch scale and that is not altogether suited to mining.

Q. The point of my question is this. You say, "A visit by a qualified expert of two or three months duration should have put the Governments of Burma and India in possession of the facts and have been sufficient to safeguard the interests of the State." But Mr. Coggin Brown of the Geological Survey was out here for some time and some other members also. Was that before the Government of Burma agreed to this scale, or was it perhaps the case that the survey was made on this scale because time and circumstances did not permit of anything more detailed?—A. I am afraid I cannot tell you.

Hon'ble Mr. H. Thompson.—The survey was made without special reference to mining. It made no special reference to mining.

Q. You say, "I understand that the Government of Burma proposed to send an Indian Civilian to the Straits for six months to acquire a knowledge of the tin mining industry with a view to advising them on his return." A Civilian would have a good deal to learn if he wanted to acquire a knowledge of the tin mining industry?—A. Yes.

Q. Was it with reference to the rules under which tin mining industry works there or the technical aspect?—*A.* As regards the rules.

Sir F. H. Stewart.—*Q.* Has he been sent?—*A.* No.

Mr. C. E. Low.—*Q.* Under the head of technical schools, you say, "A scheme was drawn up at the time of His Excellency the Viceroy's visit to Mandalay for the institution of a technical school in Mandalay, which in the first instance would give instruction in masonry, pottery, carpentering and tanning." Do you know of any steps being taken in that direction?—*A.* No. Nothing whatever I believe.

Q. Do you know the reason at all?—*A.* Because His Excellency told me that he should wait for the report of the Commission.

Q. In the next paragraph you point out that the expert is apt to be one-sided. But there are a good many experts in different things and you can pick your expert in such a way as to get a man who would not necessarily be one-sided?—*A.* No doubt, that is so, but what I meant to convey was that the tendency in acquiring expert knowledge was to restrict.

Q. Apart from the question as to where you draw your first Director from for the Department of Industries, is it not likely that the Department will evolve its own Directors in the future?—*A.* I think that will depend very largely on the constitution of the Department.

Q. You speak of the Board of Industries. Do you think that it is desirable that you should have Government officials who are heads of Departments on the Board? I put it to you this way. The Industrial Department can always obtain the advice of Government officers in other departments fully and freely without making an undue demand upon their time, whereas they cannot get in that way the advice of practical business men with a knowledge of local and industrial conditions. Would it not be preferable to have a Board consisting of business men and to obtain the assistance of departmental officers in the ordinary way? You know how difficult it is to get them together, to bring them from tour and so on? Could not the same amount of assistance be got from them with less trouble to themselves and to others by consulting them departmentally?—*A.* I am afraid I am not very favourably impressed by the process of departmental consultation.

Q. It is very often done quite privately and informally?—*A.* That is so. But when it takes the form of notes sent to office it is a most unbusinesslike way of doing things.

Q. If you have a Board of Industries consisting of private individuals with industrial experience, they discuss a certain proposition and they want more data or the Director wants more advice on a technical point outside, he goes to the head of the other department and talks it over?—*A.* No doubt, but I do not see why the head of that Department should not be also on the Board and discuss it before everybody.

Q. It is rather difficult to get them together at the meetings of the Board and it will make it more difficult if you have a number of departmental officers?—*A.* I do not think that it is necessary to have all these departmental officers together on every occasion, but they may attend only such meetings as relate to matters affecting them.

Sir F. H. Stewart.—*Q.* With reference to the first two or three pages of your note, would you not say that the position of affairs out here is very different from that at home, owing to the fact that the Indian industrial development has not been so great?—*A.* Yes.

Q. And therefore the case here is different from outside as regards Government help or intervention?—*A.* I think it certainly is in the case of small industries.

Q. That is the next question I was going to ask you. In the first instance, do you think that the development of industries throughout India and perhaps especially in Burma has been commensurate with the possibilities?—*A.* No. Up to about 50 years ago I should say we had done very well.

Q. But of late, afterwards there has been no corresponding advance?—*A.* No.

Q. Is it your idea that Government help and encouragement could be more usefully confined to smaller industries?—*A.* Not necessarily confined. I think that smaller industries should have the first call.

Q. Would you not agree that the appointment of this Commission which was contemplated I think a good many years before the war, proves that Government is taking an increased interest in industrial development?—*A.* Yes.

Q. So far as you are concerned, you have answered the Commission's questions on the assumption that in India there will be no change?—*A.* Yes.

Q. But surely that change is already taking place and here is one instance of the appointment of this Commission?—*A.* Yes. I have tried to make clear that in certain directions Government did interfere to assist or undertake the development of industries to a very much larger extent than in England.

Q. It seems to me that your written statement does not quite tally with the ideas you now express?—*A.* Perhaps the distinction is between small and large industries.

Q. You would agree that Government should give all possible help in the way of surveys and information?—*A.* Yes.

Q. And facilities for acquiring land?—*A.* Yes.

Q. Do you think that Government should go further and give direct financial aid?—
A. In small industries.

Q. Have you any suggestions to make on the subject of communications, road communications particularly? Is there any possibility of co-operation, say, between Government and private enterprise? A suggestion was made to us elsewhere in Burma that, for instance, the lessees of forests might be willing to share in the expenditure of making certain roads which would open up the country for the public good?—A. Perhaps, I think a little may be done. Villages in Burma are required to keep open communications, but that in a sense is private work. But the main communications are insufficient in Burma.

Q. You attribute all that to lack of funds?—A. Yes.

Q. If you are given a freer hand with more funds you would have done more?—A. Yes.

Q. With reference to forests would you agree—I think that was the trend of your evidence—that you require silviculturists, research officers, working plans officers, commercial officers, revenue collectors and forest engineers?—A. Is that meant to be a complete list? Chemists also.

Q. Do you think that the circumstances of Burma are so individual and so special that a Forest research institute is required for Burma?—A. I think it is special in this way that forests are a very much more valuable possession in Burma than the rest of India.

Q. Would you agree that the Forest Department is very weak on the commercial side in dealing with matters of business?—A. Yes.

Q. How do you think that it should be remedied? By giving certain selected forest officers some business training, or by recruiting business men to run that side of the work?—
A. I am afraid I am hardly prepared to go into details.

Q. With reference to cotton and silk fabrics, you say that they are not adulterated as a rule in any way. Is that still true?—A. I think so.

Q. Is the quality maintained?—A. I think so. I am speaking about the silk woven here. There is some adulteration but it is not very great. Cotton and silk are mixed but that is not adulteration.

Q. You think that the Board of Industries should have executive powers. You also think that the Director of Industries should be a Civilian. Would you give your Board control over the Director?—A. Yes.

Q. And in case of disagreement between the Director and the Board it would be a matter for reference to the Local Government?—A. Yes.

Q. What sort of status do you think the Director should have? Would he hold the position of a Secretary to Government with direct access to the head of the Government?—
A. Certainly, yes.

Q. You want it to be really an important appointment?—A. Yes.

Q. With reference to the proposed Imperial Department, you think that the various activities of the different provinces should be correlated under the Member for Commerce?—
A. I say, "e.g., under the Member for Commerce."

Q. Do you think that the Department of Commerce would be able to devote the necessarily increasing time and attention to industrial matters?—A. I am afraid I am not competent to answer that question. I should think it should be extended.

Q. What I wanted to know was whether your answer contemplates the formation of a separate Industrial Department under the Government of India?—A. I am afraid I could not answer off-hand. It is a matter requiring some consideration.

Mr. A. Chatterton.—Q. I should like to ask you about the results achieved at the Amarapura Weaving School. Are you still in touch with this school?—A. Occasionally.

Q. What is the present position of the school in relation to the weavers in the neighbourhood? Is it exercising any considerable amount of influence over them?—A. Yes. The unfortunate part, of course, about the school is that it is beginning to feel the effect of the war as it has seriously affected the silk market.

Q. You mean that the price of silk has risen so much that there is less demand for it?—
A. Yes.

Q. Are there many silk weavers in this neighbourhood?—A. Yes. It is the principal silk weaving centre of Burma.

Q. In your written statement you say that for the development of the smaller industries amongst which we may include handloom weaving "Co-operative societies offer a means of development which may be of the greatest value." Has anything been done in that direction as an off-shoot of the Weaving Institute?—A. It is rather the other way round. It is because there were existing co-operative societies in Amarapura that the school was started.

Q. Some one outside, yourself for instance, must have mentioned the matter and started the thing? Did the working brains come from the societies themselves?—A. From the societies. I got a loom.

Q. You initiated it?—A. I got it and put it up in my bungalow and the president of the societies in Amarapura came up with some of the weavers to see it. I had to go away for a few minutes and when I came back I found it had been taken away to Amarapura.

Q. Who is the president? *A.* Burman?—*A.* Yes.

Q. In connection with the appointment of a Director of Industries you would preferably have a Civilian as Director. In connection with these experiments of your own in the improvement of the weaving industry do you think that it would have been very much easier for you if you had had a good deal more technical knowledge than you would probably have had at the beginning?—*A.* I do not know if it would be easier. When I persuaded Government that the services of an expert were required they fell in with the idea at once and obtained an expert. I do not think that a Director of Industries with a knowledge of weaving such as he possessed would have done much better.

Q. What is wanted in most industrial work is a knowledge of mechanical engineering? That comes in largely in almost every industrial problem?—*A.* Yes.

Q. With such a knowledge it is possible for a man to take up any specialised industry and more rapidly get a grip of it. Don't you think that it would be better to have a Director of Industries who is more or less qualified in that way rather than a man who has merely administrative ability?—*A.* I do not think it is necessary.

Q. For instance, in dealing with weaving problems the mechanism of weaving appliances is a matter of importance and a trained mechanician is more likely to be able to ascertain what is best to use rather than a man who has not that experience and knowledge?—*A.* I doubt very much whether you wish the Director of Industries to go round and put looms right.

Q. Not to put them right, but to start the thing. You might want to purchase these Hattersley looms for the Institute. A knowledge of mechanism in that case would be a matter of considerable help. You do not wish to be entirely in the hands of your expert who may be prejudiced in favour of one particular type of machine?—*A.* Of course, the same applies to everything. With a little knowledge of medicine it would be easier to decide whether your expert doctor's advice is good.

Hon'ble Mr. H. Thompson.—*Q.* I should like to put one question in connection with the general aspect of Government assistance or interference in industrial concerns. As you may be aware, a Provincial Committee has been appointed by Government to frame proposals to be placed before the Commission. This Committee proposed to make a clear distinction between large industries and small industries, and in the case of large industries the Committee suggests that Government interference should ordinarily be restricted to pioneer work, to experiments in new branches of industries, whereas in the small or cottage industries Government is required to go further and it may be necessary if possible to finance and also to instruct the persons employed in these small industries. Would you look at that as a suitable classification or division?—*A.* Cottage industries are not new industries. You say that you would restrict to new industries—

Q. I did not mention new industries. I said that as regards large industries help should generally be restricted to pioneering, in the case of cottage industries you should go further and it may be necessary that Government should both assist and finance and give technical instruction?—*A.* Pioneer work is not a large industry. It may be developed into a large industry.

Q. By "pioneer" work I use it in the sense in which it is used in the Commission's questions; that is to say, pioneering an industry is experimenting to see whether a new large industry will or will not be commercially successful?—*A.* If a pioneer industry is successful, one hopes it will lead to a large industry.

Mr. C. E. Low.—I would emphasise the words "commercially successful."

Hon'ble Mr. H. Thompson.—*Q.* Take for instance the Mergui rubber plantations. That is a good example of Government pioneer industry. Do you think that would be the general lines on which you would be inclined to recommend that Government should proceed?—*A.* I should think so.

Mr. C. E. Low.—*Q.* As regards this Amarapura Institute, did you find yourself in the position of not knowing where to go to for advice as to the right type of loom for the purposes you have in mind?—*A.* Yes.

Q. You had no one to ask anywhere in India?—*A.* I think the Director of Industries, Madras, was the person to whom I applied.

Q. Don't you think that some form of co-ordination of that sort is wanted to make the information in one province useful to another?—*A.* Exactly. If there were Directors of Industries and Boards of Industries there would be co-ordination.

Q. If you have a small industry run successfully in one province, unless the Director of the province where the information is wanted follows the reports in every other province he may not know where the industry is going on?—*A.* How would you propose to inform him.

Q. By having a Central Department, a Government of India Department?—*A.* But then they would distribute these reports?

Q. There would be a certain amount of touring and discussion, just as is done in the Agricultural Department. Speaking as an ex-Director of Agriculture I may say that I have obtained considerable assistance from the interviews that I had with the Agricultural Adviser

and the Pusa experts, and they were able to tell me what was happening in other provinces?—
A. I should think that would be useful.

Sir F. H. Stewart.—Q. Is not the proportion of literacy very high among Burmese?—
A. Yes.

Q. Does that make the Burmese responsive to new ideas?—A. Yes. Mr. Hurst will tell you that he found the Burmans more intelligent and more receptive than the Indians.

Q. They have done very little in the way of industries so far?—A. Yes.

Q. What is the explanation of that?—A. The extent of education is greater than the degree. To be able to read and write is not quite the same thing as having a good education.

Q. But what they have would render the people more responsive to the initiative and influence of Government?—A. I should say so. There is very great scope in Burma for development.

Hon'ble Sir E. N. Mookerjee.—Q. What made you to take so much interest in weaving at Amarapura?—A. Well, in the first instance, it was a fact that at one time—in the Burmese times—throughout the country the clothes that everybody wore were home made, but in Lower Burma weaving practically died out and there was hardly any weaving except in a few well known centres. In Upper Burma it was the same thing and when we annexed Upper Burma later the industry was in the same condition and I thought that the people should have a chance of learning better methods and be given an opportunity of competing with outside fabrics.

Q. What was the first step taken by you to give it a start?—A. First of all, I had to learn weaving. I think I have explained the whole thing in my statement.

Sir F. H. Stewart.—Q. Do Burmans of good families and position weave? In Assam we were told that ladies of respectable positions weave still?—A. It is dying out. I think they used to certainly. There is no caste in Burma. There is not very much distinction between families.

Mr. A. Chatterton.—Q. Are there any other domestic industries except weaving in Burma?—A. There are a great many.

Q. Purely domestic household industries, not carried on in the bazaar?—A. In the dry zone of Burma crops are precarious and the people have always a subsidiary industry such as mat making, pot making, or sugar boiling.

Q. How do they get a market for these things?—A. Either the middlemen come and buy or they themselves take them to the market.

Q. Is there any export trade from the dry zone to other parts of Burma in the products of these home industries?—A. Yes.

Q. It is organised?—A. No.

Q. If there is a middleman it would be to some extent organised?—A. Yes. There is no organisation.

Q. Is pottery one of these home industries?—A. Yes. I should say so.

Sir F. H. Stewart.—Q. Is it your idea that silk weaving should be developed or revived on the cottage system or the small factory system?—A. Cottage system I think. Of course, the war has greatly interfered with its development, and the difficulty now is to find a market; that is one question which will have to be settled at first.

Q. I was really wondering. Mr. Hurst says that there is sufficient reason to believe that a sufficient number of factories could be maintained in full time employment. The Institute is really for the purposes of instruction?—A. Yes.

WITNESS No. 440.

Mr. A. Hurst.

MR. A. HURST, Principal, Saunders Silk Weaving Institute, Amarapura.

WRITTEN EVIDENCE.

I.—Financial Aid to Industrial Enterprises.

Capital.

Q. 1.—So far, I have had no experience in raising capital for industrial enterprises, and therefore, I am not in a position to say anything regarding the difficulties that one would have to contend with in doing so.

Q. 2.—But as far as my knowledge goes, capital can be raised from the following sources:—

- (1) Individuals.
- (2) Shares.
- (3) Co-operative Credit Societies.
- (4) Government.

Q. 3.—As far as this province is concerned no factories or any kind of industrial enterprises in silk have been started, and hence their full time employment is out of question. But there is sufficient reason to believe that, should a number of factories be started, all can be maintained in full time employment, as the consumption and demand of the province is far more than what is and can be manufactured.

Q. 5.—(1) Grants-in-aid should be given by Government to factory owners, in order to enable them to undertake the training of deserving students, who when trained will be available for employment in furthering and extending the business of their particular industries. Government assistance.

(2) Bounties and subsidies in the shape of land free, or free of rent for certain periods, and similar concessions should be given by the Government to new enterprises.

(3) Government should guarantee dividends for five or more years according to the conditions prevailing in the province, so as to create faith in the shareholders of the concern. The dividends may be realised after the concern is well established.

(4) Loans for starting private enterprises should also be given by the Government at a small rate of interest, as there are many skilled persons who, for want of capital, are unable to do anything, and, even if they try to obtain the necessary funds from others, the rate of interest is so high that the whole of their profit is swallowed up in paying the interest. This is especially the case in Burma.

(5) Government should supply the poor class of people, who are not in a position to manage a factory, machinery on the hire purchase system.

(6) Many intending enterprises have had to be closed down owing to the want of further capital, in such cases Government should step in and finance the concern, on the basis of public subscription.

(7) It has always been difficult for any new going concern with a small capital to establish itself on the market immediately. In such cases Government should come to the assistance by purchasing the product of the concern which can be disposed of through Government agents.

(8) To encourage further the establishment of a larger number of new factories, and to enable them to compete with the foreign market, the Government should not impose any income-tax on the profits, and exempt them from all taxes levied on the machinery required, and on all the articles used in the manufacture, for a period of at least five years.

Q. 6.—In all the above cases when Government is assisting financially, it should exercise supervision and control over the working, both by audit and the appointment of Government directors during the time such assistance is given.

Q. 7.—It is essential for the opening of new industries, and especially in such a province as Burma where there is no industrial spirit due probably to lack of faith, that Government should raise pioneer factories to prove to the masses that they can be worked commercially. Unless this is done, it is very difficult to prove the same by means of private capital, as there are very few capitalists ready to launch out on any enterprise they know nothing about. Pioneer factories.

Q. 8.—The Government should pioneer the industry by having their own model factories, and keep these factories going till such time as they are able to convince the people of the profits and benefits to be derived, and when the proof of its success has been established, Government may hand over the same to the people.

These pioneer factories should be fostered by Government till such time as there are many factories of the like established in different parts of the province.

Q. 11.—The Amarapura weavers have received assistance from the co-operative societies in the shape of improved machinery and small capital to purchase raw material; but, owing to the bad state of the silk market since the commencement of the war, no satisfactory result has been obtained. Co-operative Societies.

Q. 12.—As far as the silk industry is concerned co-operative societies for weavers should be encouraged in weaving centres and their objects and aims in forming such societies should be to work conjointly on a joint stock factory system.

Q. 12.—(a) Trade guilds and associations should be formed and encouraged in large industrial centres. Their objects should be to look to and safeguard the interest of that particular industry in all its aspects.

Q. 13.—Government aid should be given at all times, but on the principle that the aid will not in any way hamper or compete with any already established business. Limits of Government assistance.

Q. 14.—There should be no limitation on Government aid to a new enterprise which will try to compete with an established external trade, and every step should be taken to stamp out external trade by such aids. This is the only way whereby the industries of a province can be improved. As for instance, as long as Japan competes and has the monopoly of the silk market, there is very little chance of the improvement of the silk weaving industry here.

II.—Technical Aid to Industries.

Q. 15.—Technical aid is useful in the way of making known to the people the latest improvements and methods of an industry for which it is intended.

As far as the weaving industry in this province is concerned, the experiments carried out by the Weaving Institute have done much to improve the local weaving industry which improvements gradually, it is hoped, will spread throughout the province.

Q. 16.—The benefits derived by the local industry are that the people have been made acquainted with the working of elaborate patterns which being attractive in nature were readily adopted and found a ready market, and it is hoped when the Institute is in a position to teach designs, such as are manufactured for the Burmese market by Japan, the Burma weaving industry will then be able to compete with the Japanese.

Q. 17.—I don't think Government should lend its experts to those private firms or companies who are in a position to have their own.

Government experts should devote all their energies to those not in a position to pay for expert advice, which advice if not given would mean the closing of the business. Advice to these should be given gratis.

Demonstration
factories.

Q. 19.—The silk industry of this province is one that requires Government demonstration factories and such factories should be opened up in all the chief weaving centres. Their objects should be to prepare and turn out efficient men who will after leaving be in a position to manage and conduct a factory.

Research abroad.

Q. 22.—Arrangements for the research of special subjects in the United Kingdom is advantageous and should be arranged for. But care should be taken in the selection of the candidates. Only such expert hands who are in touch with the development of that subject should be allowed to proceed there for research work.

III.—Assistance in marketing products.

Commercial
Museum.

Q. 25.—From the little experience I have of the Calcutta Commercial Museum, I can say that it is quite a good institution, as it readily brings the manufacturer and the buyer in touch with one another.

Q. 29.—During the short time that I exhibited at the museum, the inquiries that I received prove that such an institution will be of the greatest value and assistance to industries and I would certainly suggest that such institutions should be opened up in each presidency or province. They should display all manufactured articles which would find a ready market in their respective provinces, and should, from time to time, advise the manufacturer of the requirements of their localities. At the same time they should also advertise largely by way of pamphlets, and do all they can to make the exhibits popular.

Sale agencies.

Q. 30.—To display and effect a ready sale of the products of minor and unorganised cottage industries, sale agencies are beneficial, and should be on the co-operative basis; and, where this is not possible, then the agencies should be formed by Government. The duties of these agencies would not only be to effect a sale, but also to advise the manufacturers as to the requirements of their markets.

Exhibitions.

Q. 30(a).—Travelling exhibitions, in my opinion, would be of advantage only if they exhibit such articles as are of interest to the local people, and such exhibitions should only be held at places where there are likely to be big assemblies due to a festival or other causes, as exhibitions of general character and held at a quiet place would be of no use.

Q. 32.—Government should take every means to hold and encourage only such exhibitions as would go towards benefiting the new and unorganised cottage industries and they should only be held as above suggested.

Trade representa-
tives.

Q. 34.—Trade representatives in different provinces, in India itself alone, would be a great boon to the industry, if the representatives work on behalf of the province and open up new markets for the products of those provinces that they represent.

Government
patronage.

Q. 37.—Government departments should exhibit such articles which are not manufactured in India, and the manufacture of which in India will open up fresh avenues of industry and enable her to compete with imported ones. As to the other articles which are produced in India, a list of the same should be published for general information and guidance of those interested in the manufacture of those special articles to enable others as well to compete.

V.—Training of Labour and Supervision.

Primary education.

Q. 44.—Primary education is essential for industrial development as it tends to make the worker think for himself and at the same time to widen his knowledge in the special line he is interested in, and thus make him a better worker than an illiterate person.

Q. 44 (a).—I know of no institution in the industry in which I am concerned where an effort has been made to improve the labourers' skill and efficiency by means of primary education.

Steps to improve
efficiency.

Q. 45.—For the improvement of the labourer's skill I would suggest the following:—

- (a) 1. Primary Education.
2. Night Schools for whole-time workers.
3. Day Schools for half-timers.

(b) Technical Education—

By night schools giving technical knowledge of the special line in a simple manner, which could be understood by common labourers.

Q. 46.—Regarding the training of apprentices in factories, no special training is given Apprenticeship in the factories. The apprentices learn just those things that they have observed, and are system. not in a position to solve difficulties by themselves which have not come within their observation. This is due to the lack of technical instruction.

Q. 47.—Industrial schools generally produce far better and more intelligent workers than Industrial schools. ordinary factories, where apprentices learn only by observation.

Q. 48.—The two systems, i.e., apprenticeship and industrial schools should be arranged Co-ordination of the in such a way that a student will be able to take advantage of both simultaneously. The two systems. hours of school should be arranged in such a way that the student will be able to take advantage of the factory. The teacher should lecture on the particular subject in which the student has got more facilities to study in the factory. He should at the same time accompany the students in the factory and should see that the student makes use of the knowledge given by him in the school.

Q. 49.—Night and day schools are good in a way for less educated people and for others Half-time schools. who can ill afford to take advantage of regular training in the Technical Institutes. But the training given in such night and day schools should be given by thoroughly efficient men.

Q. 50.—The Industrial and Technical schools should be under the Department of Industries Control of industrial and technical education. and not under the Department of Education because the Educational Department is not in touch with industries.

Q. 51.—For the training of supervisors and of skilled managers, special schools for Training of supervisors. advanced training should be instituted, where instruction will be given only in the management of the particular department together with the training of the subject.

Q. 52.—Assistance should be given—(1) by way of scholarships, (2) part of expenses, and Assistance to (3) free passage, etc., according to the grade of service, which would enable supervisors, study abroad. managers, technical experts of private firms to proceed to foreign countries to study the conditions of the trade.

ORAL EVIDENCE, 31ST JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. In your answer to Question 5 (4) you say "Loans for starting private enterprises should also be given by the Government at a small rate of interest, etc.," and you go on to say "even if they try to obtain the necessary funds from others, the rate of interest is so high that the whole profit is swallowed up in paying the interest." By whom would it be decided whether a certain company should get loan from Government at a low rate of interest or not?—A. By those who are interested in that particular industry.

Q. Government must require somebody's advice, must it not?—A. Yes. I am interested in the weaving business; of course I would advise Government whether it would be advisable for it to give a loan for that particular business or not.

Q. Supposing there is a loss in the business, who will be responsible?—A. Of course there will be a Government director to look after the interests of Government if Government is giving the loan. At the same time that Government gives a loan, whoever advises that the loan should be given that person has got to see how the factory is managed. Of course he may not advise a loan if he feels that the business does not require such loan. The mere fact of his advising Government that a loan should be given means that there is a possibility of the business doing well.

Q. In answer to Question 5 you say "Grants-in-aid should be given by Government to factory owners in order to enable them to undertake the training of deserving students, etc." Who will select the students? The factory owners?—A. It will be left between the man and the factory owner. Of course in these questions there should always be an adviser to Government; if Government is giving grants-in-aid to these factory owners, it will be the business of that adviser to advise between the man and the factory owner as to what he will be capable of taking instruction in.

Q. But the adviser may not come in contact with the student? How is he to ascertain whether the student possesses the necessary standard of education?—A. There must be some restriction on the selection of candidates; he will select those who wish to take instruction in a particular factory to which Government is giving a grant; he cannot take anybody and everybody because everybody has not got a mechanical aptitude or an aptitude for learning or any other special trait. Therefore particular selection must be made and that selection must be left entirely in the hands of the man who recommends to Government that a grant should be given to such factory.

Q. Do you think it will be possible for him to keep in touch with the candidates?—A. Why should he not? I do not think it is an impossibility. There won't be such a large number of people taking advantage of your technical instruction in these factories that the man would not be in a position to advise.

Q. In answer to Question 5 under clause (6) you say "Many intending enterprises have had to be closed down owing to the want of further capital, etc." Can you cite any particular instance?—*A.* There is one at Nyaungu. They are running 10 looms, 8 Hattersley's and 2 Salvation Army looms. It is on the verge of being closed down. If Government does not come to its assistance I am afraid that within a few months the factory will have to be closed down.

Q. How would you advise the Government to come to its help?—*A.* I would give a loan repayable after a certain time.

Q. On what security?—*A.* On the security of the machinery. Of course if Government wants to further the cause of an industry here, it should be prepared to lose a certain amount of money.

Q. You want Government to give a loan without taking any security?—*A.* Of course the machinery there will stand for a certain amount of security.

Q. Suppose it won't cover all?—*A.* Of course that depends upon what is the amount of money asked for or what is required.

Q. You know the state of affairs in this particular instance as you are an expert: have you any idea as to what amount of money they want to keep the factory going?—*A.* They require about Rs. 2,000 or Rs. 3,000. It is not a big sum for Government to launch out.

Q. Is there not a co-operative society here?—*A.* Possibly so.

Q. Why should it not lend the money required by this factory?—*A.* I believe that they are arranging to amalgamate themselves with a co-operative body whereby they can get the necessary funds to continue.

Q. In answer to Question 48 you say "The two systems, i.e., apprenticeships and industrial schools, should be arranged in such a way that a student will be able to take advantage of both simultaneously." Industrial schools in that case should be located where there are industries?—*A.* Certainly.

Q. Then there will be different types of industrial schools, one for say weaving industries and another for mechanics, etc., etc.?—*A.* There should be different industrial schools for different centres.

Q. Is it not your idea that you should select a place for establishing an industrial school where all the industries are grouped together?—*A.* Quite so, but then there are certain places having a particular industry of their own.

Q. And you want a school of that type established there?—*A.* Quite so. I suppose in the districts where there is weaving done and weaving forms the most important industry, a weaving industrial school would be a thing that is required. What is the good of having an industrial school dealing with a special subject which is not called for in that place?

Q. What will be the qualification of these students when they leave the industrial school according to your proposal?—*A.* It entirely depends on the class of industry and the class of students that we are going to deal with.

Q. I should like to know your ideas about it.—*A.* If you are going to deal with an ordinary man, and make him a practical man, the instruction should be such as will give him the necessary knowledge to produce that which is required from him. There is no use teaching him further beyond that.

Q. You don't propose industrial schools for higher class students, namely, those who would take charge of factories as supervisors or foremen?—*A.* Not for the present.

Mr. A. Chatterton.—Where did you acquire your knowledge of weaving?—*A.* In India.

Q. At Serampore?—*A.* No.

Q. Were you a student there?—*A.* I was Assistant Principal there.

Q. Where did you acquire your knowledge?—*A.* In Bombay at the Victoria Jubilee Technical Institute.

Q. After you left Serampore, were you employed by the Salvation Army?—*A.* That was long before that. In fact I was the first one employed by the Salvation Army when they started their business.

Q. Was that before Mr. Maxwell came?—*A.* There was Mr. Maxwell when they opened it in a commercial way. I was the first man on the field there and I worked up their business for them when they first started. Thereafter I joined Messrs. Greaves Cotton and then I joined the Government school at Serampore. In Greaves Cotton I was connected with Hattersley looms and I opened a factory at Surat.

Q. You have no experience with other types of looms than those of the Salvation Army and Hattersley's?—*A.* Yes, I have experience of the Churchill loom, in fact all types of Indian looms.

Q. Where did you work these?—*A.* At Anand; in fact I had been working at the loom; there the Salvation Army had two types when I was there, both their loom and the Churchill loom.

Q. How long have you been at Amarapura?—A. Just four years.

Q. Here you have to deal with the problem of improving domestic industries?—A. Yes.

Q. Are all the weavers here professional weavers?—A. Yes, on their own indigenous loom.

Q. Are they financed by traders?—A. No, by the co-operative societies.

Q. How many co-operative societies have given assistance to weavers?—A. When I first came there were 12 men given to me who were financed by the co-operative societies. We took up improved looms.

Q. How many co-operative societies were there when you became Principal?—A. I think there were about 12. Each society sent one student to me.

Q. Have you had any experience of the working of these societies?—A. No.

Q. You have nothing to do with them?—A. Not in the sense of a weaving master.

Q. In what sense do you mean that the co-operative societies have financed your weavers?—A. That is, after they left the school they were supplied with machinery, and also with money for the purchase of raw material.

Q. How much money did a single co-operative society give to a single weaver after he left your school?—A. These 12 men were given Rs. 200 to Rs. 250 of which about Rs. 100 went for machinery.

Q. The co-operative societies paid up to Rs. 250 to each individual weaver: was that on your recommendation?—A. No, that was on the recommendation of the co-operative society. At that time the Institute was not on its present footing. It was worked purely as a co-operative concern. When I first came to Burma, these 12 students who came from different co-operative societies were learning under me.

Q. Who employed you here?—A. The Burma Government.

Q. The Government lent your services to the co-operative societies?—A. Practically.

Q. And you were employed to put these 12 students on to improved methods of weaving?—A. Quite so.

Q. And then?—A. When the students had learnt, they were given the necessary machinery and means by the co-operative societies to buy raw products.

Q. Was that on your advice?—A. Not on my advice.

Q. Did you advise the co-operative societies that these students were fit to be entrusted with machinery?—A. Yes.

Q. And did you advise what kind of machinery should be purchased?—A. Yes.

Q. And they bought this machinery?—A. Yes.

Q. What has become of these 12 men?—A. These 12 men have closed down their work. Owing to the war the prices of silk having gone up.

Q. Are they all out of employment now?—A. They were for some time, but they have been re-employed now. The institute is now spreading its activities further. Seeing that these people have closed down and are not in a position to look after themselves owing to the heavy prices in the markets, the institute is now extending its activities still further; we are canvassing for work for them; we are opening out markets by selling their products for them.

Q. Are you financing these 12 men?—A. For the present we are financing them.

Q. When these men were supplied with machinery roughly how much money was spent?—A. Rs. 1,200.

Q. Rs. 100 each?—A. Yes.

Q. How much was given them as working capital to go on with?—A. Rs. 1,800.

Q. Rs. 150 each?—A. Yes.

Q. How long ago was this?—A. That was three years ago.

Q. Have they repaid to the co-operative society any of the money that had been advanced to them?—A. No.

Q. None at all?—A. None.

Q. Why not?—A. Because they closed down owing to the bad state of the market.

Q. How long ago did they close down?—A. About a year after that.

Q. During that year did they make a profit or did they incur losses?—A. They incurred losses.

Q. Notwithstanding the fact that you gave them improved machinery?—A. Yes.

Q. To what do you attribute this loss?—A. The loss is due first to the high prices of the raw product. The prices went up 150 per cent.

Q. Three years ago the price of silk was down, not up?—A. The first year after the war the price of silk went up a little; just a little before the commencement of the war the price

was moderate, then there was a slump in the market. These boys were working on their own at the time, with the result that, when they took their finished articles to the market, the merchant immediately offered a very low price; there was nobody else to assist them or any middlemen between them and the merchant, and the merchant took advantage of the position, with the result that they incurred loss not only on account of the high prices at which they bought the raw product, but on account of the diminished prices they received from the merchants.

Q. So these 12 men have lost all the capital advanced by the co-operative societies?—A. Yes.

Q. How long were these 12 men with you?—A. They were a year with me.

Q. What did you teach them?—A. We taught them to work on the improved frame loom.

Q. What is the width and quality of weaving on the indigenous loom?—A. Anything between 12 and 22 inches.

Q. What are they weaving now on the improved loom which you have introduced?—A. 44 inches.

Q. Have you provided them with warping machinery?—A. No.

Q. How do they do their warping?—A. They do it in the old fashion.

Q. On pegs?—A. On vertical mills.

Q. Have they got vertical mills?—A. They had those before I came.

Q. Was that introduced before you came?—A. Long before improved weaving was first started they had those.

Q. Is it an indigenous machine?—A. Quite so.

Q. They were fairly advanced in methods of warping?—A. Yes.

Q. Is there any sizing done to the silk?—A. Sizing is done on the machinery itself.

Q. What do they size with?—A. With wheat or rice flour.

Q. What is the silk they are using?—A. All Chinese silk.

Q. Do they get any silk from India?—A. Not at all.

Q. How many students have you got in the school now?—A. I have got 65 students.

Q. On what terms do they come?—A. They come without machinery, and the condition on which they are taken is that they must purchase improved machinery; also they must be expert weavers on indigenous looms before admission.

Q. Who sends them to the school?—A. The different co-operative societies, from all over Burma.

Q. Do any of them come on their own initiative without any suggestion from other people?—A. Many.

Q. Do they enter into an agreement with you to purchase improved machinery?—A. That is the first thing.

Q. What improved machinery are you advising them to purchase?—A. The one that is taught at the institute, and no others.

Q. What kind of loom is that?—A. The improved wooden loom and Hattersley's.

Q. What is the width of the Hattersley loom that you are using?—A. 50 inches reed space.

Q. Do you find it quite satisfactory?—A. Perfectly. In fact at the institute women are working on these looms.

Q. Are the weavers here a stronger class than the weavers in Bengal?—A. Not in the least; in fact I think they are much weaker.

Q. Would you recommend us to use Hattersley looms in India?—A. Certainly.

Q. For cottage weaving?—A. Yes. There are a large number of Hattersley looms, about 100, working in different homes in Surat alone, which I introduced in 1908-09. They are working on these looms, not with thrown silk but spun silk; of course the woof is thrown silk.

Q. Are the weavers now in the Saunders Institute being financed by the co-operative societies while they are working at the Institute?—A. No, they get scholarships from Government.

Q. All of them?—A. Yes.

Q. How much does the Government give them?—A. Rupees 15 a month.

Q. For how long a period?—A. For six months.

Q. Is six months sufficient time for them to acquire a complete practical knowledge of the work you want them to do?—A. Quite enough because they are expert weavers before they come to the Institute.

Q. I understand that. Are you using dobbies and jacquards?—A. No, we have been negotiating for jacquards, but we cannot get them now.

- Q. Do you multiply the healds for pattern weaving?—A. Yes, up to 12 healds.
- Q. That is in the Salvation Army Loom?—A. Yes.
- Q. Have you introduced a large number of new patterns in this loom?—A. Quite a variety.
- Q. Are they popular?—A. Very.
- Q. Is the success of your weaving due to the variety of patterns at all?—A. Yes, in a kind of way. Where the loom has not gone out the patterns have gone out.
- Q. Which is more important relatively, new loom or new patterns?—A. Of course the pattern is the first thing.
- Q. More important than the loom?—A. Yes.
- Q. Is the success of the weaving that is now going on due more to the variety of patterns which you have introduced, or to the improved mechanical efficiency of the loom?—A. At the present moment it is due to the pattern because there is no need for looms on account of the bad state of the market, so that the patterns have made an easy way practically everywhere.
- Q. Are these weavers who are using improved looms working as individuals or are they associated in any way?—A. They are working as individuals.
- Q. Are they repaying any money to the co-operative societies?—A. Not at the present moment.
- Q. Have you got any idea as to how much money the co-operative societies have advanced them up to date?—A. Rupees 2,500 between 12 men.
- Q. That was given originally? Were any sums given subsequently?—A. Nothing since then to my knowledge.
- Q. Are not the co-operative societies then assisting this movement?—A. Nobody has been applying for advances; owing to the bad state of the market, the high rates for the raw material and the low rates for the finished article, no profits could be made. How are they then going to pay the advances back to the co-operative societies? That is the reason they are not applying for advances, when the times become better, they may apply for advances from the co-operative societies, not at present.
- Q. Is cotton weaving going on in your institute?—A. Yes, we teach cotton weaving also to those people who come from the cotton districts.
- Q. Are you teaching them silk also?—A. Yes, both. I have got a new experiment in Amarapura quite outside the institute.
- Q. What is this experiment?—A. To those boys that have left my school I am giving work to do and opening out markets for them. As the rates for silk are at present high, they are earning their living by weaving cotton.
- Q. Does the Saunders weaving institute undertake any financial responsibility in regard to this work that you are now doing?—A. That is running in conjunction with the school at present as an experiment.
- Q. To what extent are you getting orders?—A. We have only just started.
- Q. Have you got orders to the value of half a lakh of rupees?—A. No.
- Q. Then on what scale?—A. We have got a very small place and it is on an experimental scale.
- Q. What is the scale of the experiment?—A. There are only about 14 men.
- Q. What is the value of the orders put out so far?—A. None, we have only just started.
- Q. You have not done any work? You are just proposing to work?—A. We have just started work. We have not put anything on the market yet or canvassed for business, we are still manufacturing.
- Q. How much have you manufactured?—A. Not more than 15 yards on each loom.
- Q. What is the value?—A. About Rs. 500 or Rs. 600 for the stuff we have manufactured now.
- Q. Who is at the back of this? Who is financing?—A. The School, that is, the Government.
- Q. To what extent are you authorised to incur financial responsibility in this direction?—A. As an experiment it forms part of the school; we are just experimenting, and the funds come out of our funds.
- Q. You have got a budget?—A. We have got a special fund for the purchase of raw material.
- Q. Where does this fund get supplies from?—A. From Government, and all profits from the fund go back to the Government.
- Q. You have got a lump sum grant?—A. Yes.
- Q. How much is that?—A. Rupees 4,000.
- Q. When was that given?—A. That was when I first came in 1914.

Q. Is the fund still intact?—A. Yes.

Q. Probably you have turned it over so many times?—A. There was only one grant since the fund was open. We have received no further advance. We were able to make the fund grow. In fact it has earned certain profits every year.

Q. How much does this weaving institute at Amarapura now cost Government? I understand it is under the Educational Department?—A. No, it is at the present time under the Co-operative Department.

Q. Is it under the Registrar of Co-operative Societies?—A. Yes.

Q. What is the annual budget?—A. Of course our annual budget for the last couple of years has been rather high.

Q. What is the amount?—A. About Rs. 15,000 on the average. Anything between Rs. 15,000 and Rs. 20,000.

Q. Does that include cost of machinery?—A. Yes.

Q. How much of this was incurred as capital expenditure?—A. I could not say that at once.

Q. Will you furnish us with copies of the annual reports of your school?—A. So far we have had no annual report for the school.

Q. Do you furnish any report to Government?—A. Not so far.

Q. Within the last four years have you made no report to Government?—A. Very likely the Co-operative Department has done; the school has not sent any report.

Q. Don't you send any report to the Registrar of Co-operative Societies?—A. No, because the Registrar is very closely in touch with us; he knows all about the school, and he reports accordingly.

Q. Have you got copies of his report?—A. No; I can obtain copies of that report.

Mr. C. E. Low.—Q. You have certain ex-students who I understand are weaving silk in your factory, is that so?—A. Yes.

Q. What are you doing with references to the weavers commercially or otherwise outside your factory? Are you doing anything for them at present? Or are you merely contemplating helping them to sell their goods?—A. In Amarapura we are helping them directly. Those that have been in touch with the institute and have learnt in it we are helping by means of this new experiment which I explained a little while ago.

Q. Are you giving them fresh patterns?—A. We are giving them material; we sell their goods for them, and they make profit on them.

Q. You are purchasing and making over silk to them?—A. Yes.

Q. And you repay yourself out of their manufactured goods?—A. Yes, we take back their goods.

Q. What steps are you taking to arrange for the sale of the manufactured articles?—A. As far as silks are concerned, we only work to orders.

Q. What steps do you take to obtain orders?—A. We send out samples that are woven in the institute to different people.

Q. For instance, what kind of places or people?—A. Well, we do not send samples to business houses.

Q. You have had no firm orders?—A. Yes, we have now had from one or two firms in Tavoy.

Q. Are you trying to find customers in India outside Burma?—A. No, it is all we can do to supply Burma. I have received many orders from India, but I have had to refuse them.

Q. Is the price offered you sufficient to pay a reasonable profit, taking into account the increased cost of material?—A. It won't give a very large profit, it would just keep us above water.

Q. If you increased your markets could not you help more people?—A. Certainly; that is the reason for the experiment that we are carrying out.

Q. Have you ever had the idea of putting your silk on the American market?—A. I have sent samples to America but I have heard nothing.

Q. To what firm?—A. I forget now.

Q. Messrs. Valentines?—A. I don't particularly remember.

Q. You can obtain lists of such firms from the Commercial Intelligence Branch of London Board of Trade, and you can also get confidential information as to the financial standing and liability of such firms; do you contemplate doing anything of that sort?—A. Not just now.

Q. For how long has this experiment been going on?—A. It commenced just a month and a half ago. There are a lot of preparatory stages before you come to weaving.

Q. Is this experiment intended to prove whether the weavers could produce stuff according to the requirements of the market, or whether the technical processes are satisfactory or

what?—*A.* Technical processes are quite satisfactory; it is the markets that are unsatisfactory.

Q. You said that you were not going to push your goods in the market until you satisfied yourself as to the success of the experiment; I do not quite follow you?—*A.* We must first have sufficient stuff before we put it on the market. There is no use of our trying to canvass business when we have got nothing to supply. When we have a reasonable quantity we shall market the goods; and on the successful sale of those product and the sufficiency of the profit that we get, it is worth while to try further.

Q. You are not now able to deliver a large quantity of a certain stuff or pattern?—*A.* No.

Sir F. H. Stewart.—*Q.* What is your idea about the future of this silk industry? Do you wish it to be a factory industry or a cottage industry?—*A.* Cottage industry.

Q. But you refer in your written evidence in several places to the factory system and you say "should a number of factories be started, all can be maintained in full time employment," and later on you speak of co-operative societies for weavers and say "their objects and aims in forming such societies should be to work conjointly on a joint stock factory system"?—*A.* Certainly, if factories were instituted over several places and there was sufficient work to give them full employment, then they could work on the joint stock system.

Q. Is it your idea that the factory system must come with power looms or with hand looms?—*A.* It need not necessarily be a power loom factory.

Q. Is it your idea that it should be or not?—*A.* Well, yes.

Q. Is the Burman sufficiently energetic and industrious to work regularly as a factory hand?—*A.* Well, in a kind of way he is.

Q. Is he so in this particular line, weaving?—*A.* Yes, he is.

Q. Are the weavers largely illiterate?—*A.* No.

Q. The percentage of literacy in Burma we have been told is much higher than in India generally?—*A.* Yes.

Q. But it is not so among weavers?—*A.* No.

Q. How does the Burman weaver compare in the matter of intelligence and education with the Indian weaver?—*A.* From the experience that I have gained, between an Indian weaver and a Burman weaver I think the Burman is much more clever in picking up knowledge of machinery, he has got a mechanical turn of mind.

Q. For the improvement of skill you want to have night schools; will the weavers come to these night schools?—*A.* Yes.

Q. Is there anything of that sort being done now?—*A.* No.

Q. Have you thought of starting one yourself?—*A.* No, not as yet.

Q. What hours do whole timers work in Burma?—*A.* Say, 11 hours, from about 7 to 5 in homes. There is no particular hour for work. There is practically no factory formed in Burma except one at Nyaung-u, and they work from 7 to 5.

Q. What are the hours in your institute?—*A.* 10 to 4.

Q. Do the co-operative societies co-operate in sales at all? Do they do anything to sell the products of the weavers?—*A.* Nothing has been done so far.

Q. You say that "Industrial schools generally produce far better and more intelligent workers than ordinary factories . . .": do you believe that it is better that the student should be put through an industrial school before putting him to actual work in the factory?—*A.* Certainly because theoretical training besides practical training is far better than mere practical training.

Q. Are there any industrial schools in Burma?—*A.* None.

Hon'ble Mr. H. Thompson.—*Q.* Could you tell us what has been done towards sericulture at Amarapura with a view to produce silk?—*A.* It is only a plantation which has been put down; it is still in its infancy. We have tried a small experiment, but so far the mulberry plants are not sufficiently developed to permit of our carrying on the experiment further, but as soon as the plantation is sufficiently large and yields a sufficient supply of leaf, we shall carry on the experiment.

WITNESS No. 450.

MR. A. E. ENGLISH, C.I.E., I.C.S., Commissioner, Maymye, Burma.

Mr. A. E. English.

WRITTEN EVIDENCE.

I.—Financial Aid.

I take large undertakings, such as paddy milling, chemical industries, etc., separately from cottage industries.

Capital.

Large industries.—There has been a pronounced tendency in the last 20 years in Burma and specially in Rangoon for capitalists to look to speculation and speculative undertakings as a means to wealth. We have had our land boom, oil boom and mining booms and the Bank of Burma crash. Capital has of course been invested in sound concerns such as teak, rubber, oil and mines but capitalists have neglected a good many developments which might have been both justified and expected such as mofussil banking, sugar, jute, coconut and other palm oils.

Cottage industries.

The speculative nature of a good many of the Rangoon companies has probably deterred Burmese capital from investment in industrial concerns. Burmans have started mills (timber, paddy, etc.) but have frequently lost their money owing to bad management and bad accounting. Hence Burmans have become shy of Rangoon or local companies and their spare money goes into land purchase and promotes the tendency to the accumulation of land in a few hands. The Burman is in no way hide-bound by caste or otherwise and is ready to put his capital into any safe and paying concern. Given good and successful management Burman capital is bound to be available for industries in the future.

As Registrar of Co-operative Societies I helped in the financing of the silk weaving industry in Amarapura. We began with financial aid through societies. It soon became apparent that financial aid was not enough and that improvement in technique was essential if local fabrics were to hold their own against those imported. The Saunders' Institute was therefore established and improved technique resulting therefrom combined with cheap credit have done much to keep the industry going. In normal times it is probable it would even have flourished but the war has of course depressed it.

Co-operative Societies have also assisted the cane weaving industry and others, such as carpentering, and boot making industries in Mandalay with cheap credit and by arranging co-operative purchase of raw materials. There are also Co-operative Societies for the exploitation of sleepers and stone metal which promise well. The rates of interest in Upper Burma where cottage industries are more common than in Lower Burma are largely ruled by custom and are extremely high (from 30 per cent. to 100 per cent.). Given a proper economic survey of such industries on which to base financing the co-operative movement can therefore render great assistance. Such cottage industries as still remain are probably, given cheap credit, destined to maintain themselves. The Burman is a free buyer of imported goods and has discarded indigenous products where the imported article was clearly more useful.

Government assistance.

With the exception of the railway I know of no case in which Government has given financial aid to industrial enterprises.

I think the best way in which Government can financially aid industries is by supporting with funds financing institutions on terms which will ensure some loss to the institution in case the enterprise assisted fails. I would prefer however to lay down that Government should be prepared to give financial assistance to industries and to select the method of doing so on the merits of each case. Conditions in different countries differ and it would be a pity were the Commission to pronounce too strongly in favour of any one system.

Pioneer factories.

I have no personal experience of pioneer industries. I understand that the Government Rubber Plantation was a success in this way and it is said that the aluminium factory in Madras was also a success. The principle seems to me sound and it is a principle on which we are working our colonization schemes. There Government finances the breaking of the land and takes the risk of the land proving unsuitable. As soon as its suitability is established a co-operative central bank takes colony societies over and finances them in the usual way. We want industries and factories established and it is right and advisable for Government to test the possibility of working them as paying concerns.

Financing agencies.

Omitting large companies the smaller mofussil mills are principally financed by Chetties. As a rule they are established and worked at first by individual Chinese or Burmans or by small companies or partnerships. The Chinese understand accounting and generally retain the mills and run them successfully. Burmans as a rule do not understand accounts and have practically no opportunity of learning accounting. They frequently begin with only sufficient capital to erect the mill. They borrow the working capital at 20 per cent. to 40 per cent. interest. Interest payments and bad accounts lead to mortgages and foreclosure.

Cottage industries are largely financed on the advance system by which funds are given in raw material or cash which have to be paid by the sale of manufactured goods at specially low rates. The rate of interest on such transactions works out at from 50 per cent. to 120 per cent. and the result is that the actual artisans work from hand to mouth and in many cases are practically slaves. This was specially so in the silk weaving industry where artisans were always kept in debt and could not even change their employers as a civil suit and arrest were held over them *in terrorem*.

In my opinion the time is ripe for the establishment of mofussil branches of European run banks in Burma. So far we have been unfortunate. Most of the banks in Rangoon are exchange banks and do not seek mofussil business. The Bank of Burma did not want it and the Bank of Rangoon has hitherto hardly sought it. We appear to be behind India in this respect. Mofussil branches of course presuppose a staff which knows Burmese and understands the existing credit system of the country. It should surely be possible for Europeans to compete with the Chetties who are foreigners and who err against one of the canons of banking by exchanging their agents in the mofussil towns every 3 years. Given

most branches of strong well-managed banks the rate of the interest should be reduced from 24 per cent. or 30 per cent. to 12 per cent. and 15 per cent. This would render the prospects of the smaller industrial concerns very much better. I do not suggest that banks should overload themselves with long-term loans. There is much business to be done in financing trade, crops and the transport of crops and the success of many of the Chetty firms shows that it is possible for foreign banking institutions to thrive.

I have already mentioned these. Co-operation can help in the exploitation of timber, deepers, bamboos and forest produce generally, of stone metal, in the furniture and carpentering trades, in cotton ginning and in the provision and working of other machinery employed for preparing raw materials for market, in the collection and sale of hides, in the pottery industry, in mat and basket weaving, umbrella making, sandal making, boat building, cart building, dairying and in financing arts. It can do this by cheapening credit, by enabling the purchase of machinery, by joint purchase of materials, by providing intelligence as to markets and assisting in advertising. Societies also provide a machinery for imparting instruction to individual workers. In the same way as they link up the agriculturist with the Department of Agriculture they can in industries link up the artisan with the Department of Industries.

In the present conditions of Burma there is little fear of undue competition with private enterprise. Limits of Government assistance.

In the above remarks I have assumed that it is rather the desire of Government to establish native industries, that is industries under native ownership and control, than large centrally managed European concerns which will do little more than provide employment for labour. There is little need for the latter kind of institutions at present. In Burma labour is scarce and the object should be to develop industries on a smaller scale and of a local character. Our agrarian policy has led to the rapid increase of landless cooly population. We do not want to develop a large industrial cooly population which will not even be Burmese. What we should aim at is to direct the spare capital that there is in the country into small industrial concerns thereby lessening the pressure on land as an investment. We shall thus also provide occupation for our "literate."

II.—Technical Aid.

The Saunders Weaving Institute has certainly, I think, been a success. It does not set out to teach weaving to children; its definite object is to take adult expert weavers and teach them improved technique. In this way time is not wasted in teaching boys and girls—a trade which they afterwards do not engage in. The institute also requires that a student must be in a position to engage in weaving after his course on his own or borrowed capital. I think this system is particularly sound and would apply where other technical instruction is given. Technical aid in general.

I would like to see a technical institute established in Mandalay. It might begin with masonry, blacksmithery and carpentry and it might so to speak give a finishing course to artisans who have already adopted such trades. If it was successful it could be expanded.

I quote the case of jute. As jute grows wild in many parts of Burma and is cultivated to a small extent already in the delta, there is good ground for believing that Burma could produce at any rate a large part of the jute required for the gunnies in which our rice is handled. At present there is a deadlock. The cultivator says, 'Show us the jute mill and the market'; the capitalist says 'Show us the jute.' In such a case it is for Government to demonstrate that jute will grow and then to demonstrate that jute milling will pay. It is possible of course that the paddy millers are sufficiently enterprising to establish jute mills when once Government has proved that jute will grow. But in effect it is necessary to do somewhat more than to prove that jute will thrive. Government must show that it will grow and the cultivator must show that at prices at which it can be manufactured at a profit he will grow it. The quickest way of determining these points is for Government to prove that jute will grow and also that it can be manufactured at a profit after leaving the cultivator a profitable return. I would also establish a demonstration pottery. I understand that we have excellent clays and earthenware in Burma and that much of the crockery now imported from Japan and Central Europe might be made in the country. Without experiment by Government it is most unlikely that any progress will be made. The method of sending young Burmans to England to walk about in potteries and attain a smattering of pottery methods is perfectly useless. Government expected one such to return to Burma and establish a factory. This presupposed the command of capital and business ability and a knowledge of accounts. These were not forthcoming and money spent on such scholarships has of course been lost. Demonstration factories.

Our Agricultural and Forest Departments are very seriously undermanned. Before real results can be obtained we require 10 or a dozen agriculturists of the deputy director class and before a proper use can be made of our forests, I imagine we require a superior staff of at least 3 times the present strength. I suspect we might do more at minerals. On the agricultural side experiment with new crops (not necessarily new to Burma) is essential so that there may be a diversity of crops in all areas and that the most valuable crops may be grown subject of course to proper rotations. Only after such

experiments shall we be able to record the results in a survey. On the forest side exploitation is confined to teak and a few other species. The forest area is enormous and there is yet much reservation to be done. Shortness of staff renders new reservation difficult and has precluded the completion of working plans in many of the forests already reserved. Excepting teak and a few other species extraction is in many cases inadequate and in others unregulated. There is now a Research Officer but it is quite impossible for one officer to conduct all the research desirable in Burma. I say without hesitation that our existing knowledge of the forests of the country is grossly inadequate. Forests should be our main secondary industry after agriculture. If properly developed and worked they will be a boon rather than a curse to the inhabitants of the country.

III.—Assistance in Marketing Products.

Commercial
Museums, etc.

Generally speaking I think one of our needs is assistance in marketing products. The Commercial Museum in Calcutta led to several orders for silk after samples had been sent. The Commercial Museum and Sale Depot at Madras struck me as a useful institution which we might copy in Rangoon after the war. Burma is likely to be again resorted to by travellers and sight-seers and such a sale depot would be useful to them and to the country and would serve as an excellent advertisement. Some system for exhibiting our products in London, Paris and other centres seems also to be desirable. Exhibitions should, I think, be developed and I would have them popular in character. I would also have trade representatives in Great Britain and foreign countries for particular trades or groups of trades.

Banking facilities

The internal trade of Burma is much hampered by the absence of up-to-date banking facilities. The post office is expensive and the *kundi* though used is not popular. I have before suggested a progressively decreasing fee for money orders proportionate to the increased amount of the order. In Austria-Hungary the post office does a regular cheque business. Remittance of funds is a serious difficulty in Burma.

IV.—Other forms of Government Aid to Industries.

Land policy.

I have no remarks to offer on the supply of raw materials or on our land policy. In neither case does any change seem necessary.

V.—Training of Labour and Supervision.

General.

Compared with Indian provinces Burma is in a satisfactory position as regards primary education. I would improve the efficiency and skill of artisans by technical schools on the lines of the Amarapura Weaving Institute. For unskilled labour the Burman, where he is so employed, should be suitable as he is both intelligent and clever with his hands. At present the Burmese coolie is mostly employed in agriculture. I would certainly place industrial and technical schools under the Department of Industries. I have seen some cases of serious impracticality where the Educational Department has embarked on technical training.

VI.—General Official Organization.

Proposed organization.

There is at present no regular organisation in Burma for development of industries. A Director of Industries was proposed but the then Local Government thought such a post not yet necessary and that the Registrar of Co-operative Societies could do what was needed. I am not at present in favour of a Board of Industries. I still consider the proper system would be a Civilian Development Commissioner who should be a senior Deputy Commissioner or a Commissioner who should deal direct with Government. Under him should be the Director of Industries with his experts, the Director of Agriculture with his experts and the Registrar of Co-operative Societies. Neither industries, I mean the smaller ones, nor agriculture can get on without finance. Co-operative societies must be the financing medium for both agriculture and industries. Again agriculture and industries are in many cases intimately connected. All three departments should be under one head whose duty it would be to co-ordinate them and to see that they work in together with the maximum of efficiency. In Burma this is all the more necessary as we have now adopted a definite colonization system, at present controlled by the Registrar of Co-operative Societies, where new land is concerned. The Development Commissioner should, if possible, have been himself Registrar (I am retiring myself and am not seeking a job). The Director of Industries should preferably be a business man and he should have experts when necessary. I am against an imperial department at the start.

VII.—Organization of Technical and Scientific Departments.

College of Commerce.

It is a case of "*solvitur ambulando*." I think the Development Commissioners important. The Development Commissioners of the different provinces will correspond and keep in touch and from time to time it may become necessary to appoint scientists or experts for all India. Out of these in time an imperial department may grow. I think that a separate college of commerce is probably unnecessary in Burma but I think there should be a chair of commerce in the coming University and that diplomas in account keeping and commerce should be granted. Assuredly one of the factors making for the ill-success in Burman enterprises is ignorance of the principles of accounting.

VIII.—Collection and Distribution of Commercial Intelligence.

I consider the dissemination through publications of commercial intelligence and information on industrial subjects, e.g., forests, etc., of great use. Immediate results are not always got but such information falls on fruitful soil every now and then and the results are worth the expenditure. Part of the success of German agriculture is due to the excellent system of information as to prices, crops, requirements, etc., which is made available to all farmers. Much more use might be made of the newspapers both English and Vernacular. The Co-operative Department in Burma some years ago arranged with the editor of a vernacular paper for a monthly co-operative supplement. Results show that this is very generally read in all societies. It has provided an extremely useful medium for disseminating information. "Advertisement is the soul of business" and Government should do much more than it does at developing the advertising principle.

Publication of industrial information.

IX.—Other forms of Government action.

It is unfortunate that in Burma the crops and in particular the paddy crops are of practically no use as security for their own movement. Middlemen work on borrowed capital and secure such borrowings on jewelry and land pledged. The necessity for such is one reason why capital is sunk in land and jewellery. That sunk in jewellery is immobile for half a year, whilst that sunk in land creates a really unnecessary demand which tends to push out the land-owning peasant. The remedy is a third-party godown owning company which would have depôts at railway stations, etc., take over paddy, grade it and give receipts on the system which obtains in Canada. Such receipts would then be pledged at banks and the cash obtained used for further paddy trade. Some such system would obviate the absurdity and waste of energy involved in 80 or 100 traders storing paddy in 80 or 100 godowns at one railway station. Each such godown requires a durwan. The godowns are temporary and badly constructed. The paddy suffers from damp and deteriorates. It is with paddy that I would make the first experiment in grading. In Canada Government inspectors grade all wheat. This matter of paddy is hardly an industrial one but I mention it as a great deal of pledgeable security which might be used for industrial concerns is at present misused in financing the movement of the paddy crop. Paddy should finance its own transport.

Certificates of quality.

It is hardly necessary to criticise these in Burma as they hardly exist. The development of the country is and will be seriously hampered until we are equipped with a decent system of roads and railways. Waterways in the delta are on the whole good and given a regular programme of improvement should meet requirements. To quote an instance, the absence of a road from Minbu District to Kyaukpyu (An) prevents the poverty-stricken Kyaukpyu District from supplying salt fish, coconuts, etc., to the dry zone. Were the unjustifiable restrictions on salt manufacture removed Kyaukpyu could also do a lot in salt supply. There would also of course be a reverse trade in oils, etc., from the dry zone.

Communications.

It is commonly said that our match factories are unable to thrive owing to the high shipping freights imposed on the sea voyage from Rangoon to Indian ports and the resultant favouring of Japanese matches. If this is so the sooner the evil is remedied the better.

As I have said above the main industry of this province subsidiary to agriculture should be the lasting one of the exploitation of its forests. The forests are extensive and contain an enormous variety of trees many of which are valuable. They also contain much other produce of commercial use. If properly conserved they not only persist but improve and in this respect are unlike mines and oil fields. They are well placed all about the country and in my opinion one of the very first things to do in promoting industries is for Government to provide an adequate forest staff to develop these forests to the best advantage. It is of course necessary to develop other useful industries, such as leather working, pottery, weaving, etc., but it is certain that the forests can provide remunerative occupation for all classes of the community from cooly to capitalist for years to come provided they are properly conserved and worked. The policy of the past appears to have been in forest matters to get the maximum revenue with the minimum establishment regardless of waste. It is the long view that must be taken and the proper policy should be to put on the full staff now with a view to continuous and progressive development until the maximum extraction and revenue are arrived at in perhaps 50 years. We require silviculturists, research officers, working plans officers, commercial officers, revenue collectors and forest engineers. We want capital for forest roads, for forest railways, for forest machinery, for silviculture and for improvements.

Forest Department

A serious need in the future will be chemical manures or the ingredients with which they are made and Government assistance in the development of such industries would seem deserving of assistance.

ORAL EVIDENCE, 31st JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. Under the heading of Government assistance you say, "I think the best way in which Government can financially aid industries is by supporting with funds financing institutions on terms which will ensure some loss to the institution in case the enterprise assisted fails." Is it in your mind that you should have an industrial bank? Have you got any definite suggestions to make?—A. I have not. I should like to work that out. I think that Government assistance is desirable and it can be done safely.

Q. Is it by way of an industrial bank, or in any other form?—A. I should like to think that out.

Q. Then you say, "In my opinion the time is ripe for the establishment of mofussil branches of European run banks in Burma." Of course you know there are two classes of European banks, one, the presidency banks which by the Act cannot lend money for industrial purposes, and the other, the exchange banks who do not do it?—A. I know. I think it is very regrettable that in Burma a great opportunity has been lost, and that no banks of the type of the Alliance Bank or the Allahabad Bank have pushed out into the districts. Lower Burma has many large towns and there is good business going and at present it is done by Chetties from Madras who do not know the language and who break the banking canon in keeping their men at a branch only for three years.

Q. Your solution then comes to this, that there should be a sort of industrial banks with branches?—A. No. I was discussing the question of banking in Burma for remittance purposes and everything else. We are badly off for banking facilities and we should have non-exchange and non-presidency banks which might spread their operations all over Burma.

Q. Then it comes to what I was telling you?—A. I would not call it an industrial bank.

Q. You would call it a bank which will finance industries?—A. I want banks that will finance industries. They would not be exchange banks or presidency banks or co-operative banks, but joint stock banks.

Sir F. H. Stewart.—Q. Has the Bank of Bengal got any branch here (Mandalay)?—A. There is a branch of the National Bank here. There is no branch of the Bank of Bengal here. There is one in Moulmein and one at Akyab.

Hon'ble Sir R. N. Mookerjee.—Q. You say, "I would like to see a technical institute established in Mandalay." You know the difference between a technical institute and a technical school? If you call it a technical institute it means that it is intended for higher technical education. What is it in your mind?—A. To begin in a small way, but I would have experts as I have stated there for carpentry, pottery, etc.

Q. In your opinion Burma is quite ripe for a good technical college?—A. I think what we want is much more than what we have had at Amarapura which is slowly developing.

Sir F. H. Stewart.—Q. Has anything been done, so far as you know, in the way of looking into the possibilities of sugar and jute in Burma?—A. Jute is just being taken up. When I was in Bassein as Commissioner last year, I got some seed from the Agricultural Department and gave it out to jails and others to try. It grows wild all over the delta.

Q. Which species?—A. Capsularis. It grows in northern Burma too. It has been grown in a small way in the delta and made into rope by Attia's firm in Rangoon and the rope, etc., was shown at the last exhibition. Messrs. Steel Bros. planted about an acre with the seed I got at Bassein but it was sown too late and was poor. Some very good jute was grown, however, at the Myaungmya jail and I understand that that has been sent to Calcutta and reported on.

Q. Would not labour be a very difficult problem?—A. I am doubtful about it. After all, you have got to use labour on paddy; jute may require a little more labour, but rent is probably lower than in Bengal.

Q. The Burman would take to the cultivation of jute?—A. Yes, I think so, if it pays.

Q. And similarly with sugar?—A. There will be absolutely no difficulty with sugar either, if it pays. Sugar is grown in a lot of places.

Q. Is there a large Burman capital available for industry?—A. Yes, I think there is. The present tendency is to put it into land which is a nuisance. The reason is that the Burman has tried in the past putting it into local concerns, such as paddy mills, timber mills and things like that which owing to bad accounting have in many cases got into Chetty hands or Chinese hands.

Q. Did the Burmese suffer very much from these various smashes in Rangoon?—A. I do not think they suffered much in Rangoon. They suffered a lot up Prome way. There was a sort of burst of joint stock small mills,—rice mills, timber mills and others—and a lot of money was lost. I know a good many cases where they began with only sufficient capital to erect the mill.

Q. The working capital of these came from the Chetties?—A. Yes, or from other money lenders at 18 per cent., 24 per cent. and higher rates.

Q. These cottage industries to which you refer in your written statement they are financed by Chetties still?—A. Yes, and by other money lenders. There is always the advance system. They advance the people raw material or cash and always keep them in debt so that they cannot go to a person who can give them better terms.

Q. The remedy for that lies with the co-operative societies?—A. Yes. But the co-operative societies can only do their financing. The middlemen disposers of the produce are straight away against you. Here in Amarapura we tried to work it through advances and then by improved technique but still the middlemen sellers of the finished article are strong.

Q. As regards your suggestion about a progressively decreasing fee for money orders, have you put it before the Director-General?—A. I put it before the local Postmaster General, and he said it was useless.

Q. You have heard nothing more about it?—A. No.

Q. Was that some years ago?—A. Five or six years ago. Remittance is one of our worst difficulties in Burma.

Q. That is, you want improved banking facilities generally?—A. Yes.

Q. With regard to general official administration you wish to see a civilian Development Commissioner?—A. Yes.

Q.—Might it not have the contrary effect to what you desire and be rather apt to hang up things?—A. You must have co-ordination between the Agricultural, Industrial and Co-operative Departments and it is better that that co-ordination should be in the hands of a man who has nothing else to do than that it should be done either by the Financial Commissioner who has a tremendous lot of other work to do or by the Secretary to the Government who is in similar case to the Financial Commissioner. The three departments work in with each other and such success as we have had in Burma is due to the fact that the Registrar and the Director of Agriculture have always worked together very closely.

Q.—Where would Forests come in? Would they be included?—A. I did not consider that. I think probably not.

Mr. C. E. Low.—Q. What is your idea of land banks? We have received evidence with regard to a land bank started in a small way in a certain district. Without reference to that, what do you think of the idea of having land banks?—A. District land shaft banks would be extremely useful.

Q. Would it not tend to increase indebtedness too much?—A. I do not think so. The banks would provide a counter attraction for investors and many persons submerged in debt would redeem their mortgages. Indians and Burmans in Burma having money always think of buying land and thus increase difficulties; instead of in land they would invest their monies in these banks on bonds and these bonds would be negotiable.

Q. Have you tried any scheme of making co-operative money secured on land liquid security?—A. You mean by bonds?

Q. Yes.—A. It is in contemplation now that the Central Bank and other central banks should have long term bonds. Either that must be done, or we must have what I think we have under consideration, district land shaft banks with possibly some better system of recovery. In order to get that you must have registered land tenures and what we really want is something in the nature of the Torrens' system which they have in Australia.

Q. You do not believe in the system of recovery of the Egyptian Agricultural Bank?—A. No.

Q. Do you think it would tempt Burman money into industries if you had a sort of holding company started which would hold shares in a number of existing industries and spread out the risk and would also invest to a certain extent in new industries?—A. I do not think so, because the peculiarity of the Burman is that he likes to see where his money is. He would invest quite readily in concerns in the neighbourhood, but he has been temporarily scared by sma-hes in Rangoon during the last fifteen years from investing in things at a distance.

Q. Do you think the wider basis afforded by a holding company conducted by a fairly decent technical and business knowledge is too abstract a proposition for them?—A. I think so. If it were not so I think they would invest more in deposits in banks in Rangoon.

Q. You say that co-operative societies have succeeded in several cases in production and I think you mention somewhere the case of sleepers. Would you describe how they managed this sleeper business?—A. Up the Mu Valley Railway the business originally was in the hands of Indian contractors and they actually received about double of what they paid the producers. The difficulty is that nobody else there had any capital. The area concerned was a precarious tract for cultivation, and the cultivators through the local co-operative committees asked me to form a co-operative sleeper supply society to fell, saw, and cart sleepers and deliver to the railway company. I formed such a society and it did extremely well the first time. Last year more societies were made but they were not so successful because the railway was extra sticky about passing sleepers.

Q. What sort of security would this bank which you were mentioning to the President advance on?—A. Land to a certain extent which would scare the joint stock bankers. Land in Lower Burma is however practically negotiable. It would also advance on valuables, and on sureties—a sort of cash credit business.

Q. You speak of the way in which co-operative societies have linked up agriculturists with the Department of Agriculture. In what way have they done this in Burma?—A. Seed, for instance. There is a case in Pegu district. They have already got 20,000 baskets of a pure variety which was obtained entirely from a few baskets issued two or three years ago by the Agricultural Department.

Q. How do they secure purity while they are growing the seed?—A. They have a District Agriculturist in the place with a small farm who looks after their procedure. It is not absolutely pure but it is pure enough for the purposes of the buying mills.

Q. You say, "Our agrarian policy has led to the rapid increase of a landless coolie population." What is the policy exactly? How is it made effective?—A. When I say "policy" it relates rather to the way in which we have allowed things to develop—not our intentional policy so much.

Q. We have heard general complaints but we have not been able to get facts as to what Government could have done and is doing.—A. Government's effort in the past has been to retain land in the hands of the small peasant proprietor and it has made rules for that purpose.

Q. Regarding transfers?—A. Yes and areas to be granted or leased. Land which grows paddy for commercial purposes tends to get sooner or later into the hands of bigger people and the result is that the original pioneers tend to drop to tenants, that is why we have got colonisation schemes now—I should think 70 or 80 per cent of the pioneers drop out as owners and they or others come in as tenants and there is a general drift downwards. The more intelligent or the more fortunate men thus amass land.

Q. You speak of pottery possibilities in Burma. You are perhaps aware that the Bombay School of Arts have been doing a number of practical experiments in pottery. You do not know whether anything has been done here to take advantage of their work?—A. I do not know.

Q. Turning to the question of forests, I understand that the idea is that the forests are largely exploited from the point of view of commercial timber by two or three individual firms who are expected to do all that is done or has to be done in the way of improving communications. That is, of course, one theory of forest development. Another theory would be that Government should itself do more in the way of communications and maintain rather different relations with the exploiting firms. Government might either run the thing to a greater extent departmentally or might charge the exploiting firms in consideration of the communications provided. Which do you think a better proposition purely from the financial point of view, from the point of view of profit and loss to Government?—A. If Government were to provide communications and the firms were to work the forests, I should think there is a considerable possibility of trouble. There will be complaints both ways. If a forest is going to be continuously worked Government might of course make roads or railways.

Q. Where you get a fairly large area of forest which is going to be worked continuously, Government might put down light railways?—A. Government might make communications.

Q. Are there any places in Burma where such steps could be taken with advantage and if so should the railway do entirely forest transport or try to take ordinary goods and passengers?—A. When you get near the forest there is as a rule very little in the way of goods and passengers. It is a rather vague question. It is difficult to give an answer, without knowing an actual case.

Q. Could you call to your mind any place in Burma at present where such a railway purely for forest exploitation purposes could be made to advantage?—A. I am not sure as to railways but I certainly think roads could usefully be made in numerous tracts.

Q. Not railways?—A. The sub-committee on communications was discussing roads for Tharrawaddy and Prome recently and the principle accepted was that a road which reaches the edge of the forest should be made by Government and paid for and maintained partly by the Forest Department and partly by the district or whoever desires the traffic.

Q. What about river transport?—A. How do you mean? Improving of floating channels? There again there is difficulty. It is difficult to answer that.

Q. Generally speaking, have you any idea that it would pay Government and bring in more revenue here if a different system of forest working were adopted from what you are seeing just now,—more departmental working and greater outlay by Government on communications?—A. I do not know personally, but I have been in close touch with a number of forest officers and I have been in big forest districts and I have always understood that the best opinion in the Forest Department is that Government could make very much more revenue by more departmental working with a much bigger staff which would certainly pay shortly if not at once, and by developing the thing generally. It is an undeveloped industry.

Q. You think that the Forest Department is at present understaffed?—A. There is no question about that. In research and everything else it is understaffed.

Q. Do you think that the Forest Officers should have more acquaintance with marketing and so on and a knowledge of the business side of forestry on their part is desirable?—A. I rather doubt the correctness of the idea that they are so utterly incompetent at marketing. They have got some extremely good men in the Forest Department. The criticism comes largely from the people with whom the marketing is done.

Q. Speaking about the chair of commerce you say, "There should be a chair of commerce in the coming university and diplomas in account keeping and commerce should be granted?—A. When I say "commercial education" the main thing is accounts. The Burman is perfectly ready and willing to keep accounts but he does not know how to do it.

Q. Would not a commercial school teach ordinary account keeping at present?—A. People go to the university and they can take that as one of the courses. That is a different thing from going and putting in your time and money into courses at a commercial school.

Q. If you mean a commercial college will the man from it go and keep accounts in a small rice mill?—A. He may certainly have to do that. Government appointments won't go round and the Burmans are not averse to commerce and industrial concerns. For co-operative auditing we want a larger staff and we have the utmost difficulty in getting men who know accounting.

Q. How many have you got?—A. I do not know exactly now. The department has auditing officers and there is also a big staff of society paid auditors and inspectors. It practically comes to the co-operative department teaching new hands from the beginning.

Q. Do you think they are inclined to turn up their noses at commercial schools?—A. A college education including commerce and accounts gives a man a wide range of chances in life. A course at a commercial school fits him for much less.

Q. Are there any regular examinations for them?—A. In the co-operative department, yes. The Registrar of Co-operative Societies holds examinations twice a year.

Q. In a province where the Director of Industries has to deal with larger things than cottage industries, do you think the idea of a Development Commissioner would work? For the development of big organised industries and his relations with them would it not be desirable to give the Director of Industries more direct access to Government?—A. In what way? I do not quite follow. Do you suggest that the rice milling business in Rangoon, timber mills and that sort of thing would be helped by the Director?

Q. I am not making a direct reference to any particular industry, but we have had suggestions made to us that Government should in its Industrial Department assist very materially big industries?—A. I should not have thought that was necessary. In talking of the Development Commissioner, I have been thinking of cottage industries. When I say that, I also mean the sort of small factory, for instance, silk and cotton weaving up to 1 lakh capital. It is quite likely that such a factory will be better run by a society or one man working with 50 or 60 or 100 workmen either in their homes or in his own compound. These are the sorts of things that I had in view—small mills, small ginneries and so on.

Q. Circumstances differ considerably in different provinces and what suits one province may not suit another?—A. I do not think that a Director of Industries who is dealing with the big industries of Rangoon would be necessarily a suitable person to look after cottage industries.

Q. If you had an Advisory Board of Industries, the people who could advise about big industries would be quite at sea in the case of cottage industries and *vice versa*?—A. Yes.

Mr. A. Chatterton.—Q. Can you tell us anything about the development of industrial co-operation among the co-operative societies in Burma?—A. There are a lot of societies that finance small industries.

Q. Are there any doing industrial work, beyond financing?—A. There are the sleeper societies that I mentioned and there are stone metal supply societies.

Q. For instance, in connection with the handloom weaving which is going on at Amarapura, it appears that the co-operative societies took a hand in that?—A. Yes. That has been developing. Until recently the position of affairs has always been continually changing. It started with a few co-operators. Then it became a school and the co-operators dropped out. It is now experimenting with marketing. It has been in close touch all along with the numerous weavers, co-operative credit societies in the neighbourhood. We have, as far as I can remember, no definite productive societies apart from credit ones except sleepers and road metal supply societies.

Q. You say that the Saunders' Weaving Institute has certainly been a success. In what direction?—A. It certainly has improved the amount of fabric that can be produced with the same amount of labour per day.

Q. What we gathered from Mr. Hurst was that making proper allowances for the effect of the war he was not sure whether the weavers of Amarapura had been materially benefited.—A. I believe they would have been benefited.

Q. Have they been so? It is very difficult to come to a conclusion on that point in view of the effects of the war?—A. I cannot say definitely but they must, I think, have benefited. The amount of fabric per unit of capital and labour has increased with improved technique; but we are up against difficulties still. The middleman controls things to a certain extent still. Most of his business is done with the non-co-operative man who has no connection with the Institute, who are, still, more numerous than the co-operators.

Q. You say "Given a proper economic survey of such industries to base financing on the co-operative movement can therefore render great assistance." What sort of economic survey do you want of these cottage industries?—A. We want one man to take up several of them so that he views things from the same standpoint and then to work out everything from beginning to end of the industry and see how much money is required at the various stages to finance individuals. The Co-operative Department has no time to take up such enquiries

separately, and unless you know all about an industry before you begin to make societies and finance them you get into difficulties. Twice Government has appointed a man and kept him for about a month and then taken him away for something else.

Q. You would have a man who would know something about pottery?—A. Not necessarily. Merely an intelligent officer who can go fully into the thing and see where improvements in financing are required.

Q. He would be a mercantile expert?—A. No. He will investigate the sale processes and the means by which raw material is obtained, and consider improvements and when an individual requires loans he will see how much is required at each stage.

Q. You want this man to work under the Registrar?—A. Yes.

Q. And submit his report to the Registrar?—A. Yes, as a basis for the Registrar to take up safely the financing of societies made of these people.

Q. I suppose the amount of assistance you would render would largely depend upon the knowledge you have of the individual requiring to be financed?—A. The other members and the Co-operative Union will know about him. To quote an instance every district is settled by a settlement officer and he goes into the cost of production, the whole process, and what money is required at various stages, and on that we can make agricultural societies. In the same way I want something to go upon but I never had the time to go round and make these enquiries.

Q. Have they been completed?—A. The Kyaukmyaung pottery industry has been thus surveyed. There are now about three or four societies there of potters.

Q. Are they financing themselves or financed by a bank?—A. By the Mandalay Central Bank.

Q. I understand that you are in favour of some kind of land bank?—A. I think it is certainly a matter that should be gone into for various reasons.

Q. To get at the funds which you think are available amongst the people of this country, would it be possible for a financing society, more or less a bank probably, to guarantee bonds which people who wanted to avail themselves of the resources of the bank would be able to issue themselves—the bank to guarantee interest on bonds which the borrower would sell among his friends? It is a system which has very largely developed in certain parts of the continent.—A. You mean the German system?

Q. Yes. It is the German system.—A. I think that is quite sound, but the idea would take some time to "catch on."

Q. The object of it would be to tap the sources of wealth which could not be easily got at by the bank itself?—A. Yes.

Q. One man may not be prepared to lend money to another but with the guarantee of the bank he may.—A. That is so. I do not think however it is necessary to go so far as that. If a bank was formed which was known to have a lot of good mortgages behind it, I think people would invest certainly in Lower Burma in that bank and the bank would have sufficient funds.

Q. They would deposit their money?—A. Yes, long term deposit. When I say deposit I mean long term negotiable bonds.

Q. Could you not make your fixed deposit receipts negotiable?—A. You cannot.

Q. Why not?—A. As far as I know under the Negotiable Instruments Act they cannot be negotiable. You will have to turn them into bonds.

Q. There is one other point which I should like to ask you about. That is about sugar. Is there much sugar grown in Burma?—A. A lot of sugarcane is eaten. That is a very common amusement and I believe there is a certain amount turned into jaggery.

Q. How is jaggery made? Is it by a very primitive process?—A. Some in iron mills and some in wooden mills.

Q. Are there large patches of sugarcane cultivation here?—A. Yes. There is a lot. Half way up from Rangoon, you will see such cultivation.

Q. Do you think there is any large field here for the development of sugar cane cultivation?—A. I have been told so by the agricultural people.

Q. Do any of these co-operative societies interest themselves in it?—A. A lot of the members grow sugarcane as a regular crop but I do not know beyond that.

Q. In those districts where sugar is more largely grown and more concentrated, are there any special societies dealing with sugar?—A. No. It is one of the rotation crops in Kyaukse and Pynmana.

Sir F. H. Stewart.—Q. These colonisation schemes are for cultivation generally?—A. Yes.

Q. Or for any particular cultivation?—A. It depends on the area whether it is for paddy or not. In Lower Burma, in Pegu and Hanthawaddy paddy will grow and nothing else.

Q. Is Government doing anything in that way?—A. Quite a lot. There are two officers from the Commission on special duty on it. In Pegu and Hanthawaddy two forests have been disforested and thrown open to cultivation and placed under the colonisation scheme.

which means making societies. You collect colonists and make co-operative societies from the very beginning and they are fully financed. The object is to prevent their being financed by money lenders.

Q. Has that colonisation scheme been sufficiently long in existence to judge of its success?—A. It has been going for the last 3 or 4 years.

Q. You think that it is a very good scheme?—A. Yes. I made it.

WITNESS No. 451.

MR. J. WATSON, Partner, J. W. Darwood & Co. (Proprietors, Irrawaddy Match Company, Mandalay), Rangoon.

WRITTEN EVIDENCE.

Statement on the Manufacture of Safety Matches in Mandalay.

We might preface these remarks by saying that in our case the contract for the machinery was carried out by a German firm who failed to make good the stipulated requirements as to training of staff and guaranteed output.

This has necessarily been a heavy handicap, but setting this aside the following brief resumé goes into other important aspects of the case.

In this statement we refer mostly to our match business in Mandalay and our experience gained in starting an enterprise entirely new to the province.

We were encouraged thereto by the perusal of one of the Indian Forest Department Industrial Memoirs and we may here remark that the hopes held forth in that monograph have not been realised either in Burma or, as far as we know, in India.

As this is one of the first attempts on the part of the Government of India to furnish data with a view to encourage industrial enterprise and as the results have not been satisfactory we think it is likely to arrest further attempts and to cast doubt on the accuracy of the information supplied.

It therefore behoves Government to foster the industry and to see it placed on a satisfactory footing. As far as we can see this can only be done by admitting supplies of chemicals, paper, etc., into the country free of duty and the placing of a protective tariff on the imported article from countries other than the British Dominions.

The business also suffers from the lack of communications and high railway and steamer freights and the impossibility of sending the product out of the country, even to India, owing to high freights. There is a working arrangement between the Railway and Steamer Companies whereby all competition is eliminated. As an instance of the cost of transport, we have extracted pine timber in the Southern Shan States and the cost of freight to Mandalay from Kalaw exceeded all other costs paid on the timber, that is Government duty, felling, extraction, cartage to station and handling in Mandalay, etc. Freights from Mandalay to the east coast ports in India run to over 50% of the value of the product.

It may be here mentioned that the two principal drawbacks against the success of a new enterprise in Burma other than those mentioned above are lack of and where found the high cost of fuel and the high cost of labour. The latter cannot be easily remedied, but the former where it is obtainable is made prohibitive. Upper Burma contains immense quantities of jungle woods and no harm but rather good would be done to the forests if timber only suitable for firewood could be cleared out, but owing to the lack of communications and the high freight this is impossible.

Banks will no doubt lend capital for new industries to approved persons or firms provided sufficient security is put up to cover the loan and the rate of interest is regulated by the money market. In starting new industries something more is required than the ordinary trade facilities for old established businesses and while we do not suggest Government help in raising capital there are other and more suitable ways in which this help could be extended.

We have not known the Burma Government to give any financial assistance to any industrial enterprise. We do not include the co-operative movement and railways in the term "Industrial concerns." While not in favour of Government advancing money for the establishment of new enterprises or the giving of bounties or the guaranteeing of dividends, we think Government might agree where necessary—

To admit necessary supplies to the country free of duty.

To place a protective duty in favour of struggling industries.

To exempt these industries from certain forms of duty and taxation.

To agree to purchase the product for Government needs.

As an example of the difficulty of marketing one's product to Government we may mention that the Military Authorities purchased and paid for at a higher price than ours, Japanese matches. At that time our Lieutenant-Governor was using our matches and we were told

that our samples were not suitable for Turkish prisoners. Later we were again approached and we are now supplying the camps at Thayetmyo and Meiktila.

Under the conditions of aid given above there would then be little or no need for Government control or supervision. This control should be as limited as possible.

Technical aid.

In Burma that is obtainable is practically nil and might with advantage be extended. Government might well establish a laboratory furnished with up-to-date equipment and having a trained staff of analysts. Research work should be done at small cost and where the firm desires it the matter should be treated as confidential. The present Government chemical laboratory in Rangoon is quite inadequate to the needs of the province.

With regard to the sending abroad of Indian youths to gain technical knowledge we employed a native who had been sent by the Government of India or Bengal to Europe and Japan.

Calcutta Commercial Museum.

Our exhibit there has led to our receiving many enquiries regarding our products, but as we mentioned above even in pre-war time it was impossible to send goods to India owing to high freights.

Land policy of Government.

The factory is built on land leased from Government. The terms are no doubt reasonable, but in opening up rubber plantations, etc., land is granted free of rent for a certain number of years and we think a like concession might be extended to new industries.

Labour.

We had great difficulty in obtaining suitable labour. We had personally to train all our own work people and had difficulty in retaining the labour once so trained as the heavy work is done by natives of India who come and go.

As an example of the improvement of the condition of the people by the establishment of an industry such as ours, we may mention that the workers, particularly the women, when they came to us were dirty in their habits and persons but they soon became cleanly and their appearance reflected their prosperous condition.

Development of Industry.

No organisation exists, other than Agricultural Co-operative Societies in Burma, for the development of industry, but we are hedged round with rules and regulations for control.

Development is not encouraged by Municipalities, who take up a hostile attitude to both public and private enterprise.

As an example of this attitude we may mention that all machinery within the limits of the Rangoon Municipality is assessed for taxation. With this example of short-sightedness on the part of the representatives of the Chief City of the Province before them smaller municipalities will be tempted to follow unless Government steps in and puts a stop to it.

Cottage industries.

We tried to assist these by placing an order for Shan made paper with the Assistant Superintendent, Loilem, Southern Shan States. He has done all he can to assist us, but the paper is not yet forthcoming.

Cottage industry would do a good deal for a city such as Mandalay.

Municipalities.

As mentioned above, do not assist in the promotion of industrial and commercial development. In a backward province such as this and where Municipal Government is also notoriously backward and self-centered it would be futile to expect encouragement from them.

Trade Marks.

Facilities ought to be given to register these at a central office say in Rangoon. This would assist business and save litigation.

Transport facilities, roads, etc.

The lack of these in the Province is so notorious that there is no need to detail it. Railway and Steamer facilities are referred to above.

ORAL EVIDENCE, 31ST JANUARY 1918.

Witness gave confidential evidence regarding transport facilities and freights.

Hon'ble Sir R. N. Mookerjee.—Q. Under the next heading "Financial assistance" you say "In starting new industries something more is required than the ordinary trade facilities for old-established businesses," and you remark "there are other and more suitable ways in which this help could be extended." Are these enumerated below or have you anything else to add? What do you mean here by more suitable ways in which this help could be extended?—A. (1) To admit the necessary supplies to the country free of duty. (Imported materials form about half the cost of the finished article.) (2) To increase the duty on all foreign-made matches. (3) To exempt the industry from certain forms of duty and taxation. (4) To agree to purchase the product for Government needs. (5) To substantially reduce rail and steamer freights to enable the product to be marketed. (6) To render technical aid by means of a Government laboratory and the trained staff of the Forest Department. (7) To improve the means of communication within the province.

Q. You are not in favour of any direct financial assistance either by way of a guarantee of interest or lower rent for land, or anything of that nature?—A. As a special case financial assistance might be given but generally speaking I would not do that. I would grant lower rents when necessary.

Q. Then under the heading "Development of industry" you say that municipalities take up a hostile attitude to both public and private enterprise. Can you give any instance of such hostile attitude?—A. There is one particular point which I have put in my written

statement. This taxation on machinery in Rangoon is rather a serious matter; it affects us very badly. Our factory is nothing but machinery and if our machinery were taxed it would hit us hard. We disburse about Rs. 3,000 a month in wages. Such taxation on machinery is imposed in England but it is not done in Scotland or Ireland. It is not done either in Calcutta, Madras or Bombay.

Q. You mean special taxation by the municipality on machinery?—A. Yes, on machinery.

Mr. A. Chatterton.—Q. Are you talking of Rangoon or Mandalay?—A. Rangoon.

Hon'ble Sir R. N. Mookerjee.—Q. How is this taxation levied? Is it on the invoice or what?—A. It is levied on the assessment. It is assessed just in the same way as you assess land and buildings.

Q. It is levied just like municipal rates?—A. Yes.

Q. Without any reference to the invoice cost?—A. If you don't state what is your value, then they value it for you.

Q. What percentage do they charge?—A. I do not know at the moment.

Q. But that is very important?—A. I think it is pretty serious. I will send * information on the point to the Commission. We fought the case out, I may tell you, in the courts of Rangoon against this taxation of machinery, and we have lost that case.

Q. Could you let us know what is the percentage which the municipality charges?—A. I will do so.

Q. You brought the case against them and you lost your case on legal technicalities?—A. The whole thing was very vague, and the judgment said I think that it followed the English law. Machinery in Rangoon is not specially exempted as in the municipalities of Calcutta, Madras or Bombay. Not being specially exempted we could not win the case.

Q. Do not the Port Commissioners charge reduced port duty here for machinery?—A. We used to get it in free, but it is not so now.

Sir F. H. Stewart.—Q. I don't quite understand. These municipal regulations are in force in Rangoon: are they enforced in Mandalay also?—A. No. But I say that these points would tell rather heavily on us.

Q. How long has this match company been going on?—A. We have been running it about 5 years now.

Q. Why did you select Mandalay?—A. We were in the timber business in Burma and both our own experts and Troup's monograph led us to think that Mandalay was the most suitable site.

Hon'ble Sir R. N. Mookerjee.—Q. If you brought machinery say from England to Rangoon and instead of landing it there, you brought it to Mandalay by boat, would it in any way affect the situation?—A. No, this is a local taxation, just the same as taxation on land and buildings. It is only levied on machinery at work in Rangoon.

Q. Do you have that same taxation in Mandalay?—A. We are not taxed on machinery here.

Q. You have not had to pay taxation on machinery in your match factory?—A. No, our machinery is not taxed.

Q. Then what is your objection?—A. It might come here any day.

Q. It is only in vogue in Rangoon at present?—A. Yes. We are interested in machinery in Rangoon.

Mr. C. E. Low.—We had the same complaint in the Punjab.

Hon'ble Mr. H. Thompson.—Q. Is it not the fact that this is not a taxation on machinery, but is a taxation on land and that the machinery is taken into consideration in fixing the assessable value of the land?—A. That is so.

Q. This is a land tax imposed under the Burma Municipal Act which can therefore be imposed in any town in Burma?—A. That is correct.

Q. And the Rangoon municipality have taken the value of the machinery into consideration in determining the assessable value of the land?—A. That is so.

Q. It is a municipal tax imposed under the custom of the municipality on land, but in determining the assessable value of the land the value of the machinery is taken into consideration?—A. Yes. We fought it in the courts in Rangoon. The Lower Court gave a decision in our favour, but the Chief Court reversed it.

Hon'ble Sir R. N. Mookerjee.—Q. Because of legal technicalities in the interpretation of the Act?—A. Perhaps.

Sir F. H. Stewart.—Q. What were your reasons for starting this match industry in Mandalay?—A. If you read Troup's monograph you get the impression that Mandalay is the best site in the whole of India for match making.

Q. Does he mention Mandalay specifically?—A. Yes, and also our own experience led us to think so.

* See Appendix A printed after oral evidence.

Q. For what reasons?—A. Particularly for the timber supply.

Q. Couldn't you get a nearer source of supply?—A. Mandalay is also a distributing centre, and it is in the dry zone.

Q. Did you make any experiments of your own or did you take Mr. Troup's monograph as gospel?—A. We took it that the monograph was to a certain extent correct. We got the best expert advice in England as well.

Q. On what points did you get expert advice? It could not be about local conditions?—A. Certainly not on local conditions, but about machinery.

Q. What wood were you recommended? Was it *simul*?—A. Yes, *simul*.

Q. Are you using that now with success?—A. Yes. The point about wood is one that Troup made too much of. In one way the wood is not good, it is not so suitable for match making as the European wood, but the wood is only a small item in the whole value of the finished product. Imported materials form about half.

Q. You mean chemicals, paper and so on?—A. Yes, they form about half the value.

Q. Where do you get your labels from?—A. From Europe. (*Witness here gave confidential evidence regarding his factory.*)

Q. About trade marks you think that facilities should be given to register these at a central place, say, in Rangoon; would the registering officer have to enquire into your original right to a trade mark before he registers?—A. I am afraid he would.

Q. Is that a feasible proposition? You cannot enquire into all the trade marks? An unscrupulous person might try to register any number?—A. I would not put a trade mark on the market without registering it. The point is that there is a lot of litigation going on continually, there are always cases about trade marks and colourable imitations of them as they call it.

Q. Is that with reference to any particular trade?—A. I was not thinking of any particular trade. This point was one in your list of questions.

Q. The Burma Chamber has always expressed pretty strong opinions on this subject which have not coincided with those of other Chambers of Commerce, has it not?—A. I do not know. But in the case of match labels Sweden had a match which had a label with a cock and elephant. There is a Japanese match on the market now; and to the ordinary Burman it looks absolutely the same.

Sir D. J. Tata.—Q. With reference to what you said about the hopes held forth in Mr. Troup's monograph in answer to Sir Francis Stewart, what were those hopes which were held out?—A. He says that India is capable of match manufacture, and there is a good future for the match industry in India.

Q. Does he include Burma within India there?—A. Yes. He gives the advantages and disadvantages; the advantages outweigh the disadvantages, but the prospects must be admitted to be good; the advantages were that Burma had an abundance of suitable wood obtainable cheap, good river communication and a ready sale for the product. Against these the disadvantages were that labour was expensive and there was competition with Japanese matches. He said that Mandalay was the best site he could recommend and that a reasonable profit would be 25 per cent. on the capital invested. Later, a note of warning was issued by the Commercial Intelligence Department in 1914; the monograph appeared in 1909.

Q. What was the note of warning?—A. The warning was this: "The conclusions which Mr. Troup drew regarding the prospects of the industry in India, were optimistic, and since the publication of his note several new match factories have been started in India, notably one at Mandalay and one in the United Provinces whose fortunes will be observed with interest. It would be unwise, however, to underrate the difficulties which still beset the industry in this country. The question of finding woods entirely suitable for match manufacture cannot yet be said to have been finally solved and much detailed experiment in the treatment of Indian woods will remain to be done by those who are pioneering this industry. Chemical difficulties also attending the treatment of match heads especially in the rainy season cannot be solved except by actual experience and experiment. At the same time these factories and others which were previously in existence have demonstrated the possibility of making matches in India fully equal in quality to the best imported matches and there is reason to hope that in the match trade India may eventually become independent of foreign imports. The above considerations however indicate that there is considerable risk of loss in this as in other new industries if attempts were made to start companies on insufficient capital since the expenses of the first few years of work are likely to be heavy."

Hon'ble Sir R. N. Mookerjee.—Q. By whom was this warning issued?—A. By the Commercial Intelligence Department.

Sir D. J. Tata.—Q. You simply took the monograph about the suitability of the wood; and before starting your factory made no experiments with the wood to find out whether it would be suitable?—A. No. If there was a little more money in the business, we could select our woods better.

Q. You would have selected the same wood?—A. The same and other woods but treated better. It does not pay us to do so. For want of a little help we just missed making a

good match. The match is strong, but in its appearance it is not good. Witness here showed a sample match box to Sir D. Tata and other members.

(Witness here gave confidential evidence.)

Q. Another thing I want to ask you is about the municipality. Who form the members of the municipality here? Does the English population take any part in it? A. I should say that there are three European members out of a total of 12. I may mention one curious thing about the municipality. The revenue is going up every year in spite of all its troubles, but we have 30 to 40 deaths a day from plague, and enteric has been frightful, and the whole place wants cleaning up. These and other epidemics interfere very much with business and cause considerable loss.

Mr. C. E. Low.—Q. Can you point to any precise remarks in Mr. Troup's manual which were encouraging, or is it merely the general optimistic tone of it that led you to start this match factory?—A. He was not quite right about timber.

Q. Did he say definitely that it would be suitable?—A. Yes.

Q. Did he go into the question as to whether it would sell well?—A. He distinctly says "abundance of suitable wood, obtainable cheap."

Q. You know that the wood so far as match making goes is suitable, the only trouble is that the public do not like it?—A. It is not quite suitable, it is dark in colour.

(Witness here gave confidential evidence.)

Q. There was no experiment, so far as you know, carried out on what I may call commercial lines?—A. No. He said he made experiments in one or two match factories in India before; he talked in that way.

Q. Then regarding monographs on subjects of that sort put forward by presumably the best men under Government here at the time, do you think it is desirable that Government should issue information of that sort seeing that it might lead to losses and disappointments and might involve claims against Government?—A. I think Government should be very careful. After this experience Government should certainly be very careful.

Q. Careful in putting it more correctly?—A. Yes. I mean to say Mr. Troup makes a distinct statement about 25 per cent. minimum profit or something of that kind; but to say the least that was not borne out.

Q. And I suppose you would agree that such information should not be published unless it has been clearly borne out by some kind of commercial test?—A. You don't want to stop the people knowing possibilities.

Q. But the commercial prospects of a proposition, as apart from the technical aspects of it, should be supported, shouldn't they, by some kind of commercial test?—A. I think so.

Q. Merely to say that the timber is suitable is purely a matter of technical testing, but to say that it makes good matches, you must try it on a commercial scale?—A. Yes, I agree with you.

Q. Do you think that the absence of such commercial tests is responsible at all for the stagnation which existed before the war on the part of paper-pulp promoters in starting paper manufacture? I mean to say they were quite active in obtaining concessions, but none of them started to work them before the war although the thing had been in the air for some time; it is not merely a question of the war stopping it?—A. I should think so. The war had nothing to do with it.

Q. Supposing the thing had been done more or less on a commercial scale and the results had been favourable, you would personally have felt happier about it?—A. Yes, certainly so.

Sir D. J. Tata.—Q. You say something about Shan made paper under the heading "cottage industries." Is it suitable for your purposes?—A. It would be suitable for packing matches. You might pack the boxes with that. I might have sent you samples. I shall send down some samples tomorrow. It is a hand made paper. The Assistant Superintendent, Loleim, told us that it was a hot weather industry; when there is no work on the rice fields, they make this paper.

Q. From what? From the rice stalks?—A. They make it from pulp of some kind of wood, I could not tell you what. We gave him an order, I think, about a year ago, but we have not got the paper yet.

Mr. A. Chatterton.—Q. In regard to the competition of Japanese matches with locally made matches, do you know whether there is a place in Japan called Sweden? A. No.

Q. In the first paragraph of your note you say "the machinery was carried out by a German firm," was this one of the firms recommended in Mr. Troup's book?—A. I am not sure about that.

Q. You say they failed to make good stipulated requirements as to training of staff and guaranteed output. Does the machinery work all right?—A. No.

Q. Have you had to modify the machinery which we saw at work this morning?—A. Yes, very considerably.

Q. To make it work?—A. Yes.

Q. Was that done by a German or English expert?—A. First by a German, then by ourselves.

Q. This firm had already been operating in Northern India on a considerable scale?—A. I think so.

Q. Apart from the match industry, you say "cottage industry would do a good deal for a city such as Mandalay," what are you referring to there?—A. Home industries.

Q. What home industries?—A. I am not referring to any particular home industry, but I think in Mandalay, it seems to me, it is a place where home industries would flourish. The Burman likes to sit at home and do his work with his family; he would work early in the morning and late in the evening and sleep in the middle of the day; and if cottage industries such as weaving which they have now could be introduced, they would do a good deal to a city like Mandalay. It is not done in Mandalay, but Mandalay is a place which badly needs something brought into it as it has a very large population.

Q. You have no specific recommendations to make on the point?—A. I was thinking of our own experience more than anything. You saw this morning when you came to our factory the machines for filling matches into the boxes, how we had to take to hand filling and the way it is done, I mean by women with their children who sit round and work also.

APPENDIX A.

No. 1156—3, dated Rangoon the 8th February 1918.

From—Messrs. J. W. DARWOOD and Company, 7, Merchant Street, Rangoon.

To—The President, Industrial Commission, C/o The Secretary, Financial Commissioner, Rangoon.

Mr. Watson asks us to let you know what the tax on machinery in Rangoon is. We cannot do better than give you the case of the Power Station of the Rangoon Electric Tramway and Supply Company, Limited, the assessment for taxes on this is arrived at by taking 6 per cent. of the total value of land, building and machinery and the municipal taxes, general scavenging and lighting are charged based on this assessment.

We trust the above is clear.

WITNESS No. 452

Mr. C. G. Rogers.

MR. C. G. ROGERS, V.D., F.C.H., F.L.S., *Chief Conservator of Forests, Burma.*

WRITTEN EVIDENCE.

I.—Financial Aid to Industrial Enterprises.

The forms in which Government aid should take depends entirely upon the state of development of the industry in question.

If it is an entirely new one, Government should first make an exhaustive enquiry into the possibility of producing the raw material or manufactured product in sufficiently large quantities and at a cost which will offer a reasonable prospect of its being placed on the world's market with a reasonable margin of profit.

If a market has to be found for the raw material or manufactured product and there is any doubt as to the possibility of finding a market for the product, Government should put up a pioneer factory and work it for a sufficiently long period to prove definitely whether it is possible to find a place for the raw material or manufactured article in the world's market.

If a market exists for the raw product or manufactured article, Government might help the firms willing to raise capital to develop the industry in order to allow of their overcoming the initial difficulties in starting a new industry in one of the ways enumerated by the Commission in Question 5. The help should, I think, take the form of foregoing any royalty on the raw material required for a term of years and charging a reduced royalty for a further term of years.

If at the end of this second period the raw produce cannot be placed on the world's market unaided, the question of continuing the State aid or allowing the industry to disappear, will have to be decided on economic grounds.

Pioneer Factories.

Whether the pioneer factory should be closed or maintained permanently as a Government concern, depends upon circumstances. If capital is readily attracted to the new enterprise, and there is no need for Government to know the cost of manufacture of the article from the raw material in order to regulate the rate of royalty charged on the raw material, so as to allow of the State obtaining a reasonable share of the profit made by the companies, there would be no objection to the Pioneer factory being sold to a Company.

If it is necessary for Government to know the cost of manufacture of the article from the raw material to enable them to fix the rate of royalty, then it would be necessary for them

to maintain one or more Government factories in different parts of the country where cost of extraction differs in order to allow of their regulating the rate of royalty to be paid in different parts of the country.

Examples of Pioneer Factories or Pioneer Work.

(1) For working out the timbers of Burma other than teak and finding a place for them in the world's market.

(2) For manufacture of Turpentine, "Rusa" oil, collection of lac;

(3) Extraction of Teak.

Government enterprise should be limited to that required—

- (1) To ensure that Government gets a fair share of the profits made by the Company in the shape of royalty on raw produce. Limits of Government assistance.
- (2) To prevent the establishment of a monopoly which will force up the price of the manufactured article far above the price at which it can be sold at a reasonable profit, to the exclusive benefit of the monopolist.

II.—Technical Aid to Industries.

The provision for research for special subjects in the United Kingdom is, in my opinion, Research abroad, a necessary complement to Local Research.

The Local Research Institutes are in a position to collect full information as to the quantity of any raw product available and the cost of placing it on the world's market; but they are not in a position to compare the exact analysis of the raw products or the form of manufactured articles with those already on the market; to know the particular market on which they can be placed to the best advantage; the season of the year at which they will fetch the best prices; or the exact forms in which the raw material produced or manufactured article is demanded.

All this information can be best obtained by an institute or institutes in the principal markets of the world, to which the raw materials or manufactured articles are brought from many countries for disposal.

Very little is known about any timbers in Burma with the exception of teak and a few other species and practically nothing about over 90 per cent. of the timber-producing species of the Province. a Survey for industrial purposes.

Practically nothing is known of the minor forest products of Burma with the possible exception of cutch and lac many of which are capable of very large development.

Careful and detailed research work into both the major (timber) and minor forest products of the Province is one of the most urgent needs of the present day.

This research work must include a study of the silvicultural requirements of teak and the principal timber-producing species of Burma as well as a detailed investigation into the imperfectly known or unknown minor forest products of the Province.

The survey should be carried out by a staff of selected officers of the Forest Department under the direct control of the Chief Conservator of Forests. At least 10 such officers are required at once and the numbers should be increased as the work of the survey develops.

The formation of a Provincial Herbarium where authentically named botanical specimens of all species found in the forests of the Province would be preserved and a Forest Economic Museum in which specimens of all raw minor forest products from different parts of the Province would be kept are both necessary and would be entrusted to the Forest Research Branch of the Forest Department. The main herbarium should be at Maymyo and the Museum; a small herbarium of all species of economic importance, in Rangoon.

Pamphlets should be prepared giving all the available information about all the economic products, which would be compiled and would be available for issue to enquirers by the Curator of the Economic Museum. In addition to these pamphlets, Forest Research Officers would prepare scientific publications on the same lines as those which have been prepared by the officers of the Forest Research Institute at Dehra Dun.

III.—Assistance in Marketing Products.

Industrial exhibitions are of great value in making known the resources of the Province, and also in bringing to the notice of the cultivators and manufacturers, improved methods of cultivation or manufacture. Industrial exhibitions.

Industrial exhibitions should not only aim at bringing buyers and sellers into contact, but should be made popular in character with a view to making known to the general public as well as the business community, the wealth of the Province and the progress made in the machinery designed to convert raw materials into manufactured articles.

Government should certainly, for the present, organize Industrial exhibitions as it is more interested than any one in developing the resources of the country; knows a great deal more about the resources of the country as a whole than any other public body and can hold the balance true between rival interests.

Trade
Representation.

So far as forest products are concerned, I feel very strongly that it is the duty of Government to take steps to extract the less known timbers immediately, and the more important minor forest products, as opportunity arises; to arrange for the maintenance of stocks and the institution of regular sales of such products for a term of years in order to endeavour to obtain a place in the markets of the world for the forest products of Burma.

The local demand for timber and other forest products is much smaller than the supply and the only way of fully utilizing these products, is to find a place for them in the markets of the world.

Private enterprise is not willing to take up this work on account of the large amount of capital involved in making markets for new products. These products are the exclusive property of the State and there can be no doubt that as soon as a market has been found for them, private enterprise will come in and undertake the development of the successful pioneer industries established by Government, on a scale which they would not be justified in doing. The State is in a position to risk the loss of capital which no private person or syndicate would consider themselves justified in doing unless they got very tempting terms or, in other words, unless there was a reasonable chance of making a profit commensurate with the probability of losing their capital and this means that if successful for years they would be enjoying more than their fair share of the profits of the successful venture.

IV.—Other Forms of Government Aid to Industries.

(Witness here gave confidential evidence.)

There is no objection whatever to giving the sole right to extract all available timbers from definite areas to individual firms at reduced rates of royalty so as to make it worth their while to put capital into the business and extract timber on a large scale. For the present, a demand exists for only a very small number of species other than teak and this necessarily increases the cost of extraction by decreasing the total volume of material which can be obtained from a given area. This points to the necessity of Government starting departmental extraction on a large scale and making a market for all the timber-producing species of the Province. Until this is done, it will not be possible to work the forests of the Province in the most economical manner. Until a market has been obtained for the great majority of the Burmese timbers only short term agreements for the extraction of such species as can be taken out at a profit should be entered into.

VI.—General Official Administration and Organization.

Cottage Industries.

Samples of fibre from the stems of plantains sent to the Imperial Institute in London a few years ago resulted in the resulting fibre being valued at £27 per ton. An enquiry into the species of plantain from which the fibre was obtained, showed that the fibre was obtained from semi-cultivated plantains and that the fibre obtained from really wild plantains was much shorter and not nearly so valuable. Manilla hemp is obtained from a species of plantain (*Musa textilis*), the fibre being separated by a simple machine which could be worked by any villager. Plantain gardens are found in a very large number of villages; the stems of the shoots which have fruited are cut down and thrown away. The separation of the valuable fibre existing in the stem can be very easily effected by an inexpensive machine which can be made by any local blacksmith. The instruction of villagers in the actual method of the separation of the fibre could, I think, be undertaken by the Agricultural Department or by Co-operative Societies.

The rearing of silk worms is another cottage industry which promises well in Burma. This subject is, I think, at present under consideration of the Director of Agriculture.

VII.—Organization of Technical and Scientific Departments of Government.

For my opinion as to the formation of a special Research Branch in the Forest Department to help traders or manufacturers to get information concerning supplies of raw materials, please see my evidence under *Heading II.—“Technical aid to Industries.”*

VIII.—Government Organization for the Collection and Distribution of Commercial Intelligence.

The issue of really reliable information by Forest Research Officers in the form of pamphlets, memoirs, etc., is of the greatest use to firms seeking for information about the forest products of the Province and should be developed as much as possible.

Special
Monographs.

I would advocate making information on an important subject available at an earlier date by communicating it on printed slips to all the leading English and Vernacular papers marked not to be printed before a certain date, to allow of each paper being sure that the information communicated is not published earlier by some other paper.

Considerable delay in making known useful pieces of information will be overcome if this method is adopted.

All Forest Research publications should be on sale to the general public at the Provincial Economic Forest Museum.

IX.—Other Forms of Government Action and Organization.

The only forest product for which a Government certificate of quality might be established is cutch. So far as I know, pure cutch is prepared by the cutch boilers. This pure article is bought by Chinese middlemen who also buy other less valuable tannin extracts or adulterants and add these to the pure cutch before selling it in Rangoon. The only way of putting a stop to this nefarious practice is for Government to analyse consignments of "Cutch" offered for sale in Rangoon and to make it a general offence for a trader in cutch to be in possession of any of the products used for its adulteration. Certificate of quality.

(Witness here gave confidential evidence.)

Another most serious obstacle to the development of the valuable forests of the Province is the absence of roads and paths. The only way of getting over this difficulty is to get the principle of loans (with sinking funds for the recovery of the capital and interest within a term of years) for the construction of roads, railways, etc., sanctioned.

At present, all improvements to the forests are paid out of current revenue and so long as this principle is followed, it is impossible to get the money absolutely necessary for the development of the forests of the Province, which must result in a material increase to the annual revenues of the Province within a few years. Loans are raised for the construction of railroads and canals or embankments, made with a view of increasing the area under cultivation and I see no reason whatever why they should not be raised for the construction of roads and those buildings which are necessary to allow the work of the department developing normally. I refer to the residential and office buildings which must be constructed before the existing much too large Forest divisions can be split up into charges which can be properly managed and developed.

(Witness did not give oral evidence.)

WITNESS No. 453.

MR. R. E. V. ARBUTHNOT, I.C.S., Commissioner of Settlements and Land Records, Burma.

WRITTEN EVIDENCE.

Mr. R. E. V.
Arbuthnot.

I.—Financial Aid to Industrial Enterprise.

I consider that Government should pioneer industries—

- (1) (a) by the establishment of experimental plantations to ascertain whether some form of agricultural or forest produce for which a commercial demand exists can be successfully grown or produced on a commercial basis; Government Assistance.
- (b) by the establishment of pioneer factories to show whether—
 - (i) some raw product of which considerable supplies are available can be utilized industrially;
 - (ii) some product at present exported in a raw state can be treated industrially within the province on a commercial basis.

Experiments under both (a) and (b) should be carried out by Government on a small scale, and under the supervision of an expert, and should be confined to showing whether in the case of (a) the product can be successfully produced at a remunerative price and in the case of (b) whether a marketable article can be produced in sufficient quantities at a remunerative price. I consider it however preferable that where possible such experiments should be undertaken by private enterprise; the inducements which Government might offer to encourage or arrest such enterprises are in the case of (a) the grant of land on favourable terms as to assessment, including complete exemption from assessment for a term of years. In the case of (b) where the industry requires as its basis forest or other produce obtainable from land at the disposal of Government (1) the grant for a term of years (which should be sufficiently long to allow the industry if successful to establish itself on a secure basis), of a maximum quantity of the produce required either free of royalty or at a low rate of royalty; (2) in addition Government might undertake not to grant any similar concession for a term of years which should ordinarily not exceed 5; and (3) where necessary Government might grant a site for a factory at a favourable rent; (4) in special cases Government might also give money grants-in-aid towards the cost of any preliminary research or experiments which might be shown to be necessary.

II.—Technical Aid to Industries.

There is already in Burma a Forest Research Officer whose duties are mainly connected with the economic and industrial aspect of forest work including the collection and publication of information in regard to the kinds of timber suitable for various commercial or industrial purposes, the supplies available of the various kinds of such timber, investigation of the properties of different kinds of timber and of other kinds of forest produce, etc. I consider that Surveys for industrial purposes.

similar officers should be appointed to deal with the agricultural and mineral resources of the province in their industrial and commercial aspect. For agricultural produce this work is to a certain extent performed at present by the Director of Agriculture and his staff, but a special officer should be appointed to investigate the agricultural resources of the province with a view to their utilization for commercial or industrial purposes. His duties should include the collection of information regarding articles of agricultural produce already grown in the province for which there appears to be a possibility of creating a commercial demand, the investigation of new possible markets, and the introduction of new products not at present grown which if successful are likely to find a market. Similarly a Geological Officer should be appointed whose duties would be to investigate the mineral resources of the province with a view to their development. Although Government Geologists have visited Burma from time to time they have not nearly covered the whole of Burma and the mineralogical survey of Burma is far from complete. It should be taken up and completed systematically as soon as possible.

III.—*Assistance in Marketing Products.*

Commercial Museum

I consider that so far as this province is concerned a Commercial Museum should be established in Rangoon which should contain forest, agricultural and mineral sections under the control of the Forest, Agricultural and Mineral Research Officers whose appointments I have already suggested. Each of these sections of the museum should contain specimens of the various products including not only raw products but also specimens of products manufactured or industrially treated in this province. Each section should contain a complete library of all available reports, etc., and the available information as to any product should be tabulated on the card index system.

IV.—*Other forms of Government Aid to Industries.*

Land policy.

The rules contained in Chapters IV and IV-A of the rules under the Lower Burma Land and Revenue Act, 1876, and in Chapter VI and in VII-A of the rules under the Upper Burma Land and Revenue Regulations, 1879, for the grant of land for cultivation of rubber and other products are I consider generally suitable.

VI.—*General Official Administration and Organization.*

Provincial
organisation.

I consider that a Director of Industries should be appointed whose duties would be to suggest measures to assist the commercial and industrial development of the province and to advise Government in all matters connected therewith. Ordinarily the Director of Industries should be an expert official. The officer most suited for the appointment will generally be a member of the Indian Civil Service of from 15 to 20 years' service, but the choice should not be restricted to members of the Indian Civil Service or of the Burma Commission, and any officer from any other department who is suitable should be eligible for the appointment. The pay of the appointment should be fixed on a basis to make it worth while for a man to remain for at least from five to seven years in the appointment. The Director of Industries should be assisted by an Advisory Board of Officials and Non-Officials. The Director of Industries should be the President of the Board of which the Forest, Agricultural and Mineral Research Officers should be members. The Director of Industries should consult the Board freely and keep the Board informed of his proceedings but should not be subject to the control of the Board. The Director of Industries should, at any rate so far as this province is concerned, be subject to the immediate control of the Financial Commissioner in the same way as the Director of Agriculture and Registrar of Co-operative Societies are at present. At the same time he should be given a free hand in matters of detail such as the entertainment of temporary establishment, the expenditure of money on experiments and the like. It will I consider probably be found necessary in the near future to appoint a second Financial Commissioner to deal with all matters relating to agricultural and industrial development, including the supervision and co-ordination of the work of the Director of Industries, the Registrar, Co-operative Credit Societies, and the Director of Agriculture leaving the first Financial Commissioner to deal with all matters relating to revenue, including Land Revenue, Salt and Excise.

(Witness did not give oral evidence.)

WITNESS No. 454.

Mr. James Smith.

MR. JAMES SMITH, *Manager, National Bank of India, Limited, Rangoon.*

WRITTEN EVIDENCE.

Financial Aid to Industrial Enterprises.

Q. 1.—No.

Q. 2.—From the existing banks and shroffs or Chetties.

Q. 2.—(a) If we can educate the native of India to entrust his savings to banks instead of hoarding or converting his wealth into gold and silver ornaments there would be an

immense increase in the funds available for extending and furthering the country's industries. Better education of the masses would contribute towards this. Unfortunately of late years Swadeshi banks, run by men of no previous banking experience, were allowed to spring up with the result that there were failures which further tended to destroy the public confidence. Recent legislation has, however, placed restrictions on such institutions.

Q. 3.—No.

Q. 4.—I have had no knowledge or experience of financial aid by Government to individual enterprises.

Qs. 5-9.—Except in very special cases such as Railways, Wolfram Mining and Agricultural experiments, I consider private enterprise should be allowed to develop naturally and not be bolstered up by Government assistance. Protection is fatal to individuality.

Qs. 10, 10(a), and 39.—The extension and development of Co-operative Credit Banks should receive encouragement from Government. The existing banks such as the Presidency, Exchange and Joint Stock Banks are quite sufficient to meet the demands put upon them. These banks are not slow to open new branches or extend their influence when any good opening presents itself. The native shroffs and bankers do an immense business in centres where the large banks have not opened.

The Banking Law at present in existence seems to be adequate.

(Witness did not give oral evidence.)

Mr. G. Blackstock.

WITNESS No. 455.

MR. G. BLACKSTOCK, Merchant and Partner, Messrs. Rowe & Co., Rangoon.

WRITTEN EVIDENCE.

I.—Financial Aid to Industrial Enterprises.

In my experience there has never been any difficulty in raising money for Industrial Capital, Enterprises in this Province.

I do not think it is necessary to have any financial assistance from Government to promote existing or new industries. Government Assistance.

I have no experience of Pioneer Factories, but have an open mind with regard to these. Pioneer Factories.

So far as my personal experience goes, I have never had any difficulty in getting assistance from my own Bank to promote and increase my own business. Financing Agencies.

I have no experience of Co-operative Societies, but I believe, so far as this Province is concerned, Agricultural and Co-operative Societies are doing good work. Co-operative Societies.

This point is answered under the heading of Government Assistance.

Limits of Government Assistance.

II.—Technical Aid to Industries.

I have no experience of technical and scientific aid for promoting new industries, but it is generally acknowledged that such aid is now almost necessary for promoting and helping same. Technical Aid in General.

III.—Assistance in Marketing Products.

I have no experience of Commercial Museums, although I have no reason to think that the Museum in Calcutta does not meet a felt want. Commercial Museums.

All these are good and so far as possible should be established for India and Burma. Sales Agencies, Exhibitions and Trade.

I think the principal Government Departments which use imported articles should publish a list of their requirements and merchants in India should have a chance of quoting for the supply of same. Representatives Government Patronage.

I know there is an agitation for a Trades Bank and one has been or is being established in London, but so far as my personal experience goes I have had no difficulty in borrowing capital from my own Bank. Banking Facilities.

V.—Training of Labour and Supervision.

I can only give you my views on the above so far as experience has been gained in my own business. Furniture-making is a Department in the business of Rowe and Company, Limited. It is found that Burmans can be easily trained to make furniture which would bear comparison with anything made at home. This training of course is under expert European supervision. The Heads of Departments in my business are all Europeans, but there is no difficulty in training Burmese, Chinese and Natives of India for the subordinate work of Salesmen, etc.

VI.—General Official Administration and Organization.

So far as this Province is concerned, no organization exists for the development of industries. A Board of Industries, I believe, would be welcome, but I have no views to offer as to how this Board should be constituted or its powers defined.

VII.—Organization of Technical and Scientific Departments of Government.

Under this heading my views are that Government generally should assist as far as it possibly can towards the development of the Province with reference more particularly to its mineral wealth and agriculture. The establishment of a Mines Department under Government for the exploitation of the mineral wealth of the country, I believe, would be a good thing.

VIII.—Government Organization for the Collection and Distribution of Commercial Intelligence.

All information from statistics with reference to the trade and welfare of the country is good and should be widely distributed.

IX.—Other forms of Government action.

Transport facilities.

In this Province the great hindrance to the development of industries is the lack of communications. There are practically no roads. If communications were improved, I believe industries would spring up without any assistance from Government. Burma, no doubt, has magnificent waterways, but on account of the want of roads, produce has great difficulty in getting to the banks of the various rivers.

Jails.

With reference to Jail competition, everybody in business with whom jail productions compete desire that it should be suppressed. I recognize, however, that jails must use the labour at its hand to the best advantage.

(Witness did not give oral evidence.)

WITNESS No. 456.

Rev. C. A. Nichols. REV. C. A. NICHOLS, D. D., *American Baptist Foreign Mission Society, Boston, Mass, U. S. A., Bassein.*

WRITTEN EVIDENCE.

Memoranda for the Indian Industrial Commission.

First as regards my personal connection with industrial interests.

In 1880 I took over charge of the Bassein Sgaw Karen Mission. This included the superintendence of the town school of about 150 pupils. It was a mixed school, about a third being girls. These resided in about 80 Christian Karen villages in the Myaungmya and Bassein districts. The support of the institution has always largely come from the voluntary contributions of cash and rice from the Christian Karen community and which enables it to receive all who come, irrespective of financial condition. The school is now of the High School grade and enrolls anywhere from 700 to 900 in its ten standards.

The industrial element has, from the first, held a prominent place. About two hours manual labour daily is required, thus requiring a minimum of expense for the care of compound and buildings, the purchase, preparation, and serving of food, with steam cooking and electric lighting plant, executing all minor repairs on buildings, as well as a large percentage in the erection of new buildings; and, for a number of years, printing and publishing, including of course book sewing and binding, which were successfully carried on.

In 1888, acting upon the advice of a local European friend, a fully equipped 20 nominal H. P. steam saw mill plant was bought at a court sale and to this have been added a steam rice mill plant of about 30 N. H. P., in connection with the above and a branch saw mill on the west coast at Ngayôtgaung.

Not very long after the purchase of the saw mill property, outside job repairs were undertaken, skilled labour being available, as such had to be maintained for needed repairs to the mill itself. Later, a steel steam launch was built, as needed, others followed and

other marine craft, until about 20 of the former alone have been produced and have constituted not only a means of income but of training to our Karen young men, a fair number of such having duly qualified as fitters, drivers and assistant engineers, both stationary and marine.

Thus, the development of this industry, both directly and indirectly, has proved a valuable asset, both financially and technically, to our Karen Christian community, none of whom a few decades ago had had any mechanical training. Of course in the extraction of timber for the use of mills and for the supply of paddy there was found good business opportunities for a considerable number outside the actual employes of the mills, as well as in the disposal of the products of the plants.

The mill property was financed by voluntary contributions from our Karen Christian community at large, who had become accustomed by such co-operation by the maintenance of their religious and educational work, having been trained from the first not to rely upon funds from the mission society for the above purposes.

Most of the positions of responsibility and requiring skilled labour are filled by our Karen people, who are thus gradually gaining experience in other lines of effort than those simply connected with cultivation and in developing diversified occupations, which must be done if they are to hold their own with other races.

The property is owned by an incorporated society, composed of the contributors who have given outright the funds, the income from which goes to the High School, to be used for buildings, for current expenses or other, as may be decided by its trustees. These funds constitute one branch of our school endowment, started by Mr. C. H. Carpenter, my predecessor, possibly being the first example in the Indian Empire of an endowed educational institution where the funds were given chiefly by the people themselves.

No assistance has been asked for from the Government, although such help was apparently available, though many times it would have been of much value, but if accepted it might incidentally have led to less care being exercised in carrying on the business, if unduly relied upon.

In the matter of the Government aiding such industries in the line of facilitating securing markets for products of industry, it seems quite clear that such form of assistance would be of great value, without harm to any concerned.

As regards the supply of raw materials, it would appear that the Government could render much assistance at times, *e.g.*, by rendering as easy as might be practicable the securing of suitable supplies of timber from the forests, further details in regard to which might be suggested, if required. Supply of raw materials.

Apprenticeships would seem to be more useful in general in the earlier stages of industrial development than attendance upon expensively equipped types of industrial schools in the west. The latter would probably be more appreciated and better utilized when conditions here more nearly approach those existing there. Apprenticeship system.

As regards the assistance obtainable from the services of efficiency experts, who are now so much in demand "at home," I believe that such could be of great value in many lines, provided that ample time and patience were expended in becoming thoroughly acquainted with the people and difficulties involved in local conditions. Apparently the people, especially the agricultural people, pretty fully realize the need of such assistance and are quite ready to follow any one who will show them practical methods for increasing their profits. It may be noted that in some countries great benefit has accrued from ocular demonstration of agricultural appliances and methods by travelling experts, facilities for the transportation of whom being provided free by railway and steamer companies who have found it to be to their interest thus to assist. Some companies are glad to also pay salaries and other expenses, as such action soon leads to considerable increase of business where they have operated. This method has resulted in the greatest success when schools have co-operated and when prizes have been awarded for the best yields, following upon action so suggested and so the whole community roused to more efficient methods. Of course the best results depend upon the tact and ability of the demonstrator and the chief difficulty would be experienced in finding him, only a very small fraction of such men being wholly dependent upon any given standard of examination. Technical Assistance.

The lowest possible would most naturally benefit any and every industry, to the remotest extent. Shipping freights.

As concerns opening up of new industries, it may be noted that, with the rise in the price of teak shingles, and the evident and growing lack of a durable, attractive roofing which might be available in this country, I was much impressed with the Japanese vitrified tiles, which would seem to be almost indestructible and which do not seem liable to lose their colour. These would be almost an ideal article and it would not be at all difficult to manufacture them at reasonable prices here, as the Burmese are already accustomed to do very good glazing on their water jars. As to how their manufacture could be brought about, as to whether a lighter type would be advisable, etc., are matters of detail, to be determined as may be required. New industries.

- WITNESS No. 457.

MAUNG HTOON CHAN, *Advocate, Akyah.*

WRITTEN EVIDENCE.

Agriculture.

Importance of paddy cultivation.

Paddy is the main crop in Burma, and on it depends the welfare of the people. It is still more important in Arakan where paddy and rice are practically the only crop exported. We have no manufactures or industries worthy to speak of, and those that exist are only to meet the needs of local requirements. Paddy is the root, whereas other trades, industries, and professions are only the trunk, branches, and leaves of a tree. The whole country does not feel the injury done to any one trade, industry, or profession, but if the paddy crop fails, either owing to drought or other causes, the whole country is withered in the same way as a tree whose roots are injured. The importance of agriculture cannot be overrated in Arakan, and on the successful cultivation of paddy depends the happiness and the prosperity of the people.

Primitive methods of ploughing.

The soils in Arakan may be classified as black loamy soil, sandy soil, and clayish loamy soil. The black loamy soil is more abundant than any other kind, and the country is more fit for paddy cultivation than any other crops. Jute can be grown with advantage also, but its cultivation is now confined to a small area. Paddy is the crop grown all over the country and the prevailing method of ploughing is primitive.

It is done with a wooden plough having a somewhat pointed iron as the plough-share. In hard ground cattle can hardly drag the plough, and in consequence the cultivators wait till the rains have fairly set in to make the ground wet and soft. Ploughing is usually done in the months of June and July. The soil is turned over with a plough four times and the process of "Kyan" or harrowing is repeated three times. After the first ploughing, the second ploughing is done with having the furrows at right angles to the first. The clods are then broken and levelled with a "Kyan" which consists of three parallel bars of wood, having a length of $4\frac{1}{2}$ cubits, fastened together with four cross bars of a cubit in length. The ploughman sits on the "Kyan" drawn by cattle which are driven to every plot of his field and the clods are thus broken up. Ploughing is done again for the third time and levelling with the "Kyan" is repeated—and the same process is observed for the fourth time—a great deal depends on the nature of the soil, it may be done twice only when the ground is soft and rich in manure. The grass and other plants are weeded out and instead of being thrown away they are trampled down right to the bottom of their fields and pebbles and stones are carefully removed. The ground is now ready for sowing. This is done in the month of July and August. The seed has previously been selected, dried in the sun and carefully stored. At the time of sowing sufficient quantity for a day is taken in a basket and soaked in water for 24 hours. The baskets are then taken out from water and kept suspended for another 24 hours. Paddy is then washed and covered up with leaves and grass and kept to dry in baskets for 24 hours. Cold water is now applied and covered up in the same way, shoots begin to sprout out and then sowing is done by throwing the seeds broad east. Ploughing and sowing go on side by side, and when a field is ready sowing is done without delay.

The cultivators daily watch their fields and observe the gradual growth of the young plants removing the weeds here and there. The early crop or "Koukyin" gets ripe in September and October, and this crop is soon cut and consumed. The middle crop or "Koukiet" ripens in October and November and the late crop or Koukgri in November and December. Reaping is done in November and December and all is finished in the early part of January. The sheaves of paddy are taken to a high plot in the field conveniently situated and thrashing is done by having the grain trodden out by cattle. Winnowing is done by throwing the paddy from a scaffold or from a man's height with raised arms, depending on the daily breeze which blows either from the south or north. The average produce of paddy per *Doon* = 6.40 acres is from 500 to 600 small baskets, 100 of which is equivalent to 36.75 of Government standard 9-gallon baskets. The wages are high and the cost of cultivation per *Doon* amounts to 300 or 400 small baskets, including payment to servants and making due allowance for seed grain, hire of cattle, land and consumption of food. At the end of the season, the cultivator finds that he has made a profit of only about 200 small baskets per *Doon*, which is hardly sufficient to support his family and pay for the cultivation of the next crop—and in times of drought and bad years, he loses heavily. He gets into debt and is seldom free from the clutches of money lenders. His position is deplorable under the existing conditions. The pinch of poverty is rather acute and his lands are gradually passing away into the hands of money lenders and non-agriculturists.

Defects of the present method of cultivation.

1. *Plough*.—A wooden plough fixed with a piece of iron at the end as plough-share, it is blunt and cannot be used to plough hard ground, with the result that the cultivators have to wait for the rains and commence ploughing in June.

2. Sowing is done broad cast after shoots had come out in the seed grain in the months of July and August. The paddy fields are full of water at the time and the seed grain must be thrown broad cast and no other method can be adopted. And to prevent the seed grain being either washed away or become rotten in water, it is necessary to have seed grain with shoots sprouting out so as to catch the ground as early as possible. Young shoots come out quickly and grow out as the plants are in water, which keep them buoyant, the roots remain above ground, with the result that when the plants have grown sufficiently high, they become top-heavy and a blast of wind is liable to fell the crops as the plants are not deep-rooted in the ground, causing great damage by producing thrash out light or dead paddy.

3. Late sowing in July and August is to be discouraged. The paddy plants are not properly matured at the time when in ears, they had not enjoyed the full period of the rains, and only a few plants had come out from each seed grain. The yield becomes less with a tendency to thrash out light and bumper crop becomes illusory.

4. The ploughing has to be finished either in July or latest in August. They force their plough cattle to work nearly the whole day without proper food and rest. An interval of two to three hours at noon to graze in the neighbouring lands with hardly any blade of grass is not feeding at all. The cattle are over-worked, their bodies become lean and emaciated and many of them die after ploughing, and they are also liable to become an easy prey to cattle disease. As time is limited, ploughing and sowing are hurriedly done and cultivators do not pay much attention to these important operations.

5. That as the fields are full of water at the time of ploughing the clods of earth are not properly turned up and only furrows are made on the ground due to the defective form of plough used. The underpart of the surface soil is hardly ever exposed to the influence of the sun and air. The soil is dissolved in rain water which washes away a quantity of plant food and as remedy for this "kasins" or small bunds are made with the object of retention of water in the fields and of prevention against plant food and seed grain being washed away.

Finding that the yield with the present primitive method hardly pays the expenses of improved methods of cultivation and leaves no margin for the cultivators, experiments are being tried with a view of producing an abundant crop to the extent of 1,000 baskets of paddy per *Dooa* (6.40 acres). If successful it would indeed be a great blessing to the cultivators. The new method is known by the name of summer ploughing. The existing plough being not suitable, they use a sharp plough, some prefer the plough known as the Indian plough, but others use the Weston plough, which is much lighter than the Indian plough. The ploughing is done in March, April or May. The ground is hard, but the plough being sharp, cattle find no difficulty in dragging it. Two ploughings are done, the furrows of the second ploughing being at right angles to the first—and the "Kyan" is applied, the clods are broken up and the ground made level and smooth. If the paddy fields are fresh water fields where no brackish or salt water ever reaches, then sowing is done with dry seeds throwing them broad cast after which a third ploughing is done to get all the seed grain buried in the ground which is then left exposed to the influence of the sun and air. A few showers in May cause them to germinate and young plants shoot out—and in June the young plants are about a foot high and quite healthy, one seed grain giving out already about 10 plants, and at the end of the rains, the plants from one seed grain would number about 50 to 60 forming into a bush. The plants are strong and healthy, crops are abundant, grains are matured, thrash out light or dead paddy negligible.

The process is slightly different if the fields are those inundated with salt water in the high tides of March and April. After two ploughings and the application of the "Kyan" once as stated above, and exposure of the soil to the influence of the sun and air, the cultivators have to wait for the showers of rains in May and June—and when the salt is sufficiently washed away from the ground, a third ploughing is done and "Kyan" is being applied and sowing is done with seed grain soaking them in water for a day—and young shoots soon come out in June and the crops are good and the yield is also abundant.

1. The ground is better prepared, as the ploughing can be done in the three months of March, April and May—and the soil is brought more under the beneficial influence of sun and air, which improve the soil. The advantages claimed by summer ploughing.

2. The soil being upturned, the grass and all kinds of weeds get dried up by the heat of the sun and when the rains set in, before the weeds have time to recover, the young paddy plants shoot out and outgrow them and the weeds naturally die.

3. The paddy plants have the full benefit of the whole period of the rains and they become very healthy and strong producing a bigger yield with matured grains.

4. Plough cattle are not over-worked and ill-treated, as the ploughing is done only for two hours in the morning (6 to 8 A.M.) and for 2 hours in the evening (5 to 7 P.M.) and extended, if necessary, for any period in the months of March, April and May.

5. That the roots of the paddy plants are deeply imbedded in the ground, and although

each bush may contain 50 to 60 plants, they do not become top heavy and strong wind cannot fell them, being deep rooted in the ground.

6. The yield is abundant averaging 1,000 small baskets to 1 *Doon* (6-40 acres), of land.

7. The plants being strong and healthy have a better chance of withstanding the effects of strong wind and of drought in August or failure of later rains in October. The above remarks cannot be appreciated without saying a few words regarding the rainfall in Arakan. It is a wet country having an average rainfall of 200 to 240 inches a year. Rainfall is more copious for the lands close to the sea shore than the uplands, but no part of the country can complain of the want of rains. From January to April rainfall seldom registers more than 5 inches, although the month of May is fairly wet, yet the rains properly commence only about the first week of June, July and August are the months of heavy rain, which gradually decrease from September to October and entirely cease in December.

1. The extension of Co-operative Credit Societies to Arakan. Although the people have some ideas of Co-operative Societies, yet they are wanting in co-operation owing to ignorance. With the spread of education, suitable explanations and Government control the movement is bound to be popular and soon become an unqualified success.

The agricultural loans given by Government are not popular, the individual advances are not large enough and there is more trouble and expense in obtaining them.

That the cost of cultivation for producing one crop in the Akyab District would be large, and the cultivators to defray all expenses annually borrow from the various money lenders to the extent of about 50 lakhs, on Promissory Notes, pledge of gold, and on mortgages of land bearing interest from Rs. 1-4-0 to 5% per month.

2. Agricultural schools and experimental farms. An agricultural school and an experimental farm should be started without any delay at Akyab. It is evident that school education in the principles of agriculture is guiding the minds and habits of youth, yet the adult at practical work requires other kinds of help and teaching. Experimental farms are required not only for the students but also for adults, to teach them by demonstration the problem of local farming and to convince them by successful results the truth of the teaching and the superiority of the methods employed.

3. The necessity for the Township officers to attend a course of lectures in agriculture. A powerful impetus can be given by Government to make the acquisition of agricultural knowledge popular to bear a beneficial effect on agriculture by requiring the selected candidates to attend a course of lectures for a year in an agricultural college or school. No candidates are to be given in charge of a Township without having a certificate to that effect. This rule should be brought in force immediately. Government service is most popular amongst the people, all educated young men readily join the service. It gives them influence and power, for as Township officers the people look to them for advice and guidance. Being invested with magisterial powers they are the most influential people in the district. They go out on tours as Township officers and come into contact with the people of their township. They inspect the country and often are engaged in crop cuttings. They see every day how the cultivators plough their lands and sow their seeds and how they look after their cattle. In times of cattle disease they have to visit the infected areas, and they can more intelligently enforce the rules of the Veterinary Department and appreciate the duties they have to perform in looking after the welfare of the people of their township. Their directions as to how the ploughing is to be done, seed grain sown and in what manner the cattle are to be looked after would soon be obeyed by the people—and would be also a powerful means of enlightening people in the knowledge of agriculture—and checking defective methods the agriculturists are adopting at present.

The reasons why Government aid is needed.

1. *Manure*.—For want of knowledge the use of valuable manure is neglected.

Agriculturists know from experience that the thrashing grounds and the plots of land where cattle had been tied up in the previous year give them a much better outturn than the surrounding fields, yet no attempt had been made to collect the cattle manure. At present it is difficult to do so as cattle are allowed to sleep anywhere they like during the dry season. The erection of cattle sheds would be a great improvement both for the collection of cattle manure and for bringing up and looking after cattle. At present cultivators are satisfied with the manure the ground possesses, consisting of the decayed remains of vegetable matter such as stubble, roots, leaves, grass and other weeds that have been ploughed under and the droppings of animals, birds and fowls. In some places the soil is enriched by deposits of alluvial silts brought down by the swollen rivers which inundate large tracts of land. Nature has made the ground fertile in many places, but skill and intelligence are required to produce a bumper crop. The use of chemical manures are unknown and bone meal is never prepared nor used.

2. *Cattle*.—With the increased area of cultivation the number of cattle have also increased. At present there are 874,000 acres of cultivable lands in the Akyab District, of which 707,563 acres are under cultivation.

The following statistics culled from the settlement report are of interest :—

		1901-02	1913-14
Plough cattle	i—Oxen	50,446	105,576
	ii—Bull buffaloes	37,196	57,569
	iii—Cow buffaloes	20,747	50,218
Total plough cattle		114,389	213,362
Other cattle	i—Cow	47,023	93,710
	ii—Young stock	83,221	92,842
Total other cattle		130,244	186,552
GRAND TOTAL		244,633	399,914

The statistics for the years 1914-15, 1915-16 are not available, but the cattle have increased considerably above the figures given for the year 1913-14.

The oxen and cows are small and puny and a better breed should be introduced. This would be done if Government has taken the question in hand.

3. Grazing grounds reserved are insufficient.

	1911-12.	1913-14.
(a) The area reserved as grazing ground	68,416	98,081 acres.
(ii) Occupied fallow land used as grazing ground		90,697 "

The area reserved as grazing ground works out at the rate of two head of plough cattle or four head of all cattle per acre reserved and the cultivators keep by large area of occupied lands for grazing purposes assessed practically at full rates. The want of sufficient grazing grounds is now keenly felt by the cultivators, many of them have to send away their cattle to the hilly places where grass can be obtained and others graze their cattle in the occupied lands, left fallow for the purpose—only a few of them whose lands are not far from the reserved grazing grounds, graze their cattle regularly. The grazing grounds being insufficient, every blade of grass is soon eaten up after the ploughing is over, and the owners knowing the scarcity if all cattle are sent to the reserved grazing ground make their own arrangements for grazing their cattle.

(i) Crops for fodder can be grown with advantage in places where paddy cannot be cultivated. No such crops are ever grown in Arakan.

(ii) Straw-stacks-cattle can be fed on straw. Negligent wastage of straw through ignorance should be prevented—and stacking of straw should be enforced—as at present straw stacks are only a few to be found generally in Chittagonian villages. Serious notice should be taken of wanton and mischievous destruction of straw by fire. Agriculturists do not as yet realise the importance of straw for feeding cattle.

In the months of January, February and March, as grass is scarce, all cattle eat straw, but as soon as fresh blades come out in the early rains buffaloes refuse to be fed on straw, whereas cows consume it throughout the year.

(iv) Bran or rice-meal is a favourite food with cows, but buffaloes are not fond of it—and bran is not used as fodder, although a large supply can be had from the mills at Akyab. With the increase of ploughing in summer, more bran would be utilised than at present. Oxen are preferable to buffaloes for dry weather, but in the rains oxen can hardly drag the plough and soon get exhausted in mud.

(v) Agricultural education is much more important to a country such as Arakan which depends for its prosperity on the successful cultivation of paddy. It is by agricultural education alone that the cultivators will come to learn the importance of the different kinds of manure and of feeding and breeding cattle and the thorough preparation of the soil for sowing and the measures adopted for prevention of cattle disease, for destruction of insects and pests and for protection against drought.

(Witness did not give oral evidence.)

WITNESS No. 458.

MAUNG SHWAY THA, *Bar-at-Law, Managing Director, Messrs. U. Rai Gyan Thaw & Co., Limited, Akyab.*

WRITTEN EVIDENCE.

Agricultural products.

Paddy.

The chief agricultural product of Arakan Division is paddy. The method of cultivating the lands has not altered; the cultivators still follow the primitive way of cultivation. I attribute this cause to the ignorance of the people, so, therefore, the Government might advise them to adopt new methods, and for this purpose experimental farms should be established in each district. As far as Akyab District is concerned, the cultivators raise only one crop; but in some places it is possible for them to raise two crops, i.e., in places where fresh water is available, and for the cultivators to carry out this, it would be necessary for them to have pumping machinery; this they are unable to do for want of funds. Government might set up pumping machine and charge the cultivators.

Manure.

The fertility of the paddy lands is getting exhausted; so far as I am aware, the cultivators do nothing to fertilize their lands. There is a continual complaint from the cultivators that their outturn is getting reduced year by year; to remedy this, I would suggest that Government should introduce some kind of manure and distribute amongst the cultivators at actual costs.

Paddy Rates.

The paddy market at Akyab is controlled by demand from India. The cultivators are ignorant whether there is any demand from other countries or not; commercial newspapers in the vernacular might be of some assistance to them in keeping them informed whether there is a demand for paddy from other countries, so that they can hold out and obtain best possible rates.

Plantain, sugar-cane, coconut, sesamum, cotton and mustard-seed are also minor products of this district. Sugar-cane cultivation might be encouraged.

Toddy-palm or Dani.

This palm is extensively grown on the banks of rivers and creeks. The people extract this juice under license from the Government; before the juice ferments, it is sweet. The natives make jaggery from this—an experiment might be made to manufacture sugar.

Forest products.

Bamboo.

Bamboo in this district covers large areas of land; paper manufacture from bamboo should be encouraged, provided all the materials are obtainable.

Benefits of railway communication.

- (1) To improve paddy trade and other industries.
- (2) To reduce wages of labourers and price of food-stuffs.

Jail competition.

Jails should not be allowed to compete with the public—all their production should be utilised for State purposes.

(Witness did not give oral evidence).

WRITTEN EVIDENCE.

Capital.

Q. 1.—I have experienced difficulties in raising capital for industrial purposes. The difficulties solely concern the raising of capital. To remove these difficulties the following suggestions are submitted:—

- (i) formation of societies;
- (ii) grant of loan from banks; and
- (iii) grant of financial aid by Government in some way or other.

Q. 2.—In Upper Burma, capital is generally raised by borrowing the sum from Chetties at a high rate of interest.

Q. 2(a).—The other methods by which capital may be drawn are—

- (i) by constituting co-operative societies;
- (ii) by getting loans from banks through the help of Government;
- (iii) by receiving financial aid from Government in some way or other.

The above sources will enable the people to undertake industrial enterprises with ease.

Q. 3.—I have never undertaken such enterprises.

Q. 4.—I have had no experience of it.

Q. 5.—I think existing and new industries should receive Government aid as follows :—*Government Assistance.*

- (i) I am in favour of the grants-in-aid ;
- (ii) I approve of the grant of bounties according to the kinds of industries ;
- (iii) the money should be refunded to Government in view of their guarantee ;
- (iv) loans with interest should be given ;
- (v) the aid should be on the hire-purchase system ;
- (vi) part of capital should be provided by Government ;
- (vii) if financial aid is obtained I agree to the purchase by Government of products for limited periods ;
- (viii) I am in favour of the assessment of income-tax on the profits of undertakings according to their classes for a limited period and an industry or articles used in an industry should be exempted from payment of any tax.

Q. 6.—If Government assistance is given to the above methods they require Government control and if they are under Government control an auditor should be appointed.

Q. 7.—I have had no experience of it.

Pioneer Factories.

Q. 8.—Government should give assistance to new industries in Burma to enable them to manufacture—

- (i) different kinds of cloth from cotton ;
- (ii) sugar or jagvery from fresh palm-toddy ;
- (iii) different kinds of soap and dye from soap-sand.

Q. 9.—In undertaking any industrial enterprise, difficulties arise owing to the Financing agencies, insufficiency of capital, *e.g.*,—people are unable to manufacture cloth from cotton and to extract oil from cotton-seeds for want of adequate capital ; these industries can be carried on if they are financed either by Co-operative Societies or by Government.

Q. 10.—Existing or new banking agencies should give financial assistance to industrial undertakings with or without guarantee subject to suitable conditions.

Q. 10(a).—If industries have dealings with banks there should be a banking law.

Q. 11.—I know of no industries which have been developed by the assistance of Co-operative Societies. *Co-operative Societies.*

Q. 12.—There is none.

Q. 12(a).—In the interests of commerce, facilities should be given with a view to increase the trade in Burma as in other countries.

Q. 19.—Demonstration factories for any industry should be adopted in Burma.

*Demonstration factories.
Research system.*

Q. 24.—Yes, it should be adopted.

Q. 31.—It is advisable that there should be industrial exhibitions.

Q. 32.—It is proper that they should be held by Government.

*Industrial exhibitions.
Government patronage.*

Q. 37.—The principal Government Departments should exhibit in museums the *Forming* articles they use or publish lists of them. *Government patronage.*

Q. 39.—To give facilities in marketing indigenous products assistance should be given through banks, societies or new agencies. *Banking facilities.*

Q. 44.—I think commercial growth is hindered owing to the lack of education.

Lack of education.

Q. 47.—The Province is benefited by the establishment of these schools.

*Industrial Schools,
and apprenticeship.*

Q. 48.—Both the systems are good.

Q. 50.—In my opinion it is better that industrial schools should be under the control of the Department of Industries.

Q. 71.—Institutions should be established.

Technological institutions.

Q. 78.—It will be a good thing to have a library where works of reference both in English and Burmese are available. *Reference libraries.*

Q. 80.—The establishment of a College of Commerce is necessary and it should receive Government aid. *College of Commerce.*

Q. 81.—It should be established at Rangoon or Mandalay.

Q. 85.—Government should either establish or assist journals.

Trade Journals.

Q. 86.—The proprietors of journals should publish industrial matters for general information.

Q. 112(b).—Government should assist these industries all along—from the time the cotton is grown till the cloth is manufactured ; from the time the silkworm is reared till the silk passes through the loom as different kinds of wearing apparel ; and from the time the sugarcane is cultivated till sugar is made.

(Witness did not give oral evidence.)

THE PROVINCIAL INDUSTRIAL COMMITTEE, BURMA.

WRITTEN EVIDENCE.

Industrial Development in Burma.

In an examination of the measures which can be taken for furtherance of industrial development in this province, I shall distinguish between—

- (a) large industries, and
- (b) minor or cottage industries.

Under the former head I include the industries in which mechanical power is employed in the processes of manufacture or which require the employment of a body of skilled and unskilled labour working in co-operation. Under the head of minor or cottage industries I place the minor industries which can be undertaken by a man and his family, or by a small body of men working together and which do not require the employment of any large amount of capital or of highly skilled supervision.

2. My reason for making this broad distinction between the two classes of industries is that the measures of Government support needed by large and cottage industries will be found on examination to be different in their nature. When a large industry has been established and has proved itself to be commercially successful, no assistance on the part of Government is ordinarily needed to ensure its further development. Capital can be obtained in the open market sufficient to finance undertakings which have been proved to be successful, and the persons or firms engaged in such industries are in a position to secure the skilled and technical staff needed for management and control. (I am writing both here and elsewhere in this note with reference to normal pre-war conditions. The difficulties which have arisen since the outbreak of war both in obtaining capital and in securing skilled supervising staff may be expected to disappear after the end of the war.) The aim of Government in its relation to large industries should be directed rather to the encouragement of new industries which give promise of success but which have not yet been tested on a commercial scale. The attitude of financiers and businessmen in the East towards any new departure is distinctly conservative, and the country may possess possibilities in the way of raw product or other advantages for the establishment of some new industry which will remain undeveloped from year to year unless some encouragement or assistance is given by Government in the initial stages of the industry.

3. With minor or cottage industries the position is rather the converse. The people engaged in these industries are ordinarily of the poorest classes with little or no capital of their own and they are compelled to borrow at high rates of interest, which absorb the whole of their profits and leave them no margin from which to better their position. Their poverty precludes them from obtaining advice as to the directions in which they can improve their implements and methods of manufacture and as to the best markets for purchase of raw materials and sale of the manufactured products. The measures to be taken by Government in relation to these small industries should be directed to the support and development of existing industries rather than to the establishment of new industries. Assistance is chiefly needed in the financing of the industries, in the provision of skilled advice, and in the organization of schemes for the purchase and sale of products.

4. The most important of the existing large industries in the province are rice-milling, timber extraction, timber conversion, mining (more particularly oil winning) oil-refining, cotton ginning, iron foundries, match factories, ship building, and rubber estates and factories. These industries are all too well known to need description. There is also a large trade in the export of the raw and manufactured products of the country and in the import of manufactured goods of all kinds. The possibilities of the province as regards the establishment of new industries of this large class will be examined in a later paragraph of this note.

5. Some of the best known minor or cottage industries are silk weaving, cotton weaving, lacquer work, pottery and tile manufacture, mat weaving, boat building, carpentry, salt manufacture, umbrella making, blacksmith's work, silver, ivory, metal and wood carving. I attach notes on pottery, lacquer work and silk and cotton weaving by Mr. Morris, the Provincial Art Officer and Principal of the Government School of Engineering, Insein. Mr. Morris has been placed on special duty during recent months to examine and report on some of the more important of these industries. A complete industrial survey of the province is needed before full information can be given as to the nature and extent of all local industries.

6. In the above classification of industries I have not included agriculture, which is in a sense the most important industry in the province. The bulk of the agricultural land consists of small holdings owned by peasant proprietors, and for our present purposes agriculture will be correctly classified as a minor industry. The chief needs of the Burman cultivator are more capital, better advice regarding crops to be grown and methods of cultivation and improved arrangements for obtaining pure seed, manures, etc., and for marketing his produce. I do not place rubber estates in the same classification as agriculture generally, as the larger rubber properties are owned by firms who are in a position to provide skilled management and to construct and equip the factories needed for treatment of the rubber.

7. The scope of the enquiry which is being made by the Industrial Commission is indicated by the set of questions issued to witnesses, and in the following paragraphs I deal with the points raised in these questions with the assistance of the replies received from the witnesses in this province.

1.—Financial Aid to Industrial Enterprises.

8. The replies of the Burma Chamber of Commerce and of other witnesses with commercial experience show that there is no real difficulty in raising capital in Burma or from India for large industrial enterprises which are believed to be on a sound footing. Capital has also been forthcoming from the United Kingdom for investment in well established industries. The returns on such capital are being assessed to income-tax at present both in India and at home, and with the present high rates of income-tax this double assessment will, as the Chamber of Commerce point out, seriously discourage the investment of home capital in future either in Burma or other parts of India. Q. 1, 2.

9. The capital needed for financing small local industries is obtained mostly from wealthy money-lenders who reside in the localities in which the industries are being carried on. The workers live from hand to mouth with little beyond their personal credit, and borrow the money for their needs at high rates of interest which leave them with little or no profit on their industry and place them in the hands of their creditors. The provision of cheaper capital is one of the chief needs of these small industries, and co-operative credit societies promise to be the agency by which this need can best be met. A body of workers organized in such a society are in a position to obtain loans from co-operative banks at reasonable rates much below those charged by the village money-lender. Such a society has already been formed to their great advantage by the silk weavers at Amarapura, and the introduction of this system of finance in other localities and in other small industries can be undertaken so soon as a careful study of each industry has been made with a view to ascertain whether the industry can be profitably undertaken under more favourable conditions as regards capital, etc.

10. The position as regards agriculture is much the same as for other small industries, except that the financing of agriculture through co-operative credit agency has been much further developed and is now widely spread in several districts, chiefly in Upper Burma. The further extension of this system awaits a wider growth of a knowledge of its advantages amongst the agricultural population and provision of larger funds by the co-operative banks, through whom the societies are financed.

11. The capital raised in Burma for industrial undertakings has been subscribed mostly in Rangoon by a comparatively small section of the population and the people of the country as a whole have shown no general inclination to invest their money in industries other than agriculture except in so far as small industries have been financed by local money-lenders. The amount of capital lying idle in the hands of small holders must be considerable and it is possible that a growing share of this capital may be made available for industrial investment if, with the spread of the co-operative movement, district banks can be generally established under local management which will be able to bring home the advantages of banking to the people and will inspire them with greater confidence than they possess in the larger banks whose work is centralized in Rangoon and a few other towns. Q. 24, 10.

12. Burma is a province in which there is still considerable scope for the further development of most forms of industrial enterprise. The Chamber of Commerce mention, however, that this statement does not apply to the rice-milling industry and that there are at present more mills than can be kept fully employed. A reason for this overcrowding of the trade is possibly to be found in the speculative nature of the local rice market and in the consequent uncertainty as to the profits to be obtained in the rice-milling industry from year to year. Q. 3.

13. Financial aid has not been given by Government to any industrial enterprises other than agriculture in Burma. Government loans to cultivators are issued in accordance with the rules which have been framed under the Land Improvement Loans Act, 1883, and the Agriculturists' Loans Act, 1884. These loans are intended to enable cultivators to meet their agricultural expenses and are ordinarily repayable with interest in instalments covering a period of one to five years. Such loans have met with very limited success as a means of financing agriculture. The total sum needed for such a purpose is much larger than Government can be expected to provide, whilst the enquiries to be made and security to be taken in order to protect Government against loss before such loans can be given discourage the cultivator and induce him to look ordinarily to the local money-lender rather than to Government for the assistance which he needs. The total sum advanced as loans during the financial year 1916-17 was R12,70,813, and the total amount outstanding at the end of that year was R14,73,867; whilst the advances of private money made to cultivators through the agency of co-operative banks and co-operative societies amounted to no less a sum than R58,39,812 on the 30th June 1917. The figures for Government loans do not include a sum of R7,01,074 which has been advanced for the colonization of new areas through co-operative societies established in such areas. As these colonies become firmly established the Government loans will be repaid and the financing of the societies will be taken over by the co-operative banks. The figures show clearly that as co-operation grows Government loans will play an inappreciable part in financing agriculture as a whole and it will probably be found that such loans can best be diverted entirely to the opening up of new areas to cultivation. Q. 4.

14. It is difficult to suggest any general lines on which Government aid should be given to existing or new industries, as the nature of each industry needs to be separately considered before any satisfactory decision can be formed. Ordinarily monetary assistance by Government is not required in the case of any existing large industry and in the case of a new industry of this class I think that generally Government funds and other assistance should be directed to the provision or support of an individual pioneer undertaking established to test and prove the commercial worth of the industry, rather than to measures framed for the encouragement of the industry as a whole. So soon as a large industry has been proved to be commercially successful no support by Government is likely to be needed for its further development, and more harm than good may result from bolstering up by Government measures an industry which cannot maintain itself without such support. Exemption from income-tax and other forms of taxation may be of some small assistance to a new industry, but such exemption can be of a temporary nature only, and it is hardly likely to have any appreciable effect on the development of the industry.

15. An exception needs to be made to the general statement against the financing of large industries in the case of rubber cultivation or similar undertakings which result in the opening up of large areas of waste land, and in the general development of the resources of the Province. A person or firm investing money in such an industry must wait for some years before he obtains a return on his capital, and whilst the success of the industry may have been established in areas already taken up, financial assistance by Government to new undertakings may materially hasten the growth of the industry. Government advances have been found to be of great assistance to rubber cultivation in the Federated Malay States, and I attach a copy of a letter which I addressed a short time ago to the local Government, in which I have recommended that a rubber survey should be made in this province and that Government loans should be given for the encouragement of such cultivation. Mining operations might be held to fall under this head and to constitute an industry for which Government loans might well be made, were it not that the nature of the industry is speculative to an extent which renders it impossible to say in what instances loans can suitably be made. Money grants-in-aid might also be made by Government to industries of this class and to firms engaged in forestry for the construction of roads or other means of communication which will be of public benefit.

16. I look to co-operative societies as the best agency for the financing of small industries. Where such industries have been found on enquiry to be on a sound basis the necessary funds would ordinarily be forthcoming from co-operative banks; but instances may occur in which financial aid by Government is needed for a time until such banks are prepared to find the money. Assistance in such cases would ordinarily be made by loans to the co-operative societies formed by the workers in the industry. I have dealt above with the financing of agriculture through the agency of co-operative credit societies. An interesting note has been furnished by Mr. L. Dawson, Managing Director of the Agricultural Loan Company, Limited, Pyawon, on the advantages of the establishment of agricultural banks for financing agriculture. The subject is of too large a nature to be dealt with here, but I may note two serious objections to such a system of finance. In the first place such a bank must require individual security for its loans and cannot meet the needs of the poorest class of cultivators who have no security to offer and are most in need of assistance. In the second place an agricultural bank is prepared to make advances so long as the security is satisfactory without regard to the actual agricultural needs of the applicant and does not therefore offer that encouragement to thrift which is given under the co-operative system. In Egypt, where the system of agricultural banks under Government support has been highly developed there has not been that resulting benefit to the cultivator which was anticipated when the movement was started.

17. I consider that pioneer factories should be established by Government both for large and small industries whenever it is found after full enquiry that a new industry promises to be commercially successful and private enterprise is not prepared to make the new departure. All the information which Government possesses regarding the possibilities of the industry should be made public in order that it may be seen whether private effort will be made to start the industry before Government embarks on the venture. It would need to be determined in each particular case whether the pioneer factory should be entirely a Government concern or whether Government should assist an individual or firm who would be willing to come forward, either by financing the undertaking, by granting certain special privileges as regards the raw produce needed in manufacture, or in such other manner as can be arranged without interference with any of the existing industries in the province. The present development of rubber cultivation in Burma has been due to the establishment of the experimental rubber plantation by Government at Mergui, and the Silk Weaving Institute at Amarapura is proving to weavers throughout the province that qualities of woven silks of which they were hitherto unaware can be produced at a profit. A money grant was promised by Government towards the establishment of a sugar refinery in the Minbu District, but the scheme has fallen through for the present owing to the war; and Government has recently undertaken to allow a reduced land revenue assessment on sugarcane cultivation in a block of land in the Toungoo District with the object of encouraging the establishment of a refinery.

18. Pioneer factories for large industries have served their purpose when they have proved to the satisfaction of the public that the industry has been a commercial success, and Government should then dispose of the factory on the best terms which it can secure.

Letter No. 598-
SL-7, dated 20th
August 1917, from
Secretary to
Financial Commission-
er to Revenue
Secretary to
Government.

Q. 11, 12.

Q. 7, 8.

This course was followed with the rubber plantation at Mergui. In the case of small industries it may be found desirable to maintain a pioneer factory as a demonstration factory to encourage the spread of knowledge of the new methods. In such cases the factory should be kept solely for purposes of demonstration or for further investigation, and the articles which it produces should not be allowed to compete in the market with articles of private manufacture.

19. No action appears to be desirable on the part of Government for the promotion of Q. 12a. Trade Guilds in Burma. A complete system of co-operative organization should provide small industries with the assistance to the industry which is given by these Guilds in other countries.

20. Provided that Government assistance is restricted to the pioneering of new industries Q. 13, 14. and to the establishment of demonstration factories for existing small industries there should be no fear that the action of Government will cause any undue interference with private enterprises in the country or with established external trade.

II.—Technical Aid to Industries.

21. Technical or scientific aid to industrial enterprises has been given by Government Q. 15, 16. in Burma in geology, agriculture and forestry and in silk weaving. Experiments were made by Government in the production of tannin extracts but without success. The researches of the Geological Department are reported to have been of material assistance to the firms engaged in oil winning and wolfram mining, and a more complete geological survey of the province will be of great value to the mining industry as a whole. Investigations in agriculture and forestry have been starved hitherto for want of the necessary staff, and in both of these branches there is wide scope for further development. The Silk Weaving Institute has already rendered substantial benefit to the cottage weaving industry.

22. No cases have arisen to my knowledge in which Government experts have been lent Q. 17, 18. or could suitably have been lent to private firms or companies. The large firms engaged in industrial enterprises prefer to engage their own experts, and with small industries expert advice should be given to the workers as a whole and not to any individual. Possibly instances may arise in which a pioneer factory is established with the support of Government and in which the services of a Government expert could suitably be placed for a time at the disposal of the firm taking up the new industry. Officers of the Public Works Department might be permitted to assist private firms with advice as to the alignment and method of construction of roads, bridges, etc. In such cases, it is essential, in my opinion, that all the information obtained by the expert should be at the disposal of Government and should be made public if Government so decide.

23. The present need in Burma is for pioneer rather than demonstration factories. The Q. 19, 20. country possesses large potentialities in raw materials and products which have yet been undeveloped or which are being exported in their raw state for manufacture elsewhere, and pioneer factories are needed with a view to ascertain to what extent production of existing and new materials needed in manufacture can be developed, and whether conversion of raw materials into manufactured articles can profitably be undertaken here. Branches of manufacture which are yet undeveloped and for which a supply of raw materials exists or could probably be produced in the province are leather tanning, sugar refining, starch manufacture, paper pulp and paper manufacture, jute manufacture, soap making, the manufacture of tannin extracts, and pottery work. This list is in no sense exhaustive and cannot be completed until industrial surveys have been made of the whole province. A demonstration factory has already been established by Government for silk weaving as a cottage industry, and similar factories will be needed for other small industries when their commercial possibilities have been proved by means of pioneer factories.

24. The Scientific and Technical Department of the Imperial Institute has been of Q. 21, 22, 23, 24. assistance in the investigations made by the Agricultural Department in Burma into the commercial possibilities of agricultural products. I know of no other branches of industry in which the Imperial Institute has been able to come to our aid, and think it might be able to render more assistance if there were a local institute in touch with industrial development in the province by which references could be addressed to the Imperial Institute. I offer no opinion as to the extent to which research on special subjects should be carried out in the United Kingdom rather than in India, or as to the manner in which the Advisory Council for Research in the United Kingdom can assist Indian industries.

25. There is a pressing need for further industrial surveys in all branches of industry in Q. 25, 26, 27. Burma. Agriculture, forestry and mining would all benefit greatly by such surveys, which would add to our present information as to the raw products which are being or can be obtained in the province, and as to the localities in which the mineral wealth is most likely to be found. Agriculture and forest surveys should be undertaken by the Agricultural and Forest Departments, which both need extra staff to enable this work to be carried out. The geological survey would be undertaken by the Geological Department, which might well be re-organized as a provincial department in this province under a head who would deal with all matters relating to mining. A survey is also needed of the small industries in the province with the object of determining the possibilities of development of each industry. Such a survey should be undertaken by the Department of Industries, when such a department

has been created. The information obtained by the surveys of the various departments should be made public from time to time in such form as is most convenient.

Q. 27A.

26. The need does not appear to have been felt in Burma for Consulting Engineers appointed by Government to aid industrial enterprises by technical advice.

III.—Assistance in Marketing Products.

Q. 28, 29.

27. We have no commercial museum in Burma. Such a museum established in Rangoon would be of great value to the province. The museum should contain specimens of all the raw and manufactured articles produced in Burma which are of commercial importance, and should have a library, from which copies could be obtained of all available literature relating to these products. The curator in charge of the museum should be competent to furnish information to enquirers regarding the different products in the museum, and should be an officer with considerable technical experience. A person not thoroughly familiar with the province has the greatest difficulty at present in ascertaining what raw and manufactured articles the country is capable of producing; what quality of each article is being produced, and in what places and quantities the articles can be procured. The lack of this information may result in much time and money being spent in fruitless enquiries and acts as a serious discouragement to trade development. A proposal to construct a commercial museum for Burma in Rangoon is at present under the consideration of a small committee consisting of officials and non-officials, and it is hoped to place shortly before Government a scheme for such a museum. Difficulty has been found in the selection of a suitable site and in drawing up a design for a museum which will meet provincial needs and will be within the limits of provincial finances. The committee aim at securing a site which will be within easy reach of the commercial centre of Rangoon, and will at the same time be sufficiently large to permit of periodic industrial exhibitions being held in the museum grounds.

Q. 30, 30A.

28. There are no sale agencies or commercial emporia for the sale of the products of minor or cottage industries. Arrangements could be made if thought desirable for the sale of such products in the commercial museum, when it has been established; but I am inclined to the view that it will be found more satisfactory to provide for the sale of these products in Rangoon and other large towns either by private dealers or by co-operative sale societies, and that the functions of the museum should be restricted to an exhibition of the products, with information as to the places at which they can be procured. I attach no great importance to travelling exhibitions of the products of minor industries. These products become sufficiently well known through the agency of shopkeepers and petty dealers, and central exhibitions will assist to the same end.

Q. 31, 32, 33.

29. The first industrial exhibition was held in Burma in December 1916 and attained a great measure of success in spreading a knowledge of the industrial possibilities and needs of the province, and in bringing buyers and sellers into touch with each other. The exhibition was held by Government and was controlled by a small committee. Material assistance in the exhibition of raw and manufactured products, machinery and processes of manufacture, was given by the principal firms, and it is the general opinion that exhibitions of this kind should be held at periodic intervals in future. Such exhibitions should be primarily of an industrial nature and should be popular in character to such extent only as is needed to make them attractive to the industrial sections of the population.

Q. 34, 35, 36.

30. I am strongly in favour of the proposal to appoint trade representatives in Great Britain, the colonies and foreign countries, to represent the trade of Burma and India. These representatives should be men with commercial training and should be fully informed as to the quality and price of the different articles which Burma can produce, and as to the needs of the province in imported articles. The representatives should not themselves engage in trade of any kind, and should furnish full information from time to time to the local Government or to a local trade bureau as to the possibilities of opening up new markets or of developing existing markets for the sale of Burma products and as to the sources from which Burma's needs for outside products can best be met. Temporary Commissions for special enquiries might possibly be necessary on occasions, but the need for these should rarely occur if a system of trade representatives were properly organized. No need has been felt for trade representatives for Burma in other provinces of India. Trade relations between the different provinces are closely established at present.

Q. 37, 38.

31. The publication by Government departments of the lists of articles which they require and the local purchases of articles of suitable quality where these can be obtained at a price not above the cost of similar imported articles seem to be the only measures needed in this connection for the protection of Indian industries.

Q. 39.

32. There is a need for greater banking facilities in the marketing of unhusked rice and other raw products. Difficulty is found at present in making remittances of money from one place to another in the province and banking organization is required which would render more fluid money invested in grain and other produce which has been purchased for storage and not for immediate sale.

IV.—Other Forms of Government Aid to Industries.

Q. 40.

33. Ordinarily Government should demand a fair price in the open market for the raw materials which it owns. Sale at anything below the market price confers an undue benefit

on the purchaser in his competition with other less successful firms and does not assist the trade as a whole. Where Government has a monopoly of the raw product there may be difficulty at times in determining what is a fair market value and it may be necessary to take measures in the disposal of the produce which will ensure that the trade is not brought under the control of one or two firms only. An exception to the general rule that the full market price should be demanded may be desirable where endeavour is being made to start a new industry. In cases of this nature there may be justification for the grant of raw produce for a limited term of years either free or at rates below those obtainable in the open market, with the object of establishing the industry.

34. The land policy of this Government is directed towards the system of peasant Q. 41. proprietorship, and such a system may be said to retard agricultural development in that small land owners have neither the means nor the knowledge to enable them to employ the implements and methods, and to use the manures and other materials needed for scientific agriculture. On the other hand it cannot be said that, with one or two notable exceptions, the owners of large estates, where such exist in this province, have shown any greater endeavour than the small owner to introduce improvements in methods of agriculture. As a class they have contented themselves with securing such rentals as their tenants are willing to pay, and left the tenants to cultivate the land in the manner they thought best. The remedy for existing defects in our agricultural methods appears to lie in the development of the Agricultural Department, by which improved methods will be brought to the knowledge of the cultivator, and in the extension of co-operative organizations, by which groups of cultivators will be enabled to equip themselves in a manner beyond the means of the individual.

35. Under the Land Revenue Rules waste land is granted or leased by Government for Q. 42. purposes of cultivation either revenue free or at favourable rates of revenue for a term of years, and the existing rules for the disposal of land for such purposes are accepted as generally suitable. A rental based on a percentage of the full letting value of the site is leviable under the rules for waste land granted or leased for industrial purposes from the commencement of the term. It is suggested that some initial concession in the matter of rent might be allowed where land is taken up for a new industry, and I see no objection to the adoption of such a principle. The area required would ordinarily be small and the concession would involve no great loss to Government, whilst it might be of appreciable assistance to the new industry.

36. Under the Land Acquisition Act, 1894, land may not be acquired by Government Q. 43. for an individual or firm, and may be acquired for a company in cases only where the work for which the land is being acquired is likely to prove useful to the public and the company has entered into an agreement with Government as to the terms on which the public shall use the work. Instances may arise, such as, for example, the work of construction of a pipeline, where the work may not be for the direct benefit of the public and in which an important industry may be seriously hampered if Government cannot assist in acquiring the land. I think therefore that some power might be given to Government in the Act to acquire land for private purposes where it is proved to the satisfaction of Government that the land to be acquired is essential to the purposes of an industry and that other suitable land is not available. Such a power might be safeguarded by a provision that measures shall not be taken for acquisition until public notices have been issued and all persons concerned have been given an opportunity of being heard against the proposal to acquire the land.

37. Arrangements for the supply by Government of water or water power for industrial purposes are unsatisfactory in that there are no regulations dealing with rights in water, and the public have not been informed of the terms and conditions on which they can obtain such rights. Questions of water supply and water power are becoming of growing importance with the development of mining and other industries, and in a revised Land Revenue Code which is now being framed it is proposed to give the local Government the power to frame rules to regulate the use or supply of the water in rivers, streams and watercourses.

F.—Training of Labour and Supervision.

38. It is almost axiomatic that the spread of primary education assists industrial develop- Q. 44. ment. Education leads to a growth in intelligence and increases the value of labour, more particularly of skilled labour. Skilled workmen are being trained at present in the course of their employment in the factories or other industries in which they are engaged, and apprentices are being similarly trained in certain of these industries. The industrial and technical schools in the province consist of the engineering school at Insein, in which the pupils are taught engineering both for Government and private employment, and the Burma Forest School at Pyinmana, which trains the subordinate staff of the Forest Department. There is also the Weaving Institute at Amarapura, in which adult weavers are being taught improved methods.

39. Our system of technical training needs to be better organized. There should, I con- Q. 45, 51. sider, be Government Technical Schools in which skilled training should be given to fit the pupils for employment in the various industries which exist in the province. There should be two grades of pupils in such schools. The lower grade would consist of boys who had received an elementary education up to the 4th or 5th standard, and who would be given in the vernacular such theoretical and practical instruction as would enable them to become skilled workmen

in the trades in which they would be employed. The higher course would consist of boys with higher educational qualifications and with a knowledge of English, who would be given more scientific instruction which would fit them for employment as skilled supervisors and managers. There is a great dearth in Burma of men of this class to occupy a place between the highly skilled European management and the body of labourers. Such a need has been particularly felt of late in the wolfram mining in Tavoy. Burmans who had received a technical training in mining sufficient to enable them to supervise and control the labour employed on the mines would have found ready employment in Tavoy and would have been of great assistance in the mining industry.

Q. 46, 48.

40. The course of training in both the lower and higher grades should be of a practical nature and should be accompanied by periods of employment in a factory or workshop of the particular trade which is being taught, wherever this can be arranged. This method is being followed at the Government Engineering School at present.

Q. 49.

41. There appears to be an opening for night schools in Rangoon, and one such school might be established by Government as an experimental measure. Here again it might be found necessary to have two classes of instruction, and in the lower class it might be found desirable to combine primary education with elementary technical education, as many of the men attending the classes might have had little or no education hitherto.

Q. 45.

42. Technical schools, similar to the institute at Amarapura, are also needed for the training of adult workmen in the various minor or cottage industries. Such a training would be almost wholly practical and would need to be given by teachers specially skilled in each of the trades.

Q. 50.

43. All technical training should, in my opinion, be under the control of the Department of Industries when it has been formed, and not under the Department of Education. The latter department is not in sufficiently close touch with the industrial development of the province to enable it to determine the courses of instruction to be given in the schools, and its officers have not received the training which would enable them to supervise the practical side of technical work. The Department of Education should arrange in consultation with the Department of Industries that the course of instruction both in elementary and more advanced schools under the Education Department should be drawn up so as to provide that lads who intend afterwards to take a course of technical training either in the lower or higher grade will be instructed in a manner best fitted to suit them for such training. In the advanced schools there might possibly be a technical side in which special attention would be given to higher mathematics, physics, chemistry and similar subjects of value in industrial pursuits.

Q. 52, 53, 54, 55.

44. Government might assist the employees of well-known firms to study conditions and methods in other countries by commending such persons to the Governments of the countries concerned where assistance of this kind is sought by the firm. I do not know of any other form in which assistance towards such enquiries can suitably be given. There are no industries supported by Government which could be required to train technical experts. I can express no opinion regarding the standards of examination for mechanical engineers and the qualifications required in an engineer in charge of a prime mover.

VI.—General Official Administration and Organization.

Q. 56.

45. There is no provincial organization in Burma for the development of industries, and such an organization is urgently needed. Industrial questions are dealt with in several departments, none of which have the time and knowledge to enable them to deal with these questions thoroughly, and as a consequence industrial problems are apt to be neglected and no clearly defined policy is followed.

Q. 57, 60.

46. It is essential to my mind that there should be a Director of Industries for the province. I have advocated such an appointment for some time and I trust that it may be found possible to sanction the appointment at once and that the proposal may not be required to await consideration of the general scheme for industrial development. A careful expert study is needed of our industrial position as regards both large and small industries before Government can determine in what directions assistance should be given, and such an enquiry cannot be brought within the scope of any existing Government department. The functions of the Director would be to centralise information regarding the various industries of the province and as regards foreign markets for Burma products; to assist private individuals and firms in obtaining information on industrial questions; to advise the local Government on all matters relating to industrial development; to supervise and control technical instruction of all kinds; and to frame and carry out schemes for encouragement and development of minor local industries. He should be in close touch with the Agricultural, Forest and Co-operative Departments, and with the Mines Department if these were established, and should be concerned generally with the advancement of all measures of industrial importance. I would make no hard-and-fast rule as to the qualifications of the person to be given such an appointment. Business experience, a general technical knowledge, and sound administrative ability would all be valuable assets, and it should rest with the local Government to decide how the appointment could best be filled when a vacancy occurs.

Q. 57, 58, 59, 61.

47. The creation of a Board of Industries is not, in my opinion, so urgently necessary as the appointment of a Director. There would, however, be advantages in the formation of

an Advisory Board with the Director of Industries as president, the Registrar, Co-operative Societies, and Research Officers of the Agricultural and Forest Departments as members, and with representatives of the chief industries in the province on the Board. Such a Board should be of material assistance to the Director of Industries in the framing of measures for industrial development. The members of the Board should be encouraged to put forward schemes for the advancement of the industrial welfare of the province for discussion at Board meetings, and the Director of Industries, acting with the support of the Board, might be given considerable financial powers as regards expenditure on industrial enquiries and experiments. The control of the local Government over the Director should be on similar lines to the control exercised in respect of heads of other departments.

48. If a Director of Industries is appointed for each of the major provinces, I do not consider that it is necessary to form an Imperial Department of Industries. The Directors of the different provinces should be in frequent communication with each other, so that each province may be fully aware of what is being done elsewhere, and they might meet periodically for the discussion of industrial questions. There is the danger in the creation of an imperial department that too great an attempt will be made at uniformity throughout the whole of India and that each province will not be permitted to develop on the lines best suited to its local conditions. Q. 62.

49. I have already dealt with the subject of local or cottage industries. A complete survey of such industries and the framing of measures for financing these industries and for improving the methods employed in each industry would be one of the duties of the Director of Industries and his staff; the proposals for finance being framed in consultation with the Registrar, Co-operative Societies. Q. 62a, 62b, 62c.

VI.—Organization of Technical and Scientific Departments of Government.

50. The Agricultural, Forest, Geological and Engineering Departments may all be described as technical or scientific departments which should be capable of giving assistance to industries. The Agricultural and Forest Departments need larger staff for research work, and the Geological Department might well be provincialised so far as Burma is concerned. Q. 63.

51. Until further investigation has been made into the industrial needs and possibilities of this province it is difficult to form any definite opinion as to whether new scientific and technical departments of Government are needed, what experts should be engaged by the Imperial and local Governments, and how such experts should be employed. Questions relating to technological research require expert advice for their solution, and such advice is not forthcoming under existing conditions in Burma. Q. 64 to 77, 80, 81.

52. A reference library of technical and scientific works would form a necessary part of a commercial museum, and the Curator of the Museum under the control of the Director of Industries should be responsible that the library is kept up to date. Q. 78, 79.

53. Municipalities and local Boards (there are none such other than Town Committees in Burma at present) will best assist industrial development by the grant of scholarships or other allowances to selected students or workers who are sent for training to industrial or technical schools. Allowances of this nature are being given at present from District Funds to weavers under training at the Silk Weaving Institute. Q. 81a.

VIII.—Government Organization for the Collection and Distribution of Commercial Intelligence.

54. The only criticism which occurs to me on the present system of collecting and distributing statistics and other commercial intelligence by Government and as regards the "Indian Trade Journal" is that the information is frequently belated and would be likely to be of more value if it were got out sooner. The value of these publications could possibly be enhanced if the system of trade representatives in foreign countries were established and telegraphic summaries received from these representatives were included. Q. 82, 83, 84.

55. The "Indian Trade Journal" is little known in Burma except to the larger firms and if a Department of Industries were formed here it would be worth consideration whether a local journal dealing specially with Burma trade should not be published by Government and issued both in English and the vernacular. Q. 85, 86.

56. The publications of the Forest and Geological Departments are reported to be of considerable assistance to the public, and the research branches of the various technical departments of Government should be strengthened so as to enable an increase to be made in these and other publications on industrial subjects. Q. 87, 88.

IX.—Other Form of Government Action and Organization.

57. No need has been felt to the present for a system of Government certificates of quality in respect of either raw or manufactured products. Mr. A. E. English, C.I.E., I.C.S., Commissioner of the Irrawaddy Division, suggests that improved arrangements might be made for the marketing of unhusked rice and that the rice should be graded by Government Inspectors on the lines of the Canadian system for wheat. This suggestion seems

worthy of further consideration. Legislation is being introduced to guard against adulteration of raw materials for manufacture or of manufactured articles, whenever such action is found to be necessary. An Act has been passed recently to prevent the adulteration of ghee in Burma, and the Chief Conservator of Forests mentions that measures are needed to prohibit the adulteration of cutch. There are no other materials or articles in respect of which action appears to be needed at present, but the need for penalties against adulteration may arise as industrial development progresses.

Q. 39. 58. No suggestions are made for the prevention and misdescription of goods generally. The Chamber of Commerce point out that Customs regulations provide for correct descriptions on imported goods, where such is necessary, and it would seem advisable that the provisions of the Merchandise Marks Act in so far as they relate to the trade description of goods of local manufacture should be enforced by Government, and that it should not be left to private persons to institute proceedings under the Act in respect of such goods. A Board of Industries, acting through the Director, when such have been appointed, would constitute a suitable agency on behalf of Government.

Q. 24, 95, 96. 59. Proposals are made by the Chamber of Commerce for the revision of the law relating to Trade Marks in India. These suggestions need detailed consideration. The existing Patent Law in India is found to meet requirements; the only suggestions made are that there should be provision for filing in the province an application for a patent, and that a file of patent specifications or abstracts should be available locally for inspection. The registration of partnerships is also urged as a measure needed in the interests of trade.

Q. 97. 60. Industrial development is being seriously hampered in Burma by the lack of adequate means of communication. A representative Committee has been appointed by the local Government to enquire into the subject of communications, and a Deputy Commissioner and Executive Engineer have been placed on special duty to frame schemes for each district in consultation with the district officers for the assistance of the Provincial Committee. The Committee's enquiries are not yet completed, but from the reports received from the districts already examined it is established beyond question that the province cannot be given its first equipment of essential roads from annual provincial revenues, and that loans of a considerable amount need to be raised for the purpose. A better system of roads will reduce appreciably the cost of marketing raw products and will encourage industrial development in numerous directions.

Q. 99, 100. 61. Funds are also needed for the extension of the railway system. The more important lines which need to be constructed are probably a railway from Moulmein to Tavoy, the extension of the railway in the Southern Shan States, and the connecting railway between India and Burma. The Moulmein-Tavoy railway would pass through the most important salt field in Burma and would open up country containing wolfram and likely to be suitable for rubber, coconut and other cultivation. The extension of the Southern Shan States railway would result in the development of large areas of waste where wheat and other crops could be cultivated, and the Indo-Burma railway would be of general benefit and would assist more particularly in supplying larger bodies of labour in Burma. The waterways of the province are generally satisfactory. Measures of improvement, where necessary, are being considered by the Committee on Communications.

Q. 98, 101. 62. I can offer no detailed criticisms on railway or shipping freights. It seems desirable that Government should exercise some control over freights where a monopoly of carriage exists which might be used to the injury of trade. It might be left to the Board of Industries to bring to the notice of Government any instances in which rates of freight were thought to be excessive or otherwise detrimental to trade.

Q. 102. 63. No adequate enquiries have yet been made as to the possibilities of developing hydro-electric power in Burma. There are large supplies of water power, more particularly in the Shan States, of which no use is being made at present, and it seems desirable that a survey by a qualified expert should be made of such of these supplies as are more readily available, in order that full information may be placed before the public and that encouragement may be given to use such power for industrial purposes.

Q. 103. 64. I consider that the present Mining Rules of the Government of India are of too rigid a nature, and that, subject to the control of the Government of India, the local Government should be given the power to frame rules for the different minerals. It is not possible to frame one set of rules which will be suitable and applicable to the varying conditions under which mining is carried on for precious stones, oil, wolfram, gold, tin and other minerals. Thus, for example, the rules which provide that a prospecting license may be granted for one year and renewed for a further period of two years, whilst suitable for certain forms of mining, are ill-adapted to oil winning. A period of 18 months to two years at least may be needed for the erection of a rig and the sinking of a test bore for oil to a depth of some 1,500 or 2,000 feet, at which the geological formation may indicate that oil is likely to be found, and several years may be needed for putting down sufficient test wells to enable the holder of the license to determine whether he should take a lease of the property. Under the present Rules a prospector who takes out a license for a year only in the first instance has no assurance that he will be permitted to hold the property sufficiently long to enable a real test to be made.

Q. 104. 65. There are no minerals essential for industries of imperial importance which should, in my opinion, be developed at public expense. Wolfram is a mineral of this class, and

experience in the Tavoy District has shown that with Government encouragement and assistance better results can be obtained by private enterprise than would be likely to be secured by Government agency.

66. The chief criticism of the Forest Department is directed against its commercial aspect. The department appears to need strengthening to an extent which will permit of two branches being formed—the scientific, which would deal with research, silviculture and the general improvement of the forests; and the commercial branch, which would be concerned with the extraction of timber and other forest produce both departmentally and by private agency. Great improvements could be made, if funds were available, in the methods of extraction of timber, more particularly of the non-floating kinds, by the introduction of mechanical appliances, and by the construction of roads and tram-lines. By these means timber and other forest produce would be placed on the market in greater quantities and at reduced cost, and a market could be found for timber which cannot be extracted at present owing to difficulties of transport. Q. 105, 106, 108.

67. There have been complaints from time to time of the competition of jail industries with private enterprise, and provision has been made that jail manufactures may not be sold below current prices in the open market. To avoid the possibility of such competition it would seem advisable that jail labour should be employed as far as possible in the manufacture of articles needed by Government departments, or on stone quarrying, stone breaking or other public work undertaken by Government. Q. 109.

X.—General.

68. There are several industries for which it seems likely that this province will be found on further investigation to be suited on account of its resources in raw materials and the markets which are available for the sale of the manufactured products in Burma and India. Such industries are pottery and tile manufacture, the manufacture of rubber articles, jute manufacture, paper making from wood pulp and other materials, and the manufacture from rice of light beers, industrial alcohol, starch, etc. Pioneer investigations are needed in order to ascertain the commercial possibilities of these and other industries. Paddy husk and plantain fibre are two waste materials for which greater use could possibly be found on further investigation. If a sugar factory is started in the province it should be possible to obtain cheap alcohol from the waste sugar products. Q. 110, 111, 112, 112a.

69. Measures are being taken by Government in the Agricultural Department to improve the staple of the cotton grown in Burma, to encourage the cultivation of sugar-cane, to ascertain whether the cultivation of the mulberry tree and silkworm breeding can be improved and developed, to ascertain the possibilities of jute cultivation, and generally to improve the existing products and to determine by enquiry and experiment what new crops can be grown. Q. 112a.

70. Raw materials or partly manufactured articles are not being imported into Burma in any quantity for local industries. The Burma Chemical Company are said to obtain supplies of raw materials from abroad, and raw silk is being imported for silk weaving. Until further enquiry has been made into the possibilities of new industries, the extent to which raw materials need to be imported from abroad for use in such industries cannot be satisfactorily determined. Q. 113.

71. The Industrial Commission in their preliminary note state that Provincial Committees might profitably make detailed and, when necessary, confidential studies of a few typical examples of recent failures in order that the causes which have contributed to such failures may be brought to the notice of the Commission. The only instance which I can recall of the failure of an industrial enterprise during recent years has been that of coffee cultivation. This was being carried on to a small extent in the Toungoo District and failed, I believe, owing to the attack of the plants by a disease similar to that found in Ceylon. There have been instances of the failure of individual firms or companies which have resulted not from causes inherent to the industry, but from mismanagement or, as in the case of certain mining ventures, from the failure of the field to furnish the results which had first been expected. Government intervention could not have been of assistance in any of these cases.

H. THOMPSON,

Chairman, Burma Provincial Committee.

12th November 1917.

THE SILK AND COTTON WEAVING INDUSTRY IN BURMA.

By A. P. MORRIS.

The number of persons employed on cotton and silk weaving, according to the 1911 census return, was 97,872 and 13,063 for cotton and silk respectively. In the case of cotton this includes the processes of ginning, cleaning, pressing, spinning, sizing and weaving, but does not include the agricultural work of growing the cotton. The silk weaver returns include the numbers employed in the production of the silk, but these are few. There is, according to the census, a marked reduction; the figures for 1901 give 184,260 and 24,195 respectively

in both cases the bulk of the workers are women and, although they are in general shown as whole-time workers, it would be more correct in the majority of cases to describe the work as a subsidiary occupation taken up in time spared from domestic duties.

So far as cotton weaving is concerned the industry in the past does not seem to have risen very much above one of local supply; the workers weaving chiefly for their own use and selling very little. The cotton is procured locally to some extent, but in many areas it is found cheaper or more convenient to buy imported yarns. When this is done the occupation is only justified by the fact that the worker has spare time with not much else to do, it can hardly be considered a profitable source of income. There is, however, an exception to this in the production of a particular kind of cloth known locally as "pyinni." This is a cloth of considerable value as rough material. The best is homespun, though inferior qualities are sometimes made of imported yarns. The "pyinni" industry has grown considerably lately under the fostering care of the co-operative societies and should attain to some importance. The cloth has qualities which do not seem to be obtainable in machine-made material.

Throughout the country special ornamental fabrics are made. These are used locally for blankets, etc., and attract the attention of Europeans and others as fancy materials. If a commercial museum is established specimens should be kept for exhibit, and the museum, combined with a certain amount of organisation, might do much to foster the manufacture, not as a whole-time industry, but more probably as a subsidiary industry for the women.

Again, large quantities of "Shan" bags are made, more particularly in the Shan States. These are used locally, but judging by the sale of them at the Art Shows and taking into consideration the small number of people who see this show, the bags would probably find a good European market. They possess great lasting qualities as well as being attractive, and it would be worth while trying to bring the workers in touch with a European or American market.

The production of cotton has been receiving considerable attention of late years, and the Agricultural Department have done much to help the cultivators. The bulk of the cotton is grown in Myingyan and the neighbouring districts, and is sold to the large mill-owners for export. The Myingyan mills gin and bale it, they do no weaving. Somewhat ago it was suggested that the co-operative societies should start small ginning mills for themselves, not so much to compete with the larger mills as to secure the separate ginning of enough cotton from selected areas to give seed for the next year crops, a selective ginning which the larger mills did not seem able to undertake. To run these small mills for the co-operative societies would necessitate the supply of a certain amount of skilled superintendence, and it was considered advisable that the men should be members of the local co-operative societies rather than outsiders employed by them. At the instance of the Director of Agriculture a scheme for giving such training was drawn up, was outlined at the Co-operative Conference held in August 1915, and a resolution was formed recommending that this scheme should be funded by Government. The scheme contemplated the establishment of a small training school attached to the Government Engineering School, Insein. It was proposed to take vernacular students and not to make all-round mechanics of them, but to give them a thorough training in running a specific machine. The scheme was not confined to ginning machinery, but was to allow for training in the use of other agricultural machines. The estimated initial cost is Rs. 14,000, and the running expenses are estimated at Rs. 4,000 per year. This provides for some 20 pupils per annum but, if successful, considerable extension would be necessary in course of time. The scheme was approved, but was not put in force for lack of funds.

In the weaving processes some attempts have been made to effect improvements. The Saunders Weaving Institute, mentioned below, has introduced various improvements, and there is another school in Nyaung. The Saunders Weaving Institute has also introduced the manufacture of "Turkish" towels, and these should find a ready sale. If the indigenous methods can be made worth while as a subsidiary occupation, the improved methods with improved loom, new fabrics, and co-operative action should be able to provide a satisfactory income, even in competition with imported goods.

At present the cotton production is scarcely sufficient to encourage the erection of large weaving mills. Given an increased supply—and the area under cotton gives promise of increase—there is no reason why local mills should not be a success. But this is a question of large capital and concerted action, and the industry ceases to be a village industry or a subject for these notes.

In connection with cotton weaving the subject of carpet-making deserves mention. This industry is not indigenous. It has been introduced by gaol agency and has not gone further than the walls of the gaols. At Insein gaol and elsewhere, carpet weaving is done, but especially at Myaungmya gaol where considerable progress has been achieved during the last few years. One of the staff has spent some time studying methods in India and has taught the prisoners. The Burman prisoners have shown considerable aptitude in design and manufacture, the carpets produced are attractive and of excellent workmanship, and there are great possibilities of extension. With gaol labour economy of effort is not of much importance, the methods employed are somewhat clumsy and might be improved. The earnings of the gaol workers at present sale rates are not sufficient to encourage private work, but the sale prices might be raised quite safely, and improvements in method are possible. The fact

that the gaols are the only places where the work can be learned does much to set a stigma on the industry, but the establishment of a small school under efficient management, would do much to remove this stigma. As a start a special class might be attached to the Saunders Weaving Institute. The industry has a special value in that it makes use of the waste material from ordinary cotton weaving.

Turning to silk weaving the census figures are equally depressing, they show a decrease of 50 per cent. in ten years. The outlook is, however, not so gloomy. Mr. Hurst, Principal of the Weaving Institute, points out that the agricultural expansion of recent years has been a factor in the decline of the silk weaving industry, as the weavers were mostly members of agricultural families. Another very cogent reason is the expanded import of cheap silk fabrics from Europe and Japan. Some five years ago Mr. Saunders interested himself in the industry; he suggested the establishment of a school where instruction in improved methods could be given, and was successful in obtaining the sanction of the local Government to his scheme. A school was established at Amarapura, an expert was appointed as Principal, and the school has rapidly expanded under his supervision. The first improvement was the introduction of a wooden framed loom with a mechanically thrown shuttle. This enables the weaver to double the width of his fabric and increase the length woven per day, in fact the area which a worker could weave per day was about quadrupled. A steel frame loom was also introduced which still further increases the possible output, but it is rather expensive. The workers also learn how to weave more elaborate patterns and are given lessons in design. The result has been a very considerable revival of the industry; it is no longer a precarious source of income; the materials can now be produced at prices which allow competition with imported goods while leaving a satisfactory income for the weavers. Students attend from all over the province, and co-operative societies of weavers have been formed. The school has already done a great deal to extend the industry, and its area of influence is constantly widening. All this in face of difficulties due to the war. The prices of silk yarns which cost Rs. 18 per viss before the war is now Rs. 49 per viss, and dyes are difficult to obtain. The Principal is anxious to extend the scope of instruction and has asked for apparatus to allow of his giving instruction in the production of flowered silk, etc. A year ago the buildings were enlarged, but there is already need for further extension. Attention is also given to cotton weaving, as already mentioned, but silk weaving is the chief subject of instruction. It is all a question of funds, there is a growing demand for instruction, and scope of the instruction might well be extended, but to do so increased expenditure must be sanctioned. The students are already acquainted with the indigenous methods of weaving before they enter the school: to train them thoroughly in new methods takes about six months.

The raw silk is at present chiefly imported from China, only a small amount of inferior quality being produced locally; the pre-war annual import of raw silk was valued at about 26 lakhs. Last year Mr. Lefroy, Government Entomologist, visited Burma and was struck with the high quality of the Burma fabrics; he recommended experiments on silk production, and the subject is now under consideration. There would be objections to silk growing by the Burmese community since it involves the destruction of the chrysalis, but there are plenty of non-Buddhist people living in suitable areas who would take up the industry. The Superintendent of the Northern Shan States is particularly anxious to introduce it among the Kachins and other people in his area as a substitute for the now prohibited opium industry, and in the South the Karens would carry on the work. It will need experiment to obtain satisfactory results, but if money is made available sufficient information as to the best methods should be ready in a year or two.

So far as the dyes are concerned the fine local dyes have given place to chemical dyes which, while they are often rather damaging to the fabrics, are much cheaper in time of peace, are more brilliant, and more regular in tint. The present inflated price of dyes might justify a revival of the indigenous dyes, but it would at best be only a temporary matter hardly worthy of much encouragement. Some interest has recently been taken in a fine blue dye used in Kachin country and usually classed as an indigo; it is not, however, an indigo at all, but a dye produced with rather less effort from an entirely different plant. This, and one or two other of the cheaper dyes might be worthy of attention, but the chemical dyes as a whole will hold the field. Recently the chemists of the Burma Oil Company have interested themselves in dyes, and samples of dyes made locally from petroleum products were exhibited at the last exhibition.

The silk weaving industry was in a bad way, the census returns are an indication of its decline. It may be safely assumed that the next census will indicate a rising curve of employment. This result has been obtained by the provision of expert instruction and the development of co-operation among the instructed.

THE LACQUER INDUSTRY IN BURMA.

By A. P. MORRIS.

The number of people employed in this industry is not given in the census reports, the lacquer workers and basket makers being grouped together in one total. It is therefore impossible to make any estimate of the growth or decline of the industry by a comparison of census returns. Since, however, the lacquer material, *thitsi*, is not exported and is practically all used in the preparation of lacquered wares, the amount of this material extracted from Government forests is some guide. The amount of *thitsi* extracted has varied during the

last ten years, but there is no sign of a decrease. The industry is by no means moribund, it has had its vicissitudes, but there is plenty of possibility of growth as there is room for improvement in technique.

The chief centre is Pagan with its neighbouring villages of Nyaungoo and Myinpagan. In these three villages some 3,000 people find more or less constant employment on lacquer work, while many more find a part-time employment in the manufacture of the bamboo framework to which the lacquer is applied. Most of the people of Maungdaung and Kyaukse in the Lower Chindwin District are also engaged in the lacquer industry, some 1,500 people being so employed. There are other minor centres in the dry zone. In the Shan States, Laikha, Yawnghwe, and Kengtang turn out a good deal of the ware. Mandalay does a small amount, but is chiefly a distributing centre, and the same remark applies to Rangoon.

The materials used in the industry are bamboo and wood for the framework, and in the highest class of ware horsehair; *thitsi* for the lacquer; cinnabar, indigo and yellow ochre for colouring matters; and *shansi* as a finishing varnish.

The principal wares produced are—

- (1) Plain lacquer ware for drinking cups, dishes, trays, boxes, etc.
- (2) Ornamental coloured wares, commonly known as "Pagan" wares.
- (3) Gilt-lacquer wares.
- (4) Moulded "*thitsi* putty" work; with or without glass ornament.
- (5) Mosaic work.

The processes are described in some detail in a recently published note on *thitsi* by the Forest Research Officer, Burma (Indian Forest Records, Vol. VI, Part 3).

The highly ornamented work known to the European community as Pagan ware is chiefly produced in Pagan, the other villages being occupied with less ornate ware. Mandalay has a group of workers in Sadakatan Quarter who make the moulded putty work, chiefly in the ornamentation of *suduks*.

The material of most importance in the industry is the *oleo-resin* obtained from the "*Melastomaceae usitata*" and known as *thitsi*. This material is a Burma product and does not seem to be obtainable in India. The Forest Research Officer in his monograph says, "the average output from the Government forests for the last nine years amounts to about 200 tons per annum, but the actual amount obtainable is probably considerably larger." The price of the material has risen recently, the workers state that they pay as much as Rs. 260 per hundred viss at present as compared with Rs. 170 per hundred viss two years ago. This rise is attributed to increased freights, difficulty of securing transport, and the cessation of supplies from the nearer centres due presumably to the destruction of the trees. The price has also a yearly variation, being, as might be expected, higher in the rains when transport is difficult. With the return of normal conditions freights will doubtless come to their previous level, and by co-operation and purchase in bulk direct from the supply centres the workers could save the middleman's profits, but the destruction of the forests, and the uneconomical methods of tapping now practised, are serious matters which might well be made the subject of special enquiry and legislation by the Forest Department. Even though it effects a rise in price of *thitsi* it would be well worth while, for unless some steps are taken to regulate the process of tapping there is a danger of supplies falling off seriously in the near future.

In the plain lacquer wares practically only one colouring material is used; this is *hinthapada* (cinnabar, vermilion, sulphide of mercury). This material is obtained from China in the crude state, *hingsing*, and is refined by a small group of workers in Mandalay who regard the process of extracting the free mercury a precious secret, and who sell the *hinthapada* to the lacquer workers at a price which has risen in the last two years from about Rs. 11 per viss to Rs. 30 per viss. The material is the same as the "China vermilion" of the paint trade which was quoted at about Rs. 3 per lb. pre-war price in Rangoon. The use of other red pigments such as red lead does not seem to be very successful. For its application a little *shansi* is added to the pigment and then this is mixed in equal proportions with *thitsi*. The *thitsi* in drying darkens and kills everything except the very strong vermilion of the *hinthapada*.

These two materials, *thitsi* and *hinthapada*, cost at present prices about 60 per cent. of the sale value of the articles. As the craftsmen are unable to force bazar prices up at the same rate as the prices of the raw materials, they have had to meet the increased cost by a reduction of their profits.

The industry has not by any means reached the full scope of its development. Of the "art" wares Sir George Watt in his book on "Indian Arts" writes enthusiastically and he considers that they are capable of great development; more particularly was he impressed with the possible extensions of the *thitsi* putty work. The plain wares, in some ways more artistic, could also be improved and modified to present needs. The evolution of the industry has stopped short during recent years owing to the competition with enamelled iron and other imported wares. In the use of *thitsi* the craftsmen have little to learn from outside sources; successful research work in the introduction of a rapid drier might result in a slight stimulus

to the trade by reducing the time between the processes, but a great deal could be done to increase their profits by bringing them in touch with the export trade and by diverting their attention to modern demands for lacquered wares. At present the import trade in lacquered wares from Japan and China amounts to about half a lakh a year. The material used in the production of the lacquer is similar and in no way superior to *thitsi*, and Burma has the monopoly of supply of *thitsi* within the Indian Empire. The unskilled joinery of the local carpenters and the isolation of the lacquer workers' and joiners' crafts, is the chief cause of the lower grade of the lacquered wares as compared with the wares from Japan. The total amount of *thitsi* available may not increase greatly, but if the use of it can be diverted from crude wares to articles of superior finish it would be all to the good of the workers. It would be a great help to the industry to introduce a few skilled carpenters into the lacquer centres. This could be effected by modifying the curriculum in one of the local vernacular schools, supplying a good and adequately paid instructor in joinery, and encouraging some of the children of lacquer workers to take the modified course, at first, if necessary, granting them scholarships to do so. If some of them, when trained, drifted off to other centres of employment, the money spent would not be lost, while some of them would doubtless settle down to aid in the improvement of the lacquer industry.

Co-operation has only touched the lacquer industry at one place, Maungthaung, and the society has not been working sufficiently long to show results, while the general decline of trade owing to the war has delayed progress. But given the assistance suggested, information as to what is wanted, and help in improving their technique, the Burmese craftsmen should be able to secure an export trade to India to the exclusion of the growing trade in Japanese wares. The craftsmen usually work in small groups, as often as not a family circle, under the direction of a *saya* who finds the funds and employs the workers at fixed rates. These groups are not big enough to allow of their carrying large stocks either of the raw materials or of manufactured articles; they adopt a rather cut-throat policy towards one another and thus put themselves at the mercy of the middleman.

Recently Mr. Raikes (Electrical Inspector to the Government of Burma) has interested himself in *thitsi* and has found it has high insulating properties. The experiments on which he is engaged are not by any means finished, but the discovery opens out possibilities of a large development of the work done with *thitsi* putty. The material may prove suitable for construction of switch bases and other electrical fittings, and should this prove to be the case, there is, in the present group of workers, ample labour available. Such a development may further divert the supply of *thitsi* from its present destination in the preparation of crude wares, but it will greatly increase the profits of the craftsmen.

THE POTTERY INDUSTRY IN BURMA.

By A. P. MORRIS.

According to the Burma Census returns for 1901 there were 4,438 men and 6,623 women engaged in the pottery industry. The corresponding figures for the Census of 1911 give 3,001 and 6,147 women. The chief reductions were in the Arakan and Irrawaddy Divisions, and it is noticeable that there was a greater decrease among the men than among the women indicating that the decline has taken place in the more skilled branches of the trade. Sagaing District alone shows any noticeable increase in the number of workers, an increase due to the development of the industry at Kyauksemyaung, and here the increase is among the male workers who have risen in numbers from 353 to 815.

The pottery work of the province can be divided into two classes. In one class is a hand-moulded, light fired ware, in the other a ware moulded chiefly on the wheel, more heavily fired and generally glazed.

The first class includes water pots, cooking pots, flower pots and other cheap wares; the process of manufacture throughout the Province is similar and primitive. The workers are generally women who treat this as a subsidiary industry, and the work is seldom carried on throughout the year. Some of the finest work of the class is produced at Shwegu (Bhamo District); it is light and ornamental, but unfortunately the place is rather inaccessible for trade while the breakages in transport are heavy. Pegu and Tavoy also produce a certain amount of the better quality ware of this class. At Letthit near the mouth of the Myitnge (Mandalay District), the workers make a speciality of black pottery, work is more constant, and the better class work is done by men. The people of Letthit have the bulk of the province's trade in pottery *thabeika* (*hponggy*, bowls). This black pottery ware is distinctly attractive, and there is some possibility of a large development of the trade if the craftsmen can be induced to co-operate in their work and extend the scope of their output.

In the second class of pottery the bulk of the workers are men, while the skill exhibited is on the whole of a higher grade. Of the articles produced the "Pegu" jars call for most skill. These range from quite small sizes up to large jars capable of holding 300 viss of oil. The chief centres are Kyauksemyaung, Pyinmana, Twante, Bassein, and Moulmein. It is among the workers in this second class that the greatest chances of development will be found; what there is of good in the other class can be produced by these people.

The pottery clays throughout the Province naturally vary very considerably, but in most centres there is an ample supply of good material for ordinary earthenware. The beds of

clay are generally within a mile or so of the kilns, and the cost of digging, carting and preparing the clay averages out at about Rs. 8 per 100 cubic feet. Samples of the clays have been sent to the Geological Department, Calcutta, for report. That they were suitable for ordinary earthenware needed no proof, the potters have used them for centuries, but it was of interest to know how they stand with regard to the chances of development of the industry. Especially was it of interest to secure a report on the white clays found in the neighbourhood of Yamethin and used by the potters of Pyinmana. The samples sent to Calcutta were not carefully selected or prepared in any way, and very high class results could not be expected. The Director of Geological Survey reports of one sample that it fires to a very pale buff coloured biscuit and is infusible at 1,000°C. This is not good enough for very high grade wares, but it is good enough for cheap chinaware and justifies further investigation of the beds, not only in Yamethin, but also in other parts of the province. As a matter of fact a sample of clay used by the Pyinmana potters and doubtless washed to some extent before use, was made by them into a plaque as an exhibit; the ware produced has a very clean white fracture. At present the only use made of the white clays is as a slip over the surface of the ordinary earthenware to lighten the colour of the glaze.

The glazing material used is generally slag from the lead workings of the Shan States. The price has risen somewhat of late years and the quality has diminished owing to the more complete extraction of lead from the slag. The material is ground, mixed with rice water, and painted over the surface of the green pottery. For a higher class of glaze galena is used, generally over the white clay slip already mentioned. The potters find some difficulty in getting galena owing to the regulations affecting export from the Shan States, but in any case they would not use much as it would be too expensive for the bulk of wares which they make. Recently the Borma Mines have offered to supply litharge to the potters. This would naturally give a much better glaze, but for the wares at present produced it is much too expensive to be used. If the industry develops and a higher grade of ware is produced there may come a time when there will be a demand for litharge. With the development of the tin mines in Tavor it should be possible to secure for the potters the necessary materials for a white glaze, and provided that kaolin beds of suitable quality are found as seems more than likely, there is room for very considerable development.

From Mongkung in the Southern Shan States comes a very attractive ware with a grey green glaze; it has considerable strength, and might possibly be more accurately classed as stoneware than as earthenware. It is unfortunate that, for the present, Mongkung is so inaccessible, as evidently both the clay and the glaze are of a higher quality than usual.

Except in the case of some of the light fired wares where paddy husk and straw are used, the fuel used by the potters throughout the province is timber. It is the rise in price of this timber fuel which has been the chief factor in the decline of the industry. At Kyaukmyaung, the one place where the industry has grown, the price is still low being about Rs. 2-8 per 100 cubic feet of stacked fuel, but at Twante the price of the same quantity is about Rs. 11, so that while at the one place the industry is doing well, at the other, although more favourably situated for trade, there is a very noticeable decline. The cost of clay, glaze, and labour in making such articles as glazed pipes would be about the same at Kyaukmyaung and Twante; if there were any difference it would be slightly in favour of cheaper unskilled labour at Twante. The comparison of costs is shown in the following figures which represent the cost of Rs. 100 worth of glazed pipes ex-kiln at Kyaukmyaung and of the same quantity of material at Twante:—

	Kyaukmyaung.	Twante.
	Rs.	Rs.
Digging and preparing clay, pugging, etc.	15	15
Skilled potters' labour	42	42
Unskilled coolie labour fetching and carrying	15	15
Fuel	98	129
Total	160	195

At Letthit the price of fuel is about 20 per cent. greater than at Kyaukmyaung; at Pyinmana it is double the Kyaukmyaung price. But in the Delta and at Moulmein the price is so much greater as seriously to affect the industry. This rise is of course due to the rapid working out of local supplies during recent years.

Even were the potters to combine and purchase large quantities the price would still be high. The Burma Railways are favourably placed in the matter of transport, yet their stated cost of fuel at Bassein is such that, allowing for cost of carriage, the potters would not seem likely to get their fuel much cheaper were they to purchase several thousand cubic feet at a time.

The question arises whether other fuels could not be substituted. Considering calorific values alone and taking Bengal coal at Rs. 14 per ton, the equivalent prices of other fuels are roughly for timber Rs. 7-5 per 130 cubic feet, for oil Rs. 11-7 per hundred gallons and for Burma coal Rs. 10 per ton. These figures indicate that so far as calorific values are concerned timber fuel in the south is now more expensive than coal. This is of course looking at the question only from the point of view of calorific values; there are other points to be considered, among them the necessity for modifying the kilns if other fuels were introduced. As an

alternative fuel the use of paddy husk might be considered, there is a large quantity available, more than the rice mills need for their own use. But these questions can only be decided by experiment under expert advice.

The kilns at present used for the glazed wares are domed structures, oval in plan with an inlet for fuel at one end and an outlet for gases at the other. They are built of unbaked bricks and vary in size, the largest being as much as 30 feet long by 15 feet wide by 3 feet high in the centre. The firing is direct but sometimes the larger jars are used as saggars for the smaller and more delicate wares.

The potters as a rule work more or less from hand to mouth, they make a living wage and the bulk of the profits go to the middlemen. Thus Pegu jars for which the potters at Kyaukmyaung receive Rs. 250 per 100, sell in Henzada for over Rs. 5 each. There are, of course, breakages *en route*, and there are expenses in rafting them down the river, but the middlemen's profits are out of all proportion to the outlay. The craftsmen are lacking in business acumen chiefly because they are uneducated. When co-operation has touched them it has awakened in them a sense of the possibilities of business methods and although in some respects they still exhibit childish tendencies to consider only proximate results they have certainly benefited and will benefit still more by co-operation.

Nothing has been said so far of the production of bricks. Bricks are produced in large numbers in the province especially in the neighbourhood of Rangoon. Speaking generally they lack all the qualities of a good brick, homogeneity, regularity in shape, and accuracy of size. For want of better material they are used, but it does not follow that it would be uneconomical to produce a better article. Brick making is an expert craft and more scientific methods of manufacture might be introduced with advantage.

There is ample room for development of the industry. The value of the imports in pottery, porcelain, bricks, etc., for the year 1913-14 amounted to 22 lakhs of which 13 lakhs worth came from Great Britain and other parts of the empire, 3 lakhs worth came from Germany and Austria, and the balance from other countries. The bricks,—value 1½ lakhs—were probably fire bricks and do not enter into the question at present as no suitable supplies of fire clay are known. The chief foreign sources of earthenware and porcelain were Germany, Japan, Belgium and Holland in the order given, while France had a big trade in tiles. Since the war started imports have naturally very much decreased, the most noticeable exception being those from Japan which have increased remarkably as regards earthenware and porcelain. It is not suggested of course that all this trade could be captured by the local potters, or that any very great immediate improvement could be effected. High class sanitary fittings and the higher grades of chinaware are not likely to be successfully made by small societies. But there is no reason why the cheap German chinaware of the coarser kind, the roofing tiles, and the glazed piping at present imported, should not be made at a profit by the local craftsmen.

So far as numbers of craftsmen are concerned the figures given above represent the numbers of expert craftsmen at present engaged in the industry, expert that is to say, in the manipulation of the clay though ignorant of modern methods of treatment. But were the trade to show signs of giving a good wage there would be no difficulty in securing plenty of intelligent labour in the pottery villages and their neighbourhood.

In the way of recent developments not much has been done. The potters can produce the wares they have produced for centuries and for these their skill is sufficient. Recently at several centres, particularly at Kyaukmyaung, the potters have taken to the making of glazed pipes for the Public Works Department. At Twante the glazed latex cups for the rubber industry are being produced in some quantity though the quality might be improved and the quantity is not sufficient for the needs of the province. Elsewhere there are other small extensions.

The Government Tile Factory at Mandalay is now being moved to Kyaukmyaung with a view to its being taken over by the local co-operative society, the only co-operative society of potters.

But for successful development of the industry co-operation and education are necessary. The success of co-operation, given a motive, is fairly well assured in this Province; expert advisers are needed to provide the education. Probably two manufacturing experts will be required: one to take up the question of preparing architectural materials, bricks, tiles, pipes, etc., and the other to deal with the production of chinaware and improved pottery. It is scarcely likely that one man could cover the whole ground. A survey of the pottery clay deposits of the province is also desirable.

There is a plentiful supply of intelligent labour, and good material seems to be available; the chief thing lacking is expert advice for the craftsmen. Advice not only on methods of manufacture but also on the state of the market, the demand for new wares, and the best methods of disposing of these products.

No. 598—S L. 7, dated Rangoon, the 20th August 1917.

From—J. G. LLOYD, Esq., I.C.S., Secretary to the Financial Commissioner, Burma.

To—The Revenue Secretary to the Government of Burma.

The Financial Commissioner desires to submit for the consideration of the local Government certain proposals for the further encouragement of rubber cultivation in Burma.

2. Revised terms on which grants of waste land are made by Government for purposes of rubber cultivation were published in Government's Resolution No. 261—4 L-3, dated the 14th July 1916, and in the rules under the Lower Burma Land and Revenue Act, and the Upper Burma Land and Revenue Regulation, which formed Appendices II and III to the Resolution. The conditions under which grants would be given in future had been framed in consultation with representatives of the Northern and Southern Divisions of the Lower Burma Planters' Association and the revised rules have been accepted as suitable by the rubber planting community.

3. The improvement of the terms on which land can be obtained has not led, however, to any large growth as yet in the areas of waste land which are being taken up for rubber. The total area granted under the new rules throughout Burma during the year 1st July 1916 to 30th June 1917, amounts to 4,046 acres only, and a considerable portion of this area consists of small grants which average 50 acres or less and which have been issued to Burmese or natives of India. These small holdings are commercially unsound, for rubber cannot be produced at a profit unless the size of an estate is sufficiently large to permit of the establishment of a properly equipped factory. Small grants must therefore have been taken up either in the hope that the rubber produced can be sold to a neighbouring factory or as a speculation with a view to the subsequent sale of the land to an adjoining estate holder.

4. The returns which are being obtained from the existing rubber estates in the Mergui District, at Shwegyin and elsewhere, show that conditions in parts of the province are entirely favourable to rubber cultivation, and the Financial Commissioner believes that there are large areas of waste land covered generally with forest growth at present which are as well suited for the production of rubber as the areas already planted. No detailed examination has yet been made of these waste areas, but Mr. Thompson thinks that in the Tenasserim Division alone the area available and suitable for such cultivation is not likely to be less than 200,000 to 300,000 acres and may be considerably larger than these figures.

5. The early development of these waste areas is of great importance to the future welfare of the province, and the Financial Commissioner has consulted Messrs. Finlay and Meikle, the representatives of the Planters' Association who assisted in the framing of the revised Grant Rules, as to what further measures, if any, can suitably be taken by Government to encourage rubber planting. The chief reasons for which land is not being taken up for rubber cultivation are, firstly, the lack of information regarding the waste areas in the province which are suited for the growth of rubber; secondly, the want of capital for the development of estates; and thirdly, the difficulty in obtaining the necessary staff of Europeans for supervision of the plantations.

6. The Financial Commissioner recommends that action be taken at once to remove the first of these obstacles to further production. There is a lack of means of communication in most of the forest areas where rubber can be grown, and persons interested in rubber can obtain no information regarding likely areas and are naturally discouraged by the difficulties with which they are met in their enquiries regarding such areas. Mr. Thompson proposes therefore that a rubber survey should be made by Government of the areas in the province which are thought to be suitable for such cultivation. Such a survey would most suitably be carried out by a committee consisting of an experienced rubber planter, an officer of the Burma Commission, a Forest Officer, and a Public Works Officer. Messrs. Finlay and Meikle state, however, that it would be difficult or impossible at the present time to obtain the assistance of a rubber planter for this purpose owing to the shortage of staff on the estates, and the Financial Commissioner thinks that it may be possible to carry out the survey satisfactorily without the assistance of a planter if Mr. J. W. Ryan, Extra Deputy Conservator of Forests, can be appointed the Forest Officer on the committee. Mr. Ryan was in charge of the Government rubber plantation at Mergui and should possess the requisite knowledge as to areas suited for rubber. The Chief Conservator of Forests is of opinion that Mr. Ryan is competent to undertake the work. As some of the areas to be visited will be remote from the district headquarters, the Deputy Commissioner might find difficulty in accompanying Mr. Ryan during the course of his enquiries in each district, and I am therefore to suggest that, if possible, a senior Assistant Commissioner should be placed on special duty with Mr. Ryan. The advice of a Public Works Officer would be needed as to the best means of opening up communications in the new areas, but this assistance can probably be obtained from the local Executive or Assistant Engineer.

7. The Financial Commissioner proposes that the committee should examine the waste areas in each district which are thought to be suitable for rubber cultivation and should mark out such areas on the Survey of India 1-inch map of the district. They would at the same time divide up these areas on the map into suitable blocks of 300 to 500 acres each, and would also show on the map the proposed roads to provide means of communication in each area. No demarcation would be undertaken on the ground except possibly at a few important points where posts or pillars might be put down to enable future applicants to locate roughly on the ground the situation of the different blocks. When these maps have been prepared copies would be available for the public at the district office and it would be open to any person to apply for a grant of one or more blocks. If there were no objections on other grounds to the issue of the grant to the applicant, he could be informed at once that the area would be granted to him. It would be necessary, before issue of the deed of grant

that formal notices should be published calling for objections; that the block or blocks should first be demarcated on the ground as nearly as possible in accordance with the 1-inch map; and that a large scale survey should then be made of the area as demarcated. Roads would be constructed as the different blocks were taken up and as provincial or district funds would permit. There is no pressing need for good communications in the early days of a rubber estate.

8. If rubber areas are blocked out in the manner proposed above, the Financial Commissioner proposes to direct that no person shall be permitted to clear land or squat within such blocks, and that no grants of small areas shall be made for rubber cultivation within the demarcated blocks. The reservation of the blocks against small grantees will prevent speculation in small rubber areas.

9. The lack of capital for investment in rubber properties is partly due to the financial stringency arising out of the war, but it is also inherent in part to the nature of the industry. The cultivation of rubber requires the investment of a large amount of capital from which no return will be obtained for some 4 or 5 years at least, and the expenditure incurred during the early years of an estate must ordinarily be met from funds which can be raised locally by the grantee. Outside capital will not be attracted until a considerable amount of planting has been done and the property has an appreciable value. The local capital in Burma available for investment in rubber is inadequate for the rapid development of rubber cultivation, and it is essential that financial assistance should be given by Government to encourage new areas to be taken up. In the Federated Malay States the phenomenal development of rubber cultivation during recent years has been carried out under a scheme of Government loans, and I am to recommend that provision for such loans should be made in Burma. One of the purposes for which loans can be made under the Land Improvement Loans Act, 1883, is—*vide* section 1 (2) (d) of the Act,—“the reclamation, clearance, enclosure or permanent improvement of land for agricultural purposes.” This definition of “improvement” would cover loans made for the clearance of land for rubber planting, and I am to submit for the approval of the local Government a set of rules which the Financial Commissioner proposes to issue under section 10 of the Act to regulate the issue of loans for rubber cultivation.

10. The draft rules have been framed in consultation with Messrs. Finlay and Meikle. In the Federated Malay States the amount of an individual loan was restricted in the earlier rules to two-thirds of the value of the estate, and in later rules to one-half the value. The Financial Commissioner considers that a more satisfactory provision in Burma will be to require, as set out in the draft rules attached, that the amount of a loan shall not exceed Rs. 100 per acre for each acre cleared and planted within one year prior to the date of the application. Such a limit will be more readily applied than a restriction based on the value of the estate, and it will ensure that loans are not made to an estate which is not being systematically developed. The total cost of clearing and planting an acre of land, and of the upkeep to the time when the trees come under bearing amounts to some Rs. 300 per acre so that a loan limited to Rs. 100 per acre should not exceed one-third or so of the value of the land in respect of which it is made. In order to ensure the rapid development of rubber estates it is proposed in the draft rules that a loan shall not be made unless 20 acres at least have been cleared and planted within the year prior to date of application. This condition will be apart from the terms contained in the deed of grant as to the proportion of the total area which is to be planted with rubber trees from time to time. The proper upkeep of an estate is essential to the safeguarding of Government loans, and it is provided therefore in the rules that a loan shall not be made unless the area already planted is being cultivated and weeded in a proper and efficient manner, and that the outstanding portion of a loan may be recalled at any time if the property is not being maintained in this manner.

11. The Financial Commissioner is not in a position at present to estimate with any accuracy the extent to which loans would be taken out under the proposed rules. He recommends that a budget provision of 5 lakhs be made for such advances in the coming financial year 1918-19, and that the provision in future years be regulated by the amounts which are found to be needed.

12. The third difficulty in the way of development to which reference is made in paragraph 4 of this letter is that of obtaining the necessary staff of Europeans for supervision of rubber estates. This difficulty must continue during the period of the war, but so soon as the war is over there should be numbers of educated young men who will be well fitted for employment on rubber estates and who may find great difficulty in finding other suitable work. It is largely with a view to provide employment for young Englishmen of this class that the Financial Commissioner urges the early acceptance of the present proposals. Unless steps are taken in advance of the close of the war to give a stimulus to rubber cultivation, appointments will not be immediately available at the time when they will most be needed.

13. In conclusion I am to submit a draft advertisement which the Financial Commissioner proposes for publication if the foregoing proposals regarding a rubber survey of the province and the issue of loans for the encouragement of rubber cultivation are sanctioned by the local Government.

Draft Rules under the Land Improvement Loans Act, 1883.

In exercise of the powers conferred by section 10 of the Land Improvement Loans Act, 1883 (as amended by Act IV of 1914), the following rules are made by the Financial Commissioner under that Act for the encouragement of rubber cultivation in Burma.

1. In these Rules 'person' includes firm and company.
2. Any person holding a grant of land for the cultivation of rubber which has been issued under the Land Revenue Rules in force since the 1st July 1916 may apply to the Deputy Commissioner for a loan of money for Government for the purpose of clearing such land and bringing it under rubber cultivation.

3. The application shall be in writing and shall contain the following particulars:—

- (1) The name and residence of the applicant.
- (2) Information as to the area granted for rubber cultivation in respect of which the loan is required, *viz.*—

Situation { Township _____
 { Area _____

Date of grant _____

Area of grant _____

Name of grantee _____

- (3) Interest of applicant in the area granted.
- (4) Full details of all mortgages or other liens or encumbrances on the land.
- (5) The area cleared and planted with rubber in each year since the date of the grant.
- (6) The area of the grant occupied by buildings and roads or otherwise unavailable or unsuited for rubber cultivation.
- (7) The area not yet cleared and planted which is suitable for rubber cultivation.
- (8) The amount of the loan required.
- (9) The date and amount of loans already granted by Government.

The application shall be signed by the applicant who shall certify that the information contained in it is correct.

4. If the Deputy Commissioner is satisfied after enquiry that the applicant is the present owner of the grant and that the particulars furnished in the application are correct, he may grant a loan within the limits of the funds allotted to him and subject to the following restrictions:—

- (a) a loan shall not be made unless an area of 20 acres at least has been cleared and planted with rubber within one year prior to the date of the application and unless the whole of the area planted within the grant is being cultivated and weeded in a proper and efficient manner;
- (b) the loan shall not exceed an amount calculated at the rate of Rs. 100 per acre for each acre cleared and planted within one year prior to the date of the application;
- (c) the loan, together with the loans, if any, already granted, shall not exceed an amount calculated at the rate of Rs. 200 per acre for each acre of the grant which is not yet cleared and planted and is suitable for rubber cultivation.

5. When the Deputy Commissioner considers it expedient to publish a notice under section 5 (1) of the Act calling for objections to the loan, the notice shall be published at the district and township headquarters and in the villages near the land and copies shall be sent to every person who is known or believed to have an interest as tenant, mortgagee or otherwise in the land.

6. When a grant of land is owned by more than one person a loan shall not be made unless a joint application for the loan is made by all the owners of the grant.

7. Loans shall be made on the security of the borrowers and of the land in respect of which the loans are given. No further security shall be required.

8. Loans shall be issued in three instalments, three-fifths at the time of application and one-fifth in each of the two following years. The Deputy Commissioner may stop the payment of an instalment if he finds that the amount already advanced has not been applied for the clearance of the land and the planting of rubber.

9. Interest at the rate of 6½ per cent. per annum shall be charged on all loans and shall be payable annually from the date on which each instalment of the loan is issued.

10. Loans shall be repaid in four equal annual instalments, of which the first shall fall due six years from the date on which the first instalment of the loan was granted.

11. The Deputy Commissioner may direct, with the previous sanction of the Commissioner, that the whole of the outstanding portion of a loan with interest to date shall become due at once—

- (1) if the interest on the whole or any portion of the loan is not paid within three months of the date on which it falls due;
- (2) if an instalment of the loan is not repaid on the date on which it falls due;
- (3) if the loan or any portion of it has not been applied to the satisfaction of the Deputy Commissioner in the clearance of and planting of rubber trees on the land in respect of which the loan was granted;
- (4) if the area planted with rubber on the land granted is not being cultivated and weeded in a proper and efficient manner to the satisfaction of the Deputy Commissioner.

12. An order sanctioning a loan shall be in the form attached and shall be signed by the applicant in acceptance of the terms and conditions on which the loan is made. A copy of the order shall be given to the applicant.

13. The Deputy Commissioner, the Divisional Forest Officer and any officer authorized in writing for the purpose by either of these officers shall be entitled to enter upon and inspect any land in respect of which a loan has been applied for or granted in order to ascertain that the particulars in the application for the loan have been correctly furnished, that the loan is being applied for the purposes for which it is granted, that the area planted with rubber is being cultivated and weeded in a proper and efficient manner, or for any other purpose under the Act and Rules.

14. The previous sanction of the Financial Commissioner is required to the grant of loans for rubber cultivation on terms other than those set out in these Rules, to the postponement of dates fixed for repayment of instalments, or to the remission or writing off as irrecoverable or any portion of a loan.

15. The Rules under the Land Improvement Loans Act published in Revenue Department Notification No. 145, dated the 12th December 1907, shall not apply to loans made for the encouragement of rubber cultivation.

16. If any question arises under these rules as to whether an area is being cultivated and weeded in a proper and efficient manner, the Deputy Commissioner shall at the request of the applicant for a loan or the person to whom a loan has been granted refer the question for decision to an arbitrator agreed upon by such person and the Deputy Commissioner.

Order granting a Loan for Rubber Cultivation.

The sum of Rs. is hereby granted to residing at as a loan under the Land Improvement Loans Act, 1883, for rubber cultivation within the following grant:—

Township. _____
Kwin. _____
Date of grant. _____
Area granted. _____

2. The loan will be paid as follows:—

Three-fifths, <i>viz.</i> , Rs.	at once
One-fifth, <i>viz.</i> , Rs.	on
One-fifth, <i>viz.</i> , Rs.	on

and is granted on the conditions stated below.

CONDITIONS.

(1) The loan shall be applied solely to the clearance of land and the planting of rubber within the area of the grant.

(2) Interest at the rate of 6½ per cent. per annum shall be paid at the end of each year on the amount of the loan outstanding during the year.

(3) The loan shall be repaid in four equal annual instalments as follows:—

Rs.	on
Rs.	on
Rs.	on
Rs.	on

(4) The whole of the outstanding portion of the loan with interest to date shall become due for repayment at once—

- (a) if interest is not paid within three months of the date on which it falls due;
- (b) if an instalment of the loan is not paid on the date on which it falls due;

- (c) if the loan or any portion of it is not applied to the satisfaction of the Deputy Commissioner in the clearance of and planting of rubber trees on the grant ;
(d) if the area planted with rubber on the grant is not being cultivated and weeded in a proper and efficient manner to the satisfaction of the Deputy Commissioner.

Date _____

Signature of Deputy Commissioner.

I accept the loan on the terms and conditions above stated.

Date _____

Signature of person to whom the loan is granted.

DRAFT ADVERTISEMENT.

The following measures are being taken by the local Government for the further encouragement of rubber cultivation in Burma.

A Committee will be appointed in each district in which rubber can be grown to examine the areas suitable for rubber cultivation. The Committee will divide up the available land into blocks of convenient size, tracks will be cut to permit of the areas being visited by applicants, and roads will be constructed later as blocks are taken up and provincial funds permit.

The blocks will be shown on a map on a scale of 1-inch to the mile which will be kept in the office of the Deputy Commissioner, and it will be open to any person to apply to the Deputy Commissioner for the grant of one or more of such blocks. If the block is granted it will be demarcated on the ground as accurately as possible from the 1-inch map and a large scale survey will then be made and a map prepared to be attached to the deed of grant.

Loans will be made by Government under the Land Improvement Loans Act, 1883, to grantees to enable them to clear the land and plant it with rubber. Interest at 6½ per cent. per annum will be charged on the loans and they will be repayable in four instalments from the sixth to the tenth year after the date of issue. The amount of the loan will be determined by the area already planted, and the method of upkeep of the estate. For further information as to the terms and conditions on which such loans will be given reference should be made to the Rules under the Act published in the Financial Commissioner's Notification No., dated

THE ART INDUSTRIES IN BURMA

By A. P. MORRIS.

The Art Industries of Burma form a by no means unimportant group, whether they be considered from the point of view of numbers of persons engaged, value of output, or the future development of an export trade. If one excludes from the export trade of Japan those materials which are produced by the organised action of large numbers of employees in big factories, the remainder of her exports, no inconsiderable quantity, is largely composed of "art" wares the product of village industries. And so with Burma, her village industries are largely art industries, for the innate tendency of the people is towards ornament and most of their wares bear evidence of this. In dealing with village industries a note on art industries is therefore not out of place.

The group may be divided into two sections, one dealing with applied art industries, the other with pure art.

In the first section come silverwork, ivory carving, wood carving and sculpture, bronze statuette work, and ornamental iron work either inlaid with silver or plain. A paragraph on each of these must preface any suggestions for the development of the industries as a whole.

Silverwork.—Most big villages have their silversmith and the larger towns have many. The census returns lump together jewellers, goldsmiths, silversmiths, and workers of precious stones, and the latest census gives the total number in this group as 24,829; the silversmiths are not separated in the group but a rough return made by the Provincial Art Officer some two years ago would indicate that the number is not less than 300. Only a few of them attain to any great skill and the bulk of these skilled men are to be found in Mandalay, Pegu, Rangoon, Thayetmyo and Moulmein. The style of work varies, but the number of shapes attempted is not great, the difference being rather in the variety of surface ornament. Attempts to apply their art to modern European needs have generally been unfortunate because the workers, failing to understand the use of the objects they have been called upon to make, have naturally failed to appreciate the true application of their art. There are exceptions, more particularly in the use of niello work, and the exceptions justify the suggestions made later with regard to the aid which might be given in developing the industry.

It is scarcely possible to form any accurate idea of the relative position of the trade as composed with its position ten years ago; the war has naturally hit the art workers more than other craftsmen. There is still, and likely to be, a large demand for silver bowls, etc., on the part of the Burmese population, there is always a demand for this sort of work on the part of the tourist, and it may be possible to secure the interest of some of the higher class firms in Europe and America when the war is over. Given instruction in the wider application of their art, the possibilities of development open out considerably.

Of the other workers in this census group there is not much to be said. The goldsmiths are very numerous, but their skill is small; the demand for them lies in the custom of converting wealth into jewellery, mostly in the form of simple rings or bangles of crude workmanship, which, under stress of fashion or necessity, often change shape. The cutters of precious stones are mostly in Mandalay and Mogök, their methods are similar to those employed in Paris and Amsterdam, but they are seldom entrusted with any very big work; they earn a fair wage and are generally able to secure as much work as they can manage. Stone setting, except very crude work, which however satisfies the Burma customer, is seldom practised; one man in Mogök has acquired some idea of the finer European setting, and has done a fair amount of work for European customers.

Ivory carving.—The ivory workers are a very small group. Technically theirs is a specialised development of woodcarving industry, and they generally turn their hands to wood carving when the ivory trade is slack. The skill exhibited is great and the finer carvings will compare favourably with those from any part of the world. The centre of the industry used to be Moulmein, but it has shifted to Rangoon. The best that can be done for the industry would probably be some sort of help in getting into touch with high class European markets.

Woodcarvers and wood sculptors.—Here again the census returns are not much guide. They give a total of about 68,000 persons engaged in wood working in addition to some 1,500 cabinet-makers and joiners. In this number is included sawyers, joiners, carpenters, etc., and among them are the wood carvers. The number engaged on actual carving cannot be determined, but the group is a big one, for here, as in silver work, the local demand is great and the enormous amount of carved woodwork in the *hpongyi kyaungs* (monasteries), structures which seldom last many years,—is proof of the large amount of time spent on this work. There is, however, ample evidence of a decline in the industry independent of the effect of the present war. The fascination of imported corrugated iron, stamped metal work, coloured tiles and other building materials has caused a diversion of the money once spent on carved ornament. The woodcarver has tried to turn to other outlets for his wares and has produced carved furniture attractive to the tourist as a curio, but generally lacking in real value. Here again lack of knowledge has been the bane of the craftsmen. Working on the *hpongyi kyaungs* he was dealing only with applied ornament and his materials had to stand no strains, they were moreover viewed from a distance; changing over to furniture he still regards the article merely as a surface on which to exhibit his skill as a carver, he seldom fully understands its use, he is not a joiner and does not make the structure, and the result is generally an unpleasing curiosity.

It is difficult to predict the future of the Burmese woodcarvers. The total demand for woodcarving is not likely to reach its old limits, but when Burmese ecclesiastical architecture has regained its sanity there will probably be a large demand for woodcarving in a suitably modified form, and if the carver can also learn to be a skilled joiner and cabinet maker there is a demand for his skill in the furniture trade. On the training of the young wood worker as a joiner depends the hope for his artistic ability; very little is being done in that respect at present.

The question of enquiry into the use of other timbers and the supply of seasoned timber is dealt with in the note on furniture making and need not be repeated here.

Bronze statuette makers.—This is a small group, but interesting because it is a very modern development and an indication of what the art worker can do given a suitable suggestion. The bronze statuettes have found a fair demand of late years and the quality has vastly improved; the workers need some instruction in the study of anatomy to assist them in going a step further, but the progress they have made encourages the hope that instruction would fully repay all it might cost. The workers are few and the sales are practically all to Europeans; the local public does not appreciate the work. Here again, after the war, the workers might receive help by bringing them in touch with high class firms at home.

Iron workers.—In plain iron work the Burman craftsmen find a large amount of employment in the manufacture of pagoda 'khis.' The greatest group of craftsmen is in Mandalay but groups are found in all the big towns. The workmanship is not of a very high class. The tools are primitive and the work is structurally rather weak. Occasionally the craftsmen rise to higher things and the gates of the pagoda at Laikha, made by Mandalay workers, are comparable with some of the fine early English wrought iron work. In this line of work, wrought iron gates and railings, there is room for considerable development did the craftsmen but realise it. They have ample artistic ability. They need help in learning to handle the materials, but the demand is dependent on that return to sanity of Burmese architectural taste, a taste which at present favours imported cast iron railings painted blue and green and yellow. Incidentally it may be mentioned that the gates of the Chief Court were imported

at great expense in freight; a suitable bureau for bringing the workers in touch with the demand would have saved considerable expenditure. The creation, by instruction, of a source of supply would do much to secure a demand.

There is, however, a peculiar industry, chiefly centred in Mindan village, and known locally as *ngwezawa* work. This consists of an inlay of silver on steel. The only use made of it at present is in the production of ornamental blades for *daks*, and in the ornamentation of betel cutters and a few other domestic tools. It is however capable of a good deal wider application. In this as in other cases the development depends on advice as to possible demands and improvement of technique in the manufacture of the articles to which this special form of ornament is applied. This people of Mindan have also, in common with craftsmen elsewhere in Burma, special alloys which they use for inlay and other work and in the use of which they show considerable artistic ability, but in which their scope is far too limited and is capable of very considerable extension.

Pure Art.—Of pure art there is not much to be said. The Burman has shown considerable adaptability and has taken to drawing and painting on modern lines in a manner which, considering the lack of instruction, is truly wonderful. His natural ability lies in the direction of design and of this his industries of applied art are an indication. The schools as a whole do very little to encourage drawing, the outlook of the teachers, with a few exceptions, is too much of the South Kensington School of Art type, too lacking in breadth of view. Whatever may be the cause the schools do little to assist the natural genius of the scholars. The Annual Art Exhibition has undoubtedly been some help, and recently the attention of students and others has been drawn to the possibilities of book illustration and advertisement design, for which acknowledgments are due to the help afforded by several Rangoon firms. But a school for those of marked ability, a school where teachers for the ordinary schools could be trained, is an urgent necessity, not merely for the encouragement of art as art but for its application to the industries.

This then is the present position of the industries in applied arts. We have a considerable body of natural ability which year by year is being stifled by modern conditions, the demand for art wares is changing, the nature of the output remains unaltered or has failed adequately to meet the changed demand. Government help is practically confined to the holding of art exhibitions and the grant of a few scholarships. The Annual Art Exhibition in Rangoon supplemented by an occasional district exhibition does something to stimulate the industries; it brings the workers together, gives them an opportunity of judging what will sell, and gives the European community a chance of learning what is available and of ordering wares produced in out of the way corners of the province. The craftsmen have a system of apprenticeship of their own; youngsters are taken over by the more skilled '*sayas*' and work under them as helpers gradually learning the trade. Government has made use of this and to encourage the perpetuation of the industries has instituted a series of scholarships for apprentices so trained. There are 16 such scholarship holders in all. The fault of the system lies in the difficulty of ascertaining whether the scholarship holder is really being taught the trade or whether the money is merely being treated as a small donation from Government charity funds. If the *saya* has little work,—and there is no guarantee of ample work,—the youngster will naturally be idle. Moreover the apprentice at best only learns to repeat his master's work, there is little inducement to improve on his methods. To solve this difficulty Government recently sanctioned the entertainment of two craftsmen, a master wood-carver and a master bronze-worker, as unpaid members of the staff at the Government Engineering School. The men find work for themselves and sell their products for their own profit, and the Government apprentices in these crafts are put under them for training. The apprentices are thus under closer observation and their constant attention to work is more certain, they are given moreover some training in the school shops where in the case of the wood-carvers they receive instruction in joinery and in the case of bronze-workers instruction in the handling of metals.

This much is done, but if the art industries are to be saved, if the natural genius of the people is to be developed to its uttermost, a great deal more is required. The success of such a school of art as that at Jeypore is a justification for the foundation of a school of art and more particularly art crafts in Burma. In natural artistic ability, Burma, of the provinces of India, is second to none. The idea that a school of art will spoil the indigenous art, is coupled with the idea that Asiatic art should be tied to its old methods, should in fact degenerate to a mere art of imitation. Such an idea is unscientific and opposed to all laws of nature. It is a choice of life or death, progress or stagnation. If the natural artistic ability is there it will break through. Experiments there must be, and experiments in the future as in the past will be largely failures, but experiments in artistic development as in all other development should be encouraged and stimulated. The best stimulus for the craftsmen lies in giving him the opportunity of learning what is wanted and of studying improved methods.

Nor need the School of Art be an expensive matter. Given a Principal with imagination and of fairly wide sympathies and training to direct and guide the instructors the actual craft masters might well be chosen from the more skilled Burmese '*sayas*,' who, if they were allowed to sell their own products, could be induced to come at quite a small salary. The instruction in most art crafts should however be supplemented by a workshop training under skilled men who would probably have to be obtained from Europe, and for this reason the

school should as a matter of economy, be worked in as part of the Engineering School or of the Technical Institute of which the Province still stands in sore need.

To separate in education the art from the non-art industries is uneconomical; to tackle the technical development of industries without helping on the artistic genius of the people is to waste a valuable national asset.

For some time a proposal to establish a commercial museum has been under consideration. Such a museum should provide space for art products. The advertisement of the art wares thus obtained would greatly increase the prospect of orders for the craftsmen.

Mention has already been made of the possibility of getting the craftsmen in contact with some of the leading dealers in valuable art wares in Europe and America. It is possible that were they sufficiently interested they might in time appoint their own purchasing agents out here, but at present they know little of the art wares of Burma. After the war it would be worth while for Government to give them an opportunity of learning something of the nature of these wares, by purchasing a small collection from the craftsmen and inducing some of these firms to take up the sale on a commission basis. It would be necessary to purchase from the craftsmen in the first instance and Government would recoup itself in the end. Once a connection with a home firm is established Government can drop out.

The present cost of the Annual Art Exhibition is about Rs. 4,000. With the establishment of an art school and a commercial museum the need of an Annual Exhibition would disappear, or it might at least be held less frequently. The money thus saved would help towards the upkeep of the School of Art.

The main need of the art industries is education, an introduction to the demands of the modern market, and instruction in modern methods of handling the materials. The craftsmen are mostly isolated, art is naturally somewhat conservative, experiments will produce many failures, but stimulation of experiment by wisely directed education need not be feared; it is indeed the sole chance of preserving the industries.

APPENDIX.

Note on some industrial possibilities, etc., in Burma by Mr. J. P. Hardiman, I.C.S., Controller of Munitions, Burma.

1. Manufacture of paint and painting material, largely, if not mostly, lead. (Imports into India £600,000 in 1912-13.)

Requirements include—(a) Pig lead. Large and increasing surplus over India and Ceylon requirements available at Namtu. (b) Acetic Acid from, *et al.*, destructive distillation of wood in Northern Shan States forests (or elsewhere).

2. Manufacture of iron and steel. Smelting of iron ore deposits near Mandalay-Lashio line (or elsewhere) with charcoal obtained in the process of wood distillation. Laboratory experiments into the products of distillation needed. If promising, to be followed by investigation of commercial aspect.

3. Distillation of lignite deposits in Northern Shan States (or elsewhere). See 2 above.

4. Manufacture of acetic acid for rubber production and export to the Federated Malay States market. See 1(b) above. Increasing local, and very large export, market at hand.

(Object of 1 to 4 would be to create in Burma new range of major industries, and render India self supporting in matter of lead paints. I have asked the Munitions Board to sanction the conduct of laboratory experiments in wood and lignite distillation by Mr. Bellars, Professor, Rangoon College.)

5. Timber industries—(1) Shipbuilding. One wooden ship now under construction in Moulmein, one at Rangoon. Board has called for tenders in Rangoon for the construction of wooden seagoing tugs for war purposes. (2) Manufactures of indigenous timber, at present worked by large timber firms in sawn sections only. Some firms are considering possibilities in connection with Ordnance Department indents—but machinery supply at present difficult and firms, partly for that reason, are not keen to embark on new projects. Possibly the creation of an ordnance factory in Rangoon to deal with manufactures of indigenous wood and timber would be best means of demonstrating possibilities. The board has agreed to place an officer on special duty to look into the possibility of supplying ordnance requirements in part from Burma.

6. Manufacture of arsenic from orpiment. 13,000 mannds, say 500 tons imported into Burma overland from Western China in 1916-17. Local chemical firm reports manufactures practicable, if supply of raw material forthcoming. Laboratory experiments probably needed.

7. Paddy husk. Combustion in Rangoon at present often incomplete, and one quarter of a million tons or more of husk discharged as waste into the rivers and creeks yearly. An electrical engineer in private practice has written to me on this point as follows:—

"(1)

2)

*

*

*

*

*

*

- (3) The husk can be converted into gas and the gas burnt in almost any kind of furnace.

Of these No. 3 is probably by far the most suitable as the gas can be generated at the convenient places and led in pipes to where it is required and almost any kind of existing furnace can be adopted to its use.

I suggest that the local Government should erect a small experimental plant and should make a series of tests in order to show that paddy husk can be used in this manner, and to find out the relative fuel value of coal and paddy husk."

Waste in both directions (*viz.* (1) imperfect combustion, and (2) non-utilization of raw husk) calls for examination. Legislation could cure (1) and for (2) engineering survey is wanted. Possibly purchase of husk from mills followed by storage of gas would be found possible, and provide Rangoon industries with cheap source of power.

8. Briquetting paddy husk. Experiments needed.

9. Sulphuric Acid. Material for supply in quantity will be available from Indian sources (Namtu) within a few years. Investigation of possible industries in Burma dependent upon this acid needed.

10. Provincial Department of Industries. Recruiting field would not be so good for a provincial as for an Imperial Department and localization might cut off Burma from existing and future industrial research and educational institutions in India. Scientific investigation needed in many directions in Burma and no staff available.

11. Banking facilities. A Rangoon banker told me that, if the India or exchange banks could be given the management of the Government account in the districts, it might induce them to push out branches. I suggested that he might express this opinion before the Commission, but he was unable to do so, as the bankers have agreed not to give evidence. I gathered from him that they consider the printed questions difficult to answer without excessive reservation, and qualification.

ORAL EVIDENCE, 7TH FEBRUARY 1918.

The following members of the PROVINCIAL INDUSTRIAL COMMITTEE were present :—

- (1) THE HON'BLE MR. H. THOMPSON, C.S.I., L.C.S. (CHAIRMAN).
- (2) THE HON'BLE MR. C. H. WOLLASTON, SECRETARY TO THE GOVERNMENT OF BURMA, PUBLIC WORKS DEPARTMENT.
- (3) MR. H. CLAYTON, L.C.S., REGISTRAR OF CO-OPERATIVE SOCIETIES.
- (4) MR. J. P. HARDIMAN, L.C.S., CONTROLLER OF MUNITIONS.
- (5) MR. A. RODGER, FOREST RESEARCH OFFICER.
- (6) MR. W. H. C. PRIDEAUX, A. M. I. E. E., INSPECTOR OF FACTORIES.
- (7) MR. A. P. MORRIS, B. SC., A. M. I. C. E., PRINCIPAL, INSHIN ENGINEERING COLLEGE.
- (8) MR. H. B. HUDDLESTON, AGENT, BURMA RAILWAYS.
- (9) MR. J. A. POISON, IRRAWADDY FLOTTILLA COMPANY, LIMITED.
- (10) MR. E. J. HOLBERTON, BOMBAY-BURMA TRADING CORPORATION, LIMITED.
- (11) MR. J. SCOTT, MESSRS. STEEL BROTHERS & CO., LIMITED.
- (12) THE HON'BLE MR. E. O. ANDERSON, MESSRS. BULLOCK BROTHERS & CO., LIMITED.
- (13) MR. F. MCCARTHY, "RANGOON GAZETTE."
- (14) MR. J. MEIKLE, MESSRS. STORK & CO., LIMITED.
- (15) THE HON'BLE MR. A. K. A. S. JAMAL, C.I.E.
- (16) MAUNG MAY OUNG, BARRISTER-AT-LAW.
- (17) MAUNG HLA PE, THE "SUN" PRESS.
- (18) MR. S. W. COCKS, M. A., DIRECTOR OF PUBLIC INSTRUCTION.

(N.B.—In reply to the President, the Committee stated that the note* submitted by the Hon'ble Mr. Thompson represented their views also.)

SECTION I.

Mr. Low enquired the reason for the apparent absence of banks up country in Burma, and whether it was not a handicap to the smaller industrialists and merchants. Mr. Clayton said that it was so and continued that there were very few fields for investment and practically everybody up country went in for land or jewels. In reply to a further question by Mr. Low whether there was any place in Burma which has not any bank but which would have had a bank if it were in India, the Hon'ble Mr. Jamal stated that in India every place had not a bank. Shroffs used to finance trade and other things and in Burma instead of the Burman

shroff they had Chetties. In India there were a few banks in a few places and not all over the country. In the interior of India there were large mofussil moneylenders, shroffs and Marwaris and the Chetties did in Burma what the Marwaris were doing in India. The business in a place like Prome was not sufficient for opening a branch bank. Mr. Low said that in many other parts of the world banks had opened up business with branches with a very much smaller equipment than they appeared to do in India and they got on very well with a small amount of business. Hon'ble Mr. Jamal stated that the lack of a sufficient number of branches was due to the relative expense of the staff and its maintenance as between the East and Europe and not to want of elasticity of the banking system out here.

Mr. Holberton stated that the Chartered Bank had opened a branch recently in Tavoy and it would be interesting to find out how far and to what extent it would prove successful. It was a fair test case. There were a lot of wealthy Burmans down there, though there were very few Burmese rice, timber or produce merchants. Mr. Low suggested that it would be a fairer test if they could see how Burmese rice and produce merchants generally availed themselves of the banks in a place like Mandalay. One could hardly expect a well-to-do Burman whose property was mostly land to make the same use of banks as a Burman merchant would whose property was mostly in trade.

The Hon'ble Mr. Jamal did not think that if the European banks opened branches they would do any good to the Burmese or Indians in Burma, because they were not likely to be sufficiently in touch with the small Burman or Indian trader. The Burmese people themselves must be induced to start their own banks. Mr. Clayton observed that the trouble at present was that the Burmese were not given any education whatever in economics or account keeping. In reply to a question whether there were any Burman clerks in banks, Mr. Clayton said that they had to learn the business after they entered the banks. The account keeping of well-to-do traders of Rangoon was inferior. What he was doing was to start urban societies in every place which might develop into banks. He was strongly of opinion that some sort of commercial education, accountancy and so on would tend towards getting more Burmese into trade and industries. Maung May Oung thought that the provision of higher education and commercial education was an absolute and vital necessity. He wanted educational facilities on the lines of those of the College of Commerce in Bombay. If it could not be done, a Faculty of Economics in the new University should be introduced. Mr. Clayton observed that in the Rangoon college economics was not taught at all.

From a practical point of view Mr. Low was inclined to doubt whether the teaching of economics was valuable for the purpose of teaching accountancy, commercial law, etc. Mr. Clayton said that the ordinary graduate in Burma was an extremely intelligent and quick young man and had very good practical commonsense and if he was given some insight into trade, commerce, economics, etc., he would be much more ready when he came out of college to turn in the direction of commerce. At the present time he had not that kind of education, and when he came out of college he had no bent towards commerce or industries at all.

Mr. Meikle thought that the difficulties in the way of banking facilities would be overcome by making a greater use of the Local Government Treasuries. In his opinion the Burmese people were not sufficiently educated to use banks.

Sir Francis Stewart asked the Committee whether they would be in favour of industrial banks with or without Government support. Mr. Holberton replied that he did not think that any industrial bank would be prepared to lend money on the sort of risks that Chetties took. The Chetties were very bold and they would risk their money to any extent. They were not very strict about the securities they took. If they could get two or four annas more in the shape of interest they would not care very much for security. In reply to the Hon'ble Sir R. N. Mookerjee, Mr. Jamal stated that the rates of interest charged by the Chetties varied according to the security.

The Hon'ble Mr. Thompson said that they should make a distinction between large and small industries in the matter of finance. He thought that small industries should be financed in the same way as the small agriculturists are, but in the case of the larger industries, there would be a very real need for an industrial bank of some form or other, but how it should be established he was not in a position to say. In reply to Mr. Low who asked whether there were any large Burmese traders and industrialists, the Hon'ble Mr. Thompson said that there were large Burman brokers and dealers but he did not know whether they would be classed as industrialists. He continued that they had not at present any very large industries, but they must be developed.

With reference to Mr. Meikle's suggestion, Sir Francis Stewart asked whether it would not be better to extend the system of advances made by the Presidency banks than to go to the Government treasuries. The Hon'ble Mr. Thompson did not think that the Presidency banks would look at the proposal favourably. The Hon'ble Mr. Jamal said that the Government treasuries were financing at present as much as they could. If they had not got money they must say that they had not got it.

In reply to Mr. Chatterton, the Hon'ble Mr. Thompson said that the cultivators in Burma took *takavi* advances for the purchase of seed, cattle and other things. They took loans very rarely for the improvement of land. The loans they took were all short term loans. Mr. Chatterton asked whether this system of *takavi* loans was capable of development

on a considerable scale. Mr. Clayton replied that these loans were very expensive a Government had to make various enquiries as to the security and so forth. The system worked satisfactorily where they had a Township officer who was very keen on the thing, but where there was no urgent public demand for it, it was not so desirable as it might be.

In reply to Sir Francis Stewart the Hon'ble Mr. Anderson stated that the idea of the Burma Chamber of Commerce was that pioneer factories should be started by Government entirely and ultimately taken over by a private firm either by tender or by public auction whichever was desirable. But he thought that they would be disposed of mostly by tender.

SECTION II.

In reply to Mr. Chatterton, it was stated that chemical research was needed in many directions, and there was no chemical or technological knowledge available in Burma and that a technological institute was badly wanted which should be a separate institution from the Engineering School at Insein. Maung May Oung said that six or seven years ago there was a conference held to which delegates from all parts of Burma were invited and it was resolved that Government should be asked to open a central technological college somewhere near Rangoon or Insein and that centres like Mandalay, Prome, Bassein, and Moulmein should have smaller technical institutes which should serve as feeder institutes, but unfortunately these recommendations were not given effect to. It was stated that the technological institute would in the first place deal with mining.

The Committee endorsed the view that it would be a good thing if the Government could supply a much larger amount of expert geological assistance in the first instance to make a more complete geological survey of the country.

In reply to Mr. Chatterton, the Hon'ble Mr. Anderson stated that they should have the Geological Department in Burma as a branch of the Geological Survey as it was now, as otherwise it might contain inferior men and be shut out from participating in the advantages of Indian research.

Mr. Low said a proposal had come before them that the Geological Survey should appoint a certain number of officers to work in Burma who would tour during the field season and during the recess go to Calcutta and write up and collate the results of their work in the field and keep in touch with what was being done in other areas and thus have the advantage of Indian research. The idea would be to keep a man in Burma long enough to let him get a fair acquaintance with the local conditions and at the same time not become entirely one-sided, and at intervals of a few years there would probably be an interchange with men in India.

Mr. Polson stated that they all agreed to what was expressed in the note of the Hon'ble Mr. Thompson on the point.

Mr. Chatterton asked the Committee whether they had in mind any distinction between pioneer and demonstration factories, and if so, what it was. The Hon'ble Mr. Anderson said that a pioneer factory was one dealing with a new industry that had not developed, whereas a demonstration factory was one showing the improved methods of some industrial work that was already going on. A sugar factory to determine whether sugar could be manufactured on a commercial scale or not would be a pioneer factory. Asked whether a factory started by Government not for the purpose of manufacturing crystal sugar to begin with but for the purpose of showing the improved methods of dealing with *gum* would be a pioneer factory or not, he said that it would be a demonstration factory. Mr. Pridoux said that in the case of a pioneer factory Government might start a business which might or might not pay. If it did not pay it would be shut down, but if it paid that factory would become a demonstration factory to which people would go to learn business.

Asked whether there was leather tanning going on in Burma it was said that there was a certain amount of tanning by Madras merchants in Rangoon, Mandalay and Prome. About ten per cent. of the total Indian export of untanned leather was from Burma. There was little export of tanned hides from Burma. As regards paper pulp it was stated that the idea was to manufacture pulp from bamboos. The Hon'ble Mr. Jamal said that he was erecting a factory for manufacturing pulp from bamboos. He had asked the Government of Burma to give him a monopoly, but objections came in from some gentlemen and the Government refused to grant his request but all the same he was going to continue his work. He first of all proposed to manufacture paper pulp and ultimately paper.

As regards the manufacture of tannin extracts, Mr. Rodger said that a tannin research factory had been started but it was a failure. They never had a proper expert and little progress was made. It was an experimental factory run by the Government Forest Department of Burma.

Mr. Low said that both in India and Burma many concessions had been given for the making of bamboo pulp some of which dated several years before the war and yet he had not observed anybody taking up the manufacture of bamboo pulp anywhere in India or Burma and wanted to know what it was due to.

Mr. Holberton stated that speaking for his own firm they had been making enquiries about it during the last five years but they had not yet come to a decision. Mr. Low said that there was a certain amount of information as to the value of bamboo when converted

into pulp on a non-commercial scale furnished by the Forest Department, but there was no information as to the actual working of a factory on a commercial scale, and he wanted to know how far the reluctance on the part of the commercial firms would be overcome by the starting of a pioneer paper pulp factory on a more or less commercial scale. Maung Hla Po said that it would be a very good thing if the Government did it. Mr. Holberton observed that it would be a great assistance and encouragement to the people if the Government could get over the difficulties with reference to bamboos which they had felt, *viz.*, as regards joints or knots. He thought that there was no machinery here which could deal with anything like a whole bamboo. The expense of bringing out bamboo from the forest was not so heavy as in India.

Asked by Mr. Chatterton whether there was any record available of such experiments as had been made in Burma in bamboos, Mr. Rodger said that bamboos had been cut and sent out and tested in every sort of way, and full records were available. The experiments were not made on a very large scale. The Hon'ble Mr. Jamal said that several experiments on his behalf had been made by the chemists in Calcutta as to the percentage of pulp that could be got, the colour and so on, and he had results of these experiments.

Mr. Low said that there was a proposal that Government should appoint a mining engineer to give assistance to miners. That presumably, he thought, would not apply to the larger firms which might be expected to have at least as good or even a better mining engineer than the Government could afford, but there might be a case for it with reference to smaller miners, and he enquired whether there was plenty of local talent available at reasonable rates.

Mr. Holberton said that the Tavoy Chamber of Mines had asked for additional mining assistance in the way of an expert who should be a trained engineer and geologist. Mr. Wright had told him that he felt very strongly that expert mining assistance was very much required by the smaller people. Mr. Low said that the circumstances were at present very special and peculiar in Tavoy and that the people there were getting out the stuff in a hurry, and he wanted to know whether the same thing would hold good under ordinary conditions. Mr. Holberton said that even then a mining expert was necessary.

Asked whether the remarks in the note about the need for consulting engineers applied in the case of mining engineers also, Mr. Holberton said that consulting engineers might be useful in Tavoy at the present time. In answer to a further question whether, if further prospecting resulted in the discovery of other minerals a man of the type of a consulting engineer would not be required, he said that information had to be got where those minerals were, before the consulting engineer could be employed.

SECTIONS III AND IV.

Sir Francis Stewart asked whether the scheme for the construction of a commercial museum in Burma was not yet ready. Mr. Hardiman said that it was not, except that the site had been selected. The Hon'ble Mr. Thompson said that the Committee had submitted a report to Government. That Committee was really the Exhibition Committee which was originally appointed for the last Exhibition which was held a year ago.

Asked how the paddy crop was financed in the earlier stages, the Hon'ble Mr. Anderson said that it was done by Chetties during cultivation and when the crop was ready they got money from the big firms and banks to bring it in.

Mr. Low said that, it had occurred to the Commission that many products made by domestic industries in Burma would be likely to find a market after the war in places outside Burma. It might not be a big business but it might be worth looking into.

Maung May Oung was of opinion that it would be useful if they could start in Rangoon something on the lines of the Home Industries Association in Calcutta with an emporium in Rangoon, and in touch with outside selling agencies and the Indian Trade Commissioner in London. There were at present a few firms making it a speciality to deal in Burmese work of the sort of lacquer ware, silk and other things. The Japanese were very clever and they successfully imitated these things. His correspondents wrote to him asking for certain Burmese things which were very cheap, serviceable and strong. He did not know where they could be got. There was no shop in Rangoon which could give the information, and so he had to write to some of his friends and get the information.

Mr. Low asked whether any members of the committee were aware that the land policy of the Government had interfered with industries either among Burmans or non-Burmans. Maung May Oung said that the Government had always been willing to help as far as possible. He did not think that their policy had caused any interference.

The Hon'ble Mr. Anderson said that the Chamber of Commerce was of opinion that the rules for granting land for mining and planting had been recently satisfactorily amended and as far as they knew, there was no difficulty in acquiring land for industrial purposes.

Mr. Low asked the views of the committee on the subject of the employment of the Land Acquisition Act to acquire land for industrial concerns, and whether there was any serious difficulty experienced in acquiring land for industrial concerns which could be got over by a proper use of the Land Acquisition Act. The Hon'ble Mr. Anderson did not think that there was any difficulty. Mr. Hardiman said that the Land Acquisition Act did not give power to acquire land for general industrial extension only.

Mr. Low said that land could be acquired in the public interest. The difficulty always appeared to be what should be the criterion as to when an industrial company was in the public interest sufficiently for Government to acquire land.

Mr. Jamal said that Government should assist any man who came along and wanted to start a factory, in getting the land required. Maung May Oung said that the Government must in addition be satisfied that the man had got capital and ambition. The Hon'ble Mr. Anderson said that the Chamber of Commerce was not in favour of land being acquired under all circumstances but thought that it might be justifiable only under certain very exceptional circumstances, but the question had not risen as yet in Rangoon. Large sites for factories were still available. It was not an urgent question in Burma as it was now in Bombay or Calcutta.

In reply to Mr. Chatterton Mr. Huddleston said that he was not aware of any difficulty being experienced in regard to the construction of feeder railways or branch lines serving particular industrial concerns and connecting them with the main line. He had no knowledge of any case where an enterprise of that kind had been thwarted through the difficulty of acquiring land. If any valuable mineral be discovered and it was desired to connect it with the railway the land required for the purpose would have to be acquired under the Railways Act. No difficulty was experienced in regard to providing sidings from the existing railways.

SECTION V.

Mr. Chatterton asked whether there was any special provision made in the Railway Workshops or in any of the other larger workshops for the taking in of apprentices with a view to training them either as mechanics, that is, as workmen, or as men who would afterwards become supervisors and foremen and possibly rise to higher posts.

Mr. Polson said that apprentices were employed in the Flotilla Company's Dockyards with a view to their becoming engineers, but they were too backward. They did not often succeed because they were deficient in education. They made good fitters but very few of them passed the engineer examination. If a technological institute existed in Rangoon to enable these youths to improve their technical education a larger percentage of them would probably be able to pass the engineer examination.

In reply to a further question by Mr. Chatterton Mr. Polson said that they were now taking apprentices from Insein after training there. Mr. Morris had arranged to send some of the boys to work six months in the Irrawaddy Flotilla Company shops and then go back and work in the school, but the Eurasian boys who lived in Rangoon did not find it convenient to go to Insein and it would be a very great advantage to those boys who lived in Rangoon to have a technological school in Rangoon.

Mr. Chatterton asked whether that difficulty would be got over by providing hostels in Insein for students. Mr. Polson replied that it might be, but he thought that it would be preferable to have a school at Rangoon instead of having it away in the wilderness, far from the centre of the industry.

(Mr. Polson here gave confidential evidence.)

Mr. Chatterton asked whether there were Burman apprentices in Railway workshops. Mr. Huddleston replied that about two years ago they took about fifteen apprentices, but they had all gone back and had not been replaced.

Mr. Low asked whether they were Burmans or Europeans. Mr. Huddleston replied they were Anglo-Indians; and in reply to Sir R. N. Mookerjee he said that there were no Burmans as apprentices.

Mr. Chatterton asked whether there was any demand on the part of Burmans for admission as apprentices in engineering workshops generally. Mr. Polson said that they did not find Burmans coming forward freely. Mr. Chatterton put the same question to Mr. Morris. Mr. Morris said that first of all he would make a distinction between apprentice craftsman and apprentices who would become mechanical engineers; in the case of the latter admission to the Engineering School was by examination, as without certain educational qualifications they could not follow the classes. Mr. Polson of course preferred to have Anglo-Indians, but Mr. Morris' own experience was that Anglo-Indians would not stay; his wastage in the case of Burmans was about 33 per cent. in the first year of their training, and in the case of Anglo-Indians 90 per cent.

Mr. Polson said that his company had 28 Eurasian engineers just now, and they were rendering useful service on board steamers.

Mr. Chatterton asked whether these Eurasians were men trained in Rangoon. Mr. Polson replied that most of them were trained in their dockyards as apprentices and that they were doing satisfactory service. Mr. Morris said that of course that was true but the question was how many were taken and how many were staying now, and what was the annual wastage. So far as Burmans were concerned Mr. Morris said that there was no encouragement to them to take up mechanical engineering and there was no facility for them to take up. They started a mechanical engineer class at Insein 5 years ago; of course Burmans did not see that it would be a good thing, and so they started on a very small scale. A year ago

two students passed out with the engineer certificate after a 5 years' complete course: the engineer certificate necessitates 5 years' apprentice training. Those two students are doing very well now and they have started on Rs. 125: with the consequence that to some extent they are getting applications from Burman students. Mr. Polson has two or three Burman students from the Insein school in his engineering shops.

Mr. Chatterton asked how many students were working at the school at the present time. Mr. Morris replied there were 15 actually in the school now. Mr. Chatterton asked whether those 15 were all in the workshops. Mr. Morris replied that they had not finished their time in the school; they stay six months in the school every year for three consecutive years, and the final two years they spend in the shops.

Mr. Chatterton asked whether the school was shut up for six months, to which Mr. Morris replied that they had other classes, but so far as mechanical work was concerned that class was closed.

Mr. Chatterton asked whether it would be possible under the apprenticeship system to have two batches of students; he did not suggest that, but only wanted Mr. Morris' opinion on the subject. Mr. Morris replied that that was what he proposed, but they had not enough students at present to make up a double set of classes.

Mr. Chatterton asked Mr. Morris whether the students that he had at Insein at the present time were all Burmans, to which Mr. Morris replied that practically they were all Burmans: there were one or two Eurasians, but they ought to transfer the school from Insein to Rangoon: it was a great mistake to have it in Insein. There was a demand for part time classes, but it was impossible to work such classes in Insein.

Mr. Chatterton asked whether he meant evening classes, to which Mr. Morris replied that he meant a certain number of morning classes.

Mr. Chatterton asked whether any experiments had been made in Rangoon with night schools, and whether people would attend such schools. Mr. Morris replied in the affirmative and said that he could not give statistics but that there had been demands for such schools.

Mr. Chatterton asked Mr. Polson whether he thought that the people that were working in his dockyard would attend night schools after their work in the day. Mr. Polson replied that it might be difficult to induce their boys to attend night classes after a long day's work in the workshops.

Mr. Chatterton suggested as an alternative whether it would not be better to set apart a certain amount of time in the day time to give them a course of instruction. Mr. Polson said that that would be preferable and his company would be glad to acquiesce in such an arrangement.

Mr. Chatterton asked whether the engineering shops near Rangoon were sufficiently close to one another to make it feasible to start a polytechnic institute for the benefit of them all. Mr. Polson replied that he thought that a central place in Rangoon could be reached by all the boys, and that there would be no difficulty about it.

In connection with this point Mr. Morris said that from an educational point of view it would be better in time to have a system by which students could study half the day and be in the shops half the day rather than the present system of six months alternately in shops and school. The six months' system was better than a system in which theory and practice were entirely isolated, but the half day system would be better still. A six months' gap in school work results in a good deal being forgotten, and it has to be re-learned each period of training.

Mr. Chatterton asked whether in the Insein school any instruction was given in drawing or art or art industries? Mr. Morris replied that they had no art instruction at all except that a few Government scholarships are granted to art apprentices, who are put under local native craftsmen. But recently the craftsmen had been induced to live at the Insein school and the Government apprentices in their particular crafts are put under them and thus kept under more supervision.

Mr. Chatterton asked whether there was anything in Burma analogous to the schools of Art or Arts in India. Mr. Morris replied in the negative.

Mr. Chatterton asked whether it is not the case that Burmans have developed considerable natural aptitude for art work. Mr. Morris replying in the affirmative, Mr. Chatterton further asked whether there was any scheme under consideration for developing their artistic faculties. Mr. Morris said that various suggestions had been put forward and they evoked a certain amount of sympathy from Burmans, but nothing came of them.

Sir Francis Stewart drew attention to paragraph 43 and asked Mr. Cocks whether he agreed with that. Mr. Cocks replied in the affirmative. Referring to the aptitude of the Burmese for drawing, he said that they had been able to fit in drawing teaching in schools; they had abandoned the old South Kensington system, and adopted a more practical scheme following closely the lines of Augsburg's method; they had not been able to do anything in the way of training in applied art; he thought that it was a question on which the opinions of the commercial members of the Committee would be valuable. Government wished to know what could be done to apply the Burman's talent for drawing to practical uses. Further asked what was his opinion as regards that training, Mr. Cocks said that he could

not say anything definite because he did not know what was the commercial value of such training and how it should be utilised.

In reply to a further question, Mr. Cocks said that in normal schools only a very limited amount of drawing was taught; on the other hand, a student who showed aptitude for drawing could take up a more advanced course, that was the system all over India.

Mr. Low asked whether small industrial concerns carried on upcountry by Burmans, such as small rice mills, oil mills and so on, were running in a decent state of technical efficiency or not. Mr. Polson said that he did not believe they were; in the delta there were about 100 small rice mills, but they very frequently went out of order. He thought it was correct to say on the whole that these small enterprises were very badly run from the technical point of view, but they had a factory inspector present and he could better answer such questions.

Mr. Prideaux said that they did not repair until breakdowns occurred. Mr. Low enquired whether there was any class of man whom they could rely on, and call in to help to put things right. Mr. Polson said that they were by no means well off in that respect, and he thought that an increase of the number of technical students would go a long way to meet the situation.

Mr. Low further enquired who there was at present, for instance, to put up an oil engine for a small industrialist, set up his machinery, and when there was a breakdown come and put it right. Mr. Morris answering in the negative, Mr. Low asked whether it would not be well if they had a Department of Industries which would also advise small industrialists on such matters. Mr. Clayton said that it would be a great help. The Hon'ble Mr. Anderson said that small men already go to engineering shops of which there are several. Mr. Polson remarked that their difficulties were more particularly running difficulties.

Replying to Mr. Low's question as to what class of men these small industrialists had in charge of their machinery and whether they were of the fitter type, Mr. Prideaux said that they were engine drivers, the same class of men as fitters.

Mr. Low further asked whether they were men who had had training in the railway shops as fitters. Mr. Prideaux replied that such men would go out as engineers. Mr. Low further asked whether there was any such regular flow of men from the railway shops into private employment as they had in India. Mr. Huddleston said that he did not know the circumstances in India, but that he did not think that here in Burma men would go from the Burma Railways to the small industrial shops. Mr. Polson added there was a considerable flow of young Eurasian engineers from their dockyards to rice mills.

Referring to paragraph 47 Sir Francis Stewart asked whether business men would be willing to serve on the Board of Industries there suggested. Mr. Anderson replying in the affirmative, Sir Francis Stewart asked whether there was need to include the Registrar of Co-operative Societies and officers from the Agricultural and Forest Departments in the suggested board, and whether their services could not be dispensed with, and added that to be really useful such a board must be small. The Hon'ble Mr. Anderson remarked that there were too many officials on the suggested board, and said he would modify the proposal by saying that there should be only one official member at present.

Mr. Clayton said such a modification would eliminate the representation of small industries. The Registrar of Co-operative Societies represented small industries just as the officers of the Agricultural Department more or less represented the agriculturists. If these official members were removed, the Director of Industries being mainly the representative of the chief industries of the province, the small industries would have no representation whatever. Sir Francis Stewart thereupon asked if Mr. Clayton would so constitute the board as to indicate that small industries were represented, to which Mr. Clayton replied that so long as a distinction was made between small and chief industries, it did not matter whether the small industries were represented by an official member or an unofficial member. But if there were a board of industries, small industries should certainly be represented on it.

Replying to a further question by Sir Francis Stewart, Mr. Clayton said that the Registrar of Co-operative Societies should represent the small industries now: most likely in time there might be unofficial representatives.

Mr. Chatterton enquired whether the Director of Industries could not represent small industries: Mr. Clayton replied "he might certainly."

SECTION IX.

Mr. Low said that the Commission were informed that the railway which goes to Lashio, called the Northern Shan States Railway, charge freight on goods double that on the main lines of railway and enquired whether that information was correct. On Mr. Huddleston saying that it was correct, Mr. Low asked what was the object of that measure. Mr. Huddleston replied that the railway there was expensive to construct, maintain and work. Mr. Low asked whether such rates were charged irrespective of the ability of the goods to stand the charge, to which Mr. Huddleston replied that he was speaking generally but that they had reduced rates for several items of traffic on the Northern Shan States Railway.

Replying to a further question by Mr. Low, Mr. Huddleston said that such reduced rates obtained on the Lashio branch line which Mr. Low referred to and also the Southern Shan States Railway.

Mr. Low asked whether any timber was coming out through the Lashio branch. Mr. Huddleston replying that not very much was coming, Mr. Low remarked that they saw timber going towards the mines rather than coming outwards.

Mr. Low remarked that the Commission heard a good deal of evidence about the necessity of communications in the forests, but they saw a line there ready at the door of the forest and not much timber was going out. Mr. Rodger replied that most of the timber extracted from forests east of Maymyo was floated out.

Mr. Low enquired whether the question had ever been considered whether the increase in the rate had not had the effect of so greatly reducing traffic as to make it a losing position. Mr. Huddleston replied that they have reduced rates for timber.

Mr. Low enquired whether they had reduced the rates to the same level as on the main line, to which Mr. Huddleston replied that they had separate rates. Mr. Low further asked what was the reason for the difference between the reduced rate and the double rate that they charged on the Lashio branch. Mr. Huddleston replied that there were reduced rates although they were higher than on the main line.

Mr. Low asked whether there were particular instances of commodities for which reduced rates were given. Mr. Huddleston replied that reduced rates were given for traffic from the Burma mines, for potatoes and other traffic.

Referring to the Committee on Communications mentioned in paragraph 61, Sir Francis Stewart enquired how that was constituted. The Hon'ble Mr. Thompson replied that there was a general advisory committee, and a working sub-committee. A sub-committee has been appointed to examine all the roads in the province, to take them district by district, determine exactly what additional roads are needed and what improvements are needed to existing roads in order to provide a fair road equipment for each district.

Sir Francis Stewart wanted to know whether there was a special committee in each district. Mr. Thompson said that there is one sub-committee for the whole province, but that it makes its enquiry district by district: there are two officers on special duty. The sub-committee is mainly composed of non-officials and is under the general Communications Committee which was appointed by Sir Harcourt Butler. This general committee is a standing committee and the sub-committee presents its reports to it. The sub-committee meets frequently and as a matter of fact its reports go to Government direct. The standing committee sits occasionally only.

Sir Francis Stewart enquired whether this committee deals with waterways and railway communications also, to which the Hon'ble Mr. Thompson replied in the affirmative. Questioned whether it has made any specific recommendations to the Government, the Hon'ble Mr. Thompson said that it has as regards the districts with which it has dealt already. Reports have been sent for 4 out of 8 divisions of the province.

Sir Francis Stewart enquired whether any action has been taken on those recommendations. Mr. Thompson replied in the negative; the recommendations have been generally accepted by Government, but have not been given effect to.

Mr. Polson intervened to say that there was no money available to give effect to the recommendations. The Hon'ble Mr. Thompson agreed that that was one reason. Mr. Polson continued and said that the committee prepared estimates and presented them to the Government and said that enormous sums of money were required to bring the communications into reasonably good order, but there was no money.

Sir Francis Stewart enquired whether the non-official representatives on the committee were nominated or elected by the Chamber of Commerce. The Hon'ble Mr. Anderson said that some were nominated. The Hon'ble Mr. Thompson added that the sub-committee was appointed by the general committee.

Sir Francis Stewart enquired whether the statement in paragraph 61 that the waterways of the province are generally satisfactory represented the true state of affairs. The Hon'ble Mr. Thompson said on the whole it was so. Mr. Polson intervened and said that he did not entirely agree with that remark. A good deal more can be done to the waterways. Waterways in this country have been neglected entirely by the Government of Burma.

Sir Francis Stewart wanted to know whether what has been done to waterways so far has been done by Government or by the Irrawaddy Flotilla Company. Mr. Polson replied that the Irrawaddy Flotilla Company at its own expense maintains a vessel specially for the purpose of pounding rocks and another vessel for the purpose of picking snags out of the river, also a large fleet of launches for buoying the river. The money which it spends on the Irrawaddy river is approximately Rs. 2½ lakhs per annum.

Sir Francis Stewart enquired whether Mr. Polson considered that expenditure of that nature should be incurred by Government, to which Mr. Polson replied that a time might come when it might be necessary for the Government to provide relief of that kind.

Mr. Chatterton asked with reference to the mining rules of the Government of India and their application to oil fields, whether the existing arrangements are found to be satisfactory.

or whether any revision of the rules is required. The Hon'ble Mr. Thompson regretted the absence of Mr. Ritchie who would best be able to answer such a question.

Thereupon the Hon'ble Mr. Jamal said that he made a representation to the Government of Burma. Asked whether there was any competition between the different companies on the fields, the Hon'ble Mr. Jamal said there was.

Mr. Chatterton asked with reference to jail industries, whether there were any complaints on the part of private enterprise regarding competition from jail industries. Mr. Anderson said that there were no complaints to make.

Mr. Chatterton wanted to know what industries were carried on in jails in Burma. Mr. Polson mentioned chair making and furniture making, and Mr. Morris mentioned cane work as one of the jail industries, which had been credited with under-selling local manufactures. The Co-operative Society of Cane Workers, Mandalay, made a statement to this effect at the last co-operative conference.

WITNESS No. 461.

MR. G. VOGTARIS, *Manager of the London-Rangoon Trading Co., Ltd., Tannery and Hides Export, Rangoon.*

WRITTEN EVIDENCE

Essentials of
Industrial develop-
ment.

The industrial development of a country depends solely upon the degree of the industrial training and development of the native people and not on the financial power or capital, for the simple reason that in order to obtain the first a certain period of time more or less long is required, whereas the obtaining of the latter is often a question of favourable circumstances which can often be met at the shortest imaginable time, provided the industry in question promises a certain and secure dividend to those concerned.

Therefore before we proceed to discuss the industrial possibilities of a place whatever, it is absolutely necessary to inquire whether and to what extent the internal working power or the indigenous industrial training exists in it. For it is a well known fact that an external industrial assistance or outside labour and supervision and expert management means heavy expenditure and such an assistance would be of no avail when not supported by the internal working power or indigenous industrial activity as it will prove quite unable to introduce profitably its products into other markets and to fight the battle of competition with other places where this powerful internal factor is flourishing. In other words wherever the industrial ground of a place presents the features of a somewhat sufficient industrial understanding the accomplishment of good and satisfactory industrial results is a matter of right and convenient occasion only.

Good indigenous workmanship only would lead the way to the prospected industrial attainment and to advantageous and profitable utilization of the more or less abundant raw materials of the place. The indigenous workmen, these various hands of the managing or training external industrial head, hands not merely executing what the external industrial knowledge instructs, but thinking—so to say—hands, intelligent and skilful hands that would try and succeed to surpass the various obstacles which they would meet while discharging their industrial duties.

It is a fact that Burma for which we are now specially concerned cannot boast of possessing this essential and most important internal factor, the workman; and in a place like Burma where the mosaic of the inhabiting element differs in race, religion, language, habits and inclinations to a considerable extent we must consider the following:—

- (1) Which would be the race in general to give the most efficient and skilful labourer, supervisor and manager?
- (2) When, where, how and by whom he will be trained?

1. Which would be the race in general to give the most efficient and skilful labourer, supervisor and manager?

Qualities of Burmese
labour.

The question being about Burma's industrial possibilities, in my opinion the successful workman, supervisor and manager must be expected amongst the different classes of Burmans first, and secondly only amongst the other native people. I am in favour of Burman in this matter for the only reason that although quite untrained in good many lines he shows in the few lines he is occupying himself by natural and national inclination that he possesses those necessary persevering working faculties which would by the time make of him the careful labourer and the intelligent and efficient supervisor. Naturally not fond of alcoholic drinks, leading a rather simple life he is of a consequently better bodily constitution and therefore he promises a more hardworking and strongly builded workman. He must only be let to understand that in seeking, as is the case to-day with him, the jobs of a clerk or a shopman he will have both his position and his mental cultivation at a standstill with no prospect of any future improvement beyond that of a once-in-a-way shabby increase of his miserable salary, whereas by getting trained in some industrial line besides securing to himself the intellectual food which would make of him the man of the day, the man of a healthier and stronger

constitution, the man who would proudly be working in the general machine of the country's welfare, he would daily see himself adding to the reserve capital of independence and of a continual personal progress.

3. When, where and by whom he will be trained?

Repeated and continual lectures first to already grown up students of the various schools in various public places with practical attracting illustrations by competent and encyclopaedical experts appointed by the Government authorities would be of great assistance to them in understanding the usefulness of their embracing an industrial career which would suit their natural ability and inclination. They must see and feel that hand working is not any longer to be considered a low and vulgar and unworthy occupation; on the contrary, it will be a treasure to themselves and a reason for appreciation and admiration on the part of those witnessing their daily improvement. Dignity of labour.

Now referring to your Question No. 44 running as follows: "Do you think that the lack of primary education hinders industrial development?" Well, I am of the opinion that it is so.

Primary education is as essential to the intended industrial labourer and the industrial man in general as to any intended literary man. The more one is educated the easier one gets fit in the line he has chosen as his life occupation, the deeper he gets into the mysteries and particularities of same and the sooner he becomes the master of the necessary experience and knowledge and to crown all the more efficient and successful he proves in fulfilling his industrial duties. Need for primary education.

In my opinion the industrial inspiration and encouragement must begin along with a good primary and more encyclopaedical school education.

The Government would encourage and assist in such a wonderful achievement by procuring every lower school with the services of a competent encyclopaedical expert teacher, a person whose only duty would be to try and discover the natural inclination of every pupil intended for industrial education and classifying them accordingly would in appointed times weekly give them the necessary inspiring lessons accompanied by series of possible experiments in proportion with the pupils' conception and understanding, encouraging them in their inclination so as gradually to feel more and more interested and present in time an industrial ground ready for a further cultivation which would give forth the efficient workman, supervisor and indigenous expert manager.

The next necessary step would be the establishment of day schools for short time employees or of night schools. (Quest. No. 49.) Half-time schools.

The efficiency of such establishments is widely witnessed in every country under the sun. For we have more than plenty instances of men of world famed technical, philological and scientific distinction who having been of poor circumstances owe their success in life to the assistance they had in establishments of this kind. Besides this the only thought of young lives despoiling leisure day time and various night attractions for a persevering and rather tiring occupation in these establishments is a clear proof that a will is at work and consequently the way will surely be found and utilized to a triumphant result.

Further cultivation will be given to the young aspirants in the shape of more important industrial schools where a higher, more analytical and scientific knowledge of the line under cultivation will be surely acquired, where the cases of such knowledge will be strongly consolidated and a spirit of certainty and speciality in the shape of competent supervision and expert managership will prevail. Industrial schools.

It goes without saying that the efficiency of the above education would be sealed if commercial lessons would follow for those whose intelligence can afford. To answer your Question No. 80, I beg to say that a course of commercial lessons would make of the industrial expert the perfect expert, the most qualified transactor. For undoubtedly an industrial man of a high grade while producing his articles must be in a position to know also many other things which would enable him to dispose of them more successfully and more satisfactorily. He must for instance have an idea of other markets, other industrial countries, the degree of consumption of the different goods in general, the industrial movement in other places (this latter knowledge would be obtained by now and again visiting such other places where such lines in which he is specially interested are being cultivated). Colleges of Commerce.

In addition he will acquire in the College of Commerce the indispensable for his industrial grade knowledge of industrial and commercial geography, industrial and commercial history, commercial mathematics, science, chemistry and above all the commercial honesty, commercial tact and fairness. An industrial head must necessarily be also a commercial head and he would never be able properly to acquit himself of his industrial duties as a head unless he is a merchant in his mind and soul possessing the above qualities. Unfortunately lack of knowledge of even the elementary commercial notions is the feature of our market state to-day. It is a well known fact that with the exception of the high grade negotiants a very limited number of merchants can boast of their commercial success as the result of a really commercial behaviour and really tactful commercial transactions. Good and favourable circumstances often account for good commercial fortunes and very often unfair transactions mean the detriment of one or more fellow dealers or customers, whose interests have been played unfairly for the interest of the cleverer.

Need for commercial honesty.

A merchant to my opinion must be considered as responsible for the fate of his fellow dealers and customers, as a physician for his patients, as a lawyer for his client and a teacher for his pupils, and as no one of these latter is allowed to perform his professional duties unless possessing the respective certificate of competence and ability, similarly a merchant ought not to be any freer in his ways of amassing wealth as is the case very often. Certificated persons approved by competent commercial authorities ought to be the responsible head of every industrial or commercial firm no matter how big or small the firm is, the responsible head in front of the Government, in front of the law, in front of the fellow dealers, in front of the citizens and of the public in general. Merchants of no commercial merit, of no lawful knowledge of their obligations, merchants whose motto is to amass wealth upon wealth, no matter how, number more victims, victims of more pitiful state than those caused by an unqualified lawyer, a charlatan and an unfit teacher. Municipalities and local boards would effectively remedy this awful condition by requesting from every industrial or commercial firm to show the responsible head as above and only thus these disgraceful results would be avoided.

Finally the question here being of commercial assistance to the industrial development such assistance would indeed make of the industrial expert the ideal industrial personality, the perfect industrial merchant and consequently the more or less perfect man. It is by the acquirement of such persons in a place that adulteration, corruption and bribery would be restricted to the minimum, a spirit of well placed confidence will prevail, making of the place an ideal and model industrial and commercial place, brightly reflecting upon the responsible competent authorities.

Industries capable of development.

The industries which are specially to invite the careful attention of the industrial authorities in this place are those for the cultivation of which the necessary raw materials are natural products of this place. And such industries for which our place offering abundantly the necessary forest, animal and mineral raw materials could be developed to the utmost successful point are the following:—

- (1) Tannery.—Boot and other leather works factories.
- (2) Tanning Extract making. Ameliorated Cutch making.
- (3) Soap making.
- (4) Paper making.
- (5) Fibre industry. Thread manufacture—Weaving Hosiery—Tapestry.
- (6) Various kinds of varnish making.
- (7) Perfume making.
- (8) Sugar making.
- (9) Starch making.
- (10) Pottery and Plastic art.
- (11) Carpentry, Furniture and wood carving.

In many of the above industrial lines the services of capable girls also would be suitably utilized, of girls who by getting in this noble and decent way a paying and satisfactory means of life would be saved from the evil to which they are otherwise exposed and to which an unoccupied and lazy life unfortunately leads them every day.

Trade Representatives.

The industrial development having been successfully achieved the products would be easily introduced into other markets also and compete with those of other producing countries to a profitable extent with the assistance of the different Consuls who will facilitate and protect the industrial and commercial interests of the country they represent by means on one hand of exhibitions of such products in the Consulates themselves and by furnishing on the other hand to the industrial merchants the necessary information concerning the state of the markets and the local industrial improvement and local trade of the place they reside in.

Land policy.

One of the most effective assistance that Government might give to private and public industrial enterprises would be also to grant them the occupation of suitable land by the water side at a reasonable rate and to reduce the freight on necessary raw materials at the minimum possible rate.

In conclusion I beg to express my confidence that a slow but steady process will surely bring the desired favourable results. For Burma, to those who had the opportunity of knowing her before over two decades, as is the case with me, is known to have made strides of considerable importance towards improvement and there must be no doubt that in future also she will not stand back in the general evolution of improvement and progress.

(Witness did not give oral evidence.)

WITNESS No. 462.

Mr. R. R. PRAUSE.

MR. R. R. PRAUSE, *Managing Director and Chairman of the Board of Directors of the Burma Chemical Industries, Limited, Rangoon.*

WRITTEN EVIDENCE.

I shall confine myself to a statement of my own personal experience, by submitting some of the correspondence I, as Managing Director and Founder of a new industry, have had.

1. With the Local Government (Docket A).

2. With the Director General of Commercial Intelligence, Calcutta (Docket B).
3. Some criticisms on this correspondence, with some suggestions of a remedial nature as invited, as well as touching on a few other of the questions under consideration.

Docket A.—This is only a part of the correspondence with the authorities, relating to the vital question of the Burma Chemical Industries, Ltd., water supply at their factory. Concessions for water supply.

This Company's application for the promised lease of five tanks adjoining their factory, although sympathetically regarded by the Government, was summarily vetoed by the Rangoon Municipality (possibly influenced by mis-statements of interested parties), as also were subsequent applications for the lease of three tanks, the lease of two tanks and finally the lease of one tank, although in the latter case, the Company had at considerable expense practically created a tank out of a tank site.

Again, the Company's application for a lease of Government land for a more suitable site (still vacant) was vetoed by the Port Commissioners of Rangoon for no adequate reason.

I would suggest, therefore, that in similar cases, the power of summary veto possessed by Municipalities and Local Boards be curtailed to such an extent, that any such veto be accompanied by a detailed statement giving the reasons therefor, with the opportunity being given to applicants to refute the same.

The attitude taken by the Rangoon Municipality is,—that although the obligation of their supplying water within Municipal limits is admitted, they favour the non-tax-payer and ignore the claims and urgent necessities of the highly assessed tax-payer, even at the risk of strangling a new industry, which is officially admitted to be engaged in munition work at the present time.

Docket B.—This correspondence is the result of an enquiry from the Ordnance Department of the Government of India, for materials urgently required for munitions of war. Commercial intelligence.

It will be seen that as a result of this correspondence, and after a delay of six weeks, the information obtained was practically nil.

I have on previous occasions written for information to His Britannic Majesty's Consuls at Genoa, Yokohama, Rio de Janeiro, and have on each occasion received an early detailed reply to each question asked.

The anomaly is, that such information cannot be obtained from any British possession, although previous to the war I was able to get the desired information through local German sources.

The necessity is therefore obvious for the establishment of an efficient Bureau of Commercial Intelligence in the Province, open to the public for interviews as well as for written correspondence.

I suggest—1. That such an institution be under the direction of European experts. This would be a course more efficient and economical than the detailing of Indian civilians for the post.

2. That a technical library be attached to this bureau not only for the guidance of the directorate, but for reference too by members of the public, showing their *bona fides*. I estimate that such a library would only comprise from 150—200 volumes.

3. That this bureau be affiliated with the Department of the Government Analyst, and that an applicant with a well considered scheme, be entitled to a free analysis of raw material, with tests, etc.,—this free analysis, however, not to apply to periodic tests or Mining Minerals.

4. That on a well considered new commercial scheme being found to have favourable prospects, the directorate may be empowered to recommend the proposition to the Government for support under any of the headings specified in the list of questions (page 2), but more particularly for a financial backing and also some preferential treatment as regards import duties on machinery or raw material, as well as some assistance in marketing products. With such a Government Imprimature, I am of opinion that the present difficulty of raising capital due to the recent series of commercial fiascos in Rangoon would be greatly overcome.

There are objections in such a case to Government appointed directors and auditors.

I have studied the question of possible new industries fairly closely. These could certainly be developed with the necessary Government assistance.

Should I be examined on the subject of a Government control of shipping freights, I should prefer to make a statement *in camera*.

A

No. 527-JV—341, dated Rangoon, the 10th September 1914.

From—J. P. HARDIMAN, Esq. B.A., I.C.S., Collector of Rangoon.

To—The Secretary, The Burma Chemical Industries, Ltd., Rangoon.

With reference to your letter, dated the 22nd of July 1914, I have the honour to inform you that the Municipality object to the issue of a lease of the five tanks to the Company. In these circumstances I regret I am unable to issue the lease asked for.

No. 48, Sale Pagoda Road, Rangoon, dated the 16th April 1915.

From—The Managing Director, The Burma Chemical Industries, Ltd., Rangoon.

To—J. P. HARDIMAN, Esq. B.A., L.C.S., Deputy Commissioner, Rangoon Town Land.

On the 13th day of May, 1910, a lease was granted by the Secretary of State for India to the Burma Chemical Industries, Ltd., of 1st class Extra Suburban Allotment No. 42 (situate on the south side of the Pazundaung Creek). The lease was for a period of ten years, with clauses of renewal, and the rent fixed at Rs. 2,250 per annum. The acreage was stated to be 272 acres.

On this land the Burma Chemical Industries, Ltd., have erected works for the manufacture of Sulphuric Acid, for which there is a great local demand.

From the first, there has been a steady erosion of this land, caused by the tides. Recently this erosion has become so accentuated and alarming, that Mr. E. C. Niven, the Engineer to the Port Trust, was called in as an expert to examine and report upon the matter. A copy of this report is herewith appended.

From this it will be seen that further rapid erosion is to be expected, and Mr. Niven advises as the only safe remedy, a revetment of the whole of the foreshore.

He estimates the cost of this at Rs. 30,000. This is considerably more than the value of the land, and would average about Rs. 15,000 an acre. One can only judge the value by comparing with recent sales. The latest sale of land on this creek was that of the freehold land of Zaretzky Bock and Co., to Diekmann Bros. The land sold was 34½ acres in extent, amply protected on the foreshore with stones, and with an excellent artesian water supply. In 1911 this land with all buildings, mill machinery and godowns, was put up for auction and the highest price offered was 1½ lakhs. Since then Diekmann Bros. bought the whole property for 2 lakhs, by private treaty. Taking the mill, etc., as being only worth 1 lakh, this leaves 1 lakh for the land, and this averages less than Rs. 3,000 an acre.

Mr. Niven assures us that it is only a matter of time for the whole of this land to be washed away. To give an idea of the extent of the erosion, there were three rows of trees on this land previously. The last are now falling into the river.

The Burma Chemical Industries, Ltd., has during its tenancy expended from Rs. 5,000 to Rs. 6,000 in foreshore protection. The capital of the Company is only 2½ lakhs and there is no cash reserve. Under these circumstances the Company is unable to expend such a large sum of money as Mr. Niven estimates as being necessary, and especially as the land is only held on lease, and not being the property of the Company, no money can be raised on it.

The continued working of the Company's property is of the first importance to the Province. Owing to the war, no further shipments of Acid are arriving from Europe, and on our ability to supply depends the carrying on of the whole of the oil industry in Burma.

The matter is extremely urgent, and the Directors of the Burma Chemical Industries, Ltd., make a strong appeal to the Government, through you, to take the necessary steps to preserve this Government property, and thus guarantee the Company the continuation of their possession of this already much curtailed acreage.

No. 2215-XIII—18, dated Rangoon, the 26th April 1915.

From—J. P. HARDIMAN, Esq. B.A., L.C.S., Collector of Rangoon.

To—The Managing Director, The Burma Chemical Industries, Ltd., Rangoon.

With reference to your representation, dated the 16th April 1915, I have the honour to state that I am unable to admit that the Government is in any way responsible for restoring or protecting the foreshore of your leased land on the Pazundaung Creek.

48, Sale Pagoda Road, Rangoon, the 18th August 1915.

From—The Managing Director, The Burma Chemical Industries, Ltd., Rangoon.

To—The Collector, Rangoon.

We enclose a copy of a letter from the office of the Revenue Secretary, in answer to a petition of ours, praying for Government assistance for the protection of allotment land No. 42, in Dawbon, leased by us.

In the course of an interview on Tuesday last between the Officiating Revenue Secretary (the Hon. Mr. W. J. Keith) and our representative, the former naturally confirmed his letter of the 16th ultimo. Our representative was, however, able to marshal an array of facts and figures, which materially affect the situation. After listening to the arguments adduced and an account of our transactions with the Government in this matter, the Hon. Mr. W. J. Keith expressed an opinion that we had an equitable claim and suggested that we might have a fair chance of success provided our application for Government assistance were presented in a different form.

We therefore set forth for your consideration a recapitulation of the facts brought to the notice of the Revenue Secretary.

At the time of the inception of the Burma Chemical Industries, Ltd., there were only two sites vacant near Rangoon suitable for a chemical factory, and these were both on the Pazundaung Creek.

The Company applied to the office of the Collector of Rangoon for the lease of what was considered the most suitable site. This was a shipbuilding allotment, situated below Zaretsky Book and Co.'s rice mill. A reply was received from a Mr. Stevens, who was apparently the officiating officer in the Collector's office, to the effect that this land had been promised *verbally* to a Mr. H. P. Cameron, who subsequently obtained the lease. The Company then applied for a lease of another shipbuilding allotment, situated opposite Mohr Bros.' Upper Mill. For some inscrutable reason, this application was vetoed by the Port Commissioners.

The abovementioned Mr. Stevens, on being again applied to with the idea of obtaining an alternative site, recommended the land at present occupied by us. Mr. Stevens definitely stated that an application on our part for the lease of the tanks adjoining this land, at a nominal rent, would be granted at once, the application being only a matter of form. He pointed out that by taking over this land with the tanks, we should obtain the necessary water supply without the expense and risk of putting down artesian wells.

This definite promise on the part of a responsible Government official, as far as our representatives were able to judge, decided the issue. At this time the land was in the possession of a Mr. Pappadimitriou, a Greek hide merchant. After negotiations, in which Mr. Stevens took a prominent part, the Company purchased the lease from the lessee, paying in all Rs. 6,835-4, a considerable portion of which was understood to be for unpaid rent. Possession was taken of the land, work commenced, and an application made for the lease of the tanks. Tank No. 1 at the back was in a state of disrepair and overgrown with weeds. In the full expectation of the fulfilment of Mr. Stevens' promise, the Company expended approximately Rs. 900 in cleaning out this tank, deepening it and repairing the bund. To the dismay of the Managing Directors, not only was the application for the lease summarily refused but they were personally severely reprimanded by the officiating Collector for trespassing on Government land and interfering with No. 1 tank. By this time the Company was committed to this site as construction work was far advanced. The problem of water supply became urgent, also the erosion of the river bank. We made two attempts at a cost of several thousands of rupees, to obtain water by drilling, but without success. We were thus forced to purchase water, and our expenditure on this item up to the present, including concrete reservoirs, piping, etc., has cost us Rs. 12,533-5. We are at present paying Rs. 2,000 a year for our water, and this supply is not guaranteed as permanent. According to our Balance Sheets, we have expended Rs. 8,572-9 on foreshore protection, including the sum of Rs. 750 paid for expert advice. Up to a year ago, we were able at this considerable rate of disbursement to hold our own, but during the past year we have been unable to do so, there being apparently some alteration in the ebb current which may or may not be due to the Railway Co.'s pier construction higher up the creek. In view of the inevitable loss of land by this erosion, we obtained the best expert opinion, and on his report appealed to the Government for assistance, which has been refused.

We have repeatedly endeavoured to purchase or lease paddy land adjoining our works, but unsuccessfully. This is not to be wondered at, as the present proprietors are well aware that within a comparatively short period they will obtain an extended and valuable river frontage in the natural course of events, due to the erosion of the bank. This erosion must cease at some time but certainly not until our land has been carried away.

We are paying a yearly rental of Rs. 2,250. The amount capitalised at 6% equals a sum of Rs. 37,500. This is a Government asset in process of destruction.

In the event of our expending a sum of Rs. 30,000 on the necessary foreshore protection scheme, even could we borrow the money, we should certainly have to pay at least 6% for the accommodation. This would mean an addition to our rent of Rs. 1,800. It is estimated also that maintenance of the revetment would cost Rs. 1,000 a year. These combined sums represent to us a rental of Rs. 5,050 a year, which is absurdly high, being about half the value of the land as freehold.

It is admitted that this land was leased by Government at a time when land values in Rangoon were at their zenith, as a result of the organised scheme of unnatural inflation of values known as the great Land Boom. At the present time, although land values may be rather below normal, we are paying an exorbitant rent, with *pro rata* Municipal taxes, for which we receive no equivalent benefit. Therefore it is a question for the consideration of our Directors, whether it would not be the best business policy to allow matters to take their natural course, without further expenditure on foreshore protection, until such time as the land becomes untenable, and then to expend the Rs. 30,000 now estimated as necessary for revetment, towards the cost of removing the works to another safer, more economic and extensive site. At present there is not a yard of margin between the river and our back boundary, and extensions of our plant are urgently required, notably for the manufacture of chemical manures for which the Agricultural Department of Burma is urgently enquiring at the present time.

The only indigenous manure in Burma consists of bones, and these have been systematically exported for years past—a most unsound economic practice.

It is admitted that the Government's objection to granting us the assistance prayed for is due to the fact that there is no precedent for such a course. This, however, does not apply to the Local Government's power to remit revenue, as is instanced in the cases of the Burma

Ruby Mines, Limited, and the Mergui Crown Rubber Company, Limited, both being companies represented by capital outside Burma and therefore and having that special claim to consideration possessed by the Burma Chemical Industries, Limited.

Summarising the above facts and information, we desire to submit to your careful consideration the following points:—

- (a) The continued manufacture of chemicals is of great and increasing importance to the province.
- (b) At the inception of the Burma Chemical Industries, Limited, on account of unfounded prejudices, we were not granted ordinary facilities for obtaining premises.
- (c) The land eventually was obtained under a regrettable misunderstanding with a responsible Government official.
- (d) The present rate of erosion was unforeseeable and is due to recent causes. Up to the present we have expended large sums of money in protecting Government property, but this amount of protection is now insufficient.
- (e) It is an unsound business proposition from our point of view to expend the large sum of money required in an attempt which may not be successful, to protect land held by us only on lease. This point of view will also no doubt be expressed by our bankers whom it will be necessary to approach to advance the cost of the revetment scheme. If the land was freehold, negotiations would be simpler. Would Government be prepared to consider a grant of the land for a moderate consideration?
- (f) It is an unsound business proposition from the Government's point of view to contemplate unconcernedly the destruction of such a valuable property.
- (g) We are paying an absurdly high rent.

Under these circumstances we petition that we be granted such a substantial remission of our rent (at any rate temporarily) as may be sufficient to pay the interest on that sum of money which must necessarily be borrowed for the execution of the work.

Also we petition that we be granted a lease of two of the tanks adjoining our premises, in order that our water supply may be assured for the future.

A petition in proper form for this purpose will follow.

In the event of our petition being granted, we undertake to do our best to protect the foreshore at our own expense.

In the meantime we are making an official application to the Port Commissioners for permission to proceed with the necessary revetment, in the full confidence that the Government will not unconcernedly acquiesce in the strangulation of a small, but economically important company, struggling against such unexpected difficulties.

Dated Rangoon, the 20th August 1915.

From—The Offg. Secretary, the Burma Chemical Industries, Limited,
To—The Collector, Rangoon.

With reference to our letter of the 16th August 1915, we beg to apply formally for the lease of three tanks in the near neighbourhood of our Works at Dawbon and marked C, D and E on a plan of the site herewith.

Recently an application for the lease of the whole five tanks was refused, but as the tanks marked A and B on the plan should prove ample for the water supply for the villagers, we beg that this further application be reconsidered and a lease granted.

Dated Rangoon, the 15th October, 1915.

From—The Offg. Secretary, the Burma Chemical Industries, Limited,
To—The Collector, Rangoon.

We beg to acknowledge your Revenue Department, No. 723-SV—18 of the 15th October 1915, and in conformity with the suggestion therein, beg formally to apply for the lease of the two tanks nearest to our Works and marked B and C on the plan sent with our letter of the 20th August 1915.

Dated Rangoon, the 15th October 1915.

From—The Acting Secretary, the Burma Chemical Industries, Limited,
To—J. P. HARTMAN, Esq., B.A., L.C.S., Collector of Rangoon.

With reference to your letter No. 723-SV—18, dated October 12th, 1915, our Works Manager informs us that it is correct that residents of villages adjoining our village do obtain water from the tanks behind our land, but only at the end of the dry season when their own local supplies are exhausted. Boatmen also take water from these tanks, having frequently to cross the creek in order to do so.

As there is abundance of Municipal water, with street hydrants on the Pazundaung side of the creek, we presume that some official obstacles must be placed in the way of their obtaining their obviously natural supply. As unbenefited heavy Municipal taxpayers, this appears to us most unfair.

We send herewith an application in *forms* for the lease of the alternative tanks B and C, as suggested.

Dated Rangoon, the 20th March 1916.

From—The Acting Secretary for the Burma Chemical Industries, Limited, 48, Sule Pagoda Road, Rangoon.

To—J. P. HARDIMAN, Esq., B.A., I.C.S., Collector of Rangoon.

In reply to your Revenue Department No. 1815-3V—18 of the 7th March, we beg formally to apply for the lease to us of the tank referred to as "C." We regret that you cannot recommend the lease to us of both B and C tanks, as pointed out we were prepared to deepen and repair the remaining tanks so that the requisite amount of water would be available. We understand that it would be quite simple to put them in condition to supply at least $\frac{1}{2}$ more water than at present.

With regard to the question whether we still desire to lease additional land, it would suit us to lease the plot west of our holding, but the estimated cost of Rs. 4,000 and probably now higher, of removing the squatters, referred to in 347-3V—3412-13 of the 13th September 1913, stands at present in the way.

Dated Rangoon, the 27th June 1916.

From—J. P. HARDIMAN, Esq., B.A., I.C.S., Collector of Rangoon.

To—Messrs. The Burma Chemical Industries, Ltd., Rangoon.

In reply to your letter, dated 18th April 1916, I have the honour to state that in view of the opposition which your application for a lease has met with, it would, I think, be better if you do not commence deepening the tank, a lease of which you desire, until the matter is settled.

2. I have referred your application to the Municipality and await their views in the matter.

No. 1851-3V—18, dated Rangoon, the 7th March 1916.

From—J. P. HARDIMAN, Esq., B.A., I.C.S., Collector of Rangoon.

To—Messrs. The Burma Chemical Industries, Ltd., Rangoon.

In reply to your letter, dated the 15th October 1915, I have the honour to state that the Executive Engineer, Reclamations, has ascertained the capacity of the five tanks and this is shown in the statement which follows:—

The quantity of water available from each tank is given under column 3.

Tank.	Actual quantity of water on 15th October.	Water lost in 7 months.	Water available for 7 months.
	1	2	3
A	297,643	148,822	148,821
B	272,260	136,134	136,135
C	260,931	130,466	130,465
D	377,426	188,712	188,713
E	423,175	211,583	211,587
Total	1,631,443	815,722	815,721

Therefore water available from the five tanks is, say, 825,000 gallons.

Water available from three tanks A, D and E:—

A	148,821
D	188,713
E	211,587
	<hr/> 549,121 gallons.

2. You will see that if tanks B and C are leased to you, and A, D and E are left to supply the requirements of the people the available water supply for the people will be 549,121. There are 222 families using the tanks for their domestic supply and assuming that 15 gallons per day which the Executive Engineer reports to be a reasonable figure the quantity required for 7 months of the dry weather would be $7 \times 30 = 210$ days.

$210 \times 22 \times 15 = 693,000$, say 700,000 gallons from which you will see that the three tanks A, D and E would not suffice.

3. I regret, therefore, that I cannot recommend the lease to you of the two tanks B and C. If you care to apply for one of these two tanks leaving four for the people, I am prepared to recommend your application.

4. Perhaps your best course would be to move the Rangoon Municipality to instal a pipe to supply the villages along the Pazundaung Creek near your land as suggested in your letter to my address, dated 16th October 1915. The opening to traffic of the new Dawbon Railway would supply you with an additional argument for improving the water supply.

5. I do not know whether you still desire to lease additional land, but I might point out to you that there is—

(a) Government short lease and vacant and squatter land east of your holding with a creek frontage, and

(b) Government leasehold squatter and vacant land without a creek frontage but facing a proposed 30' road west of your holding.

6. Your application for a reduction in rent is being considered separately.

7. I regret the delay which has taken place in replying to your letter, but it was some time before I could obtain the information required. Kindly let me know whether you desire to move further in the matter.

B

Dated Rangoon, the 9th September 1914.

From—The Managing Director, Burma Chemical Industries.

To—J. SWAN, Esq., c/o the Director-General of Commercial Intelligence, 1, Council House Street, Calcutta.

Hearing through the Government Gazette that you have been specially appointed to assist in founding and fostering new industries throughout India, I venture to apply for the following items of information:—

1. Are there any wood distilleries in India for the manufacture of Acetic Acid and allied products?

2. If so, where situated?

3. Is there any market in India for:

(a) Miscible Naphtha.

(b) Soluble Naphtha.

There is no such market in Burma.

4. Is it probable that the Ordnance Department or the Government of India would purchase from us, in the event of our manufacturing the same—

(a) Acetic Acid.

(b) Brown Acetate.

(c) Grey Acetate.

(d) Acetone.

(e) Pure Teak Charcoal.

5. What are the amounts and values of each of the above enumerated chemicals (charcoal excepted) imported into the Straits Settlements and Malay States?

6. When will be the next occasion that the Burma Chemical Industries, Ltd., will be entitled to submit samples of their pure Brimstone Sulphuric Acid, and tender for the supply of same to the Government Telegraph Department?

Calcutta, 15th September 1917.

From—J. SWAN, Esq., c/o the Director-General of Commercial Intelligence, 1, Council House Street, Calcutta.

To—The Managing Director, Burma Chemical Industries, Rangoon.

As my enquiries are limited to Bengal, I have made your letter of the 9th instant over to the Director-General of Commercial Intelligence. I may, however, say that the Ordnance

Department are making enquiries for Acetic Acid and that none is manufactured in Bengal at present.

Calcutta, the 22nd October 1914.

From—A. H. LAY, Esq., I.C.S., Director-General of Commercial Intelligence.

To—The Managing Director, The Burma Chemical Industries, Ltd., Rangoon.

I have the honour to acknowledge the receipt of your letter, dated the 9th September 1914, which was addressed to J. Swan, Esq., I.C.S., and forwarded to this Department for disposal, and to say as follows :—

1 and 2. So far as I am informed there is no wood distillery in India for the purpose of manufacturing acetic acid and allied products.

3. I have made enquiries but have not been able to get any information to show that wood naphtha is used to any extent in India.

4. I would suggest your communicating direct with the Director of Ordnance Factories, Calcutta, on the subject.

5. There is no information available in this department as to the amounts and values of certain chemicals imported into the Straits Settlements and Malay States.

6. I would suggest your communicating direct with the Director-General of Posts and Telegraphs in India, Calcutta. The delay in replying is regretted.

(Witness did not give oral evidence.)

WITNESS NO. 463.

Mr. A. H. Morgan.

MR. A. H. MORGAN, A.M.I.C.E., M.I.M.M., Mining Engineer, c/o
The Bombay-Burma Trading Corporation, Limited, Tacey.

WRITTEN EVIDENCE.

My only experience in raising capital for an industrial enterprise consisted in floating Capital. a small Motor Transport Co. at the Ruby Mines; capital 1 lakh.

It was fairly successful and is still in being.

There were no difficulties in raising the money; it was almost entirely subscribed by local people, Europeans and natives, mainly through personal influence, my own and my colleagues.

Natives distrust limited liability companies, a rigorous supervision of the accounts and rules by a Public Trustee might produce more confidence.

Any measure calculated to induce natives to invest more of their capital in companies would be of great help in the development of this province.

Any of these would help industrial enterprises, but it would be most difficult to decide Government assistance. on the merits of each case and to provide against fraud.

This appears to me to be a practical suggestion, the fact of the Government being Provision of part interested and entitled to scrutinise the accounts would induce confidence on the part of the of share capital investors and facilitate the raising of capital.

The Government Department forced to buy might be unduly exacting while the Guaranteed manufacturer sure of his market might be careless, cease to improve and allow his product purchase. to deteriorate. The public interest can be best served by leaving its Government Department free to buy the best articles in open market.

An industry entirely new to the province might be exempted from taxation on profits at first, but they could not be so favoured if competing with similar enterprises already in being.

Unless the financial assistance is considerable a Government audit conducted according to pre-arranged terms should be sufficient.

I have invariably found that the officials of Government Departments requiring scientific and technical knowledge such as Imperial Forests, P. W. D., Geological Survey, Land Records, etc., are most willing to give information and assist the public in every way, but I have no experience of any scientific aid provided by the Government to industrial enterprises. Technical aid.

The mineral survey of this province is very incomplete, such surveys as have been made Industrial surveys. are not very accessible to the public.

It should not be difficult for all maps, surveys and reports on the resources of each district to be kept at the court of its Deputy Commissioner accessible to the public on payment of a small fee.

Consulting
engineers.

There are Consulting Engineers practising in Rangoon and Tavoy and these people would certainly object to having their living jeopardised by others being provided by Government.

Commercial
museums.

The need of a Commercial Museum in Burma, a province absolutely distinct and isolated from the rest of India, seems obvious.

The Museum should be of the "Shop Window" type such as are established by various Colonies and the Federated Malay States in the city of London.

Specimens of fibres, useful minerals, and other commercial products should be displayed; demonstrations of methods of preparation made in public, information regarding prices, markets, etc., should be given freely in reply to enquiries. Space should be rented to manufacturers to display goods and machinery at work.

Maps, plans, catalogues and technical-works should be available for the public to consult on payment of a small fee.

The Museum should be established in a prominent business thoroughfare and the public encouraged to enter.

Exhibitions.

Exhibitions should not be held too often or they will lack novelty and fail to attract. A provincial exhibition in Rangoon once in three years should be very useful.

Exhibitions cannot be made too attractive and popular as every visitor is a prospective buyer and in a lesser degree a prospective seller.

Travelling Exhibitions would be difficult to organise and maintain, the desired result might be attained by holding the exhibitions in Rangoon and excursions arranged for the inhabitants of outlying districts to visit them at Government expense. Burmans are fond of travelling and a cheap trip to Rangoon would be a very popular reward for general good conduct.

Training of labour.

I have seldom met an Asiatic who will learn and practise a handicraft if his primary education is sufficiently advanced to allow him to earn his living as a clerk or broker or something more genteel, so skilled mechanics are usually deficient in book learning, but their trade is a sort of education in itself and they through it acquire a habit of learning and are keen to improve. Burmans and natives make excellent metal workers, they are usually trained under Europeans whose methods, manners and expressions they imitate with curious fidelity.

As carpenters they are very inferior owing to the lack of European example.

Burman and native workmen usually take great pride in the work and skill and are most anxious to learn more, they are severe but fair critics of each others capabilities and insist on their pay being rated accordingly.

They suffer from a lack of knowledge of elementary science and above all of mechanical drawing the alphabet of their trade without which ideas cannot be expressed or understood.

Night classes to teach mechanical drawing and the elements of construction would be of great use to mechanics on whose efficiency all industrial development must depend.

Technical Schools.

Technical schools are of great use in training managers and teachers but they do not reach the actual operative.

They cannot turn out properly skilled men, all crafts must learn by actual practice while the learner is still young.

The short time worker is a nuisance in a workshop and few workmen can earn their living by working short time so day schools are not successful.

It is the duty of every manufacturer to train Apprentices and it should be made compulsory for those assisted by Government to employ them.

Director of Industries.

A Director of Industries is certainly required in Burma; he should have control of the Commercial Museum, act as adviser and general inquiry agent, and do all he can to introduce fresh industries and foster those in existence. He should have technical qualifications and not be an I. C. S. man as the purely literary training of these gentlemen render them out of touch and sympathy with money makers and inclines them to look on the "pursuit of wealth" as something vaguely disreputable.

Industrial Publi-
cations.

See remarks *re* Commercial Museums. The Government publications are not sufficiently advertised and not very easy to procure, frequently out of print, can only be got in Calcutta, etc., if a technical library were attached to the Commercial Museum copies might be kept there for the public to consult.

Patents.

The Indian Patent Office records should also be available in Rangoon.

Hydro-electric
power surveys.

Some years ago about 1908 a circular was sent round to the Deputy Commissioners asking for particulars concerning the waterfalls suitable for hydro-electric installations in their districts.

I have not heard that the information collected was ever published.

The amount of water power available in this province is very considerable. I know of many streams aggregating many thousands of potential horse power now running to waste.

I designed and installed the hydro-electric plant for the Burma Ruby Mines, Ltd., which I believe was the first to run in Burma; a 7 mile, 300 K. W. transmission which has worked successfully and continuously for the last 10 years.

The difficulty in gauging the streams throughout the seasons would render a complete survey expensive, but a list of the chief falls say those giving 10,000 K. W.'s might be made and published.

The law on the subject seems indefinite; as far as I know there are no special rules or rates for water power concessions, each application being considered independently.

Owing to the lack of a local demand for nitrates, aluminium and woodpulp the chief products of hydro-electric plants and the small demand for power and lights, the great majority of the waterfalls of this province are likely to remain unharnessed.

I have been a resident of this province for thirty years and seen much progress made in general that time but consider that the progress might be accelerated. The generally accepted contrast between the development of Burma and that of neighbouring provinces, Ceylon and the Federated Malay States, is rather humiliating to a resident of the first named. There does not appear to be sufficient difference in position, climate, resources, or character of the inhabitants, to account for this contrast; it may be due to the difference of policy of their government. That of the Federated Malay States advertises its province and endeavours to attract outside capital and settlers; that of Burma does not.

There have been and probably still are many officials in Burma totally opposed to what is meant by the term "modern progress," who prefer the evils of stagnation to the evils of industrialism, who dread the advent of non-officials of their own race and consider that the interests of the people under their rule would suffer from an influx of outsiders. I consider these fears unfounded and that the communities of this province are quite capable of holding their own and that they would be the first and principal parties to profit by increased progress and prosperity.

There are vast areas lying waste in Burma, the province should be considered as a Colony and the methods of settlement found useful by other colonies should be adopted.

The Great Dominions of the Empire do not consider it beneath their dignity to advertise abroad the resources of their lands, to exhibit their products and do everything possible to attract settlers and capital and while the Government of Burma abstains from doing the same it is open to the reproach of failing in its duty to its people and the Empire.

(Witness did not give oral evidence.)

WITNESS No. 464.

Mr. R. S. Dickie.

MR. R. S. DICKIE, *Manager, Petroleum Refinery, Rangoon.*

WRITTEN EVIDENCE.

The assistance which Government could give to industries, would, in the writer's opinion, be best given through a Director of Industries in each province with a suitable staff. Department of Industries.

The Director of Industries might be a senior member of the Indian Civil Service and his staff would consist of temporary and permanent assistants. The temporary assistants would be junior members of the Indian Civil Service attached for a year or two and the permanent staff would include an analytical chemist, a metallurgist and a highly qualified mechanical engineer.

The lines upon which the department would work might be as follows:—

- (a) It should prepare a careful survey of the industrial development and resources of the province.
- (b) It should issue a periodical bulletin at convenient intervals, possibly monthly, which would be its means of communication with the industrial community.
- (c) It should have a laboratory and assay office at which samples would be tested for a nominal fee, provided full particulars of origin of samples were furnished. Analyses would be published in the bulletin, but not particulars of origin.
- (d) It should collect data regarding suitable industrial sites and might have powers to assist the acquisition of land for industrial purposes.
- (e) It should institute tests of competency or examinations for various classes of skilled labour and might include a labour bureau to act as intermediary between employers and employed. The bulletin might be made self-supporting by advertisements.
- (f) It should have a museum of the industrial products of the province.
- (g) It should have a well equipped library kept up-to-date and containing standard technical works and a reading-room with the more important technical papers. A small fee might be charged for the use of this.
- (h) It should act as intermediary between the industrial community and Government, and no legislation affecting industries or rules under existing legislation should be introduced without reference to the department.

- (f) It should have a representative on the Chamber of Commerce, on the Railway Board, on the Boiler Board and on any other provincial boards affecting industries. The Director should be *ex-officio* a member of the Legislative Council.
- (g) The experts of the department might be consulted on payment of a fee by those requiring their assistance.

The writer believes that the institution of a department on the foregoing lines with the frankly avowed policy of encouraging and assisting industry would lead to a very marked extension of industrial activity.

Pioneer industries approved by the Director might in exceptional cases be given a virtual monopoly for a short period, say, three to five years. In such a case it might be possible to arrange for a portion of the profits above a certain percentage to revert to Government, in a similar manner to the excess profit duties. Special encouragement should be given to cheap sources of power and fuel, the want of which is probably the greatest obstacle to industrial extension in Burma. This might take the form of a prize for a suitable producer gas-plant utilizing paddy husk, saw dust or coal mined in Burma. A rebate of the duty on oil for such quantities as are used in internal combustion engines might also be beneficial. Electrical undertakings to supply power for industrial purposes should be specially encouraged, provided the unit rate to be charged was low.

The work now being done at the Government Engineering School, Insein, deserves to be extended as regards the training of young Burmans as mechanical engineers: the men turned out are very promising. Very useful assistant-analytical chemists are being trained at the Rangoon College and they should be a distinct asset to industry in the province. Something should be done to show the qualifications of the so-called skilled labourers. Fitters, turners, drillers, moulders, bricklayers, concrete layers, carpenters, rivetters, tin smiths, etc., vary from very good to very bad and there is nothing to distinguish them until tried.

It should be possible to file an application for a patent in the province and a file of patent specifications or abstracts of the same might be available in the suggested Department of Industry.

(Witness did not give oral evidence.)

Mr. W. Nuding.

WITNESS No. 465.

MR. W. NUDING, *Managing Director, Messrs. Foucar & Co., Limited, Rangoon.*

WRITTEN EVIDENCE.

- Registration of partuaships. Registration is, I think, desirable to enable traders to know with whom they are dealing. If names of partners were placed upon business paper it would help to carry out this object.
- Shipping freights. Conference rings with their deferred rebates prevent competition and lead to higher freights than may be necessary to ensure fair return on capital invested in ships, and thus help to retard trade progress.
- Forest Department. I do not know what the policy of the Forest Department as to industrial enterprise is. Any policy which would be calculated to engender a feeling of uncertainty and insecurity to the capitalist is likely to discourage capital being attracted to the country, and, in the long run, might not be in the interests of the Forest Department itself. Continuity of policy is desirable.
- Concentration of special kinds of trees. The cost of extracting forest produce might be reduced by providing district roads. Bamboo forests might be cleared in suitable areas and special kinds of trees of the more valuable species planted intensively.
- Transport facilities. Deficiency of roads might perhaps be overcome by annual allotments given for road building in each Forest Division. The roads to be built where necessary to tap the more valuable parts of the forests.

(Witness did not give oral evidence.)

Mr. J. E. S. Nisbet.

WITNESS No. 466.

MR. J. E. S. NISBET, *Forest Manager, Messrs. Steel Bros. and Co., Limited, Rangoon.*

WRITTEN EVIDENCE.

Policy and working of the Forest Department.

- Suggestions and criticisms. The Forest Department as at present constituted is composed of a highly educated sylvicultural staff and even judged from that point of view is in my opinion understaffed.

They have no practical experience of the various difficulties connected with any commercial enterprise, market requirements and extraction problems so cannot, I think, fully appreciate points put up by lessees and traders, even if they had the time to devote to such items.

I therefore consider the cadre should be strengthened by a branch composed of men with such training who would have the same status as the silvicultural staff and in no way be considered subordinate. This branch should arbitrate on all questions put up by the Forest Department which affect timber merchants and likewise on commercial aims and requirements affecting the technical side of forestry.

In my opinion this would tend to remove the present lack of co-operation between officers of the Forest Department, who are responsible for the conservancy of the State forests, and merchants whose business it is to extract the marketable yield to be obtained from same.

It should also be laid down that final interpretation of clauses in agreements is not to be made without both parties to same being allowed to state their case before the official appointed to decide the point in dispute. No feeling of security for heavy capital outlay can be felt so long as the Department can alter radically or otherwise, the terms of a contract lease.

To discuss the subject in more detail I consider that :—

1. The present system of issuing only prepaid licenses for unreserved woods should be abolished in the case of reliable traders. The necessity to prepay royalty prevents a man getting the full advantage of his capital and so of course curtails the scale on which he can work. Few traders own the buffaloes they employ in timber extraction so have to hire animals, the owners of which demand an advance of not less than Rs. 50, more often Rs. 100, per pair. Were the trader allowed to pay royalty when his timber reaches a Revenue Station he could purchase his buffaloes outright, command more power and contract to extract more timber. Government could adjust matters by slightly raising the felling fee, which is also prepaid, and so prevent one man applying for a license for more than he intends to or can extract, in order that others may be kept out, and correspondingly lowering the royalty to be paid when the timber reaches the appointed Revenue Station. The reason for unreserved timber being brought out in lengths seldom exceeding 18—20 feet may be attributed to a certain extent to the lack of sufficient power, so that postpayment of royalty might also have the effect of better and consequently more valuable lengths being put on the market. Royalty should be levied not on the log but on the ton, the present system of levying it on the log has not produced the result probably aimed at, *viz.*, to induce traders to bring out longer lengths in the log—length in all timber being the most valuable factor. Levying of royalty on the ton would tend to correct the present notorious waste in traders' logging; once the main log has been cut from the bole the remaining portion is meantime rejected if it will not yield a log of say 10 to 12 feet.

At present whether a trader takes out a license to extract timber sufficient for one or twenty rafts he is given the same time, *viz.*, one year—the period should be altered proportionately to the quantity covered by the license.

2. To encourage the large firms to take up the extraction of unreserved woods the present intensive working applied to teak would require to be modified until a market had been established for the output.

They should be asked to extract any species they choose to select from within the boundaries of their present teak leases, allowed to select their own trees and extract as much of each as they consider desirable—no penalty being inflicted for what the Forest Officer may term 'waste' and given a fixed rate of royalty on a low basis for a term of at least five years with a rebate on all converted tonnage exported with a view to popularising the woods outside India.

If a five-year lease is decided on, a pre-arranged plan of annually vacating one-fifth of the area should be drawn up so that any improvement scheme the Forest Department has in view can be put into operation unhampered.

3. Whether in the case of lessees or licensees, permission to work timber of a specified kind in a given area should carry with it a similar permission to cut all necessary materials required for actual rafting of the timber, free of royalty, and the Forest Department should give every facility for procuring same—if necessary starting plantations of the kinds of timber used for poles and restricting cutting to persons holding such leases or licenses.

4. Gazetting of drift timber is unsatisfactory as are the regulations attached to the redemption of same. Notices of all drift logs recovered should be printed in English and Burmese and displayed in a prominent position outside the Forest Office of the Division in which the timber was worked so that the owner might be able to trace the whereabouts of his lost property.

Government should not have the right to confiscate same before six months have elapsed from date of such posting.

5. The necessity for frequent Check Stations is not apparent; if Government police the river more thoroughly one main Check Station (say at the entrance to the Yandoon Creek for the Irrawaddy) should be sufficient—in any case the reduction of these Check Stations is desirable as much annoyance and delay is caused by raftsmen having to tie up so frequently.

6. Measurement and classification for royalty at Revenue Stations should not be entrusted to newly joined officers with no experience of the difficulties of extraction or the value of timber and how it is depreciated by natural faults in the log. Treatment at time of measuring at Revenue Stations is bound to be reflected in the timber extractor's logging at the stump—more sympathetic treatment then would encourage the extraction of more of the yield of a tree.

7. Government's sales direct to the Admiralty and Indian Railways deprive firms who are lessees of State Forests of a legitimate market. The transactions are so arranged that the business does not come into the open market so that firms have not even the opportunity of competing. Government having entered into Agreements with firms to work their forests should not encroach on the lessees' outlets.

Measures to reduce
cost of assembling
raw forest products.

Firstly, it is essential that Government build cart roads and lay down railways into the heart of the forests, without this nothing can be done. Secondly, freights and scale of weights over the Burma Railways system should be adjusted on timber in the log, while as regards output placed on the market through the various waterways restrictions regarding removals passes, drift and Check Stations referred to under the previous heading should be removed.

Concentration of
special kinds of
trees.

This can be answered only by officers of the Forest Department though personally I see no insuperable difficulties in concentrating as indicated.

The problem as to how and where the classes of timber required for rafting poles can best be cultivated is one of extreme urgency. Easily accessible stocks are yearly becoming more difficult to locate and prices have consequently risen enormously.

There appears to be no economical manufactured substitute.

Transport facilities.

I have yet to learn of any forest transport facilities. Beyond cutting bridle paths to facilitate officers of the Department getting about their Divisions I cannot recall anything done by the Department which could be termed a transport facility. The large firms annually spend considerable sums of money in improving the forests—principally as regards waterways—but have had no encouragement to build roads, in fact they occasionally have been discouraged by Divisional Officers taking over either in whole or in part, the roads they have made spending a little money on them and then calling them Forest Department roads along which the transport of all but light kit is forbidden. Royalty is demanded on unreserved timber used by firms in building inspection huts which are always at the disposal of officers of the Forest Department, while delay and annoyance is caused by it being necessary to have the logs measured and other petty formalities gone through.

The cost of all permanent improvements to forests should be refunded by Government until such time as the Forest Department can devote a fair proportion of its receipts from royalty on timber and forest produce extracted to the formation of transport facilities.

All restrictions on the use of timber required for rest-houses, etc., in the forest should be removed.

(Witness did not give oral evidence.)

Mr. F. M. Jonas.

WITNESS No. 467.

MR. F. M. JONAS, Tobacco Manufacturer, 74, Merchant Street, Rangoon.

WRITTEN EVIDENCE.

Capital.

1. I have had considerable experience in raising capital, with an industrial enterprise such as I control. You sink your own capital in it; if it is insufficient to bring the enterprise to success, and you wish to raise further capital, none of the big Banks will assist. You have either to borrow money from a small Bank, or from private sources, and the terms are very onerous, interest ranging from 9 per cent. to 15 per cent. You have to give a full mortgage on the business, and you are at the mercy of the lender who may demand his money at any moment, and failing payment may assume possession of the business you have created.

2. In Burma there are no facilities for raising capital for legitimate industrial undertakings outside of the Banks. In Japan where industries have increased by leaps and bounds, to assist these the Japanese Government some years ago established an industrial Bank solely for this purpose. This bank has the power to advance money to industries for a term not exceeding five years, the money is raised by the issue of debentures bearing interest at 6 per cent. and the debentures are guaranteed by the Government, such a bank would be of great assistance in Burma, I do not believe in Government assistance to industries, unless they are of special importance, such as the manufacture of bamboo pulp and paper, where a large amount of capital is required, in the first instance, before the industry can be started. In such an industry where there is more than a likelihood of ultimate success, the Government to attract investors might guarantee dividends during the development of the industry, which should during the period of inception be under Government control, until time proved it was able to run without such assistance and control.

I may mention here that I was a tobacco manufacturer and exporter of Japanese tobacco for many years, and my business as a manufacturer was taken over by the Japanese at the

time of the establishment of the Monopoly in 1904. I was in Japan from 1872 until 1905, so I had exceptional opportunities of seeing how that country established its present numerous industries. I have just visited that country after an absence of ten years.

I should therefore strongly recommend the Establishment in Burma of Commercial Museums say in Rangoon and Mandalay, where different products and manufactured articles, which could be manufactured in Burma from such products should be on exhibition. Particular care should be taken only to exhibit such articles, which could be manufactured or produced in Burma, and not to fill the museum with a lot of articles that would be of no use. Commercial Museum.

The industries that could be established in Burma are as follows in my opinion. The silk industry might be greatly improved and extended, jute and cotton carpets, weaving, matting, basket making of all kinds, lacquer work, pottery, improving paper making in the Shan States, toys, fans and other industries. Most of these are village industries. The work is given out and done in the homes. Why I recommend such industries for Burma, is that the cultivator is idle from the time that the crops are planted until harvesting and from harvesting to planting again, in towns such industries can be carried on.

I would recommend that a few intelligent Burmans be selected and sent to Japan under proper guidance, and there investigate and see for themselves how these industries are carried on, as this class of industry must be conducted by Burmese labour and supervision.

I have been an employer of labour at home in England, in Japan, China and in Burma. I do not find the labour in Burma lacking in intelligence, but at present it is not equal to Home or Japanese labour, and it lacks the application of the Chinaman. Training of labour.

In my own industry I have had to train my supervisors and engineers myself. As far as the Burman male labourer is concerned I find him wanting in thrift and diligence, the women are much better. I strongly advise that the young Burman should be taught in school these two qualifications of a good workman.

In the special industry I am engaged in the tobacco trade, I strongly recommend the employment of an expert (American for preference) to instruct the growers in the growing, but more especially in the curing and marketing of their tobacco, the lax manner in which this is now done causing considerable loss, and also giving the tobaccos a bad name when exported. There is no reason in my opinion why Burma should not be one of the largest producers of good tobaccos in the British Empire.

(Witness did not give oral evidence.)

WITNESS No. 468.

Mr. L. Dawson.

MR. L. DAWSON, *Bar-at-Law, Managing Director, Dawson's Agricultural Loan Company, Limited, Pyapon, Burma.*

WRITTEN EVIDENCE.

Agricultural Banking in the Delta of Burma.

I shall take advantage of paragraph 4 of the instructions and instead of submitting a series of answers to questions, I shall make a connected statement, based on my practical experience and knowledge of the only matter I may be in some degree competent to express an opinion and which deals with the subject of financing agriculture in Lower Burma and particularly in the delta.

I am the Managing Director of a small bank which was incorporated in 1914, and which is the first joint stock bank that has opened in the mofussal of Burma for the purpose of financing the agriculturist. The enterprise is therefore something of a pioneer in the field of agricultural banking.

The capital of the bank is small, viz., Rs. 4 lakhs, and this is divided into 2,000 ordinary and 2,000 preference shares. Of this capital three-fourths has been paid up. The business was carried on by me on a proprietary basis before it was incorporated and the capital was raised privately from depositors who held deposits before incorporation and who were guaranteed a minimum cumulative dividend of 8 per cent. with the right to share in any surplus profits to the extent of 25 per cent. The Company did not go to the public for its shares, because, as it happened, it could raise a sufficiency of capital from within. If, however, the formation of the Company had depended upon public subscription it is probable that it would not have been floated. The conditions of agricultural finance are not well understood and the public has little confidence in mofussal enterprises of this description and is biased in its judgment by the views of professional bankers in cities who are conservative in their ideas and have deep-rooted prejudices against the class of security that obtains in the mofussal. It was necessary to find an enthusiastic circle of friends, who, convinced of the possibilities, were willing to risk their money; and in this respect the vendor was fortunate. But, even so, the flotation was achieved, only because the shareholders were protected by preference rights and had a high rate of dividend, with the right of participating in further profits, guaranteed. In the event of a winding-up therefore the loss, if any, would fall entirely on the vendor; for,

he was paid in ordinary shares and not cash and more than one half of the par value of these shares had already been sunk by him in the working capital of the business.

The shares are held as to one-third by people resident in Scotland and as to two-thirds by Scotsmen resident in Burma.

The bank was incorporated in October 1914, after the outbreak of war and the present is the third year of its incorporation. Notwithstanding the war, the bank has justified the expectations its share-holders entertained of it and has attained the position of a successful pioneer: but its sphere of usefulness is capable of being greatly enlarged and its capacity for development is so considerable that the fact that even greater development has not taken place must be put down to the causes already referred to in connection with the difficulty of raising capital.

1. *The agricultural, which is Burma's chief industry, is hampered by the conditions under which it is financed.*
2. *Existing attempts and methods of dealing with this situation are partly good and partly indifferent, but are very inadequate.*
3. *Proposals for improving the financing of the agricultural industry of Burma and the nature of Government assistance that is required to carry them out.*

I purpose to examine these three propositions in their orders.

1. *The agricultural, which is Burma's chief industry, is hampered by the conditions under which it is financed.*

Rice is the chief crop of Burma, but I am only concerned with the financing of that branch of the industry which consists in the production of the crop and with the producers' point of view and my experience is confined to Lower Burma and particularly to the delta, where the bulk of the crop is raised.

The business of financing this great crop has hitherto been in the hands of the Chetty, a money-lender who hails from Southern India and who has no particular aptitude for agricultural banking. He is essentially a money-lender who is concerned with the realizable value of his pledge, and with that only. He has done much for Burma because he filled a place and supplied a want when there was no one either ready or willing to do it. But his limitations are both numerous and obvious. I shall indicate them.

1. He is not interested in agriculture itself and questions of the improvement of the soil or of improved husbandry do not appeal to him. He makes no attempt to contribute to their solution and he will not finance such schemes.
2. He does not particularly concern himself with the purpose for which a loan is raised, or see to it, that the loan is applied to that purpose.
3. He is not contented with legitimate business, and touts for loans and encourages the taking of them for unproductive purposes if the security is ample.
4. He does not care about repayment in small instalments and does not press for them, as he should, if he were merely a banker.
5. He is not a sympathetic banker and demands payment regardless of the plight of the agriculturist or his ability to pay and generally makes the conditions of payment more difficult when, in the circumstances, they ought to be made more easy.
6. He is unbusiness-like. He seldom grants receipts or delivers up cancelled documents and encourages rather than discourages unbusiness-like methods.
7. The temptation to overreach the customer in technical matters, proves almost too great to be resisted by him.
8. He is relieved every three years by a new agent and the system involves something like a triennial winding-up of the firm's local business. There is, in consequence, no guarantee of continuance in the financial relations between customer and banker, which are often seriously dislocated by the caprice of the agent's successor.
9. His business is an unregistered partnership.
10. His rates of interest are very high.

The large bulk of the Burma crop is still financed by the Chetty and the agriculturist has maintained himself in spite of, rather than because of him. He is as an agricultural banker, therefore, a failure and he is out of date.

The Burman agriculturist wants (a) a banker more sympathetic with his needs and aspirations, (b) a banker who can give him cheaper and better credit, consistent with good security: and for these qualities, he must look elsewhere than towards Southern India.

The rise in market values of land in Burma, in the last decade, has been followed by a general improvement of conditions and agriculturists have paid the Chetty rates of interest, varying between 24 and 36 per cent. per annum and have survived; but these high rates have prevented him making payments towards principal and thus building up a financial

reserve: so that, bad harvests or low prices may at any time cause a serious set-back in his position.

I may state parenthetically that I am dealing with agriculturists as a class and not those who are nursed by private banks, or co-operative credit societies.

I have been criticised by Mr. Maxwell Laurie, M.V.O., I.C.S., Commissioner of Irrawaddy Division, retired, for understating the case about rates of interest, by not doubling these figures, but I had in mind the Chetty, who is not nearly so heavy in his charges as is the village money-lender, whose rates often run as high as 60 per cent.

Owing to the scarcity of capital and to dear credit the agriculturist in Burma cannot afford—

1. To build up a financial reserve against low market prices:
2. To develop or improve land or bring new land extensively under cultivation:
3. To allow his land to lie fallow:
4. To build barns within which to winnow, thrash and store his crop so as to avoid damage from unseasonable showers:
5. To purchase improved implements or agricultural machinery:
6. To experiment with other than the cheapest manures:
7. To raise good stock:
8. To insure his cattle or indeed anything:
9. To grade his grain:
10. To hold his stocks up when the market is exceptionally low.

There are exceptions, but the above, I think, fairly represent the prevailing conditions of the agriculturist. He is hampered at every turn by the want of capital and the dearth of credit and it would be interesting to know what other great productive industry in the Empire suffers from being so badly financed and with which the Burman agriculturist can compare himself.

2. Existing attempts and methods of dealing with agricultural finance are partly good and partly indifferent but are very inadequate.

Government has, so far, employed two methods of assisting the financial conditions of the Burmese farmer, one direct and the other indirect.

The direct method consist of legislative measures and these are the Agriculturists' Loans Act and the Land Improvement Act and the indirect methods are by the propagation of and the fostering of the growth of Co-operative Credit Societies and of a Central Co-operative Bank.

(a) Direct methods—

The amount lent by Government in the year 1915-16 under the Agriculturists' Loans Act was 13 lakhs for the whole province, but under the Land Improvement Act no figures are given and the amount may be assumed to be negligible. The amount lent under the Agriculturists' Loans Act is officially considered in the current Revenue and Administration Report to be large and satisfactory but this is not the unofficial view, and as regards the Land Improvement Act the report is practically a tacit confession of failure.

This Act was generously conceived. It provided for the relief of agricultural distress and it is clear both from the Act and the rules framed under it that it was not intended that its scope should be limited to cases of distress which are the result of natural causes like flood, drought, cattle disease, etc. It recognized that there might be genuine and unavoidable cases of distress arising from causes other than natural causes or theft of cattle and it recognized no distinction between the holder of 30 acres and the holder of a less area. The Agriculturists' Loans Act No. 12 of 1884.

Distress of a very acute description might quite easily arise from the crop being marketed at an exceptionally low figure and distress often arises from the failure of others to fulfil their obligations pecuniary or otherwise or both. The "Instructions" under the Act do not recognize such cases and the relief that the Act affords is frittered down to the narrowest specified limits by the "Instructions" and although these do not in theory govern the Act, in practice they do. The Act is only a very modified success. With all due respect, if a broad view is taken, the Act must be regarded as a failure and for the following broad reasons:—

1. Only a proportion, probably small, of those who really need agricultural advances apply for them or get them.
2. And, the converse proposition is also true, *viz.*, those who get the advances are not necessarily those who most deserve them.

It is worthy of remark that the low rate of interest which Government grants is, in this respect, not altogether an advantage. It makes the advances seem like prizes in a lottery and reacts upon the individuals to be benefited as if they were: and, in order to secure them, it inspires the class that is ever ready to seek favours, and to cultivate the Burmese official to exercise its ingenuity and is the wrong class.

The agriculturist, who is simple and who is not versed in Court ways or in office routine, who does not know how to get on the soft side of a Myook, a Thugyi, a Court clerk or even the apprentice who fills up a treasury challan, is apt to be left in the lurch.

In my view the making of agricultural advances except in the case of widespread distress is a branch of activity that is not suited to administration by Government and it is perhaps because Government recognizes this fact that the relief it affords is cut down to such narrow limits.

Considered as a measure of financial aid, this Act with its 25 lakhs outstanding for the whole province strikes me as very inadequate. The Chetties alone have about 50 lakhs in agriculture in this single district of Pyawon and the "distress" that they relieve is perhaps not less acute.

This Act is also very wide in principle but the rules framed under it as well as the instructions render the aid it offers illusory. Rule 13 insists that the applicant's resources to carry out the improvement without a loan should be fully taxed; so that, if his land is free, he should encumber it or even sell a portion to provide himself with the necessary funds and the same rule lays down that no loan should be granted unless there is good security.

The applicant can therefore easily be impaled upon the horns of a dilemma and he may be met in this way. If his land happens to be unencumbered he may be told he has resources; and if not, he may be told that he has no security to offer. It is therefore easy for an over-worked Township Officer to avoid responsibility and to find grounds for rejecting the application in any event.

I find that no loan has been granted under this Act in this district of Pyawon in the last six years. My enquiries did not take me further back. No one would deny that Burma stands in need of extensive land-improvement. The Act is obviously a dead letter.

(b) *Indirect methods—*

Government is more happy in its indirect methods and its co-operative credit propaganda is attended with the best results. The propagation of Co-operative Credit Societies and the fostering of their growth and influence have far-reaching effects. It is a substantial contribution to the solution of the problem of agricultural indebtedness but it is apt to be forgotten that it is only a contribution and that notwithstanding the success that has attended co-operation in recent years it is a mistake to expect too much from it or to assume that in course of time, with the growth and progress of the movement every agriculturist will respond to its "vade mecum."

Co-operative credit is the best form of credit because it has an ethical as well as a commercial side and is ideal. But it is just because it is ideal and requires temperament and character to conform that it finds its limitations in human nature.

It is easy to be converted to its principles. It is difficult to act up to them. For a hundred that have "faith" there are few who can prove their faith by "works" and the few are not always sufficient to leaven the lump.

In theory, co-operation should appeal to all, rich and poor. In practice, it appeals more to the needy, because they are under the strongest necessity.

In certain districts in Upper Burma, co-operation has thriven and is now a flourishing plant. In the delta, its seed has fallen on stony ground.

Co-operative Credit Societies can do much but they cannot do everything and they are not best suited to solve problems of agricultural indebtedness in the delta and Government should not rest satisfied with this single form of activity or take the view that in the dim and distant future, agriculture will find its complete salvation in co-operation. The needs of the agriculturist are pressing and insistent and if methods equally good are available and offer equal if not greater prospects of immediate or ultimate success, I suggest that measures be taken to investigate these methods and if they afford the promise, which, from my experience, I can confidently maintain exists, they should be adopted and in respect of them, Government should adopt a propaganda not less energetic or enthusiastic than that which it adopts in the case of Co-operative Credit Societies.

I need not add that any such investigation would be welcomed by this Bank and that this Bank would put whole-heartedly at the disposal of Government all its resources and would give all the assistance that lies in its power.

3. *Proposals for improving the financing of the agricultural industry of Burma and the nature of Government assistance that is required to carry them out.*

(a) *Proposals—*

The establishment of banks in the mofussal will greatly assist the financing of the agricultural industry in Burma. The type of bank that will be successful is a mortgage bank that will give the agriculturist long credit. It is due to ignorance of this important point that the press and others advocate the extension into the mofussal (by the opening up of branches) of the type of commercial bank that does business in large cities. Banks specialise as do trades and other professions and the commercial type of bank in a purely agricultural

district would be as much out of its element as a fish out of water and would be of less use than is the Chetty.

Short credit is the basis of the business of a commercial bank, whereas the basis of the business of an agricultural bank in the present state of agriculture in Burma, must be long credit.

I therefore favour the type of a joint stock agricultural mortgage bank as best suited to the needs of the districts.

The requisites.

1. *Type.*—Joint Stock Agricultural Mortgage Bank.

2. It should of necessity be incorporated under the Indian Companies Act so that it would have the advantage of trading with limited liability while at the same time all the safeguards may be had of meetings, accounts and audit.

3. It should be under European supervision or management until such time as its work and administration is thoroughly understood and absolute confidence is assured if entrusted to other hands.

4. The European element in the management should be in very close touch with the people and for this purpose it is necessary that it should know the language and understand the people and have some local influence.

5. It should confine its operations to an area over which it can effectively exercise control.

6. It should co-operate with co-operative credit societies and work in sympathy with them and with the Central Bank.

7. It should have an organization and a system ready to hand and which is easily workable and it should be possible to demonstrate that the system is reasonably sound.

8. It should take the fullest advantage of the work of the Agricultural Department and use its influence to improve husbandry and allocate funds for experimental purposes.

9. While not making credit too facile, it should aim at the cheapening of credit and should attempt to level rates of interest to the level that members pay to their Co-operative Societies.

An incorporated mortgage bank that owes its existence to private enterprise and complies with the above requisites is an institution that, I think, deserves positive encouragement and support. It can do much towards relieving agricultural indebtedness and it can help to forward the best interests of the province and it can reach that large and not unimportant class which either refuses to open its doors to co-operation or through some defect of character or idiosyncrasy of temperament fails to adapt itself to co-operative methods.

It will have a field of labour which will be the complement of the field of the co-operative movement and it is therefore entitled to similar consideration and support.

(b) Nature of Government assistance that is required to carry out these proposals and the nature of Government control—

Owing to the difficulties of raising capital, the best way to promote the establishment of such banks as have been indicated is for Government to provide a proportion of the capital, say, 50 per cent., of what is considered advisable or necessary and for Government to be content with a guaranteed 5 per cent. dividend and to hold all the preference rights and to exercise its control by holding either a Government audit or such other audit as it may prescribe.

Such a scheme would not commit Government far. A bank on these lines could be opened up in some district headquarters as an experiment and if the results are satisfactory the principle of the promotion can be applied and banks opened up in other districts.

I do not think that Government should be represented on the board of such a bank and it would obviously be undesirable for many reasons: there would really be no necessity, as the safeguards would seem to me to be ample.

I am confident that such a bank would require small capital and that it would be able to get all the funds it required from the public, quite easily.

I do not think that such a bank should be assisted by loans from Government, unless, in the particular district in which it operates, Government should decide to allow it to administer all agricultural loans and do away with the official administration of them.

Loans made by Government for such a purpose should be fully secured and should be repaid promptly once a year. If loans should be required from Government for any other purpose, a strong case should be made out and if granted, should be secured by debentures, so as to afford Government absolute security.

Under this scheme each district bank will be an independent unit and will stand on its own merits.

A proportion, say, one-fourth of the capital, should be locally subscribed and this Bank, which I represent, would be willing (and as the pioneer would expect to be offered) to subscribe in addition to a few founders' shares—a proportion equal to the locally subscribed capital and would undertake to raise locally the proportion of the needful capital.

This Bank owes nothing to Government assistance and has asked for none. It has attained its present development not without difficulty and not without encountering some prejudice, but it has received a substantial measure of support from the public and it is satisfied that its achievement will continue to merit that support and that it has discovered a field of enterprise that offers good investments while at the same time it is helping to develop the agricultural resources of this great country.

WRITTEN EVIDENCE.

Note on the Registration of Partnerships.

In a recent issue of the *Calcutta Weekly Notes* (11th February 1918), I suggested the registration of partnerships. The matter has evoked some amount of public interest and, in view thereof, I beg to explain the suggestion in some detail.

Partnerships can be formed and dissolved in writing, as well as verbally. Deeds of partnerships are, however, rare among Indian traders. These traders have partnership firms spread all over the country and, so long as business is carried on honestly, no difficulty is experienced by people dealing with them. Trouble commences when a partnership seeks to repudiate its just liability and a creditor is compelled to go to law.

These partnership firms are not always managed by the partners. Sometimes, the partners or one or more of them are found to be engaged in active management, but in very many instances they leave the management with *gomastas* or servants. In the latter cases the *gomastas* do all acts necessary for or usually done in carrying on the business of the partnership. A *gomasta* gets either a fixed pay or, such pay plus a share of profits, or a share of profits only, in lieu of remuneration.

The capital invested in the partnership generally carries interest, but the rate of interest sometimes varies with the profits, and it frequently happens that a share of profits is paid in lieu of interest. The capital invested may be the money of the partners or of a creditor having no share in the partnership.

The constitution of the partnership or the internal arrangements as to shares, capital, interest and management generally, are unknown to the outside dealer. Such knowledge is unnecessary in normal conditions of honest trade. But it becomes a matter of paramount importance when he is confronted with a dishonest attempt to repudiate just liability and the dispute is to be settled in court.

It is well known that Indian traders of the class mentioned above do not attach much importance to the name of the firm, and changes of name are of frequent occurrence. A firm's name is no guide to its constitution. Very often a minor son's name is tacked on to that of the father or a grandfather, long deceased. There is no method or system in a firm's name from which any safe inference can be drawn.

The difficulty which a stranger has to contend against may be illustrated by the defences usually set up in courts of law.

Suppose A, B, C and D are partners of a firm, the first three only having furnished the capital and D contributing labour and skill as the working partner. D gets a fixed allowance and a small share of the profits as partner. P brings a suit against all the four partners for the balance of the price of goods sold and delivered. A, B, and C put in a joint defence denying that they are partners. D in a separate defence says that he is a mere *gomasta* and he supports A, B and C in their denial of partnership. P has got to prove that A, B, C and D are partners. He calls a number of witnesses who had dealings with the firm for many years and they swear that they always knew A, B, C and D to be the partners. In cross-examination they cannot support their evidence with any definite facts, such as division of profits, for such facts cannot be within their knowledge. They then go on inventing things, e.g., that in some adjustment of accounts all four took part, or that the defendants admitted to them that they were partners, or that all four sometime or other actually took part in the dealings of the firm, such as buying or selling, or giving or taking delivery, or making or receiving payments, or that the defendants always held themselves out as partners and, in short, they invent circumstantial evidence in support of their contention. False documents are produced to connect the defendants with the firm. Besides these, various other shifts and devices are resorted to. Thus, false evidence is given to support a case, true in fact but difficult of proof. To rebut this evidence, the defendants in their turn bring forward another set of mixed true and false evidence to establish their irrelation to the firm. A, B and C's non-participation in the business of the firm is easily proved. D's acts and conduct are not inconsistent with his being a *gomasta*. After careful consideration of a large mass of true and false evidence, the court comes to the conclusion that P has failed to prove that A, B, C and D are partners. His suit is dismissed with costs.

Take another illustration. A, B, C and D are partners. A and B are the capitalist partners, C and D bring in no capital, but get a share each for managing this business. The former have money; the latter have none. When sued, A and B deny that they are partners. C and D say they are the only partners and that A and B are mere creditors of the firm. The plaintiff notwithstanding a mass of evidence, partly true and partly false, finds himself unable to prove his case against A and B and has to be content with a decree against C and D, which is of no value to him. The impecunious partners are in these cases invariably put forward as the owners of the firm, the moneyed partners, remaining in the background and supplying the sinews of war against the honest dealer.

Instances may be multiplied to illustrate the defeat of just claims and the failure of justice in the tangled mass of true and false evidence.

Leaving aside false oral testimony, books of account and letters are generally produced in these cases. It is a by-word in the corridors of the courts that dishonest traders keep three sets of books—one for their own use, the second for use in courts and in view of possible insolvency and the third for defeating income-tax authorities. Whatever may be the truth about this, it is common experience that false books and false entries in books are much too frequently used in courts whenever the issue of partner or no partner is raised.

The time and money spent in the trial of the issue of partner or no partner are always large. If truth prevails, the cost is out of all proportion to the benefit. If truth does not prevail, all is wasted.

It has been suggested that the failure of justice indicated above and the mass of perjury and forgery may be avoided by the simple expedient of registration of partnerships. If provision is made for the compulsory registration of all partnerships with the names of all the partners and of all changes in the constitution of firms, and also that none but registered partners shall be deemed to be partners in any court, the waste indicated above may be avoided. Further, persons dealing with firms will then know to whom they are giving credit. Such a provision will obviate the necessity of resort to dishonesty in manner stated above. No law can induce honesty, but it can deter dishonesty by rendering it futile.

The practical suggestion therefore is the addition of a section to the following effect in Chapter XI of the Indian Contract Act (IX of 1872):—

"An agreement for partnership can be made only by registered instrument which shall contain the names and addresses of all the partners and the date of the commencement of partnership. Any change in the constitution of the partnership, including the names and addresses of the outgoing and incoming partners shall also be registered. Registration as partner shall be conclusive evidence of partnership and no one whose name is not registered as above shall be entitled to claim any right or be liable as a partner in any suit or proceeding."

Explanation.—In an agreement for partnership between a Hindu joint family and a stranger, the *Karta* for the time being shall represent such joint family.

The addition of a clause to the following effect at the end of section 17, Registration Act (III of 1877), is necessary to give effect to the above suggestion:—

"Instruments creating partnerships after the day of 1918 and all changes in the constitution of such partnerships shall also be registered."

I desire to make it clear that the suggestion made in this note does not relate to or in any way affect Hindu joint family firms. There are obvious difficulties regarding such firms. Under the *Mitakshara* School of Hindu Law, for instance, a male child on birth acquires an interest in the family business. It is undesirable, if not impossible, to attempt to interfere with such interest by legislation. The suggestion made in this note relates only to contractual partnerships, such as are governed by the Indian Contract Act. It is necessary to make this point clear. So long as a business is a purely joint family business, with no stranger in it, the suggested registration will not apply. But directly a stranger comes into the business, it becomes a contractual partnership, the two contracting parties being the joint family, as a unit, of the one part and the stranger of the other part. Registration will in such a case be necessary. The joint family in the name of the *Karta* will be registered, and the stranger in his own name. So long as the joint family is regarded as one unit, however much it changes internally by birth or death, there is no difficulty. The business of a single owner need not be registered. Nor, on the same principle, the business of a joint family which is really one unit. But as soon as a second person comes in, the business belongs to two, i.e., the family and the stranger, their relationship as between themselves being governed by agreement and not by birth. Shortly registration will be compulsory if the partnership is contractual. Not so, if the different persons interested in the business acquire such interest by birth and not by contract.

ORAL EVIDENCE, 9TH MARCH 1918.

Hon'ble Sir R. N. Mookerjee.—Q. In the case of a Hindu joint family, if a *Karta* (head of the joint family) enters into a contract as a partner with a second party outside the family and if a decree is obtained against that firm, and the property of the joint family is attached, can the other members of the joint family raise any objection?—A. No, they cannot, because the share of every member of the joint family is liable for the legitimate debts incurred by the *Karta* for the benefit of the family or for debts incurred in the business.

Q. Can you tell me why, if the whole matter is so easy, so much objection is raised by every Indian community, whenever the question of the registration of partnership deeds has been brought up?—A. I don't know whether this question ever came to a head. Casual suggestions were made from time to time; but, so far as I know, the suggestion was never brought forward in a serious manner before the public.

Mr. C. E. Low.—Q. You mean the suggestions now put forward by yourself?—A. Yes.

Q. You don't mean that the suggestion in regard to the registration of partnerships was not put before the public?—A. I mean that, so far as the public is concerned, it has never been put. I have heard that Chambers of Commerce have discussed the matter many times before; but so far as the public, or the legal profession is concerned, this matter has never come up before.

Hon'ble Sir E. N. Mookerjee.—Q. I take it that your opinion is practically the opinion of all the senior members of the bar?—A. My opinion is shared by a large number of members of the bar and solicitors with whom I have talked. I cannot say that it is unanimously held.

Q. You discussed this with your other colleagues?—A. Yes, with many members of the bar and many solicitors and vakeels, since I wrote that letter to the *Calcutta Weekly Notes* on the 11th February. I have shown my note to a number of my friends, who approve of the suggestions generally; but they make certain other suggestions. For instance, in my note there is no provision for existing partnerships. That matter has been discussed by members of the bar, and I am prepared to uphold my views, if I am asked any questions on the matter.

Q. What you say in your paper refers to the registration of partnerships for the future; but is there any remedy in the case of those who are already doing business as firms?—A. I don't want to make registration compulsory in the case of existing partnerships; under the present law, existing partnerships come under the category of optional registration, and I think optional registration is quite enough for dealing with existing partnerships. There are serious objections to compulsory registration with regard to existing partnerships. If I may be permitted to explain, I would state my reasons under 4 heads. First of all, there is the retrospective effect of legislation which is always unsatisfactory, as it works harshly. Secondly, the evils sought to be met by compulsory registration can be met by compelling existing partners to execute and register written instruments of partnership. This latter point requires a little explanation. The parties who suffer most are capitalists and bankers, who advance money to partnership firms. Take, for instance, the case of a Calcutta bank which advances money to, say, a Sirajgunge jute firm. At the beginning of the jute season these firms want capital, which they pay back at the end of the jute season. A bank may very well say to these Sirajgunge jute merchants, "Unless you register and reduce your partnership into writing, we are not going to advance you money." In that way it can put pressure on existing partnerships, and compel them to register. Again, the partners themselves may be interested in reducing their agreements to writing and registering them. For instance, if there is a provision that in future none but registered partners can bring suits or assert any claim in a court of law, unless their names appear in the register, they will find it difficult to bring suits for partnership accounts against each other without registration. Existing partners will be interested to compel their co-partners to register, because in that case they will be perfectly safe in future when bringing suits for partnership accounts. I am thinking of suits as between partners themselves. Capitalists can compel registration by refusing to advance money without registration of partnerships, and partners can compel co-partners to register; so that the evil which is sought to be met by registration, if left optional to existing partnerships, can be met in that manner. They will get used to register partnerships. Partnerships can be registered now, under the existing law. The Registration Act provides for it in section 15; but people do not register, as a rule, because registration of partnerships is not, first of all, enforced by law, and, secondly, is not common. Once you make registration compulsory, people will take to registration even when it is optional.

Mr. C. E. Low.—Q. It is merely ignorance which has prevented optional registration so far?—A. Yes. Then my third reason is this. Compulsory registration is likely to be oppressive to small partners, who, through ignorance or force of custom, may not register. They will then be unable to enforce their rights for want of registration. The fourth head is, that under the existing law, in the absence of a contract to the contrary, the death of a partner *ipso facto* dissolves a partnership; therefore this optional registration of existing partnerships cannot last beyond a generation. After 20 or 30 years all existing partnerships are likely to come to an end, and the intervening period will be quite enough to enable people to get familiar with the idea of registration; so that by not interfering with existing partnerships, the law, as regards compulsory registration, will gradually become known to people and there will be no sudden change.

Q. Supposing a partner dies, does the whole partnership come to an end?—A. Yes, in the absence of a contract to the contrary.

Q. Supposing one partner transfers his two-anna share to another one?—A. He cannot do that, except with the consent of the other partners. In that case it would be a new partnership, a fresh start in respect of all the partners.

Sir F. H. Stewart.—Q. Do these small people, whom you refer to, have any actual partnership agreements?—A. Among Marwaris, you sometimes find little bits of yellow or pink paper on which they write down the terms and particulars of the partnership, the internal arrangements. That is not very common.

Q. Would those papers be recognised in court?—A. Yes, but more often than not, the arrangements are verbal.

Q. It is clear to us that the case of these small traders and shopkeepers presents difficulties. Would it be possible to exempt them from the provision of legislation?—A. That would be very difficult: where would you draw the line? A partnership might begin with a very small capital and grow into a large business, and it would be impossible to draw a hard and fast line that, up to a capital of, say, Rs. 10,000, a partnership is registrable and below that it is not. That would interfere with the growth of partnerships; and besides, partners would not like to have their internal affairs, as to how much capital is invested, and so on, known either to traders or to the public. It is not like the case of a company, whose internal affairs are revealed in their Articles of Association.

Q. I suppose the *Karta* is recognised in law as the head of a joint family and can sue and be sued?—A. Yes, in his own name but on behalf of his family. He represents the family.

Q. You say you have talked this over with a good many barristers and solicitors. Hindu gentlemen, I suppose?—A. Yes, and English also.

Q. English opinion has always been in favour of this question of registration, generally; but what would Hindu lawyers say about it? Would they fall into line with your ideas?—

A. Yes. I have not received any serious objection to my suggestions up to now. Objections of a political nature have been raised, and it might be worth your while to consider them. One gentleman told me that if you make registration compulsory, then outsiders, i.e., non-Indians who do not want trade to develop in this country, or who want to have complete control over the petty trade of the country, may come to know who the people are, who are engaged in trade. In that way you would give them a handle to control or dominate petty trade.

Q. You will agree that that is a very far-fetched idea?—A. Yes. I do not share the apprehension. It cannot be the intention of either the Government or the English merchants here that trade should not develop in this country.

Q. The European point of view is that registration is necessary in the interests of Indian firms. At present a great many European firms and banks are rather reluctant to do business with Indian firms, because they don't know who the members of those Indian firms are?—A. Yes. I will give you an instance. There are commission agents, Marwari as well as Bengali, who deal very largely with up-country dealers. They advance large sums of money to these dealers, and they find that whenever there is the question of partnership raised in court, they lose their money, because they cannot know who the partners of these dealers are. In making my suggestions I was not thinking of European merchants and banks so much as I was of Indian commission agents in Calcutta, who advance money to up-country dealers and find difficulty in realising their money.

Q. And, therefore, they charge proportionately a much higher rate of interest?—A. Undoubtedly, because they always run greater risks.

Q. Have you any business experience as well as legal?—A. No, I have no business experience.

Q. Have you studied the fairly recent Act at home—the Registration of Business Names Act?—A. I cannot say I have made a special study of it.

Mr. C. E. Low.—Q. Where do you propose that this Act should apply?—A. Everywhere in British India.

Q. One other political objection occurred to me, because it had, to a certain extent, been taken already, and that is, that at present Indian firms derive certain advantages from their knowledge of the bazaar, which is set off against the advantage derived by European firms from their knowledge of shipping and of foreign traders. It was objected that you are depriving Indian traders, to some extent, of this advantage.—A. How are they deprived of it?

Q. By levelling up in respect of their knowledge of the bazaar. I am not asking your opinion of the force of that objection, but do you think it is likely to be pressed much by politicians?—A. I don't think so.

Q. Turning to the proposal itself, you are aware that there are many tens of thousands of very small partners: say, a couple of durrizies, or one or two men keeping a grocery shop, not only in Calcutta but all over India. Sometimes they are joint families, but sometimes they are partners. You realise that your proposal would make it compulsory for all people of that sort to be registered in future. Don't you think that would be difficult to accomplish?—A. I don't anticipate any difficulty, because we know that when one or two cottas of land are sold, it is often registered, although it is optional in the case of land under the value of Rs. 100, yet registration is very common.

Q. A great many of these people are very ignorant, and there is not the same tradition at present about business as there is about the transfer of land. Take the case of Mahomedans, two Mahomedan brothers. They are not usually joint in estate?—A. They may or may not be.

Q. In a very large proportion of Mahomedan family businesses, it would require registration?—A. The family business would not, because by custom in Bengal and Bombay Mahomedan joint families are regulated by practically the same law as the Hindu joint families.

Q. That is not really the case in the more truly Mahomedan families. The Mahomedans you are speaking of "are largely of Hindu origin." In the Punjab and United Provinces the Mahomedans have their family affairs regulated according to the Koran.—A. That is so; but Mahomedan joint family firms are very rare, so far as Bengal is concerned. I have never come across a Mahomedan joint family firm, in the strict sense of the term.

Sir F. H. Stewart.—Q. Do they have Trusts?—A. For business purposes *wakfs* are not recognised; but they have been recognised by the Privy Council for the maintenance of Mahomedan families. I don't know of any case of trust of a family business recognised in law.

Mr. C. E. Low.—Q. What Sir Francis Stewart means is—could they set aside part of the business as a *wakf*?—A. There has been a conflict of opinion in regard to that. There have been some recent cases in Calcutta and Bombay, in which the question was raised whether you could not make a *wakf* of shares. But the better opinion now is that you can. These were shares in joint stock companies. There is no such thing as a share in a partnership which is transferable. It is not transferable unless with the consent of all the partners.

Q. But a very large number of Mahomedan firms, especially those engaged in the leather trade, consist of several brothers or cousins?—A. Such partnerships are all contractual; they are not joint family businesses.

Q. But they will all need registration?—A. Yes; that is the reason why I say, if you allow 20 or 30 years to pass by, that will make people get used to registration, and it will not operate harshly at the end of that period.

Q. This case has been under discussion, I think, since the sixties or before, and it has been to the High Court several times for decision. Apparently they did not consult the bar or the public, though the various chambers, both European and Indian have been consulted on several occasions. This question of small partnerships has always been considered one of the stumbling blocks in the way. That is why I have been pressing the question. There is another difficulty which exists in Bombay to a great extent. In Bombay it is very usual to have what they call single ventures, or transitory partnerships, which have reference to a particular period, or a particular transaction: that is to say, certain persons who each have special facilities towards the completion of one portion of the business will enter into a partnership, say, for the chartering of a ship, or for the collecting or financing or exporting of a particular consignment: or they may join together, say, for bringing cotton from up-country into Bombay for the season. This business is perfectly legitimate and is conducted on honest lines. These cases are extremely numerous, and you get such transitory partnerships overlapping with permanent partnerships. That means the bringing in of a very large registration of business, and if you leave them out, a coach and four could be driven through any form of law.—A. I would not leave them out. They are syndicates for single ventures, and are governed by all the rules which regulate partnerships.

Q. Don't you think the roping in of these very small partnerships and these transitory partnerships constitutes a serious stumbling block in the way of any registration of partnerships?—A. I do not think so, because registration means the paying of a small fee and going to a registration office. Whether it is a single venture or a more ambitious undertaking, after all it is not such a great hardship to go to a registration office and pay a rupee or two.

Sir F. H. Stewart.—Q. There again the difficulty may be met by fixing a limit as to the amount of capital or the period of time.—A. Say a partnership is for a fixed term and the partners continue the business beyond that term. That is perfectly legitimate in law and they are regulated by the same agreement which was originally entered into. Say a partnership is entered into for 5 years, and the partners find it profitable and continue the business for a further period of 5 years. After the first 5 years they are regulated by the same agreement into which they had originally entered.

Mr. C. E. Low.—Q. Have you considered the amendment to the Civil Procedure Code, particularly order No. 30, which followed the English order? How has that affected the position.—A. It is really this. Previous to the change in our law, partners bringing a suit against a firm had to sue in the names of individual partners; and if the partners themselves had to be sued, they had to be sued in their individual names. The change is they can now sue or be sued in the firm's name. As Lord Lindley has pointed out when a firm's name is used, it is only a convenient method for denoting those persons who compose the firm at the time when that name is used, and a plaintiff who sues partners in the name of their firm in truth sues them individually, just as much as if he had set out all their names. The partnership name is a compendious mode of dealing with it for the purposes of a suit; but when the suit is brought in the name of the partnership, the defendants can always call on the plaintiff to disclose the names of the partners. The same difficulty which is experienced in other cases is experienced there because if the partners are dishonestly inclined, they will disclose the names of impecunious people and keep back those of people who have money; and it has no effect on the evil which has to be remedied.

Q. Supposing they registered only the men of straw ; then any party dealing with them has this preventive that he can look at the partnership deed and need not deal with them ?—
A. That is my point ; he need not give them credit.

Q. This registered description could not be impugned either by the firm registering, or by anybody else ?—A. A member of the firm may impugn it, if he finds that a man is left out or that a man is entered as a partner who is not a partner.

Q. Supposing a firm consists of A, B and C and was registered. D goes on giving them credit as members of the firm and then files a suit against them, and C also files a suit to get the registration altered, and he wants A, who is a rich man, left out. Would that be possible ?—A. If the two suits are instituted very shortly after the registration of partnership, such a contingency is possible.

Q. But if it is done three or four years afterwards ?—A. The Registration Act ought to provide that if you want to rectify a registration it must be done in a certain time. The register can always be rectified. In the case of the Patent Law for instance it is possible to have simultaneous suits filed against a registered patentee and to rectify the register ; but such a contingency is not likely to occur frequently.

Q. You say that it is open to the public to register their partnerships as things are ; but that custom has prevented this being done and there is no particular reason why it should not have been done hitherto ?—A. There may be other reasons, e.g., the unwillingness of partners to let their internal affairs be known.

Q. But the case of the banks you were citing just now makes it very curious that banks or other financing agencies should never have insisted on their customers registering their partnerships.—A. They have suffered in consequence.

Q. It is very curious they have not done so.—A. Because the banks deal with people who ordinarily carry on business in an honest way. I have known of several cases. I was appearing for a well-known bank and we could not prove partnership. If the bank had insisted, before advancing money, on the partnership being registered, all the cost and time involved in the suit would have been avoided.

Q. Did you ask them why they did not do it, in the first instance ?—A. No, I don't think I did. Even if I did they would have simply said they did not do it. That would not have improved matters. It is always the confidence trick. Dealers go on for years and years doing business in a perfectly honest manner ; pay up their dues in proper time, and the bank has no suspicion. Suddenly, perhaps for reasons over which they have no control, the dealers find themselves unable to pay, and then they resort to all sorts of shifts and devices.

Mr. A. Chatterton.—Q. When two men enter into a partnership, each of whom belongs to a separate joint family, do they pledge their own joint families in any way ?—A. Each pledges the credit of his joint family, if he enters into the partnership as *Karta*.

Q. And in cases in which they are not the *Kartas* ?—A. One who is not the *Karta* has no right to pledge the family credit. He pledges his own credit, i.e., the credit he enjoys independently of the joint family.

Q. Can the *Karta* pledge his own credit separately to his creditors as a member of the joint family ?—A. Yes. A *Karta's* liability fastens on the joint family's property, if that liability has been incurred for purposes of the family.

Q. Can he separately pledge his property ?—A. Yes.

Q. In making an agreement can he differentiate between the two properties ?—A. Yes.

Q. Does this law about *Kartas* and their power of representing joint families apply to the whole of India : does it apply to the south of India ?—A. Yes. If I may explain, Hindus are classified under two schools of law. One is called the *Dayabhaya* School which applies only to Bengal, and the other the *Mitakshara* which applies to the rest of India ; and the law of *Karta* is common to both schools, and much about the same.

Q. In the south of India we have been advancing money on the security of landed property ; and it has always been our custom, under the advice of the Government solicitors, to make every party in the joint family sign. Is that necessary ?—A. It is not strictly necessary, if you get the *Karta* as *Karta*, but it is certainly safer.

Q. What protection would you get by registration ?—A. The others may say there was a separation and the *Karta* no longer represented the joint family ; or a member of the joint family may say, "I have separated, and the *Karta* had no right to represent me." It is the interest of the stranger partner to see that the man who represents himself as *Karta* is the *Karta*.

Mr. C. E. Low.—Q. Supposing the defence is raised that the person who registered as *Karta* had no right to register ?—A. If a man does something which he has no right to do, then the usual consequences will follow.

Hon'ble Sir R. N. Mookerjee.—Q. But he is individually liable as one of the partners ?—
A. Yes.

Mr. A. Chatterton.—Q. And is it common, when suits are brought, to declare who is the *Karta* of the family ?—A. Such a suit is unknown.

Q. Supposing there was any dispute as to who was *Karta* ?—A. No, there is hardly ever any such dispute. There can be but one *Karta*.

Hon'ble Sir R. N. Mookerjee.—Q. What made you write this article in *Weekly Notes*? What led up to it?—A. I was recently engaged in several suits each lasting 5 or 6 days, and in the end nothing came of them. The plaintiff could not prove his case. This was not only a recent experience of mine, but has occurred ever since I joined the bar. Recently there was a crop of cases like that, which made me write the letter in question.

Sir F. H. Stewart.—Q. You say that a death in the partnership voids any partnership agreement?—A. Yes, it dissolves the partnership unless there is a contract to the contrary.

Q. Does that apply to Hindu joint families?—A. No. I have explained in my note that, so far as a Hindu joint family is concerned, the joint family is not affected by death or birth; it only affects the shares. For instance, there are 5 male members in a family. Each is entitled to a one-fifth share. If there is a death in the family, then the share increases to one-quarter. If there is a birth, the share is reduced to one-sixth. But the family goes on, irrespective of births and deaths, and is represented by the *Karta*. The *Karta* might change. Supposing the joint family consists of 5 sons and a father, the father is *Karta* and when the father dies, the eldest son becomes *Karta*.

Q. That would not void any responsibilities which the joint family entered into?—A. Oh, no; because once you accept the principle that the liability of the *Karta* is the liability of the joint family, then if the father, as *Karta* incurred liability, that is the liability of the family. It does not matter if the father dies, and the eldest son becomes *Karta* the liability is there. When the father is *Karta*, his debts are payable by the sons, if the same are not incurred for illegal or immoral purposes. The joint family property becomes liable.

WITNESS NO. 471.

MR. G. S. HART, C.I.E., *Inspector-General of Forests, Simla.*

(This witness's written and oral evidence is confidential.)

WITNESS NO. 472.

Mr. J. W.
Meares.

MR. J. W. MEARES, M.I.C.E., M.I.E.E., *Electrical Adviser to the Government of India.*

WRITTEN EVIDENCE.

I will deal first with the condition of the electrical industry in India, making suggestions in the course of my note (paragraph 5) with regard to the question of "Financial aid, guaranteed Government purchase of products for limited period." In the course of my experience as Electrical Adviser to the Government of India, I have frequently had occasion to remark on the shyness of capital in relation to electrical enterprise. Until a few years ago the companies, who obtained licenses for supplying electrical energy to the public, obtained their capital entirely from England. Several fairly promising schemes, after being investigated by specialists at considerable expense, failed to mature. This may have been due to lack of financial support, but it was more probably due to the capitalists being unable to get any assurance that they would get a return on their investment. Quite recently however companies of this nature have been floated successfully with indigenous capital, and have justified their expectations, but on the whole the progress of electric supply has been very slow in India.

2. I do not think that this slow progress has been due to the legislation governing the subject; at any rate this has not been an important factor. The law was revised in 1910 and is now very favourable to licensees as compared with British law; and the subsidiary rules are revised every few years, generally in the direction of less stringency, as the result of practical experience. In such a matter as wayleaves for overhead lines, which are the greatest stumbling block in England at present, India has led the way.

3. Apart from the small municipal water-power installation at Darjeeling, the first public supply scheme was that in Calcutta. This began on a very small scale, but has grown enormously and has proved a great success. So also have the undertakings in Bombay and some other places. Where success has been slow in coming, or has not been achieved at all, I think it has been largely due to the undertakings being tied down to particular manufacturing contractors. It is obvious to the technical man that the conditions in small towns are totally different to those in Calcutta and Bombay, but the English capitalist was probably not so well informed. Having been once bitten he remains shy. There is no doubt at all that electric supply can be made to pay in many other towns with good management, provided that the consumers do not expect to pay low rates for a few years and the shareholders or ratepayers, if the scheme is municipal, are prepared for the almost inevitable loss in early years of working. Given that concerns are being run by people who have no axe to grind, and to whom the shareholders' interests are the prime consideration, capital will probably be forthcoming. Municipalities, except in hill stations where there is water power, have been very unenterprising.

4. In electrical concerns the majority of the higher supervising posts must, I think, inevitably be held by European trained engineers. Experience in manufacturing works is a *sine qua non*, and no such electrical works exist in India. It is probably true, however, that this does not greatly affect the total working costs. Analysis of published figures shows that, while supervision and management cost decidedly more, labour costs much less in India than in the United Kingdom.* Lack of progress is not then due to this cause. The lower grades of supervision are already staffed by men trained in India, including Indians.

5. In most cities that are likely to be able to support an electric supply company there are a certain number of buildings in the occupation of Government. The probable consumption for fans and lighting, and perhaps printing or pumping machinery, can be gauged approximately beforehand; and sooner or later these buildings will inevitably require a supply. Where Government takes the lead the public are certain to follow; but the result of a preliminary canvas of inhabitants is almost invariably disappointing. Government, however, cannot be expected to pay out cash until it is able to use the electricity it buys; what it can do is to guarantee an annual sum equal to the value of its estimated consumption, to come into force as soon as the installations in question can be fitted up and (say) within a year of the commencement of supply. In several towns guarantees of this nature (though differing in detail) have been given with good effect. Such guarantees during the early years, when some loss to the concern is almost inevitable, would be a great incentive to licensees as well as a direct benefit to the towns in question. The Electric Supply and Traction Federation of India, representing all licensees under the Indian Electricity Act, have strongly urged on the Conference of Government Electrical Engineers the desirability of a Government guarantee on a sliding scale, such that the excess profits over (say) 10 per cent. are returned to the guarantor.

6. Much misunderstanding arises from reference to electric *lighting* as though it were one with electric *supply*; an anachronism due mainly to the unfortunate British "Electric Lighting Act" of 1882. Domestic lighting is now perhaps the least important of all the various applications of electricity. In the Indian towns which have at present no supply the mainstays of an undertaking must be electric fans and street lighting. From the point of view of the supplier these are the applications which pay, owing to their long hours and high load factor. From the point of view of the towns they spell health and improved public order. The public lighting of most Indian towns is at present deplorable, and good illumination would perhaps almost pay for itself indirectly in decreased crime.

7. As regards light, technical advances in the last few years have given about three times the amount of light for a given expenditure of power. More than ever now, domestic lighting is by far the least profitable item in the output of a power station, owing to the fact that its maximum demand occurs at the same hour for every consumer and lasts but a short time. Of course in industrial districts power supply to factories and the like is far more important than any domestic application, but these places mostly have a supply in being already. For new industries, especially electro-chemical, both fuel and water power are available.

8. Consumers in India expect to get their power as cheaply as consumers in large cities in England. In course of time they will probably be in this happy situation; in some places, for special purposes, it is already an accomplished fact. The grounds for and against a cheap supply in India may be tabulated as follows:—

- (i) *In favour of cheap supply.*—A large fan load during daylight hours as well as all night, giving an exceptionally high load factor; the extensive use of overhead lines for distribution, which (especially in the early stages of an undertaking) enables the supply to keep pace with extensions, owing to its lower cost and great flexibility. Lower cost of labour is also of some importance.
- (ii) *Against cheap supply.*—In Indian cities a large proportion of the inhabitants will always be too poor to afford electricity in any form; consequently the premises actually requiring a supply are more scattered than in home cities. Even apart from this factor, the houses in the European quarters are generally further apart. The heavy cost of freight and carriage of plant; the necessity, already emphasized, of European supervision and management; the difficulty of obtaining cheap capital and of avoiding unreasonable promotion expenses, or undue profits to contractors for plant by no means always suitable.

9. It must not be forgotten that consumers in European towns, in the days when lamps were inefficient and motors unreliable, paid rates which would now be considered ludicrous and thus (despite adverse legislation in some countries) assisted to build up a huge industry. A similar willingness to pay fairly high rates at first would materially assist here.

10. Although perhaps without effect on the progress of electric supply, the question of the jerry wireman and contractor—corresponding to the jerry builder—is an acute one in India, and merits attention. Wherever public electric supply exists there must be firms to carry out the installation work in buildings, and in this respect the private standard of work in India is at present lamentable. Proposals were made at the first Conference of Electric Inspectors, held in Calcutta in 1915, for the licensing of wiring contractors and wiremen; these proposals were again discussed at the second Conference in December 1916, and it is hoped that a method may be evolved of dealing with the matter. The Indian workman, and especially the

* See tables in the "List of Electrical undertakings in India" published by the Superintendent, Government Printing, India, 1918.

Sikh, has been extraordinarily clever in learning the technicalities and practical difficulties of wiring work. There appear to be enough of these men to ensure that good work shall be done and a great deal of high class work is done, where the supervision is competent and honest. On the other hand, trading on the general ignorance of electricity, there have sprung up a large number of firms who will carry out such work at cut prices, with the worst material, incompetent labour and no supervision. This state of affairs is of course dangerous, but the examination of every installation by the supply company, the insurance companies or the Government is an impossibility. So long as the lowest tender is accepted the worst work will generally result, except where it is carried out to specification. Engineers in charge of prime-movers are required to be qualified, as already pointed out to the Commission; the Hon'ble Mr. James Currie would apply similar tests to mechanical engineers; and I would extend the list to include electrical engineers and contractors, and if possible electrical mechanics and wiremen. To change the proposition becoming practicable, better facilities for proper training are desirable; and, as limited liability companies are likely to deal with the matter only to the extent of their own limited needs, I think the municipalities should take it up. The training would almost certainly have to be free, the cost being set off against the heavy material loss now occurring through bad work. The class of men in question would not voluntarily pay to be trained. At present they pick up their knowledge in the way peculiar to India, by attaching themselves to others a little more advanced.

11. *Purchase of stores.*—I now turn to another matter, namely the local purchase of electrical stores for Government work. In this matter the rules have from time to time been altered, but it remains true that most stores have to be purchased through the India Office. In my opinion it would be far better if there were unrestricted facilities for purchasing locally. I am not aware that the officers who now have the duty of purchasing in England have any experience of Indian conditions; the results sometimes point in the opposite direction. For instance, cases have occurred where admirable but very complicated types of oil engine have been supplied, which the average Indian mechanic is quite incompetent to understand or work efficiently. Apart however from specific instances, if a contract is entered into with a local firm for supply and setting to work of plant, the payments will not be completed until the plant has satisfactorily passed its tests on site. No tests in manufacturers' works, even if the Inspector never leaves the room while they are taking place, can ensure that after 7,000 miles of transit by sea and land the same results will be obtained in a different climate and at a different altitude. The usual British methods of packing alone have precluded much hope of this in the past. Most of the large electrical manufacturing firms have branches or agencies in India, with engineers familiar with the climate, the modes of land carriage, and the ways of the Indian mechanic and his attendant coolie. Inevitably these branches carry out most of the private work, and are therefore in a far better position to judge what is necessary and what is useless than their principals in Great Britain. If the latter receive an enquiry through the India Office they will have to conform to the requirements laid down; enquiry as to whether this is suitable, from their Indian branch, would mean useless delay and presumably a loss of some part of the profits. In the case of bulky material, where shipping freights are perhaps the ruling factor, supply through the India Office is probably the better course; electrical goods however do not come in this category; not even plant, still less accessories. Agencies are of course much less satisfactory than actual branches.

12. *Co-ordination of Engineering Institutions.*—I understand that endeavours are now being made in England to draw the various engineering societies together, so as to co-ordinate their work; and that similar suggestions are being made to the Commission as regards civil, mechanical, electrical and mining engineers in India. At present engineers have no such legal status as doctors and lawyers; anyone can call himself a consulting engineer without let or hindrance, and it is not uncommon to see the misleading letters C. E. put after a man's name, as though they had some real significance. In India it is even more important than in Europe that engineers should have a definite legal status, with power to proceed against unauthorized, incompetent or corrupt practitioners. This applies not only to the electrical profession, though the proportion of untrained men is perhaps greater in this than other branches. With support from Government it should be possible to form a strong association of engineers of all sorts in India, as suggested to the Commission by Mr. Coubrough, such body to have legal powers of inclusion and exclusion, and to work in conjunction with branches of the existing Institutions of the Civil, Mechanical, Electrical and Mining Engineers.

13. *Advisory Boards.*—The association suggested would, amongst other functions, be able to provide an Advisory Board for the settlement of technical questions. The necessity for such an advisory body has, I believe, already been put before the Commission, and will be further urged in relation to electricity. At the third Conference of Electrical Engineers to Government, held in January 1918, the Electric Supply and Traction Federation of India sent a deputation to discuss questions of common interest. This deputation suggested that industrial progress was hampered by "onerous, unsuitable and restrictive legislation" but in the course of discussion it became clear that the real gravamen of the charge was not against the law and the rules but against their administration. Now the Indian Electricity Act is administered almost entirely by local Administrations, and will certainly continue so to be. In practice this means that the Government Electrical Engineer or Inspector has the settlement of questions spelling success or failure to industrial enterprises. It is true that an appeal lies from decisions of this officer to the local Government, but the Electric Supply

and Traction Federation urges, and I think rightly, that this means that the technical officer generally has his own way. Possibly a nebulous right of appeal to the Government of India and the Secretary of State may exist, but it is worthless in practice and will probably cease to exist when the foreshadowed political changes come to pass. If the technical officers were invariably of the right stamp it is fairly evident that complaints as to administration would be few and far between; but I cannot admit that this is the case. In the past it has been even less so, and many instances have arisen within my official experience where cases involving big interests have been badly mishandled.

14. The remedy suggested to the Electrical Conference by the Federation was an appeal to an Advisory Board, and I am very strongly of opinion that such a Board is urgently required in electrical matters. The Indian Electricity Act, in section 85, provides for the constitution of such Advisory Boards either by the Governor General in Council or the local Government, but hitherto no such Board has been formed, although the question has been mooted more than once. In discussing this proposal at the Electrical Conference it was not unnatural that some officials strongly objected to an Imperial Advisory Board, to which their decisions could come on appeal; they maintained that a local Advisory Board would be effective. The Federation did not agree with this view, nor do I. Cases have occurred where (in my opinion) a wrong line has been taken up by the technical officer and upheld by the local Government; and a local Advisory Board would probably also support its technical member.

15. Admitting that a direct appeal to the Government of India is no longer practical politics, a properly constituted Advisory Board for the whole of India offers a solution of the problem. It may be necessary (though I deprecate it) to give the final decision to the local Government concerned; but it would seldom care to act contrary to the advice tendered, if the report of the Advisory Board were made public. As regards the constitution of such a Board the Federation suggested the Director of Industries as one member. This proposal is sound so long as the Director has a knowledge of industries, but it is notorious that this is not always the case. Presumably in future such appointments will be filled by men with the necessary training, knowledge and experience. In addition the Board should have a Chairman with administrative experience and an electrical expert. As regards the latter, the Federation asked for the Electrical Adviser to the Government of India; but the Public Works Reorganization Committee (Report, para. 64, lines 8, 24, 56) state that there appears no necessity for this appointment. As commercial opinion does not appear to have been consulted this is not unnatural; and I know well that practically the whole commercial community think exactly the opposite. However, it is essential that an electrical expert, independent of the local Government, should be on the Board, whether he be a non-Government expert or an Electric Inspector from another province. In any case, he should be a man who at some period of his career has had actual commercial experience; men who have never earned their living by assisting to make profits or dividends cannot be expected to take a rational view of company management.

ORAL EVIDENCE, 21ST MARCH 1918.

Hon'ble Sir R. N. Mookerjee.—Q. You say in paragraph 3 of your written statement, "Where success has been slow in coming, or has not been achieved at all, I think it has been largely due to the undertakings being tied down to particular contractors." How tied down?—A. Quite a large proportion of the electrical undertakings in India were started by particular manufacturing contractors. I would rather not mention names, but these, seeing that there was a chance of making money in these places, got licenses and got the contracts for supplying machinery and plant without any competition; they were able to sell their own plant at their own prices, which were very much in excess of the market rates, and so the undertaking remained tied down to those particular contractors for years and years after they were started.

Mr. C. E. Low.—Q. Although in some cases there was a breach of the conditions and the contracts were cancelled?—A. They were cancelled in the end, but for years all the profits went to the contractors and the company was left high and dry. Some of those companies, such as the one in Cawnpore, took a long time to pull through; similarly Allahabad and Lucknow, and also Calcutta and Nagpur. I know in some particular cases that the profits which the contractors made were very great, while those made by the companies were entirely negligible for years. That has discouraged capitalists from putting money into electrical undertakings since. Calcutta, of course, was bound to pay from the very start, as they had conditions more favourable to them than any company has ever had since. They can be bought up as a "going concern," whereas many others can only be bought for their "then value" which is practically scrap value.

Hon'ble Sir R. N. Mookerjee.—Q. Your complaint is that the firms who obtain licenses give them out to certain contractors at higher rates?—A. It is really the manufacturers themselves who get the licenses and proceed to instal plant and do the whole thing themselves, as engineers, contractors, managers, they being the company practically.

Mr. C. E. Low.—Q. Would it not be correct to say that contracting firms take the initiative in these cases?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. And if they did not do it?—A. They take the initiative certainly, and put up plant; but they put up what it pays them best to do, as contractors, rather than what would pay the company best in the future.

Q. But the public subscribe to such undertakings?—A. Yes.

Mr. C. E. Low.—Q. Was it not the rule that the capital was subscribed through the initiative of local people?—A. Not always; in one or two cases it was so; but in the other cases the capital was got in London.

Q. Those were the earlier cases; but in the later ones was not the capital got together by the initiative of local people?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. In paragraph 4 you say, "In electrical concerns the majority of the higher supervising posts must, I think, inevitably be held by European trained engineers." Don't you think that Indian engineers could hold these positions as well?—A. In time they might; but at the present moment there are so few Indian engineers who have had a chance of works training. It largely turns on that question of works training. A man must have been through large engineering works in order to be enabled to undertake such responsibility. With the exception of a few trade and railway works, the great majority of engineers in India at present are not able to get that training. They have got college training which does not fit a man for the commercial side of an electrical undertaking. A man must not only be an engineer, but have been through a drawing office, an estimating department, and all the commercial side of a large works unless he happens to be altogether an exceptional man.

Q. What about those Indians who have been to America and had European training? There are a few such now in India.—A. There are men like that. Sir Dorabji employs many Indians, and I know a good many myself who are exceedingly promising.

Q. In paragraph 5 you say, "Government however, cannot be expected to pay out cash until it is able to use the electricity it buys." What do you mean by that?—A. Companies sometimes want to get a guarantee from the very start, in advance of the Government consumption. It takes some time before Government finds the money for wiring its buildings, putting up motor pumps and fans, while the company says, "Unless we can get the money to start, your guarantee is of no use to us." They want Government to begin paying from the very start.

Q. That is a sort of loan or advance payment?—A. It would practically be that. They want the Government to guarantee to buy (say) fifty thousand units per annum, at a certain rate, and they want Government to pay for those fifty thousand units at once, while, perhaps, Government is only using five thousand units at the time. The company want the Government to pay for the entire fifty thousand units from the first year of the undertaking.

Q. In your opinion do you think it fair that Government should pay reduced rates?—A. No. In regard to that matter I am originally responsible for the arrangement. I made the arrangement between the Calcutta Electric Supply Corporation and the Government of Bengal a long time ago. At the time when the arrangement was made, it suited both parties: it paid Government and paid the company, and it was an entirely mutual arrangement. I said to Government, "This business is here to stay; you will have to wire your buildings in the coming years: why not go straight away and do them now." They told me to estimate the rates for the whole thing and I went to the company and said, "If I can get Government to wire their buildings, will you give them a rebate on the aggregate consumption in all Government buildings?" They said they would, and so we made those terms. I know that at the present time most of the companies in India think that the terms are not to their interest, and that the private consumer has had to pay more in consequence. I think myself now that that is true, that the public has to pay more if Government pays special rates; and that some other arrangement should be entered into.

Mr. C. E. Low.—Q. Is it not also the case to some extent, that Government have a certain amount to do with the terms which are ultimately arrived at by the licensee. Government are receiving certain consideration and are supposed to uphold the interests of the public; not only with regard to the rates but with regard to other arrangements and facilities. Is it not possible that Government might concede certain things to the public, having received other things, such as consideration by way of lesser rates for their own supply? Might they not be influenced by that?—A. No doubt if Government is taking, say, 10 per cent. of the whole output at special rates, the public have to pay more. From the Government point of view, they would naturally want to make the best bargain. That was the view when this arrangement was made. The companies, and I think the public, are inclined to say that Government has got the whip-hand by being in a position to tell them to take it or leave it, and that they will put their own plant down if the company does not give them the rates.

Q. Are Government the biggest consumers?—A. Not the biggest, but very near it.

Q. Do they have a specially favourable load factor?—A. No, a very bad one.

Q. Is anything of the same kind done in England?—A. No, nothing of the sort.

Q. Do you know if it is done anywhere else?—A. No, I am not aware of it.

Hon'ble Sir R. N. Mookerjee.—Q. The general opinion is that Government should encourage all these industries?—A. So it should.

Q. But in practice Government instead of encouraging takes advantage of the situation and obtains reduced rates?—A. Yes.

Q. Do you approve of that policy as head of the Electrical Department?—A. I approve of Government encouraging undertakings by every possible means, and not discouraging them. I have been trying to encourage the electrical industry for the past twenty years, but have had great difficulty, because the decision in such matters rests in the hands of the provincial Governments and not in mine. I should like to say on this point that I have seen the memorandum* put up by Mr. Griffin on behalf of the Electric Supply and Traction Federation and except for a few details, agree with everything in it. Generally speaking, I agree with the whole of that memorandum.

Sir F. H. Stewart.—Q. In paragraph 10 you say, "To ensure the proposition becoming practicable, better facilities for proper training are desirable; and, as limited liability companies are likely to deal with the matter only to the extent of their own limited needs, I think the municipalities should take it up." I don't quite understand what you want the municipalities to do: is it to insist that the work is carried out properly or to provide training?—A. It is a difficulty that we have been discussing for years. Take the case of Calcutta or Bombay or any of the big cities. In half the houses of the more ignorant class of people, who know nothing whatever about electricity but who want their houses wired and can afford to pay for it, the installation is defective. They ask their friends, "Whom shall I get to wire my house?" and they find some little man who calls himself an electrical contractor, and, in four cases out of five, is neither competent himself nor are his workmen, and the work is done with bad material and bad supervision. This is a great source of danger to houses by fire, and is getting worse yearly. It was laid down many years ago that, when properly installed, electricity was the safest illuminant; but that, when badly installed, it was very dangerous. In order to prevent incompetent people from setting up as electrical contractors, I suggested that the Government of India should address all local Governments, saying that it was a matter for each local Government to take up itself, and suggesting that action should be taken towards this end. Some of the local Inspectors have been instructed to see what can be done, and some have started the licensing of wiring contractors and wiremen; so that, unless a man has got a license from the municipality or local authorities, which can be endorsed like a motor license, he cannot practise as an electrical contractor.

Mr. C. E. Lowe.—Q. Can an Electric Inspector inspect a domestic installation?—A. He has power "to enter any place, carriage or vessel" in which electricity is installed or used; but he does not go to inspect a private installation unless requested. He is supposed to go into factories.

Sir F. H. Stewart.—Q. With regard to your suggestion of an Advisory Board, what are your views as to its composition?—A. I have changed my point of view a little bit since last week. We discussed the matter, when it came up in several connections, at our recent conference. It was brought up by the Electric Supply and Traction Federation, who asked for an Advisory Board consisting of myself and the Director of Industries as another member. I thought this out, and, after our conference, sent up a suggestion to the Government of India that it would be better to constitute an Advisory Board consisting of five members; a Chairman, who would not be a specialist at all, and who would be appointed by the local Government; the Director of Industries; the Electrical Adviser to the Government of India. Then I suggested that the local Electric Inspector should be appointed, and, *per contra*, a man appointed by the local Chamber of Commerce. Those two would set off one against the other. That arrangement would be free from some of the objections to an Imperial Advisory Board, which some of the local Governments hold. Some of the local Governments have a great objection to any Imperial officer having a say as to what is done in their provinces. A Board like that would have only one Imperial officer out of the five members. I find however that the Federation are very strongly against having the local Inspector on the Advisory Board, looking into his own decisions.

Q. I do not quite understand how many of these Boards you want? One central one or one for each province?—A. If you had a Board of five, you would have four members from each province, and I should be a member common to all. If you had a Board of three members, it would consist of myself, the Director of Industries and the Chairman who would be a local man.

Q. What is the summary of your ideas?—A. That there should be a Central Advisory Board of three, and a local Board in each province of perhaps five, the one Board consisting of the same officers (*i.e.*, men holding certain appointments), but whether they would be the same men would be a matter of convenience. It would probably not be better to have one Director of Industries to go all over India, but to have the local Director of Industries for each province. My alternative proposal is for a Board of five, but there would be strong opposition to that, with the Electric Inspector on it; so that I am quite willing to say that the Central Board of three will do equally well.

Q. That is only to be advisory?—A. Yes, necessarily as the law stands.

Q. Who would have the executive authority?—A. The local Government, because we are entirely decentralized. I am only a Government of India official, and have no powers not even those of a head of a department under other Government departments.

Q. You say that the chief complaint was not against the law and the rules but against their administration. Would the Advisory Board have influence over the administration?—

* *Fide* Appendix A printed after oral evidence.

A. I cannot say. It would, if it was a body of weight. I presume the Chairman would be a senior Indian Civil Service man. You could by law give the Board more than advisory powers. Personally I should be in favour of that; but I am sure that every province will object to it.

Q. Do electrical problems vary very much in different parts of India?—A. Yes, considerably, and the treatment of them.

Q. Does that not strengthen the case for local control?—A. The principles are the same everywhere and are capable of a common-sense solution.

Q. Under which department of the Government of India do you work?—A. Under the Public Works Department, whereas my work has far more in common with Commerce and Industry.

Hon'ble Sir R. N. Mukerjee.—Q. What is the remedy for all these complaints?—A. At the present moment any consumer can appeal to the Electric Inspector, and an appeal lies from decisions of this officer to the local Government; but licensees are not at all satisfied with this and say that the appeal to the local Government is useless.

Mr. C. E. Low.—Q. What is the lowest salary paid by any local Government to an Electric Inspector?—A. I think Rs. 500.

Q. Do you know what the Bihar and Orissa Government pay now?—A. Yes, Rs. 700.

Q. Is there not a number of high-class installations in the Bihar and Orissa province, which are in charge of men on considerably higher pay than Rs. 500?—A. Yes, the big colliery installations are in charge of men of far greater experience, better training and more pay than the Electric Inspector.

(Witness here gave confidential evidence.)

Q. What is the legal position regarding appeals, under the Electricity Act, to the Government of India? Does the Indian Electricity Act make any provision for such appeals?—A. No; the Indian Electricity Act says there shall be an appeal from the decision of the Electric Inspector to the local Government or the Government of India, as the case may be, because either can appoint an Electric Inspector; but there is no appeal from a local Inspector's decision to the Government of India except in the sense that the latter have a general power of control under the Government of India Act.

Q. I am not quite clear about this Board: is the Board of three to be provincial or Imperial?—A. I don't care what you call it. The industry want me on it, and I think I should be on it. The Federation ask for a Director of Industries. He would be local, and the Chairman would in all probability be a local man. The best thing would be for it to be an Imperial Board, with the Director of Industries brought on as a third member, and the Chairman an Imperial officer. But that would mean a great deal more expense, and I don't think the Government of India will be able to do that. They would be able to appoint one Imperial man, but if they made the whole Imperial, it would cause a lot of opposition.

Q. You recognise that there is a very strong feeling held by local Governments against interference by the Imperial Government?—A. Yes, and I sympathize with it but new industries require different treatment from old established ones; and some local Governments are badly advised.

Q. What is the objection to your having the local Electric Inspector on the Board, according to your original idea of a Provincial Board of five members?—A. The original idea was a Board of five with the local Inspector on it, in order that he might put the case which was being appealed against before the Board; but I am inclined to drop that simply because the Federation tell me through their officers that they would not have confidence in a Board on which the Electric Inspector sat, because it will be about his decision in every case that the Board will have to decide.

Q. In the case of an executive decision of this kind, is there any particular objection to having the authority appealed against present, when you have the Electrical Adviser to the Government of India there; and you have other people representing the appellant and two unprejudiced outside authorities?—A. I pointed out to the Government of India that there would be four disinterested people against one officer concerned in the order appealed against.

Q. Would not the presence of the Electric Inspector on the Provincial Board be much more acceptable to the local Government?—A. Undoubtedly. The local Government don't want me; they will object to having me.

Q. It would be much more easy to have you, if they had also their own man?—A. It would.

Q. There are no works manufacturing electrical appliances as a commercial proposition in India at present?—A. Not on any large scale. There are the Calcutta Pottery Works which are making accessories. No factories are making electrical machinery: just repair work, but not manufacture.

Q. That makes it very difficult for an Indian to get shop-training in this country?—A. Yes, electrical shop-training. He can get mechanical, but not electrical.

Q. What is your view regarding the inception of surveys for hydro-electric sites by Government in this country?—A. It is rather an important matter and I have made a note on it. (The witness here read the following note.)

Hydro-Electric Survey.

(i) I am strongly in favour of a reconnaissance survey being made in the first instance. A detailed survey would take a long time, cost a lot of money, and be largely wasted for reasons I will explain. I believe that desultory enquiries have from time to time been made as to the available water power in India. Such investigations as have been made, however, have not, I think, been carried out by experts or on very well defined lines. The development of water power is quite a different proposition to irrigation or the like and the conditions are little understood. For large scale water power one of three conditions must be fulfilled—

- (a) A large flow of water with a potential fall capable of utilisation, i.e., a difference between the head and tail waters of least 4 or 5 feet and up to any head.
- (b) A comparatively small flow of water with a high head, up to 3,000 feet or even more.
- (c) A site capable of storing monsoon rainfall in sufficient quantity to last through the dry weather (with or without any normal inflow) at an altitude and in a position such that it can be discharged through a high head.

In case (c) the size of the reservoir definitely determines the total amount of power stored. In cases (a) and (b) there is not only the power available from the normal flow, but the possibility (especially in b) of storing excess monsoon flow. Furthermore the normal flow continues all the 24 hours, whereas the power demand varies, so 1,000 H. P. may be made to give 3,000 during the hours of heavy load, by suitable storage.

(ii) In all three cases the fall may be either a natural one or may be developed by carrying the water in flumes or canals, with a very small bed-slope, to a point where the necessary drop can be obtained. As the power available is proportional to the product of the quantity of water and the head it is immaterial which you have. In exceptional cases both are obtainable.

(iii) These conditions rule out most of the rivers in the plains of India where the natural bed slope is so small and the seasonal rise and fall of the water so comparatively great that economic development is impracticable.

(iv) Again, it is useless to have available power with no demand for it, as is the case of the Jhelum at Mohora. Before a reconnaissance survey is put in hand all the industries which it is proposed to start should be known. Then the question of raw materials must be looked into. Unless either the raw materials are near a possible site for water power or are within transmission distance of it—say, roughly 200 miles for large scale operations—it becomes a question of whether expensive freight will counterbalance cheap power. Presumably the Commission have full data regarding this point. In this way the ground to be examined might be greatly circumscribed.

(v) Many irrigation canals with a large volume of water come under head (a) in that they have small artificial falls from 5 to 10 feet capable of utilisation. But in most cases there is an annual closure which militates against commercial use. For sub-soil pumping and high level irrigation however the closure is not objectionable. There ought to be no difficulty in collecting information through the Irrigation Department of all useful canal falls. The data required are merely the maximum and minimum discharges; the maximum and minimum differences between head and tail level; places where two or more falls are near enough to be jointly utilised; and the maximum and minimum closures.

(vi) Some rivers also come under head (a) and the Cauvery and the Jhelum have been utilized for power with a moderate flow and a moderate head. It ought not to be very difficult to ascertain, from local engineers, all possible places where rivers of moderate (or large) flow have enough natural fall to make development possible. Wherever there are rapids, wherever a river turns in a loop with a moderate natural bed slope, there are possibilities. In the first instance the roughest calculation of the discharge and of the difference of levels would alone be required. Beyond that expert advice is needed.

(vii) Coming to head (b), the conditions to give high heads must necessarily be in the hills. The first stage here is to find out where hill streams with reasonable catchment areas have a perennial flow at altitudes from 2,000 feet and upwards, with a drop of that amount (or more) within easy access. Steep ground is therefore essential. Much could be done in the first instance by the examination of contoured maps by engineers familiar with the district. This would eliminate the useless sites. The next stage would be a series of very rough dry weather gaugings, coupled with aneroid determinations of height at the gauging point and at the lowest point within a few miles where a power station could be placed. Differences of altitude of 1,000 feet upwards should be looked for with pre-monsoon discharges of 30 cubic feet per second and upwards. These minimum figures combined would give about 1,000 kilowatts of power continuously, and considerably more under actual conditions with storage. Anything below that is hardly worth looking for except for hill station supply.

(viii) Under head (c) come at present the various Tata Schemes in the Bombay Presidency. I think this enterprising firm have already examined most possible sites in the Western Ghats, but there may be other localities where similar development is possible. To find these, if they exist, the first thing is to mark off all districts with extra heavy rainfall at high altitudes. The Assam Hills may be cited as an example. Such places alone can be of any use. Next it is essential to know whether these places have geological formations suitable for impounding very large volumes of water by means of dams. Thirdly it is necessary that there shall be a drop of 1,000 feet or more (the more the better) within reasonable distance. Most of these particulars are probably obtainable either from the Meteorological or Geological Departments, coupled with information obtainable by local engineers. Heads up to 5,000 feet have been utilized.

(ix) Such a reconnaissance would be neither tedious nor expensive. As sites fulfilling the conditions of (a), (b) or (c) were found they could be reported—this is more likely to bear fruit than the usual method of collecting a vast mass of figures before submitting them. Each promising case could then be examined by an expert in water power, who could determine in a course of a few days whether it was worthy of detailed investigation. If it proved so he could give in detail the lines on which that particular case should be examined by the engineers on the spot. Most of the surveying and gauging could be done by good Indian subordinates, under direction; and with the necessary guidance the local engineers could determine if there was a suitable site for a power house and practicable ground for channels, storage, etc.

Q. Do you think that, in cases where it is proposed to utilize canal falls, on anything like a large scale, the decision as to the amount of use which may be permitted, i.e., the conditions under which the use of the falls may be permitted, and the rate to be charged, should be settled entirely by the Irrigation Department?—A. Most emphatically no. In the cases which have come to my knowledge, I certainly do not think so. I grant you

that the Irrigation Department must have a say as to whether the falls can be used or not. If the canal is constructed for irrigation work, you cannot stop such work by switching off the water for a different purpose. But if the falls are to be used for power, the Irrigation Department should have no say whatever in regard to the charge to be made for the water, because the charge should be absolutely nominal in every case. In fact, we should say to the applicants, "Come and utilize the water, and we will give you every possible facility."

Q. Do you consider a charge of Rs. 24,000 for about 700 H. P., with interruptions running between one and two months a year, is a fair charge?—*A.* If you strike off the last three ciphers it would be about right.

Q. But you would agree that the irrigation of crops, speaking quite generally, must come first?—*A.* Yes.

Q. What agency would you suggest to decide as to the conditions to be imposed in a case like that of the Jhelum at Rasul? Do you know the site?—*A.* I have not seen it.

Q. But you know the general situation of it. In the first place, the question has to be decided as to how far a continuous supply could be guaranteed, and for what quantity. Do you think the Irrigation Department should be the only department having a say in that matter?—*A.* No, I think they should have the chief say, but I think somebody above the Irrigation Department should decide whether they are right or wrong. They should give their technical reasons but there should be a higher authority to accept or not accept the advice of its technical men. I think it absurd that our specialist opinions should be treated as absolute at any time.

Q. You realise that, when the Irrigation Department have arranged their programme anything which upsets that programme introduces a lot of new and disturbing factors which may prove impossible to readjust. But admitting the difficulty of that, what agency would you propose for considering what should be allowed in the way of supply to a hydro-electric concern at a place like Rasul?—*A.* That is rather a large question. The present method is for the proposal to emanate from the local Government; it then wanders round the Irrigation Department, then goes to the Government Solicitor, and then to the Electrical officer, when the whole scheme is cut and dried, and when it is too late for him to make any reasonable suggestions at all. I would suggest discussion on the spot by competent experts not of one branch, but all of them to begin with.

Q. In regard to the charge to be levied, who should be the agency to determine that?—*A.* I don't think that any agency is necessary. I think the charge should be nominal entirely. It should not be such that it would cause the slightest difficulty to the company.

Q. You realise that you only transfer the difficulty from one head to another. You would have to decide which, out of the numerous applicants, should be given the concession?—*A.* That would be a matter for the Board of Industries, which, I presume, will some day come to pass in India. At the present moment we have not had many applicants. I know of no cases in which people were competing for concessions. Generally one group asks for a concession and after from 3 to 5 years haggling gives it up as a hopeless task.

Mr. A. Chatterton.—*Q.* Among the suggestions made by the Electric Supply and Traction Federation of India, for alterations in the existing system of administration, is one that the administration of the Electricity Act should be controlled by the Commerce and Industry Department and not by the Public Works Department. Are you in favour of that suggestion?—*A.* Entirely.

Q. For what reason?—*A.* Because the greater part of the questions that come up are commercial questions rather than technical ones. At the present moment we have got a certain number of technical rules, and the Electric Inspector has to see that those rules are complied with. Government has practically nothing to do with that. The Electric Inspector goes his own way in technical matters; but when it is a commercial matter, if I may venture to say so, the Public Works Department is the last department which should have anything to do with it, because they have no commercial knowledge.

Mr. C. K. Law.—*Q.* For the same reason that the Inspector of Explosives is under the Department of Commerce and Industry?—*A.* Exactly. I think it should unquestionably be either the Board of Industries or the Department of Commerce and Industry, but not the Public Works Department.

Mr. A. Chatterton.—*Q.* The Federation also say that the status of Government Electric Inspectors should be improved. I suppose we may take it that your opinion is that Electric Inspectors should be men of the same status as managers of these large electrical supply companies?—*A.* Yes, at least as good.

Q. Apart from commercial considerations, there is a considerable number of technical matters on which the Electric Inspector must give a decision, and his ruling on these matters is, under the Electricity Act, subject to appeal to the local Government. Questions have arisen regarding, for instance, the testing of meters. Has that been brought to your notice in any way?—*A.* Yes.

Q. Have these Electric Inspectors the proper equipment for testing meters?—*A.* Some have; not all.

Q. When a man has not got proper equipment, what happens?—*A.* He cannot test the meters.

Q. How does the Supply Company get on?—*A.* There are some provinces where at present they have no testing to do whatsoever, and therefore no question has come up. If a question did come up, they would have to send the meters to Calcutta. Take the case of the United Provinces. The Electric Inspector there is asking for a laboratory. What he would do if he had a meter dispute I don't know: probably he would take it down to Calcutta.

Q. When a concession is granted by a Local Government, have the plans for the installation to be passed by the Electric Inspector?—*Witness.*—Do you mean for a power house?

Mr. A. Chatterton.—*Q.* For a power house or distribution lines.—*A.* Overhead lines require a general sanction, because if the lines don't comply with the rules, they are turned down afterwards; but in regard to the design of a power house, that is entirely uncontrolled by Government, except in small matters like earthing, etc.

Q. Have such questions come up?—*A.* Mainly in connection with overhead lines, not with power houses.

Q. Do you consider the rules laid down in regard to lines satisfactory, and is there uniform practice throughout India?—*A.* There are uniform rules throughout India. Twenty-five years ago we had the Board of Trade rules which said that poles must have a factor of safety of 12 with a wind pressure of 50 lbs. per square foot, which is absolutely impossible. Government revised the rules about 1898 and brought the factor of safety to 5, and the wind pressure to 25 lbs. per square inch. We went on with that for some time, and found that also impracticable. I then got it brought down to four, and it is now that, and applies to all India. At the present moment I have a suggestion with the Government of India for altering the wind pressure according to zones, in place of a fixed 25 lbs. for all-India, and I have had a map prepared by the Meteorological Department to show these Zones. I also suggested that the factor of safety should be brought down to 3, but the Public Works Department would not agree to that. I have gone back to that point again and suggested the factor of safety of 3 for steel poles. Three is in my opinion ample, but I have agreed to keep it at 4 for reinforced concrete and wood.

Sir D. J. Tata.—*Q.* How about wooden poles?—*A.* They should have a bigger factor of safety. I have seen quite a number that have rotted away in the earth and in some cases the section of the pole had been reduced to one-seventh of its original size. They should not be used here.

Mr. A. Chatterton.—*Q.* It is also suggested by the Federation that Electric Inspectors be given increased power to relax rules and more definite instructions to encourage electrical development.—*A.* They already have power to relax certain rules, and the local Government has power to relax nearly all other rules, which is exactly the same as if the Electric Inspector had the power. He will not, however, exercise that power. To my knowledge rules have been relaxed in only about 8 cases. The Government of India has the power of revision, but that power has never been exercised so far, as the relaxations have all been reasonable. Rules are really only necessary for people who will not do good work; bad work never pays a company which has to go on using it afterwards.

Q. I understand you have a list of electric installations in India. Has that been brought up to date?—*A.* Yes, it is in the press at the present moment. I shall have it out in the course of a month or so.

Q. Can you let us have a proof copy?—*A.* Yes, but it is very incomplete. It has got most of the statistical data, but is not up to date in regard to some of the working costs, as some provinces will not send in returns.

Q. I understand you are a Member of the Institution of Civil Engineers and a Member of the Institution of Electrical Engineers in London. The question is before us as to whether it would not greatly assist the development of engineering in India if we had some society in this country run on lines analogous to these institutions at home. I see from your note that you have given the matter some consideration, and I would like to know your views in more detail.—*A.* The question arose originally in connection with the mechanical engineers, who have a local branch in India. Mr. Conbrough told me what they were doing and gave me certain papers which (as Local Honorary Secretary for India) I have sent officially to the Institution of Electrical Engineers, suggesting that the Council should look into the matter with a view to forming a body out here, composed of the Engineering Societies at home. I think something of that sort, or an alternative, is under consideration; the alternative being that an Indian Institute of Engineers, which would be independent of the home institutions, should be formed. The difficulties which we have in this country at the present moment are very great, from the constant stream of applications that come from young men for admission as members of one of those societies. One can find out nothing about the man. He sends in papers showing he has a certain amount of experience, but somehow or other he has not got the signatures of local people. It is a very difficult question. If you could get a local Institute with sufficient driving force behind it, and a sufficient status, it would be a very fine business indeed.

Sir F. H. Stewart.—*Q.* Which would you prefer; that there should be branches, or a separate institution?—*A.* Speaking personally, I would prefer it to be run from the institutions at home. I would not, however, be sure as a matter of policy whether the other would not be the best.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You say in the tenth paragraph, "This state of affairs is of course dangerous, but the examination of every installation by the supply company, the insurance companies, or the Government is an impossibility." In Bombay, the supply companies do not give us current, except after the installation has been examined and passed by their man.—A. Doubtless the statement is rather sweeping, but in point of fact it is perfectly true. The company supplying energy under license has certain obligations not to take on a consumer unless his installation is in reasonably good condition. If a new consumer applies for power, the company sends a man round to connect the installation, and he takes a testing set and tests the insulation resistance. He may have a glance round the part of the installation nearest to him, but if there is no leakage, he connects the installation on. The company wants to get revenue. They say, "This installation is passable: it is pretty rotten, but is good enough for us." They connect the installation on at once and never go near it again unless there is a fire or other trouble. It is impossible to make periodical inspections of five or ten thousand installations.

Q. This is a very serious question. In a big mill, if I have an inferior installation, and the insurance company accept the certificate of the supply company it means a serious loss to the insurance company, should the installation catch on fire.—A. The insurance people sent over a deputation to our Conference last month and we taxed their electrical inspector with it. We said to him, "Surely it is your business as electrical inspector to the insurance companies to examine the installation." He replied that, as a rule, until the whole installation was erected, they did not get the opportunity to overhaul it, so they took their chance.

Q. What is your suggestion—that the Government Inspectors should do it?—A. No, they cannot do it except for Government work. We want to educate the public not to accept the lowest tender, and to educate the men who do the work to do decent work. I think those are the only two directions in which the matter can be remedied.

Mr. A. Chatterton.—Q. Are accidents reported to you?—A. Yes, or rather to local Inspectors; but many are not reported. I don't think there are a great many at the present time, but there are going to be many more when the present bad wiring goes to pieces.

The witness here desired to refer to the question as to what extent the present Electricity Act is out of date in England. He said that the Electricity Acts there are and have been from the very start utterly hopeless. They were bad, lock, stock and barrel. The Board of Trade rules, which were framed under the Acts, were, without exception, the most restrictive in the world.

Mr. C. E. Low.—Q. Has the position you are now taking up been supported by anybody in position at home?—A. Most strongly by the whole business world. It has been trotted out before several committees. The question has been raised for 30 years without any effect, because the subject did not interest Parliament: but a very able man, who has been Electrical Adviser to the Board of Trade, was strong enough to say the same. There is a tendency on behalf of business men here to take up the same attitude as regards the Acts and rules in India, and I would like to say a word on that. When I came out to India there was only a local Calcutta Act. We started the first Imperial Act in 1903. We looked through the different Acts in England and abroad, and made a simpler Act, with most of the features, to which exception had been taken in England, knocked out. We took the Board of Trade rules, which were then in force in India, and struck out two-thirds of them, altered a large number, and made them fairly unobjectionable. Since then we have revised the rules five times altogether, in the direction of more latitude in every case, and striking out things to which the supply companies rightly objected. In amending the Act in 1910 we took a lot out and made many of the points better: for instance, purchase terms of undertakings. One of the objections at home is the very great cost of getting statutory powers, because you have to go through Parliament at a cost of thousands of pounds. Here a license costs Rs. 500. The second thing was that undertakings at home could originally be bought up after 21 years for scrap value. They subsequently altered that to 42 years. Here an undertaking can now only be bought compulsorily after 50 years, and the price to be paid is not scrap value but scrap value plus percentage up to 20 per cent. The licensees will get a really good price for their undertaking so long as the undertaking is in good condition and is successful. The third difficulty at home, and one which has done more than anything else to keep electric supply down, was that they would not allow overhead lines for many years. In recent years the Board of Trade have allowed big power companies to erect overhead lines, but this concession is practically valueless, because they cannot get wayleaves. We have provided for wayleaves all along in our Act, and the provision works well. I have a proposal for amending that clause under consideration. I have no doubt that within a couple of years the Act and rules will be amended again. My proposals are with the Government of India. The objection which the Federation brought up in regard to the rules is not borne out in practice. Mr. Gibbs of the Tata Hydro-Electric Supply Co., has told me that the rules are on the whole excellent and have given no trouble at all to him. On broad lines they are very excellent indeed. Nor for the matter of that have the Calcutta Electric Supply Corporation had any trouble. The unsuccessful companies, who have never made a success of their business, and perhaps never will, have got to put the blame on something, and so they put it on the rules.

APPENDIX A.

MEMORANDUM FOR SUBMISSION TO THE INDUSTRIAL COMMISSION.

From the Committee of the Electric Supply and Traction Federation of India.

1. For several years there has been serious dissatisfaction among Supply Companies in India with regard to the Indian Electricity Act Laws and Rules under which they operate, and to the administration of these laws. As a result of this dissatisfaction the Electric Supply and Traction Federation was formed in 1916 to enable companies working under the Act to take combined action and lessen if possible those difficulties under which they now operate. The Federation maintains that these causes are stumbling blocks to electrical and industrial development, and their views are expressed more fully in the enclosed copy* of a speech made by the Chairman of the Federation at the Government Electrical Conference in January last, and which I am requested to commend to the attention of the Commission†

The Federation feels that the Commission can do much towards obtaining for electrical licensees the sympathy which is so greatly needed for the encouragement of electrical development, and with this end in view it begs to offer the following suggestions for alterations in the existing system of administration:—

- (a) That the administration of the Electricity Act Laws relating to electrical licensees and the granting of new licenses should be controlled by Commerce and Industry Departments and not by the Public Works Department.
- (b) That the status of Government Electric Inspectors should be improved (*vide* paragraph 8).
- (c) That Electric Inspectors be given increased power to relax rules and more definite instructions to encourage electrical development.
- (d) That there should be an Imperial Technical Court of Appeal to which licensees should be able to appeal where an Inspector gives a decision which is considered unreasonable.

The following reasons are put forward in support of the Federation suggestions:—

2. *Administration of Electricity Act.*—It will be admitted that the training, the duties and the heavy responsibilities of the officers of the Buildings and Roads Department of the Public Works Department produce a strong tendency towards codifying, to framing and enforcing cast-iron rules and specifications, and to spending large sums of money in order to avoid personal risks of unsatisfactory work. The Federation submits that the attitude and view point of any British engineer accustomed to live under such a routine must inevitably be foreign to that required in the control of new industries needing flexibility in the application of rules, and sympathetic encouragement with a view to extending their spheres of operation to the greatest possible extent.

If electrical development, which is so closely linked to industrial development, is really desired by the Government of India, then it thinks that there can be no doubt whatever that the administration of the Electricity Act Laws, in so far as they relate to licensed undertakings should be placed under the Department of Commerce and Industry. It is perhaps not the function of the Federation to suggest to Government how this administrative change should be made, but in order to meet possible objections that the proposal is not practicable, it offers two suggestions—(a) that the electrical officers of Local Governments should report to Commerce and Industry Departments as far as their duties as Electric Inspectors of licensed undertakings are concerned, or, as an alternative, (b) that either the Electrical Adviser, or an engineer with good administrative as well as engineering experience in the electricity supply business, should be permanently attached for the purpose to the Commerce and Industry Department of the Government of India. This officer might need one, or eventually two Assistants; but for the hundreds of power stations in England, the number of Government Electric Inspectors is very much less than now exists in India for less than 25 electrical undertakings.

If undertakings are placed under Commerce and Industry, it anticipates much benefit both to the undertakings by relaxation, where circumstances warrant, of the red tape limits of the law, and not less benefit to the public by cheapening and extension of electric supply facilities. Its experience shows that at the present time the attitude and standpoint of Electric Inspectors is not infrequently that they are required to act as zealous policemen (and even as detectives) ever watching against the possible infringement by licensees of arbitrarily fixed limits. It submits that in place of this their attitude should be that they are Courts of Appeal wherever the licensee gives dissatisfaction to his consumers or prospective consumers, and that where relaxation of a rule within reasonable limits is likely to result in an extension of the supply, such relaxation should be favourably entertained provided that the licensee is prepared to accept responsibility for any civil risks involved. It believes that the attitude of Electric Inspectors would be on the lines suggested in the last sentence if our undertakings

* Not printed.

† The report on the Conference is on sale with the Superintendent, Government Printing, India.

were controlled by Commerce and Industry, and it does not consider that there is any force in the argument that it is essential for these engineer officers to be solely responsible to the Public Works Department. No one appreciates more fully than the engineer members of this Federation the immense debt which India owes to the able men who from time to time fill the positions of Chief Engineers to the various provinces, but, experienced and versatile as these officers invariably are, it considers that everything possible should be done to avoid any conflict of opinion on electricity supply matters between the Chief Engineer of a presidency or province and any Government electrical officer who has had sufficient experience in his own profession to entitle him to act as an Electric Inspector.

3. *Increased Authority of Inspectors.*—Assuming that officers of the right type and experience only are employed, it considers that they should be allowed much more discretion in the relaxation of Electricity Act Rules than is now permitted. Something more than mere permission is required, however, and this is the spirit of willingness to look at matters from a common sense point of view. The deputation of the Federation which met the Electric Inspectors in Conference recently found that various limits mentioned in the Rules are arbitrarily fixed upon by the Government engineers collectively, and its protests at such limits were met by the easy statement that in each province it would be within the discretion of the Inspector to relax the limits in special cases. Its universal experience is, however, that in actual practice the Inspectors are not prepared to consider the merits of any special case, but shield themselves behind the wording of the rule, and are unwilling to accept any responsibility of relaxation. It hopes and believes that under Commerce and Industry Departments all Electric Inspectors would realise, as a few of them do at present, that it is at least as much their duty to assist the extension of electricity supply as to restrict its use by the application of rigid limits.

4. *Imperial Technical Court of Appeal for Licenses.*—The Indian Electricity Act, Section 36 (3), states that an appeal shall lie from the decision of an Electric Inspector to the local Government. In practice the decisions or requirements of an Inspector, modified as they may be, and as the Federation knows they sometimes are, by the Chief Engineer of the province, are issued by the Chief Engineer in his capacity of Secretary to Government in the Public Works Department, and if the licensee wishes to appeal from the decision, the Appellate Court in practice is also the Chief Engineer, in consultation with the Electric Inspector. Common-sense dictates, and experience confirms, that an Appeal Court of this nature is of scarcely any value, and the Federation asks for entire separation of the executive and judicial in these matters.

The Federation has already suggested, at the Government Electrical Engineers' Conference, that there should be an Imperial Appeal Court composed of the Electrical Adviser and Director of Industries, and now suggested that the Appeal Court should meet twice a year only. To avoid vexatious references a forfeitable deposit of, say, Rs. 150 might be demanded from each licensee when filing his appeal.

5. Apart from the question of alteration in the administration of the Act referred to in the above paragraphs and hereafter, the Federation also wishes to put before the Commission its views on the important subject of the means whereby Government action financially may encourage and foster new electrical developments.

6. *Development of Town suppliers.*—There are many small towns in India wherein a supply company could earn a reasonable return on its capital but hitherto great difficulty has been experienced in raising enough local interest in such schemes to produce a sufficient financial backing. Some municipalities have gone to the extent of guaranteeing to take a certain amount of power per annum and others have guaranteed to pay a certain monetary sum for street lighting, but experience has shown that neither of these forms of guarantee are sufficiently attractive as they are not understood by the general public who look for a definite guaranteed interest on their money. The result has been that the major portion of the capital hitherto invested in existing undertakings in India is drawn either from England or from large industrial cities, such as Bombay or Calcutta, and local interest which is such a desirable feature does not exist.

From an industrial point of view electrical undertakings differ from other manufacturing concerns and have two peculiarities, one of which is that they do not produce a commodity which can be bought and sold in other markets, thus becoming a source of profit to dealers or merchants. These schemes therefore fail to interest traders as does an ordinary manufacturing company and it becomes necessary to attract investors in some other way.

Another peculiarity of supply companies is that, in the case of smaller towns anyhow, it is not feasible to start with a small capital and build up a business as the concern flourishes, to anything like the extent possible in other industrial enterprises. There is a minimum expenditure possible for plant, mains and buildings which minimum may mean as much as 75 per cent. of the capital value at the end of ten years working and is often a very substantial sum, also there are heavy outgoings for the payment of a full staff which is necessary as soon as supply is started, all of which takes place without the possibility of any return until it is convenient for other people to make a considerable outlay in wiring their houses. The result is that few companies are fortunate enough to earn sufficient to pay their way, until they have been established for two or three years. As against this disadvantage, supply companies however have an advantage not often enjoyed by other industrial enterprises namely that they seldom lose customers; for when a

house is once connected (except during temporary periods, such as when the house is empty) they can be reckoned on as a consumer for all time and a constant source of income. Thus the business is an ever and surely increasing one, not subject to market fluctuations and slumps, such as other businesses suffer from.

This being the case it is quite a sound business proposition for Government to guarantee a minimum return to investors in supply companies—provided, of course, that they first satisfy themselves that the town under consideration is sufficiently wealthy to support an enterprise of this nature. As a return for the capital guaranteed and to recoup the sums they would probably be called upon to pay out during the first two or three lean years, it could be arranged that they should share in profits which may be earned by the company over a fixed percentage (of, say, $5\frac{1}{2}$ per cent.), half of the excess above this figure going to the shareholders and half to Government in perpetuity or some scheme on the lines suggested in our Chairman's speech at the Electric Inspectors' Conference. Such an arrangement is a much more equitable one than that of giving Government a special rebate on bills for current supplied to their buildings which has the effect of delaying the time when the company could afford to reduce to the public the rate fixed upon when it first started business.

Another retarding factor in supply company development is the system of finance adopted in making loans to municipalities. Many cases occur where pumping for waterworks and sewerage is in existence and which could easily be adapted to working electrically. The stumbling block against this hitherto has been that municipalities claim they can pump at a cheaper rate by using their own engines and staff than a supply company and figures are produced in support of this statement.

On investigation, however, it is found that as far as fuel, oil stores and running staff are concerned, the supply company can do as well if not better than the municipality, but where other charges are concerned, such as return on capital repairs and depreciation, the supply company's costs are considerably higher.

The reason for this appears to be due to the fact that money can be borrowed by municipalities from Government on terms quite impossible for the company to obtain from the public. In one particular case a municipality borrowed at $8\frac{1}{2}$ per cent payable in 30 years or an equivalent of $3\frac{1}{2}$ per cent depreciation on the plant. Needless to say long before the 30 years had expired and the first loan redeemed a large portion of the plant had become useless and a fresh loan was obtained wherewith to purchase new plant. This method of obtaining money for renewals and depreciation of plant is commercially unsound, but all the same was the basis on which the municipality calculated their total costs.

As the company, as a business concern, had to set aside adequate sums to provide against obsolescence, depreciation, renewals and interest on capital, their total costs were considerably in excess of the figures put up by the Board.

There are many towns where pumping schemes are maturing at the present time; the load for which would form a solid foundation for the development of a supply company, but, under conditions as instanced above, negotiations usually come to a standstill and the opportunity goes by.

To meet cases, such as the above, we suggest that a rate be charged based on actual cost price of current supplied for pumping or whatever operation it is plus a percentage which cost can be easily ascertained by reference to the company's accounts.

As the outside load develops, so this cost will fall until in course of time the municipality will be able to get its power at a low rate and a further object is achieved in that electricity is introduced for street lighting and developing small industrial concerns as well as for private lighting and fans. A certain amount of knowledge is required to be able to forecast the electrical possibilities of any particular town; but the Government of India has an official in its Electrical Adviser who would be in a position, in conjunction with the proposers to form an accurate judgment on this point. As mentioned above, the possibilities of small towns are numerous, and it is only necessary for Government to treat the whole subject in a sympathetic and practical manner to enable these schemes to mature and develop.

7. Since the above memorandum was prepared, members of the Federation have had an opportunity of seeing the recommendations of the Public Works Committee in regard to the encouragement of private enterprise, and they wish to express their great appreciation of the policy embodied in the recommendation and their agreement with practically every point raised.

8. *Suggested improved status of the Electric Inspectors.*—This matter* was very fully discussed by the Federation, and its opinion is that in view of the large and further expected development of the electrical industry in India, the status of the Electric Inspectors should be much improved.

The Federation understands that in some provinces Electrical Inspectors receive a commencing salary of Rs. 400 per annum and are appointed under Section 38 of the Indian Electricity Act, 1910. Clause 2 of this section states that the local Government may, by notification in the local official gazette, appoint duly qualified persons to be Electric

Inspectors. The Federation is not aware of the qualifications called for by Government, * but is of the opinion that they should be of a high grade and considers the following qualifications should be aimed at:—

The Electric Inspector should have a thorough training as an Engineer. This training should consist of at least 3 years in large engineering works and 2 years at a technical school or college.

The Electric Inspector should have had at least ten years' service with an electric supply corporation, the latter portion of this training in the distribution department. With this experience he would have to deal with the business side of undertakings as well as the technical side, particularly the distribution.

The age for an Electric Inspector should be not less than 32 years and the commencing salary should be not less than Rs. 800. With this scale of salary the Federation considers Government would be able to obtain a suitable class of officer to deal with the Electric Inspector's duties thoroughly and efficiently from the Government's point of view as well as the licensees.

WITNESS NO. 473.

MR. W. A. FRAYMOUTH, F.C.S., *Managing Director, Eastern States of Central India Export Trust Company, Limited, Mairhat, Central India, and Director, Essociet Tannin Research Factory, Indian Munitions Board.* *Export Mr. W. A. Fraymouth.*

WRITTEN EVIDENCE.

The future of hides and tanning in India.

In submitting the following to the Indian Industrial Commission, I would explain that my ideas are based on my personal experience during six years work with the worst quality of hides in the whole of India, and during the last 9 months, with high quality hides as tanned in the Government Tannery, Allahabad, and in the Research Factory.

I would state at once that I had no experience of hides or tanning before the year 1910, but that I have had considerable previous practice in chemical and general technology.

It will be remembered that a year before the outbreak of war, there was much agitation by Indian firms and others, to protest against a strong combine of German and foreign firms, who attempted to control the business of export of hides from India.

There is no doubt whatever that Germany systematically bought huge quantities of hides during the 20 months before the war, thus raising the price of raw hides throughout India, and that these were bought for the purposes of the war.

It is known that during the last 20 years, the export of hides was in the hands of German and Austrian firms and that British firms did not participate to any great extent in this huge trade.

If these conditions are to be altered in the future, steps must be taken and as a first step, Hides it is quite clear in my mind that it is essential to the hide and leather industry of India that the whole system of hide collection should be revised.

We are faced with the fact that at least 12,000,000 hides are available in India every year, as hides that are taken off the animal after natural death. The number of hides that are taken from slaughtered animals is relatively negligible and in any case these hides are so good that they can look after themselves. We need, therefore, only consider the "dead hide."

This category includes many hides which are classed as "slaughtered" or as "commisariat" in the markets of India and when exported, but I would make it very clear that the highest qualities such as "Best Dacca Slaughtered" as selected, baled and exported from Calcutta are nearly all "dead hides."

Real slaughtered hides can obviously only be available where there is a demand for beef and the few centres where such a demand exists in any degree can easily be imagined.

It is an open question, whether a hide that is taken off an animal directly after natural death, is of less value to an expert tanner than one which is taken off after the animal has been slaughtered and bled. In any case a dead hide which has been flayed carefully and which goes at once, while "green," into the hands of a careful tanner will afford very good leather.

Although the conditions in my States are not exactly similar to those in other parts of India, I may here describe the usual way in which the hide from a cow that has died is treated. The animal is taken ill, say with colic. It is brought in to near the homestead and there attempts are made to doctor it. The remedies usually fail and the animal gradually dies, so gradually in some cases that its hide actually rots before the animal is dead. We must realise

* The required qualifications are laid down in Indian Electricity Rules, No. 8.

that in no case will the owner put the animal out of its misery unless in the rare cases when a non-Hindu hide merchant is the owner. When quite dead, or at the moment when the carcass becomes objectionable, the local *chamar* is called in to remove it.

More often than not the low-caste *chamar* may not enter the precincts where the carcass lies. Ropes are tied to the animal's legs and it is dragged on its side for perhaps a half-mile.

This custom is the cause of the commonest fault on the dead hide, i.e., "scratched" or "rubbed grain." The *chamar* does not always flay the animal at once. More often the carcass is visited by carrion birds which peck at the hide, until it is covered with scratches and tears, before it is flayed.

The hide is taken off, usually carelessly with resultant "butcher cuts" and it is allowed to dry as it is, without stretching or cleaning. No subsequent care is taken to store the hide properly and so eventually it reaches one of the centres where hide dealers wet it down, stretch it and smear it with salt and plaster to cover up the evident faults.

It is these hides that eventually are sorted and baled in Calcutta for export. It is only from the published export figures that we can estimate the number of hides that India produces, but from my experience in our States I feel quite certain that for every hide that reaches Calcutta, at least one more hide is spoilt completely and is thus lost. At the lowest computation this means a loss of half a million pounds sterling per annum.

Some 5 years ago, I was called upon to sell big lots of the ordinary badly collected "real dead" Central Indian hides. While these could be sold, as they were at 7 annas per lb.; by cleaning, stretching, disinfecting and classification I was able to sell them at 12 annas per lb. Thus I found the secret of the German firms' success:—*Classification*. By taking infinite pains to put a general average class of hide in each bale, the hide expert was able to supply the continental tanner with exactly what he wanted. Having bought a bale of say, X-2 mark hides, the tanner knew that he would get the same quality as he had previously bought under the mark X-2.

Prior to the German interest in this trade it had been the custom to send all hides direct to London, there to be auctioned and dealt with by the London hide experts, whose firms used to take the profits on sorting and classification, but even then, I am told, the bulk of the low class hides of India went to the continent, where by special means big profits were made. The British merchants thought there were no profits in low class hides.

The others knew better and in face of the German methods the old trade languished practically to extinction.

It will be asked why the British export firms do not engage hide experts and copy the German classification? Such experts are not easily found. A good judge of hides; one who can detect any fault, in spite of all the tricks to conceal the faults, is difficult to find because such faults in hides in the raw state are not self-evident.

There are very few judges of a hide and the reason is not far to seek. It is not an ideal profession and it necessitates the closest supervision daily in very malodorous hide yards. It is not surprising that such conditions in India's climate have driven most people away.

I regret to say that I have little hope that the great British firms in India will attempt to take up this export trade, and, as in common with many others I greatly desire to see the development of the leather industry in India, my special investigations have been turned in another direction.

Although it is extremely difficult to judge and select raw hides, it is not difficult to judge good leather. The faults in a raw hide are not evident. After the raw hide has been wetted down and treated by the liming process, previously unseen faults disclose themselves. What was a mere "flatness" of the hair in the raw hide, may appear as a great gaping hole "after lime" (note, that the Government Harness and Saddlery Factory always buys hides on a *limed hide basis*). There are other faults that appear only after the liming process, and even after bating, i.e., during the tanning process.

The tanned but unfinished hide (so-called half-tanned) has no faults which are not evident. Any intelligent man will learn to judge tanned leather in the unfinished state in a few weeks, simply because the faults are all evident. Further, the handling of clean finished leather is not repulsive. It even has its charm!

If the fact be added to these considerations that the Indian hide can be tanned and perfectly preserved with indigenous tan-stuffs and by indigenous methods, in any part of India, at a lower cost than elsewhere in the world, then there seems to be no other reasonable conclusion but that great efforts should now be made to tan every Indian hide with Indian tan-stuffs, calling to our aid the great export firms to finance the purchase of hides to be turned into leather in Indian tanneries and to handle them at the ports.

When in 1911, I commenced to try and improve the collection of hides in the Central Indian States, I introduced the use of alkaline arsenite of soda, in weak solutions. Dipping the freshly flayed hides in this, or painting with this on both sides of the hide, are equally successful in arresting all putrefaction and in serving as an insecticide. After tanning many thousands of hides and skins so treated I have found no trouble in the subsequent tanning process which could be traced to the use of this chemical.

Experience has shown however that this solution cannot be sent into every village. Though fortunately no trouble resulted from the use of this strong poison when used by an intelligent subordinate in larger centres, yet the possible risk and danger of sending it out to be used by channars in distant villages, without supervision, are too great.

The fears expressed by cattle owners that cattle will be poisoned cannot be overlooked but they are in many cases the mere cry of those who are opposed to progress and who look on unmoved while wealth is destroyed.

I have therefore come to the conclusion that a poisonous preservative cannot be used.

The usual preservative in use in those parts of India that take any care of their hides is "Khari" salt, a mixture of sodium chloride and sodium sulphate. When well rubbed into a fresh hide this Khari preserves the hides, although it is not a perfect insecticide.

The tanner on the other hand objects to Khari as a preservative and I have experience to show that it causes damage to the grain. Mr. Shewan of Cawnpore and Mr. Das of Calcutta both condemn the use of Khari.

We are thus thrown back on the use of ordinary table or common salt, and when this is used in relatively large quantities, and particularly if the wet-salted hide reaches the tanner within 10 or 15 days, without allowing the hides to heat, a very fine hide is the result.

These conditions are not always possible, especially in the hottest month of the wet weather, and so we in our States, have been reduced to the following process:—

Flay carefully, remove excess flesh and trim off ends of shanks, tail, etc., lay on the ground in the shade and rub in common salt (not Khari). Gradually the hide will begin to absorb the salt, eventually drying. Move often, without putting in the sun, dry, by hanging in a frame if necessary, and when quite dry, fold once down the back with the hair inside. If the hides are stored in a heap, handle them over twice a week, searching for insects or hair slip. If such be detected, then clean and rub in a little more salt. It may be possible to use some formic acid with the salt when such chemicals are available after the war.

The above is, in my opinion, the most practical and simple method for use in the jungle.

In spite of the great impetus to careful curing afforded by the high prices paid for India's dead hides during 1912-13-14 and the careful teaching given to hide collectors by the German and Austrian firms before the war, the greater number of the hides of India are spoilt by bad flaying and bad curing.

It is here that I think that Government will find an excellent way to increase the wealth of the country and consequently increase revenue:—by instruction, reward and penalty, to induce greater care in curing and collection of the hides of India. I personally feel that the present destruction of wealth ought to cease.

Although the general average of the hides that we now collect in our States is better than it was, owing to the high prices we have paid for good hides, yet the progress during three years of sustained effort has not been rapid. For this reason Government cannot expect immediate or direct results and the cost of teaching the people how to collect hides properly will be high.

We have found that the worst factor that we have to deal with is that even the rottenest hide has some value in the market, and this is because the dealer always puts some of the poor hides into a bale of good ones. It is the custom. Similar adulteration is common in other branches of India's trade.

We have lately introduced the rule of payment for hides of a certain length instead of the old payment by weight which only encouraged bad flaying and the application of dirt.

Owing to the generosity of the States of my concern the Eastern States of Central India The small Tannery, Export Trust Company Limited (Esociet), and lately of Government through the Indian Munitions Board, I have had the opportunity of three years' research on little known and undeveloped tanstuffs of Central India, and India generally.

In order to investigate these tanstuffs and to prove their value, in the only way that I consider satisfactory, i.e., to make leather from them, I built a small tannery, the original capital cost of which was Rs5,000.

We started tanning skins early in 1916 and our balance sheet at end of August 1916 shewed:—

	Rs. a. p.		
Tannery; Profit	1,212	11	6
Sales	1,268	11	0
Stock	2,684	12	6
	10,948	7	6
	Rs. a. p.		
Less purchases	9,583	14	0
Treatment charges	2,151	14	0
	9,735	12	0

More than half of this stock had been sold before the auditors finished the balance sheet.

This small tannery has continued to run profitably with the exception of a loss on skins when export was stopped.

We have now converted our business into a cow hide tannery which is producing half-tan cow hides which we are offering for export to the war office.

From my experience I have formed the opinion that it will be possible (in peace time and if measures are taken to discourage the export of hides as raw hides from India) to erect and start a tannery in almost any part of India, at a capital of less than Rs10,000, to produce 10,000 lbs. of leather per month at an average profit of 2 annas per lb. Even allowing for spoilt batches and other troubles of the tanner, this means a very high return on capital block invested. The capital necessary to buy the hides and cover the time of tanning and sale, will of course be a much greater sum, but this working capital would not be put up by the small tanner. I feel sure that the great export firms would advance monies against hide value under process and sale at 1 per cent above bank rate, as has been done for years in the hide trade and in other industries in India.

There are many such tanneries now existent in India, but not all over India.

The right owner for such a tannery is to be found all over India; the Musalman who has made money in the raw hide trade. He knows how to buy hides. He will never make a mistake; also he is of the class to whom money can be lent with a great degree of security.

I would place one of these numerous small tanneries in almost every small town, all over the country, for it is always possible to get a certain restricted number of chamar labourers in any small town throughout India. It is not possible to get say 5,000 tannery hands anywhere, except after long years of tending and teaching of a community at huge expense and trouble. Two hundred chamars can be got in any locality and, properly handled, they make excellent factory hands.

It will be necessary to train young Indian tanners. I think the sons of those who previously dealt in hides would afford the right material. Although I know of one or two Indian gentlemen who, having been trained in Europe, are quite capable of running a tannery successfully, I know only one really brilliant Indian tanner and have heard of one more, and I do not think that a foreign training is necessary, except after two or three years practice in India and then only for the exceptional man. Two years' practice in a properly run model tannery would be sufficient to turn out a useful foreman tanner.

It is possible to get lime, oils and other tannery stores in almost every part of India. I am of the opinion that almost any potable water can be used to produce good leather.

There remains only the problem of the tanstuff and how to use it. It is possible that *Turkad* (*Cassia auriculata*) can be grown in nearly every locality in India, and if it is possible to get cheap and regular supplies of the bark of the twigs of this plant, the tanner is provided with a most exceptionally excellent tanning agent which can be applied by a fool-proof process. It is, however, difficult to imagine organised supplies of *Turkad*, except in a few localities in Southern and Western India.

It will be necessary for some years at any rate to turn to other scrub jungle trees which will yield good tanstuffs without destruction of the tree. I am of opinion that such tanstuffs can be found, and after proper research to determine all pitfalls and adverse factors, certain mixtures of these tanstuffs could be prescribed to suit each locality.

Such mixtures would be applied direct like *Turkad* in "contact tanning," perhaps with local modifications. I am at present occupied in the effort to work out such methods on the commercial scale. I find myself opposed by all European tanners, but as their system of tanning cannot be applied by the small tanner in India, I am determined to follow up my so far successful results and feel confident of the ultimate result. I have formed the opinion that tannin extracts will not succeed if applied by the small tanner, although India will probably find some natural tanstuffs that will produce valuable extracts for export. I do not expect to see many successful applications of the process of extraction and solidification, but I am certain of a most successful export trade in carefully collected and concentrated tanstuffs, direct from the jungles to European markets. The possible mixtures of scrub jungle tanstuffs now known, offering the best promise of suitability, run into hundreds and the species to afford these are found from Victoria Point to Karachi. We have been able to establish the value of five or six new tanstuffs (now as applied in this manner, but not new to the chamars) and we have discovered one entirely new tanstuff, "Karunda." My Committee of Control after the examination of our first leathers has recommended that these and other proven tanstuffs shall be tested on the tannery scale without delay.

The output from the many small tanneries throughout India would be sold as good, but unfinished leather (crust or half-tanned leather) to several great export firms with headquarters at the ports. These firms would have well lighted and properly constructed sorting godowns at the ports. Here all leathers, good and bad, cows, kips, goats, sheep, etc., would be sorted, if necessary, into thousands of qualities and marks, each to be consigned to a special buyer in some part of the world. Selection must be extremely strict and exact, and the more qualities and sorts, the better, so long as the buyer always gets what he expects. I think a Government export certificate would be of extreme value here.

There will be room for finishing tanneries in India, but I regard it as impossible to carry on such businesses without many lakhs of capital. I would put no machines in the smaller tanneries, beyond perhaps simple wooden drums and a crusher in those where the size of the business would warrant such.

As regards chrome tanning as a means to work up Indian hides, I do not believe in its immediate future, chiefly because it requires a good hide. There is lots of room for chrome tanneries in Calcutta, Bombay and the ports, where perfect slaughtered hides are available and possibly for half-chrome finishing tanneries, but for the ordinary dead hide of India, India's natural tanstuffs are the right thing.

I consider that one of the first essentials to such successful indigenous industry is that the Forest Department should pay special attention to the getting of tanstuffs from its forests. It will be quite impossible for the present staff to do more than they do now, and it will be necessary to convince the Forest Department that tanstuff exploitation will pay. It must be remembered that tanstuffs are to be got in greater quantities from private forests near the rail, than from Imperial Reserve Forests where the goal aimed at has been to get timber.

I know of thousands of mounds of valuable bark and leaves that are now left to rot on the ground, simply because the contractor who takes a coupe for firewood or charcoal, does not know the value of the bark and leaves.

The pioneer work that the Forest Department did many years ago to get out timber, to perfect the process which now runs on siled bearings, has now to be repeated with tanstuffs. The tanstuffs will not come out of the jungle by themselves. Neither will they come out unadulterated and containing the maximum of tannin, without devoted supervision. The tanneries will have to pay good prices if they want rich tanstuffs.

The next essential is that the railways must fix a low freight rate on tanstuffs. Let them not look to make a high profit on the first freight on tanstuffs. Let them rather realise that, if the people along their lines are paid for getting out a new product, the railway's real profit will come out of freights on leather, and even more out of freights on other commodities which will be imported and paid for out of the new monies that the people earn by collecting products from the jungles that were previously of no value.

The railways all carry raw hides at very low rates which were probably granted to the German firms who worried the Companies until the rates were reduced.

The East Indian Railway have recognised the above principles and have fixed a rate:—

1 to 300 miles Rs. 0-2-6 per wagon mile.
301 and over „ 0-2-0 „ „ „

If this rate could be accepted by all railways from any station to any station via any station, from any broad gauge railway on to any broad gauge railway, and if the railways will allow any degree of crushing and close packing, and if instead of several dozens of classifications they will put in each goods tariff:—*Tanstuffs natural, to include all barks, leaves, fruits, crushed or uncrushed that may be used in tanning*, one of the greatest difficulties that I have met in three years pioneer work in this industry would be removed. The Indian Munitions Board has persuaded the Railway Board to recommend these new conditions to the railways. Very few railways have taken action in these matters yet.

I believe that if Government could establish a Leather Survey as a department to A Leather Survey, improve collection of hides, to encourage exploitation of tanstuffs, and to foster small tanneries, and will adopt some measure to stop the export of raw hides, we will see a really vigorous indigenous industry, an industry well suited to India, and one that will do more to increase general revenues than any that I know of.

I feel assured that the Indian Munitions Board has made a most useful move in the right direction in the establishment of the Esocet Tannin Research Factory.

The many enquiries that we have had, and the appeals for help and advice that have come to us from those who own, or who propose to start small tanneries, have shown us that not only was there a need for such an institution but that we will only be able to deal with the work to be done in the central parts of India and that our range of influence should not stretch further than over a radius of 300 miles at the outside.

The Director of Industries, Bengal, is moving in the direction of the establishment of a research factory for Calcutta and there is a leather school at Madras. I feel certain that a research factory in Bombay could do splendid work.

It is essential that the work of these institutions should be practical, and tests should be carried out on a practical scale. There is nothing more misleading than a small tanning test.

The work to be done in these research factories should be co-ordinated to prevent overlap in research, and this can best be done by committees of control, with representatives from other centres to criticise the work in each research factory.

I strongly recommend that visits should be paid by those researching to the small tanneries of the country.

My experience is that any aid that is offered tactfully is gratefully accepted. I believe that really vigorous propaganda of carefully proven facts will do great things. But it is not sufficient to publish laboratory results. The methods must be proven on the commercial scale, and those who wish to learn must come and see the operations. I would place on record this warning; tanning research takes time! Five years would be nothing to prove the value of one tanstuff!

My critics will ask why I advocate half-tanning, and why I do not advocate the immediate production of finished leathers in India.

I have the greatest belief in the future of finishing and currying leathers in India for export, but I feel that if we can firstly succeed in half tanning our hides, to produce sound crust leather and persuade tanners in Great Britain and elsewhere to leave us our first profit, while we leave the finishing profits to tanners overseas for the present, we will be likely to succeed, because we will not be attempting too much, and because India is not likely to receive many favours unless she offers inducements to gain friends abroad.

I advocate research in India with a view to demonstrate what can be done with the raw or half-refined products that suit India's interests. If technical emissaries can be sent home to push such products amongst technical men at home and abroad, I am certain that larger demands will be made for India's products; and particularly for those products which leave most money in India.

APPENDIX.

Esociet.

Prices for produce to be paid at Maihar Factory from 1st January 1918 until March 31st 1918 or until further notice, as decided by the Board of Directors in meeting.

Special War Rules. Hides will no longer be purchased by weight, but by the piece, according to size. This is to prevent valueless flesh and dirt being sold as hide matter.

Measurements of length will be made from a point on the neck, 4 inches behind the back of the ears, down the spine to a point two inches from the root of the tail. Hides will be laid on the ground without stretching for measurement. Width will be disregarded because the thinner belly parts of the hides are not required for war leathers.

Classification will be strict, as follows:—

Extra quality; a wet salted or fresh "green" hide without flaw or blemish.

First quality; dry salted; not more than one flaw.

Second " dry salted, not more than three flaws.

Third " dry salted, not more than five flaws.

Scratches, holes, hairlip, flaying cuts, goad-marks, yoke-marks, poek-marks, warble-holes, Sun-drying faults and unshapeliness are all flaws.

Nistar claims are to be satisfied with rejects from collection centres.

Mhote claims to be satisfied with leather.

Local pot tanning to be discouraged.

All other hides outside the above classes will be brought to Maihar, where they will be paid for at current market rates.

All four qualities as above are to be flayed clean of flesh, without useless shank-ends, tails, etc., they are to be salted with rock salt or country salt and not with Khari salt and to be dried in the shade, smooth and flat, finally they are to be folded along the spine with hair inside. Unless hides are cured exactly as above they will not be accepted in the above 4 classes.

The cost of salt will be paid at Maihar, from 2 as. to 5 as. per hide according to size. The cost of transport to Maihar and the expenses of the collector or contractor in bringing the hides to Maihar will be paid.

A duplicate of the classification certificate and bill will be sent in all cases direct to the Durbar concerned. Payment will be made at Maihar to the contractor or to the Durbar concerned as desired.

On the above basis and to produce war hides the following special prices will be paid:—

	Extra	I.	II.	III.
Large cow 5 feet long and above Rs.	5/-	4/-	3/-	2/8/-
Army kips 3 " " "	4/-	3/ 8/-	2/8/-	2/-
Calves 2 " " "	1/-	1/12/-	1/8/-	1/4/-

All below these sizes and qualities will be sold as rejects.

Large Buff 5 feet long and above Rs.	3/12	3/4/-	2/12/-	2/4/-
Medium Buff 3½ " " "	3/4/-	2/12/-	2/4/-	1/12/-
Calves 2½ " " "	1/12/-	1/8/-	1/6/-	1/4/-

All below these lines and qualities will be sold as rejects.

At least 10% of value will be paid as royalty, but a higher rate of royalty is being worked out.

No goat or sheep skins will be purchased by Esociet in view of the wishes of Government that no skins are to be tanned.

Wild skins will be purchased at current market rates.

Gok or Monitor skins 6 annas each for No. 1's, and proportionately lower prices for smaller and badly collected skins. 2 annas per skin will be paid as royalty.

Lac is to be paid for at a price, at collection centres, to be settled later, which shall include all cost of picking, cleaning and storing and special supervision.

The cost of propagation shall not be included.

To this shall be added a royalty on the same basis as that paid by Esociet to the C. P. Forest Department as present equal to Rs. 40/- per maund.

Tanstaffs—At cost price plus 2 annas royalty.

SUPPLEMENTARY EVIDENCE.

Q. How did you arrive at the estimate that 12 million hides are available in India every year, as hides that are taken off the animals after a natural death? The seaborne trade returns for 1912-13 show that 13½ million raw hides were exported from India. Have you any information as to the number of hides used in India for water bags and for leather, for internal consumption, in the form of boots, shoes, sandals, harness, etc?—A. I gave 12 million as a figure that I have arrived at by study of statistics, from my knowledge of the qualities of hides which are used by the existing tanneries in India, and above all from my experience of the quality of hides that were exported from Calcutta. Taking the 13½ million figure, I allowed for an excessive export in the years immediately before the war. I allowed for the ever-increasing care of cattle. I then allowed for the small number of real slaughtered hides (I will call these "slaughter-house" hides because the word "slaughtered" is used in the trade to describe a good "dead"), that could have been exported after the big tanneries in India had taken what they could get of the "slaughter-house" hides.

I understand that a big slaughter-house such as that in Calcutta affords about 1,000 hides per day (of all sorts and with many very small hides). A slaughter-house like Allahabad affords some 50 per day. Saugor, in the Central Provinces, produces some 50½ hides per day, but not all from actually slaughtered animals. Unless these areas in India which are populated entirely by Mussalmans produce an excessive number of "slaughter-house" hides, I cannot arrive at a total exceeding one million per annum of "slaughter-house" hides.

During the last six years I have seen that the big tanneries of India have purchased as many "slaughter-house" hides as they could get. The better-run Turwad tanneries of the South have taken as many "slaughter-house" hides as they could get. Allow for this internal consumption and there will be very few "slaughter-house" hides available for export. The number of animals actually slaughtered in India must be extremely small in proportion to the total number that die a natural death. In my opinion not more than 10 per cent. I have no actual figures and would like to know them. Such figures should be classified into weight classes. I cannot but believe that under the conditions of religious scruples and lack of money to pay for an expensive food like beef, coupled with the existence of extremely cheap goat's meat, any extensive slaughtering can exist even in the few districts that are populated by Mussalmans only. Of such districts I have little experience.

I cannot tell a "slaughter-house" hide from a good "dead" or those "deads" that are classed in the trade as "commissariat" or "slaughtered" when both are put before me, properly prepared, in either the wet-salted or dry-salted state. I doubt very much whether anyone can. I am prepared to cure some of the better collected dead hides from our States, and to mix them with "slaughter-house" hides cured in the same way, and to challenge any hide expert to differentiate between the two.

If, however, I examine hides during the processes of liming and tanning, I can say which has been taken from an animal that was slaughtered and which from an animal that has died a natural death.

I have evidence from another side. I was lately sent to purchase hides in Calcutta. I took 2,000 of a lot, "slaughtered" that had been selected by the expert Germans as the finest qualities (B. D. S.) and as they lay "faked up" in Calcutta, I could have believed that many were really "slaughter-house" hides.

I have since seen these hides through lime and now know them all to have been "dead" hides!

Further, the price of "slaughter-house" hides during the last nine months, under conditions of export stopped or controlled, has been such that no one could possibly buy them (7½ annas per lb. wet) and deliver leather to the Controller of Hides at Rs. 1-4 per lb., while "commissariat" and "slaughtered" hides were to be purchased at much lower prices which afforded the tanners a fine profit at Rs. 1-4 per lb. of leather.

Thus I conclude that most of the hides that were exported before the war were those which had been taken off the animal after death, and that the "slaughter-house" hide was largely absorbed by the existing tanneries. The existing tanneries will want all that will be available of those which are of suitable weight and quality after the war.

I have no definite information as to the number of hides used in India for local leather consumption except that we allow a full 15 per cent. of the hides of our States, as "nistar" (or those hides which are required for local uses) which are given back to the chamars.

If my impression is of any use, I would say that I think one hide in five will be wanted for local uses in our parts of Central India, as soon as the methods of tanning can be improved. As the well-being of the people increases, the demand for leather will increase.

Q. What proportion of the hides available in India are suitable for the chrome-tanning processes?—A. If I am right in the above conclusions, there will be very few hides available for an extension of chrome-tanning. To draw on the supply of "slaughter-house" hides will be to hamper the existing tanneries. After an attempt lasting several years, I am certain that the low quality "dead" hide cannot be worked successfully with chrome salts and that much better results can be got with the many excellent natural tanstuffs of India. Although I expect the Commission has the information I must mention that chrome salts must no longer be considered as foreign materials in India. Mr. Das of Calcutta is producing chrome salts directly from chromite ore with which he tans good chrome leather. He says, however, that he must have the good hide to be able to do it.

Q. Do the conditions prevailing in the Central India States approximately represent the conditions prevalent in other parts of India? How have you arrived at the conclusion that for every hide that reaches Calcutta, at least one more is spoilt completely and is thus lost?—A. The conditions prevailing in Central India that I have described prevail to my knowledge all over the Central India Agency, in most parts of the Central Provinces (just around Saugor is exceptional), in most parts of the South of the United Provinces, even quite close to Cawnpore.

From hearsay, I believe that the conditions in most parts of Bihar and Orissa are the same.

I do not know Madras nor the Punjab, but I hear that tanners in both these provinces have the same trouble about spoilt hides. Whether the Mussalman States are better in this respect I cannot say, but so long as it is the custom to put a few rotten hides in each bundle, I would expect to find the same bad collection as I have described. In Burma, conditions are different, the Shan and the Chinese of the North particularly take care of their hides.

In certain areas in my States we have had reports from the civil authorities and the police as to the number of cattle that have died. The number of hides that we have accepted from these districts is less than one-third of the total that should have been available after deducting those returned for "nistar."

I include in those that are lost, i.e., those that do not reach the tanneries or the ports, all those rotten and therefore cheap hides that our village chamars tan to produce pieces of leather which are good enough for local chadilah (shoe). I see huge quantities of these whenever I tour and we return such hides as "nistar." I have seen very many cases of a hide being so far rotted that even the village chamars will not tan them.

Q. Can you give any information as to the special means by which big profits were made on the continent from the bulk of the low-class hide exported from India?—A. Generally speaking, the continental tanners must have taken off the grain and have produced waxed or false grain leather. Mr. Das tells me that many of the Indian "deads" were half-chromed. I would refer the Commission to Mr. Das for information on this point; he worked in tanneries that treated such hides. I think that big profits were made because I sold third and fourth quality "dead" hides to Hamburg in 1912 at 12*l.* per lb.!

Q. Have you considered the possibility of dealing with hides locally by some pickling process similar to that employed with goatskins which, at one time, were largely exported to America from the South of India? If so, do you think it would be advisable to establish local factories in which hides would be limed, unhaired and pickled, such pickled hides being then sold to large tanneries for conversion into finished leather?—A. I have not attempted the pickling of "dead" hides. The pickling in the south was done with slaughtered goat-skins, where great value could be packed into a relatively small space. I would fear the cost of the wet packing, casks, etc., with "dead" cow hides.

Thanks to a suggestion from Mr. Pilgrim, we have a method by which we can preserve a limed and bated hide for a long time. The solution contains 2 per cent. of Boric acid and 1 per cent. of Phenol and the effect of 3 weeks immersion in this is to greatly improve the grain of the hide besides preserving it. I am prepared to treat a big lot of cow hides in this way, and if Government will export them, we might then find out if the scheme is workable. I do not trust any experiment with less than 200—300 hides and deprecate any small tests.

I doubt whether the poorly supervised liming usual in small tanneries in India would ever afford satisfaction at a home tannery.

Having soaked, limed and pickled cow hides and having paid the heavy supervision costs necessary I believe the extra cost of tanning would be relatively very small. The tanner would have dry leather in bales for export and sale, while the pickler would still have raw hides and would have to pay the heavy freight on casks and wet packing.

Q. Can you supply a balance sheet showing the results of your small tannery at some later date than the end of August 1916? Are the supplies of hides and skins obtained at the ordinary markets or are they a monopoly of the State and therefore delivered at the tannery at rates much below their market value?—A. The balance sheet of the small tannery at the end of August 1917 shewed a nett loss, the profit during this second year on the tanning (about Rs. 8,000) being swallowed in a loss of Rs. 16,000 on goat skins when the export was stopped. Having paid some Rs. 2-5 each for skins in our States, we were unable to sell the resultant leather and so wrote down the value of our stock of tanned skins to 12 annas each. At the moment when export was stopped we were offered 4-6s per lb for our tanned skins from Glasgow. We hold the tanned skins and propose to hold them until export is allowed. My States would not have approved of a publication of these troubles, for we know that the prohibition of export was necessary, and my fellow directors, the Dewans of the States, have no complaint to make under these conditions.

The balance sheet as at the end of September 1918 will be published in my reports of the Research Factory. I know that the tannery is paying well now.

The prices that Esociet has paid for hides in the States have been consistently higher than in the neighbouring districts of the Central Provinces and United Provinces. When we started buying in 1914 we paid as much as 10 annas per lb. all round.

We dropped prices with the slump in 1914-15 to 5 annas per lb. We have consistently raised prices for good hides since then *but we deliberately pay as little as possible for the badly collected hide, which we sell again as it is.* Our price to-day for a properly collected dead cow hide is 5 to 10 annas per dry lb., paid direct to the chamar who divides his gains with the cattle owner. Both of these get almost double the amount that their fellows in Central Provinces and United Provinces are getting. We have eliminated the middleman. We have only one measure to help us. Export from each State is forbidden and Esociet Limited offers good prices for well collected hides and poor prices for spoilt hides. We discourage pot tanning, but never by coercive measures. I notice that most of those who tanned in pots at home before, either come in to work on contract in our tannery, or devote themselves to hide curing. We have in view the establishment of a tannery in each State.

Large quantities of hides are brought in to us from British territory.

Q. What degree of success have you met with in the use of mixtures of tanning barks? On what grounds are you opposed by all European tanners? May we assume that although the results of your experiments are, in your opinion, promising, nothing has yet been demonstrated on a commercial scale, the general adoption of which throughout India could be advocated?—A. The exact present position of the work at Maihar and at Allahabad is that both tanneries are now putting out a regular flow of very high class leathers, closely imitating Turwad half tan, which have been tanned by the use of the new local tanstuffs. Within the next month Mr. Henderson, the War Office Representative, will inspect our work. I await his verdict with confidence. I suggest that the Commission should ask for a special report through the Controller of Hides.

In my Maihar tannery I am taking in and turning out 25 cow hides per day, and I know my costs for labour and tanstuffs are lower than the same costs in Cawnpore and Bombay. It will only be after our yearly audit in September next, however, that we can publish such figures as will prove the commercial success beyond doubt.

The mixture in use, Dhawa—Karunda—Aonla is as perfect a tanstuff as exists. Of this there is no question whatever, and its cost may be compared thus:

Turwad in Bombay	5-3 as.	for each 1 per cent. of tannin per pound.
Oak bark in England (pre-war)	4-0 as.	ditto ditto
C. I. Mixture in Maihar	1-2 as.	ditto ditto
Betul in Cawnpore	2-0 as.	ditto ditto

While we are not using more tanstuffs per lb. of leather than the Turwad tanner.

I wish to impress upon the Commission that although the printed and published proof of success cannot be shown to-day, yet the complete success of what I went out to do, i.e., to work out a simple indigenous process to produce perfect leather from local hides, local labour and local tanning materials is to be seen here *now*, and that I fully expect the published proven success will be available by the time the Commission can issue its report.

I do most strongly advocate the application of the simple indigenous process with system and cleanliness throughout the country (except in the great cities). This will do more to improve hide collection in India than anything else. Above all, it will do what we have done in Maihar, i.e., double the income of the whole chamar community and consequently greatly increase the general prosperity of the place.

The European tanner is wedded to the processes (a) *leach the tannin out of the bark* and (b) *suspend or pack the hide with the filtered extract.*

I maintain, and have proved, that the two processes are unnecessary, that for the small tannery in India the one process of applying the crushed or chopped tanstuff with liquor direct to the hide, is the only possible method!

The best tanner in India lately said that I could never succeed and when pressed for his reasons said that the hides were of poor quality! This factor has nothing to do with the tanning method. There are others who do not want to see a large number of small tanneries in India. They disapprove of my methods. Success is already there however and I count enquiry and investigation. The best tanner in India lately said I was wrong, in that my mixture of liquor and ground tanstuff was thick and dense. His idea is that a liquor must be filtered and clear. I have held the opinion that the thicker and denser the liquor, the better leather would result, and with this idea selected that tanstuff which contains the most gummy and thick solution for early treatment of the hide with very great success. By last mail there arrived a technical journal containing the successful result of a research by Turnbull and Carmichael in Liverpool in which they actually added starch to produce the thickness and density by which they made better leather. I have not yet met an European tanner in India who is prepared to consider new methods with an open mind. On the other hand, two first class Indian tanners of my acquaintance think very highly of my results.

Although the President visited Maihar in 1916, I greatly regret that the Commission could not have come to see what we have done here.

Q. Are the conditions in an experimental tannery such as those at Maihar or Allahabad, suitable for the training of students? Would you advocate the establishment in other parts of India of tanning schools similar to that which has been started in Madras? Should such schools be really demonstrative factories working on a commercial scale and employing students as workmen under a trained and experienced staff?—A. I find myself in a difficult position in the matter of students or apprentices. My Committee of Control is most opposed to anything like a tanning school at Maihar. Personally, I realise most clearly that it is no good working out suitable processes to improve tanning in India unless we train men as practical tanners to work the processes. I have no desire to train managers or chemist-tanners who aspire to take degrees in tanning chemistry. I have seen so many hopelessly useless men with diplomas from European tanning schools who have no idea how to tan (I have said that I have met one brilliant Indian tanner with foreign training). I do not wish to suggest that the tanning schools at home are not excellent for home students.

In addition we have had over a dozen requests from established tanners and from Directors of Industries of the Provinces to take young men for training. The number of applications from individuals who wish to become tanners is very large.

My Committee fear that we may turn out a lot of young men who will not find a job. I have had some thirty young men here, out of which scarcely half a dozen have had the courage to face the dirty and hard work. I purposely put the would-be tanner to the most objectionable work at the start. This eliminates the waster quickly.

After much discussion, the present state of affairs is that I am permitted to take young men for training as working apprentices, at the request of those who can guarantee a future for the boy. There are six such boys now. Perhaps when my Committee sees the results of the training of these it will revise its ideas.

The ideal age to take a boy is, in my opinion, 16 to 18. The lad should start to work with his hands, learn to unhair and flesh a hide, learn the classification of hides and to handle them through tanning with constant discussions as to why certain phenomena appear. He should learn the reason for everything. He should acquire the "tanners' sense." I would keep the boy at this for 2 years, and as far as possible limit his field to the production of crust leather. I would allow no students to have anything to do with finishing machines, or fancy dyeing and finishing experiments, during the first two years. At the end of two years an intelligent boy would be able to lime, bate and tan good leather and would know how he had done it.

Most of these foremen could go straight away to a job in a small hand tannery and they would easily command Rs. 30 to Rs. 50 per month.

I am of opinion that this training cannot be done in a big finishing tannery.

Out of these trained foremen I would select certain boys to go on to learn how to handle tanning machinery and to care for the machines. Having taught them this engineering side of the subject, I would teach them leather finishing, dyeing, currying, retanning, chrome tanning, etc.

This later training would take about a year, and if there should appear one or two really brilliant men who could be sent on to university at 20 to study science, it is quite likely that some efficient tanning chemists would result. Here India would find her tannery managers for the future.

I cannot imagine anything worse than to send a young Indian home to study at a leather school, take its easy diploma and return to believe that he is fit for a job as a tannery manager. Unless a young Indian can first pass a really difficult examination like the B. Sc., London, Glasgow or Leeds he should not be sent to take an easy diploma like those to be obtained at the tanning schools at home.

The conditions at Maihar are in my opinion extremely suitable for teaching young Indians to tan good crust leather and to become working foreman tanners. The conditions at Allahabad are not suitable at present, they could be made so.

Unfortunately, I have not seen the Tanning School at Madras. I do not advocate the purchase of a lot of expensive machinery for demonstration purposes in Government Tanning Schools at present. Let us teach some men to tan first. Certainly the young boy must work as a workman. The use of the word "students" is perhaps wrong, "apprentice" expresses what he should be. I advocate the early establishment of research factories which would have plenty of work to do in the study of Indian tanning conditions. Each should contain a running tannery in which good crust leather would be produced.

A small number of boys could be taught to tan by working under good tanners. The research factories at the ports can, even now, work on the finishing of leather, but to serve the greater part of the interior of India we ought to teach the people to produce good leather from local hides, local labour, local tanstuffs, etc.

Hand-worked tanneries to produce hand-finished leather.—I fail to describe the immense field for good work and proper application of Government aid that I can see in this direction. I have taken as my particular subject that of production of good crust leather from "dead" hide. I am pleased with my results so far. I feel that perhaps in 10 or 15 years time I may be satisfied with the results. I know of no other field of research with such scope.

In conclusion I regret that I have not been able to deal with the questions from the Commission as thoroughly as I could have wished. My chief assistant is at Allahabad and with 3 others of my staff away I have had little time to prepare these answers.

(Witness did not give oral evidence.)

WITNESS NO. 474.

Mr. B. B. Osmaston.

MR. B. B. OSMASTON, F.C.H., *President, Forest Research Institute, Dehra Dun.*

WRITTEN EVIDENCE.

Financial aid to Industrial Enterprises.

Q. 5. I have had little experience of Government financial assistance to industries. Methods of Government assistance.
My opinion is, however, in favour of guaranteed dividends for a limited period in the case of big enterprises and of supply of machinery and plant on the hire-purchase system in smaller concerns.

In the case of big enterprises as for instance the utilization of bamboos or elephant grasses for paper-pulp, I think Government should fix a fair royalty on the raw produce and should also guarantee a reasonable interest in the capital invested for a fixed number of years. It is up to Government to take this risk.

The Government should exercise no control over the working of the Company but should have the power to examine the books, etc., in order to keep in touch with the financial position of the venture.

Q. 7. My experience of Government pioneer factories is limited to the United Provinces Pioneer factories.
resin distillery at Bhowali and its predecessor, which started on a very small scale, in Dehra Dun, some 27 years ago. The present methods have been gradually evolved as a result of many experiments. I think Government have undoubtedly been wise to keep this industry under departmental control. It has now developed into a very paying concern. On the other hand, had the very inadequate offers of certain firms been accepted and the industry made over to private enterprise, the Government would have had to be satisfied with very much smaller profits.

Q. 8. The extraction of major forest produce, timbers, sleepers, etc., from the higher Himalayas in order to give a maximum return or in some cases, to be profitable at all, frequently necessitates the employment of extensive engineering works, such as wet slides, wire ropeways, sledge roads, dry shoots and tramways. The construction of such works requires considerable technical skill and training and it has usually been necessary in the past for the Government to pioneer such work through officers of the Forest Department. After a number of years provided the local timber purchasers learn how to construct such export works the Government may cease departmental extraction and dispose of the trees standing in the forest, preferably on fairly long leases.

Technical aid to Industries.

Q. 15 & 16. I have held for the past 11 months the post of the President of the Forest Technical aid in general.
Research Institute at Dehra Dun. During this period the Research Officers of the Institute, more especially the Forest Economist and the Chemical Adviser, have been in correspondence with many firms interested in the impregnation of timber, the manufacture of paper-pulp from wood, bamboos and grasses, matches, tea-boxes, bobbins, oil, turpentine, etc., and much information has been published by this Institute on the above and other subjects, in the shape of Records, Memoirs and Bulletins.

Lending of Government experts to private firms.

Q. 17. I am not in favour of the services of Government Experts being lent to private firms or companies unless they are in possession of very special knowledge or experience which is not available elsewhere.

Q. 18. Provided he did not disclose any of the secrets of the private business to which the Government Expert might be attached he should certainly publish all the results of his researches.

Research abroad.

Q. 21. I have no personal experience of aid afforded by the Scientific and Technical Department of the Imperial Institute.

Q. 22. Provided the Institutions in India are properly and adequately equipped and staffed, I see no reason why all research work on Indian subjects should not be carried out in India. This would tend to expedite the attainment of results and at the same time reduce the expenditure.

Surveys for industrial purposes.

Q. 25. As regards forest produce, the resources of Indian forests are very imperfectly known. The areas occupied by the more important timber-yielding species, such as Teak, Sal, Deodar, Pines, Firs, Padonk, etc., are known with considerable accuracy and where working plans have been framed, there is some idea of available outturn but of the vast majority of accessory species very little is known of their distribution or possible outturn, and it is of great importance that the present available data should be supplemented by further surveys.

Q. 26. Owing to the inadequacy of the forest staff and to the vast areas included in the charges of individual officers the above surveys cannot be carried out by the local officers. Such surveys could best be carried out by the Working Plans Officers when collecting data for working plans. As a matter of fact in the ordinary course these officers are obliged to carry out surveys of the more important forest trees and this could advantageously and without much additional labour and expense be extended to other less important species resulting in valuable data relating to the distribution and available quantities of the various accessory species which are found in mixed forests. This information would be recorded, Division by Division, and the results would be tabulated by species with the aid of stockmaps.

Q. 27. The above information could then be made public through Directors of Industries and the Press.

Assistance in Marketing Produce.

Commercial Museums.

Q. 28 & 29. Commercial Museums, more especially at big industrial centres, are in my opinion eminently useful. The Economic Museum at the Forest Research Institute, Dehra Dun, is of recent origin, and as yet incomplete. Its primary object is educational.

I think that such museums might, with advantage, be started at other centres, and they could be organised and run by the proposed Commercial Branch of the Forest Department.

General Official Administration and Organisation.

Provincial organisation.

Q. 57. I do not consider that the establishment of a Board of Industries is desirable. A Director of Industries in each province would meet the case. He should, I think, be a business man, preferably, of course with some expert knowledge. The possession of tact is an important qualification for this post. His main activities would be in the direction of starting new industries and fostering existing ones. He would answer enquiries and publish information of industrial interest. He would, in fact, direct the work of the Commercial Branch of the Forest Department in consultation with the Conservators of Forests. Research work, laboratory experiments, etc., should form no part of his duties. These would be carried out by experts under central control.

Correlation of provincial activities.

Q. 62. Centralisation in the control of industrial development would, I think, be a mistake and I should not be in favour of an Imperial Department. The Directors of Industries in the various provinces would advise their local Governments and carry out the provincial policy.

The correlation of the activities in the different provinces could be attained by the circulation of the annual programmes of work; this would prevent unnecessary overlapping and duplication of work. The programmes might, with advantage, be drawn up at an annual meeting of all Directors of Industries, which would also result in a valuable interchange of ideas.

Organisation of Technical and Scientific Departments of Government.

Existing organisation of Forest research work.

Q. 63. The Forest Department, as explained below, is not at present constituted on the best lines for working in local industries. The existing staff is fully occupied with works of protection, maintenance, improvement and exploitation to which is added the ordinary administrative routine. As explained in further detail below, a commercial side to the Department is called for. Up to the year 1906 the scientific side of the Forest Department had received too little attention. It was in this year that the Government of India decided to start a Forest Research Institute at Dehra Dun. Their action in doing

this has since proved sound, and it is only to be regretted that it was not started sooner. Research work at this Institute falls under one of the following five sections :—

(1) Silviculture, (2) Botany, (3) Zoology, (4) Chemistry, and (5) Economy.

Each of these branches with the exception of (4) is at present in charge of a gazetted Imperial Forest Officer.

The Chemical section is under an Indian trained Chemist, who completed his education at the Tokio University in Japan. The President of the Institute (the post held at present by myself) is also President of the Forest College.

The following statement gives the strength of the staff—both gazetted and ungazetted—of the Forest Research Institute :—

Silviculture.

Silviculturist	1	(Imperial Forest Officer)
Assistant Silviculturists	2	(Non-gazetted Officers)

Botany.

Forest Botanist	1	(Imperial Forest Officer)
Assistant Botanist	1	(Non-gazetted Officer*)
Assistant Botanist	1	(Non-gazetted Officer)

Zoology.

Forest Zoologist	1	(Imperial Forest Officer)
Assistant Zoologist	1	(Non-gazetted Officer)

Chemistry.

Forest Chemist	1	(Held in abeyance)
Chemical Adviser (special post)	1	(Indian trained Chemist)
Assistant Chemical Adviser	1	(Non-gazetted Officer)

Economy.

Forest Economist	1	(Imperial Forest Officer)
Assistant Economist	1	(Imperial Forest Officer)

The sanctioned staff is inadequate to deal with the vast number of problems of all sorts which are bound to crop up in forests of every conceivable kind ranging from tropics to the snows and from areas where the annual rainfall is anything between 4 and 400 inches, and where there are over 4,000 species of trees and shrubs to be dealt with.

Silvicultural enquiries, which have for their main object the attainment of a maximum sustained yield compatible with the proper maintenance and improvement of the growing stock, should receive first attention.

The amount of Silvicultural research which ought to be carried out is beyond the present sanctioned staff at the Research Institute. Local Research Officers, working in collaboration with this Institute, are urgently required in all the large Provinces. This has already been recognized but has not as yet been given effect to, except in Burma.

Botanical enquiries, relating to fungoid diseases, are also of importance and problems affecting the germination, nutrition, disease, and death of seedlings of all species have to be dealt with. The identification of trees and shrubs has also to be undertaken. Botany.

Botanical investigations not being of such obvious importance or direct utility as some other are liable to be neglected, which is not as it should be. For the present the sanctioned staff may perhaps suffice but an increase will no doubt be eventually required.

Forest Zoology is a young science in India, and the insect pests of Indian trees are only now beginning to be studied systematically. Until their life histories have been carefully worked out it is impossible to suggest measures of control. The damage done every year by wood-boring insects and by leaf-defoliators throughout the length and breadth of India undoubtedly runs into many lakhs of rupees. This form of damage can only be successfully dealt with by careful and patient observation. The work is, however, beyond the capabilities of the present staff. A second Assistant to the Zoologist is required, as well as a number of Field Assistants. The training and appointment of two of the latter have recently been sanctioned as a commencement, but more are required. Zoology.

Here again the problems in organic chemistry, connected with major and minor forest produce, are as numerous as they are varied and there is scope for much research work.

The post of Forest Chemist, which is at present in abeyance, should be filled as soon as a suitable officer is available. He would require at least two Assistants of the standing of gazetted officers. Chemical research work must always be centralized and there will be no place for local officers in this branch.

* (Not yet appointed.)

Economy.

This is a very large subject and one which will naturally appeal more directly to the Commission. It embraces a variety of different enquiries among which may be mentioned (1) the antiseptic treatment of timber, (2) seasoning of timber, (3) the preparation of Cellulose for pulp, (4) gums and resins, (5) fibres, (6) essential oils, (7) wood distillation products and others.

It is too much to expect one man to be an expert on all these and many other subjects and yet there is at present only a single Forest Economist.

It is true that the post of an Imperial Assistant is also sanctioned but this post is vacant owing to shortness of officers. At least two additional officers are required, who would specialize in the different branches of Forest Economy. There would then be three officers in charge of three parallel branches of Forest Economy, and they might be styled:—

- (1) Wood Technologist;
- (2) Forest Specialist—Timber treatment;
- (3) Forest Specialist—Minor products.

- (1) would include the study of the structure, technical properties, distribution, and uses of Indian woods,
- (2) the seasoning and impregnation of timber,
- (3) all minor forest produce, e.g., fibres, flosses, gums, resins, essential oils, drugs, tanning materials, oil-seeds, etc.

Imperial Department to aid industrial development.
Provincial Departments.

Q. 64. I am strongly in favour of the formation of an Imperial Department of Chemistry.

Q. 68. The employment of experts by Local Governments seems to be very necessary in order to give confidence to the public in cases where it is proposed to market some new form of produce which, it is believed, will be of considerable value for a specific purpose.

Other Forms of Government Action and Organization.

Forest Department.

Q. 105. The Forest Department in the past has devoted its energies to the following main objects:—

- (1) The permanent reservation and demarcation of the Government Forest Estate.
- (2) The policing and protection of the same from external injuries.
- (3) The drawing up of schemes or working plans for the utilization of the interest on the forest capital on the most suitable silvicultural lines.
- (4) The marketing of the produce.

In addition to the above the Divisional Forest Officer has various other duties, and his time is fully occupied. Moreover, he has a scientific and technical training but little or no knowledge of commercial or business methods. It is not his fault. He is trained in science and then expected to be a member of a so-called quasi-commercial Department. I find no fault with his education. I think it is entirely suitable but I do not think he should be expected to run the commercial side of the Department without the assistance or advice of a commercial expert. It would, I think, be good if such a specialist or commercial expert were attached to each Chief Conservator or Conservator to give assistance in commercial development. In addition to the commercial side of the Department there is a crying need for Engineering Experts, able to tackle the many problems of exploitation which confront the Department on all sides.

Taking Burma as an example. There are vast areas of trackless forest full of literally hundreds of species of trees, which at present cannot be profitably exploited for want of facilities of export, and about which little is known. It is a potential gold mine which has only escaped being worked owing to the enormous profits to be got out of working teak. The time has come, however, when all these miscellaneous species should be worked out along with the teak, on systems of working involving concentration of work. In this way alone can the forest be made to yield the best and fullest return, and such concentration of working would, moreover, justify the construction of proper mechanical arrangements for export.

Reducing the cost of assembling raw products.

Q. 106. The first step to be taken is to introduce methods of treatment which involve concentration in fellings. The trend of the Working Plans' idea is in this direction, and it is difficult to estimate the enormous saving which will be involved thereby. Scattered fellings naturally mean increased cost of transport resulting in low prices offered for standing timber. This, together with improved methods of extraction, will effect large savings in the cost of exploiting forest produce.

Concentrating special kinds of trees in limited areas.

Q. 107. Many species of trees occur naturally in pure forests (gregarious), e.g., the Sal (*Shorea robusta*), Pines, Firs, etc. Others, on the other hand, e.g., the Teak, grow naturally in forests mixed with other species. Attempts to grow trees of the latter class as pure woods are fraught with danger and frequently lead to disaster owing to epidemics of

insect or fungoid attack. The study of mixed and pure crops falls within the province of the Silviculturist and is receiving due attention from him.

Q. 108. Export facilities in the shape of good roads and tramways are as a rule absent or inadequate. This is mainly owing to the fact that the forests are so vast in extent that it is practically impossible, for financial reasons, to maintain permanently a good system of roads. Deficiencies in
forest transport.

Now that concentrated working is receiving greater attention it will be possible to develop the communications tapping each area under working in turn.

In this way road repairs will also be concentrated and it will be possible profitably to introduce tramways owing to the larger volume of material which will be exploited from a given area. This will result in a considerable economy in exploitation charges and, as a result, bigger profits.

In Burma, communications, except by water, are almost non-existent and the only means of getting timber from the forest to a floating channel is by draught elephants. Elephants are very expensive and very liable to disease, and in these days of mechanical transport and engineering devices they are an anachronism. The only excuse for their employment under present conditions is owing to the fact that teak, which is practically the only species of trees being worked out at present, occurs scattered through the forest.

With concentration of working, however, and the exploitation of miscellaneous species, the elephant will have to go, for the concentration of elephants into big camps involves great dangers of epidemic disease, especially of Anthrax. The development of forest export roads in Burma is, therefore, a necessity of the first order.

SUPPLEMENTARY EVIDENCE.

Q. 1.—What is the basis of the assertion that more forest produce can be extracted at a profit with the help of engineering works, especially in the Himalayas, on the West Coast, and in Burma? Have any schemes been prepared or put into operation?—A. The value of timber trees in the Himalayas varies, *ceteris paribus*, inversely with the distance of the forest from a floating stream. The zones occupied by the main timber-yielding Conifers in the Himalayas are roughly as follows:—

(1) Long-leafed pine	3,000' to 6,000' alt.
(2) Blue pine } Deodar. }	6,000' to 8,000' alt.
(3) Spruce fir } Silver fir }	7,000' to 9,000' alt.

Zones (1) and (2) have been worked at a good profit for over 20 years. The less valuable pine timber of Zone (1), on account of its lower altitude and consequent greater accessibility, gives a substantial net profit.

The intrinsically more valuable deodar and blue pine timber of Zone (2) costs more to exploit, owing to the forests being situated at a greater mean altitude.

The fir forests of Zone (3) have scarcely been touched as yet. In order to render the extraction of these timbers a profitable concern it will be necessary to reduce the cost of transport of the timber from the forest to the floating stream to a minimum. This can only be done by the introduction of one or more of the recognized methods of mechanical transport, *viz.*, sledge roads, tramways, wire ropeways, wet slides, and shoots. The selection of the best combination of the above in any given instance is an engineering problem requiring considerable technical skill, and a judicious selection may mean increased profits in working a forest amounting to lacs of rupees.

I have no experience of the forests of the West Coast and did not mention them in my original answers.

Many of the forests in Upper Burma cannot at present be worked at a profit (except for teak) owing to lack of communications. Roads, and probably in some instances light railways, are required before the large number of second, and third, rate timbers in this country can be profitably exploited.

Schemes have been prepared and have actually been in operation for many years for the exploitation of the more valuable deodar forests of the United Provinces. As instances I may quote the export works which were designed and utilized for the extraction of deodar timber from the (1) Deota, (2) Bamsu, and (3) Kulni valleys of the Chakrata forest division.

In No. 1 a sledge road and dry shoot were employed. In No. 2 a sledge road and wire ropeway (in 3 lengths).

In No. 3 a tramway, wire ropeway, and wet slide.

By the use of these engineering works the timber (sleepers) was brought down for about 6 miles through a vertical height of some 3,000 feet and the cost of transport of metre-gauge sleepers was reduced from 1 anna per sleeper per mile (the rate on coolies' backs) to about $\frac{1}{10}$ th of an anna per mile, resulting in a very substantial saving on 5 lacs of sleepers.

Q. 2.—What were the tests applied to bamboos to discover their suitability for paper pulp-making? How far was the hesitation of concessionaires before the war to work their

concessions due to doubt whether the cost of transport of raw material, manufacture, etc., would not be too great; and would this hesitation have been overcome by a Government factory working on a small commercial scale?—A. The tests carried out to discover the suitability of bamboos for paper pulp were as follows:—

- (i) Laboratory tests carried out by Sindall in Burma in 1905 at the instigation of the Government of Burma.
 - (ii) Laboratory tests carried out by Mr. W. Raitt from 1905 onwards.
- The results of both of the above tests have been published.
- (iii) Following the above tests, which were not accepted by interested parties, as they had only been carried out on a laboratory scale, the Forest Research Institute arranged with the Titaghur Paper Mills to carry out tests on a large scale. Eighty tons of the bamboos were supplied free of cost and tests were carried out on a commercial basis, which proved not only the value of the bamboo for the manufacture of pulp, but also gave fair indications as to the cost of production.
 - (iv) Similar tests to the above have been recently carried out on the same lines in order to ascertain the merits of a digester especially designed for the treatment of bamboo.

The above tests have been sufficient to convince several well-known companies in India that bamboos are suitable for the manufacture of paper pulp.

The latter portion of question No. 2 refers to the hesitation of concessionaires before the war to work their concessions due to doubt as to the cost of extraction.

Doubt certainly existed in the minds of certain interested parties in Calcutta as to the cost of extraction, whereas two interested firms in Bombay had no doubts on the subject. What doubt existed in the minds of the Calcutta people before the war has recently been removed by one of the firms' representatives proceeding to Burma to carry out a personal inspection of the proposed leased area.

In the case of bamboos for pulp I very much doubt whether the erection of a small Government factory would have overcome the difficulties which arose in connection with the starting of this business. On the other hand, had a Government factory been in existence, it would have enabled us to carry out tests with other raw materials, such as elephant grasses.

Q. 3.—How far would the exhibition of large samples which could be tested by the public under commercial conditions improve the demand for the less known timbers?—A. The exhibition of large samples of such timbers would be beneficial, though the establishment of small Government timber depôts at large centres might perhaps be a better solution to the problem.

Q. 4.—Is it not the case that the use of *Simul* for matches is rendered difficult owing to the objection taken to its dark colour, and was not this objection overlooked in the Forest Department bulletin on the subject? How can a purely commercial difficulty of this sort be ascertained and estimated?—A. The question of colour was no doubt one of the factors which militated against *Simul* for matches, but this was by no means the primary objection. The principal difficulty is that the stick is not strong enough, owing to the twisted nature of a large proportion of the timber. Moreover, *Simul* timber being open and loose-grained renders it impossible to cut a uniformly square stick, which results in an uneven match-head.

The answer to the last portion of question No. 4 is "By the appointment of a Match Expert."

Q. 5.—Describe the qualifications, training, and duties of a Forest Commercial Officer and the reorganization of the Forest Commercial Service.—A. The outstanding qualifications which the Forest Commercial Officer should have are:—

- (i) A good business training.
- (ii) It would be preferable that the man should possess some knowledge of timber, though this is not absolutely necessary, as information on technical qualities of timber can be supplied to him, while he will soon pick up a commercial working knowledge of the timber trade.

The next point concerns training; preferably the man should be recruited from the commercial community in India and should have had at least three years' experience as an Assistant in a business firm.

As regards the duties of a Forest Commercial Officer he should primarily be a liaison officer between the Forest Department and the commercial world.

As such his duty should be:—

- (1) to deal with sales of timber and minor forest produce;
- (2) to introduce on to the market both timbers and minor forest products for which there is at present no sale;
- (3) to keep in touch with the markets for forest produce and issue statistics on the same;

- (4) to answer enquiries made by Government officials and private persons in connection with his work; and
- (5) to supervise experiments carried out in his province in connection with forest products.

There should, in my opinion, be at least one such commercial officer attached to each Province, who should work under the general supervision and orders of the Chief Conservator or Conservator, as the case may be, and the Director of Industries should be kept in touch with the progress of his work.

I now wish to modify my original note under Question No. 57 in which I suggested that the Director of Industries should direct the work of the Commercial branch of the Forest Department. I think that this would not be such a suitable arrangement as the alternative now suggested.

Q. 6.—Can Government with advantage put down the movable tramways, etc., mentioned in your reply to Question No. 108, or should this be left to forest contractors, or in the case of more permanent railways to outside private agency?—A. The Forest Department, with or without the advice of the Forest Engineer, can quite well lay down a movable tramway, provided the motive power is by draught animals, and in the case of departmental working of the forest, the Department should certainly do this.

When through purchasers or contractors the procedure would be different in the case of short and long period leases. With a lease extending over at least five years the contractor could well afford to buy and lay down his own tram-line, whereas in the case of annual sales Government might perhaps purchase the line and rolling-stock and lease it annually to the purchaser, who would lay down the line to suit his requirements.

Q. 7.—How should the Forest Department be financed—as capital expenditure from loans, or out of revenue?—A. A forest property differs from any other estate, such as rubber or tea, in that it has been acquired with a large proportion of its maximum possible stock already existing, whereas the planter has to create his *ab initio*. In other words, the great majority of forests are in a position to produce, at least temporarily, a very handsome dividend without further expenditure being incurred on them from the moment they are acquired.

Now, since this capital has been found by Providence without the existing generation having provided one iota towards it, it is obviously unjust to the future generation that the present one should reap too largely where it has not sown. In other words, it is up to us to put back a fair proportion of the vast property we have been given free, in order to at least maintain its paying capacity for our successors, in place of handing it on to them in a damaged and depreciated condition.

So long as the Forest Department is generously provided with funds to allow of a proper development of its resources it seems to me that it is immaterial whether these funds are provided from revenue or from loans.

It is obvious, however, that in certain cases where forests have deteriorated through abuse, overfelling, or other causes fellings may have to be temporarily suspended for a number of years with the result that the revenue might for a number of years fall to *nil*, in which case funds for the reconstitution of the forest would have to be provided from outside.

Q. 8.—To what extent is the success of the turpentine industry due to assistance rendered by the Forest Research Institute?—A. The advice of the Chemical Adviser to this Institute has been sought by, and given to, the turpentine factories in the United Provinces and the Punjab on numerous occasions, and at least one important item in the system of distillation at present in force was adopted as a result of suggestions made by him.

Q. 9.—It is not necessary that the officers attached to the Economic Section should be in a position to test the products they have to deal with on a fairly large commercial scale? If so, how is this to be provided for?—A. It is essential that this Institute should be in a position to prepare large samples in order to confirm laboratory tests. At present, with few exceptions, we have to submit the raw material to manufacturers for testing; this system has many disadvantages. With the object of undertaking such work in this Institute proposals have been submitted to the Government of India for the extension of the buildings and workshops so as to include the following plant which will make it possible to prepare products on a semi-commercial scale:—

1. A tan extract plant of $\frac{1}{2}$ ton capacity.
2. A destructive distillation plant of 4-6 cwt. capacity.
3. A pulp plant of 5-8 cwt. capacity.
4. A solvent extraction plant of a thousand pounds capacity.
5. Steam stills of various types, which we already have in stock.
6. A thirty-ton timber-testing machine.

Items Nos. 1 and 5 are already in India and the rest have been indented for and will, it is hoped, be supplied before long.

(Witness did not give oral evidence.)

WITNESS No. 475.

MR. J. A. PILGRIM, L.T.C., *Tannin Expert to the Government of India.*

WRITTEN EVIDENCE.

The available tanstuffs of India.

During the last year and eight months since my arrival in India I have had the opportunity of making several extended tours in different parts of the country including Burma; and in every district I have visited I have been struck with the large number of natural tanstuffs at hand. But as I am asked to write on *available tanstuffs* I think it will be wise to sub-classify the latter as follows:—

- (I) Tanstuffs available for large areas of India.
- (II) Tanstuffs available in various districts locally.
- (III) Tanstuffs available for special uses.

Of these, classes (I) and (III) are necessarily more restricted than class (II) in that there are so many tanstuffs sufficiently abundant in a given district which are, however, from one cause or another, of insufficient value to stand freight charges to any great distance. But there are, on the other hand, a considerable number of tanstuffs which, owing to such factors as abundance, cheapness, strength, or special characteristics of the tannin-principle will justify their conveyance by the means available to centres of the tanning industry. The *Cassia auriculata* of the South, which finds such enormous application almost all over the Indian Peninsula, being often profitably conveyed very long distances by rail, realizes prices out of all proportion to its percentage of tannin for the simple reason that this tanstuff is so safe in operation that it is said to be "fool-proof". It is doubtful whether there is any other tanning material yielded by Nature which is so uniformly successful even in spite of carelessnesses which often obtain in its application. But India has a number of other tanstuffs possessing merits of their own and from which, in some cases, equally useful leathers can be made provided the tanner is educated in their use and exercises careful supervision of the tanning process. Some of these tanstuffs may be applied singly; others are better in more or less complex mixtures. Others, again, while not necessarily useful throughout the whole process of tanning, may, nevertheless, be invaluable for special properties exercised at certain points. Such are the common Myrabolams used so much at the finish of the process with Turwad and similar tannages, as a "bleaching" agent; also 'Sumac' and other agents used in the retanning of half-tanned hides. I am aware that there are tanners who use Myrabolams in admixture with Babul in the earlier stages of the tanning process, but their use would appear to me then general rather than special. In any case they constitute a tanstuff widely in demand all over India. The Myrabolam tree (*Terminalia chebula*), though widely distributed, is not found everywhere; and it pays to send consignments long distances by rail in India—not to mention the enormous export to Europe in the peace times of the past. There are even districts growing their own Myrabolams who find that it pays to import by rail "nuts" of known high grade, such, e.g., as Jubbalpores and Bimlis, for best work, rather than use the probably inflated "nut" which is commonest near at hand. Myrabolams, then, are to be regarded along with Turwad as universal tanstuffs. To them I would add the Babul (*Acacia arabica*) bark because of its wide, though scarcely general, distribution and of the enormous quantities of it consumed annually in Northern India. I am aware that in Sind this tree grows almost pure, but I have been struck with its occurrence here and there in most parts of India that I have visited; and more particularly in the extreme South I saw very many thick groves of this species, especially in the neighbourhood of tanks and shallow pieces of water; and the fact that at present it finds practically no application in Southern Madras as a tanstuff should not be taken as indicating that it never could be so used.

To the above three tanstuffs I would add the following as potential tanstuffs for more or less universal application:—*Asogeissus latifolia* leaves; *Phyllanthus emblica* twig bark; *Carissa spinarum* leaves; *Zizyphus xylopyras* (Gothar) fruit; *Cassia fistula* bark; *Kahua* (*Terminalia arjuna*) bark; various Mangroves; Sal; Divi divi; *Caesalpinia digyna* pods; and *Acacia leucophloea*.

Tanstuffs available for large areas of India.

(1) *Cassia auriculata*—so well known and widely distributed as to need no further description here. My best analysis showed 21 per cent, but I understand that analyses sometimes run as high as 24 per cent. The proportion of non-Tannin to Tannin is low; viz., $\frac{N.T.}{T} = \frac{18}{11}$, and the tannage, though of the Catechol class, is soft and mellow, as is well known.

It may be well to add here that I do not regard the fact of an excess of non-Tannin over Tannin ($\frac{N.T.}{T} > 1$) as necessarily tending to the condemnation of the tanstuff. I mention later in this paper, under "*Carissa spinarum*" a non-Tannin which is distinctly beneficial, but

in cases where the non-Tannin possesses no particular merit of its own, the tanstuff with non-Tannin < 1 will naturally be the better; and for the purposes of manufacture of Extract, this is specially the case.

(2) (a) *Babul* (*Acacia arabica*) bark—as well known in the North as *Cassia auriculata* is in the South, but by no means so easy to apply with a certainty of good results except in the hands of an experienced tanner. I learn from Captain Guthrie, Deputy Controller for Hides, Madras, who has done much work on Babul, that its average tannin content shown by a large number of his analyses was 12.4 per cent with 8.6 per cent of soluble "non-Tannin."

(b) *Babul* pods.—I believe that Mr. Puran Singh, the Forest Chemist, has done considerable work on this pod, but I am not aware with what final results. I append my analyses of (i) pods, dried green; with seeds, as far as possible, removed afterwards; and (ii) ripe husks without seeds picked up off the ground.

	(i)	(ii)
Tannin	16.86	19.76
Soluble non-Tannin	26.43	27.09
Insoluble matter	56.71	53.15
	100.00	100.00
non-Tannin	1.6	1.4
Tannin	1	1

The colour measurement of the filtered infusion of the ripe husks showed — calculated to 5 Grams per Litre Tannin strength — Red units 7; and Yellow units 26.

Owing to the very wide distribution of Babul, as already mentioned, further work from the tanning standpoint must be undertaken on these pods. The difficulty so far has been the tendency of the infusion to ferment, but this was not apparent in husks without seeds, which probably constitute a potential general tanstuff of the future. The matter will be gone into more fully from the practical standpoint, at Maihar, when time permits.

(3) *Myrabolans*.—Myrabolans of good quality may vary between 30 and 45 per cent of tannin, but by crushing and removal of the stones of the fruit, the residual "flesh" constituting two-thirds of its weight has an average of 50 per cent tannin, and Esociet has introduced this crushed product—which packs very close into bags—to the European market—before the war—with success. The kernels, I am told, only contain some 6 per cent of tannin. The nuts crushed have been first carefully picked and cleaned at the collecting centre, hence the fine product obtained.

(4) *Anogeissus latifolia* leaves (Dhawa).—Much has been already written with reference to this tanstuff pioneered by the Esociet, Maihar. Its wide distribution almost throughout India has been pointed out, and a number of analyses also have been published showing that its leaves may vary at least from 15 per cent to 50 per cent in tannin-content according to their age, the young red leaves and shoots being the richest. These would appear to be more abundant and to retain their red colour and high percentage of tannin until of larger size in Southern India than in the North; and according to the Conservator of Forests, Southern Circle, Madras, P. M. Lushington, Esq., I.F.S., in the Palni hills (Kodaikanal Ghat) new 'flushes' have been observed to recur almost every month. An analysis of Mr. Lushington's 'Rosy Sumac', which is prepared from these red leaves, showed 49.21 per cent of tannin with 14.02 per cent of soluble 'non-tannins' on dry. The infusion was almost colourless (very faint tinge of yellow). The experience of the Esociet Tannin Research Factory is that the *anogeissus latifolia* leaves (especially the fine quality which is referred to as 'Sumac') have a bleaching action on almost any other more highly coloured tanstuff with which they are admixed; and this tanstuff is, therefore, extremely valuable in mixture tannages although by itself it produces a rather hard leather with a greenish tinge. Its tannin belongs to the Pyrogallol class and shows almost identically the same reactions as Sicilian 'Sumac' prepared from *Rhus coriaria*. Further, the Dhawa 'Sumac' (i.e., ground leaves) resemble Sicilian 'Sumac' in smell and in appearance, unless a very large proportion of the rich red leaves are present as in Mr. Lushington's Rosy 'Sumac', which has a reddish tinge.

(5) *Phyllanthus Emblica*.—The twig bark of this tree has been proved at Maihar to be a most valuable ingredient in various mixture tannages worked out there although the mature bark was low in tannin (about 10 per cent), and not useful in leather making.

An analysis of this twig work is as follows—result calculated to dry:—

Tannin	21.60
Soluble non-Tannin	17.18
Insoluble matter	61.22
	100.00
Non-Tannin	1
Tannin	1.26

* The ratio of non-Tannin to Tannin is at various places in this paper expressed as $\frac{\text{N.T.}}{\text{T.}}$.

The other two samples showed respectively 19 per cent and 20 per cent of tannin with, in each case, only about 10 per cent of soluble non-tannins. A very recent analysis by Lead (Pb.) method done in the Research Factory in the comparison of *Phyllanthus emblica* bole bark and twig bark gives the further confirmation of 12 per cent tannin in the former and 25 per cent in the latter.

The tannin of *Phyllanthus emblica* penetrates well and gives both weight and plumpness to the leather. It is found in sufficient quantity within reach of most parts of India, and though never exactly gregarious, the trees are often quite near neighbours in an average jungle.

The fruit of this tree has been very long known as a tanning material under the name of "Emblie" Myrabolams, which have been exported to Europe and used there to some extent on a commercial scale. Great attention is at present being paid at Maihar to the collection of this fruit which analyses over 30 per cent of tannin when taken green. It is too early to say at present under what conditions of collection it will yield good leathers, but this matter will be elucidated by the Research Factory at Maihar. At least the tanstuff seems promising on our present results, although in the past it has only yielded a very poor grade of leather as a "self-tan".

I was informed by a Village Headman when in the Belgaum Division that during a dearth of common Myrabolams several years ago the local tanners turned to the leaves, and not to the fruit, of the *Phyllanthus emblica* as a substitute, with fair results according to their own statement. An analysis of mine of these leaves was as follows—calculated to dry:—

Tannin	37.85
Soluble non-Tannin	19.12
Insoluble matter	52.03
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{1.5}$$

Preliminary practical tests at Maihar have not so far been encouraging; but the matter is not yet regarded as determined and further work on the leaves is being taken up.

(6) *Carissa Spinosa* leaves (Karundah)—widely distributed in many parts of India, often on dry slopes at the base of hills; averages about 10 per cent of tannin; has shown itself a valuable ingredient in mixture tannages on account of its plumping properties. The proportion of $\frac{\text{non-Tannin}}{\text{Tannin}}$ is about $\frac{2.5}{1}$, but we have reached the conclusion that here the non-tannin is of peculiar value for its plumping action on the leather.

(7) *Zizyphus Xylopyrus* (Gothar) fruit.—A number of analyses of Gothar fruit without stones has been carried out with varying results up to over 20 per cent of tannin in a ripe sample. A single estimation of a sample from the East Coast showed as much as 34 per cent by Lead (Pb.) method, but this has not been confirmed in any other samples done by either Hide Powder or by Lead (Pb.) method. The matter is still being investigated with repeated analyses for the reason that the separation of stones from flesh is expensive; and it is important to note just at what time of the year the fruit is richest in tannin. Mr. Fraymouth has recently discovered an entirely new application of Gothar fruit in the tannery. I may mention that this fruit yields a very gummy infusion and Mr. Fraymouth has found that strong Gothar liquors, which are both gummy and acid, have a remarkable plumping action on hides suspended in them at the outset of tanning. These liquors further impart hardly any colour at all to the leather, but the great point in the discovery is that the gum itself would appear to be very largely absorbed into the hide substance and that after a suspension of, say, 7 days' time, it may, in the main, be removed by washing, when it leaves the hides in such an "open" condition that on being moved to stronger tannin liquors they absorb tannin with remarkable evenness and rapidity and apparently without any bad effects at all, as 'half-tanned' leather which has been so treated comes out soft, mellow, pliable, and with a smoothness of grain hitherto unattained at the end of the tanning process. It is interesting that in the Leather Trades Review dated 25th January 1918, just to hand here, Dr. Andrew Turnbull and Mr. T. B. Carmichael have taken out a patent for the use of a starch jelly in combination with tanning materials where, they claim, that a very strong tannin solution may be employed without any "drawing" of the grain. We, here, have long been aware of the large amount of the gum contained in Gothar fruit, which has compelled me to use special treatment in its analysis. But it is quite independently of the discoveries embodied in the above-mentioned patent that Mr. Fraymouth has discovered that this very gummy thick Gothar liquor has this remarkable effect, which he has already turned to practical account in the routine of the Maihar Tannery where all hides receive this preliminary treatment with the Gothar liquors to the very great benefit of the ultimate leather. The Gothar tree is very widely distributed.

(8) *Cassia Fistula* (Konai)—largely used in the Madras Presidency as a diluent for the *Cassia auriculata*. I cannot speak of it as yet from practical experience, but it is reputed to contain from 9 to 12 per cent of tannin.

(9) *Terminalia Arjuna*—very largely found along the banks of water-courses in most parts of India. By itself it yields a somewhat harsh leather, but it is very valuable for sole leather tanning. Mr. Fraymouth's experience over a number of years both in Rewah and at Mailar is that the bark averages about 22 per cent tannin. The outer bark may be stripped from the tree and renews itself within a year provided the cambium is not disturbed. This tanstuff was largely used successfully by Mr. Fraymouth in the Rewah State Tannery from 1911 onwards for leathers produced there, and has been supplied regularly for three years to two tanneries at Cawnpore with equally good results. Mr. Fraymouth has a simple and ingenious cutter for flicking off the outer layers of the bark, without damage to the cambium.

(10) *Mangroves*.—These, though not of very general distribution in large quantities in the Indian Peninsula, cover an enormous area in the Sunderbans and all along the coast of Burma from Arakan to Victoria Point, including very many of the islands of the Mergui Archipelago. They are also abundant in the Andaman Islands and were so, at one time, on the South-West Coast of the Indian Peninsula, but now they have been very largely cut out to make room for the cultivation of coconuts and paddy. They may, however, be regarded as available for large areas of Burma and North-Eastern India.

(a) The commonest of all in Burma is *Rhizophora mucronata* which is known as the "common mangrove". The following is the analysis of a sample collected at Killai, South Arcot District (Madras)—calculated to dry:—

Tannin	22.17
Soluble non-Tannin	16.76
Insoluble matter	61.07
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{1.3}$$

Other samples from Burma have shown variations from about 19 to 29 per cent according to Hooper. I regard my sample as rather low. The Agricultural Ledger of 1902, No. 1, states on page 35 that the tree *Rhizophora mucronata* is called "pyu-bin" by the Burmans and "Bakan" by the Malays. But the latter is evidently a misprint for "Bakau". My experience, however, is that the *Rhizophora mucronata* is not "Bakau" at all, but "Bais" or "Bewis", of which I had some experience in Borneo. "Bakau" is known in Burmese as "Payon" (pronounced Pé Yón) which, according to the District Forest Officer, South Tenasserim, has not yet been botanically classified. I have several years' experience of the use of the bark of this tree for the preparation of Tannin Extracts in Borneo. It is also very abundant in Southern Burma.

(b) *Rhizophora conjugata* is often associated with *R. mucronata* and has similar properties.

(c) There are also two or three species of *Bruguiera* yielding similar barks. I append an analysis of *Bruguiera caryophyllodes* from the Madras East Coast, the figures of which are as follows—calculated to dry:—

Tannin	18.41
Soluble non-Tannin	10.49
Insoluble matter	71.10
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{1.75}$$

The three foregoing "Mangroves" could, in my opinion, be mixed together even in varying proportions without making very much difference to an extract, and the same probably applies to direct tannage.

(d) *Ceriops roxburghiana* and *candolleana*.—These trees are abundant in the Sunderbans as well as in Burma. A sample from the former district, *vid* Calcutta, taken from a bulk consignment of *Ceriops roxburghiana* supplied to a tannery, gave me the following figures—calculated to dry:—

Tannin	27.73
Soluble non-Tannin	8.15
Insoluble matter	64.12
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{3.4}$$

while a sample of *C. candolleana* I brought from South Arcot (Madras) only showed 22.6 per cent of tannin with 10.72 per cent of soluble non-tannins. But my own experience has shown me that there is a great variation in even the identical species of Mangroves, so that

for either the *C. Roxburghiana* or *candolleana*, I could not take these as typical figures. The two species are so alike that they were always mixed up in collection by the natives of Borneo and the only distinction they made between them was to call one big ("bassar") and the other little ("ketidil"). Both went by the name of "Tangah". I have myself analysed samples of these barks showing as much as 40 per cent tannin. I personally have always regarded these *Cerios* as more suited for the manufacture of a dye-extract of the character of *Acacia catechu* "Cuteh" than for use in the tannery. But the Esociet Tannin Research Factory has been able not only to use *Goran* (*Cerios roxburghiana*) bark in mixtures with good results, but by the system of contact tannage applied there they have produced a half-tanned leather of good colour and quality, where I have hitherto seen nothing but hard and harsh leather from this Mangrove alone. The "*Goran*" (*Cerios roxburghiana*) exists in the Sunderbans in such quantity that it sells in Calcutta at only about annas six per maund; and it is equally abundant in Burma, Malaya, and many other tropical countries so that it might well form an ingredient of mixture tannages at least in those countries, if not even further afield. There are many other Mangroves which yield most promising analyses, but have yet to be tried on the practical scale. Amongst them I would mention:—

(d) *Two species of Carapa*—*Moluccensis* and *obovata*.—A sample of the bark of the last named gave me the remarkable result in Borneo, of over 60 per cent. of tannin. It is found in most parts of the upper Mangrove stretches, but it is scarcely gregarious, and the Chief Conservator of Forests in Burma has made arrangements for experiments, at my request, regarding its propagation.

(e) *The Heritiera fomes*.—a fine timber tree—, has been reported as a tanstuff yielding a leather of good colour, but a sample received from Calcutta was most disappointing in showing only 7 per cent of tannin.

My own feeling with regard to Mangroves is that as a class they almost all present tanning possibilities, more especially for use in mixture tannages. I believe that in most districts the right dry-land tanstuff or tanstuffs for admixture with them, to improve the colour and the quality of the leather, will be forthcoming, and I would much like to take up this work in Burma at some time if the opportunity presents itself.

It may perhaps interest the Commission to know that an area around Mergui, South Burma, of some thirty miles showed much smaller Mangroves than in other parts I have visited, for the reason that prior to the war all the larger trees had been cut out for export of the bark to Germany, which suggests that the Germans must have discovered the profitable application of these barks.

(11) *Sal* (*Shorea robusta*).—The bark of this tree varies very much in tannin and has a high colour. But the Maihar Research Factory has prepared leathers of beautiful pale colour with mixtures in which it constituted up to one-third. The best leather was obtained with one-third each of *Gothar* (*Zizyphus xylopyrus*) fruit, *Carissa spinarum* (*Karundak*) leaves, and the *Sal* bark. I have analysed a number of samples of this bark which vary from 5 to 9 per cent tannin-content, and but for the enormous distribution of the *Sal*, especially in Northern India, it would hardly come into consideration as a tanstuff. It is because so much *Sal* timber is felled by the Forest Department, the bark being simply a waste product, that on account of its cheapness it has found a limited use in tanneries up to now, and might, in time, to come, find a larger application. Mr. W. A. Fraymonth, F.C.S., the Director of the Esociet Tannin Research Factory, has devised and patented a method of concentration of tanstuffs by separation of the bark into fibre and a powder "concentrate", and I have found that in some cases the tannin strength of the powder thus obtained has been double that of the original bark. I may mention that the young leaves of *Sal* have analysed nearly 22.84 per cent of tannin by Chromed Hide Powder. An analysis of another sample carried out by Mr. S. P. Chowdry by Lead (Pb.) method showed 20.5 per cent of tannin. The young leaves, therefore, hold out a promise as a tanstuff of the future.

(12) *Cassalpinia Coriaria*—the common *Divi divi*.—Hooper states in the Agricultural Ledger of 1902, No. 1, that the Indian *Divi divi*, first introduced into this country from America, had been found by Professor Dunstan to give an average of about 30 per cent of tannin; while the American product may contain from 30 to 50 per cent. An analysis of mine, from a bulk, two maunds, received from Madras—showed calculated to dry bark:—

Tannin	42.52
Soluble non-Tannin	23.57
Insoluble matter	31.91
	<hr/>
	100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{1.9}$$

But, in this case, I had removed the useless seeds before analysis. *Divi divi* is cultivated in many parts of India. It is used mainly for heavy leather tannage and I found it was applied pretty largely at the Chrome Leather Co.'s Tannery at Pallavaram (Madras), which firm do not turn out half-tanned, but finished, leather. *Divi divi* is said to be useful for rapid drum tannages of light leathers, and in this case it gives a good colour. But in the heavy tannage it is apt to develop a dark colour the formation of which—Proctor indicates—may, to some extent, be prevented by the use of an antiseptic.

(13) *Caculpinia Digyna*.—Pods of this (seeds removed) are reported to contain between 50 and 60 per cent of tannin, and this should be practically investigated in Bengal, Assam, and throughout Burma, where it is plentiful, though with its high percentage of tannin it should have prospects of universal application.

(14) *Anciea Leucophlea*.—Distribution very general; gives a dark-coloured tan with a violet tinge which has been objected to. It has been proved at Maihar to be capable of yielding a good coloured leather by 'Partridge' tanning and might probably, in due time, find a more extended application. I am aware of its having been used to a limited extent by tanners in Northern India.

II.—Tanstuffs available in various districts locally.

(1) *Xylia dolabriformis*.—North and Central Kanara (Bombay), South Kanara (Madras), and Burma.—Is abundant both above and below the Ghats in Central and North Kanara and, I am told, grows almost pure on the laterite hills in South Kanara (Madras Presidency). Mr. G. H. Butterworth, I.F.S., Divisional Forest Officer for the Central Division, Kanara, computed that in three of his Forest Compartments it constitutes respectively 26, 28, and 30 per cent of the timber, and the trees sometimes run up to five feet in girth. Mr. G. Dodgson, Divisional Forest Officer, North Kanara, inspected ten of his compartments in which the average percentage of the tree was 24. He stated that the timber is not used there, and the wood can only be disposed of as fuel to the Railway Company. But if the tree were cut primarily with regard to the tanner and the extract manufacturer—the latter using the wood which produces a valuable extract—I take it that there would be no objection on the part of the Forest Department who seem, in this part of the world, to find no other use for the wood, whereas throughout Burma, and in South Kanara under the Madras Government, the timber is highly valued and the bark and saw-dust would only be available as a waste product from fellings. Mr. P. M. Lushington, I.F.S., Conservator of Forests, Southern Circle, Madras, estimates that of the bark some 1,200 tons would be available from fellings in South Kanara. But as many trees of the species are to be cut out this year at Kottiyur by Mr. A. W. Lushington there is little doubt that much larger quantities of bark would soon be available if wanted. I have an analysis of a Burma sample of the bark which shows the following figures—calculated to dry:—

Tannin	14.45
Soluble non-Tannin	17.05
Insoluble matter	68.50
	<hr/> 100.00 <hr/>

$$\frac{\text{Non-Tannin } 1.2}{\text{Tannin } 1}$$

My latest information is, however, that there is some slight difference between the Burma species and the Indian. In Burma the whole of the Railway system is laid on sleepers of the *Xylia dolabriformis*, and there should be an enormous quantity of waste bark and also saw-dust available in that Province. The wood is not very rich in tannin, but contains a high proportion of tannin to non-tannin—important point in extract manufacture—and is reported to yield an extract very similar to that of the South American Quebracho wood.

(2) *Terminalia bellerica*.—I learnt during my visit to the Belgaum Division that this was very common in Central and Eastern Kanara, but it is more or less prevalent in most parts of India, including Burma. My own work on this tanstuff indicates that the twig bark shows 10 per cent tannin on dry, with 6 per cent of non-tannin, whereas the mature bark shows 7 per cent of tannin and 12.75 per cent of non-tannin. The colour is also distinctly better in the case of the twig bark and I should not regard the mature bark as worth much consideration. In the meantime, we keep the twig bark in mind for further experiments when time permits, and the fruit is also listed for investigation.

(3) *Cassia marginata*.—This tree is abundant in Southern Madras. My attention was called to it by Mr. Lushington, and we subsequently found that it was actually in use in a large tannery in Trichinopoly where it was admixed with *Cassia fistula*, the mixture being used as a "diluent" for Turwad. The Manager of the Tanbery seemed hardly to distinguish between the two barks; they have similar names in Tamil, the *Cassia fistula* being called 'Konai' and the *Cassia marginata*, 'Sarai Konai'. It occurs to me, therefore, that possibly the same confusion may exist elsewhere in Madras tanneries. The tannin of *C. marginata* lies mainly in the middle part of the bark. In my rough tests referred to in my Madras Report I estimated its proportion at under 10 per cent and I now find that Hooper found some 6 per cent in the sample he analysed. This tanstuff would, therefore, scarcely be worthy of mention except for the fact that it is in actual use in Madras.

(4) *Wattles*.—Wattles of the Nilgiris and the Palni Hills are of three species, viz., *Anciea decurrens*, *Acacia melanoxylon*, and *Acacia dealbata*. The bark of these trees might even now find a limited use in the tanneries, but there are no great quantities as yet available, probably not more than 200 tons a month, of all the three kinds put together. If a greater

demand for the Wattle timber be created more bark would naturally be annually available, but without extensive planting it will be a long time before the Wattle bark could be regarded as a generally valuable tanstuff in Madras. I understand that two gentlemen have applied for large concessions in the Nilgiris for the cultivation of the Wattle—*Acacia decurrens*—the species yielding the richest tan bark. But I think this is mainly with a view to the manufacture of extract in the future, the Wattle extract being much appreciated in England. The experiments carried out at Mailhar indicated rather harsh tannage even in mixture, but the Wattle barks, if available in sufficient quantity, would, doubtless, prove very useful in the future in sole leather tannage; and so I feel they may rightly be mentioned here as *potential* tanstuffs. *Acacia decurrens* bark has over 30 per cent, and has been reported with over 40 per cent tannin.

The other two species are less rich, but a bulk of the mixed barks of all three species has been supplied to the Mailhar Research Factory from Mr. Richmond, I.F.S., District Forest Officer, Nilgiris, at the request of Mr. Fraymouth, and will shortly be reported on. Mr. Fraymouth's feeling is that there might now be sufficient of the barks used mixed, for use in local tanneries, while there would not be any really large quantity unless the supply is increased by cultivation, which would naturally be of the best species.

(5) *Rhus mysorensis*.—I examined samples of the twig bark and leaves received at Mailhar by the courtesy of Mr. Lushington, the analyses being as follows—calculated to dry:—

	Twig bark.	Leaves.
Tannin	18.52	13.04
Soluble non-Tannin	15.44	14.98
Insoluble matter	66.04	72.88
	<hr/> 100.00	<hr/> 100.00
	<hr/> Non-Tannin = $\frac{1}{1.2}$	<hr/> Tannin = $\frac{1}{1}$
Colour analysis calculated to Standard Tannin strength of 5 Grams per Litre	Red 3 Yellow 6	3.5 8.7

The twig bark particularly is promising, and both bark and leaves are remarkably free from colour. This tanstuff ought to be fully investigated practically at the Madras Leather Trades School as it is of particular interest in Southern India.

(6) *Anacardium occidentale*.—(Cashew nut Tree). This tree, although originally an importation from South America, is cultivated very largely in Madras. My analysis of the bark—sample received from the Director of Industries, Madras—was as follows—calculated to dry:—

Tannin	9.48
Soluble non-Tannin	9.40
Insoluble matter	81.17
	<hr/> 100.00
	<hr/> Non-Tannin = $\frac{1}{1}$

The tannin appears to be of the Pyrogallol class. The inner bark seems to contain a red dye.

(7) *Phyllanthus Polyphyllus*.—A sample of the twig bark received from Mr. Lushington showed the following analysis—calculated to dry:—

Tannin	16.51
Soluble non-Tannin	9.60
Insoluble matter	73.89
	<hr/> 100.00
	<hr/> Non-Tannin = $\frac{1}{1.7}$

Mr. Lushington suggested that, as *Phyllanthus polyphyllus* was plentiful in Madras, it might be used along with, or in place of, *Phyllanthus emblica* twig bark, and though on this result it shows itself somewhat inferior in tannin to the latter, its use in this way would appear practicable.

The following is a list of other trees in the Madras Presidency which have given good indications on rough tests, but on which I have had no time as yet to work further:—

Name of Species.	Particulars of Tannin.	Where available.	REMARKS.
(8) <i>Diospyros amblyoptera</i> "Panichinga"—cast nut bark.	Good indication of pyrogallol tan.
(9) <i>Grewia tiliaefolia</i> —red leaves	Considerable pyrogallol tan.	In South Coimbatore, Tinnevely, and Pailani Hills.	The tree is stated to coppice freely and grow well from seed.
(10) <i>Ocotea woderi</i> bark and leaves.	Fairly rich in catechol tan.
(11) <i>Thespesia populnea</i> bark	Considerable indication of pyrogallol tan.
(12) <i>Cocos nucifera</i> ; the well-known coconut fibre.	Good indication of considerable catechol tannin.	Samples asked for when in Madras for further investigation of this not received.
(13) <i>Barringtonia racemosa</i> leaves	Considerable indication of pyrogallol tan and yields a colourless infusion which might be valuable for white leather.	Found growing on river banks and edge of creeks.

On the 25th January I received a letter from Mr. G. A. Baker, the owner of large Estates,—including an area of uncut Mangrove swamp—at Komarom Kottayam, Travancore, and this letter informed me that he was despatching to Maihar on the 18th January a number of Travancore tanning samples, including Coconut fibre and samples of many of the reputed tanstuffs named in the foregoing list; also certain Mangroves—for investigation of their properties for general information. These samples will probably occupy about a month in transit to Maihar.

(14) *Anogeissus acuminata*.—Very serious attention should be paid to this tree in Burma. The leaves and bark appear fairly rich in tannin and, if the former possess a similar bleaching property to the *Anogeissus latifolia* of India, they should be very valuable in admixture with various more or less highly coloured Mangroves. My analysis of the mature bark is as follows—calculated to dry:—

Tannin	14.98
Soluble non-Tannin	5.79
Insoluble matter	79.85
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{2.5}$$

The young bark is less rich in tannin only, showing 10 per cent with 8 per cent of soluble non-tannins. The low value of $\frac{\text{non-Tannin}}{\text{Tannin}}$ in this bark is a very good feature. The colour of the infusion is very similar to that of French Chestnut Extract. I have as yet no analysis of the leaves.

Oaks.—I recently had an opportunity of doing some preliminary work on the natural tanstuffs of the Darjeeling District, more particularly four species of Oak and one species of Chestnut, common in that locality.

(15) *Quercus pachyphylla*.—Yields, with annual regularity, an acorn enclosed in a very large cup, which cup will probably be of use as a "Valonea", though much below the Turkish Valonea in tannin content. The following are the figures of my analysis—calculated to dry:—

Tannin	18.11
Soluble non-Tannin	13.60
Insoluble matter	70.89
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{1.3}$$

Colour analysis calculated to standard tannin strength: Red, 20.5; Yellow, 91.

The acorn itself is of practically no value. The mature bark has the following analysis—calculated to dry:—

Tannin	12.24
Soluble non-Tannin	10.75
Insoluble matter	77.01
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{1.1}$$

Colour analysis calculated to standard strength:—

Red, 11; Yellow, 40.

Proctor gives the average tannin content of best English Oak bark at 12 to 14 per cent of tannin matter. This bark, therefore, is practically equal in tannin to English Oak; and it should be possible to turn it to very useful account in a hill tannery.

(16) Another hill Oak; abundant near Darjeeling, the *Quercus lineata* has a much lower analysis, the figures for the mature bark being as follows calculated to dry:—

Tannin	9.69
Soluble non-tannins	11.73
Insoluble matter	78.58
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1.2}{1}$$

Standard colour analysis:—Red, 11.5; Yellow, 45.5.

(17) *Chestnuts*—A hill chestnut giving a good analysis is the *Castanopsis hystrix*. The figures are as follows calculated to dry:—

Tannin	13.00
Soluble non-Tannin	11.81
Insoluble matter	75.19
	<hr/> 100.00

$$\frac{\text{Non-Tannin}}{\text{Tannin}} = \frac{1}{1.1}$$

Standard colour analysis:—Red, 13.5; Yellow, 47.5. In smell and colour it closely resembles the English Chestnut Wood Extract. We have requested Mr. J. L. Baker, I.F.S., Deputy Conservator of Forests, Darjeeling Division, to send us a bulk sample of the foregoing for practical tests at Maihar; not necessarily with a view to the utilization of such tanstuffs except in tanneries near to where the trees grow. I have still to examine (18 and 19) two other species of Himalayan Oak—*Quercus lamellosa* and *Quercus fenestrata**—which gave very good preliminary indications, and I may also further mention the following species, the first rough tests of which have shown that further investigation on the practical scale will be justified:—

(20) *Alnus nepalensis* (the Himalayan alder) good indications in bark.

(21) *Himalayan Maple* (*Acer cambolii*) mature bark indicates Catechol tan in fair quantity.

(22) *Rhus* (related to Sicilian Sumac).

(a) *acuminata*:—Leaves, twig bark, and mature bark—all give good indications of Pyrogallol tan.

(b) *R. semialata*:—Bark of this gives good indications.

(23) and (24). Further, the *Laurel* (*Machilus*) and the "Pipli" (*Bucklandia populnea*) indicate Catechol tannin in fair quantity.

N. B.—The classification into Catechol or Pyrogallol is so far only tentative and has not yet been confirmed.

III.—Tanstuffs available for special purposes.

(a) *Extracts*.—These tanning materials having the lowest proportion of $\frac{\text{N.T.}}{\text{T}}$ are obviously the ones which, *ceteris paribus*, yield the best extracts. It sometimes happens that the ratio $\frac{\text{N.T.}}{\text{T}}$ varies very greatly according to the age of the tanstuff, for instance, in old leaves of *Amogium latifolia*, the non-tannin is sometimes as high as, or higher than, the tannin; whereas, in a sample of picked young leaves, the tannin may be $\frac{3}{4}$ times as high as the non-tannin. It may sometimes pay to prepare an extract from a tanstuff in which $\frac{\text{N.T.}}{\text{T}} > 1$, provided that tanstuff is either very cheap, or a waste product, or its tannin principle has some particularly valuable characteristic. For instance, a sample of tannin extract has been prepared on the experimental scale in the Government Experimental Tannin Solidification Plant at Maihar from purely waste products produced during

Mr. J. L. Baker, I. F. S., Darjeeling, already referred to, has given me particulars of the number of trees of

Note with reference to Himalayan Oaks of the Darjeeling District. *Quercus lineata*, *Quercus lamellosa*, *Quercus pachyphylla* and *Castanopsis hystrix*; and I see that in fifteen forest blocks where the trees of over 1' 6" in girth have been counted there are 24,710 trees of *Quercus lineata*; 24,663 trees of *Quercus lamellosa*; and 29,742 trees divided between *Quercus pachyphylla* and *Castanopsis hystrix*. The reason that the latter two have been counted together is that they bear the same name in the Pahari dialect spoken locally. It is, however, easy to distinguish between them as the *Quercus pachyphylla* only grows above 7,000 ft., whilst the *Castanopsis hystrix* grows only below this level. Speaking roughly, the two trees constitute about half and half in the 29,742. There are another 18 blocks equally rich in fine timber of the same class which are yet to be counted; so I feel that it will be realized that there is abundance of raw material to work upon in the Darjeeling Division.

* My analysis of this, since completed, shows Tannin = 15.85 per cent with soluble non-tannins 8.44 per cent., remarkable figures for an Oak bark.

The standard colour measurement was—Red 4; Yellow 7 units.

the handling of Myrabolams (as mentioned on page 5), such as kernels of the "nuts", dust formed in crushing the latter, etc. This extract has the following analysis:—

Tannin absorbed by chromed hide powder	88.70
Soluble non-Tannin	42.30
Insoluble matter	5.35
Molature	13.75
	<hr/> 100.00

Colour analysis: Red, 4; Yellow, 25.8.

For comparison with raw tanstuffs I may state that this percentage of tannin will be equal to 45 per cent on an absolutely dry extract; and with such percentage an extract should come in good value, in view of the practically negligible cost of the raw material from which it is prepared. But as an example of a highly suitable tanstuff for the manufacture of the extract I may quote the *Hopca parviflora*, the mature bark of which shows 21.71 per cent. of tannin to 4.69 per cent. of non-tannin. $\frac{N.T.}{T} = \frac{1}{45}$. It may, further, be pointed out that in some instances the tanstuff containing only a very low percentage of tannin may come into account for Extract manufacture provided there is a proportionately lower percentage of non-tannin. European Oak-wood extract from *Quercus robur* only contains from 3 to 6 per cent of tannin and yet, because the non-tannins are relatively low it is chosen as the material to produce the Oak-wood extract largely used in Home tanneries. In a similar manner, as already mentioned, the wood of *Xylia dolabriformis* with only 4—6 per cent tannin gives a likely type of extract.

It will be apparent from the foregoing that there are already available in India a large number of tanstuffs of which, though much is known, much more is continually being learnt; further, that there are a number of at least potential tanstuffs which it is the duty of Tannin Research Institutes, such as the one at Maihar, to investigate on the practical scale for the benefit of the Indian tanner. It will, however, obviously be a long time before anything like all of them can be thoroughly reported on and the results practically translated into leather. But, when this is done, the first really valuable compendium of Indian tanstuffs will be the result. We already have much information that was hitherto not general knowledge, and Research Institutes founded with the object of such work as we are doing gradually gain a wide experience of varying types of tanstuffs which will put them in a position to give useful information and advice to any tanner. The amount of work to be done, as will be seen, is very large and, in my opinion, will necessitate the institution of several local Tannin Research Institutes in different parts of India. One of these, for instance, should be located in Burma; another at some convenient hill station, to study the tannins of the Himalayan forests; a third would naturally be located in Bengal; a fourth in Bombay; and perhaps a fifth in the North-West Provinces. Madras is already provided with the beginnings of such an institute in the Madras Leather Trades School, where practical trials on similar lines to those at Maihar, have now been inaugurated under Captain Guthrie. And at the latter place the research work is in full swing in the Government Esociet Tannin Research Factory where the work has been going on for several years. It was in recognition of this that Government sent me to Maihar first on my arrival in India. I am not aware that at that time any similar work was being done elsewhere in this country, but there it was in a sufficiently advanced state to compel my admiration of the enterprise shown by Mr. W. A. Fraymouth and his staff in the practical exploitation of certain tanstuffs quite new to the tanning world as a whole, although some of them have been applied—or, more correctly, misapplied, on a very small scale by the local *chamar*. The latter did, however, have the wisdom—on the score of cheapness—to use the tanstuffs locally available, and I feel that this will in the future often be the wisest course for his more educated successor; but his education by the Research Institutes will include the proper collection and preparation of his local tanstuffs before applying them in the tannery. Mr. Fraymouth's principles have always been to obtain such tanstuffs as may be had annually without destruction of the tree, unless the bark happened to be a waste product from large numbers of annual fellings. Other factors he has kept before him are wide distribution, ease of collection and packing, ready solubility of the tannin principle in cold water, and, needless to say, a sufficient proportion of tannin which does not necessarily imply that the richest tanstuff in tannin-principle produces the best leather. Indeed, many tanstuffs with a relatively low proportion of tannin will yield a better leather than others that are very rich. As regards the particular tanstuffs selected for use in a tannery it will be obvious that the large, scale tannery will be able to import tanstuffs from greater distances should the most suitable ones not be locally to hand; but, here again, the art of proper collection and packing in small compass, into bags or pockets, on Esociet lines, so as to get the maximum value out of each railway wagon loaded, ought to be studied. Esociet has used pockets (small gunny bags) which are easy to pack, and easy even for children to handle, with great advantage, and their methods will, I do not doubt, be copied when the end of the war opens up once again the prospect of exporting Indian tanstuffs to the Home country—probably in much larger quantities than ever heretofore.

For the present the Esociet Tannin Research Factory is naturally devoting its energies primarily to the investigation of tanstuffs for war leather; but when the war is over and an enormous demand arises for tanstuffs suitable for every class of leather making, the value of such work on a multitude of tanstuffs as has been done there will be doubly appreciated; and if, in the meantime, further Research Factories in different parts of India—the desirability of which I have indicated—are not inaugurated I feel sure that there will then be an insistent

demand for their institution. The Esoclet Tannin Research Factory has done much, but there is so much more to be done that, in my opinion, there will be ample scope for several other similar institutions.

(Witness did not give oral evidence.)

WITNESS No. 476.

HON'BLE Mr. F. C. ROSE, M.I.C.E., *Secretary to the Government of India, Public Works Department.*

WRITTEN EVIDENCE.

Some information regarding available sites for the development of hydraulic power is contained in the statement accompanying this note. This information is the result of an enquiry made in 1907 from the Governments of Madras, Bombay, Bengal, the United Provinces, and the Central Provinces. It will be seen that the information given is of a very general character and the need of further information is evident.

I consider the best method of obtaining further information would be to convene a committee consisting of hydraulic and electrical engineers and experts in those industrial and agricultural concerns which it is particularly desired to promote. This committee would, in the first instance, draw up a statement of the information required and the points to be specially reported on. With this information in hand local Governments should be asked to undertake a systematic reconnaissance of possible sites. When normal conditions return this work could probably be undertaken by each local Government, with their existing staff, but, at present, in view of the depleted state of the cadres, this would be impossible.

When local Governments' reports have been received the most promising proposals could be examined in detail. For this special staffs would be required comprising hydraulic and electrical engineers, with the necessary establishment. They would be assisted by local officials. Their duty would be to put up detailed proposals for development of power at each site and to submit approximate estimates therefor. On these reports Government could decide whether the scheme could be put forward as a probable sound commercial undertaking. Probably the electrical experts required for the detailed examination of promising sites cannot be found from the ordinary establishment now employed in India, and it will be necessary to procure men on short-term agreements experienced in this type of work.

Province.	Division and District.	Site.	Particulars.	REMARKS.
Central Provinces	Baster State	Chitter Kot Falls	Chitter Kot falls in the Baster State has a fall of 80 feet. Gauging necessary before available power is known. The falls are about 20 miles north-west of Jangdalpur, the capital of the Baster State.	
Ditto	Akola, Berar.	West River Ban near Wari on the border of Jalgaon and Akole Taluqs at the foot of the Satpura hills.	At this place there is a fine rocky bed with an abrupt—practically vertical—fall of about 60 to 70 feet which can be improved to 100 feet or more. It drains 130 square miles of the hilly and rocky tract of Melghat, west of Narnalla fort. The Ban is here a practically perennial stream. Reservoirs for impounding rain water can also be constructed along the course of the river at very small cost by throwing small masonry dams across the narrow ravines. The area drained has 50 per cent more rainfall than the average of Berar, and even in a famine year the rainfall does not fall so badly as in the plains. The electric power generated here could be utilized with advantage at Shegaon, Akole, Akola, and Khamgaon, situated 23, 19, 34, and 36 miles distant, respectively. The physical features here are favourable for cheap hydro-electric energy.	
Ditto	Ditto	River Arun at Masni in Mangrul Taluq at the junction of Mangrul, Murtizapur, and Darwaha Taluqs.	At Masni there is a good site for a large reservoir impounding about 5,000 million c. ft. of water with a bund only 2,600 feet long and 90 feet high with 530 square miles drainage area. Most of the land that will be submerged is forest waste land. There is a good site for utilising the water with a high fall. The electric power thus generated could be utilized at Karanja, Mangrul, Murtizapur, Badnera and Amraoti, situated at 0, 22, 26, 32, and 37 miles, respectively.	

Province.	Division and District.		Site.	Particulars.	Remarks.
Central Provinces	Akola.	West	River Morna at Shaikla in Akola Taluq.	At Shaikla a large reservoir, impounding water, of 80 square miles can be constructed with a bund 5,000 feet long and 70 feet high. The Morna is practically a perennial stream in ordinary years; the electric energy generated here can be fully utilized at Akola, 16 miles to the north.	
Ditto	Buldana.	West	River Mhas at Nalgaoon Barar.	Between Waigaon and Hingna, a tank could be made with a bund only 2,600 feet long and the maximum height of 100 feet and impounding over 10 million cubic feet of water with a good site for a waste weir needing practically no cutting. The drainage area of the river Mhas at the site of the suggested tank is only 60 square miles, but the waters of the rivers Mun and Paingunga could, without much difficulty, be diverted to the reservoir, thus increasing the drainage area to 450 square miles. The electric power generated at this place could be utilized at Khangaon, Shageon, Balapur and Akola, situated at distances of 10, 14, 8 and 22 miles respectively. It is considered a promising project with the feasibility of utilizing some minor falls on the river Mun. The Mun and Paingunga are practically perennial streams.	
Ditto	Amravati.	East	River Sarpin, at Wajar, 8 miles north of Ellichpur.	The river here has a rocky bed with a number of falls along its course, and drains 44 square miles of hilly country to the east of Gawilgarh. The river with its rocky bed has a fall of over 2,000 feet in a length of about 10 miles. With impounding reservoirs along its course, very cheap electrical energy can be obtained. Once hydro-electric installations have been established in this locality, there should be no difficulty in supplying water to Chikhaldas by utilizing the great falls near Chikhaldas in pumping water up.	
Ditto	Ditto		River Chandra Bhaga, about 8 miles to the north-west of Ellichpur.	This river drains 67 square miles of the Gawilgarh hills with over 2,000 feet fall in its 10 miles course, and the falls on the same with their rocky beds can be well utilized for generating electrical energy as stated above in the case of the river Sarpin.	
Ditto	Ditto		River Shahanur at Raipur at 12 miles to the west of Ellichpur.	The river Shahanur drains 45 square miles of the southern most hilly tract of the Satpura mountains at Raipur, 12 miles to the west of Ellichpur. Besides a number of falls along the course of the river, there is a good site for a large reservoir between Raipur and Moragarh with a bund 2,000 feet long and about 80 feet high.	
Ditto	Ditto		River Muga, north of Pala, 13 miles to the north-east of Ellichpur.	At this point a reservoir may be constructed with a drainage area of 88 square miles of hilly country and a number of falls on the course of the river higher up.	
Ditto	Ditto		River Purma, north of Biarli, 18 miles to the north-east of Ellichpur.	A large reservoir could be constructed with a drainage area of 186 square miles, and the river must have a number of falls in its course higher up through the Satpura ranges.	
Ditto	Ditto		River Madu, branch of the Wardha, to the north of Deotara, Morsi Taluq.	A series of reservoirs could be constructed with falls along the course of the river with a drainage area of 204 square miles of hilly country. The electrical energy thus generated could be economically and advantageously utilized in working a 2'-6" gauge electric tram line from Morsi to Ammoti.	
Ditto	Ditto		River Chargad at Udkhair in Morsi Taluq, 9 miles to the south-west of Morsi.	A large reservoir could be constructed here with a bund 900 feet long and 80 feet high and with a good site for a waste weir. The drainage area is about 80 square miles. Along the higher parts of the river, in the Satpura ranges, some falls would probably be found which could be utilized with advantage. The electric power generated could be transmitted to Ammoti, 28 miles distant, besides supplementing that required for the Morsi-Amratoli tram-line referred to in the entry above.	

Province.	Division and District.	Site.	Particulars.	Remarks.
Central Provinces.	Amraoti, East Berar.	River Purna above Jasegaon. River Wardha Chikhmandal and Paghal, 10 miles north of Pagnon Coal Fields.	No particulars are available with regard to these two sites.	
Ditto	Chhattisgarh States, Division Raipur.	Indrawathi river at Chitra Kote, about 20 miles north-west of Jagdalpur in the Bastar State.	At this site the Indrawathi always has a very substantial flow and the fall is 97 feet. The gauging of the fall was done in May 1906. The main channel discharge is 720 cusecs and that of the secondary channel 20 cusecs with a drop of 85 feet.	
Ditto	Nagpur	Junction of the Kanhan with the Wainganga, above the village of Ambhora, 40 miles from Nagpur and 8 miles south of Bhandara.	A dam could be built on the barrier of rock which lies across the Wainganga river.	
Ditto	Ditto	Four points on the Kanhan river between the town of Kiapa and its junction with the Wainganga.	No particulars.	
Ditto	Ditto	Site on the Pench river near the village of Bheegari, 30 miles north of Nagpur.	No particulars.	
Ditto	Ditto	The Pench river on its leaving the hills north of Kantee.	Might just be possible to get a site on this river and if sites are found, they would be very favourably situated.	
Ditto	Bhandara, Balaghat.	On the Ghisari river which runs through Odha and Dhanusa near Dhanusa.	There is a high waterfall here which is reported to be perennial. The stream falls almost sheer in a series of rapids from several hundred feet; in the hot weather this section of stream dwindles to 3 or 4 square feet only.	
Ditto	Ditto	The Nahara river on leaving the hills near Chargaon.	The catchment area of the river is about 200 square miles and the river should here be capable of giving throughout the year a large body of water running at a high velocity.	
Ditto	Ditto	The Bigh river, one mile from the village of Kajgaon at Gograhat on the Gondia-Balaghat Road.	The fall is about 10 feet in height. The bed of the stream at site is rocky.	
Ditto	Ditto	The Wainganga river near Bhamori, between the villages of Chikhgaon and Gurghai.	The height of the waterfall is about 25 feet and the bed of the stream is rocky.	
Ditto	Ditto	The Son river to the north-east of Langi above Bijagath.	Very promising sites may be found on these streams where they run through the hills above the Balaghat plains.	
Ditto	Ditto	The Udaal and Nahara rivers, east of Chargaon railway station on the Satpura Railway.		
Ditto	Ditto	The Deo river above Bhanpur.		
Ditto	Ditto	The Wainganga river above Balaghat.	Might just be possible to get a site on this river, and if a site is found it would be very favourably situated.	
Ditto	Chanda	River Enai, 12 miles south of Chanda.	This river passes through hilly country where a dam could be made to hold up water from a catchment area of 300 square miles.	
Ditto	Ditto	Randighi Fost, nearly 6 miles north-east of Chargaon village, or nearly 22 miles from the Wazara railway station.	There is a natural fall of 20 feet at the source of a branch of the Enai river in the Mul hills. From the toe of the hill range at the pool to its source the stream is nearly 2½ miles in length. The catchment area is nearly 3 square miles. If a dam is built, the tank thus formed will contain nearly 53 million cubic feet of water. The water thus available for generating electricity will be nearly 200,000 cubic feet per day for nine months of the year when the stream generally remains dry. The cost of the dam, excluding the apparatus for generating electricity, would come to not less than rupees two lakhs.	

Province.	Division and District.	Site.	Particulars.	REMARKS.
Central Provinces	Chanda	Sitamkhandi on the river Indravathi, nearly 125 miles from Chanda and 35 miles from Sironda.	This natural fall is on the Ailapalli-Sironda Road. It is nearly 10 feet in depth, and the water in the river here flows with great velocity.	
Ditto	Bilaspur	The Hasu river where it leaves the hills above Korha and Chhuri.	A storage site might be found here.	
United Provinces.	Banda	River Ken at Kheroni.	This site is a suitable one for a reservoir, but is situated some 30 miles below the Ken Canal head. For effect it must depend on rain supplies. There is not likely to be any available volume in the river during the greater part of the cold weather. There is a catchment area of 7,056 square miles and a flood discharge of 450,000 cusecs.	
Ditto	Panna State	Paund village below junction of Sunai and Ken rivers.	Catchment area=5,700 square miles. Flood discharge=325,000 cusecs.	In 1907 it was reported that there were favourable sites for reservoirs, and were situated above the works proposed for storage for the Ken canal, and that the sites were probably too far distant from any commercial centres to be of any value.
Ditto	Damoh	Khumargar below junction of Sunai and Besrni rivers.	Catchment area=4,126 square miles. Flood discharge=235,000 cusecs.	
Ditto	Lalitpur	Giror on the Dhasan river.	This site is probably too far distant from any commercial centre to be of any value. The catchment area is 826 square miles and flood discharge is 190,000 cusecs.	
Ditto	Rewah State	Lunpur on the Tons river.	Catchment area=3,400 square miles. Flood discharge=4,00,000 cusecs.	
Ditto	Ditto	Poorwa on the Tons river.	There is a fall here of 100 feet. Catchment area=2,010 square miles. Flood discharge=235,000 cusecs.	
Ditto	Ditto	Chachai, 3 miles from Poorwa, on the Bahar Nala.	There is a fall here of 300 feet. The immediate site is not suitable for a reservoir. Except during the rains the discharge is small. The catchment area=640 square miles. The flood discharge is 70,000 cusecs.	
Ditto	The Jamna river, 10 miles west of Mussorie and within 40 miles of Saharanpur.	At this site it is possible to obtain a head of some 220 feet or more. The power thus available is estimated at more than 25,000 H. P.	Government have entered into an agreement with the United Provinces Power Association who intend using the waters of the Jamna for generating electricity.
Ditto	Banda	Kotasia on the Palam river not far from Markundi Station, East Indian Railway, Jabalpur line.	There is a fall here of 150 feet. The river carries a fair supply in the rains and dries up in the cold weather. Its value must depend entirely on storage. The catchment area=175 square miles. It is not unfavourably situated for Allahabad and Sonna.	
Burma	Hatay, rapids on the Salween river.	Water is available for generating electricity which can be regarded as commercially promising.	
Ditto	One place in Arracan	Ditto	
Bombay	Nasik	The Valtarna river in Nasik.	The Valtarna river rises in Nasik above the Ghats and falls down into Thana below, at about 12 miles from Igatpuri Station on the Great Indian Peninsula Railway and 90 miles from Bombay. The amount of power that could be obtained from this river with storage works is very considerable and probably averages over one hundred thousand horse power continuously.	
Ditto	Belgaum and Kanara.	Castle Rock	The Kali Nadi rises at Castle Rock on the Marmagao Railway, along the boundary between Belgaum and Kanara Districts. The site of the power works would be within 60 miles of Belgaum, Dharwar, Hubli, Marmagao and Karwar. The water power on this river probably exceeds that possible on the Valtarna (entry above) if storage works be made.	

Province.	Division and District.	Site.	Particulars.	REMARKS.
Madras	Kistna	Between Dulla and Srussewaru on the Kistna river above the Berwada anicut.	The site is neither situated in the vicinity nor connected by easy means of communication with any town or trade centre. It is unlikely that a power scheme in this part of the river can be worked with profit unless the Kistna reservoir project is sanctioned.	
Ditto	Salem	Hogestal falls, on the Cannedy river, 40 miles from Salem.	It is believed that 1,000 horse power can be developed. Minimum discharge = 96 cusecs.	
Ditto	Madam	Uthman anicut	At different places on the Suruliyar river, by means of which the waters of the Periyar lake are passed into Vaigai river. At all these sites the maxima and minima discharges are 1,260 and 250 cusecs respectively. The minima are subject to special storage arrangements being made. Natural flow nil. No continuous flow will be available throughout the year at these anicuts unless a reservoir on the plains proposed in connection with the question of utilising water power of the Periyar tunnel is made.	Government have under consideration an agreement with Mr. Garrett to utilise the waters of the Periyar for generating electricity.
	Ditto	Palayampuray anicut		
	Ditto	Chinnamannur		
	Ditto	Maridenkottai		
	Ditto	Sattampatti		
	Ditto	Kattur		
	Ditto	Upparapatti		
	Ditto	Virepandi		
Ditto	Ditto	Chattrepatti		
	Ditto	Periyar Lake tunnel	At Kuruvamth at the head of the Cambern valley 69 miles distant from Annayanayakur. Maximum discharge = 1,110 cusecs. Minimum discharge 250. Only 250 cusecs can be given a day for 240 consecutive days. There is a 50 feet fall, 20 feet vertical and rapids. Maximum discharge = 3,000 cusecs. Minimum = 40 cusecs.	Ditto.
	Coimbatore	Bhavani falls near Thondai, 15 miles above Mettapalayam.	There is a series of cascades of 2,000 feet, 500 feet easily available. Maximum discharge = 500 cusecs. Minimum discharge = 6 cusecs.	
Ditto	Ditto	Allyar, Anamalai hills	By cutting a channel from the Upper to the Lower Jhelum canal a fall of 78.5 feet can be obtained. Discharge* = 5,000 cusecs representing 44,000 horse power.	*Presumably not the whole year round, but only when water is passed down the Upper canal for irrigation.
Punjab	Rasul	At the tail of the Malakand Tunnel there is a fall of 321 feet in 4,100 feet. The minimum discharge recorded in 20 years prior to 1905 for the Swat river at Abassi was 1,000 cusecs. A perennial discharge of 518 cusecs through the tunnel would be available, representing 15,300 horse power, assuming that 61 feet of fall is lost in the channel.	
North-West Frontier Province.	Tail of Malakand Tunnel on the Upper Swat River canal.		

SUPPLEMENTARY EVIDENCE.

Q. I.—The list of available sites for the development of hydro-electric power contained in the statement accompanying your note appears to be very incomplete. Some provinces apparently have made more detailed investigations than others. Would it be practicable, without great expense, to get prepared for the use of the public a much more exhaustive list of possible stations, supplying only particulars similar to those given in respect of the majority of sites mentioned in the list?—A.—I consider that without very great expense a more exhaustive list of possible power stations could be prepared. At the same time, I think it as well to sound a word of warning. Except on the large rivers which debouch from the hills from the Himalayas and in Madras the success of any possible site will generally depend on the facilities of being able to store a sufficient supply of water in the monsoon to ensure a regular supply throughout the remainder of the year. Investigations in respect of reservoirs must necessarily be more or less detailed though it would generally be possible to indicate by a more or less cursory examination whether any particular site was worth further investigation or not. Such an examination could be carried out by an officer specially deputed for the purpose in each province and would no doubt result in much fuller information being obtained than we have at present and at no great cost. One point which I may bring to notice is that it appears likely that the majority of the sites at which it will be possible to generate really large amounts of power will be in Native States. In this connection it may be noted that the greater portion of the territory in which the rivers flow through the Himalayas lies in Native States. Similarly the larger perennial rivers in Madras have their greatest delicuity and consequently their greatest prospective potentiality in the States of Mysore and Hyderabad. I do not intend to convey the impression that suitable sites of fairly large power cannot be

found in British territory, but at the same time I do think that on investigation it will be found that the majority of such sites will entail expensive storage works.

Q. II.—Under existing regulations, by what authority, namely, Provincial or Imperial, are water power concessions granted? Do you consider it desirable to have rules framed somewhat on the lines of the Mining Rules, which will show applicants for concessions what they may expect to obtain, after undergoing the expense and trouble of a survey of the site? —A.—The local Government enters into negotiations but under statutory rules contained in Appendix 15, Volume III, of Public Works Department Code, the sanction of the Government of India or the Secretary of State is necessary under certain conditions. Generally speaking the sanction of the Secretary of State is necessary—

(a) if the concession is intended to endure for more than ten years and is not accompanied by an unconditional power of revocation or cancellation, and imposes on the revenues of India an annual liability in excess of Rs. 50,000; or

(b) imposes on such revenues expenditure or liability to damages in excess of Rs. 12 lakhs; or

(c) involves the cession of property or rights estimated in value at more than 12 lakhs,

and the Government of India's sanction is necessary—

(i) if the period in clause (a) exceeds 5 years and the liability Rs. 5,000;

(ii) if the sum in clauses (b) and (c) exceeds Rs. 1 lakh. Below these amounts the local Government can sanction the concession.

I consider it would be almost impossible to frame rules on the lines of part III of the Mining Rules to govern concessions for water-power. The circumstances are so very different. In the case of mining concessions they are all much alike, but in the case of water-power concessions every case will have its own peculiarities, e.g., irrigation, forest, or navigation rights may be concerned, and obviously the concession to generate power from a natural fall will be entirely different to one where storage is required. Care must also be taken to ensure that any particular company is not allowed to monopolize for its own use a site which, if properly developed, might provide power for many more industries and concerns than the particular one in which the company was interested.

(Witness did not give oral evidence.)

WITNESS No. 477.

Mr. A. C.
Coubrough.

MR. A. C. COUBROUGH, Controller of Home Indents and Priority, Indian Munitions Board.

WRITTEN EVIDENCE.

On the training of engineers.

In the following notes, I make no attempt to deal exhaustively with the above subject. My endeavour is to emphasize the necessity of raising the status of an engineer and of the engineering profession generally in India. I consider that the benefits which would be derived from such action are first, that it would act as an encouragement to the intelligent youth of India to adopt engineering as a profession, and, secondly, that it would lead to material advancement in the general knowledge of Indian engineering problems and of the means of solving them.

2. My experience of India is comparatively short (7 years), nor can I lay claim to any wide experience of Indian workmen such as is obtained by the works manager of a large engineering factory or railway workshop. I have, however, travelled much in India and have come in contact with employers of labour in all the important industries of the country. I have always taken an interest in problems relating to technical and industrial education. I have also had the advantage of 17 years' experience of engineering workshop practice in the United Kingdom, together with an intimate knowledge of university and technical college curricula and methods. My direct experience of Indian mechanics and engineers is confined to what one derives from the employment of engineering draftsmen, fitters, etc., engaged in the designing, erection and starting up of electrical installations in mills, collieries, etc., and in the supply of a great variety of textile, hydraulic and other classes of machinery.

3. I think it may be taken as granted that engineers in India, and particularly mechanical engineers as distinct from civil engineers, have not hitherto received the recognition which is their due. An engineer, whether Indian or European, has little or no standing. He requires no University qualification, and in fact in past years, it has been rather the practice to look upon degrees with suspicion than as evidence of a man's capabilities. In other professions, for instance, doctors, and lawyers, individuals have a certain status as

members of recognised societies or institutions, which societies in general include the whole of the individuals practising that particular profession. No similar organization exists as regards engineers.

4. The effect of this lack of organization among engineers in India is twofold. In the first place, there is an absence of co-ordination of aim and purpose among European engineers in India, and, in the second place, there is lacking the incentive which is very necessary to attract the better class of Indian to take up engineering as a profession. Such incentive would be given by attainment to a certain rank or position in his profession.

5. At the present time, there exist in India several small bodies of engineers who, from time to time, have made spasmodic efforts to form themselves into societies for the advancement of their particular section of the profession. In Calcutta there exist three or four such societies. With two of these, I have been, more or less, intimately connected, *viz.*, a local section of the Institution of Electrical Engineers and a 'Calcutta and District' section of the Institution of Mechanical Engineers. The members of these two societies are recruited from the members of the corresponding Home Institutions of which they are branches, and membership of the local sections is strictly reserved to members of the Home Institutions. Both of these local sections have been in a more or less moribund condition for several years, and it had become evident that some radical change in the constitution of such local sections was necessary, if they were to become representative of the engineering profession in India or even remain in existence.

6. Apart from these two societies, there is a purely Indian Institution, the Mining and Geological Institute of India. This Institute is the only society which has made any attempt to co-ordinate its aims with the industrial life of the country, and it has for many years carried on a work of considerable usefulness in its own sphere.

7. I mentioned above that it had become evident that these small societies, restricted to certain branches of the engineering profession, could not carry on an effective existence in India as they are at present constituted. The committee of the local section of the Institution of Mechanical Engineers therefore recently submitted certain proposals to the Home Council of its Institution with the object of widening the basis of membership of the Indian branch and of placing that branch on a sounder financial footing, so as to enable its work to be more effectively carried on. These proposals are at present under the consideration of the Council at Home, and, at the present moment, I am unable to state what attitude will be adopted towards them.

8. It is, however, evident from recent observations by members of some of the leading Institutions at Home that, not only is the question of the reorganization of sections of these institutions in the Colonies and Dependencies under consideration, but an attempt is being made in the United Kingdom to co-ordinate the efforts of the various engineering societies towards increasing the power and influence of the engineering profession as a whole.

9. I am of opinion that it is very desirable that a move should be made in this direction in India jointly with the deliberations which are taking place at Home. It is obviously far more necessary in India that the various engineering societies and institutions should be co-ordinated, as the total number of members of the various societies in India is comparatively small, and their individual influence small compared with that of the leaders of thought and action at Home. In the past, the members of one branch of the engineering profession have been too much inclined to cultivate acquaintanceship only with engineers in their own particular lines, and have consequently tended to lose the breadth of view which is brought about by contact with men engaged in other co-related spheres of work.

10. The establishment of an Indian Institution of Engineers would be of inestimable benefit not only to members of such an institution, but to India as a whole. The State and the individual would jointly derive benefit from the impetus which would be given to engineering in India by the establishment of a State-recognised institution of Engineers.

11. The actual constitution of such an Institution would require careful thought and working out, but the main principles which, in my opinion, should be embodied in its constitution are as follows:—

(i) The Institution should be definitely affiliated with the leading engineering and scientific institutions in Great Britain, and this affiliation should mean more than mere rights of individual members of the Home Institutions to become members of the Indian Institution. It should be the duty and privilege of the Home Institutions to contribute to the upkeep of the Indian Institution a definite proportion of the subscriptions paid by members of these Home Institutions resident in India, and such members would, in virtue of their residence in India, become members of the Indian Institution.

(ii) The Institution should be self-supporting, and should not be dependent on State aid for its maintenance. At the same time, I think it would be very desirable that the Government of India should contribute to the establishment and upkeep of the Institution and should have a directing influence on its policy and operations.

- (iv) The Institution should be given a Royal Charter conferring on it such powers as would enable it to take effectual action for the good of its members and therefore for the good of the State to which they belong.
- (iv) Under the proposed Charter, the Institution would have powers to regulate the admission of new members and the expulsion of those who might not worthily maintain the dignity of their profession. The Institution would have powers of conferring certain indications of rank to its members either by examination or by the vote of members of the Council of the Institution. Such rank would be in every way equivalent to a University degree, so far as assisting the holder to the attainment of a position in life to which his qualifications entitle him.
- (v) The Institution would be mainly supported by the commercial and industrial community. The Council of the Institution would be composed of men drawn as far as possible from all the various branches of the profession and would include representatives of the Government of India and of other official or semi-official bodies. The majority, however, of the members of Council will be composed of men actively engaged in the practice of engineering.

12. Such an Institution would not necessarily be the final authority in dealing with all matters connected with the engineering profession. It would have, as before suggested, full powers in regard to the treatment of its own members, but in so far as laws or rules relating to engineering practice or standard are concerned, the Institution would act in an advisory capacity to the Department or Departments of Government dealing with industrial progress, commercial administration or general legislation.

13. The above very brief outline of the constitution of the proposed Institution indicates what in my opinion is necessary in order to give the engineering profession in India the standing and influence required for its proper development.

14. It will be well at this stage to indicate a few of the drawbacks to such development which exist under present conditions. I saw it stated recently by one of the members of the Commission that, if he were asked to sum up the needs of India as a result of the evidence before the Commission, he would have no hesitation in stating that the general plea was for education, education, education. In putting forward this note on the necessity for the establishment of an Engineering Institution, I am adding my voice to the chorus of cries for education. I desire, however, to dissociate myself entirely from those whose cry is for education of the kind which is given in an Indian University. I am an Engineer and I look to the requirements of the engineering profession, and, to my mind, the primary idea as regards education for an engineer is to train the youth of India to an understanding of the dignity of labour. I am not at all pessimistic about the possibility of doing so. It takes time to change the trend of thought and ideas of a Western nation, and, longer still, those of an Eastern race. There are, however, plenty of indications that even in India the practice of past centuries does not necessarily become the practice of the next generation. Industrial India is rapidly awakening, and one sees here and there signs of a different aspect on life to what one might imagine would be possible from reading volumes of Indian economics.

15. Very little, so far as I have seen, has been done towards encouraging the spread of education of the type to which I refer. The most interesting examples are the work which is being done in the schools of the Buckingham and Carnatic Mills, the Industrial school which has recently been started in Bangalore and the educational methods which are adopted at the Sibi Engineering College. I do not think that there is such a wide difference between the boy born in the Western Hemisphere and his brother in the East that the latter has not some sort of natural inclination towards learning the mysteries of mechanical appliances. I suppose five boys in England out of every six at a certain period of life have no greater ambition than to become an engine driver, and I see no fundamental reasons why five out of every sixty in India should not have similar aspirations. If these aspirations were encouraged instead of being repressed, we should in a very short time have a nucleus of a body of mechanics and engineers in India who could be trained to use their hands for the benefit of the State.

16. The point I wish to emphasize in this connection is that the proposed Institution of Engineers would insist, as a primary qualification for membership, that the applicant should, in the first place, be a good craftsman. Membership of the Home Institutions is occasionally given to men who have risen to eminence in their profession on the purely commercial side, but the number of such admission is exceedingly few. The great bulk of the members have to prove to the satisfaction of the Council that they have gone through a course of training which included years of work with hammer and chisel, followed by years of service in a junior position, and the same policy would be adopted by the members of Council of the Indian Institution. In this way, encouragement would be given to manual training and actual practical work which, at the present moment, does not in my opinion receive sufficient encouragement or recognition.

17. The Institution would serve a very useful purpose in another direction. Distances are so great in India that the members of the same profession in different parts of the country often do not know each other, seldom meet, and only occasionally carry out any transference of ideas from one to the other. The Institution would form a centre of gravity for all engineers, and would have, as one of its primary objects, the bringing together of members of the same

profession, both by conferences and by circulation of information from one part of the country to another. I have been surprised, many times, to find that engineers in Government service and frequently in the same branch of the service have little or no idea of what is being done by their colleagues in other provinces. In fact, in regard to certain classes of work, Government engineers more or less rely on the representatives of engineering firms to keep them posted, not only in the developments of engineering trade in Great Britain or other parts of the world, but in the developments which may be taking place in a neighbouring province. The Institution would bring such men not only in closer contact with each other, but also with the commercial world and with the needs of India in parts other than those in which the individual for the time was stationed.

18. One must not overlook the advantages of the Institution from a purely commercial point of view. I have suggested above that the majority of the members of Council of the Institution should be drawn from the section of engineers most closely allied with commercial and industrial enterprise. After all, money making, although it may not be a desirable object in itself, is the great criterion of successful progress in any direction. No engineering work can be held to be successful unless it is so from the purely practical point of view of saving money. The Institution, therefore, must be very closely connected with the leaders of commercial industry whose lives are bound up with problems of industrial production, and unless the Institution has some value from the point of view of such men, it can never survive.

19. There is no reason why certain sections of the Institution should not be devoted entirely to scientific work, and in fact, it is becoming more and more recognised by engineers that purely scientific work carried on by men who have no interests in commercial enterprises whatsoever are a very necessary adjunct to commercial progress. The work of such a section is carried out by the individuals engaged on it purely for the love of the work which they are doing, and without any idea of commercial gain entering their heads. But a society composed entirely of such men loses the practical grasp which is necessary for industrial development, and, therefore, it is very essential that the basis of the Institution should be founded on ideas of commercial practicability rather than on those of high scientific attainment.

(Witness did not give oral evidence.)

WITNESS NO. 478.

Mr. T. R. J.
Ward.

MR. T. R. J. WARD, C.I.E., M.V.O., *Inspector-General of Irrigation in India.*

WRITTEN EVIDENCE.

As I am leaving for Mesopotamia I very much regret to say that I will not be able to meet the Commission, and I supply these brief notes in the hope that they may be of use, first with reference to the sentence at the bottom of page 141 of the (first) Draft Report beginning "The project for," etc., to end of that paragraph; the construction of the barrage and the remodelling of the Canals is a comparatively simple work of a class in which a large experience has been gained in India in the past and recently; the only difficulty will be in actual construction in that there will be more work in the wet than has been usual in other similar works. The local authorities are hard at work preparing a project; the only difficulty about this is to devise a project that can be constructed under the productive public works rules that require that the interest on the sum at charge at the end of 10 years from the date the project comes into operation *plus* the working expenses must be returned. The difficulty here is that Sind has been developed by irrigation, and the difference between present net revenues and those that will be earned when the project comes into operation is all that can be credited to it as nett income, so that the longer the barrage is postponed the more difficult it will be to make a project under these rules, that have proved so far very suitable and will continue to be so for some time yet so far as one can foresee. In any case, whether suitable or not to Sind, the investigation must be made before it can be shewn that the rules are not all that can be desired. I have just returned from Sind and I find all are sanguine that such a project can now be got out. If so, it will be probably the first to be carried out when normal times return, and once in operation, it will be followed probably by a project for another barrage above Sukkur near the Punjab border at Mithankot and another below Sukkur at Jherruck; such weirs have been discussed since 1867, see Colonel R. Strachey's note on Sind, page 76, Appendix V, Famine Commission Report, 1880. About pumping, the Commission have received a note from Mr. Gebbie, the Chief Engineer, Bombay, who has passed hitherto all his service in Sind. I gather from him that he has explained that development by pumping in the area to be commanded by the barrage is fraught with difficulty because the river is shifting and it will be difficult to get a suitable site for pumps. The inundation canals in upper Sind run dry and are not suitable for pumping, but in the Delta on the Fuleli Canal, for instance, there is a small perennial flow and a few pumps are in use already, and there seems a field here to help the farmers with expert knowledge to attain to more efficient things. I gathered in discussion with Mr. Lawrence, the Commissioner in Sind,

and Mr. Gebbie that there is a fairly large area of good land on the right bank of the Indus below Kotri that is unsuitable for a flow canal because it slopes from the hills to the river, but it might be possible to irrigate if the water were lifted. The scheme would be a big one, as large, or perhaps larger, than that at Divi in Madras, where 500 cusecs are pumped by eight sets of Gwynne pumps driven by Diesel oil engines. Otherwise, there is not the scope for pumping in Sind that there seems to be in the Punjab and United Provinces where wells are already numerous. The delta of the Indus seems to be like that of the Ganges in Bengal, and the sub-soil water conditions over extensive areas are not suitable for irrigation wells. But when the conditions for perennial flow canals are so extraordinarily favourable as they are in Sind, and when the economic conditions that now obtain have made inundation canals an anachronism, the purpose of those with influence in this matter with regard to Sind should be, it seems to me, to do all that is possible to hasten the advent of a larrage with modern up-to-date canals. I listened to the evidence of merchants to the Cotton Committee at Karachi, and I realized that though the Sind farmer is connected to the world's markets with a good up-to-date railway, dock, and steamship service, yet he can get but a very limited advantage from this because the quantity of his crop was not reliable. The difference of area matured in a good year from that in a bad is, I believe, 800,000 acres; this uncertainty in the yield that will come to market at harvest militates against good business.

With reference to the remark half-way down page 140 that the Irrigation Commission attached but little importance to the results that might accrue from improvements in the methods of lifting water, I have read through the chapter on this subject in part I, General, and I have not found anything wholly to substantiate this assertion; whilst there is something to be shown against its correctness in paragraph 134, page 59, part II, Provincial, where the Commission wrote with reference to steam pumping for irrigation, "this form of enterprise is at present in an experimental state, but it appears to us deserving of every encouragement". At the time the Irrigation Commission toured even in Madras there were few, or no, prime movers and pumps that could be recommended with confidence to the irrigator as designed and proportioned exactly to meet his needs. Since then I have had many discussions with pump makers on this subject, and there seems to be a consensus of opinion that the problem to be solved is a very difficult one, and private mechanical enterprise has not and is not likely to be able to afford to get that access to the minds and experience of the farmer that, for instance, the irrigation officer has by being caught young and worked hard in close contact with the irrigator during those years of glorious energy. Unless this point is realized the progress made in the many machines detailed at the bottom of page 139 will be slower than need be. The designer of machines, both for irrigation and agriculture, must be in the same close contact with the farmer during his impressionable years, as the irrigation engineer and the settlement officer are brought by their work. It should be possible to organize this through the workshop side of the Irrigation Department and the demonstration side of the Agricultural; in both I have met men of talent in, I think, every province I have visited, who have the right instincts in this matter. Doubtless the time is ripe for the farmer to make an advance to his advantage in this direction, and there is no doubt he is doing so, in spite of the fact that he is being "bitten" every time he goes forward, as one agricultural expert said at the Board of Agriculture at Poona. The manufacturer would not "bite" the farmer if he could get into touch with his needs and so provide what was really needed; but the capital required to do this in the way Government is able to do it for its irrigation and revenue services makes it out of the question. I am old enough to recollect the introduction of machinery in South Africa in 1869, and it had not made much advance in England when I first knew it in 1875. The farmer had to learn a lot before he could profit by the machinery, and to my certain knowledge many ruined themselves in the process of learning. In Europe competition among manufacturing engineers can be left to work out the most suitable machines and teach their use, but in India I am afraid Government will have to organize to work this out on some such lines as the agricultural experts are doing now at Lyallpur.

I am of opinion that use should be made of the British artisan to work among the Indian in our workshops and on our civil engineering works; only good handcraftsmen should be selected for this work. It is impossible to say in what heart lies the ambition to improve himself, or in what head the talent; but if it is once known among craftsmen that an *anubad* is at work those who have the heart and head will get employed under him. I think that much might be done to raise the level of artisan skill, the first requisite for an extensive introduction of machinery, by the systematic use of craftsmen on our public works. I have been given to understand that Mr. Hoare, the architect in Karachi, has brought out craftsmen from home and was using them to good purpose; the engineer is not necessarily a craftsman and, if he is, he is otherwise occupied, and the opportunities that his skilled workmen have to observe his skill are so rare as to be negligible.

Since agriculture is the greatest industry, and India the greatest agricultural country, and the deltas of Bengal, Burma, and Madras the most intensively cultivated part of India, very particular attention should be paid to the inland waterways of these tracts; the inclusion of inland navigation with irrigation is not altogether happy; such waterways should radiate from harbours for ships from overseas; whilst irrigation is the distribution of the flow of the far distant catchment over the fields. In the deltas only have waterways been profitable so far, and it would seem that a solution to their proper development might be found to bring inland waterways and harbours under the same organization. The aims and interests are much

the same, and their combination into one department would enlarge the interests and, in consequence, increase the influence; whatever reduces the cost of carriage makes for agricultural wealth, a due share of which is likely to go to railways in passenger and high-class goods traffic; moreover, in delta tracts canals are perhaps cheaper to build than are railways. The *pros and cons* of railways *versus* canals have been stated clearly by Sir Thomas Higham in his article in the *Imperial Gazetteer*, volume III. I would also refer to Mr. Oswald Lees' lectures on inland waterways to the students at Sibpur. I have found a strong feeling in Bengal, Madras, and Burma that more might be done with our inland navigable waterways.

In conclusion, I would suggest that the removal of tolls as early as possible should be aimed at in the interest of agriculture as an industry.

(Witness did not give oral evidence.)

WITNESS No. 479.

MR. J. F. CONNOLLY, I.C.S., *Commissioner, Northern India Salt Revenue.*

WRITTEN EVIDENCE.

Note on the Saltpetre Industry in India.

The production of saltpetre in British India is practically confined to the United Provinces of Agra and Oudh, the Punjab, and Bihar and its production, as well as that of *khari* (sulphate of soda) and *rass* or *saji* (carbonate of soda), in these provinces is controlled by the Northern India Salt Revenue Department, as explained in paragraph 3 of this note. A small quantity of saltpetre is produced in Madras for local consumption. A certain quantity is also produced in some of the Native States of Northern India, e.g., Bharatpur, Patiala, and Bahawalpur, a part of which finds its way to Calcutta, but no statistics of Native States production are available. Formerly all saltpetre destined for the export trade was consigned to Calcutta, but since the war began a considerable quantity has been shipped from Karachi and a certain amount from Bombay. The recognized centre of the industry is Farrukhabad in the United Provinces of Agra and Oudh, but the refined saltpetre produced in the Punjab is, I consider, superior to that of the United Provinces or Bihar. The refiner in the Punjab is, as a rule, a man of capital who takes out the licenses for manufacture of crude saltpetre in his own name, employs his own servants for the manufacture, and defrays all contingent expenses. The same custom is followed in the case of the Muttra refiners of the United Provinces. Elsewhere the *luniya* takes out the license to manufacture crude saltpetre, pays for the *patla*, and sells to the refiner through a middleman by whom he is financed from start to finish. In the United Provinces and Bihar and a few southern districts of the Punjab the manufacture of crude saltpetre starts in November or December and is continued until the monsoon sets in. The *Jherria* process, or crystallization by artificial heat, is the common one. In the Punjab when fuel is scarce and expensive the *Abi* process, or crystallization by solar evaporation, is more generally resorted to and manufacture takes place in the hot months preceding the monsoon. A good monsoon is favourable to the production of crude saltpetre, but manufacture is seriously interfered with by abnormal winter rains. The crude saltpetre of the United Provinces and Bihar yields, as a rule, from 40 to 50 per cent of refined saltpetre; in the Punjab the average yield is about 30 per cent. A licensee in Bihar manufactures during the season on the average about 15 maunds, in the United Provinces 55 maunds, and in the Punjab 250 maunds.

2. I attach a statement showing the exports of refined saltpetre to British dependencies and foreign countries in the three years prior to the war. The exported saltpetre is chiefly used as a fertilizer for coffee, rubber, sugar, etc., a certain amount is utilized in China for fireworks, and a small quantity is consigned to Australia and New Zealand for refrigerating purposes. The saltpetre exported for fertilising purposes is, as a rule, of a low grade, i.e., 30 or 40 per cent refraction. As the chief impurity is salt one would expect that a low-refraction saltpetre would be more in demand—also because of the saving in freight. Why this is not so I have failed to obtain any satisfactory explanation in India, but enquiries might, with advantage, be made from the countries concerned. In Coorg the purest saltpetre is used in the best coffee estates, and the Posa authorities consider its employment as the more economical. The war has created a considerable and fresh demand for saltpetre, and the supply to the Colonies, etc., has had to be greatly curtailed in order to meet the requirements of Great Britain and her Allies. The various purposes for which saltpetre is employed in the United Kingdom at the present moment are stated in a demi-official letter, dated the 6th March 1917, from an officer in the Ministry of Munitions, which is here reproduced:—

"In reply to your note regarding the employment of the large quantities of saltpetre which we import from India to the United Kingdom, as you know, in the main we use it for the manufacture of military gunpowder and blasting gunpowder for mining coal and iron ore and for certain other permitted explosives for mining. The gunpowder contains from anything up to 75 per cent of saltpetre.

"Another important requirement, which has grown up during the war for which saltpetre is extensively employed is the production of smoke mixture.

"There is also a fair demand for the material now for hardening tools and steel, and it is coming into use for certain qualities of glass in which the Ministry is interested.

"Then, of course, there is the large commercial requirement for curing bacon and preserved meat generally, for which the war has largely increased the demand. All these various requirements have become so large that we do not allow its sale for fertilizing purposes."

The export trade is in the hands of a comparatively small number of firms who, I may remark, are very much alive to each other's shortcomings. One or two firms buy direct from refiners but, as a rule, the refiner sells through a broker who acts as his representative in the selection of samples for analysis. Until recently this analysis was confined to a test for the usual impurities to be found in saltpetre and the determination of the percentage thereof in a given sample. Recently, however, Chile nitre has been imported to Calcutta and some dishonest brokers utilized it for adulteration, and samples are now subjected to a thorough chemical test.

3. The origin of the system of control exercised by the Northern India Salt Revenue Department over the manufacture of crude and refined saltpetre, respectively, is described in the following extracts from a note which I recorded in January 1915 in connection with certain proposals made by the Government of the United Provinces for stimulating production:—

"The primary object of the Internal Branch of the Salt Department is the prevention of loss to the salt revenue, and it is with this object that the rules contained on pages 48-53 of volume I of the Departmental Manual, which have the sanction of the Governor-General in Council, and the departmental instructions contained on pages 89-126 of the same volume, have been framed.

"In the manufacture of saltpetre, both crude and refined, and *khari*, as manufactured in the United Provinces*, salt can be obtained as a by-product. In the case of *rassi* or *sajji* no salt is educed in the process. But in the case of crude saltpetre, *khari* and *rassi* or *sajji* the plant of the factories is the same and this plant can also be utilized to manufacture salt from saline earth, or earth-salt as it is called, quite a different article from saltpetre salt. Such factories are, therefore, licensed in order that the person responsible for the working of a factory may be ascertained and that the locality at which the manufacture is to be carried on may be known so that it may be possible to exercise supervision and prevent the production of salt illicitly. The fee on the licenses in the Punjab and United Provinces is Rs. 2 per license, except in the case of *khari* made by solar heat, for which the license fee is Rs. 10. In Bihar, for special reasons, the fee on each kind of license is only four annas. The total income from these fees amounted in 1913-14 to Rs. 28,000 (round) and if the concession asked for in respect of licenses involved merely a question of surrendering this source of income the solution of the case would be a simple one. But larger issues are at stake and, to clear the ground for the discussion of the proposal of the United Provinces Government, I think I had better give a brief account of the causes which led up to the imposition of the restrictions now in force in regard to the production of saltpetre which term as defined in the Salt Act includes *khari* and *rassi* or *sajji*.

"These restrictions apply to the United Provinces, the Punjab, and Bihar. In the case of the United Provinces the necessity for control is much stronger than in either the Punjab or Bihar because of the existence of large tracts of rich saline soil from which earth-salt can easily be extracted. In the Punjab such tracts are confined to a few districts in which a preventive establishment is maintained; in Bihar they are so limited as to be almost negligible. In the Punjab, moreover, there is never likely to be demand for earth salt, except in the few districts just referred to, as the Punjabi has always been used to the rock-salt from Khewra and tastes in salt differ as widely as tastes in tobacco, opium or wine. But in the United Provinces earth-salt has been a favourite form of salt in many districts. It was manufactured and consumed to a large extent in Oudh "where it had a high reputation" and, before the annexation, its importation from that province into British India had to be forbidden. It was also manufactured and consumed largely in districts in the Agra Province, notably Etah, Mainpuri, Cawnpore, Allahabad, Jaunpur, Agra, and Meerut. In 1831 its manufacture was prohibited, and illicit manufacture on an extensive scale was carried on, and in 1838 its manufacture was for a time again permitted under supervision. In 1843 it was finally prohibited. But the *lunias* whom I have seen described as "that hereditary incorrigible salt manufacturer", for long taxed the efforts of the preventive staff and, taking advantage of the fact that saltpetre manufactories were then ill-controlled, caused much loss of revenue by educing salt from saltpetre or by making salt from saline earth under the cloak of a saltpetre factory license. This led, in 1861, to the saltpetre industry, including manufacture, of *rassi* or *sajji* and *khari* being brought under strict control—which was made stricter in 1867—by the introduction of the system of licenses now in force and by the creation of "proscribed"† areas which will be presently dealt with. The illicit manufacture of earth-salt, however, died hard, and was only finally crushed after many years. This was due partly to the efforts of the

* Proscribed areas were those in which a high degree of salinity was believed to exist, and no license was granted for any such area unless an examination of the soil disproved the assumption.

† Proscribed areas were those in which a high degree of salinity was believed to exist, and no license was granted for any such area unless an examination of the soil disproved the assumption.

preventive, staff and partly to the cheapening of salt owing to the reduction of the duty on the one hand and on the other to improved means of transport as the railway system extended. In 1863 the price of salt was Rs. 6-7-10 per maund at Allahabad, its present price being Rs. 2-2-4 per maund. That illicit manufacture had, however, been widespread may be judged from the fact that, in 1868, the preventive staff employed in the United Provinces reached a total of 1,277 officers, subordinate officers and men, while 1,052 persons were punished for offences under the Salt Act. In 1913-14 the total cadre of the Internal Branch, Upper and Lower Divisions, amounted to only 312 officers and men, including 243 peons, and the number of persons convicted in the three areas of control was only 116.

"It now remains for me to deal with refineries. The necessity for maintaining control over refineries has already been explained, but the control exercised is of the mildest description and the remarks of the Government of the United Provinces are here again based on a misapprehension and are, in fact, absolutely misleading. Compared with the control exercised over distilleries the refiner is practically a free agent. Salt and *sitta* are unavoidable by-products in the manufacture of refined saltpetre, and saltpetre, salt though it may only fetch four annas a maund, is a marketable commodity in certain tracts. Before we took over the Bihar Circles it was calculated that, at the then rate of duty, Government was losing nearly 10 lakhs a year through illicit trade in saltpetre salt, and large seizures of such salt have been made from time to time. It is not correct to say that this salt is only used for curing hides. It is an edible commodity and in parts of Oudh is preferred to other kinds of salt. Salt produced in a refinery is kept under the lock and key of the refiner himself. The refinery is visited about once a month by the Circle Officer or Inspector, and if the refiner wishes to excise it he can then do so; if not, it is destroyed under departmental supervision. The refiner suffers no inconvenience except having to wait for the visit of the Salt Officer. *Sitta* may contain 60 per cent and upwards of salt, and salt can easily be educed from it at a minimum of cost. As *sitta* it is utilized for curing hides, and has a market value. Its disposal is regulated on the same lines as saltpetre salt. In the course of the past month I have visited about half of the refineries in the United Provinces and Bihar and I have seen or heard nothing to justify the allegation that legitimate operations are being seriously hampered. I have rarely come across a more contented body of men than the refinery licensees. I welcome, however, the suggestion put forward by Messrs. Waldie and Co. that refineries should be allowed to compound for salt duty. The suggestion, which has its parallel in cases where business firms are allowed to compound for octroi, is an excellent one and will be given effect to as soon as possible. But, otherwise, I see no necessity for modifying in any way the present system of controlling refineries."

4. As a result of the proposals I then made with a view to stimulating production the license fee for manufacture of crude saltpetre, *casai* and *soji* and *khari* was reduced to one rupee, a system of issuing licenses through the agency of the Post Office was originated, certain vexatious rules for the control of the manufacture of *khari* were cancelled, proscribed areas was thrown open, and refinery licensees were permitted to compound for salt duty, though, so far, no refineries taken advantage of this concession. The system of issuing licenses through the agency of the Post Office has proved a distinct success and saves the *luniga* much trouble.

5. At the commencement of the war the saltpetre industry had been on the decline for some years. In 1883-84 the exports were over 35,000 tons; in 1913-14 the exports were only 13,400 tons. The decline has been attributed to the vexatious prosecutions for breaches of the Salt Act and rules thereunder, and to the zeal or greed of supervising officers of the rank of Inspector and of the lower grades. There is, however, a great deal of exaggeration in all this. In the ten years succeeding the assumption of control in Bihar the industry reached its zenith of prosperity and the development of the industry throughout the whole areas of control during the past three years as shown below speaks for itself. The Salt Act and rules thereunder do not, I might point out, compel anyone to make illicit salt any more than the Deceased Wife's Sister's Act, as some of its opponents feared, compels a man to hazard a second venture. The *luniga* has some grounds for complaint, but like every Indian with a good case at bottom he destroys it by his *subaligha*, or gross exaggeration. I gather that in Bihar the Inspector generally gets 4 annas per license *dustooree* and in the United Provinces Rs. 2 and, possibly, similar amounts pass when works are inspected. The fact is that the subordinate ranks of the Salt Department are no better or worse than the similar ranks in the Irrigation, Railway, or Land Revenue Departments. The more real causes of the decline are that the natural and synthetic products of Germany have come into the market, and are cheaper and better, and also that the demand for saltpetre for gunpowder is no longer what it was as it is not now used or, if used, is used to a less extent than formerly, for many of the new high explosive gunpowders which have replaced, except for special needs, black powder.

With the increased demand for saltpetre that arose with the war, and the good prices that have been obtainable, the industry has been resuscitated and, but for the extraordinary rains exports in 1917, in all probability would have reached 40,000 tons and, as nothing but

low refraction saltpetre can be exported, this is really the equivalent of at least 50,000 tons in normal times. The following figures are of interest :—

Number of licenses issued for production of crude saltpetre.						
	Bihar.	United Provinces.	Punjab.			
1913-14	24,545	8,275	1,371			
1914-15	29,970	6,370	1,748			
1915-16	20,801	8,495	2,301			
1916-17	30,251	11,160	2,407			

	Number of refineries.			Production of refined saltpetre in maunds.		
	Bihar.	United Provinces.	Punjab.	Bihar.	United Provinces.	Punjab.
1913-14	213	82	32	1,65,079	1,69,760	87,010
1914-15	206	83	33	2,32,123	1,88,386	1,06,176
1915-16	213	95	37	2,19,565	2,30,558	1,52,301
1916-17	227	128	48	2,61,038	3,00,566	2,45,976

The cost of a refinery license is Rs. 50.

Licenses were applied for in the case of only 400 formerly proscribed villages, but 1,500 other villages were worked for the first time. The development of production in the Punjab has been remarkable and has not yet reached its maximum.

6. I have now to consider whether the saltpetre industry might be extended and developed by a relaxation of the rules in force and by improved methods.

If the present demand for saltpetre were to continue, with its attendant high prices, I consider that so far as rules and regulations are in question no further incentive would be necessary either to the *luniya* or to the refiner, both of whom have profited much in the past three years. In any circumstances I am most decidedly of opinion that no further concession in the matter of control is called for in the case of the refiner. Whatever else is settled that control which is almost nominal should be maintained. In other words, the refiner must excise his salt under supervision or destroy it. It is puerile for Mr. Hutchinson or anybody else to assert that good edible salt cannot be produced in a refinery. The department has 60 years' experience to the contrary. I have sent for the Hon'ble Mr. Low's inspection samples of salt so produced which is as good edible salt as any Liverpool salt I have seen and which will stand the test of a chemical analysis. In the Patna district this year a refiner was sent to jail for six months and his agent for two months, the latter being also fined Rs. 500 for smuggling 57 maunds of first-class salt out of his refinery, the sentence being upheld by the High Court. At the present moment the Punjab refiners are taking out for the first time licenses for the manufacture of saltpetre salt owing to the high price consumers are ready to pay for it.

As regards the *luniya* I am not prepared to admit that the control exercised by this department over his operations has had any very appreciable influence to the bad.

Nevertheless, on the assumption that we return after the war to normal conditions, I am prepared to recommend to the Government of India that the *luniya*'s operations should be freed from control of any sort; in other words, that the Internal branch (except the Rajanpur Circle) should be abolished. The main object of that Branch was the suppression of the manufacture of earth salt, and that object has been obtained for some years, and I do not believe that in normal conditions the manufacture of earth-salt is ever likely to revive. I would leave it to the ordinary district excise staff to see that it does not, and I would leave refineries to be dealt with by this staff also. As to maintaining control over the illicit practices of the *luniya* with the present establishment of the Internal Branch I am now, after three years' close contact with the working of that branch, decidedly of opinion that the game is not worth the candle. That control is pure *camouflage* and of a poor order. I do not believe that it has the slightest effect in checking illicit practices. It is a common saying in the department that a *luniya*'s dāk runs for 40 miles; in other words, when a Circle Officer or Inspector is on tour his movements are known 40 miles all round. Even if this were not the case what can the establishment on its present reduced scale do to check production of salt? In the whole Punjab there is no Circle Officer and only one Inspector. In the Saran Circle of Bihar there are, scattered over an area of over 6,000 square miles, some 18,000 crude workers controlled by one Circle Officer and five Inspectors. They cannot visit each *luniya* even once a year. A *luniya* can undoubtedly produce good edible salt but, even if we could prevent it, the quantity is relatively so insignificant that I would not grudge the poor dog his bone. It is, I now consider, mere waste of money to maintain the Internal Branch. That its abolition will mean the reduction of the cadre of the department is unfortunate, but I cannot assert that this in itself is a sufficient ground for its maintenance. In short, the Internal Branch has accomplished its main object, the suppression of the manufacture of earth-salt, and may now chant its *cum dimittis*.

7. There remain for consideration the questions whether improved methods can be devised for the production of saltpetre, and whether the *luniya* can be brought into direct relation with the refiner and the middleman ousted. In my opinion it is as impossible to dispense with the middleman as it is to dispense with the refiner. The *luniya* is of the poorest

of the poor. From start to finish he is financed by the middleman, who is equally necessary to the refiner. As to improved methods of production I support Mr. Hutchinson's proposals and have nothing to add to them.

As regards refined saltpetre I think that it was a great mistake not to sanction a proposal of Dr. Leather's for further testing the apparatus described in Pusa Bulletin No. 24, page 18.

It was, I consider, vetoed on inadequate grounds. In any case, now that it is recognized that the refiner cannot be eliminated, no time should be lost in getting the further test carried out. If it is successful there are plenty of refiners who would adopt it at once.

Statement showing the exports of Saltpetre from Bengal.

(Witness did not give oral evidence.)

WITNESS No. 489.

MAJOR H. ROSS, M.B., F.R.C.S.I., *Additional Assistant Director-General, Indian Medical Service.*

WRITTEN EVIDENCE.

The Director-General, Indian Medical Service, is, in conjunction with the Director, Medical Services in India, responsible for the equipment and supply of all military medical stores, and with the Quartermaster-General in India for military veterinary medical stores.

He is also responsible for the supply of medical stores to Government and Government-aided institutions (both medical and veterinary) on the civil side, and for the X-ray equipment required for both military and Government civil hospitals. In addition, since the outbreak of war, the supply of artificial limbs to disabled soldiers, dental equipment to army dentists throughout India, the equipment of orthopaedic institutions has devolved on the Medical Stores Department.

He also, at the request of other Government departments, assists in procuring or manufacturing a great variety of articles urgently required for war purposes, which cannot, strictly speaking, be adjudged as coming under the nomenclature of medical supplies.

The stores required are obtained:—

- (1) By importation through the India Office.
- (2) From other Government departments, such as the Supply and Transport Corps, Military Works Department, Department of Revenue and Agriculture, etc.
- (3) By purchase from business firms and contractors in India.
- (4) By manufacture at Medical Stores Depôts.

For storage, manufacture, and distribution there are five Government Medical Stores Depôts, *viz.*, at Calcutta, Lahore Cantonment, Madras, Bombay, and Rangoon, under the control of the Director-General, Indian Medical Service; of these the depôts at Lahore Cantonment, Madras, and Bombay are manufacturing as well as supply depôts, those at Calcutta and Rangoon being mainly supply Depôts.

Each of these depôts is in charge of an Indian Medical Service officer who is known as the Medical Storekeeper to Government, and it is customary for officers once appointed to the Medical Stores Department to remain in that department throughout most of their service.

Medical Store depôts also undertake the repair of surgical instruments, etc., returned by both civil and military institutions.

Prior to the outbreak of war the Medical Stores Department was manufacturing pharmaceutical preparations to a considerable extent, and the fact that it was in a position to do so has been of material assistance in meeting the greatly increased demands not only from military hospitals in India, but from overseas forces.

Prior to the arrival of a British Base Medical Depôt at Bombay in January 1917 we were responsible for the supply of all the medical and surgical stores required by the army in Mesopotamia, and still continue largely to supplement the requirements of this depôt, in addition to supplying all articles coming under the heading of Indian pattern field medical equipment.

We have equipped all General Hospitals, Field Ambulances, Clearing and Stationary Hospitals, Advanced Depôts of Medical Stores, Sanitary and X-ray Sections to meet the demands, both for the army in India and for overseas forces, as from time to time required by the military authorities.

Owing to freight difficulties and in order to relieve the strain on the Home resources, every endeavour has been made to develop the manufacture of medical requirements from Indian sources.

It was recognized that many articles formerly imported could, and should be, manufactured in India.

To assist in this direction, at our request, the Army Department sanctioned the deputation of an Advisory Chemist to the Madras Depôt, also a Chemist for the Bombay Depôt; these are in addition to the three Pharmaceutical Chemists already attached to the Medical Stores Depôts at Lahore, Madras, and Bombay.

The progress made of late by the Medical Stores Department in the utilization of Indian resources in manufacturing drugs is considerable.

The following articles which were, prior to the war imported are now either being manufactured at our depôts in India, or experiments regarding the possibility of their manufacture have been undertaken.

I.—*Medical Stores Depôts are manufacturing our total requirements of :—*

- (1) Absolute alcohol from rectified spirit.
- (2) Amylum B. P. (starch) from rice.
- (3) All B. P. belladonna preparations (from Indian-grown belladonna).
- (4) Digitalis preparations, formerly manufactured from imported leaves, now manufactured from Indian leaves.
- (5) Lysol from saponified cresol.
- (6) Ferri sulphas from iron filings (foundry waste) and sulphuric acid.
- (7) Thymol (pure white crystals) from ajwan seeds.
- (8) Nux vomica preparations from the seeds.

II.—*Special articles manufactured at our Bombay Depôt to meet war demands.*

- | | |
|--|--|
| (1) Vermijelly. | } Deterrents to attacks by mosquitos, etc., supplied in large quantities to Mesopotamia. |
| (2) Antifly spray. | |
| (3) An insecticide substitute for Keating's powder, which is now unobtainable in India. | |
| (4) Bamber oil—an insecticide oil. | |
| (5) Sinclair's glue, from glue, glycerine, calcium chloride, and thymol—a substitute for adhesive plaster. | |

III.—*Preparations we have lately succeeded in making, of which we hope shortly to manufacture our total requirements :—*

- (1) Ether.
- (2) Tannic acid B. P.—has been manufactured from myrobalans, and from Divi Divi; samples are now under test.
- (3) Silver nitrate—the crystals are manufactured by several firms in India, and we have succeeded in making silver nitrate sticks from silver nitrate crystals of local manufacture.
- (4) Hydrargyrum ammoniatum.
Hydrargyrum oleatum.
Hydrargyri iodidum rubrum.
Hydrargyri oxidum flavum.
Oxymel scillæ.
- (5) Chaulmoogra oil B. P. (oleum gynocardia).
- (6) Boric acid—Enquiries regarding the availability of raw material show that sufficient raw borax (from Tibet and Nepal) are obtainable in the Calcutta market to meet departmental requirements. Sulphuric acid is the only other raw material required and ample quantities are available in India. Manufacture on so small a scale as to meet our requirements will not pay commercially so long as imported boric acid is obtainable within certain limits of price.

- (7) Collodium flexile.
- (8) Soda sulphate exsiccated.

IV.—*Preparations the manufacture of which is now in the experimental stage :—*

- (1) Calcium chloride.
- (2) Calcium carbonate precipitated.
- (3) Strychnine.
- (4) Emetine and its derivatives from ipecacuanha root.
- (5) Various essential oils.

V.—Experiments in the manufacture of glucose from starch and the refining of crude glycerine of local manufacture have not, up to the present, proved successful. Messrs. Smith, Stanistreet and Co., have succeeded in manufacturing a commercial liquid glucose which is sufficiently pure for our ordinary manufacturing purposes; we propose obtaining our requirements from them.

In addition to the above, Lieutenant McCulloch, our Advisory Chemist at the Madras Depôt, has produced a solution for cleaning the incrustation which accumulates on the inside of boilers which is much less expensive and just as effective as the patent boiler anti-incrustator previously used.

A member of the staff at our Madras Depôt has devised an attachment for the pill-rounding machine which effectively removes the coating from discoloured pills without affecting either the shape or weight of the pills. This invention is now under trial and, if satisfactory, should effect a considerable saving; the inventor has applied for permission to patent it.

In order to relieve, as far as possible, the strain on Home resources, and to economize in freight, every effort has been made to extend the manufacture of various surgical dressings at our depôts and, at the same time, to encourage reliable private firms to extend their output in this direction.

Our efforts have been most successful and have, undoubtedly, effected a considerable saving to Government, especially in the local purchase of cotton, wool, gauze, lint, etc., the prices of which, on the English market, have advanced roughly 400 per cent since 1914.

The absolute necessity for securing the correct percentage of medication and complete sterilization make it essential that orders for the manufacture of these articles should only be placed with firms whose reliability has been fully ascertained.

Our depôts are making first field dressings for the use of troops in the field, rolling, compressing, and sterilizing bandages of various kinds, medicating, and compressing the different cottons, gauzes, and lints required.

Private enterprise is largely responsible for the supply to us of absorbent cotton of good quality, lint, gauze, etc., and, in addition, is being utilized to supplement the supply of medicated and compressed dressings.

The Indian Medical Stores Department is a very large purchaser of surgical instruments and appliances, of which an important source of supply for many years has been the work-shops at the Medical Stores Depôt, Bombay. Part of the premises has been handed over to a private concern which has established in it a factory to supply a portion of the requirements of the Department.

It employs several hundred workmen who have been trained to make and repair instruments and appliances.

War demands have led to many new developments, including the manufacture of artificial limbs and orthopaedic appliances.

Our depôts manufacture almost all the pharmaceutical preparations required, including tablets, pills, extracts, tinctures, liniments, liquors, unguents, powders, etc.

Various oils, such as castor, arachis, are expressed from Indian seeds.

Our Madras Depôt also compresses oxygen in cylinders for issue to hospitals.

Field medical panniers, chests, fracture boxes, etc., required for field hospitals (including veterinary) are also made at our Bombay Depôt.

The question of ascertaining what raw materials are, or can be made, available in India, and the best methods of obtaining supplies, both for immediate requirements and with a view to future development, is being investigated by this office.

It is recognized that up to the present the indigenous resources of India have not been utilized to anything like the extent possible. Our practice prior to the outbreak of war was to purchase in England, through the medium of the India Office, not only manufactured drugs, but most of the raw materials required for the manufacture of pharmaceutical products some of which raw materials had actually been exported to England from India.

As examples of this sandal-wood was exported as wood and returned in the form of oil.

Myrobalans sent Home returned as tannic acid.

Nux vomica beans went to England and returned as the powder and extract, and in the form of Strychnine.

Potash salts existing in India were never utilized in making potassium carbonate, bicarbonate, acetate, citrate, cyanide, red and yellow prussiate, etc.; all these are now being made by private firms in India.

Ajwan seeds were exported to Germany and returned to India as thymol; we now manufacture.

Such examples could be multiplied, showing how little indigenous resources were utilized.

One of the great difficulties heretofore experienced has been that of organizing practical methods of collection and the present heavy cost of such collection without proper organization.

The high rail freights from sources of supply to the seaports or manufacturing centres in India permitted Germany and other producing countries, in many instances, to collect, ship to London, and reship to India at prices which were actually lower than indigenous products could be made available at the seaports of India.

To exemplify this take the case of belladonna.

This root was grown in Germany, collected, dried, packed, shipped to London, paying one or two middlemen's profits there, reshipped to India, duty paid on entry, and bought in India at Rs. 40 per cwt.

The cost of collection, royalty (in the case of private firms), and rail freights to Calcutta or Bombay made it impossible for Indian, grown belladonna to compete.

The drug grows wild in India in quantities probably ten times greater than the Department's requirements, and is now being successfully cultivated both at the Kumaon Gardens, and by Messrs. Smith, Stanistreet and Company, Calcutta.

I.—*Medical Stores Depôts are manufacturing our total requirements of:—*

- (1) Absolute alcohol from rectified spirit.
- (2) Amylum B. P. (starch) from rice.

It is recognized that up to the present the indigenous resources of India have not been utilized to anything like the extent possible. Our practice prior to the outbreak of war was to purchase in England, through the medium of the India Office, not only manufactured drugs, but most of the raw materials required for the manufacture of pharmaceutical products some of which raw materials had actually been exported to England from India.

As examples of this sandal-wood was exported as wood and returned in the form of oil.

Myrobalans sent Home returned as tannic acid.

Nux vomica beans went to England and returned as the powder and extract, and in the form of Strychnine.

Potash salts existing in India were never utilized in making potassium carbonate, bicarbonate, acetate, citrate, cyanide, red and yellow prussiate, etc.; all these are now being made by private firms in India.

Ajwan seeds were exported to Germany and returned to India as thymol; we now manufacture.

Such examples could be multiplied, showing how little indigenous resources were utilized.

One of the great difficulties heretofore experienced has been that of organizing practical methods of collection and the present heavy cost of such collection without proper organization.

The high rail freights from sources of supply to the seaports or manufacturing centres in India permitted Germany and other producing countries, in many instances, to collect, ship to London, and reship to India at prices which were actually lower than indigenous products could be made available at the seaports of India.

To exemplify this take the case of belladonna.

This root was grown in Germany, collected, dried, packed, shipped to London, paying one or two middlemen's profits there, reshipped to India, duty paid on entry, and bought in India at Rs. 40 per cwt.

The cost of collection, royalty (in the case of private firms), and rail freights to Calcutta or Bombay made it impossible for Indian, grown belladonna to compete.

The drug grows wild in India in quantities probably ten times greater than the Department's requirements, and is now being successfully cultivated both at the Kumaon Gardens, and by Messrs. Smith, Stanistreet and Company, Calcutta.

To take another example—boric acid. This has up to now been invariably imported.

The raw borax is available in large quantities in Nepal and Tibet, but the cost of transport from these countries to a manufacturing centre such as Calcutta has hitherto made it possible to import both pure borax and boric acid more cheaply than the latter could be prepared from the country borax. When, as is probable, the price of imported boric acid reaches certain limits it will then be economical to manufacture in India on a commercial basis; but the demand in India is comparatively small and it is improbable that the manufacture of boric acid would be profitable after the war.

The general investigation as to the possibilities of obtaining Indian-grown products has occupied our attention and, on the 14th December 1917, a note on the desirability of taking up the question of the cultivation of medicinal trees and plants in India was drawn up by this office and submitted to the Department of Revenue and Agriculture.

This note, a copy of which is attached, merely, as it were, touches the fringe of possibilities, and, owing to the almost complete lack of data in the form of any up-to-date literature or reliable information on the subject, a considerable amount of work and enquiry still remains to be done.

As to the feasibility of the cultivation and the best methods of obtaining drugs of high grade of quality, the Department of Revenue and Agriculture is, it is considered, the best fitted to judge and make arrangements.

Many of the medicinal plants required grow wild in Indian forests but, owing to the hitherto small demand, are classified as minor forest produce, and no special attention appears to have been paid to them, nor does there exist, as far as is known, any effective organization for collection.

In the first place it would appear desirable that a survey should be undertaken to ascertain what medicinal plants grow wild in the forests, where such plants grow most freely, and are most accessible for collection.

Such a survey would assist in supplying Government's requirements and those of private firms, possibly creating a lucrative export trade in the future.

This undertaking could only be carried out thoroughly by the Forest Department and the Botanical Survey.

Articles such as castor-oil seeds, cinnamon, senna, cloves, and various others of everyday consumption known to grow, and to be available in large quantities in India, have not been considered.

It is also advisable that there should be centralization of effort in anything that is done in this direction as, at the present moment, there appears to be considerable overlapping.

Our efforts have been concentrated chiefly in the direction of obtaining satisfactory and regular supplies to meet our own requirements, but enquiries have opened up the larger question of the possibility of creating a considerable and valuable export trade from India and, incidentally, making the Empire self-supporting as regards a number of products formerly obtained from what are now enemy countries.

There can be little doubt that a market would be available as private firms in India have been, and are now, exporting to Great Britain, America, and other countries Indian-grown drugs which these countries formerly obtained elsewhere.

The demand exists, and the problem to be overcome is mainly that of organizing cultivation and collection, also the reduction of railway freights on such products over long distances, the latter as a temporary measure until information is obtainable as to what rail tariffs such products can reasonably bear to allow competition with other sources of supply outside India.

Owing to the fact that all purchases of the products mentioned in the preceding paragraphs were, prior to 1914, made through the medium of the India Office, little or no information was available in this office to show what India could supply, and the accumulation of such information as has already been obtained has entailed prolonged enquiry.

Certain private firms have been of considerable assistance in giving us information regarding the possibilities of obtaining raw materials or of manufacture.

It has been our policy to encourage, as far as possible, private firms to extend their activities in the direction of the manufacture of indigenous products. This is shown by the fact that, prior to the war, practically no local purchase was made by us except to meet urgent demands for imported articles, whereas, during the past ten months, the amount expended to meet our ordinary annual requirements and war demands for stores previously imported by us amounted to Rs. 15,92,376.

Owing to the absence of a Food and Drugs Act, and the prevalence of adulterated drugs, one of the greatest handicaps we have had to contend with has been the elimination of unreliable sources of supply.

In dealing with purchase of drugs, surgical dressings, and instruments the question of quality is all-important.

It is, unfortunately, true that in India the difference between samples submitted and actual supplies subsequently delivered is liable to be considerable and, until trial orders have been placed and deliveries have been found to be according to the standard required, it has been very necessary to exercise the greatest caution in placing orders for large quantities only with firms whose reliability is assured. We are constantly testing the reliability of new firms who offer us supplies, and when we consider them reliable we place trial orders with them, the continuance of our dealings with such firms depending entirely upon their supplies being up to the standard required.

Another difficulty experienced, more particularly with the smaller firms, is that in their anxiety to obtain contracts they undertake more than they can safely guarantee and break down as regards delivery within the period contracted for. They are also prone to quote terms which, in practice, they are unable to carry out without either suffering heavy loss or having to ask for a revision of rates owing to fluctuations in the market.

Under present conditions we are strongly of opinion that our best policy is to place no reliance upon any doubtful source of supply as failure to fulfil contracts might involve serious consequences in our failure to meet war requirements.

The question of the possibility of obtaining supplies of Indian-made glassware for laboratories early engaged our attention, and we succeeded in obtaining certain articles such as Petri dishes, Litre flasks, glass tubing, and test tubes of reasonably good quality made by the Upper India Glass Works, Ambala City.

The firm is, however, a small one and their output is very limited; we suggested *vide* our letter No. 342-6271-3-17, dated the 12th September 1917 (copy attached) that this question of glass manufacture in India is one to be taken up by either the Department of Commerce and Industry or by the Indian Munitions Board.

Our consumption of bottles and glassware generally is considerable, and up to this we have not been able to find any firm in India who is in a position to undertake to manufacture our requirements.

This is regrettable as Japan is already shipping enormous quantities of bottles to India some of which we are purchasing.

Japanese bottles, however, are unreliable as regards capacity, although the shape and quality are fairly good.

Among our largest Indian sources of supply, both of imported and locally manufactured goods, are:—

Loose woven bandages—The Bengal Jail Department.

Wool cotton, absorbent—Messrs. Andrew Yule & Co.

Cottons and gauzes, medicated and compressed—Messrs. Smith Stanistreet & Co., Calcutta (We propose placing orders with the Bengal Chemical and Pharmaceutical Works, Calcutta).

Oil of turpentine and resin—

from Forest Departments, United Provinces and Punjab.

Sandal-wood oil—

Mysore State Distillery.

Glycerine, medicinal—

North-West Soap Company.

Liquor ammonia fortis—

Acid sulphuric, B. P.—

Acid hydrochloric, B. P.—

Acid nitric, B. P.—

} D. Waldie & Co., and Bengal Chemical and Pharmaceutical works, Calcutta.

Medicinal potash salts, such as acetate, bicarbonate, etc.—

Messrs. Smith, Stanistreet & Co.

The Indian Institute of Science, Bangalore, is kindly making for us portion of our requirements of the following drugs:—

Calcium lactate.

Sodium acetate.

Aniline oil.

Lactose.

Calcium chloride.

Ethyl chloride.

It is essential that during the war we should manufacture our requirements, as far as possible to safeguard ourselves, as private firms are daily finding increasing difficulty in obtaining imported drugs, a difficulty which will almost certainly become intensified in the near future.

The policy to be considered, however, as a post-bellum problem is whether the Government Medical Stores Department should continue to manufacture articles which reliable private firms are also manufacturing in sufficient quantities in India from Indian raw materials. If the policy of encouraging private enterprise in developing manufactures

is carried to its logical conclusion the manufacture of many articles at our depôts should not be continued; only such articles as are not manufactured on a sufficiently large scale by private enterprise should continue to be manufactured by us.

It appears essential, however, that we should not discontinue any manufacture until the output by reliable commercial firms has been established on a sufficiently large scale as to render it absolutely certain that Government will be able to obtain all its requirements without difficulty and at reasonable prices.

The same policy would seem to apply also to the question of cultivation of medicinal plants by Government (except those such as cinchona, poppy, ganja, etc., which are under special Government control).

Once the possibility of cultivation on a commercially successful basis has been ascertained private enterprise should be invited to undertake this. Of course, we presuppose that manufacture by private enterprise should furnish us with supplies at least as cheaply as we are able to manufacture ourselves.

U. O. No. 506-8306-6-17, dated Delhi, the 14th December 1917.

From—The Director-General, Indian Medical Service.

To—The Department of Revenue and Agriculture.

Reference this office unofficial note, dated the 5th July 1917, regarding a scheme suggested by Mr. Carter for the establishment of a medicinal plant garden in Simla. From the Forest Department noting, and from information received from the Madras Government, we are now in a better position to discuss the feasibility, or otherwise, of the scheme.

We now know that experiments are being conducted in the Madras Presidency, in the Punjab, and by Messrs. Smith, Stanistreet & Co., with a view to ascertaining what medicinal plants will, or will not, grow well in India.

For such experiment to be successful it appears in most cases essential that accessible ground should be available at altitudes varying from about 1,000 ft. to 8,000 ft. For purposes of supervision it is thought that the plots of ground selected should not be too widely separated.

It is doubtful if Simla is the most suitable site as it will be difficult to obtain the above conditions Darjeeling and the Nilgiris would probably be better.

Experiments are being conducted by the Government of Madras, chiefly in the Nilgiris, as to the possibility of the successful growth of a number of the trees and plants included in the list submitted by Mr. Carter; we also know that several of them are being successfully grown there.

It is probable, however, that the cultivation of certain trees and plants—natives of North-West America, Tibet, etc. require severer winter conditions than those present in the Nilgiris; these should, it is thought, be cultivated in the Himalayan ranges.

Of the trees and plants which it has been suggested might be experimented with the following may, for the present, be ruled out as the quantity of oil that could be extracted, and that used in India, is very small:—

- (1) *Juniperus communis* L.
- (2) *Lavandula vera* D. C.
- (3) *Rosmarinus officinalis* L.

Gaultheria procumbens L. from the leaves of which *oleum gaultheria* (oil of wintergreen) is distilled is a native of North-West America and is also cultivated in Europe, but is not known to grow in India. The commonest Indian species is *gaultheria fragrantissima* which is indigenous to the Nilgiris.

This is being collected for the Medical Stores Depot, Madras, as an experiment. The report as to whether *oleum gaultheria* can be distilled from its leaves should be awaited.

- Rhamnus purshianus* D. C;
Hamamelis virginiana L;
Lobelia inflata L;
Econymus atropurpureus, Jacq;
Prunus setotina, Ehrh;

are all natives of North America, and none of them are known to grow in India; might be experimentally grown in the Nilgiris.

Rheum officinale bail—is a native of Tibet and could probably be cultivated in the Himalayas; *rheum emodi* wall, or a closely allied species, is, however, said to be found growing wild near Simla and is very common in Garhwal and Kumaon. Samples of the root of this plant should be collected and sent to the Medical Stores Depot, Madras, to see whether it would be an efficient substitute for rhubarb root, B. P.

Atropa belladonna—grows wild in Kashmir in large quantities; also grows in Tehri Garhwal. At our request this year five acres were added to the area already under cultivation.

at the Kumaon Government Gardens, and the resulting crop (a good one) was purchased by us. It is suggested that the area under belladonna cultivation be extended next year to 15 or 20 acres at the Kumaon Gardens, Government to purchase the crop.

Atropa belladonna is also being grown at Darjeeling by Messrs. Smith, Stanistreet & Co.: it is suggested that it should be grown at the Government Gardens at Darjeeling. Also the area under cultivation in the Nilgiris should be extended.

There has been, since the outbreak of the war, a great scarcity of belladonna root and leaves in England as it is believed that large quantities were formerly imported from enemy countries.

As regards belladonna India should, undoubtedly, take up its cultivation on a large scale in order not only to meet all Indian requirements, but also to be in a position to meet the requirements of the United Kingdom.

Podophyllum emodi wall.—grows wild in large quantities throughout Kashmir. Messrs. Smith, Stanistreet & Co., Calcutta, have secured the collecting rights for a part of Kashmir. This plant grows there in such large quantities that further cultivation in India is probably not necessary. Government should, however, secure the collecting rights of certain forests in Kashmir, and arrange to supply not only the Medical Stores Depôts in India, but also to export at least sufficient to meet all Government requirements in the United Kingdom.

Podophyllum emodi—is also common in Tehri Garhwal.

Aconitum napellus L.—is imported in large quantities from Tibet; could probably be successfully cultivated near Darjeeling or in Tehri Garhwal.

Digitalis purpurea—grows well in the Darjeeling District at about 8,000 ft., also in the Nilgiris. Its cultivation should be extended in the Government Gardens at both places to a sufficient extent to meet Government requirements.

Gentiana lutea (Gentian)—is being experimentally grown in the Nilgiris; its cultivation should also be tried at the Government Gardens at Darjeeling and at the Mussoorie Branch Garden of the Saharanpore Gardens.

Fiburnum prunifolium L.

Colebitum autumnale L.

Polygala scutellaria L.

} could be experimentally grown in the Nilgiris, Darjeeling, and Mussoorie.

Urginea arilla stein L.—is said to grow in Bengal. Mr. Carter might be asked if he can give information as to its distribution.

The indigenous Indian *urginea indica kunth* is said to be an efficient substitute; samples should be collected and sent to be analysed by our Advisory Chemist at the Madras Medical Stores Depôt. It grows both in the plains of India and at an altitude of 6,000 ft.

Glycerhiza glabra—grows in Yorkshire; might be experimentally grown at Saharanpore and the Nilgiris.

Ipomoea purga (jalap)—grows well in the Nilgiris; the area under cultivation should be extended to meet our requirements also grows well at Ootacamund.

Hyoscyamus niger (haubane)—grows well at the Koilpatti Agricultural Station in Tinnevely; the area under cultivation should be extended to meet our requirements; also grows well in the Ootacamund Gardens.

Psychotria speciosa—grows at Kallar (1,000 ft.) in the Nilgiris; the area under cultivation should be extended to meet our requirements. Experiments in its cultivation should also be tried in Malabar and at the Cinchona Plantations, Bengal.

Eugenia caryophyllata (cloves) and *nutmegs*.—It is hardly necessary to cultivate these as they are readily obtainable in the open market.

Artemisia maritima (santonin)—should be experimentally grown in the Nilgiris.

Aloes socotrina (bitter aloes).

Anethum foeniculum (fennel).

} should be experimentally grown in the Nilgiris.

Citrullus colocynthis—grows in the Bombay Presidency; should be tried at Kallar.

Cassia angustifolia (senna)—is already largely exported from the Madras Presidency.

Chenopodium anthelminticum—is already growing well in Madras.

In undertaking experiments in the cultivation of these medicinal trees and plants it will be advisable that such experiments be undertaken by a staff which has a thorough practical knowledge of tree and plant-growing, thus obviating failures and waste of money by unsuitable methods of cultivation.

It will also be wise to utilize the establishments and facilities already existing in the various provincial botanical and agri-horticultural gardens. It is thought that the original scheme of establishing a medicinal plant garden in Simla should not, therefore, be proceeded with, but that the superintendents of various Government gardens, including those at Darjeeling, Kumaon, Mussoorie, Saharanpore, Ootacamund, and Kallar, be circularized and asked their views as to the advisability of undertaking experiments in the cultivation of such of the above-named plants as are not known to grow already in abundance in India.

An organized effort should be made for the collection and supply to Medical Stores Depôts of a sufficient quantity to meet their annual requirements of such plants as are known already to grow well in India, Kashmir or the Himalayas.

U. O. I. No. 16—1460—1—18, dated the 28th February 1918.

Reference this office unofficial note No. 506—8300—0—17, dated the 14th December 1917, the following additional information has since been ascertained:—

Podophyllum emodi wall.—We have ascertained that Messrs. Smith, Stanistreet & Co. have contracted with the Kashmir State Forest Department to take over the whole output of the Kashmir forests for a period of five years, commencing with the 1917 autumn collections, and are arranging to manufacture podophyllum resin in Calcutta.

This firm has also acquired the total output of the Chamba State for the next two years.

This plant also grows extensively in Sikkim, and a private Calcutta firm has asked the Maharaja for permission to purchase the whole crop.

It also grows in Hasan Abdal in the Rawalpindi District.

Aconitum napellus.—The true napellus variety does not appear to grow in the Himalayas all the roots obtained being those of varieties of *aconitum ferox* (spicata principally). This latter is the most common Nepal variety, and is unsuitable for the manufacture of tincture, but excellent for the manufacture of the liniment; a Calcutta firm has offered to buy all the *aconitum ferox* in Sikkim.

Glycyrrhiza glabra.—It should be possible to obtain this from Mesopotamia; the presence of a Liquorice Factory at Kut indicates that the root is probably grown in considerable quantities there. It is also obtainable commercially in large quantities from China.

Hyoscyamus niger (henbane)—mentioned in the note is also grown at Saharanpore. It was cultivated formerly at the Saharanpore Government Gardens but they have, it is believed, discontinued growing it as a local firm (The Emerald Fruit Gardens) undertook to cultivate.

No mention was made of *hyoscyamus muticus* which, in the past, has been the principal source from which atropine has been derived. This was formerly procured from Egypt and the Sudan but grows wild in the Northern Punjab. A small quantity of Indian *hyoscyamus* sent to England in 1916 proved to be of fair average quality but suffered from the usual complaint regarding Indian herbs, viz., careless collection and assortment.

The Agricultural College at Lyallpur proposed experimental cultivation on a large scale in 1916, but this fell through.

Dr. Carter has arranged for a small experimental growing in Bhagalpur and elsewhere in Bengal, and the Madras Agricultural Department has three acres now under cultivation in the Madura District the result of which will be ascertainable in May or June of this year.

Prior to the war the value of this article, free on board Alexandria, varied from £16 to £18 per ton, but lately the price in London has averaged from £50 to £56 per ton, while in 1916 as much as £90 per ton was paid for it.

Psychotria ipecacuanha—is also being grown experimentally at the Government Cinchona Plantations at Maung Poo. Samples have been sent to England, and have been reported on as approximately intermediate in value between the best Brazilian and Carthagena *ipecacuanha*. It also grows well at Johore in the Malay States.

Artemisia maritima (santonin).—As far as is known Russian Turkistan is the only source of supply, this being a Russian Government monopoly.

Citrullus colocynthis—also grows in the Rawalpindi District and near Cocanada; samples have proved of good quality.

Lycopodium—grows wild in the Darjeeling and Sikkim forests and probably elsewhere throughout the Himalayan ranges. Samples were collected last year by a private firm, approved of in England, and arrangements are being made for collection on a large scale in 1918.

Urginea scilla, *steinh* L.—The indigenous Indian squill grows wild in large quantities on the beach in Salkette (just outside Bombay) and is collected, sliced, and exposed to the sun.

This is being used at our Bombay Depôt for the manufacture of tincture and powder.

U. O. I.—No. 16—378—1—18, dated the 16th January 1918.

I agree with the view expressed in Colonel Gago's note, dated the 1st January 1918, that this scheme for the extension of the cultivation of the medicinal plants in India should be entrusted to the Cinchona Departments, as ample lands, at varying altitudes and latitudes, are at their disposal.

I am of opinion, however, that the Cinchona Department should, for the present, be asked only to undertake to supply to the Medical Stores Depôts their requirements of the root, bark, leaves, fruit, seeds, etc., of the various plants grown; the actual manufacture of the medicinal preparations therefrom should be carried out at our manufacturing Medical

Stores Depôts at Madras, Bombay, and Lahore, where the necessary machinery and technical knowledge are available. As regards the list of medicinal plants to be grown it is suggested that cultivation of all those mentioned in this office note, dated the 14th December 1917, should be experimented with in the first place; it is probable that additions will be made to this list later on.

The Medical Stores Department of this office are prepared to furnish Colonel Gage with any information he requires as to the portion of the various plants, viz., root, bark, leaf, etc., used: also annual requirements in each case.

If the work, as now proposed, be taken over by the Cinchona Departments, it is suggested that the various Provincial Governments, such as Madras and the Punjab, be kept fully informed as to what is being done. It is known that both the above Governments have undertaken investigations in this direction, and it would appear desirable that all future efforts should be co-ordinated, and should eventually be centralized, in some one Department of the Government of India, preferably the Department of Revenue and Agriculture.

No. 342-2771—17, dated Simla, the 12th September 1917.

From—The Director-General, Indian Medical Service,

To—The Secretary, Indian Munitions Board.

(Through the Secretary to the Government of India, Department of Commerce and Industry, Simla.)

I have the honour to forward herewith, for information, a copy of a letter No. 3630-E. S., dated 20th August 1917, from the Director, Central Research Institute, Kasauli, and to state that I consider that the whole question of glass industry in India is one to be taken up by either the Department of Commerce and Industry or the Indian Munitions Board.

2. Such an industry should be liberally financed by Government and a couple of glass experts should be imported to train Indians; our requirements are only a small part of such a scheme but, up to now, it has been necessary to import all superior kinds of glassware. As it is, we cannot depend upon either the Allahabad firm or the Ambala Glass Works.

3. It is quite time that the manufacture of various kinds of glassware in India was taken up by some Government Department.

4. There is no doubt that, as a business proposition, the undertaking would financially be a success. If a small one, man Indian firm like the Upper India Glass Works, Ambala City, with their rudimentary appliances can make such good glassware viz., Petri dishes, flasks, test tubes, glass tubing, etc., as we have received from them, there is little doubt that a Government subsidised business could effect excellent results.

(Witness did not give oral evidence.)

WITNESS NO. 431.

Mr. H. Marsden.

MR. EDWARD MARSDEN, *Indian Forest Service, Silviculturist at the Forest Research Institute, Dehra Dun.*

WRITTEN EVIDENCE

The introduction of mechanical export in forests depends upon either (1) certain individual trees being of great value, or (2) the big trees being concentrated within a limited area, or (3) the majority of the trees being of valuable kinds. In the North-West Himalayas, where the trees grow gregariously in pure forests, the stems of marketable size are not infrequently dispersed widely amongst smaller trees of all ages. The problem of replacing these irregular forests by blocks containing trees of uniform size is being tackled; the existing forest has to be removed, and the fellings have to be regulated so as to produce conditions of moisture, light, shelter, and soil which will favour the establishment of seedlings springing up naturally from the seed of the old trees. Definite progress has been made, particularly in Kulu, but it is clear that a study of the demands made by the seedling upon the physical factors mentioned must precede any such attempts on a large scale. This work demands concentrated and continuous study on the spot; Divisional Forest Officers cannot give the time necessary. In such forests a knowledge of the methods to be adopted in order to guarantee successful natural regeneration is the essential preliminary to all sound administration, and there should be in every province at least one specialist detailed for this.

In his evidence before the Industrial Commission Mr. H. Thompson, Financial Commissioner, Burma, said that the chief criticism of the forest Department was directed against its commercial aspect. There are numbers of business men in India, and of these a considerable proportion is interested commercially in forest products. If the scientific men in India formed an equally strong body, and if some of them depended upon the forests for their livelihood, I think there would be at least as much criticism directed against the scientific management of the forests. I should like to emphasize, this point because, in my opinion, the methods of the Forest Department are too conservative, and not nearly enough attention is paid to experiments in new silvicultural systems of management. Compared with the

attention devoted to the realization of immediate revenue, to improved transport, to the development of new markets, to the stimulation of forest industries, etc., there is no doubt this aspect has been gravely neglected. All such efforts are futile unless the supply of the raw product can be guaranteed continuously, regularly, and of a non-fluctuating standard. This depends, on a knowledge of the trees, of their reproduction, of their rate of growth, and of the best methods to be applied in thinning, tending, and protection generally. Silvicultural knowledge is, in fact, the foundation of successful forest management.

When considering the tropical forests of India conditions are very different from those of the North-West Himalayas. The tropical woods form a reserve whose value has not been appreciated. The Reconstruction Committee at Home, when passing in review the sources from which a supply of timber might be drawn to repair the damage done by the war in England, Belgium, and France concluded that only Canada and Russia could provide the material; *India being already an importing country was dismissed as negligible.* The fact is that India could supply from her tropical forests all the timber wanted, and that the opportunity now available of selling profitably all sorts of timber presents the finest chance India has ever had, or is likely to have, of introducing sound silvicultural methods in the tropical forests and of developing new methods of concentrated extraction on a large scale. In gregarious forests it is possible to produce conditions which will favour the establishment of seedlings; but in mixed forests where 200 or 300 species may occur per square mile it is not possible to produce conditions which will favour the seedlings of one or two species (valuable trees) to the exclusion of all others. Hence, natural regeneration with the object of forming blocks containing uniform trees of one species is out of place in the tropics. We must have recourse to plantations; but before starting it is necessary to acquire some knowledge of the climatic and edaphic demands made by the trees we propose to introduce, of the best methods to be adopted in sowing or planting, and of how, subsequently, to tend the crop. It seems advisable to stress the fact that one cannot suddenly take action and start a plantation anywhere. In clearing the existing tropical forest to make way for plantations the best chance of economic working is the introduction of a scheme on the largest possible scale based on the concentrated exploitation of all species. If one square mile of tropical forest is cleared there is difficulty in disposing of the varieties of timber obtained from 200 different kinds of trees; but if a thousand blocks of 500 acres each, distributed judiciously amongst the tropical forests of Burma, Assam, and Madras were cleared the timbers could be classified, and there would be considerable quantities of each kind. The general opinion that the building trade of the United Kingdom prefers soft wood to hard wood has no real foundation; soft woods are used because they are cheap. If scantlings for building were standardized they could be turned out in bulk at conversion-centres in the forests. Labour is cheaper in India than in Europe. The concentrated extraction of all species on a large scale is the key-note of the whole scheme. A stimulus has long been lacking to set the timber trade of India on its legs; extraction on this scale once started will mean practically the development of new industries; and once embarked on the new venture it is unlikely that firms will revert to the antiquated methods of the present day. Among the first steps needed would be the provision of a large staff of forest engineers, surveyors for the railways (which should be permanent lines), labour-recruiting officers, and a few silviculturists supervising on the spot the formation of plantations.

In deciding with what species to reforest the cleared areas the obvious step is to raise valuable trees like teak and rosewood. But it seems to me that further consideration is wanted. These hard woods take 80 or 100 years to mature. Throughout this long period not only are they open to danger from fire, insects, and fungi, but the return on the money invested in their production is deferred, and the plantations not yet mature represent a very large working capital. A timber-crop which could be realized at an earlier age, say 25 years, would be worth consideration even if the value of the wood were a good deal less. Assuming a rate of 4 per cent compound interest the present value of one thousand c. ft. of timber, worth Rs. 5 per c. ft., to be realized after 100 years and thereafter every 100 years, is Rs. 101. The present value of one thousand cubic feet of timber worth annas 3 per c. ft. to be realized after 25 years and thereafter every 25 years, is Rs. 112. The specially favourable condition for growth which these tropical forests enjoy is the hot, damp climate. To utilize fully this favourable condition we should cultivate trees which can take advantage of it. The kind of tree which responds best to a hot, damp climate by extreme rapidity of growth produces wood either soft, or only moderately hard, not generally considered valuable. Such trees are, amongst others, *Anthocephalus cadamba*, *Dioscorea sonneratioides*, *Terminalia myriocarpa*, *Gmelina arborea*, and *Bombax malabaricum*. There is already a demand for wood to make tea-boxes, packing-cases, matches, pulp, light furniture, and especially ply-wood (Venesta), which has to be imported from Japan and elsewhere, and which there is reason to believe will increase rapidly. And there seems little doubt that, given the conditions of continuity in supply and good communications, a satisfactory price could be obtained for soft woods grown concentrated in pure plantations of fair size.

Further surveys of the extent to which certain trees occur are not wanted; it would be better by experimental research to discover how to concentrate these trees within smaller areas.

It seems likely that after the war increased competition, arising as a result of industrial expansion, will lead to a demand for more exact knowledge. This will be translated into the erection of technological institutes and museums. It would appear prudent to prepare for this

eventuality by the formation of a small imperial staff of technological architects who would plan the construction of such institutes on sound lines and who might be employed also on the building of Government demonstration or pioneer factories. There are now very few men in India competent to design a factory, museum, or institute.

It is essential that silvicultural research should be centralized in order to prevent duplication or overlapping and to distribute the work in localities where it can best be carried out. For statistical research in the rate of growth and development of forest crops it is obvious that the methods adopted for the collection of data must be identical in order to render them comparative. Centralized control by one chief is liable to the drawbacks inseparable from individual control: prejudice in favour of one branch, slackness, conservatism, and personal domination. Control by a board is preferable; for silvicultural research the existing Board of Forestry would form a suitable body to control the allocation of work and the methods to be adopted. Annual meetings of all silviculturists would decide minor points. In no case should the risk be admitted of equally powerful and independent research institutes setting up rival methods of procedure, whether experimental or statistical; the essence of research work is that it should be comparative.

Co-ordination of research.

Early action is desirable on:—

- (i) The forests in which concentrated exploitation on a large scale should be started.
- (ii) Experiments in sowing and planting on the spot.
- (iii) Preliminary surveys for railways.
- (iv) Recruitment of labour.
- (v) Engaging experienced lumber-engineers.
- (vi) Classification and standardization of outturn.

(Witness did not give oral evidence.)

WITNESS No. 482.

MR. PURAN SINGH, F.C.S., *Chemical Adviser to the Forest Research Institute and College, Mr. Perm Singh, Dehra Dun.*

WRITTEN EVIDENCE.*

The main objects in thus placing my views before the Commission are to indicate to the best of my ability—

- (1) Principles underlying the successful industrial development of Japan and the lessons to be learnt therefrom in their application to India.
- (2) Defects in the present system of co-ordination of scientific research and industrial development in this country.
- (3) Suggestions for the future development of industries and organization of scientific research.

Before embarking upon the subject matter of this paper it is necessary to give a brief outline indicating my qualifications for the expression of certain views and for venturing to suggest the study and adoption in India of methods that have proved eminently successful in the industrial development of such a country as Japan.

I was trained in the Tokio Imperial University for about three years and spent a year acquainting myself with the industrial life of Japan. While working in the Osaka Pharmaceutical Works I introduced the manufacture of citric acid as an additional item of manufacture and underwent a complete course of the various processes for pharmacopoeial preparations. For some time I was in the Shinagawa India Rubber Works, where I learnt all the processes of the manufacture of rubber goods. I have visited all the important factories and industrial centres of Japan and have inspected a number of copper and coal mines, the great iron works near Moji, sulphuric acid and chemical factories, camphor and peppermint manufacture, leather tanning, wood-tar and turpentine distillation, paper factories, and minor industries such as matches, umbrellas, needles, soap, dyeing works, cement, pottery, and glass works. I came into close association with the best scientific minds of Japan and was accorded free access to all factories and workshops. Returning to this country in 1905 I was offered, in 1907, the post of organizing the chemical laboratory and initiating forest research work in chemistry at the Forest Research Institute, Dehra Dun. Given this good opportunity I have, since that date, been studying the technical aspects of the chemistry of forest products and have now a chemical laboratory well fitted up for this purpose. The nature of my work has enabled me to observe the various systems of organizing scientific research, and I have had the opportunity of meeting a number of scientific experts with many of whom

* This paper embodies the private views of an individual only, and should not be taken as representative of the views of the Institute or service with which his official work is associated.

I have a very cordial relationship. I must admit that I occupy a post of minor importance at the Research Institute as from the very nature of my work I can but act as an Assistant or Consultant to other research officers. In spite of this, however, I have managed to prosecute a number of original investigations and have kept in close touch with the industrial development of this country. I trust, therefore, that, having thus obtained a first-hand knowledge of industrial Japan, it is not presumption on my part to give a brief outline of the factors which influenced the development of that country, and to deduce therefrom ideas for the future progress and welfare of India.

I.—THE INDUSTRIAL DEVELOPMENT OF JAPAN AND LESSONS TO BE LEARNT THEREFROM.

In Japan, which was modelled on the pattern of industrial Germany, the organization of the scientific education of the people, including industrial and scientific research, was undertaken simultaneously with the wholesale transplantation, if I may use such a term, of the industrial talent of other countries by importing the latter's mature industrial experience and technical knowledge in the form of their leading experts. Japan did not wait for the birth of industry by means of the gradual inculcation of an expert knowledge into their own people by a methodical training based on the resources of their own research work. The principle was fully recognized that scientific and industrial research is not an essential preliminary to industrial development and progress. The Japanese obtained the services of the best engineers, chemists, or business-men obtainable in order to make a success of their industries. Model factories were erected by Government and private agency to become, in many cases, splendid failures. But such failures proved the means of education of the masses and enabled the small man to succeed where greater intellects and greater men had actually failed. Glass industries are a case in point; those who first invested their money in glass lost hundreds and thousands, and the workmen thus trained became masters of millions. I met a man who started life as a glass-blower on a few pice a day in the same factory of which he subsequently became the owner. Government started a window-glass factory in Shinagawa, the ruins of which I have myself seen. Though directed by American and Austrian artisans the enterprise collapsed, but the people learnt the art and the industry became a flourishing one. Take, again, the case of the iron works at Moji. Though at the time of the establishment of this gigantic factory Japanese training in metallurgy was perfect, and clever engineers and chemists were available in scores, yet it was German and Austrian engineers and foremen who were placed in charge. The Japanese contracted with the engineering firms who supplied the machinery that they should train eight or ten Japanese engineers in the manufacture of steel. In spite of the fact that iron is imported from China yet they have made the industry a brilliant success, which is now entirely in the hands of Japanese engineers.

Industries were so well organized that they proved the best training-ground for the science students of Tokio University studying mining and metallurgy, and there was an intimate relation existing between the University and industrial concerns.

As in the case of Japan it will be noticed that such industries which have come to stay in this country have originated by a similar process. The industrial education derived from the establishment of such factories as the Cawnpore tanneries can be obtained in no other way, and cannot be in any way replaced by the well-intentioned labours of a dozen Directors of Industries. The success achieved by the Cawnpore tanneries was obtained by bringing over a portion of England to India. Similarly, a second Manchester has sprung up in Bombay, and Swindons in miniature can be seen in the railway workshops all over the country while illiterate *mistris* thereby acquire a remarkable knowledge of construction and design of machinery.

Again, the iron industry has been under the consideration of Government for more than 50 years. Mr. Schwarz, who was an expert iron metallurgist from, I believe, Sweden, was invited by Government to come over to this country. His illuminating reports and much preliminary work at the hands of others led to nothing, and it was not until the problem was tackled in a businesslike way, by making a preliminary economic survey and thereafter, through the famous enterprise of the Tatas, by the wholesale transplantation of some of the expert steel-makers of the world, that the initiatory stimulus for steel-making in India on the modern gigantic scale was received from America and, hence, Tata's Iron Works may be said to represent America in India.

No doubt, indigenous industries will also gradually improve by knowledge acquired from outside and the skill of foreign countries will permeate the conservative intellect of the indigenous artisan.

My object in thus citing the above cases is to lend emphasis to my point that the real development of industries cannot be attained by any amount of organization of research nor by the creation of such posts as Directors of Industries, Directors-General of Agriculture, Chemistry, Metallurgy, etc. The life nucleus of industry to which growth takes place must spring from its natural source of origin and cannot arise as a product of local education and general research. General research, it is true, may give us new nuclei in the laboratory but, in the case of a country which is otherwise in a backward state of industrial development, the small laboratory nuclei of wonderful discoveries usually fail to develop and die unrecognized. It may safely be said that the remarkable discoveries made by research workers in Germany on such subjects as, to quote a few instances only, the contact process

of sulphuric acid manufacture, synthesis of indigo, and the preparation of many coal-tar products in general have been achieved through the stimulus of the high state of the development of chemical industry. This brings me to my point that *it is only when industry has reached a certain stage of development in a country that the mutual reaction of that industry on scientific research and of scientific research on industry comes into full play.* The industrial development of the resources of any country must be, in my opinion, the fruit of enormous losses and failures. I would urge that the first and most important step in the industrial development of this country is the establishment of *model factories*, rather than the organization of scientific education and research as an essential preliminary. The latter are, no doubt, necessary, and the necessity for them will arise as the industries themselves develop. In conjunction with the establishment of factories it will be necessary to secure the services of the best experts in the various industries. The selection of such experts should not be limited to one country, but based on the Japanese principle. The expert for any one industry should be sought for in that country in which that particular industry has been developed to the greatest advantage.

Before making more definite proposals in this connection it is necessary to indicate the more obvious defects of our present system of organization of industrial and scientific research and to discuss some possible remedies.

II.—DEFECTS IN THE PRESENT SYSTEM OF SCIENTIFIC RESEARCH AND INDUSTRIAL DEVELOPMENT.

A. General.

It is, doubtless, easy to find fault with any new system of organization and, in making what may be considered to be "sweeping assertions", I am aware that I am laying myself open to criticism. I am, however, prepared to face this and my only desire is to offer my opinion for whatever it may be worth. I cannot claim to be able to solve the difficulty, as the conditions of this country are peculiar, but I make no statement in this paper that cannot be substantiated by facts or specific examples, if need be, and shall, in a subsequent section, endeavour to outline a system, the adoption of which would eliminate some, at least, of the defects of our present organization. Dealing first with the organization of scientific research in this country it is no exaggeration to say that in no other country is scientific research, whether pure or applied, separated from the academic atmosphere of a University or a Polytechnic. It is true that, for certain reasons, Universities as centres for research have proved failures in India, but this is no reason for fostering the rapid growth of independent centres of research, official and otherwise, throughout the country. My first point, therefore, is that officialized research, the outcome of Government control, is unsatisfactory. No institute in India, be it run by Government or by a public fund, can, in my opinion, work to its full efficiency under the present system of control. The reasons for this are:—

- (1) Government being in charge of the official administration of the country cannot command that open and personal affection of the people at large which is common to the Universities. The Universities are the *Alma Mater* of the rising generation and, thus, the latter have a personal affection for the temple whence they derive the light of knowledge. For this reason, scientific and industrial research, when carried on by Government departments, does not become as popular as it would do if it were associated with the Universities.
- (2) The work of the University Professor, unlike that of the Government official, is open to public criticism and valuation not only at the hands of laymen, but before the other Universities of the world. This accounts for the high standard of University work, a standard which it is the pride of the Professor to maintain not only for the sake of his own good name, but for the reputation of the University to which he belongs. A Government official, on the other hand, has to keep a limited circle satisfied with his work and, his reputation, when once made in that circle, runs little risk of being marred, as he is safe under the protection of his official seat.
- (3) Up to this time, in no country which encourages scientific research, has it been possible for anyone to aspire to the dignity of a Professor of a University without having first risen through the ranks of student and assistant. On the other hand, in this country we see young men fresh from Universities appointed direct to responsible positions of research and educational work, and the stimulus for ever-increasing effort is, in most cases, lacking.
- (4) Research work by the agency of a Government department, as such, does not carry sufficient weight with the scientific bodies of the world. To take one example here, *viz.*, that of the Department of Agriculture, United States of America, the only department of its kind which is run by Government agency, it is a fact that, though the work done by this department is of a high order, yet it does not command that international respect which should be its due.
- (5) Research is the highest form of education and, as such, it should be directed with the sole object of educating the people. This being the proper function of the Universities the research officer should be in the nature of a democratic

public man, rather than a Government official who is bound to become, by the very nature of his environment, somewhat of an autocrat.

- (6) Many public research institutes that have recently sprung up in this country indicate a desire on the part of the people to be rid of official control in order to carry on research as independently as is at present done in the Universities of other countries. Though the desire is thus indicated yet all work in this direction is waste of energy if there exists no clearly defined and harmonious co-operation between Government and these private institutes. Such institutes are bound to starve finally through the lack of the University atmosphere and the authority and resources, as distinct from control, of Government at their back, just as the Universities of Tokio and Kyoto have both the Government, and through the Government the people, at their back.
- (7) Education when given in colleges run by a Government department such as those of Agriculture and Forests, as distinguished from colleges affiliated to Universities, does not tend to efficiency. The teacher therein is neither properly responsible to the students and the public, nor to Government. This is because Government has no means of judging the ability of the Professor as such. The fact that no Government selection till now has proved a failure in research or in imparting scientific education is due to Government having unwittingly lent to them an authority and position which causes men of average attainments to appear as geniuses.
- (8) And, lastly, it is a fact that no country in the world has followed the procedure adopted in this country for organizing scientific and industrial research. This point is well illustrated in a recent number of "Nature" by Mr. Hugh Robert Mill in reviewing "A Note on an Enquiry by the Government of India into the relations between Forests and Atmospheric and Soil Moisture":—

He says:—"To our mind the method adopted could produce no better result than it appears to have done. In a scientific problem, such as was set forth, the only function of the State seems to us to be to decide that such an enquiry shall be carried out at the public expense; and that every facility for obtaining data shall be given by all the departments and all the Government concerns, local and central. It should then be handed over to a competent man of science, set free from all other duties and supplied with necessary systems. His report, when complete, would be authoritative and epoch-making, if not final; and, incidentally, his own reputation would be made or marred by his handling of the facts. The total expense would probably be no greater, and the labour of many public servants would not be diverted from the work for which they were trained."

This comment emphasizes exactly the point I am attempting to bring to your notice, viz., that scientific research must be independent and in the hands of the best possible men. I know, under present conditions, that scientific research cannot be very well affiliated with the Indian Universities, whose graduates are at present received by the foreign Universities as matriculates only, a fact which shows that the standard of scientific education in Indian Universities is very low.

The remedy for this appears to be either to associate the scientific and industrial research in this country with a new University of Science or, failing that, to create a Science Council, with authority to direct and control all scientific work in India.

2. Lack of control.

Another defect intimately connected with the last-mentioned is the absence of qualified control to direct the general lines of research. There is no proper check on the work of research workers due, no doubt, to the fact that the existing centres of research are not connected with the University or a Supreme Science Council, the result being that, in the name of research, or in the name of industrial development, Government very often lends a considerate ear to ill-considered schemes of enthusiastic amateurs, or is sometimes misled by plausible arguments of concession-hunters. Such lack of control also leads to the pernicious system of what I must term, for lack of a better expression, "Landlordism of Research", under which credit is taken by one for work done by another, in many cases by men who know little more about their subject than their subordinates who, being in a subordinate position, are unable to protest.

Numerous examples may be quoted to show the inadequacy of control. How often has it happened that a new Government post has been created and much money spent and the post finally abolished? In other cases the holders of certain posts are compelled to justify their existence by issuing reports which, in many cases, are faked and of a misleading nature. It is not Government that is responsible for such mistakes, but the fact that no properly qualified Advisory Council exists to control the general lines of policy. By way of an example I may perhaps be excused for citing an instance in which I have been personally connected. Some years ago I was sent to report on the Rangoon Tannin Extract Factory and to investigate the causes of its failure. As a result it was decided that the matter should be enquired into further by a specialist, who would study and start the tannin extract industry in the country, and, after much delay, a Government tannin Expert was appointed. However, on his arrival a strong case was put up to Government in which the main object for his appointment seems to have been lost sight of and, as

a result, his services were directed to an ambitious project of research work of a different nature. I am convinced that, had this expert been permitted to prosecute the enquiry for which he was originally appointed, we should have seen at least three or four tannin extract factories working in the country and actually supplying tanning materials in the form of extracts to the United Kingdom. I make this statement in the full knowledge that there is a prevalent idea that it is the manufacture of leather itself which should enlist our efforts at the present time, rather than the manufacture of tannin extracts. In support of my opinion I may mention that I have now a report from Singapore which states that the people are at present making crude mangrove tannin extract without the aid of vacuum pans and selling it by tons to Japan at remunerative rates. This lends emphasis to my point that research work is not subjected to adequate qualified control. By this I mean that, failing the foundation of a Science University, not only results, but also programmes of research work should receive an exhaustive scrutiny at the hands of a Science Council for the whole of India as already proposed.

3. *Lack of co-operation between the existing institutes.*

There are now a number of institutes dealing with the various branches of science in India, and I think it is true to say that co-operation or intercommunication between them does not exist. It is tolerably certain that under such conditions in some branches, particularly in those connected with chemistry, there is bound to be considerable overlapping of work. One institute may be engaged on working up a subject in entire ignorance of what data may be already available elsewhere. Another result is that the public are uncertain where information on any particular subject can best be sought and, what is worst of all, a kind of "expert jealousy" arises between these various centres, causing a tendency to secrecy in divulging the results of research, a feature that is entirely foreign to true scientific research, and which, moreover, would be quite impossible were all such work carried out under the control of a University. Here, again, therefore, it is a fountain head of control that is needed to neutralize existing defects.

4. *Recruitment and personnel.*

To be quite frank it is my opinion that, under the existing system of recruitment, we do not obtain scientists of the best type in this country, and the good men that do come, by the exigencies of Government control under which they find themselves, gradually lose much of their initiative and personal inclinations for scientific study and rapidly sink to the level of the official autocrat. What we require, in my opinion, is men of ripe experience, nominated by Universities, who would be placed in charge of the various branches of science in this country and their appointment, promotion, or dismissal must be entirely in the hands of the said Council of Science in India.

III.—SUGGESTIONS FOR THE FUTURE DEVELOPMENT OF INDUSTRIES AND ORGANIZATION OF SCIENTIFIC RESEARCH.

In the preceding section I have attempted to express a frank opinion on the defects of the present system, making a few suggestions for possible improvement. I now propose to put these suggestions into definite shape and so give my ideas for taking immediate and practical steps to develop the industrial resources of the country and to organize scientific research on a sound basis. In doing so, I am aware that I may be considered an idealist or a dreamer, but, should a few only of such proposals be held worthy of consideration, I shall feel that my object has been attained, and I shall feel amply compensated for any adverse criticism that my temerity in criticizing existing institutions may call forth.

Taking the question of industrial development I venture to propose :—

- (1) The formation of a strong industrial syndicate, with a capital of some ten crores, which should include in its directorate the best business men, representatives of the leading manufacturing firms of India and England. The work of this syndicate should be to select suitable localities and make a start by importing the required machinery for experimental factories for the utilization of Indian raw materials that have not been developed either at all, or at any rate not to their full extent. Such a syndicate would arrange for the services of engineers and expert manufacturers that may be required and generally control finances. If it were possible to start such a syndicate I should say from my personal experience of the embryo industries of the country that they could proceed at once to start factories for the following industries without the necessity of any protracted preliminary research to aid them :—

- (a) Manufacture of essential oils of all kinds and perfumes, together with extensive and regular cultivation of the raw materials required. For example, Rosha Grass Oil, Khushkhas Oil, Ajwain Oil, Wintergreen Oil, Eucalyptus Oil, Germanium Oil, and oils of *Skimmia*, *Costus*, *Calamus*, *Lemon*, *Rose*, *Kewra*, and *Bed-mushk*. Among the oleo-resins let me mention turpentine, especially in Burma, *Boswellia*, and Wood Oils of *Dipterocarp* species.

- (b) Manufacture of all British Pharmacopœial drug preparations in the form of powders, tinctures, extracts, together with an extensive and regular drug plantations, with the object of securing a regular supply and standard quality of all raw materials.
 - (c) Manufacture of alkaloids in general, such as opium alkaloids, strychnine and brucine from *nux vomica*, atropine from *datura belladonna*, together with a regular and extensive cultivation of such raw materials.
 - (d) Manufacture of alcohol, ether, and other solvents.
 - (e) The immediate erection of at least three tannin extract factories, each with a capacity of 10 tons per day, for myrabolans tan extracts and those of mangrove and other mixed tan materials.
 - (f) Manufacture of chemicals; acids such as sulphuric, hydrochloric, and nitric; alkalies, such as ammonia from coal-tar, caustic soda from salt, and caustic potash, etc.; and salts such as those of potassium, manganese, chromium, magnesium; organic chemicals such as benzol, aniline, naphthalene, phenol, and creosote oils from coal-tar distillation; manufacture of acetates, acetic acid, wood alcohol, Stockholm and wood-tar, etc., from destructive distillation of wood.
 - (g) Antiseptic treatment of timber.
 - (h) Manufacture of paper and pulp.
 - (i) Leather and leather goods.
 - (j) Fruit preservation and fruit cultivation.
 - (k) Fat and oil extraction industry, in conjunction with glycerine and candle factories.
 - (l) Glass, enamels, pottery, tiles, and cement manufacture, with which may be combined the metal-cutting industry for the manufacture of enamelled ware.
 - (m) Paints and varnishes.
- The proposed syndicate could, in my opinion, start with at least 50 large experimental concerns at once.
- (2) The handing over of successful concerns for further development to limited companies started for each of such successful industries, which should be bound to the parent syndicate by the contribution of a quota of their profits or by some similar arrangement.
 - (3) The syndicate should work in harmonious co-operation with Government who would help in every possible way to further definite proposals formulated by the syndicate by opening up that portion of the country proposed for exploitation by building roads, railways, irrigation canals, by making free grants of land for cultivation purposes, by the reduction of railway and shipping freights for raw materials and finished products, and by permitting the syndicate access to all available data and information on any particular subject.
 - (4) That Government will employ this syndicate as their consulting expert for an industrial scheme submitted to them for concession, and no experimental work for the industrial development of the country should be undertaken by Government without its advice, and through its agency.
 - (5) The syndicate should enlist the services of experts from America, England, France, India, and elsewhere to carry out an economic survey of the resources of the country for exploitation.
 - (6) Government should not distribute bounties to private commercial firms in the name of industrial development except in such exceptional cases as may be recommended by the syndicate.
 - (7) Such posts as Director of Industries, as constituted at present, appear to be more a hindrance than a help to industrial progress. It is unreasonable to expect officers from the Civil Service or even business men to administer such posts successfully. The Directors of Industries, if required, should be technological engineers, with duties of disseminating information regarding the raw materials available and the localities of occurrence. They would, as a consequence, work in close co-operation with the syndicate, helping the latter in its economic surveys.
 - (8) The industrial department of Government working in close co-operation with the syndicate should be Imperial and, under no circumstances, Provincial. There should be no decentralization of research or industrial organization on the part of Government. The whole country should be bound together in one large network, radiating from one centre. All expenses must be borne by the Imperial Government. This will be the case for at least the next thirty years, after which period it may appear desirable to decentralize.
 - (9) Under no circumstances should any factories be started by Government agency, and such as are at present in the hands of Government should be immediately handed over to the syndicate proposed, whose duty will then be to further the development of such industries.

Coming now to the allied question of the organization of scientific research I have to offer the following suggestions:—

1. All science departments of Government, such as the Geological Survey, Botanical Survey, Zoological Survey (except perhaps the Trigonometrical Survey), the Forest Research Institute, all Provincial Agricultural and Forest Colleges, and similar private Research Institutes that might wish to come in, such as the Bengal Institute of Science, the Bangalore Indian Institute of Science, Professor Bose's Research Institute, could well be brought under one supreme organization akin to that of the Tokio and Kyoto Universities of Japan. Each section should be directed by one or two specialists in their line, who should possess an international scientific reputation and must be of ripe age and of wide experience. Each officer in his special subject must be a free man, and his activity should not be restricted by any set of red-tape rules and regulations that often defeat the very purpose for which they are framed.
2. The existing staff of the various departments, as available at present, may constitute the staff for such an organization, but it is essential that such a staff be strengthened by the addition of men of high qualifications, men of whom their own country might well be proud to send as representatives of national genius to this country.
3. Official authority in their respective subjects should be vested in the heads of the various scientific sections engaged in research work, who should be given an opportunity of making special world tours with the object of keeping themselves up to date in their respective subjects.
4. The future recruitment of the scientific departments should not be made to the prejudice of any one race or creed, but with the sole object of obtaining the very best men for the various posts; for it is quite obvious that, under the present system of recruitment, such ideals are not attained. In this connection, I may be permitted to quote here the following from the "Memorandum on the Reorganisation of Scientific Research Institutions of the United States of America" by Jerrald Lightfoot, M. A., S. S., presented to the Parliament of the Commonwealth of Australia, and published in 1916:—

"10. Experience of institute in problems of organization.

The experience of the institute in regard to research work is that the best method is to map out a field in which the more pressing problems arise, then to obtain the best man available in each branch and to allow him to associate with himself assistants and collaborators and attack the problems in such a way as he may think fit. All that is necessary in the way of supervision is that some broad policy should be agreed upon, i.e., as to the general lines of the work and the most important problems, the solution of which is considered feasible in view of the existing state of scientific knowledge. Having decided these broad lines of policy it is best to allow the persons selected for the research to work the problems out in any way and at such times as they like. It is quite probable, for example, that in attacking some one problem discoveries may be made which will lead directly to the solution of some other allied problem. In the Rockefeller Institute the greatest freedom is allowed to the members in charge of the various laboratories. They know what it is desired to accomplish, but whether to pursue any particular line, or to continue in that line, is left to their discretion. Two things are considered essential in research work—viz. :—

- (a) to secure the best men available to undertake the research work, and to allow these men to choose their own associates; and
- (b) to give the men appointed the greatest freedom in the prosecution of their researches.

Public pressure is frequently brought to bear upon the Rockefeller Institute to solve particular problems, but the question as to which problems are to be investigated must depend very largely on the state and progress of knowledge in the particular branch of science involved. For example, the institute has often been asked to investigate "hay-fever", but they have refused, as they see at present no likelihood of solving the problem.

In regard to the separation of research from instructional work the experience is that the best teachers are undoubtedly those who do research work, but it does not by any means follow that the best research men are those who also do instructional work. The question is largely one of temperament."

5. As regards the technical training for the various departments of research and industry it is my opinion that students cannot well be admitted into all branches at once, but in agriculture, forestry, applied chemistry, botany, and zoology we should at once collect students from all parts of the country and all those who have the necessary qualifications, as might be laid down by the proposed Science Council, should be admitted for training at their own risks, without receiving any promise from Government or the Industrial Syndicate as to their future appointment and prospects. Both the syndicate and Government will then be in a position to make the best selection from among a large number of students so trained for the various departments. Moreover, the competition so engendered will ensure the best brains of the country being placed at the disposal of Government and syndicate for the good of the country.
6. The practical training of qualified students in pure and applied science in factory, field, or forest should be administered through the agency of the industrial syndicate and the Science Council, on the recommendations of whom

the Government of India, Local Government, or private firms may extend facilities for the completion of such training.

7. All results of research should be published in full detail for the benefit of the public, and nothing should be kept secret, for, as Dr. Hoffmann used to say, "there is no chemical secret that cannot be discovered, hence it is not worth concealing". I should not insert such a suggestion as this had I not personal knowledge that in some cases there has been a distinct tendency in the past to withhold detailed information on vital points.

In conclusion, I must apologize for the length and very obvious literary and other defects of this paper. My sole object has been to offer a frank opinion for whatever it may be worth and, should any of my suggestions be considered worthy of further consideration, I shall feel that I have not laboured in vain.

(Witness did not give oral evidence.)

SUPPLEMENTARY WRITTEN EVIDENCE

BY

MR. A. H. SILVER, *Controller of Textiles, Indian Munitions Board.*

(For the written and oral evidence of this witness see pages 126—157 of volume I of the *Minutes of Evidence*.)

Notes on Provincial Syndicates for developing local industries.

This syndicate is composed of some four or five individuals who probably possess between them capital to the extent of some two lakhs of rupees. Its first venture was to attempt the organization of the blanket-weaving industry and they chose as its headquarters Muzaffarnagar, where blanket-weaving is common. The syndicate commenced business about October 1916 and has since that date been able to take up some fairly large Government contracts for hand-made blankets—contracts which could not have been placed with small individuals. It is at present engaged on a contract for one lakh of blankets of army quality, size $7\frac{1}{2}' \times 5'$, weighing $4\frac{1}{2}$ lbs. each. The ordinary hand-made blanket is not wide enough for army purposes but with the help of some technical instruction Provincial manufacturers have now been able to sew the narrow widths together satisfactorily and then put the blanket through a process of milling or fulling by which means the finished blanket closely resembles the mill-made blanket. They have recently commenced the introduction of fly-shuttle looms of wide reed space capable of weaving a full-width blanket. They have themselves made up to the present 26 of these looms and, having been successful with these, are proceeding to make up this number to 100. The looms are loaned out to weavers working for the syndicate.

The syndicate purchases its yarn from villages throughout the north of India—the members buy the wool themselves and give it out for spinning locally, paying 3 annas per seer for spinning. This is usually done by women, and experience shows their output to be approximately one seer per day, the work being done in addition to their ordinary household work. In the case of men devoting their whole time to spinning the outturn is found to be from 2 to $2\frac{1}{2}$ seers per day.

The weaving of the blankets is done mainly in the Muzaffarnagar and Najibabad districts—10 annas per blanket is paid for weaving, and the average output per man is from $1\frac{1}{2}$ to 2 blankets per day. The milling or fulling is done in three centres, but mainly in Muzaffarnagar itself, where the syndicate has established a depot. One pair of men mill five blankets per day and are paid 0-4-6 per blanket, the pair thus earning Rs. 1-8-6 per day between them. At present the syndicate have some 400 weavers working for them in their homes and about the same number milling. The present output of blankets is rather over 20,000 per month.

It will be observed that on this work alone the syndicate is paying out in monthly wages some Rs. 11,000 for spinning, Rs. 12,500 for weaving, and Rs. 5,600 for milling. This, added to the cost of carting, handling, and baling the blankets, means that a total of over Rs. 30,000 monthly is being paid out in wages to these workers. The effect of this upon the people is, I am informed, most marked; indebtedness has been paid off and the women are purchasing ornaments.

Having taken up the organization of the blanket-weaving industry the same syndicate has been in a position to tender for the supply of made-up jhools required by the Ordnance and Supply and Transport Departments—most of these jhools are of blanketing faced with jute canvas. They have been successful in securing a fairly large order recently and this will give work to another set of people.

They have recently submitted samples of hand-made webbing and tapes—this is another village industry which is capable of being organized upon the same lines and it is probable that orders for this class of goods will be duly passed to this or to similar organizations.

The syndicate is virtually a private trading concern, but each member of it takes in hand some portion of the practical work which requires to be done. One member, for instance, is engaged in purchasing wool and handing it out to local spinners, while another member spends his whole time at the receiving centre of Muzaffarnagar inspecting the blankets as received from the hand-weavers and supervising their milling and fulling. The making up of these blanket strips (as ordinarily woven) into full-width blankets suitable for army use and the milling of the same is a new industry and could only have been brought about by the widespread operations of such a syndicate.

Note regarding the work of the Association of Provincial Manufacturers in the United Provinces.

As promised, I now send you the latest information which I can obtain with regard to the operations of the Provincial manufacturers in the United Provinces.

The manufacture of blankets is still their main line and under their present arrangements the blanket passes through the hands of five different classes of workmen, namely, teasers, spinners, weavers, Tailors, and millers.

Teasers. One man teases from 15 to 20 lbs. of raw wool per day and is paid from Rs. 2-8 to Rs. 3 per maund for this work, but during the monsoon when the wool is damp and is consequently difficult to tease this rate is increased up to as much as Rs. 4 per maund.

Spinners. The bulk of the work is done by women and the rate of output is still approximately one seer per day as this work is carried out in addition to the ordinary household duties. The rate for spinning is still 3 annas per seer.

Weavers. Ten annas per blanket is still paid for weaving. When the work was first started the syndicate found that the "Gadaria" and "Kamalia" class were the only ones who would take up the work, but gradually the "Julaha" class has been encouraged to take it up and the industry has, therefore, come to the rescue of those "Julahas" who were finding it difficult to continue their ordinary work on account of the high prices of cotton and cotton yarn. It is reported that the "Julahas" have proved themselves already equal to the "Gadaria" and "Kamalia" class—in some cases better, and I think that there is little doubt but that the "Julaha" class will in the end show better results than those who took up the work originally. A weaver, with the help of a boy, who assists in the sizing of the warp, can weave two whole lengths of blankets per day and, therefore, earn Re. 1-4 per day.

Tailors. After the blankets are woven in the ordinary hand-looms the comparatively narrow widths have to be sewn together with woollen yarn prior to milling. Each blanket length as it comes from the loom is cut into three equal parts which are sewn together to make a complete blanket of the required width and length. It is found that the tailor ordinarily finishes 35 complete blankets per day, and he is paid at the rate of $\frac{1}{2}$ anna per blanket.

Milling. This was originally done entirely by the "Gadaria" class, but in this direction also it has been found possible to induce the "Julahas" to take up the work and I am informed that there are now more "Julahas" at work than "Gadaris". The men work in pairs and each pair does from four to five blankets per day for which they are now paid at the rate of per blanket—the former rate was $4\frac{1}{2}$ annas per blanket.

The output of the syndicate under present arrangements still averages approximately 20,000 per month, but they hope to do better as I am informed that they are engaging more weavers. The bulk of the labour employed is, of course, engaged in the spinning of the yarn, and the syndicate has godowns and agencies for giving out the wool for spinning at Meerut, Saharanpur, Bijoor, and Karnal. That is, I think, all that I can tell you about the blanket industry except that, following the examples of the Provincial manufacturers of Cawnpore, I have been approached by the representative of another syndicate which proposes to operate with Panipat as its centre in the same line of business. Lala Anand Sirap, one of the leading residents of Muzaffarnagar, has taken up the same work and orders have been placed with Messrs. H. Beris & Co. of Cawnpore (a firm owned by Lala Bhagvandas) and Messrs. Booda Singh & Sons who each propose to operate in the same manner.

The Provincial manufacturers took up the supply of some country-made felt last year for the Government Harness & Saddlery Factory upon the same lines, while, as Director of Industries, I also placed with them a large order for khua-khus tatties which were required for overseas and which they got made promptly. I am considering the possibility of offering further employment to the "Julaha" class by placing with them, through similar Syndicates, orders for shirting twills, towels, dusters, and any fairly heavy cotton fabrics which may be needed from time to time for the army services for which I buy. There is, however, one difficulty in the road according to the information at my disposal, and that is unnecessary interference on the part of zamindars. I am informed that the weavers are frequently harassed by the zamindars and forced to work for them under the threat of being turned out of their villages on refusal. This is a matter to which the Commission might usefully direct attention.

I might add that certain forms of cutlery can usefully be made through the agency of similar syndicates as several villages and districts are capable of turning out such items as spoons, forks, table knives, clasp knives, etc. I am informed that goods of this character made in the districts of Moradabad, Bijoor, and Aligarh have been sold in fairly large quantities in the Bombay market. In addition, of course, there are several districts in the Punjab where goods of this class are regularly and fairly largely made.

SUPPLEMENTARY WRITTEN EVIDENCE.

BY

MR. G. FINDLAY SHIRRAS, M.A., F.S.S., I.E.S., *Director of Statistics.*

(For the written and oral evidence of this witness see pages 778...869 of volume V of the Minutes of Evidence.)

MEMORANDUM ON BANKING.

SUMMARY.

I.—Indian Banks.

1. Presidency Banks (Paragraphs 2 to 5).
2. Exchange Banks (Paragraphs 6 to 9).
3. Indian Joint Stock Banks (Paragraphs 10 to 12).
4. Other Banks (Paragraph 13).

II.—The Great Commercial Banks of Germany.

1. The banking business of Indian Joint Stock Banks as compared with the Great Commercial Banks of Germany with special reference to :—

- (a) The promotion of industry (Paragraph 14).
- (b) The trading in, and the issue of, shares (Paragraphs 14 and 15).
2. The strength of the eight Grossbanken (Paragraph 16).
3. The interlocking of these banks and industrial concerns (Paragraph 17).
4. The systematic collection of deposits (Paragraph 18).
5. The lending of credits by the banks (Paragraphs 19 and 20).
6. The investment of the funds in such a manner as to be prepared at any moment to repay one-third of all outsiders' funds (Fremde Gelder) (Paragraph 21).
7. The overseas and foreign business of the banks (Paragraph 22).
8. Summary (Paragraph 23).

III.—Industrial Banks in general.

1. The Industrial Bank of Japan (Paragraphs 24 to 27).
2. The Trade Bank for the United Kingdom (Paragraph 28).
3. The proposed Trade Bank for Spain (Paragraph 29).
4. Summary. The financing of industry after the war (Paragraph 30).
5. Concluding paragraph (Paragraph 31).

Memorandum on Banking.

This memorandum has been prepared at the request of the President of the Industrial Commission. It is mainly, if not entirely, descriptive, and not analytical. Its object is to describe (a) some of the main features of the Indian banking system, and especially the business of the various classes of banks in the financing of Indian commerce and industry; (b) the methods followed by the Grossbanken, or Great Commercial Banks of Germany; and (c) the main features of the Industrial Bank of Japan and the British Trade Bank. Although based, so far as Indian banking is concerned, on "Statistical Tables relating to Banks in India," published by the Department of Statistics, it is in no sense an "official" memorandum. The memorandum has not been prepared under the instructions of Government. For the statements which it contains I am alone responsible.

I.—Indian Banks.

2. *Presidency Banks.*—It is not intended to trace the history of joint stock banking in this country from its introduction into India by the agency houses in Calcutta in 1770, when the Bank of Hindustan was founded by the firm of Messrs. Alexander & Co., nor is it intended to refer to the extension of banking after the establishment of the Bank of Bengal in 1809; nor to the bank failures between 1829 and 1833 (which put an end to most of the Agency Houses, such as Alexander & Co., Colvin & Co., Fergusson & Co., Mackintosh & Co., Palmer & Co., and Cruttenden & Co.); nor to the vicious system which began as early as 1839 of large advances upon indigo factories and the personal security of the borrower, a system which at the close of 1842, by the failure of indigo houses (Messrs. Fergusson Brothers, Gilmore & Co., etc.), resulted in 60 lakhs of rupees being locked up in indigo. Reference need not be made to the lessons of mismanagement in the first half of the 19th century, equalled perhaps only by the failures in 1913-14, or to the Raj Kishore Dutt forgeries when the Bank of Bengal lost at least Rs. 3½ lakhs and the shareholders a dividend for one year, which coincided with the fall of the bank's stock from Rs. 6,000 to Rs. 500 premium, and even to par. It is not necessary to refer to the scandals connected with the failure of the Benares Bank in 1849, to the Bank of Bengal's breaking its charter during the crisis of 1829-32, or to the winding up of the Bank of Bombay in January 1868*. It is intended in this part of the memorandum rather to show what functions the main classes of banks fulfil in the banking system. The Presidency Banks, the Exchange Banks, and several of the Indian Joint Stock Banks have done excellent work, often too in difficult circumstances, and it is interesting to examine how far each plays a part in the banking system.

3. *Distribution of Banks and their Branches.*—In connexion with this memorandum two maps† have been prepared. The first map‡ shows the Presidency Banks, the Exchange Banks, and the Indian Joint Stock Banks, with their branches, throughout India. The second map (not printed) shows the Treasuries, district by district, and Currency Offices. This latter map may also be taken as an example of what a banking map of India would be under an ideal system of bank distribution. The Presidency Banks are confined to a fixed territory in accordance with the Presidency Banks Act of 1876 (Act XI of 1876, sections 3 and 42). Section 42 permits

* These points, and the lessons to be drawn from them, were treated at some length in the 1914 Readership Lectures on Indian Currency and Finance in the Calcutta University.

† Not reproduced.

‡ The map and the tables on the map refer to 1915.

of the establishment " of branches or agencies at such places within the Presidency in which the bank is situate, as they (the Directors) deem advantageous to the interests of the bank; and, with the previous consent of the Governor-General in Council, and subject to such restrictions as to the business to be transacted, as he thinks fit, in each case, to impose (such consent and restrictions being notified in the *Gazette of India*), to establish branches or agencies at such places outside the Presidency in which the bank is situate, as the Directors deem advantageous to the interests of the bank; provided that no agency of the bank now or hereafter established in Bombay, Calcutta, or Madras shall advance, or lend money, or open cash credits on securities, or receive deposits and keep cash accounts or discount bills of exchange drawn and payable in the Presidency in which it is so established, or shall act as agent *en commission*, or transact any business except as agent of its principal bank, or any of its branches or other agencies". The Bank of Madras is limited to the Presidency of Fort St. George, which means the territories under the government of the Governor of Fort St. George in Council; the Bank of Bombay to the Presidency of Bombay, which means the territories under the government of the Governor of Bombay in Council; and the Bank of Bengal to the Presidency of Fort William, which means all the territories in British India, other than the Presidency of Fort St. George and the Presidency of Bombay. The Exchange Banks are situated in Calcutta, Bombay, Madras, Karachi, Rangoon, Tuticorin, Cochin, Chittagong, and also in Delhi, Cawnpore, Howrah, Srinagar, Lahore, Amritsar, Rawalpindi, Murree, Tavoy, and Mandalay. The inland branches of the Exchange Banks are concerned largely with the financing of piece-goods. It will be noticed from the map that the Indian Joint Stock Banks are scattered chiefly over the Punjab and the United Provinces. There are very few Indian Joint Stock Banks in the rest of India except in the southern parts of Madras. The Indian Joint Stock Banks are of small importance as compared with the Presidency Banks or even the Exchange Banks. The deposits are less than 23 per cent of the total as will be seen from the following figures for 1916 :—

Banks	Deposits (£1,000)	Per cent of total
Presidency Banks (3)	33,276	43.9
Exchange Banks (10)	* 25,359	33.5
Indian Joint Stock Banks (48)†	17,149	22.6
Total (61)	75,784	100

It will be seen from the map that there are no Indian Joint Stock Banks in Assam, and none in Burma with the exception of Rangoon. In the Native States, Joint Stock Banks, with one or two exceptions, may be said to be extremely few, if not altogether non-existent. The following table gives the number of branches, (together with head offices, throughout India in 1916 :—

Banks	Head Offices	Branches and Agencies‡
Presidency Banks—		
Bank of Bengal	Calcutta	25
Bank of Bombay	Bombay	14
Bank of Madras	Madras	23
Total	3	62
Exchange Banks	8	45
Indian Joint Stock Banks	68	160
Total	68	205
GRAND TOTAL	71	267

It will be seen that the branch banking system is not yet developed to a large extent. This map includes only Joint Stock Banks, and does not include the business undertaken by the banias, saucars, mahajans, or by private firms which frequently do banking business as a subsidiary part of their main business]. Notwithstanding the increase of the Joint Stock Banks the circulation of the hundies of these bankers has increased in the last two decades as the evidence collected during the Enquiry into Prices in India showed. The loss incurred from the dishonouring of these hundies at maturity is an insignificant fraction per cent.

* Deposits in India.

† Banks furnishing returns.

‡ Cf. Appendix I for a list of these.

§ There are 10 Exchange Banks doing business in India of which the head offices are situated outside India.

|| e.g., Messrs. Thacker, Spink & Co. and similar firms have a banking and agency department, e.g., they open current accounts, attract deposits, etc.

These bankers are able to place themselves in funds in the Presidency towns by calling for remittances from their numerous agencies established in various parts of India. It is not possible to give estimates of the extent to which the Indian bankers (mahajans, marwaris, etc.) receive deposits and take part in the internal financing of trade. It may, however, be said that they do so to a large extent. After the outbreak of war they restricted credit to a considerable degree as may, to some extent, be gathered from the bills discounted and purchased by the Presidency Banks at or about the end of December.

	1913 R(lakhs).	1914 R(lakhs).	1915 R(lakhs).	1916 R(lakhs.).
Bank of Bengal	274	184	243	317
Bank of Bombay	161	65	114	115
Bank of Madras	167	81	89	101
Total	602	327	451	531

In this connexion it may be pointed out that these bankers are very useful middlemen to the Presidency Banks. They get into touch with traders in a way the banks do not.

They, therefore, bring business within the scope of the Presidency Banks Act, and enable the banks to give accommodation. These Indian bankers go to the banks to get bills or hundies discounted under their endorsements, the banks accepting such bills freely to an extent determined by the standing of the Indian or native banker, and the strength of the drawers. The banks have found it one of the safest kinds of business in which to engage. Recourse is had to the bank when the demands are greater than these bankers can meet from their own funds. The accommodation by these bankers depends on (1) the limit to which the banker thinks he can, or should, make advances, and (2) the extent to which the banks are prepared to discount bills bearing the banker's endorsement. When Joint Stock Banks are established in the various market towns of agricultural districts these Indian bankers may find it convenient to make deposits and employ the banks for remittances. This, however, opens up a large question which cannot be conveniently discussed here.

The amount of paid-up capital and reserve in Indian banks is still small as compared with that in the United Kingdom. The "capital and reserve" in 1916 is only £46 millions as compared with £132 millions in the case of the United Kingdom; the deposits amount to £76 millions as compared with £1,658 millions; the deposits per thousand of population £241 as against £36,657; and the deposits per £1,000 of trade £288 as compared with £1,015 (Appendix II).

4. The Presidency Banks have deposits of over £33 millions as compared with £25 millions in the case of Exchange Banks and £17 millions in the case of Indian Joint Stock Banks. The capital, the reserve, and the cash balances of the three banks are given in Appendix III. It will be seen that during the 27 years (1890 to 1916) the capital and reserve increased considerably. Private deposits increased by 208 per cent in the 27 years while the public deposits increased only by 45 per cent. Cash balances increased by 53 per cent. The following table shows the increase of private deposits of the Presidency Banks in the five years ending 1916 :—

On 31st December.	BANK OF BENGAL.		BANK OF BOMBAY.		BANK OF MADRAS.	
	Private deposits R(lakhs)	Cash balances R(lakhs)	Private deposits R(lakhs)	Cash balances R(lakhs)	Private deposits R(lakhs)	Cash balances R(lakhs)
1912	17.11	6.65	11.39	3.15	7.43	1.00
1916	31.44	7.73	13.67	6.68	9.60	3.87
Increase	25%	16%	21%	112%	29%	46%

Private deposits increased by 29 per cent in the case of the Bank of Madras, 25 per cent in the case of the Bank of Bengal, and 21 per cent in the case of the Bank of Bombay. Cash balances increased by 112 per cent in the case of the Bank of Bombay, 46 per cent in the case of the Bank of Madras, and 16 per cent in the case of the Bank of Bengal. The increase in the Bank of Bombay's cash balance in 1916 is noteworthy.

As compared with the pre-war year (1913) private deposits increased by 17 per cent in the case of the Bank of Bengal, 19 per cent in the case of the Bank of Madras, and 34 per cent in the case of the Bank of Bombay. Cash balances showed an increase of 40 per cent in the case of the Bank of Bombay and 31 per cent in the case of the Bank of Madras, but a decrease of 8 per cent in the case of the Bank of Bengal. The figures refer to the 31st December in each year. The proportion of the cash to the liabilities on deposits of the Presidency Banks at the end of 1916 was 35 per cent as compared with 25 per cent in the case of Exchange Banks doing a considerable portion of their business in India.

35 per cent in the case of Exchange Banks which were merely agencies of large banking firms doing business all over Asia, and 24 per cent in the case of major Indian Joint Stock Banks.

5. The question of the relations between the Presidency Banks and Government is not relevant to the present issue and it is unnecessary for me to go into this. The earlier history is dealt with in Mr. Brunyate's book*, and some information on the subject will be found in the Report of the Chamberlain Commission.

The most important sections dealing with the restrictions at present in force with the Presidency Banks are sections 24, 26, 27, 34, 36, 37, 42, 43, and 63. Sections 24, 26, and 27 refer to the Directorate, including the qualifications and disqualifications of Directors; sections 36 and 37 deal with the business which the banks may not transact; section 42 with the establishment of branches and agencies; section 43 with the balance-sheets; and 63 with the power of Directors to make bye-laws. Section 37, which is of special importance, is as follows:—"The Directors shall not transact any kind of banking business other than those above specified (i.e., in section 36), and in particular they shall not make any loan or advance:—

- (a) for a longer period than six months; or
- (b) upon the security of stock or shares of the bank of which they are Directors; or
- (c) save in the case of the estates specified in section 36, paragraph (b), upon mortgage, or in any other manner upon the security of any immovable property or the documents of title relating thereto; nor
- (d) shall they [except upon the security mentioned in section 36, paragraph (a), Nos. 1 to 5, inclusive] discount bills for any individual or partnership-firm for an amount exceeding in the whole at any one time such sum as may be prescribed by the bye-laws for the time being in force, or lend or advance in any way to any individual or partnership-firm an amount exceeding in the whole at any one time such sum as may be so prescribed †; nor
- (e) shall they discount or buy, or advance or lend, or open cash credits on the security of any negotiable instrument of any individual or partnership-firm, payable in the town or at the place where it is presented for discount, which does not carry on it the several responsibilities of at least two persons or firms unconnected with each other in general partnership; nor
- (f) shall they discount or buy, or advance or lend, or open cash credits on the security of any negotiable security having at the date of the proposed transaction a longer period to run than six months ‡ § or, if drawn after sight, drawn for a longer period than six months ‡.

* * * * * * *

"Nothing contained in this Act shall be deemed to prevent the Directors from allowing any person who keeps an account with the bank to overdraw || such account, without security, to the extent of sums not exceeding at one time ten thousand rupees in the whole ¶ as may be prescribed for the time being by the bye-laws made under this Act."

6. *Exchange Banks.*—The Exchange Banks, several of which were founded 60 years ago, play an important part in the financing of Indian trade. There are ten banks; of these five do a considerable portion of their business in India, e.g., the Chartered Bank of India, the National Bank, the Mercantile Bank, etc., while others are merely agencies of large banking corporations doing business all over Asia, e.g., the Hongkong and Shanghai Bank, the International Banking Corporation, the Yokohama Specie Bank, etc. The Delhi and London Bank, it may be noted, has recently been amalgamated with an Indian Joint Stock Bank, the Alli-

* An Account of the Presidency Banks, by the Hon'ble Mr. J. B. Brunyate, C.S.I. (The book has not been published, but copies are in the Imperial Library, Calcutta, at the India Office, etc.)

† This clause was substituted by the Presidency Banks Act, 1870 (V of 1870), section 5, General Acts, volume III. The original clause was as follows:—

"Nor shall they lend or advance by discount of bills or otherwise, to any individual or partnership-firm [except upon the security mentioned in section 36, paragraph (a), Numbers (1) to (5), inclusive], any sums of money exceeding in the whole at any one time such sum as may be prescribed by the bye-laws for the time being in force."

‡ These words "six months" were substituted in both places in which they occur for "three months" by the Presidency Banks (Amendment) Act, 1907 (I of 1907), section 4(iv), General Acts, volume VI.

§ The following proviso was repealed by the Presidency Banks (Amendment) Act, 1907 (I of 1907), section 4(iii) *ibid.*:—

"Provided that in the case of the Bank of Madras the Directors may discount negotiable securities payable in Ceylon having at the date of the transaction a period to run not exceeding four months."

|| The words "to overdraw" were substituted for "from overdraw" by the Presidency Banks (Amendment) Act, 1907 (I of 1907), section 4(iv), *ibid.*

¶ These words were substituted for the words "sums not exceeding at any one time two thousand rupees in the whole" by the Presidency Banks (Amendment) Act, 1907 (I of 1907), section 4(iv), *ibid.*

ance Bank of Simla. The following table summarizes the position of the Exchange Banks that do business in India :—

*Capital, reserves, deposits, and cash balances of the Exchange Banks, classified in groups, according to extent of business in India, on the 31st December 1916.**

	No. of Banks.	Capital. £(1,000)	Reserve and Rest. £(1,000)	DEPOSITS.		CASH BALANCES.	
				Out of India. £(1,000)	In India. R(1,000) £1,000	Out of India. £(1,000)	In India. R(1,000) £1,000
(1) Banks doing a considerable portion of their business in India	5	5,812	5,931	45,722	31,54,40 = £21,029	14,095	7,86,14 = £25,341
(2) Banks which are merely agencies of large banking corporations doing business all over Asia	5	19,024	11,114	102,510	6,40,48 = £4,330	27,272	2,27,87 = £1,519
TOTAL	10	24,836	17,045	208,232	38,33,88 = £25,359	41,367	10,14,01 = £3,750

This summary statement will be referred to in a subsequent paragraph.

7. It is important to describe the part which the Exchange Banks play in Indian trade. The business of these banks may be divided into (a) exchange business, and (b) ordinary banking business.

8. Firstly, with regard to the *exchange business* so far as it relates to the export trade of India. Bills against the export trade are drawn D/A (documents on acceptance) and D/P (documents on payment). They are purchased by the banks' branches in India. The D/P bills are held by their London offices until they are retired or paid at maturity. The D/A bills as a general rule are discounted, or rediscounted, immediately after acceptance. They are rediscounted with the English Joint Stock Banks and the Scotch Banks, or with bill-brokers financed by these, and, especially in times of stringency, with the Bank of England. These bills may be held for a time by the Indian Exchange Banks in London. This would only occur when business in India was stagnant. To the extent to which the D/A are rediscounted immediately after acceptance (which they are in the great majority of cases) the Indian export trade is financed not with the funds of the Exchange Banks except from the time of the purchase of the bills in India to their arrival in London†, but with the funds of the British banks, i.e., with British, and not Indian, capital.

Next, with regard to the import trade. The Exchange Banks also finance the import trade through their London offices. Bills are drawn on the consignees D/A or D/P, in sterling for the most part, payable with interest, from the dates of the bills to the approximate dates of arrival of the remittances in London, by demand draft on London. These bills are never rediscounted. Thus, the import trade, it will be seen, is financed to a much greater extent than the export trade with the funds of the Exchange Banks alone. The Exchange Banks' purchases of Indian export bills represent transfers of their funds to London. Their advances against import bills are the return of these funds. As exports normally exceed imports the deficiency of import bills is made good by shipments of gold coin and bullion and also silver bullion from London and elsewhere and, to a very small extent, by transfers of Government rupee paper from London to India ‡, and as regards the balance by purchases of Council Bills and Telegraphic Transfers §. The last will be resorted to freely when exports from India are at their height, and when it is to the banks' interest to move their funds back to India in the shortest possible time. The Chartered Bank, for example, may buy on Wednesday these transfers and by the following day the Calcutta, Bombay, and Madras branches will find themselves in funds. This, in brief, is an outline of the banks' exchange business proper.

9. The Exchange Banks also do an *ordinary banking business*, and in this they have as competitors both the Presidency Banks and the Indian Joint Stock Banks. They compete with these latter banks in raising deposits, whether on current account or as fixed deposits.

* It is not possible to give the deposits and cash balances bank by bank. The representatives of the Exchange Banks, however, i.e., of the Chartered Bank of India, the National Bank, the Mercantile Bank, the Eastern Bank, the Hongkong and Shanghai Bank, and also the so-called Foreign Exchange Banks, in fact all the Exchange Banks with the exception of the Delhi and London Bank, informed the Chamberlain Currency Commission that if all the banks agreed to publish an account of their Indian deposits and Indian cash, apart from outside Indian deposits and cash, they would have no objection to the separate publication for each bank of such details.

† As the present time the mails take about four weeks, and the amount which the Exchange Banks have invested in the transit of bills is large and about twice what it is in normal times.

‡ This is of little importance, and seems to be decreasing.

§ The purchases of Council Bills and Telegraphic Transfers ordinarily exceed the net imports of treasure (vide The Review of Trade, 1915-16; page 97—Table on the Balance of Trade).

Their deposits have increased very considerably during the last few years (Appendix V). The terms for deposits, both on fixed deposit and on current account, are, as a rule, more favourable than those of the Presidency Banks, while less favourable than those of the Indian Joint Stock Banks. The Exchange Banks also compete with these banks in loans, overdrafts, and discounts. It will be seen from table II in paragraph 3 that the Exchange Banks have 45 branches in India as compared with 65 branches (including head offices) of the Presidency Banks and 88 head offices and 160 branches in the case of Joint Stock Banks. The summary table in the same paragraph shows that the Indian deposits of the Exchange Banks amount to £25,359,000 as against £33,276,000 of the Presidency Banks and £17,140,000 of the Indian Joint Stock Banks. Inasmuch as the Exchange Banks are not under the obligation resting on the Presidency Banks of maintaining, even during the busy seasons, large cash balances, it may be said that their deposit position is rather better than a comparison of their figures with those of the Presidency Banks would lead one to suppose—£25,000,000 against £33,000,000—or the percentages in table I in paragraph 3 would lead one to think. The Presidency Banks' deposits include the balances of the Exchange Banks. On the average of the five years ending 1916 the cash balances of the Exchange Banks on the 31st December amounted, it may be noted, to 48 per cent of the total balances of the Presidency Banks. Upon the strength of the deposits will a bank's participation in the loan, overdraft, and discount business depend. The extent, then, of the Exchange Banks' participation in this ordinary banking business will readily be understood. The Secretary of the Bank of Bengal in his evidence before the Chamberlain Commission said that the Bank of Bengal had to reduce its rates in Calcutta for advances to jute mills to $\frac{1}{4}$ per cent below the bank's published minimum in order to compete successfully with the Exchange Banks. The representatives of the Exchange Banks before the Commission also said that they were, to some extent, in competition with the Presidency Banks, and illustrated this by the branches of the Exchange Banks in Delhi and Amritsar, which foster in these cities their Manchester connexion. It must, however, be remembered that when exchange business is at its maximum, in February and March of each year, the funds of the Exchange Banks are much more largely invested in the exchange class of business than at other times. This is important as it results in some impairment of their power to compete with banks other than Exchange Banks in the discount market.

10. *Indian Joint Stock Banks.*—Indian Joint Stock Banks are 68 in number, with 160 branches. The deposits of 48, which furnished returns, amounted to over £17 millions sterling, or nearly 23 per cent of the total deposits in India. As already mentioned they are chiefly scattered throughout the north-west of India, especially in the Punjab and in the United Provinces. Twenty banks, i.e., banks with capital and reserve amounting to above Rs. 5 lakhs, have a paid-up capital of Rs. 2,87 lakhs and deposits amounting to Rs. 4,71 lakhs. The cash balances were only Rs. 63 lakhs. Appendix VI gives the capital, the reserve, deposits, and cash balances of these banks classified according to the amount of capital. With the exception of the Bank of Upper India, which was established in 1862, the Allahabad Bank, which was established in 1805, and the Alliance Bank of Simla, which was established in 1874, most of the major banks are of comparatively recent date or have recently been reconstructed (Appendix VII). Recent failures of Indian Joint Stock Banks are already still fresh in mind. About 31 per cent of the capital of Indian Joint Stock Banks has been lost owing to the failures in 1913-16. The estimates on which these figures are based are the following:—

	R. (1,000)	Equivalent in sterling £(1,000).
Paid-up capital of Indian Joint Stock Banks working on 31st December 1916	3,39,13	2,351
Paid-up capital of Indian Joint Stock Banks liquidated in 1916	4,28	28
" " " " " " " " 1915	4,60	31
" " " " " " " " 1914	1,09,12	729
" " " " " " " " 1913	35,13	234
	1,63,08	1,091
Total capital of banks, existing and liquidated	4,92,21	3,292

Such a large disappearance of capital owing to these failures is remarkable, and is striking, and may be explained by the phenomenal (almost mushroom) growth of such banks in Western India, in the Punjab, and in the United Provinces, particularly in the five years preceding the failures. In 1911-12 many of the balance-sheets of those companies which did issue balance-sheets were extraordinary. Some of these banks attempted to make large profits without having a staff of experienced bankers. Many had not adequate reserves against their deposits, and the balance-sheets in many cases were good samples of window dressing. In 1910 the percentage of cash to their liabilities was only 11, and in very many cases the percentage was lower than this. Many had little paid-up capital, and the word "bank" was used in a way that exploited deposits from the unwary at rates of interest which made it impossible for money so obtained to be employed lucratively in any way except in the most hazardous enterprises. In one or two cases banking included medical attendances, coach-building, etc. The Presidency and Exchange Banks had not interested themselves to any extent in these banks and, when the debacle occurred, Government gave timely assistance by offering to place funds, if required, at the

disposal of the Presidency Banks, through whose agency assistance could have been given to legitimate trade.

11. Every year balance-sheets show, with one or two exceptions, much to be desired, and it is interesting to compare the provisions that must be observed in the preparation of balance-sheets by Indian Joint Stock Banks and German banks. The managers of a Joint Stock Company in Germany must, within three months, submit to the Board of Directors a balance-sheet for the year past, also a statement of profits and losses, and a report showing the conditions of the funds and the general state of affairs of the company. These documents, with the written remarks of the board, are submitted at a meeting of the stockholders and, after their approval, the balance-sheet and the statement of the profit-and-loss account are published in the newspapers mentioned in the charter of the company. In the preparation of balance sheets in Germany the following general provisions have to be observed:—(1) securities and merchandise having an exchange or market price must not be listed above their exchange or market price prevailing at the time the balance-sheet is made up; in case this price exceeds the cost they must not be listed above this cost; (2) other assets may be valued at prices not higher than the cost of purchase or manufacture; and (3) a reserve fund must be created in order to cover any possible losses shown in the balance-sheet. An annual amount equal at least to one-twentieth of the annual net profits is added to the reserve fund as long as the reserve fund does not exceed a tenth part of the capital, or whatever higher proportion has been provided in the charter of the company. In India the main provisions briefly are:—(1) every Joint Stock Bank shall, at least once every year, cause the accounts of the bank to be balanced and a balance-sheet prepared, duly audited and authenticated, and filed with the Registrar of Joint Stock Companies; the balance-sheet shall contain a summary of the property and assets and of the capital and liabilities of the company, giving such particulars as will disclose the general nature of those liabilities and assets and how the value of the fixed assets has been arrived at; and (2) in addition to this, the bank shall, before it commences business and also twice yearly, make a statement, showing the share capital and the number of shares issued, the amount of calls made and the amount received, and the debts and assets of the company.

12. A great deal may be done by these Indian Joint Stock Banks to farther industry and trade in this country. It may be possible for some of them to undertake industrial development. Before, however, our Indian Joint Stock Banks can assist the industrial development of the country it is necessary to prevent by legislation a repetition of the disasters of the past. These weaknesses are well illustrated by liquidators' reports on the People's Bank, the Indian Specie Bank, the Credit Bank of India, the Industrial Bank, and the Hindustan Bank, extracts from some of which are given in Appendix VIII. The Chartered Accountant's report on the Pioneer Bank points out "it is monstrous and deplorable to find that ever since the inception of the bank no profits have been made, *

*. It is very disappointing to find that the affairs of the bank were not run on lines of legitimate banking". It is necessary to legislate in order to provide that these banks will be of real use in furtherance of Indian trade, and that they will always be in a sound healthy condition. It cannot, in short, be said at the present time that the Indian Joint Stock Banks, with one or two exceptions, are conducted on lines which would give the maximum of assistance to trade. A body of experts would be of advantage in drawing up the restrictions with regard to the use of the term 'bank' and the general conduct of business, the amount of paid-up capital, the investment of funds, the auditing, the advancing of money on security, the publication of required balance-sheets, and of the allocation of profits, etc. Such restrictions will be necessary should it be decided to follow the example of the Commercial Banks of Germany and the Industrial Bank of Japan in regard to the assistance to be given by banks to industry. The following table may be of interest in regard to the small proportion of cash to liabilities on deposits of the Indian Joint Stock Banks:—

	1907	1908	1909	1910	1911	1912	1913	1914	1915	1916
	per cent	per cent	per cent	per cent	per cent	per cent	per cent	per cent	per cent	per cent
I. Presidency Banks	30	33	33	31	35	39	36	40	34	35
II. Exchange Banks*										
(1) Banks doing a considerable portion of their business in India	25	17	20	16	18	20	19	28	19	25
(2) Banks which are merely agencies of large banking corporations doing business all over Asia	44	27	23	21	16	24	17	26	41	35
III. Indian Joint Stock Banks (Capital and reserve Rs. 5,00,000 and over)	14	15	14	11	14	15	18	21	21	24
IV. Indian Joint Stock Banks (Capital and reserve between Rs. 5,00,000 and Rs. 1,00,000)	18	23	22	17

It should be remembered in connexion with the Indian Joint Stock Banks generally that, unlike the Exchange Banks, they are, as a class, unable to obtain funds from London.

* The percentages for the Exchange Banks have been calculated on their deposits and cash balances in India only.

The percentage of cash liabilities of the major banks on deposits since the beginning of bank failures has increased (24 per cent in 1916 as against only 15 per cent in 1912). With proper restrictions these banks should certainly be able to assist in a far greater degree the development of Indian commerce and industry.

13. *Other Banks.*—In addition to the banks already described there are Post Office Savings Banks with deposits amounting to approximately £10,214,000. Deposits have increased considerably in the last 15 years as the following figures will show :—

Year ended 31st March	Number of Depositors No. (1,000)	Balance of Deposits, inclusive of Interest R.(1,000).
1900	788	9,64.84
1905	1,059	13,40.70
1910	1,379	16,90.74
1912	1,501	18,89.88
1913	1,567	20,61.14
1914	1,630	23,16.75
1915	1,644	24,50.26
1916	1,660	25,32.12

The deposits are treated by Government as unfunded debt, and there is no reserve against these deposits. The deposits are used for capital expenditure. Experience, however, has shown that a run on these banks, as occurred after the outbreak of war, can be met, when necessary, without a very considerable degree of difficulty. There are also Co-operative Credit Banks. These, however, are not important in the banking system as the capital and reserves (in 1915-16) were only R2½ crores, the deposits (including loans held by the banks) R7½ crores.

II.—The Great Commercial Banks of Germany.

14. *The banking business of Indian Joint Stock Banks as compared with the Great Commercial Banks of Germany.*—The Indian banking system, built up on the English model, is widely different from the *Grossbanken*, or the Great Commercial Banks of Germany*. Indian banks, with some exceptions, have given much assistance to trade on lines similar to those of banks in the United Kingdom. They have granted banking facilities to traders, and by banking facilities are meant those which in the main can be provided by the banks without a "lock-up" such as would impair the liquidity of the bank's assets. The banks receive the spare cash of their customers, grant loans, and discount bills largely. Except as banks for companies they take no part in promotion and flotation business, nor do they deal in stock exchange securities on their own account. The Indian Presidency and Exchange banker, like his English confrère, is, in short, a professional banker in the strictest sense, and he does not assist directly in the running of industrial concerns. The Great Commercial Banks of Germany, however, undertake, in addition to the ordinary business of attracting deposits, giving loans, and discounting bills, the supply of capital to promote the founding of an industry which is not considered proper banking business in this country, although short loans for this purpose are not unusual. The *Grossbanken* promote industry and commerce by devoting capital and credit to the building of works, plant, etc., on a large scale, and they take a close interest in the industry to which they have given their support. They float new companies either by inviting subscriptions from the public (*Zeichnung*) or by themselves (*Einführung*). In this latter case a bank, or syndicate of banks, take up the shares; and they may sell these after a year, since, according to Article 41 of the *Bourse Law*, they are permitted only to place the shares on the Stock Exchange on the expiry of one year, and only after the first balance-sheet has been published. The banks also regulate the shares by buying when they are extremely low, or selling when they appear to be unduly high. They also buy and sell securities on a large scale on their own account, a practice which is not, perhaps, to be commended for our Indian banks. The banks, however, do not engage *ordinarily* in the speculative selling or buying of shares.

* These banks are usually known as Credit Banks—a term which in no way shows the scope of the activity of these banks. The term, however, is used to differentiate those Commercial Joint Stock Banks which do not possess a note issue from those banks which are limited to a greater extent in the scope of their operations, such as the mortgage banks, the mutual or co-operative banks, the savings banks, etc.

The issues of securities made in Germany according to the *Deutscher Ökonomieist* were as follows:—

	1906.		1907.	
	IN MILLIONS OF MARKS.			
	Face value.	Nominal value.	Face value.	Nominal value.
State loans	637.00	638.11	651.00	646.22
Municipal loans	346.83	347.00	430.86	425.44
Mortgage bonds	404.59	404.59	326.33	326.33
Railway bonds	2.50	2.02	1.00	0.99
Industrial bonds	182.27	182.10	170.90	172.79
Railway shares	1.70	2.16	0.61	0.62
Bank shares	184.19	282.19	108.89	152.40
Insurance Companies' shares	1.50	1.86	3.06	3.06
Industrial shares	389.04	652.80	284.14	431.32
TOTAL	2,157.62	2,520.83	1,876.79	2,059.28

It will be seen that about 50 per cent of the issues were industrial bonds and shares. The issuing business absorbs a very large portion of banking activity and it requires much sagacity and caution on the one hand, coupled with an intimate knowledge of trade conditions on the other. A large amount of knowledge and practical experience is required. For example, it is necessary to see whether a quick distribution of the issue is possible, in view of the situation of the home market, general, economic, and political conditions. The fixing of the most advantageous conditions of underwriting and of payment, etc., are all studied carefully. The banks are well posted as to information, especially statistical, in their "Secretariats". The banks' security transactions may include voluntary transactions, e.g., in investing liquid bank resources in equally liquid securities, and involuntary security transactions, e.g. (1) the holding of those securities which cannot at the time be disposed of, such as securities issued by the bank itself, or turned over to it as its share of syndicate participations; and (2) the purchase of securities immediately after their issue for the purpose of preventing an undue depression of their market value. Excessive holdings of securities are avoided as this may be interpreted to mean (1) that the issues of the bank have not been issued at the time they ought to have been issued; or (2) that the bank has made excessive speculative engagements on account of its clients; or (3) that on its own account it has been involved in excessive speculative transactions, "a line of business which", in Bliesser's words, "can be regarded as permissible only to a very limited extent"; or (4) that the bank is unable to find profitable employment for its funds.

15. The banks, in short, as flotation concerns, watch permanently over the companies which they have promoted. The intimate connexion of the so-called regular banking business with that of the floating of companies, the trading in, and the issue of, shares is typical of the organization of the German Commercial Bank system. Industrial financing and stock issuing, it may be noted here, were part of the functions of the oldest *Grossbanken* founded as early as the middle of the nineteenth century. The model for these institutions was, of course, the *Paris Crédit Mobilier*, founded by Pereire Brothers. The adaptations were, however, not merely imitations for imitation's sake, but originated in answer to the real demands of German economic development. The endeavours on the part of the German Credit or Commercial Banks, especially the chief Berlin banks, to place the banks at the service of German commerce and industry have been remarkably successful during the last 30 years, and especially as the table in Appendix IX shows, since 1896.

16. *The strength of the eight Grossbanken.*—Before the outbreak of war the eight German banks (the *Grossbanken*), including the banks associated with them, possessed a capital of no less than £132,000,000 as compared with £120,000,000*, the whole banking capital of the United Kingdom, and £46,000,000 † in the case of India.

* Excluding the Bank of England, as the Reichsbank is excluded from the *Grossbanken* capital of £132,000,000.
† Includes the total capital and reserves of the Exchange Banks as their Indian portion cannot be estimated.

The amount of the capital of the eight great German Commercial banks is as follows:—
(1912).

Name of Bank.	Capital.	Reserve fund.	Profit and loss, etc.	Deposits and Current Accounts.	Total liabilities, including amounts in columns 2, 3, 4, and 5.
1	2	3	4	5	6
	£	£	£	£	£
Bank für Handel und Industrie	8,000,000	1,000,000	557,745	27,280,000	44,728,489
Berliner Handels-Gesellschaft	5,500,000	1,725,000	648,330	15,933,000	28,729,330
Commerz und Disconto Bank	4,250,000	675,000	—	11,082,000	29,922,333
Deutsche Bank	10,000,000	5,500,000	3,213,341	78,673,000	112,008,929
Direction der Disconto-Gesellschaft	10,000,000	4,065,000	1,471,394	30,225,000	68,013,381
Dresdner Bank	10,000,000	3,050,000	1,255,791	44,345,000	72,275,408
National Bank für Deutschland	4,500,000	788,500	24,000	13,516,000	22,818,827
A Schaaffhausen'scher Bankverein	7,250,000	1,708,000	839,061	16,854,000	35,474,981
TOTAL	59,500,000	19,111,568	8,010,182	241,012,000	398,338,910

Of these Grossbanken the Deutsche Bank founded in 1870 is the most powerful, and its dividend is usually the highest. From 1909 to 1912 it was at the rate of 12½ per cent. It will be noted from the table that the total capital is £59,500,000, the reserve fund £19,111,568, the profit-and-loss account £8,010,182, and the current accounts and deposits £241,012,000. The capital, reserves, and other money belonging to these Grossbanken are about one-third of the deposits. The Grossbanken have founded other banks (foreign banks) in combination or otherwise. The Deutsche Bank, for example, founded or took part in the founding of the Deutsche Asiatische Bank (1889), the Banca Commerciale Italiana (1894), and at least five other banks. They have absorbed not only banks and private bankers, but through stock-ownership have community of interest with numerous banks. The ramifications of these Grossbanken are given in Riesser's "Die Deutschen Grossbanken (Appendix IX—the development of concentration).

17. *The interlocking of these Banks and Industrial concerns.*—A statement has been compiled from the appendices of Riesser's "Die Deutschen Grossbanken und ihre Konzentration" (the Locus Classicus) and is appended to this memorandum to illustrate the interlocking of the Grossbanken and industrial concerns. The Bank für Handel und Industrie, the Berliner Handels-Gesellschaft, the Commerz und Disconto Bank, the Deutsche Bank, the Direction der Disconto-Gesellschaft, the Dresdner Bank, the National Bank für Deutschland, and A Schaaffhausen'scher Bankverein are represented on no less than 697 companies, or on an average of 87 companies for each bank. The Deutsche Bank is represented on 116 companies, the National Bank on 96, A Schaaffhausen'scher Bankverein on 94, and the Disconto-Gesellschaft and the Bank für Handel und Industrie on 92 each. Trading concerns and banks, machine construction and instrument-making, mining, smelting, and salt works, and foreign companies form the majority of these companies. As Sir R. H. Inglis Palgrave points out:—

"Among them (the banks) is one which controls mines at Bochum, a place which is in the centre of the "iron" industries of Germany, not far from the enormous works of Krupp & Co., which are known throughout Europe. Another carries on a factory for working in cast steel, the business of another is to establish waterworks on the continent of Europe, another works mineral oil, another salt works and salt baths; some undertake mines and smelting works, others smelting works only, others work in aluminium, others in copper and brass, and in making metal screws. We may also mention, to show the varied industries assisted, that the bank also appoints the vice-chairman of a company which makes the machinery employed in the works required for storing electricity in connexion with different industries, for works employed by companies which deal with the transmission of mechanical power, and also for companies established to supply the requirements of railways, and also for those of light lines used in agriculture. They are also connected with eight insurance companies, both for life insurance and insurance of goods which are transmitted by sea and river and by land. It is easy to see how these different industries may assist each other by undertaking different parts of a considerable undertaking. To control these

various industries the Deutsche Bank's representative is the chairman or vice-chairman of the governing bodies of 50 important companies at least. Among these companies there are 13 banks, including the Reichsbank, on the advisory board of which its representative has a place. The Deutsche Bank is also represented by six directors on the board of the Deutsche-Überseesische Bank, which had been founded by the Deutsche Bank in 1893.*

The Grossbanken, accordingly, have played an important part in the industrial development of Germany since 1870, and chiefly since 1888, which marks the beginning of a period of vigorous development.

18. *The systematic collection of deposits.*—It is important to examine the methods by which the banks collect deposits. Although, as already noted, the banks are not uniform in their business policy, yet it is possible to summarize their methods of collecting deposits. In the first place there are, in addition to the main offices, 'Filialen', or branches; secondly, Kommanditen and agencies. It is difficult to find an exact English equivalent of Kommanditen but 'silent partnership' is, perhaps, the nearest equivalent. 'Commandites' were originally private houses in which the Grossbanken had a share of the profits owing to their having supplied capital, e.g., Dreyfus & Co. in Frankfurt-on-the-Main, and S. Kaufmann & Co. in Berlin, in the case of the Commerz-und-Disconto Bank. Thirdly, there are the Depositen-kassen, or deposit offices, which are in conspicuous parts of German towns. As the name suggests, these Depositen-kassen are mainly for the collection of deposits from the public, but all Depositen-kassen, while established principally with this end in view, are not worked within the same limits. The increase in the number of these branches and the progress of concentration is shown in the following table:—

Data for the Eight Great Banks.

End of year.	Number of establishments (main offices and branches) in Germany.	Deposit and exchange offices in Germany.	'Commandite' connexions with banking houses in Germany.	Permanent participations in German Joint Stock Banks, etc.	Sum total of Institutions.
1896	18	33	13	2	59
1896	20	27	14	2	63
1900	25	53	12	9	99
1902	33	87	11	16	147
1905	46	149	12	34	241
1908	69	264	12	97	442

It will be seen that these Depositen-kassen have increased, especially since 1897, when the Bourse Law which accelerated the movement of concentration became effective. These were primarily for the convenience of customers. They were intended to facilitate connexions between the banks and holders of cash, especially the smaller tradespeople. At the same time they were to take the place, to some extent, of the rapidly disappearing private banking houses and to facilitate the placing of securities issued by the parent bank. Although these "deposit branches" were originally established with the object of attracting deposits and dealing in securities on a commission basis they found it necessary to extend their operations and at the present time they are more or less complete banking institutions. They have continued to bring a growing circle of customers who purchase the bank securities and thus strengthen the banks' issuing power. By means of these, too, the banks are able to extend their cheque, giro, and clearing business, and thus to diminish the need of cash and at the same time to develop credit. A German writer has summed up other advantages as follows:—

"Through the activity of the bank the deposit is made to perform several economic tasks at one and the same time. The same sum which the customer has entrusted to the bank may be used by him for business purposes, the manufacturer being able to make contracts, the merchant to order goods, etc., on the strength of his bank balance; the banker uses the money for his own purposes, granting a loan to a customer. The customer, again—say, a manufacturer—uses the loan to pay his workmen, who in turn use it to make purchases; and all these transactions take place during the intervening few weeks while the deposit remains at the bank. Thus, the same sum has performed several economic functions at the same time and in so doing has rendered to the public several times the amount of service that it could have done without the intervention of the bank. Herein lies the main advantage of the banks for the money circulation, an advantage which is not sufficiently appreciated."

The increase in the deposits of the Commercial Banks is shown in column 8† of table in Appendix IX.

* Bankers' Magazine, June 1916.

† In the balance-sheets of the banks there is no uniformity in the distinction between "credit accounts" and "deposits". Some banks, for example, mention under "deposits" credit accounts held by their deposit and exchange offices. Others place commercial deposits, i.e., those withdrawable without notice, under "credit accounts".

10. *The Lending of Credit by the Banks.*—The chief ways in which the Commercial Banks lend their credit are:—

- (1) by discounting mercantile bills;
- (2) by acceptances;
- (3) by unsecured credit or Blankokredit;
- (4) by secured overdrafts on current account;
- (5) by advances on goods and goods in transit;
- (6) by advances on book debits;
- (7) by advances on securities.

In this seventh class of business may be included the *report*, or *contango*, business.

Of these, secured overdrafts on current account are by far the most important, followed by the discounting of bills, acceptances, and advances on securities. Blankokredit is the next important as a rule. Advances on goods and book debits are of comparatively small importance. The balance sheets of any of the Grossbanken will show this very clearly.

(1) *Firstly, as regards advances on discounts.*—The prime discount bills throughout the German discount market are the acceptances of the six foremost Berlin banks, namely, the Deutsche Bank, the Disconto-Gesellschaft, the Darmstädter Bank, the Dresdner Bank, the Berliner Handels-Gesellschaft, and the A. Schmaffhausen'scher Bankverein, as well as two private banks in Berlin, Mendelssohn & Co. and S. Bleichröder. According to the regulations of the Berlin Bourse these prime bills must be payable in Berlin or at a place where there is a branch of the Reichsbank; they must be at least 5,000 marks in amount, and run not less than two, nor more than three, months. In fixing and quoting actual market rates of private discount no difference is made between fifty-six and ninety-day-bills. The acceptances of the largest mercantile houses and industrial concerns are not regarded as prime discounts, but as a rule by those of their banks. The margin between the private discount of prime bills, and the quotation for commercial bills, amount approximately to $\frac{1}{2}$ to $\frac{1}{4}$ per cent, just as in London, where the difference between bank and trade bills is about $\frac{1}{2}$ per cent. In dealing with a firm abroad the purchaser of goods advises the seller as a rule to draw the bill of exchange for these goods (maturing after several months) not on himself, the purchaser, but on his bank. The seller is then able to discount more advantageously the acceptance of one of the well-known banks than that of a mercantile firm.

(2) *Acceptances, i.e., a bill of exchange accepted by the banks and placed at the disposal of their customers.*—Excessive acceptance credit is looked on with disfavour by some German financial authorities who have stigmatized these as kite-flying, or accommodation, paper*. There is a considerable danger, especially when short-time acceptance credit is resorted to for purposes other than that of supplying temporary deficiencies in operating funds. Such credit is often not repaid at maturity, i.e., the acceptance is replaced by a new bill issued by the borrower of industrial credit. The bill is accepted by the bank, and taken by the borrower to another bank, who discounts it: with the proceeds the old acceptance is taken up. To the banks this form of granting credit presents the advantage that it requires no effective funds. The greater portion of bank acceptances originates through domestic and foreign trade transactions. The difference between current account credit and acceptance credit is that the borrower receives cash in the former case and an accepted bill in the latter.

(3) *Blankokredit.*—Blankokredit is an unsecured overdraft on current account. The banks grant unsecured credit only when after a study of the applicant's financial standing it is established beyond doubt, as far as practicable, that the loan will be repaid in time. Information is collected by A. Schimmelpfeng, Berlin, and similar firms. Schimmelpfeng has private agents throughout Germany. The banks will give information to Schimmelpfeng in the interests of trade. Each piece of information is paid for at a lower rate by subscribers than by non-subscribers. The banks in giving such credit may inspect the firms' books if they wish. The use of this form of credit is not so extensive in Northern Germany as it is in Central and Southern Germany. It is seldom granted to other than business men, at least not in large amounts.

(4) *Overdrafts on current account* form a very large part of the credit operations of the banks. They are one of the main sources of commissions earned by the banks. These current account advances are those by which the borrower can obtain cash or credit up to an amount which has been agreed upon between the bank and its client. The credit may be secured by a general hypothecation of the assets of the firm, and may include raw materials, plant, manufactured goods, the land belonging to the factory or firm. It is also possible to secure an advance on current account by sureties. The bank does not hold the goods as in the case of advances on goods. "The security", says Riesser, "for credit on current account, or for credit given on current account through acceptance, collateral loans, or bill discounts consists as a rule of shares, bonds, merchandise, bills, or the outstanding accounts of the borrower, that is, of claims arising from the sale of merchandise and manufactures, or of raw materials, half-finished or finished products belonging to the firm receiving credit, or of life insurance policies, patents, mortgages, dwelling-houses, factories, land, or sureties, including secondary and counter-sureties (Nach und Rückbürgschaften) and the like".

* When there is no security for these acceptances, and when they are continually renewed, they are "kites".

† A guarantee mortgage i.e., a mortgage which is not intended to be permanent, as in the case of Mortgage Banks.

(5) *Advances on goods and goods in transit.*—The creditor may wish to hold the goods until better prices are obtainable, or he may manufacture goods which are consumed in certain seasons of the year. The banks take as security the goods. The amount of business done in this way is insignificant. The banks, to be fully secured, must have the goods in their actual possession. This, however, is not in the interest of the merchant as it might damage his reputation or credit.

(6) *Advances on book debts**.—This system has been introduced into Germany from Austria, France, and the United States of America, and has not been, and never will be, popular. Such an advance is made only after investigation by the bank's officer who examines the books and enquires about the solvency of the debtor. The book debt must be due within three months. The bank advances money on the debtor's giving a bill on himself (promissory note). The advance is only from 50 to 75 per cent of the debt, and the amount of the debt must not be less than 200 marks. The bank reserves to itself the right of informing the purchaser of the goods that the prior claim has been ceded to the bank.

(7) *Lombards, or advances on securities, including Contango, or Report, business.*—Advances on securities, or Lombards, form a considerable portion of the banks' credit business. The securities consist chiefly of listed securities. The stipulated margin on the paper differs according to its quality; it is larger in the case of stock than of paper bearing a fixed rate of interest. In case of a fall in prices the margin is maintained by an increase in the deposit or by a corresponding reduction of the credit balance. The average margins are:—

In the case of German securities bearing a fixed rate of interest, 10 per cent.

Foreign securities, 20 per cent.

Domestic Stock Shares, 25 to 33½ per cent.

Foreign Stock Shares, 25 to 50 per cent.

A large portion of the advances on securities are merely speculative loans for dealing in securities. Loans of this nature are a source of continual worry to the banks. In a rising market the banks' clients are inclined to deal to a great extent in such dealings as to cause inconvenience to the banks. In a falling market the banks have to demand an additional margin. If the clients cannot pay this additional margin the banks sell the clients' stock. The ultimate recourse of selling the security is avoided as far as possible as it involves a loss to the client. The banks, too, are lenient in order not to impair the success of their own future issues. Moreover, the banks regard it as a rule not to refuse assistance to their borrowers, especially in times of stringency. In addition to this Lombard business is the report, or contango, business (Stock Exchange loans). The loan is for one month for which time the bank becomes the real owner of the securities.

20. The Commercial, or Credit, Banks have sometimes incurred serious losses, especially during the bubble era (*Gründerjahre*) in the seventies. The Berliner Handels-Gesellschaft, for example, financed in 1876 the construction of a railway called the Muldetalbahn which two years later had to be sold to the Government of Saxony at a loss of 6½ million marks. The bank had a capital of 45 million marks which was reduced to 30 millions and afterwards to 20 millions. In 1908 the capital of the bank stood at 110 millions. The Leipziger Bank failed in 1909 because, with a capital of 48,000,000 marks, it had allowed loans to the extent of 98,000,000 marks to the Trebertrocknungsgesellschaft (company for the utilization of desiccated leas). The Dresdner Kreditanstalt für Handel und Industrie went under because it had extended too much credit to the Kummargesellschaft. Industrial credit, it must be remembered, is less developed than commercial credit. In looking back over the history one notes that, through ignorance of correct principles, *e.g.*, industrials, took too much long-term credit from the banks, or took credit at the wrong time to put into improvements or extensions sometimes without stating these to be the object of the loans, and sometimes some banks thrust credit upon industrial undertakings. The banks sometimes disregarded the principle of distributing the risk, giving too much credit to one industry, or one branch of industry, or even to a single establishment.

21. The banks as a general rule, it may be noted, invest their funds in such a way as to be ready to pay one-third of all outsiders' funds (*Fremde Gelder*), irrespective of whether payable on demand or after longer or shorter terms. These funds include deposits (*depositen*), the credit balances on current account, and other balances not on credit account, "resulting from loan operations, and other issue business, or from the coupon service, or from interest bearing funds held until settlement day to the credit of domestic and foreign states, provinces, districts, communes, commercial and industrial concerns, land banks, note banks, and other banks, insurance companies, administrations, corporations, institutions, foundations, and private capitalists"†. The resources kept to meet such a contingency are cash, including bank notes, sight drafts, cheques, contangos (reports), bills realizable in international markets, also the "nostre" credits, *i.e.*, credits held with first-class domestic and foreign banks and banking firms.

22. *The Banks and foreign trade.*—Since the founding of the Deutsche Bank in 1873 the Commercial Banks have assisted largely the development of German sea-borne trade. Previous to 1870 the financial regulation of German foreign trade was almost exclusively in

* Advances on book debts are not unknown in Indian banking. Jute mills and other public companies hypothecate their outstandings in such cases to the banks.

† Riesen, chapter III, section I.

the hands of London banks. The charter of the Deutsche Bank contains the following sentence:—"It is the purpose of the corporation to do a general banking business, particularly to further and facilitate commercial relations between Germany, the other European countries, and overseas markets". The founders of the bank recognized that there was a gap to be filled in the organization of the German banking and credit system in order to render German foreign trade independent of the English intermediary. The establishment of a gold standard in Germany in 1873 facilitated this. Before 1873 Germany had a silver standard and bills of exchange made out in various kinds of currency were disliked in the international market. London is the only place outside Germany where the Commercial Banks have established agencies*. The Deutsche Bank in the early seventies established agencies in Shanghai and Yokohama, but these were liquidated owing to the losses in exchange consequent on the depreciation of silver. To further foreign trade, however, the bank established subsidiary banks, with the main offices in Berlin and Hamburg; these banks in their turn established agencies in overseas countries, the capital of which almost, if not entirely, belonging to the parent banks. The banks, as will be seen in Appendix X, have taken a considerable interest also in foreign trading companies. The Deutsche Bank's interests in this respect may be taken as typical:—

Foreign Companies.

	Seats on the Board of Directors.	
Anatolische Eisenbahn-Gesellschaft, Constantinople	Two	(Chairman).
Bagdad Eisenbahn-Gesellschaft	Two	(Chairman).
Bank für elektrische Unternehmungen, Zürich	Two	(Vice-Chairman).
Bank für orientalischen Eisenbahnen, Zürich	One	(Vice-Chairman).
Betriebsgesellschaft der orientalischen Eisenbahnen, Vienna	One	(Vice-Chairman).
Compañia Barcelonesa de Electricidad	One	
Eisenbahn-Gesellschaft, Messina-Adana	Two	(Chairman).
A. Goerz & Co., Ltd., London	One	
Gesellschaft für elektrische Beleuchtung, St. Petersburg	One	(Chairman).
National Bank of South Africa, London	One	
Société du Chemin de Fer Ottoman, Salonique-Monastir	Two	(Vice-Chairman).
Société du Port de Haider-Pascha, Constantinople	Three	(Vice-Chairman).
Steaua Romana, A.G. für Petroleumindustrie, Bucharest	Two	(Chairman).

23. While the Indian banker has to deal with the request of his individual customer the German banker has, it will be seen, to take up a different position. He has to be ready to become a director of the company which he assists and to be familiar with the general conditions of that industry in order to control the necessary expansion. As Riesser puts it:—

"Above all, they (the banks) must promote all the economic interests of the nation, i.e., the interests of all producing classes without distinction, in so far as the services and the credit required by them come within the sphere of banking activity, and do not conflict with the necessary premises of sound banking policy." "In the next place they have to keep the amount of credit to be granted within reasonable bounds, and to offer, as far as is within their power, the utmost opposition to an unsound demand for credit. The banks must, therefore, endeavour to obtain at all times a comprehensive and accurate insight into the general conditions of the branches of industry and trade chiefly dependent on them for support in order to be able to discriminate between necessary requirements and false bankings after expansion and aggrandizement. They should also be able to intervene, or at least restrain and check, in cases where the form and extent of the credit received cause the fear of unsound development."

Some time ago Mr. G. H. Pownall in his inaugural address as President of the Institute of Bankers† dwelt on the constitutional differences, already noted, that exist between the English banks (composed of bankers in the strictest sense) and the German banks (composed of traders and company promoters). He said that development companies skilfully handled might introduce much new and good business in England and if, like the German banks, they once got a deserved reputation for the soundness of the ventures which they introduced they might, with fair readiness, place the shares of the companies they initiated on the English market. English banking, he pointed out, had gone on the lines of "every man for himself", while the German Government had thrown its shield round every German trader.

In short, it is manifestly clear that the Commercial Banks of Germany have promoted commerce and industry in ways which, in Indian, as in English, banking, would be looked on as outside the scope of banking proper. In this connexion the balance-sheet of the Bank für Handel und Industrie (Appendix XI) brings out strikingly the main differences that have been referred to above.

* The Deutsche Bank, the Disconto-Gesellschaft, and the Dresdener Bank had branches. The business transacted was large. Over and above the assets of the three banks there were securities lodged to the value of £10,000,000. The Deutsche Bank had documentary credits to the value of £35,000,000 and its uncollected credits to £7,500,000. Cf. "The Times", October 27th 1910.
† *Ibid.* "The Times", November 9th, 1910.

III.—Industrial Banks in General.

24. The Industrial Bank of Japan is an interesting example of a bank founded primarily to develop industry. It was founded on the French model—on the *Crédit Mobilier of France*.* It assists industry just as the Hypothec Banks assist agriculture. The Hypothec Bank of Japan and the Agricultural and Industrial Bank (the latter being a Joint Stock Company established in every prefecture†) were engaged in making long-term loans on the security of immovable property and the need arose for a bank which could advance long-term loans on the security of Government bonds, shares, and movable property. It was also deemed advisable to combine in such a bank the business of a trust company. A bank was, therefore, established in 1902 as a Joint Stock Company under the law of the Industrial Bank of Japan which was promulgated in March 1900‡. The bank was established with a capital of 10,000,000 yen (21,024,275) which by an amendment of the law was raised to 17,500,000 (11,792,482) in May 1911. Of the fully paid-up capital (17,500,000 yen) 7,500,000 yen is held by foreign capitalists. The bank is authorised to issue debentures to an amount not exceeding ten times its paid-up capital provided that the amount of such debentures shall not exceed the total amount of outstanding loans, discounted bills, national or local loan bonds, companies' debentures and shares, and the gold and silver bullion in the bank's coffers. The bank, with the approval of the Minister of Finance, may issue debentures irrespective of these restrictions in the event of funds being required for enterprises for public benefit undertaken in a foreign country. The business of the bank is under the direct control of Government, which appoints the Governor and Deputy Governor in addition, it is understood, to holding a very considerable portion of the share capital. The bank had a Government subsidy to the extent of a guaranteed 5 per cent dividend for five years after its establishment.

25. The authorized and paid-up capital, together with the reserve fund, was as follows:—

Year.	Authorized capital, yen.	Paid-up capital, yen.	Reserve fund, yen.
1905	10,000,000	5,000,000	294,100
1906	17,500,000	13,750,000	409,100
1907	17,500,000	16,250,000	632,200
1908	17,500,000	16,250,000	993,000
1909	17,500,000	16,250,000	1,364,000
1910	17,500,000	16,250,000	1,669,000
1911	17,500,000	17,500,000	1,989,000
1912	17,500,000	17,500,000	2,369,000
1913	17,500,000	17,500,000	1,540,944
1914	17,500,000	17,500,000	1,776,000

Ten years ago the paid-up capital was only 50 per cent of the authorized capital of 17,500,000 yen. In 1914 the total capital was entirely paid up. The increase in the reserve fund was continuous up to 1912. At the general meeting held in 1913 it was

*The *Crédit Mobilier* (*Société Générale de Crédit Mobilier*) was established in the same year as the *Crédit Foncier* (1852). It was formed in order to promote industrial and financial enterprises. Unlike the *Crédit Foncier* it was free from Government control. It was constituted with a capital of 60,000,000 francs and with their power of issuing bonds for 600,000,000 francs. Between 1852 and 1867 it succeeded in establishing and aiding numerous railway, gas, shipping, loan and insurance companies, banking institutions, etc. The *Crédit Mobilier* was reconstructed in 1871. In 1902 it combined with the *Office des Pontiers*, and the new company's capital was fixed at 45,000,000 francs. Upon the model of the *Crédit Mobilier* numerous other banks have been established, e.g., the *Crédit Industriel et Commercial*, the *Crédit Lyonnais*, and the *Société Générale*, with original capitals of 60,000,000, 20,000,000, and 120,000,000 francs (now 100,000,000, 150,000,000 and 500,000,000 francs).

† It may be noted that, just as the Industrial Bank of Japan took the *Crédit Mobilier* as its model, the Hypothec Bank of Japan (which acts mainly as the financial medium of agriculture) was founded on the lines of the *Crédit Foncier*. The *Crédit Foncier* was granted in 1854 a Government subsidy of 10,000,000 francs and its capital was then increased to 60,000,000 francs. In 1853 and 1856 the *Crédit Foncier* was granted certain privileges and placed under strict supervision by Government. In 1860 the *Crédit Foncier* founded the *Crédit Agricole* which was absorbed in 1877 by the *Crédit Foncier* itself. In 1882 it bought up the *Banque Hypothécaire*. The operations of the *Crédit Foncier* are of two kinds:—

(1) loans for short terms (so-called), repayable in ten years at most; and
(2) loans for long terms, payable by annuities.

‡ These provincial Hypothec Banks (*Noko Ginko*) act as local banks for agriculture and industry, each with a capital of 200,000 yen or upwards. The lines of business transacted by these banks are similar to those dealt with by the Hypothec Bank, only to a smaller degree.

§ Law No. 70 (1900). The Law and the Bye-laws of the Industrial Bank of Japan will be found in Appendix XIII.

reported that the bank had incurred losses of 2,799,751 yen against profits amounting to 3,287,257 yen. The losses were caused owing to the depreciation of the market value of 4 per cent bonds and 5 per cent bonds by the bank, the outstanding loans to Itasami and Washinosu gold mines (4,100,000 yen), and other items of minor importance. To redeem this loss it was arranged that the bank should receive a loan of 13½ million yen at a low rate of interest from the Bank of Japan and the Yokohama Specie Bank*.

26. The business of the bank includes the following:—

- (1) Advances on the security of national or local loan bonds or debentures, or shares of companies;
- (2) Subscriptions for, or taking up, national or local loan bonds or debentures of companies;
- (3) General deposit; banking; also accepting the custody of articles of value (safe deposits business);
- (4) The business of a trust company. (This business has recently developed to a great extent. The passing of the Law of Trust for Secured Debentures and the Railway, Factory, and Mining Mortgage Laws in 1905 made this rapid development possible.)
- (5) The discounting of bills and general exchange business;
- (6) Advances or loans on the mortgage of railways, factories, and mines as prescribed by Law 70 of 1900;
- (7) Making call-loans or loans for a fixed term on the security of sites and buildings belonging to factories or of residential land and buildings lying in localities where the City Organisation Law is in force or in city land to be designated by Imperial Ordinance provided that the total amount of such loans shall not exceed one half the amount of paid-up capital;
- (8) The purchase of national or local loan bonds or companies' debentures and shares or gold and silver bullion with money lying idle in the course of business;
- (9) Lastly, as already noted, any banking attendant business in foreign countries, with the permission of the Minister of Finance.

The foreign loans negotiated directly by the Industrial Bank, and for which it has acted as trustee or guarantor up to 1911† are:—

Name.	Date of Issue.	Amount.	Rate of Interest per cent.	Place of Issue.
Japanese Government 5 per cent Bond Loan	October 1902 . . .	Y. 50,000,000	5	London.
Hokkaido Colliery Railway Debentures	January 1906 . . .	£ 1,000,000	..	"
Tokio City Loan Bonds	July 1906	£ 1,500,000	..	"
South Manchurian Railway Debentures	July 1907	£ 4,000,000	..	"
Ditto ditto	June 1908	£ 2,000,000	..	"
Fuji Paper Manufacturing Company Loan	August 1908	Y. 1,500,000	6½	Tokio.
Industrial Bank of Japan Shares . . .	March 1906	Y. 7,500,000	..	London.
South Manchurian Railway Debentures	December 1908 . . .	£ 2,000,000	5	"
Osaka City Loan Bonds	April 1909	Y. 30,220,000	..	"
Yokohama City Loan Bonds	July 1909	£ 716,500	..	"
South Manchurian Railway Debentures	January 1911	£ 6,000,000	4½	"
Fuji Paper Manufacturing Company Loan.	March 1911	£ 155,000	6½	Tokio.

It will be seen that the scope of the business of the Industrial Bank of Japan is limited in the main to making loans on the security of national bonds, local loan bonds, or shares of

* The loans to the mines may perhaps after a period of years be recovered.

† This precludes the bank from engaging on business which belongs to the Hypothec Bank.

‡ Vide p. 251 of the "Full Recognition of Japan" by R. F. Porter, Chapter XIII.

companies, receiving deposits of money, and to undertaking trust business in relation to local loan bonds or the debentures and shares of companies.*

27. The Industrial Bank of Japan, although the youngest of the six special banks †, has made very rapid progress as will be seen from the table in Appendix XII. These figures may be summarized thus :

	Ten years ago (1906) 1,000 yen.	Five years ago (1910) 1,000 yen.	1914 1,000 yen.
Paid-up capital	5,000	16,260	17,500
Reserve Fund	204	1,669	1,770
Deposits	1,456	6,876	16,675
Advances—			
(a) Loans	2,475	26,233	30,132
(b) Bills discounted	2,012	3,567	30,716
(c) Total	4,487	29,800	60,848
Profit and Loss Account—			
(a) Earnings	1,391	4,993	5,540
(b) Expenses	1,134	2,826	4,200
(c) Net profit	257	1,657	1,342
(d) Rate of Dividend per cent.	7	8	6.6

28. *The British Trade Bank*.—A departmental Committee was appointed by the Board of Trade to enquire into "the best means of meeting the needs of British firms after the war as regards financial facilities for trade, particularly with reference to the financing of large overseas contracts, and to prepare a detailed scheme for that purpose". The question was an old one which the tonic of war had brought to a head. It was the question of the financial facilities granted to British traders by the existing banks, especially as compared with those afforded by the Commercial Banks of Germany. The committee contained representatives of banking, commerce, and industry, and was presided over by Lord Farrington. The committee insisted that existing institutions left little undone in the way of providing sound financial facilities in the past, and could not be said to have starved home industries. "British bankers," they said, "are not shy in making advances on the strength of their customers' known ability and integrity, and the charges for accommodation are, we believe, often lower than the corresponding charges in foreign countries." "Similarly," they added, "the colonial banks and British foreign banks and banking houses render immense assistance to British trade abroad." The committee, however, believed that there was ample room for an institution "which will not interfere unduly with the ordinary business done by the British Joint Stock Banks, by colonial banks and by British foreign banks and banking houses, but would be able to assist British interests in a manner that is not possible under existing conditions". A concrete scheme was put forward, for a new type of bank, fortified with a Government charter, working with a large capital, but not taking deposits at call or short notice as the Grassbanken and the English Joint Stock Banks did. The bank would not open current accounts except for actual traders using its facilities. It should have a foreign exchange department where special facilities might be afforded for dealing with bills in foreign currency, and it should open a credit department for the issue of credits to parties at home and abroad. The *raison d'être* of the bank is, among other things, to give longer credits than ordinary banks and to supplement the business done on a less "adventurous" basis than those banks which attract deposits. The committee laid much stress on the part which the new institution would play in obtaining with its Bureau d'études complete and up-to-date information, especially as to the status of firms, in the study of foreign languages, and in the staffing of the bank by experts who would, in the three proposed and distinct departments, financial, industrial, and commercial, be in a position to deal thoroughly with all matters for consideration. As *The Times* pointed out with regard to longer credits than English banks ordinarily give "That is, of course, just what our manufacturers have been asking for, and, in essentials, a new institution on these lines has, as we have always said, its own special sphere only too obviously cut out for it. There is no reason why it should not be added at once to our financial system on a commercial basis, and made to pay, directly and indirectly, if competent

* Appendix XIII, page 37.

† The Special Banks are the Bank of Japan (1882), the Yokohama Specie Bank (1880), the Hypothec of Japan (1896), the Industrial Bank of Japan (1902), the Bank of Taiwan (Formosa) (1907), and the Colonial Bank of Hokkaido (1900). The total number of banks of all descriptions at the end of June 1914 was 2,159. The Government of Japan, when necessary, can assist industry and commerce through these banks, in order, for example, to relieve the tension in the money market, as in 1912-13 when rice had fallen in price. This chronic depression was made worse by the outbreak of war. Government requested the Bank of Japan and the Specie Bank to give every assistance to importers and exporters as regards exchange transactions and made the Hypothec Bank and the Provincial Hypothec Banks accommodate loans to small manufacturers in the provinces, to the extent of 5 million yen, and the Industrial Bank to advance within the limit of 2 million yen to those in cities.

management is forthcoming. Where the scheme, as much too briefly explained in the report, is bound to meet with criticism is in its connexion with the Government. On the one hand, it is proposed that the new bank shall 'not unduly interfere' with the business done by existing commercial firms or institutions and should not actually be "under Government control". On the other hand, besides a Royal Charter, it is proposed to give it in various respects a privileged position, and apparently a preference, in respect of Government financial assistance towards creating new business in the foreign, and even in the home, field in a way which looks like necessarily bringing into competition with ordinary private enterprise possibly to the serious disadvantage of existing financial houses. Alternatively it is proposed, by means of the credit attaching to Government support, to enable it to take just the bad risks that no other capitalist will finance—a rather doubtful benefit ultimately to the public. On all this part of the scheme, so far it connects the Government with the bank, we should have preferred discussion than the report vouchsafes". This has been quoted *in extenso* to show the difficulties in the way of the creation of the industrial banks, difficulties which are frequently apt to be slurred over. The very conservative, although admittedly sound, system of English banking has, many think, justified itself in the past, and before an industrial bank should be founded it should be examined (1) as a promising business proposition in regard to those who may be called upon to invest in its shares; and (2) without any idea of making use of public sentiment for the immediate creation of such an undertaking. A critic pointed out that "More than one banker of experience with whom we have discussed Lord Farrington's report has summed up the position by saying that, given the immediate establishment of the proposed Trade Bank on these lines, and given an immediate adequate response as regards the subscribing of the capital mentioned, he would be very sorry to be in the position of having immediately to set to work and earn dividends for the shareholders". The advantages of greater banking facilities are all too obvious. In India as in the United Kingdom there are three currents of opinion among bankers and traders. These are well summed up by Sir Francis Pigot in a letter to the *Morning Post* of September 26th, 1916:—

"First, many believe that no new institution is necessary; that industry already receives all the financial assistance it requires, and that the good old way of doing business cannot be improved.

"Secondly, the opinion is strongly held by others that there is a great need for an institution which would finance contracts with foreign Governments and corporations which provide for payment by 'non-marketable' securities which, however sound they may be financially, are not acceptable by the Joint Stock Banks as security for advances.

"Thirdly, among traders there is an equally strong opinion that British industries stand greatly, and immediately, in need of what I may call 'development advances' and that this is not necessarily confined to the creation of new industries or to the fostering of overseas commerce. In this connexion it is specially held by a few, who speak with experience that those who are in most urgent need of this form of advance are the medium and small manufacturers who, although they have perfectly sound business, yet for various reasons cannot avail themselves of the existing form of banking facilities nor are sufficiently large to warrant conversion into limited companies."

The committee's proposals are summed up in paragraph 24 of their report, which is quoted in Appendix XIV†.

29. According to the "Gaceta De Madrid" of 2nd October 1916 a Trade Bank is proposed for Spain. The decree authorizes the Minister of Finance to present to the Cortes a bill known as the Banco Español De Comercio Exterior, with its headquarters in Madrid. The capital of the bank is to be not less than 40,000,000 pesetas, or £1,600,000 at par, and will be fixed by Government. It is to be subscribed either by competition between Spanish banking concerns or by public subscription. The shares in the hands of foreigners must not exceed one-fifth of the capital issue. The State will give an annual subsidy to the bank of a maximum sum of 5 per cent of its share capital. The business undertaken by the bank is as follows:—"The granting of credit to facilitate the export of goods of all kinds, and the import of raw materials and accessories for agriculture and national industries; the discount, purchase, and sale of international drafts in any currency; the opening of credits in foreign money operations abroad; the "nationalization" of acceptances and drafts resulting from the importation of foreign merchandise; the establishment of general merchandise warehouses and of free zones; the formation of information bureaux and commercial museums; the granting of loans for guaranteeing vessels; and maritime insurance.

30. Summary.—The financing of Indian industry after the War.—It will be convenient to summarize what has, in a somewhat platitudinous way, been dealt with in previous paragraphs. The three main points to which attention is directed are:—

- (a) the introduction of industrial banks into the Indian banking system;
- (b) the establishment of a network of branch banks; and
- (c) the development of the present system of banking to meet the changed circumstances brought about by the war.

a) After the war Indian industry will require financial assistance in a fairly large way because (1) new schemes for the development of industries will demand, and receive, more

† Extracts from the Royal Charter of Incorporation of British Trade Corporation will be found in Appendix XV.

encouragement than hitherto; (2) old industries will require to be renovated or overhauled; and (3) in order to enjoy the economies of large-scale production such industries will have to be conducted on a much larger scale. This means that the *organized* aid of banking, especially in the higher direction of Indian industry, will be advantageous, if not essential. The problem before us is to discover whether the undoubted merits of the German system of co-ordination of industry with finance can be secured, due allowance being made on account of dissimilarity in local conditions, whether, in short, the example of the German Credit Banks (*Grossbanken*), which undertake the responsibility for industrial issues, could not be followed in the development of industrial financing in this country. Indian banks, with, perhaps, the single exception of the Tata Industrial Bank, do not accept any responsibility to the public as regards issues of any sort, even when their name appears on the prospectus. The German Credit or Commercial Banks, on the other hand, undertake the responsibility for industrial issues, and this is the keystone of their close relations with German industry. In the so-called "heavy" industries (mining, iron and steel) and in the light industries (the electrical industry, petroleum enterprises, breweries, etc.), these banks have been not only financial advisers, but, in some cases, even controllers of industrial concerns. They carry through the reorganization and the promotion of industrial concerns; they examine and nurse new schemes until they are ripe for public investment. In Berlin all the bankers are members of the Stock Exchange and it is part of a German bank's business to act the part of a stock-broker. These banks encourage new undertakings, and allow acceptances and acceptance credit to be freely used. The *Grossbanken* are, as it were, the General Staff of German industry, the brains of the Industrial Army. Firms like the *Allgemeine Electricitäts Gesellschaft*, as compared with small firms, are like a highly-trained army attacking ill-trained troops in the field. "One difference," said a German Bank Director before the American Monetary Commission, "between the banks of England (and he might have equally truly said of India) and Germany is that in England the primary purpose of the banks seems to be to secure large earnings for their shareholders. In Germany our banks are largely responsible for the development of the Empire, having fostered and built up its industries". The truth of this remark is shown in Appendix X where the companies on the directorates of which the *Grossbanken* are represented are surprisingly numerous. It is true that Indian banks are, so far as strictly banking and temporary assistance to industry are concerned, fairly liberal, but, with the exception of the Tata Industrial Bank, floated only some months ago, these are deposit banks the watchword of which must be safety and liquidity. It cannot be expected that industrial banks, with their funds invested for long periods, can earn high dividends, like the Presidency Banks or the Exchange Banks. The Presidency Banks and the Exchange Banks earn dividends from 12 to 18 per cent or even more, while the German Commercial Banks earn from 7 to 8 per cent. There are two other advantages of industrial banks on the *Grossbanken* model, the first of these being that the company promoter is not left, as in India, with new schemes. The company promoter is concerned mainly with the success of the issue, and is often regardless of the future welfare of the business. The expression "company promoter" has sometimes a sinister significance to the investing public,* and he does not always bear the imprimatur of an institution which would guarantee that the business has been thoroughly investigated and will be looked after when the issue has been made. The other advantage is that if financial assistance to industry on the part of Government is deemed to be necessary, industrial banks are convenient media through which such assistance can be most safely given. For further references to industrial banks, other than those quoted above, the Charter of the British Trade Corporation, the article on "Industry and Finance" in *The Round Table* (December 1916), and that on "Industrial Banks—Their place in Industry and their Sphere of Usefulness" in the *Times of India* (1st and 3rd December 1917) should be read.

(b) *Next as to the establishment of a network of branch banks.*—There are 71 head offices with 267 branches and agencies in India including Burma.—In the United Kingdom there are 65 banks with no less than a total number of offices of 9,135.† The location of these branches is discussed in the introduction memorandum on "Indian Banks in War Time" published in the third issue of the Blue-Book on Banks in India (1917)‡. A Bill has recently been brought in by the Ministry of Finance for the renewal of the charter of the Bank of France and it provides for, among other things, the opening, in the next twelve years, of 12 new branches, 25 subsidiary branches, and also special offices in 50 provincial towns, including Cantons having more than 6,000 inhabitants. The bank also undertakes to act as a clearing-house for local bills and local paper issues, with the result that credit facilities will be made available in the most remote districts of France. In regard to this Bill the *Times of India* wrote:—
"The Presidency Banks have not that monopoly of the Note issue, which is exceedingly

* The inaugural address of the Institute of Bankers, London, November 8th, 1916 (Mr. G. H. Fowdell).
"Company promoters do not exist in Germany, and in England they have, as a body, done great harm by their action as intermediaries in converting private concerns into public companies. The company promoter exists to induce the public to take shares in a private concern which he is turning into a limited liability company, and, as a rule, his personal interest is to inflate the issued capital of the new concern to his own personal profit, without regard to its future welfare. This is a serious public evil and demands a remedy. Shall we prohibit the company promoter, and in any substituted system provide that flotations of new companies shall be made only by responsible bodies who have an interest in the continued prosperity of the companies they put on the market?"

† *Statist—Banking Section—June 2, 1917, page 972.*

‡ No. 461—1917.

lucrative to the Bank of France. On the other hand, they have a monopoly of the custody of Government funds, which directly and indirectly, is very valuable. The goal we have to set ourselves is to bring credit facilities in the most remote districts of India. As a first step in that direction we have to lay down a policy which will establish banking facilities in every district headquarters. That ought to be one of the duties thrown on the Presidency Banks in return for the valuable privileges which they enjoy—privileges whose value is attested by the appearance of their balance-sheets. If it cannot be done through the Presidency Banks then the establishment of a State Bank should be regarded as of the greatest urgency.”*

(c) Lastly, with regard to the development of the present system of banking, little, if anything, need be said in this note beyond a reference to the memorandum in the third issue of the Blue Book on Banking†. We have not what von Hugel calls that “thirst for system, wholeness, and closely-knit organisation” of Germany‡, the United States, or even of France. In France the Bank of France assists the “small” borrower, although it cannot by the terms of its charter discount bills for a longer period than 90 days. The bank is not permitted to give differential rates of discount according to the standing of the client or the amount of his bill. This is to the advantage of the small man from whom the bank accepts drafts of from Rs upwards. It takes bills and other instruments of credit sent by clients through the post from districts where no branch of the bank exists. Prior to the war the usual rate of discount on agricultural bills was only 5 per cent. In the United States the Federal Reserve Act§ has given to the United States a complete system of banking, a system which has been since the outbreak of war of the highest possible value. The kernel of the Act is section 13 which relates to the discounting of notes, drafts, and bills of exchange arising out of actual commercial transactions. The Act does not enable banks to borrow on bonds or securities other than those of Government, but it does enable the banks to borrow on business paper. Paper discounted by the bank, in order to be eligible for rediscount with the Federal Reserve Bank, must show that there is a producer and a consumer and must conform to certain well-recognized requirements. The question of rediscounting privileges in a banking system like that of India opens up many questions which cannot be taken up in this note.

31. In concluding this note I must express my thanks to Sir N. H. Y. Warren, Secretary and Treasurer of the Bank of Bengal, Mr. H. Harris, Agent of the Chartered Bank of India, Australia, and China, Mr. W. J. K. Hegarty, Manager of the National Bank of India, Mr. I. Nishimaki, Agent of the Yokohama Specie Bank, and Mr. J. A. Chapman, Librarian of the Imperial Library all of whom I have consulted with points connected with this note. Messrs. Krummacker and Christ, formerly of the Deutsche-Asiatische Bank (now in liquidation) have also rendered much expert assistance in connexion with the description of the working of the Commercial Banks of Germany.

§ Sixty-third Congress, chapter 6. “An Act to provide for the establishment of Federal Reserve Banks to furnish an elastic currency, to afford means of rediscounting commercial paper, to establish a more effective supervision of banking in the United States, and for other purposes.”

Appendix I.

NAMES OF BANKS IN INDIA, WITH THEIR HEAD OFFICES AND BRANCHES DURING 1916.

(1).—Presidency Banks.

No.	Bank.	Head Office.	Branches and Agencies.
1	Bank of Bengal	Calcutta	Agre, Akyah, Allahabad, Benares, Calcutta—Barrahaner, Clive Street, Park Street—Cawnpore, Chandpore (Pay Office), Chittagong, Dacca, Delhi, Hyderabad (Deccan), Jalpaiguri, Lahore, Lucknow, Moulmain, Nagpur, Narayanganj, Patna, Rangoon, Serajganj (Pay Office), Secunderabad, Simla, Bombay Agency.
2	Bank of Bombay	Bombay	Ahmedabad, Akola, Amroli, Broach, Hyderabad (Sind), Indore, Jalgaon, Karachi, Poona, Rajkot, Sholepur, Sukkur, Surat, Mandri (Bombay).
3	Bank of Madras	Madras	Aleppy, Bangalore, Binalipatam, Calicut, Cocanada, Cochin, Coimbatore, Guntur, Madras, Mangalore, Masulipatam, Nagapattam, Ottacamund, Salem, Tellicherry, Trichinopoly, Trivandrum, Tuticorin, Beawada, Erode, Narsapur, Rajahmundry, Visianagaram.

(2).—Exchange Banks.

1	Chartered Bank of India, Australia, and China.	London	Amritsar, Bombay, Calcutta, Delhi, Karachi, Madras, Rangoon, Tavoy.
2	Comptoir National D'Escompte de Paris.	Paris	Bombay.
3	Cox & Co.	London	Bombay, Calcutta, Karachi, Rawalpindi, Murree, Srinagar (Kashmir).
4	Eastern Bank	"	Bombay, Calcutta.
5	Hongkong and Shanghai Banking Corporation.	Hongkong	Bombay, Calcutta, Rangoon.
6	International Banking Corporation.	New York	Bombay, Calcutta.
7	Mercantile Bank of India	London	Bombay, Calcutta, Delhi, Hwerah, Karachi, Madras, Rangoon.
8	National Bank of India	"	Amritsar, Bombay, Calcutta, Cawnpore, Chittagong, Cochin, Delhi, Karachi, Lahore, Mandalay, Madras, Rangoon, Tuticorin.
9	Russo-Asiatic Bank	Petrograd	Bombay.
10	Yokohama Specie Bank	Yokohama	Bombay, Calcutta.

(3).—Indian Joint Stock Banks.

1	Indian Bank, Ltd. . . .	Madras	Cocanada, Madras, Madras (3 branches).
2	Pennar Bank, Ltd. . . .	Benares	Bhagalpur, Munaffarpur.
3	Standard Bank, Ltd. . . .	Bombay
4	Bank of Upper India, Ltd. . . .	Meerut	Allahabad, Bareilly, Delhi, Hapur, Kasauli, Lucknow, Mussorie, Nainital, Simla.
5	Bank of Mysore, Ltd. . . .	Bangalore
6	Muffassil Bank, Ltd. . . .	Gorakhpur
7	Poona Bank, Ltd. . . .	Poona City	Ahmednagar, Miraj, Sangli, Solapur, Hubli, Kolhapur.
8	Kumbakonam Bank, Ltd. . . .	Kumbakonam
9	Canara Bank, Ltd. . . .	Mangalore

(3) Indian Joint Stock Banks—contd.

No.	Banks.	Head Office.	Branches and Agencies.
10	Bharat National Bank, Ltd.	Delhi	Bhopal, Jammu, Patiala, Sialkot, Srinagar, Wazirabad.
11	Bengal National Bank, Ltd.	Calcutta	Narayanganj.
12	Jessore United Bank, Ltd.	Jessore
13	National Bank of Upper India, Ltd.	Lucknow
14	Co-Operative Hindustan Bank, Ltd.	Calcutta	Dacca, Narayanganj.
15	Gorakhpur Bank, Ltd.	Gorakhpur	Bankipur, Gonda, Bahraich.
16	Allahabad Bank, Ltd.	Allahabad	Allahabad (branch), Amritsar, Bankipur, Bareilly, Benares, Bombay, Calcutta, Cawnpore, Delhi, Hathras, Jhansi, Jubbulpore, Lucknow (3 branches), Meerut, Lyallpur, Nagpur, Nainital, Rae Bareilly, Sitapur.
17	Bhowanipur Banking Corporation, Ltd.	Bhowanipur, Calcutta
18	Central Bank of India, Ltd.	Bombay	Bombay (3 branches), Calcutta, Karachi.
19	Bank of India, Ltd.	"
20	Bombay Provincial Bank	"
21	Poona Mercantile Bank	Poona City
22	Ajodhia Bank, Ltd.	Pyzabad
23	Bank of Northern India	Rawalpindi	Delhi, Ambala City, Lahore, Murree, Rawalpindi City.
24	Kayastha Trading and Banking Corporation.	Gorakhpur	Chupra, Azamgarh, Basti, Jaunpur, Arrah, Ghazipur, Darbhanga (Laberiasarai), Deoria.
25	Ryoper Sahayak Bank, Ltd.	Meerut
26	Bangalore Bank, Ltd.	Bangalore
27	Punjab and Sind Bank, Ltd.	Amritsar	Gujranwala, Lyallpur, Lahore, Rawalpindi.
28	Vellore Commercial Bank	Vellore
29	Nedungadi Bank, Ltd.	Calicut	Badagra, Calicut Town, Cherpulcheri, Palghat.
30	Vellore Mercantile Bank	Vellore
31	Worur Commercial Bank	Worur
32	Bhargava Commercial Bank	Jubbulpore
33	Oudh Commercial Bank, Ltd.	Pyzabad	Lucknow, Cawnpore.
34	Bank of Rangoon	Rangoon
35	Malabar Bank, Ltd.	Cannanore
36	Bangalore Mercantile Bank	Bangalore
37	South India Bank	Tinnevely
38	Bombay Merchants' Bank	Bombay	Bombay (branch).
39	Karachi Bank, Ltd.	Karachi	Bombay, Hyderabad (Sind), Larkhana.
40	Punjab National Bank	Lahore	Amritsar, Bombay, Calcutta, Cawnpore, Delhi, D. I. Khan, Ferozapore City, Gujranwala, Jammu, Jullundur City, Jhelum, Karachi, Kasur, Lahore City, Ludhiana, Lyallpur, Multan City, Patiala, Peshawar City, Quetta, Rawalpindi City, Sargodha, Sialkot City, Srinagar, Ambala City.
41	National Financing and Commission Corporation, Ltd.	Bombay	Surat.

(S).—*Indian Joint Stock Banks—concd.*

No.	Banks	Head Office	Branches and Agencies
42	Erode Bank	Erode
43	Darbhanga Bank, Ltd. . .	Darbhanga
44	Coimbatore Town Bank . .	Coimbatore
45	Tinnevely Bank	Tinnevely
46	Agra Bank, Ltd.	Agra
47	Allahabad Trading and Bank- ing Corporation, Ltd.	Allahabad
48	Allahabad Union Bank . . .	"
49	Alliance Bank of Simla* . .	Simla	Abottabad, Agra, Ajmer, Ambala, Amritsar, Bombay, Calcutta, Cawnpore, Dalkousie, Darjeeling, Dehra Dun, Delhi City and Civil Lines, Ferozapore, Gwalior, Jullunder, Karachi, Lahore, Lahore Charing Cross, Lahore Cantonment, Lucknow, Multan, Murree, Mussorie, Nowshera, Peshawar Cantonment, Peshawar City, Quetta, Rawal- pindi, Sialkot, Simla (Town Office), Srinagar (Kashmir), Ujjain (Gwalior State).
50	Bank of Behar, Ltd.	Bankipore	Chupra, Patna, Sasaram, and Gaya.
51	Bank of Bihar, Ltd.	Aurauli, Benar
52	Bangalore Cant. Bank, Vilas Bank, Ltd.	Bangalore
53	Chotanagpur Banking Associa- tion.	Hazaribagh	Giridih, Ranchi, Purulia, Daltonganj.
54	Faridpur Bank, Ltd.	Faridpur, Bengal
55	Frontier Bank, Ltd.	Dehra Ismail Khan .	Banno, Teik, Lahore.
56	Hazaribagh Bank, Ltd. . . .	Hazaribagh
57	Jullunder Bank, Ltd.	Jullunder City
58	Madaripur Bank, Ltd.	Faridpur
59	Maharumi Bank, Ltd.	Chittagong
60	Muslim Bank of India, Ltd. .	Lahore
61	Rajshahi Lakshmi Bank, Ltd. .	Rajshahi
62	Rangpur Bank, Ltd.	Rangpur
63	Union Bank, Ltd.	Kumbakonam
64	Wazir Bank, Ltd.	Bombay
65	Bank of Baroda, Ltd.	Baroda	Ahmedabad, Mohana, Navsari, Surat.
66	Upper India Insurance and Banking Co., Ltd.	Benares

10. Net progressive absorption	1,286	2,890	12,694	28,766	34,836	37,064	41,661	100,873	140,227	156,414	183,827	210,767	228,012	188,770	200,819	227,879	227,879

NOTE.—The figures in this table have been revised. The quinquennial average figures are inserted only for comparative purposes. The progressive total of additions to stock (item 9) and net progressive absorption (item 10) are calculated on the annual figures and are not based on these averages. Item 9 is the sum of the yearly figures in item 4.

Appendix VIII.

Extracts relating to the People's Bank.

A considerable portion of the assets consists of debts due from individuals, partnerships and limited companies of whom many have suffered repeated losses and assets and the debts are not realisable to any appreciable extent, e.g., (1) The Punjab Cotton Press Company, Limited, Lahore, Rs20,00,000; (2) The Lahore Spinning and Weaving Mills Company, Limited, Rs7,50,000; (3) The Pioneer Investment Company, Limited, Lahore, Rs5,50,000; (4) The Surat People's Spinning and Weaving Mills, Rs4,50,000; (5) Harkishen Lal and Sons, Rs78,000; (6) Harkishen Lal and Company, Rs1,54,130; (7) Lala Harkishen Lal, Rs4,48,842; (8) Debentures in the Lahore Spinning and Weaving Mills, Limited, Rs1,00,000. Total Rs48,30,972.

The applicant for compulsory winding up urged four points:—First, that the Directors have grossly mismanaged the affairs of the Bank leading to themselves or to companies in which they are directors or partners. Second, that the mismanagement has been such as to raise strong belief that the directors' action has not been *bona fide*. Third, that the directors have committed a criminal offence in paying the dividend of 30th December last out of capital. And fourth, that in certain cases companies' assets have been deliberately made away with. For the last point the audit shows a debt of nearly four lakhs due from the Ganges Flour Mills, whereas the balance sheet of that company filed by applicant shows no debt whatever due to the People's Bank. The case of the Cawnpore Flour Mills is similar. With regard to all these points I am not recording any definite finding one way or the other. It is possible that they may be satisfactorily explained. There is, however, a strong *prima facie* case made out which would justify criminal proceedings if proved. Under the circumstances I think that the applicant is entitled to receive compulsory liquidation. I am the more confirmed in this view from the circumstances under which the proposed voluntary liquidators have been chosen. No explanation whatever was called for by any of the shareholders at any of the meetings as to the serious charges levelled against the managing directors by the company's own auditors, Basantram and Sons. At the same time the chairman chosen to preside at the last meeting was nominee of the managing director and all the proposed liquidators are nominees of another director who is himself indebted to the Bank.

We think that sufficient indication has been given to disclose the extremely unbusiness-like manner in which the Directors of the Bank have dealt with the Funds entrusted to them by the Depositors. Apart from the particularly unsound practice of locking up the whole of these funds in investments which cannot be immediately realised at a time of urgent crisis, it is evident that the bulk of these investments are either totally unsecured or made on very doubtful security.

Of the total advances of Rs1,07,09,000-14-1, we find that no less a sum than Rs71,72,687-13-1 has been advanced to companies or other concerns in which certain of the Directors of the Bank have been interested either as individuals, Directors or as joint borrowers. A list of these advances with the names of the Directors concerned, is given in Appendix "E" subjoined to which will be found a summary of the amounts borrowed against each Director, individually or jointly with other Directors. As the foregoing classification amply shows, a considerable portion of these loans have been made without sufficient security or no security at all, and it is, therefore, a matter of concern how far the Directors have advanced money to these borrowing concerns with the knowledge that recovery in full was doubtful. The Director principally concerned in this matter is Lala Harkishen Lal.

Extracts relating to the Indian Specie Bank.

The Bank has also lost heavily in loans advanced to some jewellers and the *badla* business of Fazul and David shares. Directors of the Bank have gone on paying large dividends and bonuses though the bank has really been suffering considerable loss every year and they are therefore liable to make good to the bank the amount spent for dividends and bonuses. The accounts of the bank have been examined every day by two Directors of the bank and by Sir Vithaldass Thackersey, Sir Jogmohan Das Virgivandas and Lakhamsey Napoo, and they must have known that the bank was gradually sustaining heavy losses which they ought to have taken proper care to prevent. Various balance sheets of the company from 1908 up to date are entirely false and misleading, and conceal the true position of the bank. If the affairs of the bank are properly investigated managing directors and officers of the bank will be found to have acted negligently, if not fraudulently, and they will be found liable to make good to the bank all losses by reason of their mismanagement or negligence, the result of which will be that shareholders will not be required to contribute anything further in the final winding up and a substantial balance will be available to the

shareholders for distribution. Unless an order for compulsory winding up is made, it will be impossible for the bank to recoup losses caused to it by the conduct of its directors. The petitioners therefore prayed for a winding up order and the appointment of a provisional liquidator. * * * The joint report of Messrs. A. F. Ferguson and Company, and Mr. S. B. Billimoria, accountant, were read. The report, after dealing with the various transactions of the bank stated that, though assets exceeded liabilities on paper, one crore worth of assets were irrecoverable and some allowance would have to be made for anticipated losses in pearls and shares, leaving about a little more than half the total amount of liabilities for distribution among the creditors. Another important point was that if outstanding calls on shareholders were fully paid up the creditor's interests would be entirely saved, but it was believed that at most Rs 50 lakhs would be paid in and the remaining one-third would have to be written-off. * * *

(3) due after more than 3 months	39,499,302	—39

	M.	Liabilities M. pf.
(c) Other Creditors—		
(1) due within 7 days	171,808,132—95	
(2) due later than after 7 days but within 3 months	154,557,574—93	
(3) due after more than 3 months	24,292,749—80	
		547,591,505—50
Acceptances and cheques—		
(a) Acceptances	138,478,485—82	
(b) Cheques not yet presented for payment	1,999,891—88	
		140,478,377—20
(c) Liabilities under the Bank's guarantee	37,577,594—66	
Other Liabilities—		
Unclaimed dividends	22,432—98	
Reserve for duty on Renewal of Coupons sheets	1,000,000	
Suspense account	1,082,167—43	
		3,304,600—40
Profit and Loss account	11,155,300—08
		804,529,783—13

The Balance Sheet shows the total liabilities (exclusive of share capital and reserve fund) to be 702 Million Marks.

The liquid assets of the Bank, *i.e.*, those assets which can be realized at very short notice, are the following:—

(1) Cash, foreign money and coupons	M. 22 Millions
(2) Credit Balances with clearing Banks	" 24 "
(3) Bills of Exchange which can be re-discounted with the Reichsbank and which are therefore considered liquid assets	" 120 "
(4) Credit Balances with other Banks and Bankers (nostro accounts)	" 67 "
(5) Contango loans (Report Credit) about	" 31 "
Liquid Assets	M. 254 Millions

The Bank has granted credits in the following manner:—

(1) By Discounting Bills of Exchange	M. 120 Millions
(2) By granting loans against stocks and shares (partly for the purpose of carrying over transactions—Contango or Report business). These loans are to a large extent granted to speculators and investors, rarely to commercial and industrial firms	" 125 "
(3) By granting loans on goods stored under the Bank's lock and key or in transit (often taken to hold over goods till a more favourable time arrives)	" 9 "
(4) By allowing overdrafts in current account (a) secured	" 338 "

In this case the security generally consists in a general hypothecation of the firm's stock of goods which however, remain in the hands of the firms. If the loan is granted to an industrial firm, the security consists in a general hypothecation of the firm's stock of raw goods, manufactured goods, goods in process of manufacture, buildings and plant.

The security can also consist in stocks and shares (which is rarely the case), or in surties given by personal guarantors.

(4) (b) unsecured (Blanko-Credit)	M. 71 Millions
---	----------------

An unsecured credit in current account is often granted temporarily, *e.g.*, for the season (to a hotel-keeper in a watering place) or for the purpose of enabling an industrial firm to accept and execute a large order which otherwise they would have to refuse for want of funds.

Re (4) (b).—The Bank reserves to itself the right of inspecting the firm's books at all times.

Re (4) (a) and (b).—The Bank generally insists on the firm doing all its business with the one Bank only; in the case of the firm being a limited Company one of the managers of the Bank is on the Board of Directors of the Company and is thus in a position to exercise a large amount of control over the firm's business.

- (5) By participating in the floating of limited Companies or in the transformation of private firms into limited Companies.* As a rule several Banks or banking firms form a syndicate for this purpose. They take over the shares of the new company (or part of them) and keep them until such time as the shares may be introduced (eingeführt) on the Stock Exchange, which, according to the law, generally takes place after the first annual balance sheet of the new company has been published.

The credits enumerated above are given out of the Bank's funds (Capital and Deposits) with the exception of 138 Million Marks. For this amount the Bank has accepted bills of exchange (due after three months) drawn on the Bank by its clients. The clients discount the Bank's acceptance with other Banks and thus obtain money on the Bank's name, as it were, when the bill falls (due after three months) the client (who drew the bill) is expected to supply the Bank with funds to meet its acceptance. He often obtains such funds by drawing again on the Bank and negotiating their acceptance as above.

In this case, too, the Bank is covered by a general hypothecation as stated under (4) (a).

Out of the above mentioned 138 Million Marks, about 6 or 7 Million Marks probably refer to No. (3) and the remaining 130 Millions to No. 4 a and b (mostly 4 a).

Appendix XIII.

LAW OF THE NIPPON KOGYO GINKO

(THE INDUSTRIAL BANK OF JAPAN, LTD.)

Promulgated by Law No. 79 on the 22nd day of March, the 33rd year of Meiji (1900).

CHAPTER I.

GENERAL STATEMENT.

Article 1. The Nippon Kogyo Ginko shall be constituted a joint stock company and have its chief office in Tokyo.

Article 2. The capital of the Nippon Kogyo Ginko shall be seventeen million five hundred thousand yen; which amount may be increased with the sanction of the Government. (Amended by Law No. 2, February, 1906.)

Article 3. The amount of each share of the Nippon Kogyo Ginko shall be fifty yen. (Amended by Law No. 2, February, 1906.)

Article 4. The term of business of the Nippon Kogyo Ginko shall be fifty years; which term may be extended with the sanction of the Government.

CHAPTER II.

CHIEF OFFICERS.

Article 5. There shall be one President, one Vice-President, three or more Directors, and three or more Auditors in the Nippon Kogyo Ginko. (Amended by Law No. 2, February, 1906, and Law No. 8, March, 1914.)

Article 6. The President shall represent the Nippon Kogyo Ginko, and superintend its business. (Amended by Law No. 2, February, 1906.)

In the event of the office of President becoming vacant, the Vice-President shall discharge the duties of President. (Amended by Law No. 2, February, 1906.)

The Vice-President and Directors shall assist the President and shall transact any special business as provided in the By-Law. (Amended by Law No. 2, February, 1906.)

The Auditors shall inspect the business of the Nippon Kogyo Ginko.

Article 7. The President and Vice-President shall be appointed by the Government from among shareholders owning at least two hundred shares; and the term of office of a President and a Vice-President shall be five years. (Amended by Law No. 2, February, 1906.)

The Directors shall be appointed by the Government from among candidates elected at a General Meeting of Shareholders, the qualification of such candidates to be ownership of at least one hundred shares each, and the number of candidates to be twice that of the Directors to be appointed. The term of office of a Director shall be three years. (Amended by Law No. 2, February, 1906.)

The Auditors shall be appointed by election at a General Meeting of Shareholders from among shareholders owning at least sixty shares each; and the term of office of an Auditor shall be two years. (Amended by Law No. 2, February, 1906.)

Article 8. The President, Vice-President and Directors may not engage, under any circumstance whatsoever, in any other profession or business. An exception may be made, however, by special permission of the Minister of State for Finance. (Amended by Law No. 49, March, 1905, and Law No. 2, February, 1906.)

CHAPTER III.

BUSINESS.

Article 9. The Business of the Nippon Kogyo Ginko shall be as follows:—

1. To make loans on the security of national loan-bonds, prefectural and municipal loan-bonds, or debentures and shares of companies.
2. To subscribe for, or take over by transfer, national loan-bonds, prefectural and municipal loan-bonds, or debentures of companies.
3. To receive deposits of money and undertake the custody of goods entrusted to it for safe keeping.

4. To undertake trust business. (Amended by Law No. 49, March, 1905.)
5. To discount bills. (Added by Law No. 49, March, 1905.)
6. To buy and sell bills of exchange and documentary bills of exchange. (Added by Law No. 8, March, 1914.)
7. To make loans on the security of estates (*zuidan*) created by virtue of special laws. (Added by Law No. 49, March 1905.)

Article 9-2. The Nippon Kogyo Ginko may make loans on the security of land and buildings belonging to factories as well as on the security of land and buildings in cities and in towns assigned by Imperial Ordinance, provided the total sum of these loans shall in no case exceed half the amount of its paid-up capital. (Added by Law No. 28, March, 1911.)

Article 10. The Nippon Kogyo Ginko may devote its unemployed funds to the purchase of national loan-bonds, prefectural or municipal loan-bonds, or the debentures and shares of companies, or gold and silver bullions. (Amended by Law No. 28, March, 1911.)

Article 11. The Nippon Kogyo Ginko may not engage in any line of business not mentioned in this Law. This restriction shall not apply, however, when, with the permission of the Minister of State for Finance, the Bank engages in banking and other operations ancillary thereto, which are conducted in foreign countries. (Amended by Law No. 49, March, 1905.)

CHAPTER IV.

DEBENTURES.

Article 12. The Nippon Kogyo Ginko may issue debentures, provided that their maximum limit shall not exceed ten times the amount of the Bank's paid up capital; nor shall such debentures exceed the aggregate of the moneys the Bank has actually loaned out, of the bills actually discounted and in hand at time, as well as of the national loan-bonds, the prefectural or municipal loan-bonds, and the debentures and shares of companies and gold and silver bullions in its possession. (Amended by Law No. 49, March, 1905, and Law No. 28, March, 1911.)

Article 12-2. In the event of supplying capital for undertakings of public utility abroad, the Bank may issue debentures with the permission of the Minister of State for Finance without observing the Provisions of Articles 12 and 13 of this Law and Article 299 of the Commercial Code. (Added by Law No. 49, March, 1905.)

The above-mentioned undertakings of public utility shall be determined by Imperial Ordinance. (Added by Law No. 49, March, 1905.)

Article 13. The debentures issued shall be of the face value of fifty yen or more, and unregistered: they may, however, be changed into registered debentures at the request of subscribers or owners.

Article 14. When the Nippon Kogyo Ginko desires to issue debentures, it must obtain the permission of the Minister of State for Finance. (Amended by Law No. 49, March, 1905.)

Article 14-2. When the Bank issues debentures, Article 199 of the Commercial Code is not applicable. (Added by Law No. 49, March, 1905.)

Article 15. The interest on the debentures of the Nippon Kogyo Ginko shall be paid twice in a year or oftener, and the principal shall be redeemed by lot within the space of thirty years reckoned from the date of issue.

Article 16. In case the Nippon Kogyo Ginko desires to issue debentures at a lower rate of interest, in order to replace those already issued the Bank need not be bound by the limitations of Article 12.

When new debentures at a lower rate of interest are issued as here indicated, the Bank, within the space of three months after their issue, shall redeem by lot old debentures equal in face value to the amount of the new debentures.

CHAPTER V.

THE RESERVE FUND.

Article 17. The Nippon Kogyo Ginko shall put aside, at the end of each business year, eight per cent or more of its net profit as a reserve for making up any deficit in its capital and two per cent or more of the said net profit of maintaining an even rate of dividends.

CHAPTER VI.

GOVERNMENT CONTROL AND SUBSIDY.

Article 18. The Government shall have control over the business of the Nippon Kogyo Ginko.

Article 19. The Nippon Kogyo Ginko, when it proposes to make alterations in its By-Laws, shall obtain the permission of the Minister of State for Finance.

Article 20. The Nippon Kogyo Ginko, when it proposes to establish branch offices or agencies, or to open correspondence with other banks, shall obtain the permission of the Minister of State for Finance. (Amended by Law No. 8, March, 1911.)

Article 21. The Nippon Kogyo Ginko, when it proposes to declare a dividend, shall obtain the permission of the Minister of State for Finance.

Article 22. The Minister of State for Finance may suspend any act of the Nippon Kogyo Ginko in the course of its business management, should such act be regarded by him as either contrary to Laws, Ordinances, or By-Laws, or injurious to the public interest.

Article 23. The Nippon Kogyo Ginko in accordance with orders from the Minister of State for Finance, shall present reports showing the condition of its business together with its financial accounts.

Article 24. The Minister of State for Finance shall specially appoint Comptrollers to supervise the business management of the Nippon Kogyo Ginko.

Article 25. The Comptrollers of the Nippon Kogyo Ginko may examine at any time the vault for cash, the vault for instruments of credit, the books and all kinds of documents of the Nippon Kogyo Ginko.

The Comptrollers of the Nippon Kogyo Ginko may attend the General Meeting of Shareholders or any other meetings of the Bank, and may express their views at the same.

Article 26. If the dividend to be declared for any business year of the Nippon Kogyo Ginko does not amount to five per cent. per annum of the paid-up capital, the Government shall give a subsidy sufficient to make up the deficiency, provided that the period of the Government's liability under this Article shall be limited to five years reckoned from the last day of the first business year of the Bank; and provided further that the amount of said subsidy shall in no case exceed five per cent. of the paid-up capital.

CHAPTER VII.

PUNITIVE REGULATIONS.

Article 27. Should there occur a breach of Law or regulation, as enumerated below, in the business management of the Nippon Kogyo Ginko, the President, Vice-President and Directors shall be required to pay a fine of not less than one hundred yen and not more than one thousand yen; provided that if any of the abovementioned officers has not been a party to the violation, such officer shall be exempted. (Amended by Law No. 2, February, 1906.)

1. If the Bank has not secured the permission of the Minister of State for Finance in a case respecting which it is provided in the Law that such permission should be secured.
2. If the Bank has made loans contrary to the provisions of Article 9-2. (Added by Law No. 28, March, 1911.)
3. If the Bank has undertaken any business not mentioned in this Law, contrary to the provisions of Article 11.
4. If the Bank has issued debentures contrary to the provisions of Article 13 and Article 16.

Article 28. If the President, Vice-President and Directors of the Nippon Kogyo Ginko act in contravention of the provisions of Article 8, they shall be individually required to pay a fine of not less than twenty yen and not more than two hundred yen. (Amended by Law No. 2, February, 1906.)

APPENDIX.

Article 29. The Government shall appoint a Commission for the transaction of all business connected with the establishment of the Nippon Kogyo Ginko.

Article 30. The Commission for the Establishment of the Nippon Kogyo Ginko shall make a draft of the By-Laws, shall secure the sanction of the Government for the same, and shall then invite subscriptions.

Article 31. When the said Commission has secured a sufficient number of subscribers, it shall present to the Government the subscription certificates and solicit sanction for the establishment of the Bank.

When the said sanction has been secured, the Commission shall without delay call for the payment of the first instalment of capital by the subscribers.

Article 32. At the conclusion of the General Meeting of Shareholders of the Establishment of the Bank, the Commission for the Establishment of the Nippon Kogyo Ginko shall hand over its business to the President of the Bank.

This Law shall become effective from the day of promulgation.*

* This and the following paragraphs were added by Law No. 2, February, 1906.

The Nippon Kogyo Ginko shall take the following steps within three months from the day on which this Law becomes effective.

1. Shares which are one hundred thousand in number at the time when the Law becomes effective, shall be altered to two hundred thousand shares, one half being fully paid up and the other half being not fully paid up. The latter half shall be allotted in proportion to the number of the shares owned by shareholders at the time when the law becomes effective.
2. A call of not less than one quarter of the amount shall be made without delay for the aforesaid not fully paid-up shares. In this case, the provisions of the Commercial Code relating to the increase of the capital of a Joint Stock Company shall be applied.
3. There shall be an increase of one hundred and fifty thousand shares, and a call for their full payment shall be made without delay. In this case, paragraph 2 of Article 217 and paragraph 1 of Article 218 of the Commercial Code need not be observed.
4. Necessary registrations in connection with the aforesaid three clauses shall be made within two weeks from the day of the closure of the Shareholders' General Meeting held in connection with the second and third clauses in accordance with Article 213 of the Commercial Code. In this case, the document which certifies the taking over of shares, may be used in place of the documents provided in Clauses 1 and 2 of Article 189 of the Law of Procedure in Non-contentious Matters.

BY-LAWS OF THE NIPPON KOGYO GINKO

(THE INDUSTRIAL BANK OF JAPAN, LTD.)

Sanctioned by the Minister of State for Finance on the 2nd October of the 33rd year of Meiji (1900).

CHAPTER I.

GENERAL STATEMENT.

Article 1. The Bank shall be established in accordance with the provisions of the Law relating to the Nippon Kogyo Ginko, namely, Law No. LXX of the 33rd year of Meiji (1900) and shall be called the *Kabushiki Kaisha Nippon Kogyo Ginko* (The Industrial Bank of Japan, Limited).

Article 2. The Bank shall have for its object the transaction of business in accordance with the Law relating to the Nippon Kogyo Ginko and other Laws or Ordinances. (Amended, May, 1905.)

Article 3. The Bank shall have its head office in Tokio, and its branch offices in Tokyo and Osaka. (Amended, August, 1913.)

The Bank, with the sanction of the Government, may establish branches and agencies or open correspondence with other banks in any convenient places at home and abroad. (Amended, February, 1903, and June, 1914.)

Article 4. The term of the Bank's business shall be fifty years, reckoned from the day when the Government's sanction for its establishment is given: the term may, however, be extended by resolution of a Shareholders' General Meeting and with the sanction of the Government.

Article 5. All expenses connected with the first establishment of the Bank shall be borne by the Bank.

Article 6. All notifications of the Bank shall be made public through the columns of the Official Gazette and such newspapers as are regular channels for the notifications of the courts of justice. As to notifications abroad local usage shall be observed. (Amended, February, 1906.)

CHAPTER II.

CAPITAL AND SHARES.

Article 7. The capital of the Bank shall be seventeen million five hundred thousand yen, which shall be divided into three hundred and fifty thousand shares, each share being fifty yen. (Amended, February, 1906.)

The share bonds of the Bank shall be of six denominations; namely, 50 yen, 250 yen, 500 yen, 1,000 yen, 2,500 yen, and 5,000 yen. (Amended, February, 1906.)

The capital of the Bank may be increased by resolution of a Shareholders' General Meeting and with the sanction of the Government.

Article 8. So soon as shareholders have paid in the first instalment, the share shall be delivered to them, and the amount of each instalment when paid shall be entered on the shares on every occasion of such payment.

Article 9. With regard to subsequent instalments after the second, the President shall fix the date, the method and the amount of payment in accordance with the condition of business; and notice of payment shall be given to shareholders at least one month before such date. (Amended, February, 1906.)

Article 10. All cases of negligence in the payment of instalments shall be dealt with in accordance with the provisions of the Commercial Code.

The Bank shall, in all such cases of negligence, require the payment of a fine at the rate of four *sen* per one hundred *sen* per day, during a period reckoned from the day after the appointed date of payment of the instalment until its actual payment.

Article 10-2. To unregistered share-bonds shall be attached a talon and dividend coupons for fifty business years. (Added, February, 1906.)

In case the abovementioned dividend-coupons are all used up, the share-bonds shall be presented to the Bank and new dividend-coupons with a talon attached shall be exchanged for the old talon. (Added, February, 1906.)

Article 11. When shares of the Bank are to be transferred, a statement of the transfer together with the registered shares to be transferred shall be presented at the Bank. (Amended, February, 1906.)

In the abovementioned case, the Bank shall require both the parties concerned to sign their names on the back of the shares; and after the fact of the transfer has been duly entered in the Subscription Book, the shares shall be delivered to their new owner. (Amended, February, 1906.)

Persons who, coming into possession of shares of the Bank by succession or bequest, apply to have their names registered instead of those of the former owners, shall present proper certificates.

Article 12. Should any registered share of the Bank be lost, destroyed or stolen, its owner may apply to the Bank for delivery of a new share, and must accompany his application by a statement given in detail the face value and number of the old share.

On receipt of such application, the Bank shall publicly notify during a period of one month and at the expense of the applicant, the fact that the said share has been lost, destroyed or stolen, and shall then deliver the new share to the applicant, who shall be required to produce two persons satisfactory to the Bank as guarantors.

If during the abovementioned one month the applicant recovers the shares in question, he shall immediately report the fact to the Bank, which shall publicly notify it at the expense of the applicant.

Article 13. Should any objection be raised to the delivery of a new registered share in place of one lost, destroyed or stolen, the Bank shall not deliver the new share until after the matter has been adjudicated by a court of justice. (Amended, February, 1906.)

Article 14. Should one of the registered shares become defaced or mutilated, its owner may apply to the Bank for a new share, and must accompany his application by a statement of the particulars of the case as well as by the old share. (Amended, February, 1906.)

The Bank, on the receipt of the said share, shall have its authenticity tested, when, if the latter be found satisfactory, a new share shall be given in exchange. Should, however, the authenticity of the said share be found doubtful, the procedure indicated in the rules governing the case of a lost share shall be pursued.

Article 15. The Bank, at the request of a shareholder, shall exchange registered shares of one denomination for those of another denomination, a fee of 20 *sen* being charged for each new share thus delivered. (Amended, February, 1906.)

Article 16. The Bank shall levy a fee of five *sen* per share for registering on a registered share a new owner's name in place of that of the former owner, and a fee of twenty *sen* per share when new shares are delivered in lieu of shares destroyed, lost or stolen, as also in lieu of shares defaced or mutilated. (Amended, February 1906.)

Article 17. The Bank, during a period of one month immediately preceding each Ordinary General Meeting of Shareholders, shall suspend the registration of registered shares, such suspension being publicly notified in advance. (Amended, February, 1906.)

Article 17-2. Provisions relating to the disposal of unregistered shares shall be determined by Chief Officers' Council. (Added, February, 1906.)

CHAPTER III.

CHIEF OFFICERS.

Article 18. There shall be one President, one Vice-President, three Directors and three Auditors in the Bank. (Amended, February, 1906, and June, 1914.)

Article 19. The President and Vice-President shall be appointed by the Government for a term of five years from among the shareholders owning at least two hundred shares of the Bank. (Amended, February, 1906.)

The Directors shall be appointed by the Government, for a term of three years, from among candidates elected at a General Meeting of Shareholders, the qualifications of such candidates to be ownership of at least one hundred shares each and the number of candidates to be twice that of the Directors to be appointed. (Amended, February, 1906.)

The Auditors shall be elected by a General Meeting of Shareholders for a term of two years from among shareholders owning at least sixty shares each. (Amended, February, 1906.)

Any vacancy among the Directors or Auditors shall be filled by election at a General Meeting of Shareholders.

Article 20. The President, Vice-President and Directors, during their respective terms of office, shall be required to deposit with the Auditors shares of Bank owned by them,—two hundred shares in the case of the President, and Vice-President, respectively, and one hundred shares in the case of each Director. (Amended, February, 1906.)

The shares thus deposited shall not be returned to their owners, even on the latter's retirement from office until all the documents mentioned in Article 190 of the Commercial Code shall have been presented to a General Meeting of Shareholders and shall have been accepted by such Meeting.

Article 21. The duties and privileges of the President are as follows:—

1. To represent the Bank in all its business matters.
2. To sign his name on all shares, debentures and other documents having reference to the rights and duties of the Bank.
3. To carry on the entire business of the Bank in accordance with the provisions of Laws, Ordinances and By-Laws, as well as the resolutions of the General Meeting of Shareholders and of the Chief Officers' Council.
4. To preside at the General Meeting of Shareholders and the Chief Officers' Council.

Article 22. The Vice-President and Directors shall assist the President and transact special business entrusted to them by the President. (Amended, February, 1906.)

Article 23. The Auditors shall inspect the business of the Bank.

Article 24. The remuneration of the President, Vice-President, Directors and Auditors shall be fixed at a General Meeting of Shareholders. (Amended, February, 1906.)

CHAPTER IV.

CHIEF OFFICERS' COUNCIL.

Article 25. The Chief Officers' Council shall decide questions relating to the rules for the business procedure of the Bank and other important business matters.

The President, Vice-President and Directors shall together constitute the Chief Officers' Council. (Amended, February, 1906.)

Article 26. The Chief Officers' Council shall be convened by the President whenever he considers it necessary.

The Chief Officers' Council may not be held unless there are present at least one half of the members. Provided, however, that if such quorum be unobtainable on account of unavoidable reasons, as for example travel, sickness, etc., and if the business necessities of the Bank call for immediate action by the Chief Officers' Council, then such members as are present may make decisions, and the particulars of such decisions shall be reported at the next meeting of the Chief Officers' Council.

Decisions of the Chief Officers' Council shall be made by a majority vote; provided that in case of a tie the Chairman shall decide.

Article 27. All decisions made by the Chief Officers' Council shall be entered in the minutes of the Council, to which the members present shall attach their signatures.

CHAPTER V.

GENERAL MEETING OF SHAREHOLDERS.

Article 28. A General Meeting of Shareholders shall be either ordinary or extraordinary.

Article 29. The Ordinary Meeting of Shareholders shall be held twice each year in the months of February and August. The President, at least three weeks previously to the day appointed, shall give notice to each holder of registered shares and make advertisement of the day, hour, place, and purpose of the meeting as well as the subjects to be discussed. (Amended, February, 1906.)

An Ordinary Meeting of the Shareholders shall examine the documents presented by the President, in accordance with the provisions of Article 190 of the Commercial Code, and also the report presented by the Auditors; and shall also decide questions relating to the declaration of dividends.

Article 30. An Extraordinary Meeting of Shareholders shall be convened by the President, should he consider such a step necessary, or should he be requested to do so; provided that such request must be accompanied by a statement of the objects of the Meeting and the reasons for convening it, and must be signed by shareholders who own shares amounting to at least one-tenth part of the entire capital of the Bank. The President shall fix the day, hour and place of the Meeting and shall notify these as well as the object of the Meeting and the subject or subjects to be discussed there, to each holder of registered shares and shall make advertisement at least three weeks prior to the Meeting. (Amended, February, 1906.)

An Extraordinary Meeting of Shareholders shall also be held when considered necessary by the Auditors.

In case the holders of unregistered shares wish to make the request mentioned in the first paragraph they shall place their shares in the custody of the Bank. (Added, February, 1906.)

Article 31. Every shareholder shall have the right of one vote for each share owned by him.

Article 31-2. The holders of unregistered shares cannot use their power of voting unless they place their shares in the custody of the Bank one week before the day of the Meeting. (Added, February, 1906.)

Article 32. A shareholder may vote at a General Meeting of Shareholders through a representative; but only a legal representative or a shareholder of the Bank may act as such.

The Bank's Chief Officers and other employes may not in any case perform the representative functions mentioned in the last paragraph except when acting as legal representatives.

Article 33. Persons intending to act as representatives at a General Meeting of Shareholders shall present documents duly certifying the powers entrusted to them.

Article 34. (Struck out, February, 1906.)

Article 35. (Struck out, February, 1906.)

Article 36. All decisions adopted at a General Meeting of Shareholders shall be recorded in the minutes of the meeting, and the signatures of the President, Vice-President, Directors and Auditors shall be appended. (Amended, February, 1906.)

Article 37. The members present at a General Meeting of Shareholders shall record their names, representatives stating themselves to be such, in a book kept for that purpose on the day of the Meeting and prior to its opening.

The book containing the names of the members present shall, after receiving the signatures of the President, Vice-President, Directors and Auditors, be appended to the minutes of the Meeting. (Amended, February, 1906.)

CHAPTER VI.

BUSINESS.

Article 38. The Bank shall engage in the following lines of business:—

1. Making loans on the security of national loan-bonds, prefectural or municipal loan-bonds, or the debentures and shares of companies.
2. Subscribing for, or taking over by transfer, national loan-bonds, prefectural or municipal loan-bonds, or debentures of companies.
3. Receiving deposits of money and undertaking the custody of goods entrusted to it for safe keeping.
4. Undertaking trust business. (Amended, May, 1905.)
5. Discounting bills. (Added, May, 1905, and Amended, May, 1911.)
6. Buying and selling Bills of Exchange and Documentary Bills of Exchange. (Added, June, 1914.)
7. Making loans on the security of estates (zaidan) created by virtue of special laws. (Added, May, 1905.)
8. Making loans on the security of land and buildings belonging to factories. (Added, May, 1911.)
9. Making loans on the security of land and buildings in cities and in towns assigned by Imperial Ordinance. (Added, May, 1911.)
10. Carrying on business sanctioned by the Minister of State for Finance in accordance with Laws or Ordinances. (Added, May, 1905.)

The total sum of loans mentioned in No. 8 and No. 9 of the preceding paragraph shall in no case exceed half the amount of its paid-up capital. (Added, May, 1911.)

Article 39. The trust business to be undertaken by the Bank shall be in general as follows: (Amended, May, 1905.)

1. Undertaking duties of administration, settlement, etc., with reference to money, securities, movable and immovable properties and other properties.

2. Managing matters with reference to public loans, and loans or shares of companies such as issuing bonds or debentures, paying principal, interest, dividends, etc.
3. Managing matters with reference to mortgaging debentures or to giving guarantees on behalf of debtors.

Article 40. Loans made by the Bank shall never be for a longer term than five years, except in cases of special necessity. (Amended, January, 1903.)

Article 41. This Bank may devote such of its funds as are not employed in regular business to the purchase of national loan-bonds, prefectural or municipal loan-bonds, or the debentures and shares of companies or gold and silver bullion. (Amended, May, 1911.)

Article 42. The Bank may not come into possession of or receive as objects of mortgage, its own shares or debentures. An exception may be made, however, in the case when the Bank comes into possession of its own debentures for the purpose of redemption by purchase. (Amended, May, 1905.)

Article 43. The Bank may not come into possession of real estate except in the cases mentioned below :—

1. Lands and houses necessary for its business purposes.
2. Real estate received in liquidation of debts.
3. Real estate received through the decisions of courts of justice.

The real estate mentioned in clauses 2 and 3 of the preceding paragraph shall be speedily disposed of by the Bank.

Article 44. The Officers and other employees of the Bank are not allowed to become its debtors.

CHAPTER VII.

DEBENTURES.

Article 45. The debentures issued by the Bank shall be of the face value of at least fifty yen and unregistered. They may, however, be changed into registered debentures at the request of subscribers or owners.

Article 46. The maximum amount of debentures which the Bank may issue shall be ten times the amount of its paid-up capital; but the actual amount of such debentures shall in no case exceed the aggregate value of the assets represented by the moneys the Bank has loaned out at the time, the bills it has discounted and retains in its possession, and the national loan-bonds, prefectural and municipal loan-bonds as well as the debentures of companies in possession, all calculated at their market values. Exceptions may be made, however, when debentures are to be issued at a reduced rate of interest in order to replace therewith others previously issued; or when they are issued in accordance with Article 12-2 of the Law of the Nippon Kogyo Ginko. (Amended, May, 1905, and May, 1911.)

Article 47. The interest on this Bank's debentures shall be paid twice each year, in the months fixed at the time the said debentures are issued. An exception may be made, however, with regard to the interest on the debentures issued in accordance with Article 12-2 of the Law of the Nippon Kogyo Ginko. (Amended, May, 1905.)

Article 48. The debentures shall be redeemed within the term of thirty years reckoned from the year of their issue, and the redemption may be effected by the process of drawing lots, according to the convenience of the Bank. An exception may be made, however, in the case of redeeming the debentures issued by virtue of Article 12-2 of the Law of the Nippon Kogyo Ginko. (Amended, May, 1905.)

Article 49. If debentures or interest-coupons are reported to be destroyed, lost or stolen, the Bank shall make a public announcement and not until they have been declared void of value shall the Bank deliver new debentures or interest-coupons. In the case of registered debentures the rules laid down in Articles 11, 12, 13 and 14 shall be applied.

The expense connected with the issue of a public announcement shall be borne by the owner of the said debentures or interest-coupons.

Article 50. When registered debentures are converted into unregistered, or *vice versa* or when new debentures are delivered in place of debentures which have been either destroyed, lost, stolen, defaced or mutilated, the Bank shall demand a fee of thirty yen for each debenture.

When the names registered on debentures are to be changed, a fee of fifteen yen shall be demanded for each debenture.

Article 51. Should the Bank find that loans made by it, which constitute the basis of the debentures issued, are not paid back as stipulated, or should it fail to obtain full redemption of the debentures of companies which it holds, it shall redeem a part of its own debentures so as to reduce their total amount by an amount corresponding to the said unpaid loans or unredeemed debentures of companies; or, as an alternative, it shall make good the above deficit with other negotiable instruments.

Article 52. Should national loan-bonds, prefectural or municipal loan-bonds or the debentures of companies owned by the Bank depreciate in value below the required limit laid down in Article 46, the Bank shall make good the deficit either by furnishing other national loan-bonds, prefectural or municipal loan-bonds, or the debentures of companies; or by redeeming such an amount as shall restore the prescribed balance. (Amended, May, 1905, and May, 1911.)

CHAPTER VIII.

ACCOUNTS.

Article 53. The business year of the Bank shall be from January to June and from July to December of each year.

The President shall, at the end of each business year, draw up the balance sheet of debit and credit, the business report, as well as the various accounts; and shall prepare a list of assessed properties, the profit and loss account and the proposed rate of dividend to be declared, all of which documents shall be presented to the Ordinary General Meeting of Shareholders.

Article 54. Concerning the method of dividing the profits, the Bank shall first deduct from the gross profits the various payments to be made, the interest to be paid, the salaries and travelling expenses and all other business outlays as well as the various losses if any and then taking the remaining amount as the net profit, shall divide it as follows:—

1. Eight per cent or more of the net profit, as a reserve against losses.
2. Two per cent or more of the net profit, as a dividend equalization reserve.
3. After the above two items have been deducted, an amount corresponding to five per cent per annum of the paid-up capital of the Bank shall be set apart from the remaining portion of the net profit and shall be regarded as the first dividend to be declared.
4. After the above three items have been deducted, ten per cent. or less of the remaining portion of the net profit shall be set apart as a bonus to the Chief Officers of the Bank; and if, after these four items have been deducted, there be any remaining portion, it shall be divided among the shareholders as a second dividend, or appropriated to a special reserve fund or transferred to the next year's accounts. (Amended, January, 1903.)

Article 55. Should the net profit of the Bank, after subtracting the appropriations for the first and second reserves mentioned in the preceding Article, fall short of a sum representing five per cent of the paid-up capital, then the Bank shall receive from the Government a subsidy sufficient to enable the Bank to pay a dividend of five per cent; and the period of the Government's liability under this article shall be limited to 5 years, reckoned from the Bank's first business-year.

Article 56. The reserve against losses is intended to make up any deficit in the capital of the Bank caused by losses in business.

The dividend equalization reserve is intended to ensure as far as possible the payment of a uniform rate of dividend not less than five per cent.

During five years reckoned from the first business year, the reserves mentioned in the foregoing paragraphs shall be applied only in the event of a deficiency still remaining after the stipulated Government subsidy has been received.

Article 57. The Bank may not divide any profit among its shareholders without the permission of the Minister of State for Finance.

The date of the payment of dividends shall be fixed by the President, and a notification shall be issued to the holders of registered shares and an advertisement shall be made. (Amended, February, 1906.)

Appendix XIV.

Extracts from the Report to the Board of Trade by the Committee appointed to investigate the question of Financial Facilities for Trade.

2. In view, however, of statements made by witnesses, it is desirable that we should state clearly our definitions of banking facilities in the British sense, and of what we would call by the wider name of financial facilities. The former are properly limited to those which can be provided without a "lock-up" such as would impair the liquidity of funds and deposits at call and short notice. For this reason the usual practice of bankers here is to confine their advances as a rule to a currency not exceeding a few months. By financial facilities we mean, generally speaking, those which would involve a longer currency than this.

3. A careful study of the evidence above referred to, and our own knowledge of banking arrangements and facilities, lead us to the conclusion that there exists to a considerable extent at the present time in this country the machinery and facilities for the finance alike of home trade and of large overseas contracts, and for carrying through much of the business which has been done by foreign banks. The British banks afford, we believe, liberal accommodation to the home producer. British bankers are not shy in making advances on the strength of their customers' known ability and integrity, and the charges for accommodation are we believe often lower than the corresponding charges in foreign countries. Similarly, the Colonial banks and British-Foreign banks and banking houses render immense assistance to British trade abroad, and certainly in the Far East and in many parts of South America British banking facilities do not fall short of those of any other nation. We find also that in the case of large contract operations British contractors with the assistance of Financial Houses have in the past been ready to provide large amounts of capital and to take considerable risks in connection with the operations which they have undertaken.

4. Our arrangements, however, are faulty in our not co-ordinating many of the facilities mentioned in the previous paragraph. We recognise also that the British manufacturer may be frequently in want of finance of a kind which a British Joint Stock Bank with liabilities as above described could not prudently provide, whereas the German Banks in particular seem to have been able to afford special assistance at the inception of undertakings of the most varied description, and to have laid themselves out for stimulating their promotion and for carrying them through to a successful completion. We conclude therefore that there is ample room for an Institution which, while not interfering unduly with the ordinary business done by the British Joint Stock Banks, by Colonial Banks, and by British-Foreign Banks and Banking Houses, would be able to assist British interests in a manner that is not possible under existing conditions.

5. Such an Institution might in many ways be beneficial to the development of British industry and manufactures. It might in certain cases, after careful examination, agree to make advances for the extension of existing manufacturing plant, or perhaps for the amalgamation or co-ordination of certain works so as to reduce the cost of production. It would assist these works to obtain orders abroad, and give them reasonable financial facilities for executing these orders. It should give a preference in matters of finance to orders which are to be executed in this country.

6. Such an Institution could also take a leading part in the inception of transactions and assist in connection with the machinery of overseas business. In the case of German manufacturers it frequently happens that on the Board of the manufacturing company there is a representative of a bank, and there seems little doubt from an examination of the information which is available that the German banks have exercised an amount of control over the manufacturing concerns in which they are interested, which would not be possible, even if it were desirable, in the United Kingdom. A large number of our manufacturing undertakings are wealthy concerns and would not tolerate for one moment interference by bankers in their affairs, and indeed would probably resent any enquiry into the nature of their business arrangements. Such manufacturing concerns however do require assistance when they transact overseas business. Take as a single instance the case of a Midland manufacturer selling goods to Italy. The Italian buyer has been accustomed to long credit, and if long credit is refused the business will probably be impossible. The manufacturer sells goods for, say £50,000 and the payment of that price would leave him with a considerable margin of profit, but the offer of the Italian buyer to pay him the equivalent of £50,000 in lire at six or twelve months is not attractive. He would much rather accept a lower figure than £50,000 for a clean cash transaction in sterling, and it is in connection with such business as this that an Institution of the kind contemplated would be able to act as intermediary (taking part or the whole of the financial liability) with profit to itself and satisfaction to the manufacturer.

7. Or to take another case, that of a contractor who has entered into a contract with a foreign Government, payment being made as works proceeded, such payment being possibly in paper in a foreign currency, the contractor in that circumstance would willingly share his profit with an Institution which would be responsible for the finance of the securities receivable by him.

8. It would be essential in conducting business with manufacturers and merchants, that the Institution should draw and accept bills, and it should generally be in a position to undertake credit operations. It might be well to provide that a certain portion of uncalled capital or a portion of paid-up capital (if it is deemed wise to have all called up) should be reserved against this class of risk.

9. If an Institution is formed to carry out transactions of the kinds indicated in paragraphs 5 to 8 above, it follows that it must be equipped with knowledge of affairs in the countries with which it may do business, and its managers must, by personal visits, acquaint themselves with the conditions of business in all important foreign centres. It must have either branches or agencies in those countries, and in this connection the exceptional position held by British-Foreign and Colonial Banks should be fully availed of. Instead of having to organise, as was the case with German Banks, new subsidiary undertakings, the Institution would largely use, under agreement, the existing banks and the facilities which they can afford.

10. The Institution must be equipped with an up-to-date Information Department and this will of necessity play a large part in its usefulness and financial success. This might properly be called a Bureau d'Etudes, independent of the Commercial Intelligence Branch of the Board of Trade, but in close touch therewith and under agreement entitled to all possible facilities.

* * * * *

18. If financial assistance is given by the Government to undertakings in connection with what are known as "key" industries, the business should, if possible, be done through the medium of the Institution, and it should be appointed an agent for carrying through foreign commercial and financial transaction in which the Government may be interested.

19. Foreign banks have, in most of their operations, adopted the course of forming syndicates to undertake any business of considerable magnitude. They have headed such syndicates and they have taken the labouring oar in connection with investigations. The members of the syndicate have generally included other banks, and associated with them have been those who were particularly interested in the class of business proposed to be done. These syndicates are formed after the first superficial enquiry has satisfied the banks that there is apparently a good business to be done. Directly this point is reached, the expenditure in connection with thorough investigation is on account of the syndicate. If the business is ultimately proceeded with, the profits or losses on the wind-up of the business are shared *pro rata* after allowance to the bank for management. Some such procedure should be followed here. It would enable the Institution to undertake business of a comprehensive character, and its "imprimatur" would have value when issues were made to the public.

* * * * *

21. In the financial operations of the Institution the desirability of assisting British trade and of placing with British manufacturers orders in connection with new undertakings should be always borne in mind.

22. It is desirable that the Institution without coming under Government control should receive as much official recognition as possible. Our Foreign Office should, for instance, be asked to instruct British Embassies and Legations abroad to put the Institution's representatives in contact with all Commercial Attaches, Consuls, etc., with clear instructions to them that the Institution is a commercial concern enjoying the full confidence and approval of the Government; and similar instructions should be given by the Board of Trade to their Trade Commissioners in the Dominions.

23. Having ascertained ourselves that the creation of an Institution of the character referred to above would not unduly interfere with existing Banks, Banking Houses, or Financial Institutions, we recommend the formation of a new Bank to fill the gap between the Home Banks and the Colonial and British-Foreign Banks and Banking Houses, and to develop facilities not provided by the present systems.

24. The Bank should be called the "British Trade Bank" and should be constituted under Royal Charter.

Its chief features should be as follows:—

- (I) It should have a capital of £10,000,000. The first issue should be from £2,500,000 to £5,000,000 upon which in the first instance only a small amount should be paid up, but which should all be called up within a reasonable time. A further issue should be made afterwards, if possible, at a premium.
- (II) It should not accept deposits at call or short notice.
- (III) It should only open current accounts for parties who are proposing to make use of the overseas facilities which it would afford.
- (IV) It should have a Foreign Exchange Department where special facilities might be afforded for dealing with bills in foreign currency.
- (V) It should open a Credit Department for the issue of credits to parties at home and abroad.

- (VI) It should enter into banking agency arrangements with existing Colonial or British-Foreign Banks wherever they could be concluded upon reasonable terms, and where such arrangements were made, it should undertake not to set up for a specified period its own Branches or Agencies. It should have power to set up Branches or Agencies where no British-Foreign Bank of importance exists.
- (VII) It should inaugurate an Information Bureau upon the lines indicated in paragraphs 10 and 11.
- (VIII) It should endeavour not to interfere in any business for which existing Banks and Banking Houses now provide facilities, and it should try to promote working transactions on joint account with other Banks, and should invite other Banks to submit to it new transactions which, owing to length of time, magnitude or other reasons, they are not prepared to undertake alone.
- (IX) Where desirable, it should co-operate with the merchant and manufacturer and possibly accept risks upon joint account.
- (X) It should become a centre for syndicate operations, availing itself of the special knowledge which it will possess through its Information Bureau.
- (XI) It should receive Government assistance in the ways referred to in paragraphs 18 and 22.

25. We are of opinion that there are strong reasons why the Bank should be formed without delay so that preliminaries may be completed before the War is over. Our enemies are sure to make at the earliest moment strenuous efforts to regain their position in the world of commerce and finance, and it may well be that when peace comes, unemployment may be rife at home unless new markets are exploited. It seems to us desirable, therefore, to ascertain in advance the requirements of foreign countries and the whereabouts of raw materials for our industries.

26. We believe that a Bank constituted upon the above bases, with efficient management, should not only be a great boon to British trade but should prove a commercial success.

* * * * *

Appendix XV.

Extracts from the Charter of Incorporation of the British Trade Corporation.

* * *

II. The Institution hereby incorporated (hereafter in this Our Charter referred to as "the Corporation,") shall be established for a term of sixty years commencing from the date of this Our Charter for the purpose of carrying on the businesses of trading and banking in any part of the world, either by branches, agencies or otherwise, and particularly (but without restricting the general scope of such businesses in any of their branches) with the following powers, objects and rights which shall nevertheless be exercised at all times subject to due conformity with the laws of the respective countries concerned, with due regard to the interest of Our Government:—

- (a) To act as agents for any Governments or Authorities, or for any Bankers, Manufacturers, Merchants, Shippers and others, and to carry on agency business of any description including the power to act as attorneys and to give discharges and receipts.
- (b) To carry on business as Contractors, Merchants or Traders on their own account.
- (c) To promote or finance or to assist in the promotion or financing of businesses and undertakings of any description, and to develop and prove the same, either through the instrumentality of syndicates or otherwise, and to act as an Issuing House.
- (d) To enter into any partnership or other arrangements for sharing profits or on joint account.
- (e) To acquire and hold or dispose of any shares, stock, bonds, obligations, debentures, debenture stock, scrip or other securities or interests of any Companies, Trusts, or Corporations, or of any Governments, States, Provinces, Municipalities or other authorities.
- (f) To acquire and hold or dispose of any interest in any Railways, Tramways, Ships, Canals, Docks, Harbours, Armament Works, Ship Building Establishments, Irrigation Works, Electrical Works, Gas Works, Water Works, and in addition any carrying, transporting, trading, industrial, agricultural, financial, or manufacturing works, concerns, or business of any description, and to carry on the same.
- (g) To acquire and hold any interest in and to develop the resources of, and turn to account, deal with, pledge, and dispose of any territories, forests, mineral fields or other lands, possessions, buildings or property, real or personal, immovable or movable, in any part of the world, including lands, buildings and other hereditaments in the British Islands notwithstanding the provisions of any Statutes of Mortmain or any other statutes or laws to the contrary.
- (h) To undertake and execute any Trusts and to act as Executors, Administrators, Receivers and Treasurers, and to give any guarantees.
- (i) To obtain, work or dispose of any Concessions, Charters, Acts of Parliament, or other legislative rights, Monopolies, Licenses, Patents, Copyrights or other privileges or advantages.
- (j) To establish and maintain Information and Investigation Bureaux, and to collect statistics, returns, particulars and information likely to prove useful for the consideration of business and financial propositions, and to undertake experimental and research work.
- (k) On behalf of any Governments, Authorities or Corporations to keep any registers relating to any stocks, shares, debentures, debenture stock, or securities, and to undertake any duties in relation to the registration of transfers, issuing of certificates, or otherwise.

* * *

IV. In any cases in which as the result of arrangements between Our Government of the United Kingdom and any other Government whether the Government of a British Possession or Protectorate or a Foreign Government, Our Government is desirous that British capital shall participate in financial operations not falling within the terms of any agreements or arrangements with other parties which may be existing at the date of this Our Charter and requires an agent for the representation of British interests so far as relates to trade or finance, We do hereby, but without in any way limiting or modifying the powers and rights by this Our Charter elsewhere conferred, grant and confer on the Corporation the right in such cases of being such agent of Our Government provided nevertheless that Our Government shall be entitled to appoint another agent or other agents and either in lieu of or in addition to the Corporation in any special case in which such a course shall appear to Our Government to be necessary or expedient.

V. The Share Capital of the Corporation shall be the sum of Ten million pounds sterling, with power to the Corporation from time to time by Extraordinary Resolution as defined by the Deed of Settlement hereinafter referred to, to increase such Share Capital, and with power to borrow or pledge the credit of the Corporation to such amount and in such manner as the said Deed of Settlement shall from time to time provide.

VI. The Corporation shall not commence business until at least £1,000,000 sterling of the capital has been subscribed, and at least one-fourth part of that sum has been actually paid up.

IX. The Corporation shall be regulated in accordance with a Deed of Settlement, the draft of which shall be approved by the Lords Commissioners of our Treasury before it is executed and if the Lords Commissioners of Our Treasury certify to Us that the draft so approved is not executed within twelve months after the date of this Our Charter, it shall be lawful for us, Our Heirs and Successors, at any time thereafter, by writing, under Our Great Seal, to declare this Our Charter be absolutely void.

X. Such Deed of Settlement shall contain provisions for the head and controlling office of the Corporation being in England, for the Corporation being regulated by a controlling Board of Directors in England, for the holding in England of the controlling Board and General Meetings of the Corporation, and for Special and Extraordinary Resolutions being passed in like manner as Special and Extraordinary Resolutions under the Companies (Consolidation) Act, 1908, or any statutory modification or re-enactment thereof, for the prohibition of the issue of share warrants to Bearer, for the keeping of a Register of Members and a Register of Mortgages, for the making of returns to Our Board of Trade, for the publication of Statements, for the Corporation allowing inspection to be made of the Register of Members and the Register of Mortgages and furnishing copies of the Register of Members and of the matters comprised in the Corporation's returns to Our Board of Trade, for the notification to Our Board of Trade of the situation of the head and controlling office of the Corporation and of any change therein (which provisions We hereby Ordain shall not be altered without the consent of Our Board of Trade). Subject to such provisions as aforesaid being made and retained, unless altered with such consent as aforesaid, the Deed of Settlement may be altered by Special Resolution of the Corporation, Provided always that such alterations shall not be contrary to anything in this Our Charter contained.
