QUESTIONS FOR THE ASSISTANCE OF WITNESSES.

I.—FINANCIAL AID TO INDUSTRIAL ENTERPRISES.

1. Please state if you have had any experience of the raising of capital for industrial enterprises?

If so, what difficulties have you found in doing so?

What suggestions have you to make for removing these difficulties?

2. What are the sources from which capital for industrial enterprises is principally drawn?

2 (a). Can you suggest any new sources from which capital may be drawn?

3. Do you know of any kinds of industrial enterprises where more concerns have been started than can be maintained in full time employment?

If so, please describe the general conditions.

4. What is your knowledge or experience of financial aid by Government to industrial enterprises? Government assistance.

5. What are your opinions on the following methods of giving Government aid to existing or new industries :—

- (1) money grants-in-aid;
- (2) bounties and subsidies;
- (3) guaranteed dividends for a limited period, with or without subsequent refund to Government of the expenditure incurred in paying dividends at the guaranteed rate;
- (4) loans, with or without interest;
- (5) supply of machinery and plant on the hire-purchase system;
- (6) provision of part of share capital of companies on the same basis as public subscriptions of capital;
- (7) guaranteed or preferential Government purchase of products for limited periods and
- (8) exemption for a limited period of the profits of new undertakings from income-tax; and exemption from any tax on an industry, or on any article used in an industry?

6. In which methods of Government assistance should there be Government control or supervision?

What should be the form of such control or supervision? (*E.g.*, Government audit or appointment of Government directors with defined powers for the period during which direct assistance lasts.)

7. What is your experience or opinion of Government pioneer factories?

Pioneer factories.

[NOTE.—By pioneer factories are meant those established primarily to ascertain whether a new industry is commercially practicable.]

By demonstration factories (see Questions 19 and 20) are meant those established primarily for giving demonstrations of, and instruction in, improved methods for industries which have been proved to be commercially practicable.]

8. In what ways and to what extent should Government pioneer industries?

At what stage should pioneer factories be either closed or handed over to private capitalists or companies?

What limits and restrictions, if any, should be imposed on the conversion of successful pioneering experiments into permanent Government enterprises?

9. In your experience what industries are hampered by the conditions under which they are financed as going concerns? Financing agencies.

Please describe the method of financing and its effect on the industry in each case.

10. In what ways is it possible to give more assistance to industrial undertakings by existing or new banking agencies?

10 (a). Do you think there is need of a banking law?

[See also question 39.]

11. Do you know of any industries which have been developed or assisted by the formation of co-operative societies? Co-operative societies.

What were the exact means adopted and what were the results obtained?

12. In your experience what are the industries for which co-operative societies should be encouraged?

What should be the organisation and special objects of these Societies?

12 (a). What suggestions have you to make for industrial development by means of Trade Guilds, such as exist in other countries?

How far should the State encourage the promotion of such Guilds?

Limits of Government assistance.

13. What principles should be followed in order to prevent Government aid competing with existing, or discouraging fresh, private enterprises.

14. Should there be any limitations on Government aid to a new enterprise if it competes with an established external trade?

II.—TECHNICAL AID TO INDUSTRIES.

Technical aid in general.

15. What is your personal knowledge or experience of technical and scientific aid provided by Government to industrial enterprise?

16. What is your personal knowledge or experience of noticeable benefits received by local industries from researches conducted by Government departments?

17. On what conditions should the loan of Government experts be made to private firms or companies?

18. Under what restrictions and conditions would you allow publication of the results of researches made by a Government paid expert while attached to a private business?

Demonstration factories.

19. Can you suggest any industry for which Government demonstration factories should be adopted and on what lines? (See note below Question 7.)

20. Should any demonstration factories be instituted in your province?

Research abroad.

21. What has been your experience of the aid afforded by the Scientific and Technical Department of the Imperial Institute?

What are its advantages and disadvantages?

22. In addition to arrangements made for research in India, is it advantageous to have provision for research for special subjects in the United Kingdom?

If so, for what special purposes is it advantageous to conduct researches in England rather than in India?

23. In what ways can the Advisory Council for Research in the United Kingdom give assistance to Indian industries?

24. Can you suggest for this country any system, similar to that of the Advisory Council for Research in the United Kingdom, for referring research problems to Colleges and other appropriate institutions in India? (See Questions 75 and 76.)

Surveys for industrial purposes.

25. Does the existing knowledge of the available resources of the country—agricultural, forest, mineral, etc.—require to be supplemented by further surveys?

26. How should such a survey be organised?

What should be its precise objects?

27. How should its results be made most useful to industries?

27 (a). What is your experience or opinion of the value of Consulting Engineers appointed by Government to aid industrial enterprise by technical advice and by the supply of plans and estimates?

(b) Should such Consulting Engineers be allowed to undertake the purchase of machinery and plant for private firms or individuals? If so, under what conditions?

[See Question 63 *et seq.*]

III.—ASSISTANCE IN MARKETING PRODUCTS.

Commercial museums.

28. What is your experience or opinion of commercial museums, *e.g.*, that in Calcutta?

29. If you think commercial museums should be developed and increased in number, what suggestions have you to make regarding their situation, arrangement and working?

Sales agencies.

30. What is your experience or opinion of sales agencies or commercial emporia for the sale as well as the display of the products of minor and unorganised cottage industries?

How should they be developed?

Exhibitions.

30 (a) Would travelling exhibitions of such industries be of advantage?

31. What is your opinion or experience of the value of industrial exhibitions?

32. Should Government take measures to hold or to encourage such exhibitions?

If so what should be the Government policy?

33. What should be the nature of such exhibitions?

Should they be popular in character, or should they aim merely at bringing sellers and buyers into contact?

34. Should trade representatives be appointed to represent the whole of India, in Great Britain, the Colonies and Foreign Countries? Trade representatives.

What should be the qualifications of these trade representatives?

How should their duties be defined?

35. In addition to these trade representatives would it be suitable in some cases also to have temporary Commissions for special enquiries?

36. Should provinces in India itself have trade representatives in other provinces?

How should such representation be arranged for?

37. Should the principal Government departments which use imported articles publish lists of these articles, or exhibit them in commercial museums? Government patronage.

38. With reference to the encouragement of Indian industries, have you any criticisms to offer regarding the working of the present rules relating to the purchase of stores by Government departments?

Have you any changes to propose in the rules themselves?

39. In what way is it possible to assist in marketing indigenous products by more banking facilities, either through existing agencies (such as the Presidency Exchange, Joint Stock and Co-operative Credit Bank) or through new agencies (such as Industrial and Hypothec Banks)? (see also Question 10.) Banking facilities.

IV.—OTHER FORMS OF GOVERNMENT AID TO INDUSTRIES.

40. What conditions should control the supply of Government-owned raw materials (e.g. forest products) on favourable terms? Supply of raw materials.

41. Is there any check at present imposed on industrial development in your province by the land policy of Government? Land policy.

If so, what remedies do you suggest?

(NOTE.—The expression "land policy" is intended to cover laws and regulations relating to settlements, the Government assessment, rents, tenant rights, permission to use land for industrial purposes, and generally all matters connected with the ownership and use of land.)

42. On what principles should Government give concessions of land for the establishment of new, or the development of existing, industries?

43. What criticisms have you to make regarding the working of the present law for the acquisition of land on behalf of industrial companies?

What modifications of the law do you recommend?

43. (a) In what ways and on what terms can Government assist in the provision of subterranean or surplus surface water for industrial purposes.

V.—TRAINING OF LABOUR AND SUPERVISION.

44. (a) Do you think that the lack of primary education hinders industrial development? General.

(b) What has been done in any industry of which you have had experience to improve the labourers' efficiency and skill?

45. What steps do you consider should be adopted to improve the labourers' efficiency and skill—

(a) generally, and

(b) in any industry of which you have had experience?

46. What special knowledge or experience have you of the training of apprentices in factories and workshops? Apprenticeship system and industrial and other schools.

47. What advantages have you observed to follow from the establishment of industrial schools?

48. On what lines should these two systems of training (e.g., apprenticeship system and industrial schools) be developed and co-ordinated?

49. What has been your experience of day schools for short-time employees, or of night schools?

How should these be developed?

50. Should industrial and technical schools and commercial colleges be under the control of the Department of Education or of a Department of Industries?

What measures should be adopted in order that these two departments should work in unison in controlling industrial schools?

51. What measures are necessary for the training and improvement of supervisors of all grades and of skilled managers? Training of supervising and technical staff.

52. What assistance should be given to supervisors, managers and technical experts of private firms to study conditions and methods in other countries? (See Question 77.)

53. In what circumstances and under what conditions should industries assisted by Government be required to train technical experts?

Mechanical
engineers.

54. Is there a want of uniformity in the standard of examinations for mechanical engineers held in the various provinces where engineers in charge of prime movers are required in certain cases to be certificated?

If so, should measures be adopted to make such tests uniform so that the Local Governments and Administrations may reciprocate by recognising each other's certificates?

55. If the law in your province does not require any qualifications in an engineer in charge of a prime mover, have you any criticisms or suggestions to make?

VI.—GENERAL OFFICIAL ADMINISTRATION AND ORGANISATION.

56. What provincial organisation exists in your province for the development of industries?

What criticism have you to make regarding its constitution and functions?

57. What organisations do you recommend for the future development of industries in your province?

Should there be a Board of Industries?

If so, what should be the functions of such a Board?

Should it be merely advisory or should it have executive powers with budgetted funds?

58. If you recommend an Advisory Board, how should it be constituted?

59. If you recommend a Board with powers, what should be its constitution and how should its powers be defined?

60. Should there be a Director of Industries?

What should be his functions?

Should he be a business man, or a non-expert official, or a technical specialist?

What other qualifications should he possess?

61. If you recommend both the formation of a Board of Industries and the appointment of a Director of Industries, what should be the relations between the Board of Industries, the Director of Industries and the Provincial Government or Administration?

62. What form of machinery do you propose in order to correlate the separate activities of the various provinces as regards industries?

Is it practicable to form an Imperial department under a single head?

If so, what should be the functions of such a department?

62 (a). Should there be special measures taken or special sections of a Department of Industries organised for the assistance of cottage industries?

62 (b). Please explain in detail what should be the Government policy as regards cottage industries and how it should be carried into effect? In this connection, see especially Questions 11, 30, 64 and 72.

62 (c). What cottage industries do you recommend should be encouraged in this way?

VII.—ORGANISATION OF TECHNICAL AND SCIENTIFIC DEPARTMENTS OF GOVERNMENT.

63. Are there in your province any technical and scientific departments which are capable of giving assistance to industries?

If so, what criticisms have you to make regarding their organisation?

What changes do you recommend?

64. In order to aid industrial development do you recommend the formation of any new Imperial Scientific and Technical Departments?

If so, for what subjects or natural groups of subjects?

65. How should such an Imperial department be constituted and recruited?

66. What should be the powers of the head of the department?

If he has executive control of the department, what should be his relationship to the Imperial Government?

67. What should be the relationship of an expert, whose services are loaned by the Imperial department to a Local Government, with the Local Government and the latter's Department of Industries?

68. For what subjects should Local Governments engage their own experts or organise their own technical and scientific departments?

69. Under what direct control should these experts and departments be placed?

70. On what terms should these experts be employed?

71. What is the most suitable way of developing technological research institutions, such as the Indian Institute of Science?

71 (a). Should there be a Technological Institute for each province, and should such Institutes be allowed to develop as independent units or should they be fitted into a general development scheme for the whole of India, with a central Research Institute?

Cottage Industries.

General.

Imperial department.

Provincial Departments.

Technological institutions.

72. As regards investigation and research should each Institute be general in its activities and interests, or should each deal with limited group of related subjects?

73. Should there be any Government control?

If so, should this control be Imperial or should it be purely provincial or local?

74. Is it desirable that measures should be taken to co-ordinate and prevent unnecessary Co-ordination of overlapping of the research activities in Government Technical and Scientific Departments, research, special Technological Institutes and University Colleges?

If so, what are your suggestions?

75. What noticeable results have followed from the institution of the Indian Science Congress?

76. Can you suggest any ways in which the Congress might become more useful in assisting industrial development? (See Question 24.)

77. What encouragement should be given to Government technical and scientific experts to study conditions and methods in other countries? (See Question 52.) Study of foreign methods.

78. What difficulties have you experienced in consulting technical and scientific works of reference? Reference libraries.

79. Have you any suggestions to make regarding the establishment of libraries of such works?

80. Do you think that the establishment of a College of Commerce is necessary in your province? Colleges of commerce.

If so, on what lines should it be organised?

81. In what ways do you expect such a college to assist industrial development?

81 (a). In what ways can Municipalities and Local Boards assist in promoting industrial and commercial development?

VIII.—GOVERNMENT ORGANISATION FOR THE COLLECTION AND DISTRIBUTION OF COMMERCIAL INTELLIGENCE.

82. Have you any criticisms to offer on the present system of collecting and distributing statistics by the Director of Statistics?

What changes do you suggest?

83. Have you any criticism to offer on the present system of collecting and distributing commercial intelligence by the Director-General of Commercial Intelligence? Commercial intelligence.

What modifications do you suggest?

84. What advantages have you found in the issue of the "Indian Trade Journal"? Industrial and trade journals.

85. Should Government establish or assist industrial or trade journals, either for general or special industries, which would be of real use to persons actively engaged in industries?

86. What proposals do you make for the dissemination of information of this kind through the various vernaculars?

87. What advantages have you known to follow the issue of special monographs on industrial subjects or publications like those of the Forest and Geological Departments? Other publications.

What measures do you advise in order to increase the usefulness of these publications?

88. Are there any other directions in which Government could collect and publish information of a kind likely to assist industries and trades?

IX.—OTHER FORMS OF GOVERNMENT ACTION AND ORGANISATION.

89. Are there any products for which a system of Government certificates of quality should be established? Certificates of quality.

For what products should such certificates be compulsory, and for what products voluntary?

90. What should be the organisation for testing each class of products and granting certificates?

91. Are there any classes of materials for manufacture or of manufactured articles for the adulteration of which penalties should be imposed? Prevention of adulteration.

92. For each such class of goods what organisation do you suggest for purposes of inspection and prosecution of offenders?

93. Have you any other suggestions to make in regard to the prevention of misdescription of goods generally? Misdescription.

94. What is your opinion on the present state of Indian law relating to marks and descriptions of proprietary and other articles of trade? Trade marks and trade names.

95. Have you any criticisms or suggestions to make regarding the existing law and regulations relating to patents? Patent laws.

Registration of
partnerships.

96. Is it desirable and practicable in the interests of trade, to introduce a system of registration or disclosure of partnerships?

Roads, railways
and waterways.

97. To what extent does the lack of transport facilities by road, rail or water hinder industrial development in your province?

Have you any specific recommendations to make?

98. Have you any criticisms to offer regarding railway freights, the classification of goods, the apportionment of risk, and the regulation of rates?

What are your proposals?

99. Are there any railway extensions necessary in your province to develop new or to extend existing industries?

100. Similarly, are there any waterways which should be constructed, extended or improved?

Shipping freights.

101. Are you aware whether the external trade or internal industries of the country are handicapped by any difficulties or disadvantages as regards shipping freights?

Can you suggest any remedies?

Hydro-electric
power surveys.

102. What has been done in your province towards ascertaining the possibilities of developing hydro-electric power?

Should further investigation be made in this matter?

102(a). Have you any criticisms to make regarding the effect of the Electricity Act on industrial enterprise?

Mining and
prospecting rules.

103. What difficulties have been experienced in the working of the Mining and Prospecting Rules (1918)?

104. Are there any minerals that are essential for industries of imperial importance that ought to be developed at public expense? (*E.g.*, minerals of direct importance for the manufacture of munitions of war, or minerals ordinarily obtained in commerce from one country only.)

Forest Department.

105. From the point of view of industrial enterprise, have you any criticisms to make regarding the policy and working of the Forest Department?

What suggestions do you make.

106. What measures are practicable to reduce the cost of assembling raw forest products?

107. To what extent is it practicable to concentrate special kinds of these in limited areas?

108. What noticeable deficiencies in forest transport are known to you?

What suggestions do you make for their removal?

Jail competition.

109. Have you any complaints to make regarding competition by jail industries?

X.—GENERAL.

110. What suggestions have you to make for the development of any industry in which you have been actively concerned or interested?

111. Does your experience suggest to you any new industry for which India seems peculiarly suited on account of its resources in raw materials, labour and market?

112. What supplies of raw materials are known to you of which the use in industry or trade is retarded by preventable causes?

What are these causes, and how should they be removed?

112(a). Have you any suggestions to make regarding the utilization of waste from raw materials?

112(b). Have you any suggestions to make regarding Government aid in the improvement of raw material, such as, cotton, silk, sugarcane, etc.?

112(c). What industries in the country are dependent on the importation of raw materials and partly manufactured articles from abroad?

113. Do you know of any supplies of raw materials for which there is a good case for investigation with a view to their development?

LAHORE.

MR. R. McINTOSH, *Conservator of Forests, Punjab.*

WITNESS No. 860.

WRITTEN EVIDENCE.

THE only pioneer factory of which I have personal experience is the rosin distillery maintained by the Punjab Government at Jallo some 10 miles from Lahore. This factory is used for obtaining rosin and turpentine by distillation from the crude resin of the chir-pine (*Pinus Longifolia*). The Forest Department first commenced to distil rosin at Nurpur about the year 1900 and afterwards moved its small factory to Shahdara just outside Lahore. The factory was a makeshift one and distillation was effected by the direct heat process. In 1914 the Punjab Government decided to erect an up-to-date distillery at Jallo and purchased a French plant by which distillation is effected by means of steam. The plant cost about Rs. 27,000 and the total expenditure up to date incurred on the plant and buildings has been just under a lac of rupees. The new distillery commenced working in the spring of 1915 and works from 6 to 8 months a year dealing with about 25,000 maunds of crude resin. It can deal with as much as 35,000 maunds of resin if necessary.

The gross profit obtained from working the distillery during the forest year 1916-17 was Rs. 1,44,000 and the net profit on the year's working was Rs. 1,16,000. This pioneer factory has undoubtedly had a good start on account of the peculiar conditions arising out of the European War, as, with freight difficulties, the demand for Indian rosin and turpentine has been very great indeed. At the same time I should like to state that analysis of both the rosin and the turpentine manufactured at Jallo shows that these products are capable of competing with the produce of both America and France.

Jallo rosin is at present fetching as much as Rs. 18 a maund and first quality turpentine can be sold for Rs. 4-6-0 a gallon. So entirely is the trade dependent on Indian rosin and turpentine that higher prices even than these could be secured, but it is not desirable to raise the price of those two products beyond the figure at which American products could be landed in India in pre-war times. There is a demand at present for the entire output of Indian turpentine but some difficulty is already being experienced in disposing of the whole of the rosin within India. The industry is therefore not capable of great expansion until an endeavour is made to introduce Indian products into markets situated outside India. It is proposed to take this matter in hand at once in order to secure the full benefit of existing war conditions.

When Government undertakes to pioneer industries I consider that in cases where the raw material dealt with is private property the action of Government should be confined to starting and working factories until such time as the industry is capable of producing an article suitable to the demand. As soon as that has been effected I consider that any pioneer factory started by Government might well be handed over to private capitalists or companies. Where however the raw material dealt with is already the property of Government I consider that Government is justified in retaining the development of the industry in its own hands and in continuing to utilise to the fullest extent its own raw material. Even where pioneer factories deal with raw materials which is private property there must sometimes be occasions when in order to ensure the continued production of a standard product it is essential that Government should continue to retain the pioneer factories in its hands. In addition to the pioneer rosin factory the Punjab Government in its Forest Department has for some time past been endeavouring to demonstrate the possibilities of certain other industries. These are :—

- (a) Wood pulp.
- (b) Olive cultivation.
- (c) Fruit culture.
- (d) Silk culture.

Regarding wood pulp manufacture the Punjab Government some 8 years ago gave a very considerable concession to a private individual in the shape of fir timber at reduced prices for the purpose of wood pulp manufacture. For various reasons the concessionaire has made no progress with the development of this industry and the concession has recently expired. There is no doubt that in the Punjab hills there is a large amount of timber suitable for the production of wood pulp but this industry is not one which I think the Forest Department could develop by starting a pioneer factory. The details of the manufacture of the pulp are too technical to be undertaken except by specialists and I think that in this respect the development of this industry must await the time when private capitalists or companies are ready to take it up.

Olive culture.

Regarding olive culture the Punjab Government has within the last 6 years been endeavouring to introduce the European olive industry in suitable areas in the Punjab and it now has a hundred acres of well-stocked grafted European olives of ages varying from 6 years downwards. The trees are now beginning to bear fruit and it remains to be seen if the oil or the pickled fruit can compete with European products. Government has spent some Rs. 20,000 on this experimental cultivation and has lately been endeavouring to arrange for a syndicate to take over and extend the area under olive cultivation. Negotiations have however fallen through and Government intends to continue the experiment through the agency of the Forest Department until it is known whether the olive oil and pickled olives are of a quality capable of competing with European products. Should this prove so there are large areas in the western Punjab already under Indian olives which could be converted into European olive gardens and a new industry thus awaits development.

Fruit culture.

Regarding fruit culture during the last 6 years Government has been endeavouring to popularise fruit growing in the hills. With this end in view the Forest Department has planted some 50 acres of orchard in Kulu and has done a considerable amount of work in distributing fruit trees and in grafting village trees throughout Kulu. The orchards are now coming into bearing and are a very valuable property. But it must be admitted that the villagers so far have not shown any signs of being anxious to participate in fruit culture.

Silk culture.

Regarding silk culture the Forest Department for some years has assisted the Salvation Army in its endeavours to reintroduce the silk industry in the Punjab and has allowed the Salvation Army free access to some 9,000 acres of mulberry plantation situated about 40 miles from Lahore. Should the Salvation Army succeed in its endeavours to promote silk culture at Changamanga, the Forest Department will be able to allow the collection of mulberry leaves over another 50,000 acres of mulberry plantations which are being formed at the present time in the various new colonies of the Punjab.

Financing agencies.

In my opinion the wholesale timber trade in the Punjab is seriously handicapped by what I believe is the universal practice of financing this industry on borrowed capital. This prevents the firms engaged in the timber trade from being willing to incur any considerable expenditure except in cases where Government is prepared to give the firms a forest on a long lease. The giving of forests on long leases is generally objectionable as it raises difficulties in the way of ensuring that Government secures its fair share in such rise in the value of timber as may take place during the currency of the lease. The obvious remedy for this state of affairs is that Government should participate in the timber trade and extract departmentally the timber from its own forests, thus avoiding excessive interest charges on the capital used in exploiting its forests.

Industrial surveys.

In the case of forests it is beyond doubt that considerable benefit would be derived by a further survey of the Indian forests. The properties of most of the timbers and of many of the minor products are, speaking generally, quite unknown. I am confident that India (including Burma) possesses many timbers of great value which have hitherto been practically entirely unused because the properties of these timbers are unknown. I may mention two small instances which have come to my notice since war broke out. Oregon pine has been imported into India for many years in large quantities and I have been informed by the Ordnance Department that *chil* timber (*Pinus Longifolia*) is quite as suitable for many Ordnance purposes as Oregon pine. I have also been informed that *kail* timber (*Pinus Excelsa*) has been found very suitable for beer barrels.

A survey of the forest resources of India could in my opinion best be organised through the agency of the Forest Research Institute.

The results of such a survey could be made known to the various industries concerned through the agency of the Forest Research Institute by liberal supplies of samples and by the formation of museums in central localities. Recourse will undoubtedly have to be had in the course of time to sales agents if the various trades are to be brought into touch with forest products. I feel that forest Memoirs and Bulletins do not help much in this respect: they are too technical and are possibly not sufficiently widely available for those chiefly interested to make use of them.

Supply of raw materials.

The Forest Department being officially designated a quasi-commercial department it is difficult to justify the supply on any extensive scale of raw forest products except at market rates in cases other than those of purely pioneer industries. In the case of pioneer industries however as long as the industry remains in the pioneer stage raw forest products may with advantage be supplied at reduced rates. I can however foresee that difficulties will arise in this connection. Industries will be started on the strength of raw produce supplied at nominal rates which cannot hope to develop normally

after the favourable rates are withdrawn. I have before now been approached to grant timber at reduced rates for match-making factories in localities where I am confident the match industry could not pay were market rates for the timber levied.

In the Punjab the official organisation for the development of industries consists in a Director of Agriculture and Industries. In my opinion the combination of Agriculture and Industries is not a happy one. I consider that the development of agriculture and of industries should proceed separately and I think that the development of agriculture and industries in the Punjab is more than one officer can successfully cope with. Even in the case of the development of industries I do not consider that an organisation consisting of a Director of Industries is ideal. No one official is likely to have the intimate acquaintance with the various industries and different allied departments which is essential if rapid progress is to be made. Official organisation.

For a Director of Industries I would prefer to substitute a Director of Industries acting in conjunction with a Board or Committee of Industries recruited from experts in the various departments concerned. This Board or Committee should I consider be merely advisory and might serve in conjunction with a Director of Industries having executive powers with budgetted funds.

I consider that as far as the Forest Department is concerned the necessary provision already exists in the shape of the Board of Scientific Advice, and in the triennial programme of work for officers of the Forest Research Institute which is drawn up and approved by the Board of Forestry prior to the commencement of each triennial period. Co-ordination of research.

I consider that a journal on the lines of the Timber Trades Journal if published in India would certainly be of use not only to the Forest Department but to all persons connected with the timber trade in India. At the present time one province knows little or nothing of timber prices, stocks in hand, timber requirements and methods of handling and distribution in other provinces. Trade Journals.

In the Punjab the great bulk of the timber extracted from Government forests is brought out by water transport. From time immemorial the Punjab rivers had been extensively used for bringing down to the plains timber from the hills. Since the development of the Punjab system of irrigation-canals, complaints have been numerous that the floating power of the Punjab rivers has greatly decreased and at certain seasons of the year some of the rivers are now impracticable for floating timber. On some of the rivers the canals take off a great portion of the water-supply and I think I am right in saying that excepting on the Sirhind and Western Jumna Canals transport of timber on the canals is forbidden on the ground that the canals have not been constructed with this traffic in view. Possibly it may be feasible to remedy this state of affairs by raising and widening bridges, locks, etc., so as to permit of timber traffic in the canals and if this can be done the existing difficulties in extracting timber from the hills will certainly be greatly decreased. Waterways.

The most important point to be brought forward is that industrial enterprise is restricted by the fact that the efforts of the Forest Department to supply raw materials are seriously hampered owing to the policy of financing the operations of the Forest Department entirely from revenue. The work of any one year is in practice restricted to what can be undertaken by the expenditure of a portion of the anticipated revenue of the year. The last available returns for the whole of India show that the work of the Forest Department produces a cash surplus which is 47 per cent. of the gross revenue. Forest Department.

Under those circumstances forest operations on a large scale or such as are not likely to be immediately remunerative are naturally impracticable and the promotion of industrial enterprise inevitably suffers. Were this policy abandoned and were important projects involving considerable capital expenditure financed from loans as is done in the case of the Irrigation Department this hindrance to the development of the forest resources of the province would cease.

The commercial side of the Forest Department is at present entirely undeveloped. The forest officer in the majority of cases is expected not only to grow the timber but also to extract it, place it on the market and obtain the best price possible for it. The result has been hitherto that forest officers have naturally devoted most of their attention to growing timber and have not specialised in any way in extraction or in marketing the timber grown. There ought to be a commercial side of the department with central depôts, sales agents and even commercial travellers in touch with the main timber markets.

In the hills little can be done in the way of concentrating special kinds of trees in limited areas as the cost of forming plantations of any appreciable size is prohibitive and the conditions of aspect, drainage, soil, etc., rarely permit of the artificial formation of large

areas of forest of one species. Where conditions are already favourable in the hills there are already existing extensive stretches of natural forests of one species. In the plains of the Punjab the concentration of special kinds of trees in limited areas has been developed to some extent in the new irrigated colonies. In those areas in order to take the place of large forest areas which have been disforested for colonisation certain areas on the lines of railway have been set apart for plantations of shisham and mulberry and these plantations are intended to supply the surrounding districts with fuel and timber. Some 60,000 acres of these plantations are already in course of formation and one plantation of 10,000 acres at Changamanga on the North-Western Railway has supplied Lahore with its timber and fuel for the last 40 years.

In the plains the chief difficulty of the Forest Department's work is the securing of adequate transport to market of the produce of the forests and this difficulty, already serious, will in time become insuperable unless recourse is had to mechanical transport. Out-of-date forms of transport, such as camels, carts and men, must be abandoned at no distant date. The question of replacing camel transport on the Murree-Rawalpindi road by motor lorries is at present under consideration by the Forest Department. In the hills matters are different. The great bulk of the timber is extracted by water. Much of the timber is converted *in situ* into scantlings and carried by men to the nearest side stream down which it is worked to the main river. Occasionally it is possible at this stage to substitute wire rope carriage for transport by men, but as a general rule our knowledge of lumbering is primitive and we require a better knowledge of mechanical devices for the handling and transporting of timber such as are used in Canada and the United States. We require the services of experts in these matters to advise us and a permanent staff of forest engineers to give effect to the expert's recommendations.

General.

My suggestions for the development of the timber trade industry in the Punjab are :—

- (1) The expenditure of capital for developing the resources of Government forests.
- (2) A survey of the resources of these forests.
- (3) The development of the lumbering and marketing branches of the department by the employment of a special staff for the extraction and marketing of the produce of the forests.

In my opinion there is a considerable opening for the destructive distillation of wood. There are large areas of forests which at present supply little or no valuable timber but which it is quite possible could be profitably worked were destructive distillation introduced.

There is in the Punjab a very large quantity of inferior *chil* timber (*Pinus Longifolia*) of which at present very little use is made and I think that an investigation into the possible products to be obtained by the destructive distillation of such wood might lead to favourable results.

ORAL EVIDENCE, 17TH DECEMBER 1917.

Sir F. H. Stewart.—Q.—You are Conservator of Forests in the Punjab?—A.—Yes.

Q.—Are you the only one?—A.—Yes.

Q.—With what department of the Local Government do you have relations?—A.—Revenue Department.

Q.—Can you tell us what your staff is; I don't mean in the forest, but your office staff. Have you got anyone in your office who deals with commercial questions?—A.—I do it all myself. I have a Personal Assistant who remains permanently in head-quarters, but everything of importance is sent to me in camp. I am very rarely in headquarters.

Q.—How long in the year do you tour?—A.—I should think 8 to 9 months.

Q.—You tell us about this Government distillery here. Do you manage that?—A.—No, it is managed by the Divisional Forest Officer, an Imperial Forest Officer.

Q.—It makes a very large profit; does that go into the general Provincial funds, or is it earmarked for forest purposes?—A.—It goes into Provincial revenues.

Q.—Are there similar distilleries elsewhere? Is there not one in the United Provinces?—A.—That is the only other one.

Q.—That is a Government monopoly too?—A.—Yes.

Q.—Do you come to an arrangement with them about your selling prices?—A.—Yes, for the last two years we have had an arrangement by which the Manager of the United Provinces distillery sells the produce of both distilleries. That arrangement came into force in order to avoid the two distilleries competing.

Q.—Is he a Forest officer or a commercial man?—A.—No, he is an engineer. He was State Engineer in Manipur, and is not a member of the Forest Department.

Q.—Do you think you are perhaps getting your prices up too high?—A.—I admit that, but the prices are arranged entirely by the Manager of the Bhowali distillery, who is Joint Sales Manager.

Q.—It might react after the war?—A.—I admit that also, but if we don't accept those prices, the middleman will take the profit.

Q.—Who are your principal customers?—A.—The products mainly go down to Calcutta; a considerable quantity goes to Madras, but the majority to Calcutta.

Q.—You think it is advisable, if not necessary, that it should remain in Government hands, under Government management?—A.—Yes, I think it advisable.

Q.—Then you say that you are finding some difficulty now to dispose of the whole of your resin, and you think that the markets outside India should be tapped?—A.—Undoubtedly.

Q.—Do you think that Government should become an exporter?—A.—Government will have to pioneer the exporting, find the markets and take up exporting. There is undoubtedly at present no demand in India for the whole of the resin which we can produce. The turpentine is easily saleable.

Q.—You have certain recognised firms with whom you deal as sale agents?—A.—Yes.

Q.—Through the manager at Bhowali?—A.—Yes.

Q.—Then you tell us about the attempts that were made to introduce wood pulp manufacture. Those have not been very successful?—A.—The one attempt made in the Punjab has fallen through.

Q.—Do you think that wood pulp manufacture here can compete with manufactures from Burma and other parts of India?—A.—In the Punjab it is very greatly handicapped by the difficulties in extracting wood from the hills; whereas the grass and bamboos are on the plains, which is a very great start.

Q.—Did the project here ever materialise at all?—A.—The concession was given, and the concessionaire failed to make a start. He was given 3 years in which to make a start, and he failed to start the industry.

Q.—Where was he going to manufacture?—A.—In the Punjab. He was to put up plant on one of the canals, and he was to use the power from the canal, and he failed to do so.

Q.—He was not going to manufacture on the spot?—A.—Oh! no; the wood was to come down from the hills, and from the nearest point on the river he was going to have a light railway to the canal, where he was going to put up his plant.

Q.—Is the project going to be persevered with?—A.—At the present moment there is another concessionaire endeavouring to secure a concession; but I have recommended that until the war is over, it is not advisable to give a similar concession. No orders have been passed on that yet.

Q.—With reference to what you say about olive culture, that is an experiment which you think Government should prove, and then get private enterprise to take up?—A.—Undoubtedly.

Q.—And similarly with regard to fruit?—A.—Undoubtedly.

Q.—Is it Government land on which you are trying these experiments?—A.—Yes.

Q.—Your attitude is a little different towards those projects from what it is towards distilling?—A.—In the case of distillation of resin, the resin is the property of Government. In the case of fruit culture it would not be the property of Government.

Q.—Then you speak of the difficulty of transport, and about the canals interfering to a certain extent with the transport of timber?—A.—Since the Punjab scheme of irrigation canals was introduced, there undoubtedly has been considerable difficulty in extracting timber because at certain seasons the canals take off so much water that the rafts with the timber cannot get down.

Q.—These suggestions which you make about raising and widening bridges, are they practicable?—A.—That is beyond me.

Q.—Whom do people come to with these complaints?—A.—With regard to rivers, there have been many meetings of the various officers concerned, under Government orders, to secure some means of improving the timber traffic; and several devices have been proposed. I was recently at the Mangla head-works of the Upper Jhelum Canal, where, in order to get over the difficulty of the want of water for bringing down timber, it has been proposed to make a small railway to join up, instead of using the river.

Q.—That would add to the expense?—A.—It would very greatly add to the expense of extraction and reduce the profits on the purchase of the timber.

Q.—What about labour in the Punjab forests; is that a great difficulty?—A.—Labour and transport are the main difficulties.

Q.—How do you manage about labour; is it local?—A.—In the hills we have to import labour from other parts. The sawyers and carriers generally come from places where they live by that entirely. We are rarely able to do work with local labour; we generally import it from certain parts of the Punjab.

Q.—Is that an additional reason why you think that Government should retain forest work in their own hands. It would be still more difficult for private people to engage labour?—A.—I don't think so.

Q.—About transport, have you tried rope-ways at all in this province?—A.—Yes, there have been rope-ways in the province for 5 or 6 years.

Q.—You say, "we require a better knowledge of mechanical devices for the handling and transporting of timber, such as are used in Canada and the United States." Have you got a forest engineer now?—A.—No. But we want one.

Q.—Would he be an expert in matters of transport?—A.—We have a man at present in America, trying to secure engineers.

Q.—But the man you are proposing to import, he would really be an expert from the United States of America, or Canada?—A.—Yes.

Q.—Would the problems here be much the same? They would not, would they?—A.—I should think they would be very much the same.

Q.—Your main difficulty here is that at certain seasons of the year there is no water?—A.—That is in the lower reaches after the rivers leave the hills. It is in the upper reaches that great expense is incurred in extracting timber, in getting it into the main rivers.

Q.—You require an engineer and are likely to get one or two shortly?—A.—Yes.

Q.—Then about the commercial side of forest questions. Do you want a forest officer trained, to a certain extent, in business, and then put in charge of the commercial side of the business; or do you want to recruit businessmen?—A.—I think to put a forest officer on is to waste a trained man, and to entrust him with work about which he knows little or nothing. We require a businessman.

Q.—Would you be likely to get a good enough man for anything you could afford to pay him; would his prospects be sufficiently good to attract a good man?—A.—For this province alone?

Q.—Or do you think he should be an Imperial Officer?—A.—I think the time will come when we will have to send most of our timber to central depôts for distribution.

Q.—Is your idea perhaps that of the extension of the duties of the Forest Economist: he deals with commercial questions to a certain extent?—A.—Only in an advisory sense. He is purely advisory. I don't think that he has any more actual commercial knowledge than other forest officers have.

Q.—A man like this would not be eligible for the higher appointments in the forest service, would he?—A.—No.

Q.—So that there would be some difficulty in getting a man who would go into a *cui de sac* so to speak?—A.—He might be very much on the same scale as the forest engineers whom we propose to employ.

Q.—Do you propose that those should be regular members of the forest service?—A.—The proposal is that they should be on the same terms as the forest officers, except that they should not go up to the administrative grades. They correspond to the Divisional Forest Officers.

Q.—Would that be better than putting them under the Director of Industries and borrowing them, having them attached to the Forest Department for special work or for certain periods?—A.—Yes, if you attached him for a certain period only, what is to become of the work after he had left: the knowledge he had gained would be lost.

Q.—You recommend a Director of Industries with an Advisory Board recruited from experts in the various departments concerned: would you contemplate being a Member of that Board yourself, for instance?—A.—If the timber industry was sufficiently important in the Punjab to justify that, I should say so certainly.

Q.—In the next sentence you say, "I consider that as far as the Forest Department is concerned, the necessary provision already exists in the shape of the Board of Scientific Advice." Is that with reference to the same?—A.—No, that is purely the scientific side of the department, with which the Board of Scientific Advice deals. I was considering more the commercial side when I noted about the Director of Industries.

Q.—However, you think that the Forest Department should have the services of an engineer and a commercial man, who should be definite members of that department?—A.—Yes.

Q.—With reference to the distillation of wood, have any experiments been made with the inferior timbers in this province?—A.—In this province lately we made a kiln which was not a success in practice. We have done nothing with destructive distillation. In the whole of Kangra the timber is not sufficiently good for timber purposes, but there is a very large quantity which might be of value if destructive distillation was used.

Q.—You would like to carry on these experiments a good deal further?—A.—Yes, there is something in it.

Q.—And you could do it yourself?—A.—No.

Q.—Who would be the best people to do it?—A.—That might well be done at the Research Institute.

Sir D. J. Tata—Q.—How far are you able to meet the demand for turpentine and rosin in India from your distillery?—A.—The demand for rosin we meet fully.

Q.—Have you any idea of the import figures of turpentine and rosin before the war; the quantity imported?—A.—I cannot give you them at the moment. I can get them for you.

Q.—Will this distillery be able to meet the total demands of India, or is it only beginning to make a way in that direction?—A.—I think it is entirely meeting it in the case of rosin. We are at present manufacturing more than we can sell with ease.

Q.—Selling in this part of the country; but would it meet the demand of the whole of India?—A.—Yes, we are at present sending it down as far as Madras.

Q.—And turpentine you are making to meet the entire demand?—A.—I believe I could sell a little more turpentine, but we have really not expanded sufficiently yet. We have only been working with this new plant in the Punjab for barely 3 years, and could more than treble our output if it was required.

Q.—With reference to this case of a concessionaire in regard to wood pulp which you mention, did he have any experience of wood pulp manufacture, paper making from wood pulp? Why was he selected?—A.—He applied for it. He certainly had no experience at all, but he was assisted in his endeavour to secure a concession by Mr. Raitt who is a cellulose expert in India. He assisted him and took part in the negotiations.

Q.—There is no Government expert to advise on the details of the manufacture of pulp suitably?—A.—Not that I know of.

Q.—This man failed, simply because he had not sufficient expert knowledge?—A.—Pardon me, I think he failed because he could not raise the money.

Q.—With regard to fruit culture, are there any expert fruit-growers in India, like those you have in Australia, to advise the department?—A.—We have some settlers in the Kulu valley who have been at fruit culture for many years now.

Q.—Is not fruit-growing a special branch, and there are special people who know all about fruit-growing, who might be brought in to advise?—A.—I believe there are.

Q.—What are the principal varieties of fruit you try to grow here?—A.—Apples and pears.

Q.—Is there any orange cultivation?—A.—I should think in the plains there is considerable scope for it.

Q.—You say "considerable benefit would be derived by a further survey of the Indian forests." Is that not carried on systematically at all? There is a great need to show how the various timbers could be utilized?—A.—Quite so.

Q.—What is being done in that direction?—A.—I believe up to now the Research Institute has only been able to nibble at it.

Q.—Is that because they are not sufficiently staffed?—A.—It takes time. The Research Institute has not been in existence for many years. They have been finding their feet. I should not like to say that they require at the present moment to enlarge the institute.

Q.—Great expenditure is necessary, and Government is to provide that?—A.—I should say so.

Q.—You said something about the improved methods of handling and extracting timber; but that we have not got here the necessary skilled officers. We have to import them from Canada or America or Australia?—A.—The Indian forest officer has no experience of lumbering.

Q.—I think we heard at Dehra Dun that an Australian forest officer came down and said that the methods employed were so poor that lakhs of rupees were being wasted? A. I met the gentleman in question.

Q.—What was his idea about the forests here?—Did he think they were properly handled?—A.—The only one which he told me he had visited in the Punjab was our irrigated plantation at Changamanga, and his opinion of that was very good.

Q.—But the difficulty is in extracting and handling, and for that we have no skilled labour?—A.—We have not the knowledge or experience.

Q.—That has got to be imported?—A.—Undoubtedly.

Q.—You said there were some ropeways. Where are they situated? Are they to bring the timber down from the forest into the main river?—A.—At present the timber is converted into scantlings where it is felled, and carried down to the river or nearest subsidiary nallah, by which it can be floated. To save carriage it is possible in places to put up ropeways.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—Is your distillery bigger than that of the United Provinces?—A.—Not at present. We convert up to a maximum of 30,000 maunds a year; they convert nearly 70,000. Our agreement with them at present is that we shall not exceed 30,000 and they not more than 70,000 maunds of crude resin a year.

Q.—Supposing you had no agreement with them, you would have competed with them in selling the product?—A.—Yes, in the same way that we compete in other branches of our work—bamboos, timber, everything.

Q.—Then you would be competing with private enterprise; that would mean Government carrying on a trade and competing with private enterprise?—A.—Not private enterprise, as there is none in resin at present. There is no other distillery except Government's.

Q.—But there is one in the United Provinces?—A.—That is also Government's.

Q.—Do you think after the war you will be able to show such good results?—A.—Not unless we expand.

Q.—Do you think Government is a proper agency to deal with this export of resin products; more so than private people?—A.—Government would not send men abroad. It would ship the produce to local agents there. Having found markets, the local agents would be perfectly able to sell the produce. We have already sent some to Java.

Q.—Do you wish that Government should trade in the produce?—A.—I should like Government certainly to manufacture it. You require a standard article both in turpentine and rosin.

Q.—And a private party would not be able to produce this?—A.—I am not prepared to say that.

Q.—Don't you think that in war time, when Government is making such handsome profits, if they wanted to sell this pioneer factory they could get better prices? And with private enterprise it could be developed further, don't you think the enterprise would be better off?—A.—I doubt whether if we disposed of the resin factory we would secure better results.

Q.—You think Government could carry on these factories better?—A.—Yes.

Q.—Then you want a Board of Industries having all officials as members?—A.—No.

Q.—You say "all experts"?—A.—Yes.

Q.—All Government experts?—A.—Not necessarily.

Q.—Have you got any cement factory in your province?—A.—No.

Sir F. H. Stewart.—Q.—About your accounts in the distillery, do you charge your raw materials at full value?—A.—I am afraid I don't understand.

Q.—How do you arrive at your profits?—A.—There is no cost of raw material charged.

Q.—You take that as free?—A.—At least we charge no royalty. We charge all expenditure on producing, and we charge depreciation on plant, and interest on expenditure.

Q.—And cost of transport?—A.—Yes. The only thing we don't debit the distillery with is Government royalty on crude resin.

Mr. C. E. Lee.—Q.—What classes of contracts have you got of what you might call a commercial nature with fairly large firms?—A.—We have at the present moment three five-year leases of our forests to important firms.

Q.—Are those local firms?—A.—Yes, they belong to the Punjab.

Q.—Do these firms extract everything; or do you do any departmental extraction?—A.—They don't extract everything; they only extract the trees we agree to sell them for the 5 years.

Q.—You don't have any cases where you remove timber in any form, either logs or scantlings, and then sell them at some depot on a large scale?—A.—Up to 8 years ago we did that on a large scale, and this year we have just commenced to do so in the Bashahr State. We are going to work these forests entirely departmentally in future.

Q.—Was there any import of timber into the Punjab from other provinces, or from outside India before the War?—A.—Yes, a very great deal comes down the Indus.

Q.—From Kashmir you mean?—A.—No, from up Kabul way.

Q.—I was thinking more of stuff coming in from the United Provinces, or coming overseas, and not from Kashmir?—A.—A considerable amount comes from the United Provinces and is sold in the Punjab; a considerable amount of *shis* timber and nearly all the bamboos used in the Punjab, come from the United Provinces. Much of the military requirements have been met from Oregon pine, which is all imported to Karachi and Bombay.

Q.—What sources of information, or what assistance have you at your disposal, when you enter into one of these 5-year contracts with a firm for the removal of timber from your forest, or for the purchase of timber extracted by you departmentally?—A.—For fixing the rate? We only have our knowledge of the cost of bringing out the wood, and also our knowledge of present market rates.

Q.—You know your crop and you know more or less what it costs to get it out?—A.—And the market rate at which it is at present selling, the market rate in the Punjab.

Q.—How far is that market rate, so to speak, correct: how far is it a genuine rate, or one which is due to the operations of a ring, or to unavoidable circumstances: how far is it a true rate?—A.—There is no ring in the Punjab among the big timber merchants, among the men who take leases. They compete by private tenders for those leases, and there is no ring amongst them.

Q.—How do you obtain information as to whether your products can be advantageously sent outside the Punjab for use elsewhere? Supposing you had an idea that it might be possible to work up advantageously the trade in Punjab timber, say, in Karachi or Ahmedabad, how would you obtain information on that point?—A.—We could only apply to the Forest Economist for that.

Q.—And the Forest Economist would not know it by the light of nature: how could he find out; has he got a system of commercial intelligence?—A.—He is an officer who is consulted by anybody who wants a supply of timber. He very frequently gets enquiries as to where stocks are available, and in that way would know where there is a demand.

Q.—That is all right as far as you have a man to refer to; but you also want somebody initiating enquiries of that sort?—A.—We have nobody in the Punjab to do that.

Q.—One who has sufficient information at his command to show him where such enquiries can advantageously be made?—A.—No, we have nobody really in touch with the timber market at all.

Q.—With that also would go the question of the differentiation of slightly different qualities of timber, applying them to certain particular uses, with probable increases in price. You might say you have got a class of timber here which you think would meet a demand in such and such a place. At present they are paying a much higher price for that particular class than you are getting for it here. You have no means of getting that sort of information?—A.—No, none.

Q.—In what way would you suggest that the functions of the Forest Economist should be extended; or how do you suggest that that kind of information should be obtained, and that sort of enquiry facilitated?—A.—I should like to employ officers for sales to dispose of our timbers. It is not the Forest officer's legitimate duty to sell his timber. He is trained to grow it, not to sell it; and certainly to sell it to its best advantage takes a considerable knowledge of the market.

Q.—In what sized lots to put it up? And where to send it to?—A.—We have not got that.

Q.—Do you think a man like that should be initially a commercial man with considerable experience, or a forest man with commercial training, deputed to work in a commercial office?—A.—Certainly a commercial man trained in one of those big timber firms.

Q.—And those men, in addition to being under the local Conservator, would have direct relations with the Forest Economist?—A.—Yes.

Q.—On matters of mere information?—A.—He could consult him.

Q.—Should there be free interchange of information?—A.—Yes, the Forest Economist would have nothing to do with sales.

Q.—Would he not be a clearing house between men in different provinces?—A.—No.

Q.—Is there anyone else except Government producing resin, or is there likely to be anyone else?—A.—Nobody does at present, but there is a very large area belonging to Native States, which undoubtedly will develop their resin industry. We are already training men for resin tapping in the Patiala State.

Q.—What would happen; would they compete with you?—A.—Yes, Kashmir is certain to compete with us.

Q.—You said you have had about 5 years' experience of rope-ways here. What length of rope-ways have you worked; what is the longest?—A.—As far as I know, three to four thousand yards is the longest.

Q.—You have limited your spans to 1,000 feet?—A.—That depends upon the thickness of rope and your ability to carry it into the hills. The carriage is exceedingly costly and elaborate.

Q.—Sir D. J. Tata.—Are they wire ropes?—A.—Yes.

Q.—Mr. G. E. Low.—Of course the saving in cost of extraction is very very great?—A.—Yes, not only that, but it enables you to extract the wood. You could not get it out otherwise, it expedites extraction.

Q.—Have you any information as to how people in places like British Columbia manage to move their wire ropes and set them up, and what lengths of span they use?—A.—No, I have no information. I think that extraction in the Himalayas is more difficult than in most countries.

Q.—At present, in ordinary peace time you are not fully meeting local demands; you say Oregon pine is imported?—A.—Very largely.

Q.—Are you meeting the local demand?—A.—No.

Q.—Do you consider that timber here in the Punjab was, before the war, at an unduly high figure, with reference to the ordinary development of trade and industry?—A.—Timber in the Punjab hitherto has been expensive undoubtedly, mainly due to the difficulty and cost of extraction.

Q.—Do you think if a system of development could be worked, which would enable you to increase your output a good deal, this could be done without injury to the forest, and with advantage to the public, and with a reduction in price?—A.—I think the price could be reduced considerably. We probably could not extract timber at prices at which it is extracted in Norway and Sweden.

Q.—You say you contemplate sending your timber to be sold at central depôts. What is the reason of that?—A.—We have more fir timber in the Punjab than I am sure we shall ever be able to sell locally. We cannot have separate agencies in the big towns, so obviously the solution is a central depôt for that purpose.

Q.—Can you give me an idea of how many central depôts you mean, and in what sort of places?—A.—Wherever you have a big distributing market for timber, I should have a central depôt. It is no use having separate depôts in the same town for different provinces. I should have one central depôt and pool the profits of it and have it run by one commercial man. I should have one in the Punjab; I should certainly have one in Calcutta, Delhi and so on.

Q.—Have you been supplying much timber, or scantlings or sleepers for overseas munitions work?—A.—A very large quantity has gone out from the Punjab, chiefly from timber traders. Government has done a considerable amount. We sent off ourselves 2,000 tons of scantlings to Mesopotamia.

Q.—Has that added at all to your experience of the possibilities of the timber trade in India?—A.—To my mind it has simply demonstrated our inefficiency in the way of extraction. We could have done very much more, if we had been prepared in the way of transport. Hitherto we have not attempted to use mechanical transport for bringing it out. We still use camels or men or carts.

Q.—In the plains you mean?—A.—Yes, coming down from the Murree Hills. The same in Kangra. We have very fine cart roads, and we still go on using men, camels and carts; whereas motor transport can be utilised.

Q.—There are certain matters in which you want things improved, in which you confessedly cannot see your way: for instance, in the use of rope-ways you require further information and further enquiry, before you can say how such things can be extended to advantage; but there are certain matters on which you could, if you had the money, spend it to-morrow with advantage?—A.—Certainly, where transport is easy it is purely a question of spending money to improve the transport.

Q.—Like forest officers all over India, I suppose you find some difficulty in getting your demands for expenditure improvements accepted?—A.—Yes, we are supposed to work with a portion of our surplus from year to year.

Q.—It was suggested to us in Madras and other places that the improvement of forest communications should be taken up; that there should be a fund which should be credited with certain balances, and the expenditure should go on regularly from year to year with the expenditure being debited against that forest fund, improvement fund. What would be your idea of that, to put it on a capital basis instead of a revenue one?—A.—I should like a portion of the forest surplus to be set aside to form a fund for capital expenditure. The forest surplus goes into provincial revenues.

Q.—How long is it since there has been a surplus in this province?—A.—I don't know of any year in which there has been a deficit. At present we produce a surplus of rupees 8 lakhs.

Q.—People have been coming forward and either asking for, or obtaining, concessions for paper pulp; but nobody has ever taken any practical steps whatever towards erecting plant or making the pulp. Do you think that is due to mere accident; that is to say, that all these proposals matured about the time that war broke out, and they were unable to get their machinery; or do you think it was due to people not getting capital; or to lack of information as to how things would work out on a big commercial scale?—A.—My own opinion is that they are rather doubtful of the wood pulp manufacture. I noticed a concessionaire who endeavoured to side-track into converting a very large proportion of his wood into scantlings; whether it was for sleepers or tea boxes I don't know. He wanted an option with permission not to convert into paper pulp but into scantlings.

Sir Francis Stewart.—Q.—But he got that option in his concessions?—A.—He did if I approved. He insisted on having it, and the gentleman who has now applied for this concession has made a similar request on an extended scale, and wants a concession to put up plant that will turn out a million tea-boxes a year at a nominal royalty rate.

Q.—Has there been any attempt here to make matches?—A.—There have been many enquiries, but they have never come to anything. The enquiries have chiefly been with regard to erecting match factories in the hills. It is not judicious to put a match factory in the hills, because you have to carry your chemicals up and the transport is expensive and difficult, and I can imagine no more unsuitable place than in the Punjab hills for a match factory. I had one application to make matches from poplar in the plains, but that never materialised, because there is not a sufficient supply to keep a match factory going.

Q.—Not even in Kashmir?—A.—Kashmir is outside my beat.

Q.—What species was that?—A.—The "Populus euphratica."

Q.—We were told that they grew in Sindh?—A.—There is a considerable quantity in the south-western Punjab, but not nearly sufficient to keep a match factory going. An applicant came up and saw it, and decided that it was not nearly enough for him to go on with.

Q.—Is anything known about the suitability of any of the pines?—A.—That has all been worked out. They have all been tried. Some of them are quite good. The best tree is the Simal. It is not common in the Punjab.

Q.—We heard of that from the Bareilly match factory; they did not like it at all?—A.—Every one of the conifers has some disadvantage for making matches. Some don't light properly, and others still glow after they have gone out, or snap off.

Q.—Has anything ever been done to try to get villagers to work on a co-operative basis, with reference to grafting and packing, and so on, in the Kulu fruit trade?—A.—In Kulu they have never got so far as that. We graft trees and distribute trees free; put grafts on to their village trees. They have accepted them, but shown no interest in looking after them subsequently.

Q.—Is that because your department is not suitable always for that kind of work: for instance, the Agricultural Department might perhaps have greater success. Your department is primarily concerned in telling villagers not to do certain things, and it is perhaps less easy for you to assume a beneficent aspect?—A.—I think the reason for want of success so far is not being able to demonstrate to them the profit there is in the industry. Our orchards are just beginning to come into fruit.

Q.—How long has the Salvation Army been working at this mulberry proposition in Changamanga?—A.—Off and on about eight years; ever since I came into the Punjab.

Q.—Do you know what they do in the way of sale of seed?—A.—No.

Sir F. H. Stewart.—About this option which this concessionaire wanted; are you in favour of granting such an option?—A.—You mean for the wood pulp?

Q.—For the manufacture of sleepers as well as wood pulp and tea boxes, etc. Is there not the danger that the manufacture of tea boxes or sleepers would be so much more profitable that he would neglect wood pulp altogether?—A.—That was the intention in this case, to branch off into the timber trade and leave the wood pulp merely as a subsidiary matter entirely. That, in my opinion, was his intention.

Q.—Then you would not be very favourably disposed to give him the option?—A.—No.

Hon'ble Mr. H. J. Maynard.—Q.—I have got before me the resolution of the 9th October 1894 which lays down the policy of Government in respect to the Forest Department. It does not specifically refer to any industry except the large timber industry. Supposing you follow the principles laid down in this resolution, does it give you sufficient scope for considering the needs of industries as apart from the large timber industry. I take it to be the latest statement of policy. Do the principles that are laid down, whether in this or in other places, give you sufficient scope for considering the requirements of industries apart from the large timber industry?—A.—I should say they do not. I should say that resolution was issued without sufficient consideration for industrial expansion. I should say so if I may criticise it.

WITNESS No. 361.

MR. E. A. SCOTT, Signal Engineer, North-Western Railway, Lahore.

WRITTEN EVIDENCE.

I.—Financial aid to Industrial Enterprises.

Capital.

Q. 1.—I personally have had no experience of raising of capital, but one of the difficulties which undoubtedly do exist in the Punjab is the want of confidence on the part of the minor capitalist in trusting his money to companies or firms. This lack of confidence is created by the periodical failure of banks and other industrial concerns. This defect might in time be remedied by stiffening up the rules under which such enterprises are allowed to be started and providing that the accounts of such firms be audited periodically, according to the nature of the enterprise concerned, by Government experts until such time as it is assured that they will be successful. This will ensure against new industries becoming wholly bankrupt and at least guard against total loss of capital.

Q. 4.—The personal knowledge or experience I have of financial aid by Government to industrial enterprises is confined to Guaranteed Railways. This has in most cases proved advantageous both to Government and to companies concerned. The only suggestion I have to make is that the terms of the agreement be more carefully drawn up, as at present they are sometimes ambiguous and difficult to interpret?

Government assistance.

Q. 5. This should be limited to—

- (i) guaranteed dividends for limited periods on similar terms now given to Railways;
- (ii) provision of part share of the capital on the same basis as public subscriptions;
- (iii) guarantee or preferential Government purchase of products, which are actually required for Government use, for limited periods;
- (iv) rebate on Railway freights only in those cases where this concession would help the industry against foreign competition.

Regarding the above—

- (i) it has proved satisfactory in the case of Railways; there is no reason why it should not prove equally satisfactory with other industries;
- (ii) the fact that Government owned part of the capital on the same terms as themselves would encourage small investors;
- (iii) this could be done with little or no cost to Government;
- (iv) could easily be arranged as the major portion of the Indian Railways are the actual property of Government and it is recognised as an admittedly advantageous way of helping young industries.

In all the above cases Government should claim a certain amount of control in proportion to the concession granted.

Q. 7.—If it is considered that a new industry could be profitably started and the only difficulty is the raising of the capital from public or private subscription, Government should provide the capital. The advantages accruing to a country by the establishment of a successful enterprise are in no way affected by the ownership. Pioneer industries.

The above applies more especially in the case of key industries which it would be advantageous for Government to own.

II.—Technical aid to Industries.

Q. 25.—An effort should certainly be made by Government to increase the existing knowledge of the resources of India. It is extremely improbable that we are acquainted with all the mineral, oil, coal and other deposits which exist. An experimental department should be formed for investigating the question. The cost to Government even if the department were liberally financed, which it certainly should be, would be small compared with the possible advantages which might accrue. Surveys for industrial purposes.

This is an investigation which Government should certainly undertake and not leave to private enterprise.

III.—Assistance in marketing Products.

Q. 38.—The present rules, which lay down that Government Departments should order their European requirements through the India Office, should be abolished and each department should be allowed to arrange for its own supplies. Government patronage.

The staff of the Stores Department of the India Office are not as a rule familiar with Indian conditions and are generally composed of officials who have not been to India. In the majority of cases where engineering stores are in question, they are little more than a Post Office between the indenting officer and the consulting engineers.

Railways managed by companies have no such elaborate system for obtaining their stores and I think they are better served than State Railways.

Furthermore by bringing the Heads of Departments in direct contact with the suppliers, it would encourage greater intercourse between the two concerned which would be of great advantage.

Finally there would be fewer misunderstandings, less correspondence and, I am sure, greater economy.

IV.—Other forms of Government aid to Industries.

Q. 43 (a).—Government could assist and considerably encourage industries by the establishment of hydro-electric or wholly electric power centres—See further remarks under section IX. Land policy.

V.—Training of Labour and Supervision.

Q. 44 (a).—The lack of primary education does hinder industrial development, in that without primary education no further education can follow. General.

Q. 44 (b).—No special efforts, except in the training of apprentices, have been made, as far as I know, to improve the labourer's skill on Indian Railways.

Q. 45 (a).—Generally I consider that in addition to the schools now existing, elementary, intermediate and advanced technical schools should be established.

Q. 45 (b).—In special industries if they are large enough, special technical schools on the lines indicated above should be established.

Q. 46.—I have trained numerous apprentices in the Signal and Interlocking Department of the Railway. Youths accepted as apprentices are obliged to have attained a certain educational standard. They are then put through a four years' course, starting as ordinary workmen and gradually passed through the various branches of the department; they are examined periodically, if their progress is satisfactory they are retained, otherwise their services are dispensed with. The arrangement has worked satisfactorily and there are now in the service some highly competent inspectors so trained. Apprenticeship system and industrial and other schools.

Q. 47.—Nearly all the draftsmen in my office, who are employed on both civil engineering and mechanical drawings, have been trained in the Railway Technical School, Lahore; they have been well trained and some of them are very capable.

Note.—This school is in no way connected with the North-Western Railway.

Q. 48.—Assuming that industrial schools were established on the lines indicated below (see reply to Q. 50) probably the best way of co-ordinating them with the apprenticeship system would be for youths to attend the industrial school for which they are suited for half the day and work in the shop to which they are apprenticed for the other half.

Q. 50.—Industrial and commercial schools should be entirely separated from other schools where general education is given and not be under the Indian Educational Service, but be officered by technical and business experts. The reason for this is that the ordinary general educational professor is generally unfit to undertake technical and commercial education. The existing educational system should remain as it is, with its different qualifying gradations of primary, middle and high. The industrial schools would be similarly graded. A youth would not be admitted to the primary, middle or high industrial and commercial schools unless he held a primary, middle or high school certificate from the ordinary Educational Department.

The primary industrial school, to which no youth would be admitted unless he held a primary school certificate from the Educational Service, would confine itself to training skilled workmen in their trades.

The secondary or middle industrial school would only accept youths who held the middle school certificate and would train its students as chargemen, foremen and the upper subordinate class of workmen.

Finally the industrial high school, which would only accept men who had qualified in the high educational test, would train its students as managers and heads of business generally. The above is the principle and method of industrial education adopted in Germany and it is probably one of the fundamental causes of her recent industrial progress.

Training of supervising and technical staff.

Q. 51.—This would be done by the industrial and commercial high schools indicated above.

Q. 52.—I do not think any fixed rules should be made for assisting supervisors, managers and technical staff of private firms to study methods and conditions in other countries, as these rules would probably be in many cases abused, but Government should reserve to itself the privilege of helping in special cases.

Mechanical Engineers. Engi-

Q. 54.—Tests and examinations for these should be uniform. If a separate department for Industrial Education were established this would naturally follow.

VII.—Organisation of Technical and Scientific Departments of Government.

Study of foreign methods.

Q. 77.—More encouragement should be given to Government technical and scientific experts to study conditions and methods in other countries than is now given. At present, in the Engineering Department, the rules which provide for this, are drawn up chiefly in favour of junior officers. Without depriving junior officers of this advantage, I would suggest that it would be more advantageous to Government to encourage senior officers who are, or are about to become, heads of departments. The reasons for this are:—

- (i) That a senior officer can, on return to India, undoubtedly use the knowledge gained, and put it in practice, while the junior officer probably may not;
- (ii) The senior officer's judgment and view of proportion is more matured.

Furthermore special officers should be repeatedly given these opportunities of studying foreign methods as the art of assimilating this knowledge is greatly improved by practice.

IX.—Other forms of Government action and Organisation.

Roads, Railways and Waterways.

Q. 97.—It is difficult to say in detail to what extent the lack of transport facilities hinder industrial progress in the Punjab, but I think there can be little doubt that such is the case.

In the Punjab, which is eminently naturally suited to water transport, comparatively little exists and that is certainly not encouraged.

This matter should be specially investigated.

River and canal transport should be increased to a maximum. The Punjab offers special facilities for water transport, which would be cheaper and in some cases quicker than rail. The majority of experts and investigators of industrial development consider transportation facilities as the very foundation of industrial prosperity.

The following table taken from "The causes and extent of industrial progress of Germany" by E. D. Howard, illustrates the truth of the importance of transportation facilities:—

Comparative statement of length of Railways.

	1870.	1887.	1903.
	<i>Miles.</i>	<i>Miles.</i>	<i>Miles.</i>
Great Britain	15,000	19,000	22,000
Germany	11,000	24,000	32,000
America (United States) ..	53,000	1,56,000	1,98,000

By comparing this table with the history of the industrial development in Germany and America it will be seen that the extension of railways preceded, and did not follow, the rapid development of industries in the last two countries named. I would therefore suggest—

- (i) that money be found for the railway already projected in the Punjab;
- (ii) that special officers be deputed by Government to report on what other railways are considered necessary, and that the matter be not left to enterprising company promoters;
- (iii) that a special committee be appointed to report on the feasibility of waterways for facilitating transportation.

On general principles, to encourage industries, railways should be State-managed in order to abolish abuses which appear when the management is private, e.g., rebates to favoured shippers, lack of facilities for cheap through traffic, expensive service and other points where the interest of the Railway Companies diverges from that of the public.

Whether the working of all railways by the State would be an advantage to the railways and the State is another matter.

Q. 98.—I consider that the classification of goods is too complicated, being copied from the English system, where conditions are different, and which have been considerably criticised by some experts.

A committee, consisting of an equal number of railway experts and businessmen, should be appointed to report on this matter, as I think it probably does hamper, if not prevent, industrial development.

Q. 102.—Certain investigations have I believe been made by the Canal Department to ascertain the development of hydro-electric power, but these were probably made more with a view of extending irrigation than of developing power. Further investigations should certainly be made. The long considered irrigation scheme, with head-works at Sukkur in Sind, offers to my mind an excellent opportunity of combining irrigation with a hydro-electric development. Hydro-Electric Power Surveys.

The introduction of electric installations for lighting, traction and motive power will create a demand for machinery and indirectly for other products which will quicken industry. This can be verified by examining the increase of industries resultant on the introduction of electric power in England, Germany and America. Too much emphasis cannot be laid on the fact that the creation of electric power automatically develops industries.

X.—General.

Q. 111.—Now that Tata's Iron and Steel manufactory has been established in India, many iron work industries could probably be profitably started. To get an idea of what these industries are, a review should be made, in this special case of the iron manufactured articles which are imported and generally of all imports. This would be some basis on which to consider what industries may be established.

ORAL EVIDENCE, 7TH DECEMBER 1917.

Mr. C. E. Lowe.—Q.—You say: "The present rules which lay down that Government Departments should order their European requirements through the India Office should be abolished and each department should be allowed to arrange for its own supplies." The railway is probably in a good position to know whom to buy from and also to test the quality of the supplies when they are received, but many civil departments of Government which require supplies are not in that position?—A.—Please give an instance.

Q.—Take the Agricultural or the Forest Department. Supposing they are buying engines or structural material or anything of that sort, how are they to get their supplies?—A.—I think they will get them through the Public Works Department if they are building any structures.

Q.—They are all right about things they know about, but their scope of experience is rather limited. If you suddenly turn to a Public Works Department man and ask him to purchase a rope-way or road transport train for the Forest Department he may not be very helpful. Would that not be an exceptional case? If you want to do away with this very inconvenient system of purchasing through the India Office, is there not any other way of doing it than letting all the departments loose competing against each other and running up prices?—A.—I do not mean that each little department would be ordering its own things itself.

Q.—How would you look upon the idea of a Stores Department in this country under the Government of India with branches in the different provinces which would deal with indents somewhat in the same way as the Munitions Board and the local priority committees do at present?—A.—It might be better than at home.

Q.—In order to try and get as many things as possible made in this country?—A.—I think that will be better.

Q.—Is it not your experience that many more things are actually being made in this country than we have been ordering here?—A.—I do not say that.

Q.—If you look through any of these big indents that go home, you will find that a lot of things are really being made in this country or they are things which can very easily be made with some slight adjustment?—A.—Undoubtedly.

Q.—Would it not be better for everybody if we made as many things as we could and raised the general level of industrial efficiency?—A.—I suppose it would. It depends on what way you look at it.

Q.—Is a company line better off than a Government line in this respect?—A.—Some of them have their own consulting engineers at home. They are in much closer touch with their suppliers than we. I have stated in my note that the head of the Stores Department is a retired English civilian.

Q.—Do you find that there is any difficulty in getting the manufacturers at home to follow Indian conditions and modify and improve their products in order to suit Indian conditions where necessary?—A.—No. We have not noticed that on railways.

Q.—Going round the shops of the Great Indian Peninsula Railway we had a very strong complaint from the people there that home manufacturers would not recognise the peculiarities of the Indian climate, and it was suggested to us there that if we had a branch of one of the electrical firms here actually working in this country they would know about the local requirements and improve their products with reference to Indian conditions?—A.—I have not noticed that particularly.

Q.—What do you think of the idea of allowing people to give orders to branches of firms in this country who would keep a certain amount of stocks and keep a man who would set up the plant and if possible manufacture it to some extent in this country?—A.—I think it ought to be done.

Q.—Turning to the question of training of labour and supervision you say that there should be primary, secondary and high schools for industrial purposes, and you say: "Finally the industrial high school which would only accept men who had qualified in the high educational test would train its students as managers and heads of business generally." Would you allow a man to go into that kind of educational institution unless he had shown that he could stand practical work by putting in some time in the shops?—A.—I think so.

Q.—The complaint we have heard is that the men who have come out from these institutes, which are more or less of the college type, do not like shop hours. They can run a machine all right but cannot put a thing right if it goes wrong?—A.—The man can have shop experience in the high technical school.

Q.—The other objection against them is that they do not like factory hours?—A.—We would not keep such men.

Q.—In Bombay they have the Victoria Technical Institute and we were told that the men who were put through that had such shop training as they could give from 10 o'clock to 4 in the afternoon and those men were engine-drivers and not mechanics. That was one objection to them. In mills it was said that they did not like mill hours and would not work from 6 in the morning for 12 hours. The railway people also said that they did not see much prospects either and they thought it was wrong to put a man through that technical training unless it had been ascertained first of all that the man was ready to go through the mill and keep shop hours. What is your opinion of that position? Do you agree with the necessity of securing the man who is first of all suited by inclination to practical mechanical engineering work before giving him training of the college type?—A.—It is very difficult.

Q.—He does not know. He attends at a college from 10 to 4 and he is quite happy about it, but when it comes to his going over to your shops and wanting a job in your shops he does not like the hours?—A.—We would give the man a chance and if he is bad he would not

be kept. I am training these boys. They are all educated to some extent. Some of them work and some do not. It depends entirely on the boys.

Q.—Have you produced any Indians of what you call the foremen or chargemen type?
—A.—We have.

Q.—On what pay?—A.—They rise to Rs. 400 or 450.

Q.—How are these produced?—A.—The man joins my shop as an apprentice. He has to pass the middle school examination. The men come from anywhere they like.

Q.—Are these as a matter of fact largely the sons of your employees?—A.—The majority are. We take anybody. When first of all a man comes to our shops we give him a trial for three months, and if we find that he is keen and takes an interest in the work, keeping shop hours, we give him a nominal salary of 5 or 8 annas a day and if he turns out good we keep him as an apprentice and during his apprenticeship we examine him periodically and eventually he gets post in the shops.

Q.—What pay do you give him while he is an apprentice?—A.—I do not quite remember. Something like Rs. 30, 40 or 60.

Q.—Do you provide any hostel accommodation or anything?—A.—Not myself. The Locomotive people do it for the European boys.

Q.—Do you contemplate any for Indians?—A.—I do not think so. I do not think they appreciate it. They are just as happy without.

Q.—What actual education do they get over and above the experience they get in the shops? Do you have off days or night schools?—A.—We do not have any night schools. For the men who are trained as signal inspectors or foremen in charge their education is just up to the middle school. They know how to write and keep accounts.

Q.—What class do you get among Indians? Mahomedans?—A.—Mahomedans and Hindus.

Q.—Do you know whether the Locomotive people have ever contemplated the idea of having any technical classes for their own people?—A.—The Locomotive apprentices have got a night school.

Q.—How do they stand the night school after doing work all the day in the shops?—A.—They must be rather worn out.

Q.—What we heard in Calcutta was that Europeans stood it better than Indians and for that reason more Europeans went to the night schools, that is Europeans and Anglo-Indians.—A.—I do not think so on this Railway.

Q.—They have no idea of giving half days off for the purpose of tuition?—A.—No.

Hon'ble Mr. H. J. Maynard.—Q.—You mention the Railway Technical School as one of the places from which boys come to you. Do they come only from the Railway Technical Institute or is there any other technical institution from which they come? Do they come from the Hindu Diamond Jubilee Institute at all?—A.—Not to my knowledge.

Q.—You have not got any experience of the boys from there?—A.—No.

Q.—As regards those particular boys who come from the Railway Technical School do you think that they are unwilling to take off their coats or to keep factory hours?—A.—No. I do not think so. I have got three or four of them. It entirely depends upon the men.

Q.—You cannot say generally that that kind of instruction does have the effect of making them unwilling to take off their coats and work factory hours?—A.—No.

Sir D. J. Tata.—Q.—In Section IV you say: "Government could assist and considerably encourage industries by the establishment of hydro-electric or wholly electric power centres." Should they establish them before the industries are ready to take up that power?—A.—I think if there is any prospect of an industry settling down near it they ought to.

Q.—Government will create power and then wait for industries to come and utilise that power?—A.—If there is any chance of industry being there. If you find a good site for a hydro-electric scheme they might make estimates and find what the chances were and whether there was any prospect of any industry settling down there.

Q.—You mean that they will have to make enquiries whether power is available, and then announce to the public—"so much power is available here and is it possible for an industry to be established here," and, if so, that they are prepared to develop the power?—A.—That is my idea.

Q.—In answer to question No. 45 you say: "In special industries if they are large enough, special technical schools on the lines indicated above should be established." What industries are you referring to?—A.—Take the railway for instance. They have got no regular system of technical schools.

Q.—You say: "I have trained numerous apprentices in the Signal and Interlocking Department of the Railway." Are they Indians?—A.—About half of them are.

Q.—What are these peoples' prospects?—A.—They rise to Rs. 450. They start on about Rs. 40 or Rs. 50.

Q.—Then you say: "The arrangement has worked satisfactorily and there are now in the service some highly competent inspectors so trained." About how many?—A.—About ten.

Q.—With reference to your answer to question No. 50 I do not quite understand what you contemplate. In the primary school you would have the workmen trained to begin with. Then in the secondary school you would train chargemen and foremen. But would they not go through the primary training in the industrial school before they go in for secondary training?—A.—That was not my idea.

Q.—Is not elementary education in technical work necessary for the secondary man?—A.—Not so much.

Q.—The industrial high school which would only accept men who had qualified in the higher educational test would train its students as managers and heads of business generally, without any preliminary training in technical schools?—A.—Their technical school would give them lighter mechanical training.

Q.—But they would not have the grounding?—A.—They would have a sound education.

Q.—How could a man come straight from the high school into the industrial high school without the preliminary training necessary?—A.—It would depend on how the industrial school is organised, what its curriculum is.

Q.—If he is to be put as a manager he ought to have a knowledge of the foundations?—A.—He will get that in a shorter course.

Q.—With reference to your answer to question 52 you say: "These rules would probably be in many cases abused." How?—A.—I think it is quite possible that if you draw up any rules for sending employees of private firms home at Government expense, probably the Commissioner would recommend one firm and another firm might wish to send its man.

Q.—In answer to question 77 you say that Government technical and scientific experts should be allowed to go home. Is it not likely that there would be similar abuse there also? If it is likely in the case of a private firm, it would be likely in the case of Government officers too?—A.—I do not think so.

Q.—You say: "At present in the Engineering Department the rules which provide for this are drawn up chiefly in favour of junior officers. I would suggest that it would be more advantageous to Government to encourage senior officers who are, or are about to become, heads of departments." If there is likely to be any abuse in one case why not in the other?—A.—There will be much fewer cases to deal with. Each individual is well known by the people who work the thing, while the firms are spread over the country. I do not say that they ought not to be encouraged, but it should be only in a few cases. The firms themselves ought to send their own men home if they want to.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—Have you got any entrance examination for the Railway Technical Institute?—A.—We have not got it. There is an institute called the N. W. R. Technical Institute, but it is not a part of the N. W. R. It is run by some private people but they call it N. W. R. Technical Institute. The N. W. R. may give it some grant or aid.

Q.—You do not know how they take the boys?—A.—No.

Hon'ble Mr. H. J. Maynard.—Q.—Has not Mr. Badenoch got a good deal to do with it?—A.—He may have.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—You say: "On general principles to encourage industries, railways should be State-managed in order to abolish abuses which appear when the management is private, e.g., rebates for favoured shippers, etc." Do you know that this is a fact?—A.—This is simply what is to might happen.

Q.—Is it a fact that Indians with the same qualifications as the Europeans get much lower pay than the Europeans in the Railway company? Are there any rules to that effect?—A.—The only thing I am certain about is that our Indian apprentices get less pay than the

European apprentices to start with. Afterwards they get on to the same pay. The European apprentice starts on Rs. 40 and goes up to Rs. 110, and an Indian apprentice starts on Rs. 25 or 30 and goes up to Rs. 60.

Q.—The Indian begins with a lower pay?—*A.*—Yes. In the higher grades they go on irrespective of whether they are Indians or Europeans.

Q.—We have been told that Indians with the same qualifications as the Europeans get half the pay.—*A.*—It may be. I am not sure about it on this Railway.

Mr. C. E. Low.—*Q.*—It is not the case on this Railway? *A.*—I am not sure. In my own department that is the only difference.

Hon'ble Sir Fazulbhai Currimbhoy.—*Q.*—You say: "A committee consisting of an equal number of railway experts and businessmen should be appointed to report on this matter as I think it probably does hamper if not prevent industrial development." Do you think that company management at present is hindering the progress of the industries of the country? Is that what you mean?—*A.*—I am referring to classification of rates. It is in answer to the question about the classification of rates.

Q.—You believe that the classification of goods is too complicated?—*A.*—Yes.

Q.—In answer to Sir Dorab Tata you said that if the Government hold surveys and carry on industries themselves it will be better for the country.—*A.*—Yes.

Q.—Have you heard that Government by starting a pioneer factory in the Panjab which cost Rs. 27,000 made a profit of Rs. 2,000?—*A.*—I have not heard of that.

Q.—The previous witness said that Government were trying to make a profit.—*A.*—That is not the general case.

Sir F. H. Stewart.—*Q.*—With reference to your answer to question No. 25 you have heard of the Geological Survey?—*A.*—Yes.

Q.—What you want really is that that department should be considerably enlarged and better staffed? They are the natural people to take up the survey?—*A.*—Yes. I think so.

Q.—With reference to your answer to question No. 50, you think that the industrial and commercial school should be entirely separated from other schools. You would put them under the Director of Industries rather than the Director of Public Instruction?—*A.*—Yes.

Q.—The difficulty that has been suggested to us is that of inspection and examination at regular intervals. Do you think that will be a real difficulty? The Education Department has got its system organized and it has got a lot of officers going round and examining and inspecting schools all the time. Do you think that the Director of Industries could arrange for the systematic inspection of the schools?—*A.*—That means double the staff.

Q.—Should he do it himself or should he have a sort of expert technical committee to help him?—*A.*—They would have to have a similar organisation to that of the Education Department.

Q.—With reference to the classification of goods, there is a goods classification committee?—*A.*—It assembles every year. It is all railway people.

Q.—I think on each occasion they ask the chambers of commerce whether there are any particular suggestions to make or anything of that kind?—*A.*—They might. They meet and discuss some special difficulty which has arisen. From time to time difficulties arise about the classification. Each railway says, 'we shall discuss at the next meeting,' and each railway brings up its own difficulty. The committee does not deal with the whole question of classification with any idea of revising the whole thing.

Q.—You do not want a standing committee, but a committee to assemble and report whether the classification can be bettered?—*A.*—Yes.

Q.—Have you got any views about the working of the existing laws about patents? Do you think they are a disadvantage to Indian inventors?—*A.*—I do not know about it.

Q.—In the case of your own work you have not come across any case where the Indian inventor suffered?—*A.*—We find it very difficult to protect it in America, or England or other places. I do not say that you cannot get a man at home to take up your patent if it is a valuable patent, and unless you knew the firm there is just the chance that there might be trouble over it.

Q.—You have no idea then that India should join the International Convention?—*A.*—I do not know what the International Convention is.

WITNESS No. 862.

LALA NAND LAL PURI, Secretary, the Punjab National Bank, Limited, Lahore.

WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

Capital.

I HAVE had no direct experience of the raising of capital for any industrial enterprise. In answer to several other questions also of a similar nature relating to my personal knowledge and experience, I may say that after practising as a pleader for 9 years I have now worked as Secretary of the Punjab National Bank, Limited, Lahore—one of the most important Indian-managed banks in the Punjab—for the last eleven years and my work has been limited to this institution alone.

During my career the capital of the Punjab National Bank, Ltd., was raised three times, i.e., in 1909 from 10 to 15 lacs, and in 1914 and 1915 from 15 to 31 lacs and was readily subscribed by the previous shareholders and outside public. At the time of the latter two issues, the bank was passing through the financial crisis and the Directors offered the shares at easier terms than the pre-crisis market rate, so that there may be no difficulty in their being taken up and it was satisfactory to find that the capital was always oversubscribed. The reason was that the shareholders and the investing public had some confidence in the bank and its management. But there is no doubt that capital is very timid in the Punjab as elsewhere and the confidence in the joint stock companies has been rudely shaken by their failures and the financial crisis of 1913. In my banking experience I have noticed that several industrial concerns could not raise capital mainly because they could not inspire the confidence of the public and the promoters had no expert knowledge of the business which they started or wanted to start. In other cases the companies were not provided with sufficient capital and had to borrow from banks or had to issue debentures to meet their requirements. In this case they thus suffered from the heavy rates of interest they had to pay to their bankers. Under the present circumstances, people would not subscribe to the capital of any industrial concern unless they have seen it actually working successfully or they have full confidence in the syndicate or directorates of the concern. Confidence will be restored either by Government aid or by the promoters putting in a very large portion of their own money in the enterprise and at the same time by having the best expert and skilled advice to carry on the same.

At the present time the capital for industrial concerns in the Punjab is principally drawn from middle classes from the savings of professional men and from the profits made at Bombay or Karachi by cotton-dealers, etc.

I think the capital of the aristocracy and the capital in villages and towns which have not been tapped so far and the Native States, can be largely drawn for industrial enterprises. The Indian-managed banks had done some work in this direction by opening a large number of branches all over the Province, but by their failure the capital has become all the more shy.

So far as I know the cotton-ginning industry in the Punjab is one where more concerns have been started than can be maintained in full-time employment. This industry got an impetus by its early successes and being an industry which did not require a very large capital and perhaps very large technical knowledge, other people followed those who were in this trade and took to this line of business by setting up new cotton ginning factories in different cotton centres with the result that a much larger number of such factories came into existence. In doing this they used their own money and also borrowed a part of it from their bankers, unfair competition set in, margin of profits went down and efforts were made somewhere successfully and at other places unsuccessfully to enter into pools and combinations in order to raise their profits if possible. Having spent their all in setting up factories and having utilised some portion of their bankers' money, they found it difficult to finance their business and had to pay very high rates of interest for raising the floating capital and meeting their requirements and the failure of banks created still greater difficulties for them.

Government assist-
ance.

I have no experience or knowledge of Government aid to industrial enterprises in the Punjab worth the name. Last year I brought the industry of a sewing machines factory at Ludhiana to the notice of the Director of Agriculture and Industries which came to my knowledge in connection with my bank and which stood in need of financial aid. I do not however know if Mr. G. M. Bahari, the proprietor of the factory, could or could not satisfy the Director and if any help was given to him or not.

The question of Government aid to industries, new or existing, is a difficult one. I would not like the whole initiative to be taken away from the people altogether. At the same time if Government takes interest in any industry or gives financial aid to it

or puts a stamp of its being a sound business concern after necessary investigation, it is sure to help in the raising of its capital and inspiring confidence in the public.

All the different methods of Government aid will suit one or other kind of industry at different stages thereof. Sympathetic attitude of the Government towards industrial enterprises being guaranteed, I would leave the nature and form of the Government aid to a Board of Trade and Industries which may be formed for that purpose with sound businessmen, official and non-official, as its members. It is also necessary to start strong industrial banks which may be supported by the Government and which may lend financial aid to the industrial concerns.

There is no doubt that Government should have some sort of control if it lends financial aid to industrial concerns. If the Government is however thoroughly satisfied about the soundness of the business and with the honesty and good management of the promoters thereof, it may be dispensed with. In the former case the Government control should be of the minimum nature to safeguard its own interest. In some cases periodical balance sheets may be considered sufficient, in others Government may appoint its own auditors, while in some the Government may appoint one Director or more as its representative having the same voting powers as others. It will depend to a certain extent on the amount of Government aid in each case, but it should not be the object of Government control that the other promoters of the industry may have no voice in the matter and the element of Government control should not be too predominant. People should be taught and should learn how to manage their own industries and Government's function may be to direct them in the right course. Government may pioneer industries and hand them over to the people on reasonable terms when they are successful. Turpentine industry started by the Punjab Government is quite a success so far as I know. Similarly Government can pioneer other industries.

In my experience cotton industry and other industries in the Punjab are greatly hampered by the conditions under which they are at present financed:— Banking facilities.

- (a) The Presidency Bank has not, to my knowledge, given any aid to industrial concerns in the Punjab.
- (b) The joint stock banks cannot by the very nature of their deposits afford to make advances for the purchase of machinery or for construction of buildings, etc. After the unfortunate failures of banks in the crisis of 1913 deposits do not flow in freely and those who deposit their money prefer to do so for 4 or 6 months although they were anxious to make deposits for 12, 18 or 24 months before the crisis. The banks cannot therefore make advances which are likely to be locked up. The Peoples Bank of India now in liquidation made advances to industrial concerns which could not be recovered in the time of stress and the bank had for this reason among others to close its doors. To me it is clear that the present joint stock banks cannot afford any considerable assistance in the raising of the capital for industrial concerns or make advances to a large extent.
- (c) The rate of interest charged by the joint stock banks on the advances made to industrial concerns is high which they cannot easily pay in the early stages of the industry.
- (d) In order to enable an industry to pay, it is necessary in these days of keen competition to start it on a large scale. For smaller industries there is no room on account of keen competition and larger industries it is beyond the power of individuals to start and finance, and there are no banks to finance them either and thus industrial development cannot take place without Government aid.

The other method for financing the industrial concerns is of making advances on the security of raw materials and on the security of manufactured goods till they are sent out to Bombay or Karachi for export or for sale. My experience is limited to the financing of cotton industries in the Punjab and the method followed by the banks is to reserve a margin of 20 or 25% on cotton, kappas, etc., and to make advances thereon with or without banks' godown keeper in possession of the goods. In this case also, since the failure of banks, the rate of interest is very high and takes away a big slice of the profits of the industry and the present banks are insufficient to meet the demands. Then the banks help in the matter of exchange and purchase demand drafts and R/Rts., drawn on the strength of the goods sent to the ports. It must be admitted that the absence of joint stock banks is greatly felt and industries feel some difficulty in this direction also. In my opinion Indian-managed joint stock banks are a great necessity for the development of industries and the sooner some sound, well-managed banks come into existence the better. They will tap such sources of capital which cannot otherwise be tapped. Along

with joint stock banks we should have some strong industrial banks supported by Government and which should have directors well versed in industrial matters quite able to investigate and judge the possibilities of industrial enterprises. Such industrial banks should not necessarily depend on deposits from the public. In case they receive deposits they should do it for much longer periods, i.e., 5, 7 or 10 years. It should be their business to help the formation of syndicates and to help in raising capital for new industrial enterprises which are sound and likely to succeed. They will help in raising the fixed capital and joint stock banks will do so by financing and providing floating capital. In this way the joint stock banks can give more assistance to industrial undertakings by affording greater facilities to them.

The sugar industry and the glass industry also appear to have suffered from similar difficulties.

Co-operative so-
cieties.

I have no particular experience of co-operative societies, but I am of opinion that such societies can be encouraged to help cottage industries, etc.

Reasons for failure
of industries.

I am further of opinion that most of the industrial concerns in the Punjab have failed for two reasons:—

(1) Non-provision of capital,

(2) Want of expert knowledge and management, and want of skilled labour,

and the Government aid can be obtained in both cases. It should not be the business of Government to start industrial concerns in competition with existing ones. On the other hand the Government should lead the way by helping new industries which are likely to succeed and lead the people to take to them. Government can, by sympathetic attitude, and by moral and material support, help and develop the industries. There should be no limitations on Government aid merely because a new enterprise competes to a certain extent with an established external trade. The Indian industries require the protection of the Government in every way till they can stand on their own legs.

To provide skilled labour, we should have a technical college in each province and labouring classes should be imparted primary education as a matter of compulsion and also industrial education.

I am sorry I have not studied the technical side of the industrial questions and other important matters relating to them and I therefore refrain from giving my opinions or impressions on the same.

ORAL EVIDENCE, 7TH DECEMBER 1917.

Sir F. H. Stewart.—Q.—You are the Secretary of the Punjab National Bank, and you have been so for about 11 years: had you any previous banking experience?—A.—No.

Q.—Did you find it very difficult at first?—A.—Yes, I had to pick it up.

Q.—And you have come out successfully during difficult times. Have you got branches of your bank?—A.—Yes, we have got 24 branches.

Q.—Are they all in the Punjab?—A.—We have branches at Calcutta, Bombay, Karachi, Cawnpore and Srinagar. These are out of the Punjab, and the rest in the Punjab.

Q.—Have you a board of directors?—A.—Yes.

Q.—Here at Lahore?—A.—This is the headquarters.

Q.—Is your staff entirely Indian?—A.—Yes.

Q.—How do you recruit it?—A.—We recruit it generally from those gentlemen who have had some previous experience in banking, who have worked as managers, or who have had something to do with banks before, and we also have a system of paid apprentices. We have a system of taking a graduate at a time as a paid apprentice, then we train him up and give him higher posts like managers. For the junior grades we generally take Entrance passed men as clerks. We train them as apprentices, and as soon as they learn the work we put them into these posts.

Q.—You are satisfied that the gentlemen whom you send out to manage your branches are practical men, with practical knowledge of banking?—A.—As a matter of fact the pay of the staff is not so high as to attract very good men in the Punjab at least so far as the Indian banks are concerned, and that is one drawback. We cannot have the best men.

Q.—Then you have difficulty in getting competent men?—A.—Yes.

Q.—When they come to you they have no training whatever as a rule?—A.—Some of them have. Suppose some man has worked in some other bank, if he is out of employment we take him, or if he has worked in some other institution we engage him for our managers' posts or accountants' posts.

Q.—You refer to the difficult times which the banks in the Punjab went through three or four years ago, and you say that your bank managed to come out of them successfully; you say that you had to offer your shares on very much easier terms; on what terms did you offer?—A.—We offered them at par. Before the crisis our shares were selling at Rs. 80 premium, i. e., they were selling at Rs. 180 per share of Rs. 100.

Q.—Even after these difficult times you have more than doubled your capital and got capital at par without much trouble?—A.—Both times the capital was oversubscribed.

Q.—From your experience of going through these difficult times do you think that there is any need for any special banking legislation in India?—A.—I think the Indian Companies Act now provides sufficient safeguards.

Q.—That does not prevent the use or misuse of the name 'bank' for instance? Now one can use the name bank and call himself a banker?—A.—Yes, there are some cases like that; but I do not think any particular legislation is necessary for that purpose.

Q.—You do not think it would be necessary to specify that a certain amount of the bank's capital must be paid up?—A.—That is provided for under the Indian Companies Act. According to the Indian Companies Act no particular amount is specified, but a certain portion of the subscribed capital must be paid up before a bank or joint stock company can commence its business.

Q.—In spite of the difficult times through which the Punjab passed recently, you don't think that there is any need for a special banking legislation?—A.—No.

Q.—And yet you say at the same time that these difficulties have rendered capital in the Punjab very shy?—A.—Yes, capital is shy in the Punjab.

Q.—Have you any specific suggestions to make as to what should be done to attract capital?—A.—I have suggested in my note. If the Government comes to the rescue of these institutions and if the gentlemen who start these banks or industrial concerns put in a large amount of their own capital in the concerns and are helped to a certain extent by Government patronage, then I think confidence will be restored.

Q.—You think there is need for actual Government financial aid?—A.—Yes.

Q.—Which is the Presidency Bank in this Province, is it the Bank of Bengal?—A.—Yes.

Q.—Then you recommend the appointment of a Board of Trade and Industries, that would be a Board to assist the Director of Industries, is that what you mean?—A.—Yes.

Q.—That would be an advisory board, would it not?—A.—Generally advisory.

Q.—Do you think that there are competent non-official businessmen in sufficient number in this province who could spare the time and be willing to spare the time?—A.—I think we could have them.

Q.—Where would its headquarters be?—A.—At Lahore preferably.

Q.—With reference to the industrial bank, do you think that they should not depend on deposits from the public and that it would be unsafe to allow them to receive short-term deposits?—A.—I do not think they should receive short-term deposits.

Q.—Your idea would be that they might issue bonds?—A.—They might issue long-dated bonds for a number of years, or they might receive deposits say for 5, 7 or 10 years.

Q.—But you still think that Government assistance is necessary in this case also?—A.—Yes, for starting industrial banks, also.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Do your shareholders belong to many different communities? A.—They are generally Hindus; there are a few Muhammadans and Christians, but generally they are Hindus.

Q.—Any European shareholders?—A.—No.

Q.—Generally your subscribers are professional men and merchants, or are they people who hoard their money? A.—They are professional men, and middle class men who have not hoarded their money.

Q.—The professional men form the majority?—A.—Yes. They have practically as a matter of fact invested their money as permanent investments.

Q.—Are meetings of the directors held once a week?—A.—Once a week generally; we sometimes hold them twice a week.

Q.—Do any directors, who are on the daily committees, come daily to the bank?—A.—No. We have divided the branches among the directors, and each director is in charge of 4 or 5 branches, and the papers relating to these branches are submitted to them every day.

Q.—Then the Secretary has not got discretion to do what he likes as in other banks?—A.—No, he cannot do everything that he likes. He is bound by the orders of the Board.

Q.—Under the orders of the Board he takes necessary action in all cases?—A.—Yes. The cases in which the orders of the Directors are necessary are submitted to them.

Q.—You are having weekly meetings, but in the meantime if there are hundi transactions they can dispose of them as they think best?—A.—Yes, they can pass orders in the meantime as urgent papers are circulated among the Directors.

Q.—Do you think that you can get men easily for your work here in the banking department as cashiers, shroffs and others?—A.—No.

Q.—Do you not think if there is a commercial college you can get trained men easily?—A.—I think it is necessary to have a commercial college in the Punjab. It is absolutely necessary.

Q.—You say "Last year I brought the industry of a sewing machine factory at Ludhiana to the notice of the Director of Agriculture and Industries which came to my knowledge in connection with my bank; what kind of sewing machine factory was that?—A.—There is a factory at Ludhiana which is preparing sewing machines; every part of the sewing machine except needles is prepared there.

Q.—Is it similar to the Singer sewing machine?—A.—Just like Singer.

Q.—How do they prepare these?—A.—They have got their foundry, they have got all instruments to prepare every part of their sewing machines.

Q.—And they are selling their sewing machines just like Singer's?—A.—Yes, they are selling.

Sir D. J. Tata.—Q.—Is it a copy of any particular machine, or is it a machine invented by them?—A.—It may be a copy, it is almost an imitation of the Singer sewing machine and other machines.

Q.—It does not infringe any patents?—A.—No.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—How much dividend do you pay every year in your bank?—A.—It is now 10 per cent. It used to be 11 per cent.

Q.—This is the only Indian bank in the Punjab with reputation.—A.—There are one or two other banks.

Q.—Yours is the biggest bank?—A.—This is the biggest bank. Then we have the Punjab and Sind Bank.

Q.—How are the bank rates governed here? On our side the rates for deposits are governed by the Bank of Bombay rates. How you got a standard bank rate? Are your rates governed by the rates of the Bank of Bengal?—A.—No, the deposit rates are fixed by the banks just as they think proper. For instance, they must be paying higher rates when they stand in need of money.

Q.—In the busy season the Bank of Bengal fixes the rate and the rates of other banks are governed by the Bank of Bengal rate, is it not so?—A.—I do not think they are governed here in the Punjab by the Bank of Bengal rates.

Q.—Suppose even if the bank rate is 5, the rate in the town may be 7 or 8 per cent?—A.—Yes. For instance, Amritsar has its own market rate for advances and for deposits; at Lahore the rates are generally higher. I do not think the Bank of Bengal rate governs the market rate here.

Q.—Is it because the Bank of Bengal does not advance to industries here? Do you not think that must be one of the reasons?—A.—Yes.

Q.—You cannot get advances from them at lower rates here?—A.—Everybody cannot get from the Bank of Bengal.

Q.—They are not giving advances here freely?—A.—No.

Q.—Do they advance to industries here?—A.—No.

Q.—What banking business do they do here, do they do hundi business?—A.—They do hundi business or make advances on the security of Government promissory notes or debentures.

Q.—They never advance to industries here?—A.—No. Not to my knowledge.

Q.—Then you think that an industrial bank should be started in this part of the country : do you want Government to subscribe the capital or guarantee the interest, which will be better ?—
A.—I think it will be better if it is started on the joint stock system, and then Government can put in its own money in the bank as deposits.

Q.—But they have to guarantee interest ?—A.—Of course, that will inspire greater confidence than otherwise.

Q.—And do you think that these banks ought to take money only for longer period of deposit ?—A.—Yes.

Q.—What is your experience as Secretary of a bank, do you get money for two or three years' deposit in your bank ?—A.—Not now.

Q.—You don't get deposits for more than six months ?—A.—We get deposits for six months or 12 months.

Q.—Do you think it is possible that such a bank will get money for a longer period ? Is there any likelihood of that at present ?—A.—If the Government is there to help the institution, I think there will be people who will deposit money.

Q.—For two or three years ?—A.—Yes, particularly if you give a little higher rate.

Q.—Then that rate will be passed on to the industries too, is it not ?—A.—Yes, to a certain extent.

Q.—How will they then be prosperous ?—A.—The industrial bank rate will not be so high as in the case of joint stock banks. Now in this province for instance the Indian-managed joint stock banks pay $5\frac{1}{2}$ to 6 per cent.

Q.—At what rate do the commercial concerns get advances from the joint stock banks generally ?—A.—They are getting at 9 per cent generally.

Q.—All the year round ?—A.—Yes.

Q.—What sort of people deposit in the banks for longer periods ? Are they zemindars or other people ?—A.—I cannot definitely say.

Q.—Is the money which the crops bring into the country in the Punjab from the different centres hoarded : where is gold deposited ?—A.—A portion of it is hoarded.

Q.—What portion do you think is hoarded ? The general belief all over the country is that the Punjab hoards more gold because the treasuries are empty ; where does all that gold go ? Is it going into circulation, into jewellery, or is it really hoarded ?—A.—I think 25 per cent. or so is hoarded. The rest is in circulation.

Q.—Do you consider that money that is invested in jewellery is hoarded ?—A.—I consider that to be a hoard.

Q.—You mean actual coin or jewellery ?—A.—Sovereigns are also hoarded to a certain extent and some people turn it into jewellery.

Q.—The total amount is 25 per cent.—A.—Something like that.

Q.—What do you think was the cause of the bank failures in the Punjab ? What was the cause of the banking crisis here ?—A.—The immediate cause was that there was a campaign of calumny in the press against one or two banks—that was probably the immediate cause—and then the money of these banks was locked up in industrial concerns and they could not get hold of the money and pay their depositors. There were several other causes also.

Q.—But the real cause was that the banks took money as short-term deposits and lent that money on plant and machinery for a longer period or for an unknown period, and the banks could not pay when the deposits were demanded, was that not the real cause ?—A.—The industries to which they advanced were not in a prosperous condition, therefore they could not freely pay back the money.

Q.—Do you think that trust is coming back and that people are again depositing in the banks now ?—A.—It is coming very slowly : it is not coming as it ought to have come.

Q.—The market rates are getting higher now ?—A.—Deposits are coming, but not as freely as they should have come.

Q.—Is your bank advancing money to any industries ?—A.—We advance to industrial concerns in order to finance them in their working, that is floating capital.

Q.—Do you advance to the cotton industry ?—A.—Yes, to the cotton industry, generally we make large advances.

Q.—Do you do it on joint security or on the credit of one man only ?—A.—We decide that on the merits of different cases.

Q.—But you have no bar just as they have in the Presidency Banks?—A.—We have no such bar. In some cases we make advances on the security of stocks of cotton in the possession of the bank and sometimes when the proprietor of the factory is sufficiently well off, we make it on his personal security.

Q.—So you are not working under those disadvantages of the Presidency Banks?—A.—There is no particular bar against making any advance on a single pre-note or for a particular period.

Q.—Have you got any men in your staff from the College of Commerce, Bombay?—A.—No.

Mr. C. E. Low.—Q.—Does not the Bank of Bengal generally give loans to industrial concerns to enable them to purchase raw material?—A.—Well, the only way in which the Bank of Bengal advances is on joint security on the security of two parties. They do not make advances on the security of goods here so far as I know. If the Agent of the Bank of Bengal is satisfied with the two parties coming forward, he will make the advance whatever the object of the loan might be.

Hon'ble Sir Fazulhoy Currimbhoy.—Q.—Are both parties required to be strong or only one and another is merely a clerk or a scribe?—A.—It rests with the Agent. They have got a guarantee broker, and if he recommends both parties the transaction is concluded.

Mr. C. E. Low.—Q.—But as a matter of fact, as Sir Fazulhoy very clearly indicated, this difficulty about two persons is very easily got over in practice, and they do, as a matter of fact, advance money to industries for the purchase of raw material not on the security of the raw material, but on the security of two banks?—A.—On the security of two banks they make advances.

Q.—In fact I happen to know that they have cash credits for that purpose?—A.—Yes.

Q.—Do any joint stock banks open cash credits for industrial concerns?—A.—Yes.

Q.—On what security?—A.—On personal security or on the security of stocks.

Q.—And have they any system of godowns?—A.—Yes, on the security of godowns.

Q.—What do you do, take a list of the godown?—A.—We send a clerk of our own who keeps the keys; he remains in charge of the godown and sees that the merchant does not remove the goods so as to reduce the value of the advance which the bank has made. He is considered to be in the possession of the godowns on our behalf, on behalf of the bank.

Q.—You say that they had more gins in the Punjab than there was cotton for them to gin; has not the cotton area subsequently increased?—A.—Yes, it has increased. I think just now on account of larger cultivation.

Q.—But you have had cotton years also?—A.—This time the crop has been a failure.

Q.—Do you think the cotton area is going to overtake the capacity of the gins?—A.—It might. If we have a good crop this time I think all the ginning factories would have sufficient work to do whole time.

Q.—Coming back to the question of the sewing machine factory, you are aware that the success of the Singer sewing machine is largely due to the widespread organisation they have all over India. Is your friend attempting anything like that in a small way?—A.—He is doing it in a very small way. This Mr. G. M. Bahari, I think, was the agent of the Singer sewing machine or some other machine.

Q.—He was perhaps the agent of a German machine?—A.—I think it was Durkopp, but then probably he left that; he is trying to introduce his own machine; he has now got his own factory, I have seen that factory myself. It was in working order, he prepared every part of the machine excepting, as he told me, the needles; he cannot prepare the needles. All the other parts of the sewing machine are prepared in his own factory and put together there.

Q.—How does he sell? Does he sell on the hire-purchase system, or does he sell it cash?—A.—He sells for cash. As a matter of fact he cannot produce a very large number of machines. As he told me, he was producing about 20 machines or 15 machines a month, and he was selling them at 80 or 85 rupees or something like that per machine.

Q.—He was selling them for cash?—A.—Yes.

Q.—He was not attempting this hire-purchase business because he was not producing on a large enough scale?—A.—No.

Q.—You propose a Board of Industries: what is your reason for proposing a Board of Trade and Industries?—A.—In order to deal with the methods in which Government can assist industries, I have suggested in my note that if there is a Board of Trade or a Board of Trade and Industries, they can look into the question of the method in which Government can help each individual industry. For instance, in some cases the Board of Trade may be of opinion

that an industry can be assisted in a particular way, in other cases they may hold a different opinion, and all those methods which have been suggested in the question could be considered by a Board of Trade established for this purpose, so that they may recommend the most opportune and most proper method in which an industry can be helped by Government.

Q. Do you know of any other country in which they have such an arrangement?—

A.—There is a Board of Trade in England.

Q.—But that consists of one member only, a single minister?—A.—I do not know.

Q.—What you want to do is to get sound businessmen to be at the disposal of Government to advise before giving any particular form of assistance?—A.—That is my suggestion.

Q.—But you realise that even a businessman is helpless in his turn without expert advice?—A.—I think expert advice is absolutely necessary for the Board before taking up the question of Government aid.

Q.—And any industrial bank would also require expert advice, would it not?—A.—Certainly.

Q.—You say, "the joint stock banks cannot by the very nature of their deposits afford to make advances for the purchase of machinery or for construction of buildings, etc." that is to say, they cannot lock up short-term deposits in non-liquid securities in that way. Have the Presidency Banks any funds suitable to be locked up in such long term loans or non-realizable securities?—A.—Well, the Presidency Banks have got Government funds, the public funds.

Q.—Do you know what these Government funds are for? Do you know what they run down to in busy times?—A.—But I think the Presidency Banks can find a certain proportion of their working capital to be invested in this direction.

Q.—There is no reason why the Presidency Banks any more than any other Indian bank should be able to invest in that way. Now you say that they have got public funds, but these public funds also from the very nature of the things are short-term deposits, except that Government are bound to maintain a minimum balance of 50 lakhs?—A.—That is one of the reasons why they can invest.

Q.—But this short-term money cannot be safely used for advancing to industrial concerns. I do not see how the fact that a certain amount of Government money is kept in reserve helps you in the matter. Supposing Government have to spend a lot of money on a famine or a war, how will they be able to realise their money if they advance it to industrial concerns for plant and machinery?—A.—I do not recommend that they should spend a very large portion of their money in this direction. Of course it is necessary for them also to make liquid investments; but I think that a certain portion of that money, the deposits from large depositors, could be diverted in this direction.

Hon'ble Sir Fazlulhoy Carrimbhoy.—Q.—Replying to Mr. Low you said that the Presidency Banks should invest in these industries: what is the obligation on them? Is it because they have 50 lakhs of Government money with them?—Is that the obligation you want to put on them?—A.—Yes, because they are the treasurers of Government in a way and are the biggest banks in the country.

Q.—But this 50 lakhs remains with them also in the slack season when money is cheap and they don't need money, and even if Government keeps 2 crores in that way that will not do them any good: they are giving no interest of course, but they are not at the same time getting any interest: it is only in busy time that they get this 50 lakhs without interest, but they are at the same time you know financing crops, are they not? Does that not help too?—A.—Yes.

Q.—Why, they have got their own shareholders too?—A.—Yes.

Q.—And they ought also to work in their interests?—A.—Quite so, but I think that the present financing agencies are insufficient to finance industries.

Q.—Don't you think, as you said in answer to one of my questions, that if Government starts an industrial bank, that can finance industries better instead of the Presidency Banks doing this?—A.—The Presidency Banks under the Presidency Banks Act cannot finance industries practically speaking.

Q.—Then you suggest that there ought to be an industrial bank, which would be a good agency for financing industries?—A.—Yes.

Mr. C. E. Low.—Q.—Which do you think must come first, industries or industrial banks?—A.—As I have said, Government aid being guaranteed to the industries, if they start industrial banks, proposals for advances can be entertained by them. After all there is no absolute dearth of industries, the industrial banks can help the present industries as well as take part in the starting of new industries.

Q.—Do you think there will be scope for an industrial bank here in the Punjab with its present state of industrial development?—A.—I think if there is an industrial bank, it can help the industries to a great extent.

Q.—What I mean is this: the industrial bank must necessarily have a very large proportion of share capital.—A.—Yes.

Q.—And it must also take long-term deposits in order to pay the people who subscribed to share capital in ordinary shares. Well, you realise of course that the business of an industrial bank is not like that of ordinary banks, and shareholders will expect large dividends on their money. In order to obtain large dividends with the working capital very largely made up of share capital, the industrial bank will have to make big profits; that is to say, it should share to some extent the risks of the industrial concern to which it advances money as regards profit and loss, because if it loans at high rates it would injure the industry. Now do you think that there is a sufficiently wide basis of different kinds of industry at present for an industrial bank to enter and share to some extent the profit and loss without coming to grief?—A.—There is no doubt that an industrial bank will have to share the profit and loss of the industry. They have to go into the question whether the industry will prosper or not because, by the very nature of an industrial bank, they will have to take expert advice, and they will have to take into consideration whether a particular industry to which they are making an advance or to which they are subscribing their capital, would be flourishing or not. There is no doubt of that, but it is the very essence of the thing that the industrial bank should undertake this business in order to help industries.

Q.—Supposing an industrial bank like this says to the industrial concern "whether you make a profit or whether you make a loss, you have got to pay me a certain rate of interest, say 5 per cent." that is one way; the other way is for the industrial bank to receive a certain amount of interest but also to take shares in that concern; that is what I mean when I say that the industrial bank would have to share the risk of the industrial concern. If the industrial bank merely charge heavy interest, that will not help the industry?—A.—That will not help industries no doubt, a heavy rate of interest will not help industries, but there is no other way out of the difficulty.

Q.—If you have all the industries more or less of one kind, if the bank makes 80 per cent. of its advances to industries based on the cotton trade for instance, and only 20 per cent. to other industries, the bank is taking a risk; would it not be much better to distribute that money over different kinds of industries and thereby minimise the risk?—A.—There should be certain classes of banks which should do cotton business.

Q.—My suggestion is that the wider the basis of the industries to be financed, that is, the more different kinds of industries to which the industrial bank advances, the less will be the risk. I think you have pointed out yourself in your evidence that one cause of the bank failures in the Punjab in 1913 was that they put too many eggs into one basket, namely in cotton trade.—A.—As a matter of fact cotton was one of the main industries the banks financed at that time, but they also financed other industries.

Q.—They mainly financed cotton?—A.—Because cotton was the main thing in their hands at that time.

Q.—Then if they invest in a large number of different industries you want a considerable number of experts, and you think Government can help in that way?—A.—Government can help them in the matter of experts also.

Q.—You probably know perhaps that in Germany the industrial banks have 300 or 400 directors in all sorts of different concerns, so that when a new proposition was put before the bank, the bank could ask its particular expert to advise it from the technical point of view. You realise, don't you, that it would take a very long time to work up to that stage here?—A.—Of course it will, we have to develop slowly and gradually; it will take a long time to reach that stage.

Q.—Then don't you think that the industrial bank would have first to start by doing a good deal of non-industrial business?—A.—I should not like to stop them from doing non-industrial business.

Q.—Do you suppose that industrial concerns could be started at once before the industrial banks?—A.—No, I do not think. They must also develop gradually.

Hon'ble Mr. H. J. Maynard.—Q.—Your bank I think survived when a good many other banking and industrial concerns went into liquidation; that of course was no doubt due to good management, but can you suggest any special reason why you think that the kind of management that your bank had and the system pursued was more likely to lead to survival than in the case of the other banks?—A.—The reason of the survival mainly was that we realised our investments to a very large extent at the time of the stress, and we could pay our depositors. The strain continued for two years and we had to pay about a crore of rupees which we realised from our debtors; we could realise that money, whereas the others could not.

Q.—The reason for your being able to realise that money whereas the others could not was that you chose your investments wisely?—A.—The Board made investments more carefully.

Q.—Is there anything in the constitution of your bank which differs from the other banks which failed? Are you all in any way specially connected together?—A.—No.

Q.—Specially disposed to support one another?—A.—There is nothing particular in the constitution of the Board.

Q.—Another thing I want to ask if I may do so without asking you to say anything confidential, and that is: when the crisis was on, did you approach the Bank of Bengal for assistance?—A.—Well, we did.

Q.—You approached the provincial branch of the bank?—A.—Yes, we approached the Lahore branch.

Q.—So far as the provincial branch was concerned, did you get a sympathetic response?—A.—We did.

Q.—What was the security on which you proposed to borrow?—A.—The idea at that time was this: as we were rather anxious to make sufficient provision for any demands that might come on the bank, we wrote to the Bank of Bengal asking them if they would undertake to make us advances on the security of Government paper.

Q.—What did they reply?—A.—They in their reply said that they could accept only Government securities, but they said, whenever you actually stand in need of money we will consider the matter, that was their reply.

Q.—That was the reply of the provincial office?—A.—Yes.

Q.—Then ultimately?—A.—Ultimately some other banks also approached their provincial branch and offered securities, but the head office did not care to make advances on the securities offered by these banks.—Q.—Were they Government paper securities?—A.—They were paper securities, not Government securities; in our case it was Government paper security.

Q.—Do I understand you to say that the head office did not advance money to your bank on the security of Government promissory notes?—A.—As a matter of fact we actually did not need money, we only wanted to make arrangements; in that case they replied they will consider the matter when we actually stand in need of money.

Hon'ble Sir Fazulbhoj Currimbhoj.—Q.—Would they have given money if you had asked?—A.—Well, I think they would have.

Hon'ble Mr. H. J. Maynard.—Q.—Were they prepared to advance money on the security of promissory notes or did they refuse?—A.—As a matter of fact at that time my bank was not satisfied with the reply we received from the Bank of Bengal. They got an idea that they were asked to operate on securities which they did not like to do at that time.

Q.—The Bank finally suggested that you should sell your Government paper?—A.—Yes, but we did not on account of the low prices which were ruling at that time.

Q.—Was that the impression given or you probably got a letter?—A.—We got a letter in which they said that they will consider the matter at the time when we stand in need of money. It is just possible that they might have refused it at that time.

Q.—What I want to know is, as regards the attitude of the provincial manager here and the attitude of the head office in Bengal, did you form any impression as to the more sympathetic attitude of the provincial manager than of the head office?—A.—Yes, the impression was that the Lahore branch had recommended loans for the other banks which failed as well as for us, but the head office was not agreeable to make advances.

Q.—Did you draw any inference as to the probable attitude of a provincial institution as opposed to an institution outside the province with its head office outside?—A.—The idea at the time was that if the head office had been in the Punjab it would have advanced the money.

Q.—The head office would have been more sympathetic if it had been in the province?—A.—Probably.

Hon'ble Sir Fazulbhoj Currimbhoj.—Q.—Is it the case that at a certain time certain money had been advanced by Government to the Presidency Banks in order that they might assist the market?—A.—Yes, I also heard about it. It was said that a certain amount had been placed at the disposal of the Presidency Banks for the purpose of helping the cotton trade.

Q.—In what year was that?—A.—It was I think in 1914.

Mr. C. E. Low said that it was in September 1914 but that it could be verified.

WITNESS No 363.

BARDAR JOGENDRA SINGH, Taluqdar of Aira and of Iqbalnagar.

*WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

Capital.

(1)—I have no personal experience.

(2)—The capital at present is drawn from a very small number of investors and if industrial development of India is to proceed the whole country will have to understand the benefits of joint stock business carried on large and economic lines. The only way to appeal to a larger body of investors is to prove the advantages of joint stock business. As an investor I have always felt the uncertainty which it implies when the Board of Directors is not drawn from among men of business experience. An assurance of good management by men of experience who have won confidence will greatly facilitate the flow of capital. Capital will readily be forthcoming if the prospect of good profit is ensured. A Government guarantee will provide the necessary insurance and if capital is sought in small shares with good prospects of profit, small savings of millions will make the raising of capital easy.

(3)—I have no personal knowledge. The factories that cannot find full-time employment must have been started at wrong places without any adequate appraisalment of available supply. What has happened in the past is the starting of concerns by men who had no business training. They often started business without careful estimate of the resources of the locality where they started business and the result was that factories could not find full-time employment. Now and again a capable man, elated by early success, started too many things and without the co-operation of a trained staff got himself into a tangle. The pressure of population and the productive resources of the country, so far as one can see, for many years to come can give full-time employment to any factory that is started on proper lines insuring a good wage to the worker and an adequate profit to the capitalist.

Government assist-
ance.

(4)—Once again I have to plead no personal knowledge, but I am aware of the industries started in Madras by Mr. Chatterton and the success attained in Germany and Japan. In fact Germany and Japan have built up their industries by Government aid:—

(1) I don't believe in grants-in-aid.

(2) Nor in bounties or subsidies. It often means waste of public funds.

(3) As an inducement to capital, a Government guarantee of a minimum profit combining insurance of good management and Government supervision would undoubtedly attract capital. The question of a refund is not likely to arise except in case of a failure and then there will not be any large assets to draw a refund bill on. Generally speaking Government guaranteed industries are likely to pay much higher dividends than the guaranteed interest.

(4) I think loans without interest in special cases and with reasonable interest in others in the beginning will help to foster business. As banking facilities grow the need of Government advances will become less.

(5) I am in favour of the supply of suitable machinery on the hire-purchase system but of course it only applies to small machinery.

(6) To raise share capital, on the same basis as public capital in early days, will help much to popularise investment of capital in joint stock business.

(7) The guaranteed, or a preferential Government purchase in India will no doubt help in fostering industries. The Government should as a rule purchase Indian produce in preference to outside produce.

(8) I don't see any reason to exempt profits of new industries from income tax. As soon as an industry begins to earn profit it has passed the stage when it required such help.

(6)—In all cases in which the Government aid has been given, Government officers should audit accounts and a Government Director should be on the Board till the business is firmly established and the Board of Management got well in the saddle.

Pioneer factories.

(7)—I think pioneer factories in some cases can do very useful work. For instance, the aluminium and chrome leather factories in Madras have done good pioneer work. In the manufacture of glass, the finding of suitable materials, including wood pulp for making paper and manufacturing of chemicals, there is an urgent need of Government pioneer factories.

* See also additional written evidence printed after oral evidence.

(8)—The pioneer work should be more in the nature of a practical demonstration and research than actual manufacture on a large scale. Such pioneer work is outside the domain of private enterprise and there need be no fear of competition. Once research and demonstration prove the success of an industry it will be taken up by capitalists and thus automatically indicate where Government work should stop and private enterprise take its place. I don't see why there should be any hesitation in starting Government managed industries. The old English idea of leaving industries to capitalists was started by the capitalists. The war has well nigh exploded it and I believe it is not going to occupy its old sacerdotal place again. Nationalisation of land has been a dream of many people and the nationalisation of industry must follow.

(9)—I cannot specify industries as I have no direct connections. I have heard that financing of industries is not satisfactory. Many promising industries languish to death because full financial support is not available. This is inevitable in the present transitional period. The question will find a solution when a few industries become strong and command confidence and credit. Indian banks will then find in joint stock companies a safe and a liquid security. The establishment of a State bank with strong branches in every province as recommended by the Financial Committee of the Secretary of State can be of great help. The State bank would accommodate Indian as well as English managed banks when trade demands are strong. There has been a good deal of complaint that Government did not help Indian managed banks at the last crisis and the complaint is not altogether without foundation.

Financing agencies.

(11)—I am not aware of any industry in the Punjab working on co-operative lines. In the United Provinces there is a successful co-operative carpenters' society. It is no use going into the details of its organisation as all the information can be found in the United Provinces report.

Co-operative societies.

(12)—I am strongly of opinion that co-operative societies, so far as the Punjab is concerned, promise the best possible results. I am only concerned with things that grow and to my mind there is great room for the organization of co-operative societies as the feeders of large industries; also as agencies for placing the produce of land in the best possible markets of the world. The societies could have their own stores and elevators and grade and classify their produce to suit the demand. Take, for instance, a village in the Punjab growing wheat, sugarcane, oil-seeds and cotton; under present conditions the cultivator loses from his matured crop of cane 85—90 per cent. of the yield in the simple process of extraction of juice and making of gur merely because his tools are bad and his open pan boiling is unscientific. In the October issue of the *Agricultural Journal of India* the question has been fully discussed by Mr. Wynn Sayer. The article deserves the attention of the Commission.

The marketing of his other crops is also wasteful. He sells his seeded cotton (Kapas) losing the seed and a higher price he could have obtained if it was ginned and baled. Similarly he loses on the sale of oil-seeds. The Punjab grows something like 414,110 acres of sugarcane. The area under cotton is 1,064,581 acres and the area under oil-seeds is 1,807,577 acres. Supposing a small co-operative factory were started in the centre of a group of villages and financed by the Government on the joint responsibility of the villagers, the gain to agriculture would be immense. What the villages need is a small power station equipped with a sugar factory capable of dealing with the produce of 1,000 acres of sugarcane, an area which will generally be found under this crop among 8 or 10 villages. The factory need not attempt more than power extraction and steam boiling which alone would mean a gain, on an average, of 35 per cent. If crude sugar were manufactured and molasses sent to a central factory the gain would be even greater. The factories could also be equipped with ginning mills and oil presses.

One village equipped with such a factory in the centre of 10 villages will be able to deal with the produce and send it to a central refining factory to turn the crude article into refined oil or sugar and make use of the bye-products. The small village factories will thus lead to the creation of large central factories. They will serve as feeders. I don't see any reason why a great sugar manufacturing, cotton weaving, and oil refining industry should not spring up in the Punjab. The introduction of co-operative village factories will lead to the cultivation, improvement, and extension of the economic crops such as sugarcane, cotton and oil-seeds. It will not only stop there but help the growth of large sugar and oil refining and large weaving factories, capable of making the best use of all the bye-products which are now lost. There is no reason why cotton weaving should not succeed in the Punjab when Japan after buying cotton from the Punjab can still make profit. Labour in the Punjab is cheaper than in Bombay. A good centre for a weaving industry can be easily discovered somewhere in the shadow of the hills, where not only the required humidity in the air can be secured but electric power can be generated

from one of our large rivers. I am for making the central factories national in the same way as the co-operative factories will be national. The question of finding funds will not be difficult. The Punjab has invested in the War loan largely. Most of this money has come from the villages. I have not the least doubt that the village people will have no objection to the diversion of their capital in the Government loan towards the creating of a national industry. The central factories under good management will serve as pioneers and as an incentive to the capitalists to make money in new industries which have been discovered for them. More than any other Province the Punjab is in need of industrial development. The standard of living in the Punjab has been rising while no new sources of production have been discovered. The pressure on land is tremendous and holdings in some places have been reduced to the fraction of an acre.

Limits of Govern-
ment assistance.

(18-14)—To my mind State-managed industries are not likely to compete with existing industries. In the coming years there will be room for all. The country is wide enough to permit the growth of many new industries. The State will not take up industries which are prospering already. It will take up new industries and help them to fructify. Private enterprise will have a fair field and an open market. The comparatively more economic management will ensure for private concerns an advantage over the State-managed concerns which will be sufficient protection for all industries which are promoted by private enterprise.

II.—Technical aid to industries.

Technical aid.

(15-16)—I have no experience of technical and scientific aid in the domain of other industries than that of agriculture. In agriculture the agricultural experts are doing very useful work. In the Punjab for instance by careful selection a new type of wheat (Punjab II) has been introduced which is hardy and gives better yields. Similarly 4-P. American cotton which Mr. Roberts of the Agriculture College, Lyallpur, has produced has taken hold of the Punjab. This cotton fetches better prices and is very hardy. For instance in this year of heavy rainfall indigenous varieties have suffered a loss of nearly 12 annas in the rupee, this variety has only lost 6 annas in the rupee.

(17-18)—I am for giving the services of Government experts free whenever required. As experts lent by the Government will not be servants of any private firm and merely on deputation, I do not see why any restrictions should be placed as to the publication of the results of their researches. The old idea of monopoly by capitalists is played out and in the future all discoveries should belong to the nation as a whole. The idea of private versus State enterprise had its origin in the desire of the capitalist to keep things in his own hand. The movement towards democracy is slowly exploding the myth and there is no reason why the system should be perpetuated in India. In industries helped by the Government the endeavour should be to make the concerns national. The great oil fields in the Punjab, the cement works which must be started should be all national and run by national capital.

Demonstration fac-
tories.

(19-20)—There should be demonstration village factories in every district to make sugar, crush oil, gin cotton and as these multiply and make available sufficient material a central factory should be opened under Government management.

Surveys for indus-
trial purposes.

(25)—Yes, the existing knowledge of the resources of the country should be supplemented by further surveys.

(26)—The resources of each district, agricultural, forest and mineral, should be carefully surveyed by experts. The object should be to ascertain all the buried wealth of the land, agricultural and non-agricultural, with a view to further development.

(27)—The result of these enquiries should be published in bulletins which should be sold for a small price and periodically advertised in the papers.

(27a)—I suppose they are useful but I have no experience.

III.—Assistance in marketing products.

Commercial
museums.

(28-29)—I have hardly any experience of commercial museums. They, perhaps, serve a purpose in bringing to the notice of the market the available produce, but I don't see any use in multiplying them. Speaking generally supply and demand adjust themselves automatically.

(30)—The best sale agency is the co-operative agency and its growth should be helped. The cottage industries hardly produce anything for distant markets except in special cases such as Benares silks and sarrees and other precious things, and for them an emporium may be useful, but for village industries nothing of the kind is needed as they only supply the local demand.

(30a)—I don't think travelling exhibitions will be of much good except to demonstrate the use of improved tools and machinery.

(32-33)—I would make demonstration exhibitions popular and associate them with fairs to make them sufficiently attractive to bring sellers and buyers together.

(34)—Yes, Indian trade representatives should be appointed in all countries. They will be not only useful in pushing Indian products but will be able to study the requirements of other countries and endeavour to organise Indian supply. These representatives should be Indians, men with actual experience of business and liberal education. Trade representa-
tives.

It is rather a large question to define their duties, but I suppose the programme which the trade representatives of other countries follow provides a good and safe model.

(36)—I don't think so. Special deputations of men should be arranged to study inter-provincial conditions of commerce and trade, supply and demand.

(37)—Yes, all departments should publish the lists of their requirements and exhibit the samples showing the standard and the pattern in a commercial museum in all large towns so that makers may compete for the demand. Government pat-
terns.

(38)—I have no idea of the present rules or the system.

(39)—More banking facilities will no doubt be required. I have already given my ideas on this point.

IV.—Other forms of Government aid.

(40)—The supply of raw material such as forest produce should be made available on favourable terms. The advantages of monopoly should not determine the prices. What I mean is that the prices of raw material should not prohibit the development of kindred industries. The price and other facilities should be so regulated as to allow a fair margin of profit to the manufacturer. Supply of raw ma-
terial.

(41)—I don't know how the land policy of the Government can affect industries not connected with land. If the question relates to agriculture, then surely land tax, as it absorbs something like 50% of the landlord's assets, is an important determining factor in the prosperity of the people. The subject is too big and one could write reams on it. The differences of land tax from district to district and province to province are so great that it will need a special enquiry to understand its incidence and its true relation to agricultural prosperity. Mr. Purser who was engaged in the settlement of Jullundur once instituted an enquiry as to the food required for the population that the district supported at rates which obtained in jail. He found that supply hardly met the food demand. Rai Bahadur Ganga Ram in his interesting book "The Agricultural Problems of India" has come to a similar conclusion. He puts down the food required for the population at 77 million tons and the produce at about 77 million tons also, out of which 5,382 thousand tons are exported. I strongly hold that revisions of assessment leading to progressive increases of revenue should be stayed and all the different provinces of India allowed to reach a uniform level. The required increase can be raised by introducing an export duty on produce of land. It will bring in the required revenue and at the same time tax only the surplus offered for export, and all the provinces of India will equally share the burden. Except in large towns where land values have risen I don't think any concession is necessary. The Government of course could acquire and give land for the development of industries on a long lease and on favourable terms.

(43)—I don't know anything about it. The law should provide the option, if it does not exist already, to enable the Collector to acquire land for private industrial purposes in the same way as for public purposes.

(43-a)—The question is not clear. In many parts water means everything and its use for irrigation is almost invaluable, and another use that can be made is to harness the streams, wherever conditions permit, to generate electricity.

V.—Training of labour and supervision.

(44)—I think lack of primary education stands in the way of many improvements.

(45) (a) (b)—I don't know what is being done in larger industrial towns to improve the efficiency and skill of workers by introducing elementary education. In the villages primary education has hardly made any impression. I am afraid that when agricultural education receives attention more thought will be given to the secular side than to the religious side; and man cannot live by bread alone. The education of the heart which makes a peasant happy and contented, if it is replaced by mere literacy, is not likely to compensate for the larger loss of a touch with the Divine. All schools for workers and

agriculturists should be denominational and under religious teachers. Religious training should occupy the first place and literary education should be carried beyond lower primary standards. Promising boys should be given special agricultural and industrial instruction in central agricultural and industrial schools.

Apprenticeship system.

(46)—The old Indian system was based on apprenticeship and even now for practical work it offers the best possible training.

(47, 48, 49)—I have no experience of industrial schools.

(50)—The technical colleges should be under the Department of Industries so that there may not happen a divorce between the objects and the actual teaching of the school. Educational Inspectors for these schools should be under the Industrial Department. I don't approve of a dual control which rarely ensures harmonious work.

Training of supervising staff.

(51)—The supervising staff after ordinary training should serve their apprenticeship in factories and prove their fitness before they are given supervising work.

(52)—I would rather that they served their apprenticeship in well managed private business concerns, but in the absence of such concerns actual work in Government factories ought to be very useful. Lyallpur Agricultural College for instance is turning out very good agricultural assistants.

Mechanical Engineering.

(54)—I don't know.

(55)—Yes, the tests should be uniform and require a good deal of real knowledge and an affection for the machine. There should be some kind of law, if it does not exist already, providing for professional supervision of large factories.

VI.—Official organisation.

(56)—As far as I am aware no organisation for the development of industries exists in the Punjab. The Director of Agriculture is supposed to look after industries besides a hundred other things.

(57, 58, 59, 60)—There should be a Director of Industries with actual business experience and a trained staff to assist him. He need not be a technical expert but he should have the option of employing experts. He should be assisted by a Board of Industries which should be composed of business men and technical experts; at least half the members should be Indians. The Director assisted by the Board will be competent to consider all proposals of private promoters of new business with reference to the question of guarantees and financial support. The functions of the Board should be both advisory and executive. The Department ought to have an adequate budget grant and the option to use these funds with the approval of the Board of Industries. It should have the power to grant loans, guarantee interest, sell machinery on hire-purchase system, and work pioneer factories. The Board may also serve as a model Board so that private factories could follow its methods of organisation and management.

(61)—My reply to foregoing covers this.

(62)—There should be an Imperial Board with an Imperial Director of Industries to co-ordinate the Provincial work and bring it in touch with other parts of the Empire.

Cottage industries.

(62-a)—So far as the Punjab and United Provinces are concerned ordinarily the cottage industries are merely confined to weaving of coarse cloth. I have my doubts as to any great extension of cottage industries. I strongly believe that energies devoted to the organisation of village factories, to deal with agricultural produce, promise better results than useless endeavour to help industries which are now out-of-date, and cannot compete with power looms and large manufacturing concerns.

Technical and scientific departments.

(63)—As I said before there is the Director of Agriculture who looks after industries also. The change I recommend is the formation of a separate Department with an Advisory Board.

(64)—The formation of a new Imperial Scientific and Technical Department is urgently required to carry out industrial survey, research and scientific study of all industrial matters and to help in furthering the development of promising industries.

Imperial departments.

(65). The Imperial Department may be divided into two branches—

(1) Scientific.

(2) Technical.

It should be recruited both in India and England; the men best qualified for the work should be selected.

(66)—If the Department is altogether separate from the Imperial Director of Industries then the head of the Department will have all the powers of a Principal of an institution and have the freedom to initiate research and supervise technical training, working towards the co-ordination and organisation of technical work in various provinces; occupying a similar position to that of the Director-General of Agriculture.

(67)—The Industrial Board of a Local Government must act under the direction of the Local Government.

In all matters such as agricultural produce and agricultural industries the Local Government should organise its own technical and scientific departments. Provincial departments.

(69)—Under the control of the Provincial Board of Industries presided over by the Director of Industries.

(70)—On terms sufficiently liberal to attract good men.

(71)—I cannot say much on this point. I think a beginning should be made by starting central technical institutions in all provinces, but their work should be confined to the immediate needs of the provinces and allowed to develop gradually in response to the growing needs of the Province. Technological institutions.

(71-a-72)—I think for the present two central technological institutions will meet the needs of the whole of India. The Provinces should, however, provide a large number of scholarships to enable students to study at the central institutions.

(73)—The central institutions should supervise the smaller provincial institutions carrying on local research. The institutions should be controlled by management Boards. There is an impression that if technical education was provided, technical employment will follow as a matter of course. This is not correct. I have known men highly trained after finishing their education in England or on the continent wandering in search of employment. Another mistake that is often made is to expect a man just returned after his training to pioneer and manage new industries. This is too much. Technical education should be provided to meet the demand for trained men. Pioneer industries must have experienced management. To expect a young man immediately after finishing his studies to pioneer an industry not only on the technical side, which he may be quite capable of looking after, but on all sides, is expecting too much.

(75-76)—I have no knowledge.

(77)—Foreign research scholarships should be started and enterprising individuals deputed to study conditions in other lands.

(78-79)—In all the industrial towns there should be libraries of reference. Books on scientific subjects should be supplied to existing libraries.

(80-81)—I cannot say as I have not studied the subject.

(81-a)—The Municipal and Local Boards could greatly assist by founding scholarships and pioneering local industries.

Statistics and Commercial Intelligence.

(82)—I do not know. Statistics.

(83)—The distribution of commercial intelligence ought to be on a larger scale. Special information should be published in provincial vernaculars and distributed as a supplement to various newspapers. Commercial intelligence.

(84)—The Indian Trade Journal is useful but it is not widely circulated. It ought to be sold cheaply and attempts should be made to attract readers. Perhaps it will be cheaper and ensure larger circulation of the information desired to be conveyed to the public if it were supplied to the ordinary newspapers. Arrangements can be made for a reasonable consideration with existing weekly and monthly magazines to give a page or two to the trade notes supplied by the Director-General of Commercial Intelligence. This will secure space for the trade notes in established publications and thus lead to a wide distribution of the information. Indian Trade Journal.

(85-86)—The foregoing answer covers my reply to this question. The trade notes will have to be translated for various vernacular journals. Special monographs.

(87)—These publications really never reach the public. Persons interested in a particular subject search for and make use of such publications as they can find, but the

general public rarely comes across some of the most valuable information which can be found in official reports and bulletins. Useful information should be published in vernaculars and distributed freely.

(88)—An industrial vernacular journal in each province may possibly do much to awaken interest.

Other forms of Government action.

Certificates of
quality.

(89-90)—I don't think any certificates of quality are required. Anything of the kind would only hamper trade.

Transport.

(97)—The want of good roads greatly hampers internal trade. The improvement of communications is wanted more badly in Oudh than in the Punjab. I think District Boards should periodically institute enquiries and take up the opening of new communications seriously. As it is most of the money is spent on existing roads which connect official headquarters. No attempt is made to start feeder railways which will be found more advantageous than money spent on installed roads, etc.

(99)—Feeder lines are required to connect remote villages with trade centres. The capital can be raised in the district itself and the attempt should be ultimately to have District Board owned feeder railways adding materially to the resources of these Boards.

Hydro-electric en-
veys.

(102)—Sir Louis Dane had some valuable ideas on the subject and though his ideas suffered an eclipse in his time they are now slowly coming to the fore. A hydro-electric power survey in the Punjab will reveal the immense power that now runs to waste; even the canal-falls have not been harnessed. The whole matter should be carefully investigated by a committee of experts. Indeed another Irrigation Commission is required to take into consideration the possibilities of further extension of irrigation and the uses of water power.

(109)—I don't think jail industries compete with private industries.

ORAL EVIDENCE, 7TH DECEMBER 1917.

Hon'ble Sir Fazulbhoy Carrimbhoy.—Q.—What do you think of the hoarded wealth of your province; do you think people hoard money here too?—A.—Oh yes, I think there is a certain amount of money in the province.

Q.—How can this hoarded wealth be brought out?—A.—A central bank should be started.

Q.—You say in the 3rd paragraph, "The pressure of population and the productive resources of the province, so far as I can see, for many years to come, can give full time employment to any factory that is started on proper lines, insuring a good wage to the worker, and a profit to the producer." What are the real earnings of the people here?—A.—The wages of an unskilled labourer vary from 8 annas to one rupee a day.

Q.—What was it 5 years ago?—A.—Very much lower. The wage depends upon the price of food, and price of food has almost trebled.

Q.—Have the earnings of the educated class increased?—A.—No. The educated class is very hard hit. The old salaries remain practically unchanged while the purchasing power of the rupee has been going down.

Q.—In the 4th paragraph you say, "I am aware of the industries started in Madras by Mr. Chatterton, and the success attained in Germany and Japan." What industries do you refer to?—A.—I refer to the aluminium and leather industries in Madras.

Q.—You don't believe in grant-in-aid?—A.—No.

Q.—What are your reasons for saying so?—A.—I don't approve on public grounds. A grant-in-aid is never adequate and a small grant very often means waste of public funds. Any paying industry under good management could do without a grant-in-aid.

Q.—As you know, excepting the business centres of Bombay and Calcutta, in other parts of the country many people want to go in for business; they know what is profitable but have no money to put in. Don't you think that either a grant-in-aid or a bonus or subsidy would be very helpful to such people?—A.—Grant-in-aid to help a new industry, if it is adequate, may be useful otherwise it may mean waste of public funds.

Q.—Do you know how the industries of Japan and Germany have prospered?—A.—They are, some of them, bounty fed and I have no doubt if Government helped Indian industries to the same extent, safeguarding waste, bounties may help. I am only against inadequate grants.

Q.—And the subsidies and bounties too?—A.—Bounties properly given might help industries very much.

Q.—Don't you think, if a shipping industry was started in the country to compete with any other part of the world, that could only be started with the help of bounties?—A.—I have no experience of the shipping industry.

Q.—In your 8th paragraph you say, "In all cases in which the Government aid has been given, Government officers should audit accounts, and a Government Director should be on the Board till the business is firmly established." That is, you want the Government Director to vote or veto the thing?—A.—Not veto the thing; he will have his vote.

Q.—But still he is there to inform Government of what is happening?—A.—Besides that, he is able to help with his knowledge.

Q.—In your 8th paragraph you distinctly say you are in favour of "nationalisation of industry." Can you give us any instance of an industry in any part of the world which is nationalised?—A.—You may say that in Germany they are.

Q.—Railways only?—A.—Yes; when I am speaking of nationalisation of industry I am talking of industries connected with agriculture only, and, as such, I feel there is great room for promoting industries to deal with agricultural produce, such as sugarcane, cotton, and oil-seed industries.

Q.—Do you think private people cannot take advantage of that?—A.—No. A great deal of education will be necessary before village people can start industries. You must begin by Government helping and pioneering such industries.

Q.—You have your Agricultural College here?—A.—Yes, a very good college, doing very useful work.

Q.—You say, "There has been a good deal of complaint that Government did not help Indian-managed banks at the last crisis, and the complaint is not altogether without foundation." Will you give us an instance?—A.—I have the People's Bank in my mind. The People's Bank was considered to be an absolute failure, and yet it has managed to pay as much as 12 annas per rupee, after paying very heavy charges for liquidation. A bank like that, if it was helped in the beginning, might have done well.

Q.—How could Government help?—A.—By giving an advance.

Q.—On what?—A.—Government paper and other securities, as other English-managed banks were helped.

Q.—In paragraph 12 you say, "What the village needs is a small power station equipped with a sugar factory capable of dealing with produce of 1,000 acres of sugarcane, an area which will generally be found under this crop among 8 or 10 villages." Do you think 1,000 acres are enough? We have been told that at least you need 6,000 acres.—A.—That is a thing really deserving attention. In other parts of the world people start not only on 6,000 but twelve and fifteen thousand acres. Sugarcane plantations have their own factories. In India sugarcane is grown in patches and is not enough to feed a modern factory in a convenient area, therefore we need small factories. In the Punjab, something like 500,000 acres of cane is grown, yet the Punjab is supposed to be a Province not good for cane-growing. In Bengal only 75,000 acres are grown. For the United provinces I have not got the figures. The experts after careful enquiry hold that at least 50 per cent. of the produce is lost in the process of extraction and boiling. Here is an opportunity for the Government to come to the help of the villager and save him lakhs of rupees. You want a small factory to extract the full quantity of the juice and to save sugar by steam boiling which is now burnt in the open pans. The holdings are small and broken, and each man grows 2 or 3 acres of cane. We have to remedy the present conditions by starting small factories which will make crude sugar and send it to a central refining factory. The introduction of co-operative village factories will follow in the wake of model Government factories which ought to be started.

Q.—There must be small Indian factories for gur making?—A.—You cannot call them factories. Gur is made locally in the villages. Fifty per cent. to 70 per cent. is, however, lost in extracting and boiling according to experts.

Q.—In connection with this question, I wish to know what your views are regarding Government acquiring land?—A.—For setting up central sugar factories you might do it; for small model factories you need no land, nor any improvement in cane. The cane is there, all you need is to deal with the produce in a scientific manner. It will increase the profits of the cultivator by 50 per cent., lessen his labour, lead to extension of cane cultivation and help in meeting the demand for sugar if extraction by a power three roller mill and boiling by steam is provided. It is no use trying to create central factories, what you need is to help the existing conditions, provide factories which will suit villagers. There is no great difficulty in doing it; and it will help the entire sugar industry of India and lead to the success of a few central sugar factories.

Q.—Have you got any scheme in your mind; what would a small factory cost?—
A.—There are two or three kinds of factories. One factory was started by Mr. Hulme, Agricultural Expert in Oudh, for making gur. That cost five or six thousand rupees, and the kind of factory I have in my mind would not cost more than twenty thousand rupees.

Q.—Will you give us a small review of the scheme you have in mind, by which the sugar industry can flourish in this country? On the Bombay side the people say that the industry can only be started if the land is acquired, say, five or seven thousand acres under the Land Acquisition Act by Government, so that they can get the proper amount of sugar they want. Do you think that would work as a hardship? All the cultivators would not be willing to sell their land?—A.—To acquire 5,000 acres is not very difficult, and is no hardship to the cultivators. According to what I have read, and I have gone into the question rather fully, they say you must have at least fifteen to twenty thousand acres to run a central factory properly. As you cannot provide concentrated cultivation in one place, you can avail yourself of the supply which is already available, and is being wasted by providing small factories, with a central factory to turn the crude article into refined sugar and to deal with by-products. Central factory can only prosper if it has a home farm to feed it. To make sugar from gur means working at a great loss. What would you think of a country where 50 per cent. of the produce is wasted in the process of extraction and of boiling?

Q.—What is the percentage of sucrose?—A.—I will give it to you in my written note.

Q.—Then you speak about cotton?—A.—Yes.

Q.—You have been trying to grow long staple cotton here?—A.—I got about 450 acres under 4-F. Cotton in my own farm. I have started direct steam-plough cultivation. It would help the sugar cultivation too, because you can have a big farm in one place.

Q.—What kind of seeds are fruitful here?—A.—4-F. American has done the best. Egyptian we have not tried. They tried it in Sind, but it did not do very well.

Q.—You say, "there is no reason why cotton weaving should not succeed in the Punjab, when Japan after buying cotton for the Punjab can still make profit." That is on account of the short staple of the cotton?—A.—We grow both.

Q.—Not good staple cotton?—A.—The American cotton is superior to your Broach cotton.

Q.—But there is very little cotton?—A.—The quantity this year is large, we have got a very big area under American cotton, about 10 lakhs of acres under Desi and American cotton. Next year, I think, American cotton will be grown on even a larger area as American cotton under adverse conditions has done better than Desi.

Q.—Then you say in the 14th paragraph, "To my mind, State-managed industries are not likely to compete with existing industries." By industries you mean new industries?—
A.—Any industry that is started by the State and managed by the State would not compete for this reason because State management is generally more expensive.

Q.—But at the same time the raw material does not get cheaper?—A.—They will buy it in the open market.

Q.—What is the use of the State starting an industry when there is already private enterprise?—A.—In the presence of private enterprises there is no need, but take the Punjab where there is not a single industry.

Q.—You don't want the State to start an industry which is already in existence?—A.—No, but I want the State to pioneer an industry where none exists.

Q.—Don't you think that among the lower classes, and on a small scale, education ought to be given in the vernacular?—A.—Yes.

Q.—Is it being done here?—A.—Not in the Punjab.

Q.—Do you not think that is most essential?—A.—Yes, the greatest mistake that has been committed in the Punjab is to allow Punjabi language a grudging recognition. The Sikhs, who alone are for the Punjabi language, show a higher percentage of literates in the five years that are just over.

Q.—Have you any technical or agricultural books?—A.—I just started a system of agricultural books to be compiled in Patiala, but they were not finished. Another scheme was framed in Gwalior which is working fairly.

Q.—You think that in the case of the sons of cultivators, and men with very little means, if their children are to be educated, the education must be in the vernacular?—A.—Yes, absolutely.

Q.—You also want Government bulletins and other information to be in the vernacular?—A.—Yes. The people who ought to make use of these bulletins issued by Government Departments never hear of them.

Q.—You are in favour of exhibitions?—A.—Yes, partly.

Q.—And you want primary education to be compulsory?—A.—Yes, that is the basis of everything.

Q.—Then you say in the 46th paragraph: "The old Indian system was based on apprenticeship, and I think even now for practical work it offers the best possible training." What was that old system?—A.—Anyone who wanted to learn a trade was first apprenticed to a *Guru* or master, and worked with him and got the training.

Q.—Without any pay?—A.—Yes.

Sir D. J. Data.—Q.—The stone-mason belonged to one caste, and likewise the goldsmith, and people of these castes always took up the profession belonging to their caste?—A.—Generally speaking, but occasionally you will find outside men, who did not belong to the caste taking up professions.

Q.—But a goldsmith would always be a goldsmith?—A.—That is true, but there is nothing to prevent a man, who was not a goldsmith, apprenticing himself to a goldsmith. There are some such instances.

Q.—A goldsmith would not teach his art to anyone who did not belong to his caste?—A.—Possibly in ninety-nine cases, but there are always exceptions to the rule.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—In answer to Questions 57, 58, 59 and 60, you say: "The functions of the Board should be both advisory and executive." You want the Board to be also executive?—A.—In what sense?

Q.—In starting industries or in helping industries?—A.—In both cases.

Q.—And that there should be a grant from which they can spend money?—A.—Yes. Take a province like the Panjab, the Board should be able to start industries and direct them.

Q.—Should the Director of Industries be under the Board?—A.—That is a question of detail.

Sir F. H. Stewart.—Q.—Supposing the Director and the Board differ, who is to have their way?—A.—Like everything else, the majority must have its way.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—He should be an officer under the Board?—A.—Not exactly. He would be an officer of the Board. He would be the executive head of the industries, carrying out the policy of the Board. Naturally if you have a Board of Industries, like a Board of Management, they have a Managing Director who carries out the work.

Q.—If they differ, the matter goes to a final authority?—A.—The final authority would be the Board.

Q.—In paragraph 71(a)-72 you say: "I think for the present two central technological institutions will meet the needs of the whole of India." You only want two?—A.—Yes, men have gone to England, Japan and other countries and got the training, come back and found no employment. The employment is available only for the few. The creation of a technological institute does not mean creation of industries. Where will the men who get training go? To begin with, two institutions would be quite sufficient, and as the demand increases each province can have its own; but for the time being, two will be quite enough.

Q.—Do boys go from the Panjab to the Technical Institute in Bombay?—A.—Yes, some do.

Q.—Are there many from the Panjab in the electrical line?—A.—Not a great many.

Q.—Do you think one at Bombay and one at Calcutta would do?—A.—I had in my mind Cawnpore, it is more central. There was a big scheme worked out for Cawnpore under Sir Harcourt Butler.

Q.—Then you say in paragraph 77: "Foreign research scholarships should be started and enterprising individuals deputed to study conditions in other lands." As you were just saying, the results are not very satisfactory.—A.—I did not say they were no satisfactory. All I said was that employment was only available for a few men.

Q.—Do you think that the students are selected from the right quarter?—A.—I was talking of students who go on their own.

Q.—But in regard to the Government scholars, is the selection all right?—A.—I could not tell you; I have no experience.

Q.—Do you think if they were given a chance by continuing the scholarship for another year, that that would give them some time to find a position where they would be employed?—

A.—I could not tell you. The question of employment is a question of supply and demand. I have hopes that your Commission will accelerate industrial development and increase the demand for trained men. Foreign scholarships would therefore help. Businessmen, artisans and agriculturists who have knowledge and experience could be sent to study things in foreign countries. These men, after their studies, would be able to do very useful work; starting industries and introducing new methods.

Q.—In the 97th paragraph you say: "No attempt is made to start feeder railways which will be found more advantageous than money spent on metalled roads, etc." No private enterprise has taken up railways in this province?—A.—Not feeder railways. Rai Bahadur Ganga Ram had a scheme, and there was a Bill introduced by Government to levy some tax to start these railways but nothing has happened. Feeder railways in the Punjab will pay handsomely.

Q.—In the last paragraph you say: "I don't think jail industries compete with private industries."—A.—They never do.

Q.—Suppose jails started to use power, don't you think that would compete with private enterprise?—A.—I don't think so. There is no chance of the use of powers in jails. The jail population is not large, and jail industries are run not with the idea of competing but providing useful employment to jail inmates. This is the only way of helping prisoners to learn a profession which they can often take up in after-life.

Mr. C. E. Low.—Q.—With reference to your suggestion about small cane factories, what does cane sell for, per maund, in the Punjab?—A.—From 6 to 8 annas a maund; but it varies from year to year.

Q.—That is at present, in the present season?—A.—I could not tell you.

Q.—Evidence in Bihar went to show that, excepting in war time, they could not crush cane at a profit, to make it into sugar, if it sold for more than 4 or 5 annas.—A.—This is true. The difficulty with sugar factories is that the price of cane is so high, but if there is a co-operative factory, the profits from the sugar factory also will belong to the producer, and the price of cane will not interfere with the manufacture of sugar.

Q.—Has the Agricultural Department put up any crushing plant worked by power?—A.—I don't know of any in the Punjab.

Q.—With reference to what you said to Sir Fazulbhoj Currimbhoy about the Director of Industries being an officer working under the Board, how would that affect his position as a Government officer?—A.—This Advisory Board would be something like the Executive Council, and he would be one of the officers of the Executive Council.

Q.—I don't admit the analogy in the very least.—A.—I will call the Industrial Board an Executive Council, and as a member, he would enjoy the same privileges as the other members.

Q.—Are the members of the Board to be officials while they are members?—A.—Some of them will be officials and some non-officials; as members of the Board they will all be officials of the Board.

Q.—How many members would you propose having?—A.—That would depend upon the needs of the province; in some 6, in others 8, and in others 12. They would represent different interests.

Q.—Where would they live? Would they all live in Lahore, or in other places?—A.—It all depends on the amount of business that the Board does. If there is a great deal of business passing through the hands of the Board, the Board would have to settle down in Lahore; if the business is small, and their functions are merely advisory, they would meet on dates fixed at central places to be selected from time to time.

Q.—You say they would be like an Industrial Executive Council. The members of the ordinary Executive Council are whole-time Government officers. Would these gentlemen all be whole-time Government officers, or carry on their own business?—A.—That depends upon the nature of the work. If the work is enough to provide a whole-time appointment, there is no reason why they should not work whole time. If they have only to work for a day in the week, there is no reason why there should be a whole-time Board.

Q.—Assuming that they are not, do you think it would be easy to secure the attendance of men from outlying places?—A.—I hope so; I trust so.

Q.—In practice is the attendance of people from outlying places secured?—A.—Take the Board of Management of a bank; you will find that the Directors do not live in one place yet they manage to come for important meetings.

Q.—Do they live at considerable distances, representing different outlying parts of the province?—A.—Some do.

Q.—Do the Directors of the Board live say in places as far distant from Lahore as Multan?—A.—I think so, but I cannot make a definite statement.

Q. Then take another appointment, that of the Director. It is rather a difficult post to fill?—A.—It will be a difficult post no doubt.

Q.—Do you think it will make it any the easier to fill it, if you put the Director under the orders of the Board? Do you think the ordinary man you are likely to engage would like to work under those conditions?—A.—I am taking things from a purely business point of view. If the Board of Directors in banks or business concerns can find suitable men to work with them, I don't see why the Director of Industries should not be able to work with the Board. It is most important that the Director of Industries should not remain an outsider; he must be of the people, one of them, and not an "official" superior.

Q.—Directors of banks are rather different; they put their money into the bank; but in the case of this Director, the money would be that of the Government, and not of the members of the Board. Then presumably the managers of banks get paid on results, in addition to their salaries?—A.—It is the best possible thing to give some share of the profits to the men who work. I said I did not believe in grants-in-aid, but I have no objection to subsidies and bounties. The whole thing hinges on the functions of the Board. Until you make clear the functions of the Board it is rather difficult to give a definite answer as to the position of the Board and the Director of Industries.

Hon'ble Mr. H. J. Maynard.—Q.—As regards this Board of Industries that you are thinking of, do you happen to know the constitution of the Sanitary Board in the Punjab?—A.—No.

Q.—This is a Board which consists partly of officials and non-officials. The non-officials come in from distant parts. The Sanitary officer has only one vote. Is your idea of an Industrial Board a Board of that kind distributing either grants or subsidies, or whatever may be the form of assistance, meeting together, and in which the vote of the Director of Industries would be merged in so far as he is a member of the Board, but without affecting his executive authority?—A.—That is what I have in my mind: the Board of Industries will develop slowly in response to the call of new times.

Q.—That is a Board distributing grants or subsidies?—A.—It will have dual functions as it were. The Director of Industries will be a member of the Board and will have his vote and at the same time will also be an executive officer.

Q.—About these sugarcane factories, I suppose in making your plans you consulted the agricultural experts in the Punjab. Did they not lead you to suppose that the peculiar climate of the Punjab seriously affects the quantity of sucrose, and really makes the plant a non-economic one in the Punjab?—A.—That is the theory, the facts are against it. So far as I have come to know, the area under sugarcane in the Punjab is large and on the increase. You might give some credit to the grower, he is not likely to waste his time and labour on a crop that has no economic value.

Q.—Do you happen to know whether it is increasing or decreasing?—A.—I don't think it has decreased. I have got five years' figures.

Q.—You did, I suppose, hear opinions recorded by agricultural experts that the frosts are not very favourable. Were you not told that the growth of sugarcane on a large scale must be south of Karnal in the Delhi Division?—A.—The opinion was that the cane that was grown was not quite suitable and frosts affected it; the experts also said it was possible to find new varieties that would give as good results. No new varieties have yet been discovered. Gurdaspur they thought was the best cane-growing district at present.

Q.—About these light railways, possibly you were thinking of the plans that were made before the war by two firms for an extensive series of light railways all over the province?—A.—I have not heard of these plans.

Sir D. J. Tata.—Q.—I don't quite follow your idea of the nationalisation of industries. What you say here seems to contradict the idea of nationalisation. For instance in one place you say, "Once research and demonstration have proved the success of an industry it will be naturally taken up by capitalists and thus automatically indicate where Government work should stop and private enterprise take its place." In other places you say something very similar. Do you contemplate that there should be no private enterprise altogether, and that all industries should be taken up by Government? You say again: "To my mind State-managed industries are not likely to compete with existing industries. In the coming years there will be room for all," and so on in many places?—A.—What I mean is this, that Government need not be shy of starting pioneer industries, and even when they have started them, they should carry them on to their utmost possible expansion.

Q.—And then hand them over to private enterprise?—A.—If private enterprise takes them over, let them. My note is really in connection with agriculture. I would prefer agricultural industries to be nationalised in the sense in which co-operative industries in the

villages can be nationalised. These co-operative village factories would serve as feeders to large up-to-date factories which again might be under State management. I am not against private enterprise. The two can work side by side.

Q.—You have made some remarks about technical scholarships and careers for people who take advantage of these scholarships. What is the reason that young men, who are sent abroad to be trained, find no careers? Do you realise why it is that they don't find occupation straight off after their return?—A.—I have only two or three cases in mind. One or two men went for glass manufacturing, and on their return people expected them to start glass factories at once. You cannot expect boys who have just returned after getting a certain amount of training to take up the whole management of the glass industry. They did not succeed. I heard of another candidate who had been to Japan and qualified himself as a chemist; for a long time he was hunting for a professorship but could not get it. Another man went to Germany. He could not find a place till a private firm gave him employment and he is now making Thymol with great success.

Q.—When these young men applied for these scholarships, did they have any previous knowledge of these subjects?—A.—I don't know whether they enjoyed any scholarships at all. They went on their own.

Q.—But before going and spending money on these things, did they have any idea whether when they came back they would find an opening?—A.—Decidedly.

Q.—Then why did they find any difficulty in finding employment?—A.—Because, although there was such a talk about technical education in the air, there were really no industries in existence to give employment to trained men.

Q.—Take something for which there is no opening in this country. A young man says "in Japan they make these things." He goes and studies that, comes back and finds no demand for his services. Several witnesses have told us that when some of these young men apply for scholarships to go and train themselves, say as electrical engineers, and finding there is no opening, they want to be taught leather work next; and when there is no opening in that, pass on to something else. They don't go with any idea of trying to do something. Don't they ask for scholarships without any apparent definite object in view?—A.—I think a young man, when he takes a scholarship, really wants a career and does not wish to make his living by keeping the scholarship as long as he can. It may be in making his choice he is not wise, but that is all.

Q.—Scholarships should be given to men who have already worked in any particular industry; then if they have shown any aptitude, they may be sent to perfect their knowledge of that particular thing.—A.—That is a very good suggestion. You would take up a man who has worked 2 or 3 years but I am not for closing the door altogether to capable students who are anxious to go on with their training. I think the selection might be left to the discretion of the authority empowered to grant scholarships.

Q.—But when he comes back he finds absolutely no opening?—A.—That is the difficulty.

Q.—I believe some of the most successful were those who went in for cotton spinning. One or two scholarships were given to men who worked in cotton mills and showed aptitude for the work, who were then sent to Lancashire, and came back with a knowledge of their own trade, and were really useful.—A.—I quite agree with you.

Q.—Don't you think that the ideal way in which a man could qualify should be this; that those people alone should go to foreign countries for study, whose paternal trade it is. For instance, a rich agriculturist or a land-owner should send his son to Europe after he has been associated with him in his own work, so that he can come back and manage his own business. Is not that the right way?—A.—I am one with you in this but I don't believe in perpetuating caste.

Q.—Nothing is to be had without work?—A.—I agree with you, but there is a certain amount of mixing up going on, barriers are breaking and in the new times individuals should have the opportunity to choose and pick professions for which nature best fitted them.

Q.—These unfortunate people seek careers because they want to do something, but they don't find out whether there is any opening?—A.—We who are fortunate must help these unfortunate people. Take a Brahmin, for instance; he may like to do cotton spinning, why should not he get his chance.

Q.—Before doing so, would it not be much better for him to go into a cotton mill, and learn something of it, and then go. For instance, the first men who went to learn about glass-making had no opening, because there was no ready-made industry for them?—A.—Exactly, that is my opinion.

Q.—One man I heard of sent his son to Europe to study the gold-thread trade in which he worked. That was the right thing to do. Otherwise you have so many complaints,

as you point out, of men who go through a course of technical training and are expected to start industries whom they have not studied the conditions from the factory point of view.—
A.—Exactly.

Q.—You say labour in the Punjab is cheaper than in Bombay. You mean the wages are lower?—A.—Yes, that is one thing, and I think our labour is not inefficient either.

Q.—In a cotton factory which would you consider cheaper, English or Indian labour?—
A.—Indian labour properly trained will be cheaper. It is every day increasing in efficiency.

Q.—Would you be surprised to hear that I consider that English labour is cheaper than Indian labour?—A.—Yes, but I think our labour is not inefficient.

Q.—Not according to the work turned out. A short time ago an investigation was made with regard to the proportion which wages bore to cost of production per pound of yarn; and it was found to be less in England than it is in Bombay, simply because, practically, one labourer in England, though his wages are high, does the work of 3 in India. Consequently the proportion that wages bear to cost of production in England is less?—A.—Men in England are turned into machines, while here they are not, but they are moving towards that ideal.

Q.—In that sense I don't see why you should say labour is cheaper in the Punjab than in Bombay. Wages are lower here perhaps?—A.—We have not proved that it is inefficient.

Q.—When you talk about religious education, do you mean moral?—A.—I don't disassociate morals from religion.

Q.—Consider the number of religions that exist in India. Who is to give the religious education, and in what religion? In a big public school there would be about 20 different sects. Are they all to be instructed in those particular religions?—A.—Religious education is possible everywhere specially in villages.

Q.—Even in villages, there might be Muhammadans, Sikhs, Budhists, etc.?—A.—If we go back to the education that a Parsee, Muhammadan or Hindu got in the old days, we have a good model to follow. Each community had its own *Maktab* or *Pathshalla*, under a Maulvi or Guru who was respected. The morals of the school did not differ from that of the family. The ideals of life and labour which he inherited still guided him. Are you going to do away with them entirely in your new schools, and deprive the labourer of what has sustained him through ages?

Q.—Is it a practical suggestion? How could you give religious education?—A.—Yes. We must create a moral atmosphere in the schools, and the teacher should not confine himself entirely to secular education and provide separate denominational schools.

Q.—Who is going to pay for this? Should the various religions pay?—A.—They are paying already; all you need is to provide religious teaching for various denominations and denominational schools.

Q.—In answer to Question 102, you say, "A hydro-electric power survey in the Punjab will reveal the immense power that now runs to waste; even the canal falls have not been harnessed." Do you propose that a survey should be made?—A.—Yes.

Q.—And then what should be done? All the power created at once?—A.—As it is required. When you have got a survey made and the schemes properly made you can take each scheme in turn as the industries spring up, and the demand grows.

Q.—Schemes should be worked out and people told that it is possible to store 5,000 H. P. A man then comes along and says: "I should like to make use of this power," and then it is given?—A.—Yes.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—Can you tell us anything about cottage industries?—A.—A certain amount of weaving goes on in the villages.

Q.—Can you suggest anything about cottage industries?—A.—I have really nothing more to say about cottage industries than the introduction of improved looms and co-operative working.

ADDITIONAL WRITTEN EVIDENCE—(Submitted after oral examination.)

The position of Sugar Manufacture in India and the Punjab.

India has been growing sugarcane from time immemorial. It used to produce enough sugar for its own needs. It now imports sugar like other articles which were manufactured in India before. The reason is that while other countries have sought the assistance of science and discovered more efficient methods of manufacture we have stuck to the old primitive methods which are now entirely out of date and extremely wasteful. The hand-loom is supposed to be capable of competing with power loom and the two roller crusher mill equal in efficiency to the multiple roller steam-driven crushing mill and vacuum pans. In advanced countries it is now held that the day of small manufacturing concerns is gone, in India

the day of even small joint stock concerns has not come. We are impractical not only in the sphere of politics but even in matters of industry and trade. In other countries, Governments have helped co-operation and fostered infant industries on efficient lines thus accelerating the pace. Here we shall not be surprised if the report of the Industrial Commission when it is issued wanders from office to office and is subjected to various opinions of the Secretariat and its main recommendations lost in a maze of words.

The day of hand-loom and small manufactures is over. What would you think of a man who expects a bullock cart to keep pace with a motor-car? I must not, however, digress. I must come back to the cultivation of sugarcane. The peasant puts only an acre or so under cane because even his small plot of sugarcane taxes him to his fullest capability. It is a crop which pays him best, and he would love to have a larger area under it, but with his sugar mill and his pair of weary bullocks, and all the time and labour of his family, it takes him nearly two months to crush his solitary acre. Leave him to grow the cane, manufacture sugar for him and he will treble the area under sugarcane. It is in the manufacture that he fails and loses almost all the profits of his crop in spite of continuous work night and day. When the bullocks get weary and refuse to go, the peasant with a light heart slackens off the rollers wholly unconscious that in doing this he is leaving a great deal of juice unpressed. When the crop is poor and the cane fibrous he loses something like 50 per cent. of the juice. In modern sugar factories cane passes through many rollers and even the refuse is steeped in hot water and then pressed again. How can the poor cultivator compete with these power-driven crushing mills and scientific methods of manufacture. Sugar-making is a science in itself. The following figures compiled by Mr. Sayer, Assistant to the Agricultural Adviser to the Government of India, speak for themselves of grossly inefficient methods which obtain in India in the recovery of sugar from cane. The figures have been worked on the assumption that cane is available at Rs. 7 per ton, a working price in North India :—

Process,	Tons of cane to a ton of sugar.	Cost of cane per ton of sugar.	Net manufacturing expenses.	Total net cost per ton of sugar.
Khandsari	27.3	191	70	261
Hadi	20.2	141	56	197
Gur refining	17.4	122	60	182
Small vacuum pan	15.0	105	89	194
Modern factory (crushing 300 tons of cane per day of the type).	13.8	95	55	150

When the crop is poor with low sucrose content and also low purity as much as 16 tons of cane are required for a ton of sugar. But when good quality crop is obtained as the result of a favourable season about 12 tons of cane are required. By the Indian method the Khandsari or the maker of sugar recovers from 27.3 tons of cane only 1 ton of sugar. The modern factory from the same quantity of cane recovers over 3 tons of sugar. The cost per ton of sugar according to the old methods runs up to Rs. 261 a ton while according to the new it is reduced to Rs. 150 a ton; that is to say, the producer for every 27 tons of sugarcane loses Rs. 111. Could anything be more wasteful?

It is evident from the figures given above that sugar can be manufactured at a sufficiently low cost in India to compete with foreign sugar if up-to-date factories are set up under proper conditions. The Pilibhit Factory and some other sugar factories in Bihar have been running successfully even before the war. It is not the production of cane that fails, but the tremendous wastage in the making of sugar which ruins the industry. If the cultivator could be helped at the manufacturing stage, the extension of sugarcane cultivation would follow and India will no more import sugar. Writes Mr. Sayer "The cultivator works hard for periods varying from ten to eighteen months, sinks a lot of capital (having regard to his means), raises a successful crop with the limitations under which he has to work, e.g., imperfect implements, inadequate supply of manure, etc., and yet because he does not know or because he has no means, he fails to recover even a decent average amount of sugar from his crop, in fact reduces the possible output by 35 to 50 per cent., and suffers in consequence. Could we but teach him that he wastes 20 per cent. of the sucrose when crushing his cane by a bullock-driven mill and that all told a loss of nearly 35 per cent. to 50 per cent. occurs in the whole process from the time the cane is cut to the complete manufacture of raw sugar, he would soon realize why it is that cane cultivation does not pay him as it ought to."

"With the ordinary three-roller mill driven by bullocks in the case of a cane having 8 per cent. fibre and a total possible juice production of 89 per 100 of a cane, the cultivator will extract even under the most favourable circumstances only 74.9 per cent. of juice, while a Krajewski cane crusher and a three-roller mill with maceration will extract 86.9 per cent. of juice. Just imagine what country or what industry could or would stand a waste of 20 per cent. or more occurring in a single operation, which is but a link in the whole chain of process of manufacture, if it had any competition to meet."

The whole matter has been left to the good sense of the cultivator and private enterprise. They have failed to combine and start manufacturing on up-to-date methods. The few large sugar factories which were started are compelled to purchase cane at a price which reduces their margin of profit and even then enough cane is not available to feed them. According to experts a large factory requires at least 5,000 tons of cane within a radius of 4 miles. It has not been possible for private factories to make this provision. There has been some talk of acquiring large blocks of land and placing modern factories in the heart of sugar plantations. This is, no doubt, an ideal method if a sufficiently large number of factories and plantations could be established, but there does not seem any likelihood of such a large undertaking on the part of the Government and in a large country like India one or two factories will hardly make any difference as to the output of sugar as the areas thus acquired will be limited, while the waste from millions of acres of cane grown all over the country will continue.

The other method is to take stock of the present conditions of produce and to help the producer just where he fails, that is in the extraction of the juice and the making of sugar. I will now take up the position of sugar manufacture in the Punjab. The late Mr. Barnes was of opinion that in Gurdaspur nearly one-half (varying from 34 per cent. to 57 per cent.) of the sucrose in cane is lost in the simple operation of melting and boiling. The juice is boiled in open pans direct over the fire and result is that sugar which would otherwise crystallize is inverted into caramel. And the *gur* that is made again is very unsuitable for making sugar. When the fibre content of cane is 15, the best three-roller bullock mill will only extract 53 per cent. juice, while with the Krajewski cane-crusher and three-roller mills with maceration the extraction runs as high as 75.5 per cent. out of a possible 80. That is to say where the fibre content is high the cultivator stands to *lose much more with his present methods of crushing than in the case of canes with a low fibre content. It means in the Punjab the cultivator is losing at least 30 per cent. of his crop by inefficient crushing.* To this must be added another 20 per cent. in the process of manufacture which means the loss of almost half the crop. Would not the position of sugar in the Punjab be different if the profits from cane were increased by 30 per cent. by providing power crushing and another 20 per cent. by steam boiling. It is strange that while looking out for new crops we cannot help the cultivator to recover fully what he already produces. It is argued that the climate of the Punjab is unsuitable and that the yields are poor and it is no use worrying about the position of sugar in the Punjab. But the cultivator is no fool, he finds it paying better than other crop even with a loss which runs up to 50 per cent. in manufacture. If this 50 per cent. was secured for the producer, the area under sugarcane will increase greatly. The area under sugarcane in the Punjab, so far as I am aware, is only smaller than that of the United Provinces and has not been decreasing. The war has proved the possibility of making many things possible which were held as impossible and the manufacture of sugar comes easily within the range of possible things. Through good times and bad times, sugarcane has held its own, as the best-paying crop in spite of the great losses in manufacture. If we wait for the time when more paying crops will drive out sugarcane from the province we may have to wait to the end of the time.

On the other hand if we turn our attention to the conditions of manufacture and help the cultivator at the manufacturing stage it will mean an increase of 50 per cent. from the profits of sugarcane cultivation for the peasant immediately, without any improvement in the quality of the cane. The solution appears to me to be simple. All that is necessary is the establishment of a few demonstration factories. It will be more advantageous if these factories are run by private individuals rather than by the Government. The villager is rather suspicious of the figures and facts of the Government-run farms. He pleads that he cannot emulate Government with its unlimited resources. But if a man from the villages runs a farm or a factory with success the news goes round and becomes the topic of conversation in the villages. It excites both the jealousy and the ambition of the villagers who are stimulated to action. A small beginning can be made by encouraging a few individuals to start power crushing and steam boiling of the juice. In steam evaporation a large heating surface is provided and the losses due to inversion proportionately reduced. Steam heating is also more efficient than open fire heating. In modern sugar factories heat is economized by the use of multiple effect evaporators and vacuum pans. The Government can purchase a few crushing and steam boiling plants and hire them out. The plant can be made portable with a traction engine and a wagon which can go from village to village. In the beginning only *gur* should be made. The power crushing will add at least 30 per cent. in the Punjab to the output of *gur* by more efficient extraction of the juice. Under steam evaporation the increase in the glucose ratio is not as great and hence better quality *gur* is produced to

the great advantage of the refiner. From every 100 maunds of *gur* as prepared by the country method a refiner is lucky to get 55 maunds of sugar whereas from the same quantity of *gur* evaporated by steam he will be able to recover 10 to 15 per cent. more.

A traction engine with a good crushing mill could easily serve five villages growing 200 acres of cane each. These small crushing and boiling factories will come to the aid of the farmer just where he fails. The cultivator is not wedded to the present methods, he abandoned the old wooden cane-crusher as soon as he found the ordinary two-roller mill more efficient. He will take to the new mill as soon as he finds it brings him better profit. In fact I am confident that as soon as a few plants are successfully established the villagers will combine and start these factories for themselves and thus learn co-operation on which the whole future of Indian agriculture depends. A start has to be made. Either the cultivators should combine and work a *gur* factory—which does not seem within the range of possibility at present—or the State should show the cultivator how best the crushing can be done by putting up efficient installations charging reasonable rates for crushing and manufacture of *gur*, and thereby conclusively proving (by the only method possible) to the cultivator that these modern methods of crushing and boiling are very profitable. I am confident that if small factories work successfully they will lead to the establishment of large refineries all over the country. Before the war we used to import about 500,000 tons of white sugar (16 D. S. and above) per year. There can be no doubt as to the wide scope for sugar manufacture in India.

The Government may help individuals or co-operative associations in the beginning to start small crushing and boiling factories in sugar-growing areas and establish one large sugar refining factory in each province to deal with the crude produce. I am not formulating unworkable proposals. Messrs. Begg Sutherland and Company of Cawnpore have built up a big sugar manufacturing business in United Provinces. They have small factories in some of the cane-growing districts where cane is crushed and juice boiled to required density and sent to the central factory at Cawnpore, where the crude article is turned into refined sugar and by-products also made to yield and add to the profit. At present we import 61 lakhs of rupees worth of molasses, the by-product of sugar. To those who know how many industries in the world now carry on solely by the successful utilization of by-products and careful economizing at all points it is heart-rending to see the waste that is going on in this particular industry in India. I am so sure of the success of sugar manufacture in the Punjab that I am going into the business myself. I am in negotiation with the Punjab Government for acquisition by purchase at market price of an area near my own. The only concession I am looking for is the postponement of payment during the period of laying out the farm and the factory. I have hopes that when my scheme works, it will lead to the villages combining to start similar factories of their own which will inevitably lead to the establishment of many large central sugar factories in the Punjab. The establishment of power stations in the villages will be beneficial in other directions such as cotton ginning, oil manufacture, etc., in the villages. A writer in the "Times of India" calculates the money value of the loss to the country by the waste of cotton seed at Rs. 13,15,00,000 and the producer loses at least 20 per cent. in marketing his seed cotton.

"In statistics giving the cost of production at three typical Java mills the Director of Agriculture, Bombay, shows the profits on a share capital of 9 lakhs to be 45 per cent. and the cost of sugar production is given as follows:—

				Per ton of white sugar.
				Rs.
9.65 tons of cane at Rs. 4.10	required to produce 1 ton			
of sugar	39.56
Cost of manufacture	80.84
Cost of interest on capital borrowed for cane and sugar				
production, commission, marketing and taxation	...			47.21
Total				117.61

Sale price Rs. 169.27 per ton of sugar.

Net profit Rs. 51.66 per ton of sugar.

"Calculating in a similar manner using figures which apply to conditions prevailing in the Bombay Deccan, taking 10 tons of cane to produce 1 ton of sugar, the price of cane at Rs. 10 per ton, the cost of manufacture at Rs. 40 per ton of sugar, and interest on capital

borrowed, etc., at Rs. 50 per ton of sugar, the cost of sugar production works out as follows:—

		<i>Per ton of white sugar.</i>	
		Rs.	
10 tons of cane at Rs. 10	required to produce 1 ton of sugar	...	100.0
Cost of manufacture	40.0
Cost of interest for capital borrowed for cane and sugar production, commission, marketing and taxation	50.0
Total		...	190.0

Sale price say Rs. 400 per ton of sugar.

Net profit Rs. 210 per ton of sugar.

"Previous to the war, Mauritius, which is an Island in the Indian Ocean of only 795 square miles area but on which there exist 80 sugar factories turning out 200,000 tons of sugar annually, exported the bulk of this sugar into Bombay while all the cane cultivation and sugar factories on the Island are worked by Indian labour.

"But it should be noted that the estimated net cost of cane production in the field, without cutting and carting charges, comes to Rs. 4 to Rs. 15.8 per ton in Java which is not lower than in certain parts of Bihar and Gorakhpur. This is because the cost of manning cane is Rs. 25 per acre in Java and also because the rents there run considerably higher than in the United Provinces. The wastage in cane-crushing and *gur*-making as carried on by cultivators is enormous and if this loss is prevented and a slight increase in the yield of cane per acre brought about, India will be more than independent of foreign sugar. It must also be borne in mind that the taste for sugar is growing as the annually expanding imports of sugar before the outbreak of war showed."

To sum up the most urgent reform needed is on the manufacturing side—

- (a) To demonstrate the advantages of power extraction whereby the maximum quantity of juice is expressed by crushing the cane several times in succession through many rollers.
- (b) To help the establishment of power stations in groups of villages to crush and boil cane and deal with other agricultural produce.
- (c) To establish central factories to deal with the crude village* produce and also to manufacture direct from the juice. The direct process is most interesting: "The juice as it leaves the mill is at once limed to neutralise acidity and so prevent the formation of molasses, bleached by the application of sulphurous acid gas in order to obtain white sugar, clarified, filtered and evaporated and boiled into sugar under a vacuum in order to prevent the formation of molasses. It is then spun in the centrifugal machines in order to remove the molasses and the maximum quantity of sugar is turned out ready for the market. The molasses from this sugar is re-boiled to make a second quality and even a third quality of sugar is produced. The cane refuse or crushed cane is utilised for generating the steam required to run the factory in specially constructed boiler furnaces in factories designed for the most economical working, no other fuel being necessary."
- d) The establishment of power stations can be helped by grant of bounties in the villages and by encouraging enterprising individuals to go ahead with their scheme. "A list of places where cane cultivation occupies in any single year about 3,000 acres within a radius of five miles or at such distance as can be commanded within 48 hours of harvesting should be prepared for the guidance of those who wish to set up central sugar factories capable of crushing at least 300 tons of cane a day."

If we organise sugar industry in the Punjab it will pour annually into the lap of the peasants lakhs of rupees and make the cultivator responsive to new ideas and able to help himself.

In preparing this note I am greatly indebted to Mr. Wynne Sayer's article in the October number of the *Agricultural Journal of India* and the *Imperial Trade* number of the "Times of India."

WITNESS No. 364.

RAI BAHADUR MOHAN LAL, Proprietor of the firm of Rai Sahib M. Gulab Singh & Sons,
Lahore.

WRITTEN EVIDENCE.

Capital.

The question of industrial development is pre-eminently a question of capital. Other things such as technical and general education are undoubtedly necessary, but capital is the first essential, because it is only when the requisite capital has been found that the question of utilising the products of education can arise in a practical manner. The Commission has, therefore, rightly given the first place in its list of questions to those relating to the difficulties of raising capital. Capital in India is admittedly shy, as compared with western countries as well as Japan, and if India is to be an industrially developed country in the modern sense this shyness has to be overcome. The best, perhaps the only, way in which this shyness can be overcome is by helping to float a number of successful enterprises to serve as a sort of object-lesson to intending investors. It is here that Government aid appears to me to be all-important. My suggestion is that every Provincial Government should lay aside every year a sum of, say, rupees five lakhs to help the cause of industrial development. This amount should be lent to approved companies or individuals starting a new and promising industry or seeking to resuscitate an old one, which is languishing for want of help, on cheap rates of interest for such periods as may be deemed necessary and on such securities as they can legitimately be expected to furnish. If the Government will do this for, say, 20 years then at the end of that period it will not perhaps be necessary to make any fresh advances, in the first place, because private enterprise will by that time have learned to stand on its own legs, and, secondly, because such help as industries might still require could then be afforded from out of the interest or profit accruing from the amount already advanced by Government.

Government assistance.

Of other forms of Government aid, I am in favour of the supply of machinery and plant on the hire-purchase system, the provision of part of share capital of companies on the same basis as public subscriptions of capital, as well as guaranteed or preferential Government purchase of products. On this last point I would add that where the products are cheap and of sufficiently good quality, there is no reason why the patronage of Government should not be continued even when it has ceased to be absolutely necessary. The search for an ideal perfection in quality is neither necessary nor practically helpful. I would only premise that the patronage should be extended on a basis of perfect impartiality. In all cases of direct financial and other aids to industries the Government should, in my opinion, have some control over the concerns, but the best method of exercising this control would be by means of an independent audit. The only cases in which the Government would be justified in being represented on the Board of Directors are those in which it would provide a part of the share capital. I am also of opinion that all new industries should for a period of five years be exempt from all taxes.

Pioneering industries.

As regards the pioneering of industries, it seems to me that there is justification for it only in those cases where the Government have reason to believe that the shyness of private capital would not be overcome even by financial aid in any of the above forms. In such cases the factories should be handed over to private individuals or companies as soon as these appear in the field with reasonable chances of success.

Official organisation.

That the amount annually budgeted by Government for giving help to industries may be properly distributed and utilized and its industrial policy generally may be properly carried out, I think it essential that there should be a Board of industries. The Board might consist of an equal number of officials and non-official businessmen. It should have specified executive powers, and should elect its own chairman who might be designated the Director of Industries for the Province. It should be in sole charge of the distribution of the funds budgeted for industries within the limits of its powers, and outside those powers should be a sort of advisory body to Government. The Government should not usually interfere with it, so far as its own proper functions are concerned, except for the purpose of seeing that its general policy is carried out.

Banking facilities.

Besides affording direct financial aid to industries, there is another direction in which the Government can help them financially. One formidable difficulty, which industrialists at present experience in the matter of raising capital for industrial purposes, is the reluctance of European-managed banks, including the Presidency Banks, to help Indian enterprise. I have myself experienced this difficulty. So far as the ordinary European-managed banks are concerned, the Government is, of course, powerless, but as regards the presidency banks it ought to be able to do something. In my opinion it should insist upon these banks treating Indian and European enterprise on a footing of perfect equality as a condition precedent to placing its surplus at their disposal, and it should be

represented on the directorate of the banks to see that this policy is properly and adequately carried out. The time has also come when the question of having a separate Provincial bank for the Punjab should be seriously taken up. The Bengal Bank is entirely outside the control or even the sphere of influence of the Punjab Government. The consequence is that even in cases where the Government are of opinion that an industry deserves help, it has often to go without any financial assistance from the bank.

Far from thinking that there should be any limitation on Government aid to a new enterprise if it competes with an established foreign trade, I am of opinion that it is exactly in such cases that Government aid is most essential. The question of protective tariff is outside the scope of the Commission's enquiry. Otherwise I might point out that a certain amount of protection, at least for a limited period, is absolutely essential if India is to compete successfully with other countries, most of which protect their own industries by a rigid tariff wall. England is perhaps the only free trade country with which India has to deal on a large scale, and both on this account and also because of the intimate and indissoluble political ties that bind the two countries I am in favour of a system of mutual preferential tariff as between India and England, but in all other cases there is room for rigid and systematic protection for as long a time as protection may be necessary.

On the subject of technical aid to industries, my idea is that while the Government might have a suitable and adequate staff of experts, whose services might be lent to private industries on condition that besides paying for these services at a reasonably moderate rate, the factories or concerns in question should accept for training a number of apprentices recommended by Government or specified public bodies, the industries should be encouraged as far as possible to depend upon their own experts. Here I may parenthetically add that in awarding scholarships for industrial training in foreign countries the Government should consult at least a couple of non-official businessmen in every province before the industries are finally selected. I may add that I am in favour of the establishment of at least one technological college and one college of commerce in the country. When these are established, the need both for the Government entertaining a staff of experts as well as for private capitalists and companies obtaining their experts from abroad will be largely obviated.

As regards the land policy of the Government, I am strongly of opinion that the Pre-emption Act and similar other measures should be so modified as to remove all restrictions that at present exist in the way of individuals or classes purchasing or obtaining land, even when they require it for industrial purposes. These Acts, to my mind, were conceived in the interests of agriculturists, though it is contended by my community that it has operated unfavourably against itself even from this point of view. Now that the Punjab wishes to become an industrial as well as an agricultural province a modification of the law is clearly essential.

Lastly I am in favour of a wide diffusion of elementary education. It is universal experience that the average literate labourer is more intelligent and more efficient than the average illiterate labourer, and since in the long run the success of industries depends to no small extent upon the efficiency of all its labourers, both skilled and unskilled, it is obvious that this question of the diffusion of education has a very important bearing on the question of industrial development. For this reason I welcome the movement in favour of the making of elementary education compulsory, because it is only by making it compulsory that education can be made universal.

In conclusion, I would beg leave to point out that by helping the cause of industrial development the Government would not only be helping the country to stand on its own legs economically, but would also be helping itself materially. The discontented graduate and under-graduate is a serious problem not only economically but politically, and the best and the only natural solution of this problem is to provide industrial openings for a large proportion of the products of education.

ORAL EVIDENCE, 7TH DECEMBER 1917.

Sir F. H. Stewart.—Q.—You were listening to the evidence which the Sirdar Sahib was giving?—A.—Yes.

Q.—You heard the question which he was asked about the proposed constitution of the Board of Industries?—A.—Yes.

Q.—And the position with regard to it of the Director of Industries?—A.—Yes.

Q.—You think that the Board should elect its own chairman?—A.—Yes.

Q.—Do you think that would work?—A.—I think the Director of Industries may be made chairman.

Q.—You say in your statement that he should be elected by the Board?—A.—I have changed my opinion. I think that the Director of Industries may be made the chairman of the Advisory Board.

Q.—How many members do you think you would have on the Board?—A.—At least two officials and two non-officials.

Q.—You would have it a small number?—A.—Yes.

Q.—And do you think it would help if you gave the members of the Board power to appoint special committees or to co-opt other gentlemen for special purposes?—A.—Yes.

Q.—One suggestion we had about it is that such a Board would not be likely to devote sufficient attention to helping cottage industries?—A.—They can employ persons or take the help of men who can spare the time and who may possess the requisite knowledge.

Q.—And you suggest that this Board should have budgeted funds. You suggest that five lakhs should be put aside. A considerable sum?—A.—Five lakhs or whatever is convenient.

Q.—Would that be at the disposal of the Board without further reference to Government?—A.—That should be at the disposal of the Board.

Q.—Without further reference to Government?—A.—Yes.

Q.—You would not introduce some safeguard, that reference should be made to Government if they wanted to spend more than a certain sum on a particular project?—A.—The Board should be the final authority.

Q.—You think that will be safe?—A.—Yes.

Q.—What will be the powers of the Director?—A.—He would carry out the orders of the Board.

Q.—He would really be a servant of the Board so far as his relations with the Board went?—A.—Yes.

Q.—He will be the head of the department?—A.—He will be head of the department, but the final authority will rest with the Board.

Q.—And do you think that on those terms you will get a good man to take up the appointment of Director of Industries in a province?—A.—If the selection is made of a good person who really understands his business, there will be no harm.

Q.—But do you think that you can get such a good man?—A.—I think we can get such a man.

Q.—You would be able to find a sufficiently experienced and capable man who would accept a subordinate position and who would have so many masters to serve?—A.—I think the Board should have the final authority.

Q.—You say that industries should be exempt from all taxes for a period of five years.—A.—To encourage them.

Q.—Simply to encourage people to go in for new industries whether they be good or bad?—A.—The Board will select capable men. Why should they select a bad industry? I do not think there is much risk.

Q.—Supposing they were profitable from the outset, would you still exempt them from tax?—A.—When they are proved to be profitable they may cease to be exempt.

Q.—Then you say that the time is come when there should be a separate provincial bank for the Punjab. For what banking purposes?—A.—Mostly industrial and other banking purposes.

Q.—You do not think that Government should take any particular part in starting that bank?—A.—Government should help. It should see that a bank on proper lines is started because without its help it is not possible. The last crisis has taught the lesson that without Government help it could not be started.

Q.—Supposing that Government were to place a certain amount of funds with such a bank and there was another crisis and the Government money was lost, would that not be a very serious blow to Government prestige?—A.—I think that if the people know

that the Government is associated with this bank they will trust it. Before the war the Government was paying $8\frac{1}{2}$ per cent., the European banks were paying 4 per cent. and the Indian banks were paying 6 per cent.

Q.—Do you mean that if it was known that Government was behind such and such a bank there would not be a run upon it?—A.—Yes.

Q.—There would not be withdrawals in times of crisis? There was a rush on the Post Office Savings banks, was there not?—A.—Those were small depositors, and there was a rush. They could draw at 24 hours' notice or a week's notice. I do not think that such a chance would come.

Q.—With reference to land policy you say "To remove all the restrictions that at present exist in the way....." Would you not like to put in some safeguards?—A.—If it is to the satisfaction of the Collector that it is really required for any industry.

Q.—Do you think that it is necessary that the individual or company should prove that it is in the public interests that such an industry should be started?—A.—So I say. If in the opinion of the Collector of the district this industry is a useful thing.

Q.—But useful to the public. Not useful to the individual only or the company?—A.—The industry will be useful to the man who starts it or the firm.

Q.—In your last sentence you say that industrial development will furnish a solution of many difficult problems of to-day. Do you think that a large proportion of the young men of this province are willing to turn to industries?—A.—There are many M.A.'s and the Government cannot employ such a large number every year.

Q.—Do you think that the young man realises that and that he is becoming daily more willing to turn to industrial and commercial employments?—A.—I think so.

Q.—That is your experience in this province?—A.—My opinion is that it will be more beneficial to the young men, and they will like industries. When people go to bazaar they see that ninety per cent. of the goods come from Japan which can easily be made here.

Q.—You think that the young man of to-day is willing to take off his coat and work in a shop?—A.—Some educated men may feel shy as to working in an industrial concern, but they may not enter a literary profession if they find beforehand that there is some industrial opening where they can make Rs. 300 a month instead of passing a big degree examination and getting Rs. 100.

Sir D. J. Tata.—Q.—You say "The only solution of this problem is to provide industrial openings for a large proportion of the products of education." How are these openings to be provided? Is the Government to provide them, and how?—A.—By helping industries.

Q.—If Government promoted industries and helped industries somehow or other, these failed B. A.'s would find openings. Is that what you mean?—A.—Some of them. There will be some people who will take up the technical part and some the office part.

Q.—You mean that instead of going in for literary education and getting their degrees in arts they will try and qualify themselves for technical employments?—A.—Yes.

Q.—You do not propose that simply because they failed to pass a certain examination or they succeeded in passing a certain examination Government should find occupations for them in some way in industrial concerns?—A.—No. There is my son whom I am not training for service or literary profession. I learnt business from my father and I teach it to my son.

Q.—That is a very good thing. You do not think that a good literary education is useful in business?—A.—You mean higher education?

Q.—A good literary education in arts, is that not useful in any walk of life?—A.—For many purposes it may be useful, but elementary education will be more useful for all trades.

Q.—You know that in Europe many a man, whether he is a business man or a public man, has gone through a public school and university education, and he is all the better qualified for carrying on his work in life, whatever it may be. Why should the B.A. or the M.A. seek for service under Government or something of that kind? Why cannot he after graduating take up some trade or industry afterwards?—A.—Because there is not much opening. That is the reason why we ask for help.

Q.—He cannot find openings himself?—A.—He may be the son of a pauper and he may not have enough to eat. At present it is very evident that it is only the man whom

you call the son of a pauper who takes advantage of education facilities, but the rich people never do. Is that so or not ?—A.—It is their mistake. They should also train their sons for suitable purposes.

Q.—That is the trouble in this country.—A.—I know that some rich people do not help. The Advisory Board should contain capable and successful business-men.

Q. With reference to the reluctance of European-managed banks including the Presidency banks to help Indian industrial enterprise, have you yourself experienced this difficulty ? We have heard this all over the country. What is your experience and would you mind telling us that ?—A.—The Lahore Electric Supply Company was started before the crisis and it was helped by the People's Bank and after it went into liquidation we tried to get money from the English banks. They were not sympathetic.

Q.—Why ?—A.—Perhaps—I cannot say.

Q.—They did not know enough about you ?—A.—That is one thing. We laid the balance sheets before them. On the personal security of the directors we have been able to secure money and run the show well. Within three years we have paid up that debt and we have got nearly two lakhs cash in the bank. It was only necessary for two years.

Q.—You complain that the European-managed banks do not assist Indian firms. Is it not due to a sort of want of confidence through ignorance or through want of knowledge of the people they are dealing with ? They would naturally deal only with people they knew something of. Their Indian constituents they know very little about, and secondly as they are responsible for the management and the prosperity of the concern they manage, they would naturally only advance money to those about whom they knew something. They only know casually the average Indian who goes to seek help, and consequently they do not know how far he is a man to be relied on. You know that in your part of the country there have been many bank failures recently. What was the cause of these failures ? Was it not advancing money to people who ought not to have money advanced to them ?—A.—That is not the only thing. They might have made the mistake in one or two cases, but really they could not continue the show and there was no one to help them.

Q.—There is evidence before us here to show that in many of these banks monies were advanced to the directors' own friends or relations for purposes which were not carefully examined, and for industrial and commercial projects which were really not worth starting ?—A.—There might be one or two mistakes. I have no knowledge of them.

Q.—Don't you think that under those circumstances the European-managed banks were perfectly right in refusing to support things about which they knew nothing ?—

A.—Not in all cases. Because they had no Indians on the management who could advise them. There might be a man who could be trusted to the extent of two lakhs by the European bank, but an Indian bank would trust him with twenty lakhs because the management would know what was his property and what industry he was engaged in, who was in charge of the management of it, and so on.

Q.—The gist of your complaint is that these banks do not have any Indian directors who know something about Indians ?—A.—Yes.

Q.—It was not simply prejudice on their part ?—A.—It is a mistake. It is misjudgment.

Hon'ble Sir Fazulhoy Currimbhoy.—Q.—May I know what is the business of your firm ?—A.—Printing and publishing.

Q.—Is it your own private firm ?—A.—Yes.

Q.—Have you been a director in any local banks here ?—A.—No.

Q.—In answer to the President's question you said that you did not think that the people in the Punjab would be able to start industries without Government help ?—

A.—The help of Government is essential because capitalists are shy. They have no experience as to where they should invest their money.

Q.—Do you not think that the capital is shy because the banks have failed ?—A.—Capital is generally shy.

Q.—That is all over the world, and not in this country only.—A.—In other countries they have more experience.

Q.—Always at the beginning capital is shy. In Bombay we had many failures, but afterwards confidence revived. If Government does not directly help the industries you are afraid the people will not be able to start any industry ?—A.—People are ready to start industries with big capital, and if they know that the Government is helping an industry they will gladly invest.

Q. The Government should take up some safe industry and put their money in it. The people do not want to trouble themselves to find out what is good and what is bad?—A. Some of them are ready to co-operate.

Q.—Why not initiate?—A.—All of them are not experienced.

Q.—Some of them?—A.—Some of them are ready.

Q.—And they are starting?—A.—Yes.

Q.—What have they started?—A.—They have started flour mills, ginning presses.

Q.—What is the chief industry here for which you want Government help?—A.—Match factory, mining industry.

Q.—Do you think that a match factory could be successfully started?—A.—I think so.

Q.—Do you get all the raw materials here?—A.—I think pine wood is available in the hills near Lahore.

Q.—Do you know that wood forms a very small portion of the whole thing?—A.—I am not an expert in the matter. An industry may be made into the existence of sulphur, paper and other things. Copper, iron, paper-making, spinning and weaving all these things can be easily started.

Q.—Many of these industries have been started all over the country. If the people here are anxious they can go from here and find out which is paying.—A.—Some of them understand the benefit of industry, but most of them do not.

Q.—Coming to the last para. of your note you say that many colleges have been started and graduates have been produced who are unemployed. You say also that you are in favour of one technical college and one college of commerce in the country. Do you think that one technical college and a college of commerce are enough for the country? We have got in Bombay our own technical college and college of commerce and half the student candidates could not get admission into them.—A.—You are right, but I say at least one.

Q.—Do you think one will suffice. Don't you think that your province needs a technical college and a college of commerce?—A.—Our province needs a college.

Q.—Are there any arts colleges started by private enterprise?—A.—Yes.

Q.—People have given money for arts colleges?—A.—Yes.

Q.—Do you think that they will also give money for a technical college and a college of commerce as the Bombay people have done?—A.—Some of them will give.

Q.—If you start these first you will get your boys educated in these too?—A.—Yes.

Q.—Coming to the Board of Industries you say that you have changed your mind and you think that the Director of Industries should be the Chairman?—A.—Yes.

Q.—Suppose the Board passes any resolution the Chairman must carry it out?—A.—Yes. Otherwise what is the use of the Board?

Q.—And four members should be there?—A.—At least four.

Q.—Half of them should be officials and the remaining half non-officials?—A.—Yes.

Q.—That is, three will always be on one side, the two officials and the executive officer of the Board on the other side?—A.—I thought that the Director of Industries would be one of the two officials.

Q.—And you give him a casting vote?—A.—Yes.

Q.—It comes to the same thing?—A.—We should not always expect bad things.

Q.—I am just leading you to another point. When you think that the official side would always have the majority, don't you think that in preference to that you may have an Advisory Board to the Director of Industries, and if they differ the matter may be referred to Government and the Government should decide the difference? Do you think that this would be preferable?—A.—In case there is equal voting.

Q.—If they differ. In Bombay and Bengal the people have stated that there should not be half officials, but the majority must consist of men elected by the different

chambers of commerce or nominated, and also a few officers who are experts. If the Board differed from the executive officer then the matter might be referred to the Government who should decide it. Which system do you prefer?—A.—We should not start with the idea that there will be difficulties.

Q.—Which is better? Is it not better to trust the Government?—A.—Then it may be referred to Government.

Q.—In answer to Sir Dorabji Tata you said that one of your concerns got money from private people and the concern went on without the help of other banks. You also said that the Presidency Banks and the European banks did not assist. You say, "One formidable difficulty, which industrialists at present experience in the matter of raising capital for industrial purposes is the reluctance of European-managed banks, including the Presidency Banks, to help Indian enterprise. I have experienced this difficulty." Have you got private assistance?—A.—Private Indian banks helped me.

Q.—And the European banks, though knowing you, refused loan or did not entertain your proposal?—A.—They were not sympathetic.

Q.—Do you think that if a local Presidency Bank is started for your province they will know the people and they will be better able to assist them?—A.—Yes, if a selection is made of people with local knowledge also.

Q.—Then the people will get more facilities?—A.—Yes.

Mr. C. E. Lowe.—Q.—You think that elementary education should be made compulsory. What would you do in the case of children employed in factories or other industries?—A.—Evening classes will help people who are serving in factories.

Q.—You would have compulsory evening classes for the children employed in the factories?—A.—Yes.

Q.—Have evening classes for people employed in factories ever been a success in this country? Has it not been found that the strain was too great and they are unable to attend them?—A.—That will be one hour or two hours, and the law does not permit boys to work more than seven hours.

Q.—Do you think that a boy will be able to work seven hours and then go to the night class?—A.—I do not think it is a large strain on them.

Q.—Night classes for factory or other employees have not been tried in this province?—A.—In some cases they have been tried.

Q.—Have you any experience of them? Have you seen any of them?—A.—I have not gone personally to those places, but I have heard that there are some evening classes in Lahore for children.

Q.—Not only in factories, but for any kind of children?—A.—Yes.

Hon'ble Mr. H. J. Maynard.—Q.—What proportion of your business is Government custom?—A.—It is a very large proportion.

Q.—Supposing that Government is in a position to give to a particular firm the amount of custom similar to that which it gives to you, that is sufficient help?—A.—This help which I have asked for industry is.....

Q.—I am asking you about your own particular case. I want to bring out the fact that your view that Government help is necessary is not really impeached by the fact that you yourself have been successful without Government help, because Government help has been given to you in the form of Government custom?—A.—That help is quite enough, provided there is proper competition.

Q.—In your particular case it is very largely the Government custom which supports your business?—A.—Yes. In one instance I find that the Jail industry conflicts with private enterprise.

Q.—Does it?—A.—Yes. The jail people are allowed to charge the departments Rs. 5 for a thing which private enterprise can turn out for one rupee. It is not at all economical to the Government.

Q.—Is not printing in the jail entirely on a lower plan, quite an inferior kind of printing which does not compete with you?—A.—They are doing inferior things at four times the cost. The same class of work, or even better work, can be done outside for one rupee, but the departments are paying five times more to the jail simply to show a false profit. They should be allowed to charge only the market price.

Q.—Your inference would be that the jail should only be allowed to charge the market price?—A.—Yes.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Is there a steam press in the jails?—A.—Yes. They are allowed to charge four or five times more than private enterprise.

Q.—You do not want power industry to be worked in the jail and compete with you?—A.—No.

Sir D. J. Tata.—Q.—In your paragraph about technical aid to industries you say that where the Government expert's help is given to any industry that industry should be asked to take in apprentices. Have you ever asked for any Government expert advice for your business?—A.—I have always imported experts myself from England.

Q.—Are you taking any apprentices yourself and training them in your business?—A.—When I need ten men I employ twelve.

Q.—Have you regular apprentices of your own?—A.—Yes.

Q.—Do you enter into an agreement with your apprentices, that they should serve you for a certain time?—A.—The labour is so cheap that I do not feel the necessity for anything of that kind.

Q.—You do not apprentice them, but simply employ them and train them?—A.—Yes.

Q.—About the awarding of scholarships—the scholarships are awarded for study in subjects whether there is an opening or not. Should they not be selected in such a way that when the students come back they should be able to find an opening?—A.—Yes. There are thirty-nine British paper-makers in India and there is only one Indian of Lahore who is a paper-maker. Instead of one there would have been 20 or 30 if these scholarships had been given for paper-making 10 or 20 years ago.

Q.—Then you think that when scholarships are to be given, they should be given only for such industries for which there are openings and they should not be given for industries for which there are no openings?—A.—Not only that, but if there is a businessman on the committee of selection he will give better advice.

WITNESS No. 365.

Major E. L. Ward.

MAJOR E. L. WARD, I.M.S., *Inspector-General of Prisons, Punjab.*

WRITTEN EVIDENCE.

Other forms of Government action and organisation.

THE question of jail industries has more than once within the last thirty years engaged the serious attention of the State authorities, with special reference to their bearing and effect on the growth and development of private enterprise, and with the express object of regulating them, so as to minimise, to the lowest possible extent, competition with the latter. Jail competition.

The orders on the subject are quoted in the margin and I cannot do better than to

Government of India's Resolution No. 70—1406-19, dated the 22nd September 1883.
Government of India's Resolution No. 10—905-18, dated the 7th May 1886.
Government of India's letter No. 155, dated the 10th August 1906, page 191.
Government of India's letter No. 145-54, dated the 29th April 1912.

refer the Commission to them, as they contain a full and exhaustive discussion of all the important and relevant points bearing on the subject.

I agree entirely with the conclusion arrived at therein, and can suggest nothing new by which the object aimed at can be better attained. So long as these orders are carried out, and I have no doubt that they are, there is, I consider, no fear absolutely of private business being injuriously effected. During my whole experience as a jail officer in the Punjab Jails I know of no case of a jail industry which has been carried on on such a scale as to seriously interfere with, or cause the closing down of, any similar private industry. On the other hand, I do know of one large industry at least (carpet-making), now being carried on profitably as a private concern, which owes its origin and success to the Lahore Central Jail, from where most of its trained employees were obtained, and which concern has since ruined the carpet industry in our jails; and possibly for all I know there may be a number of other petty businesses similarly set up in private by men after leaving jail. Our industries are not organized and regulated in any spirit of rivalry, but with the object mainly of employing our many thousands of prisoners on meeting, first, our own departmental needs and thereafter the requirements of the other consuming departments of Government, an action which is fully recognised by all the responsible

authorities, as being the correct and proper one to take. A certain amount of competition there will always be, so long as productive labour is a necessary requirement of prison administration, but, as I have already stated, it is so little, comparatively, and as the rights and interests of private traders are sufficiently protected, under the existing rules, I can offer no suggestions of any practicable value to assist the Commission in dealing with the matters now before it, with special reference to jail industries.

ORAL EVIDENCE, 8th DECEMBER 1917.

Sir F. H. Stuart.—Q.—You confine your note to industries in jails, what are the jail industries here?—A.—In the Panjab our main industries are lithographic printing in the Lahore Central Jail Press, and the making of a very cheap form of paper for Government offices.

Q.—Are there any such jail industries elsewhere in the province?—A.—Those are the principal jail industries throughout the province; paper-making is carried on in all the jails, excepting the Central Jails, where we have certain other industries, such as chisk-making, durry-making and tent-making.

Q.—Have you had any complaints of interference with private enterprise?—A.—No, we have not heard of any in recent years.

Q.—You mention in your note two Resolutions of the Government of India on the subject, could you just summarise them very shortly?—A.—In the first one, that is the Government of India Resolution of 1882, the Government of India were advised that nothing should be done to interfere with local enterprise and they issued very strong orders on the subject. One order was that there was to be no steam printing in any jail and in those jails in which such existed it was at once to be done away with. They realised that the labour in jails should be productive, but it should not be over-productive. There was then the Government of India Resolution of 1886 which was founded on the Secretary of State's reply. The Secretary of State was not in agreement with the Government of India at that time and said that if these orders were observed they would lead to an absolute suppression of the whole system of jail labour. The Secretary of State further ruled that while jail labour should as far as possible not interfere with local enterprise, it should be remunerative without being over-remunerative. At the same time it was realised that the population of our jail departments was also increasing and that labour must be found. Then in 1905, that is 20 years later, the whole matter was revised because, apparently, there had been a great deal of trouble from outside. As a result of this there was another Resolution again pointing out that there should be no interference; the principle was more definitely laid down. In 1909, in this province, when Sir Louis Dane was Lieutenant-Governor, he found that the cost of the upkeep of our jails, as the result of these Resolutions, was great, and the earnings scarcely anything at all in comparison with other provinces. All Government departments were accordingly ordered to obtain such articles as chisks, durrus, &c., from jails. I should say that these industries had already been duly selected so as not to interfere with the local markets as far as possible. It was further ordered that all these things should in future be supplied by the Panjab jails, if possible, without option to the officers. Of course, that led to a certain amount of trouble from officers; they were not willing to comply, and were largely influenced by their subordinate staffs not to do so. We had a great deal of trouble in that way, and eventually Sir Louis Dane insisted on the orders being given full effect to. Then finally in 1914 there was another campaign in this province to enquire again into matters, when it was definitely laid down that with regard to the printing press in the Lahore Central Jail only lithographic standard forms should be printed. The printing of books and manuals was prohibited. The result of the various orders is that excepting for Government offices, we supply, practically, nothing to the outside public, and excepting for Government, we do not interfere with the local market at all.

Q.—Do you still manufacture carpets, for instance?—A.—That is an industry which we had absolutely in our hands at one time. In the year 1887 there was a certain firm not very far from here which the Lieutenant-Governor of that time allowed to visit the Lahore Central Jail, for the purpose of learning the carpet-weaving industry. This firm was allowed not only to see how the work was carried on but to obtain jail patterns. Thus an industry which had been kept alive by the Jail Department in India, and which had been built up by the Jail Departments, was absolutely ruined. In the Lahore Jail the looms are practically all lying idle.

Q.—Is there any interference with private enterprise on the part of the Jail Department as buyers of raw material such as wool and so on?—A.—No. We have never had any

complaint with regard to wool. I have been in the Jail Department for 16 years now, and the carpet industry has been practically dead all that time. The only wool work that we are doing is for our own requirements, and of course at the present time we make blankets for the Army; but that is rather a different matter because the Army requires these articles from all sources.

Q.—Is paper-making a local industry in the Punjab?—A.—The class of paper that we make is of a very cheap kind; formerly, before this war, there was a great idea of stopping it altogether, because officers complained that it was of an inferior quality, and more expensive than the ordinary *badami* paper.

Q.—You have been supplying papier mâché?—A.—Yes.

Q.—Then your considered opinion is that there is really no ground for complaint, and that you really have no complaints?—A.—I am absolutely of that opinion.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Yesterday a gentleman who has just got a Government contract was complaining that the jail paper printing industry was competing with his work?—A.—I think one can easily answer that. In the first place it is a question of labour with us. We only want to see that labour is sufficiently supplied to our prisoners. In the second place the printing press in the Lahore Central Jail has had very great difficulties to contend with because of outside interference. As a matter of fact it is only a lithographic press and the forms that we print are simply standard forms for Government Departments, and within the last three or four years we have had to undertake lithographic printing for the Director of Land Records. The Director of Land Records formerly made his own arrangements with private presses; but when the prison population swelled from 15,000 to 21,000 and the question of labour became very acute, we had to make every effort to provide labour for these prisoners, but even then only standard forms were allowed to be lithographed. In regard to anything else in the way of manuals or books of any kind, we supply nothing to private persons, and there are strict orders not to comply. So what we do is purely for Government departments.

Q.—Do you use steam power in the printing press?—A.—In that one jail only, in the lithographic press.

Sir D. J. Tata.—Q.—Is there any system of industrial education in the jails?—A.—Yes.

Q.—Would you mind just describing it?—A.—That is particularly so in the Borstal Jail. We have got about a thousand boys there now, and we train them in carpentry and agriculture, and everything leading up to tent-making. We teach them all the different branches in connection with tent-making, that is to say, fringe-making, rope-making, tailoring, dyeing, etc., etc.

Q.—Then there is a regular school to train these boys?—A.—There is a regular school.

Q.—Is there any elementary school besides?—A.—Yes.

(Here the witness said that he would be glad to show the Commissioned what they were doing exactly, especially what work they were doing in the printing press.)

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Have you got reformatories?—A.—I have nothing to do with reformatories. We had one in this province, it is now in the Delhi province.

Q.—Do the younger boys also go to the jails?—A.—Yes, we send boys convicted for more than four months to the Borstal Jail.

Q.—Is there any separate jail for juvenile offenders?—A.—Every jail has its own small juvenile ward.

Q.—In the jail compound?—A.—There is a small juvenile ward in every jail. But nowadays juveniles sentenced for over 4 months are at once sent to the Lahore Borstal Jail from all over the Province.

Q.—Do any large proportion of the released prisoners take up honest work?—A.—Things are improving. Unfortunately, we have not any very definite records because it has been difficult in this province to start anything in the nature of a Prisoners' Aid Society, but we are hoping for great things very soon from the Act which has recently been drafted and which is now under consideration in connection with the Borstal Jail. These boys will no longer be treated as prisoners. Their sentences will be of detention only, and it will be an "institution" instead of a jail. With that we shall have a committee formed for finding employment on their release. As a matter of fact I can get employment for them under the agricultural officers and others.

Q.—Is there not a great prejudice amongst employers against these boys?—A.—No. I think there will be an increase in their employment. In fact, we have got a great demand for those boys who have been trained in the different branches of tent-making. No boy really knows the whole of tent-making but the incidental industries which lead to the same are so valuable for instructional purposes.

Hon'ble Mr. H. J. Maynard.—Q.—The Borstal Jail is providing labour for the Dhariwal Woollen Factory, is it not so?—A.—Yes.

Sir F. H. Stewart.—Q.—Is there anything else which you would like to say?—A.—There is only one thing I should like to say. I do not think it can be said that the Lahore Lithographic Printing Press is in any way interfering with local firms. When the question of the printing for the Director of Land Records arose in 1914, it was decided by Government that all departments should get their standard forms and lithographic forms from us. We do not interfere with other forms of printing.

Mr. H. T. Conville.

WITNESS No. 366.

MR. H. T. CONVILLE, Zamindar, Montgomery.

WRITTEN EVIDENCE.

I desire to give evidence on—

- (1) The agricultural industry, and
- (2) The cotton-ginning and pressing industry only.

Agriculture being the most important industry in the Punjab, Government is not likely to find a more profitable way of spending money than by encouraging it and providing more scientific workers and practical men to solve the many questions in cultivation, introduction of implements, rotation of crops, watering and the handling of the produce advantageously, in order to obtain the best market prices.

The cultivator is not unwilling to change his traditional methods of cultivation in favour of new ones, provided he has the advice of experts and has the opportunity of seeing experiments and practical demonstrations at convenient centres carried out by Government, which he cannot afford to do, that he is assisted in every possible manner by Government subordinate officials, Zaildars and Lambardars in the execution of their duties, so that he does not spend more time and labour than is actually necessary and compensated for in carrying out their orders, and that the local co-operative societies help him financially so that he may not be forced into the hands of the *Bania* for his financial requirements at exorbitant rates of interest.

This could be brought about by Government increasing the number of experts in the Department of Agriculture and Industry and by spending more money on experimental work, so that each district would have suitable experts, with the necessary subordinate staffs for controlling the work in each district.

The increasing of the Agricultural Departmental staff will mean increased expenditure on the part of Government, and create a demand for trained men. So far as the men are concerned the various districts might be manned gradually in accordance with the men available and as regards the increased expenditure Government will be compensated by increased revenue, when outturn and qualities are improved and better prices obtained.

A considerable amount of capital has been raised and machinery purchased for this industry, but in my opinion fully three-fourths of that capital has been handled to the detriment of capitalists and the cotton industry.

There are more ginning factories and presses erected than are really necessary for the amount of cotton available, with the result that there is a large amount of capital locked up, good machinery lying idle and inefficient handling of the industry.

For instance, in the Multan and Muzaffargarh Districts alone, there are 41 ginning factories and 8 presses, representing the capital outlay of about 20 to 25 lakhs rupees, whereas for the amount of cotton available there is only a necessity for 8 ginning factories and 4 presses, which is proved by the conditions prevailing there.

These surplus factories and presses have only been erected for the purpose of sharing in a pool, which is established in those districts.

Agricultural industry.

Cotton-ginning factories and presses.

The amount of cotton (kapas) available in those districts amounts to about 3 to 4 lakhs maunds, which means the outturn of about one lakh to one lakh thirty thousand maunds of ginned cotton.

This amount of cotton will be profitably and advantageously ginned by 8 ginning factories and pressed by 4 presses, yet there are 38 surplus factories and 4 surplus presses in those districts, simply because they and the working factories share in a pool of about one lakh of rupees annually, i.e., a profit of little more than 2,500 rupees for each factory, and a pool of about 80,000 rupees for the presses, i.e., that profit of a little over 10,000 rupees for each press.

Without the surplus factories or presses, the factories would earn about Rs. 12,000 or more each and the presses about Rs. 20,000 or more each.

The pool system for the factories is that each working factory pays into a pool Rs. 1 per maund on every maund of cotton ginned and buys kapas at the market rate current. In this manner one lakh of rupees is collected in the pool when one lakh maunds of cotton is ginned in the district.

The amount in the pool is then distributed among the 41 factories, in proportion to the number of gins in each factory, each gin being entitled to one and half pies per gin in the factory.

Similarly, the pool system for the presses is, that each working press pays Rs. 2-4-0 on every bale of cotton or wool pressed into a common pool and when 25,000 bales of cotton and about 10,000 bales of wool are pressed, about Rs. 80,000 is collected in the pool for distribution among the 8 presses, which amount they divide equally.

For the sake of this distribution, there are a matter of about 10 lakhs worth of ginning machinery and about 3 to 4 lakhs worth of pressing machinery lying idle in those districts alone.

This pooling system is established in the Multan District and in a few other districts and it enables the idle factory or press to receive some income, but in the districts where no pooling exists, there is no income whatever for the idle factories and presses.

The only way of helping the capitalists to stop this unnecessary locking up of capital and keeping machinery idle is for Government to limit the number of factories and presses in every district, so as to work efficiently the amount of cotton available.

One ginning factory of about 40 gins should be allowed for every 50,000 maunds of kapas available for ginning and one press for every 10,000 or 12,000 bales available for pressing.

I am of opinion that no financial aid is necessary on the part of Government, but what is really necessary is Government advisory control over all industrial concerns.

I am also of opinion that Government should establish ginning factories at suitable centres for the special ginning of long staple cotton, not only by way of demonstration, but in the interests of the industry itself; such factories could be handed over to private capitalists or companies, when Government was satisfied that the system of ginning had been established and that the industry itself would in no way suffer.

ORAL EVIDENCE—8TH DECEMBER 1917.

Mr. C. E. Low.—Q.—What area have you in your own cultivation?—A.—3,000 acres.

Q.—What crops do you mostly grow?—A.—I grow cotton and wheat principally, and also sugarcane, oilseeds and gram.

Q.—What cotton do you grow?—A.—American cotton purely, the long staple 4 F.

Q.—Have you your own gin?—A.—No.

Q.—You get it ginned by the ordinary ginneries?—A.—I have a gin under my supervision.

Q.—Is there much trouble owing to the mixing of cotton in gins?—A.—Yes.

Q.—And have you heard of the idea of licensing gins not for the purpose you mention in your note but in order to prevent mixtures?—A.—Yes.

Q.—What do you think of that idea?—A.—I agree with it.

Q.—But for the purpose you mention in order to prevent too many gins being started you propose that there should be some licensing system?—A.—That is to prevent unnecessary expenditure and outlay of capital.

Q.—There are more gins than there is cotton to be ginned?—A.—Yes.

Q.—Supposing you have in your tract enough cotton for a dozen gins, and supposing the amount of cotton grown increases and there is enough cotton to serve twenty gins, there is room for eight more gins. Supposing twelve more people wanted to start, which of them would you allow?—A.—Those that would be working in the interests of the industry and that are really reliable and approved.

Q.—Would that not rather confine the profits to existing gins?—A.—I do not quite follow.

Q.—You say that you propose to give preference to those people who have already a knowledge of the ginning industry?—A.—Yes.

Q.—That would rather confine it to people who were concerned in gins already and probably the people who were concerned in gins in the tract in question? If there are just enough gins to deal with the existing cotton the gin owners may combine for another reason, not to put down the number of gins working, but to simply keep up the rates charged for ginning to the disadvantage of the cultivator. I will give you an instance from Berar. Messrs. Hallis decided that they would not associate themselves with any pool, but work their gins irrespectively of what anybody else did, because they said that it was not their business to make money out of ginning, but they wanted ginned cotton to come on to the market as cheap as possible in the interests of cotton trade and their own trade?—A.—I understand from what you mean that people who combine to fix the ginning rate also combine to fix the rate of purchase of that *kapas*.

Q.—You get a certain number of gins who purchase from cultivators and you have also a certain number which gin for custom for merchants. Is that the case here?—A.—Not all over the Punjab, but in some factories in the Punjab.

Q.—Usually the gin people purchase cotton?—A.—They purchase cotton and sell ginned cotton.

Q.—They probably press?—A.—They press. But there are customers who are ginners in the Punjab who lease their gins to exporters.

Q.—For a month at the time?—A.—Yes, and they charge a certain rate for the cotton to be ginned.

Q.—Before coming back to that point again, is there any regular more or less accepted prevailing rate for ginning?—A.—More or less.

Q.—What is it?—A.—In some districts it is ten annas and others eleven annas a maund of 80 lbs.

Q.—That rate prevails when you have too many gins. Supposing you had fewer gins would not the rate for ginning tend to go up?—A.—Not necessarily, because the factory has got to have a certain amount of work to feed it to keep it going, and if it charged a fabulous rate it would naturally not draw cotton to be ginned at that factory.

Q.—But they have shown themselves already capable of combining to make a pool in which a certain number of gins do not work. What they would have in mind no doubt is this:—If they did not combine they would compete and thus the rate for ginning would go down to a low figure and the price paid for cotton would go to a high figure. That is why they combine?—A.—No. They combine because the nearest and the easiest method of getting money with the minimum of capital is this.

Q.—Surely the object of the pool is to prevent the rate paid for ginning going too low or the price paid for cotton going too high?—A.—Where there are Indian industries and ginneries there have been pools formed. I know of individual ginners competing with one another regardless of the money they have invested. I have known ginners losing Rs. 10,000 and Rs. 20,000 a year rather than give in to the other competitor.

Q.—They cannot do that beyond a certain point. When there is a pool I take it the individual members agree among one another to do or to abstain from doing a certain thing. That is embodied in an agreement?—A.—Yes.

Q.—Supposing one fellow breaks the agreement, then the combine put him into court?—A.—Yes.

Q.—If that combine consists of say five gins each of which has got five partners, then there is a recent ruling in another part of India that that combine should be registered as a company under the Companies Act. Is the combine registered as a company?—A.—No.

Q.—Would the various partners of the different gins if you add them up in the combine—would they come to more than, say, ten persons?—A.—It goes up to even 80.

Q.—The matter has not gone to court?—A.—Not to that extent.

Q.—How do you deal with your sugarcane?—A.—I merely extract gur by the ordinary roller.

Q.—Do you use power or cattle?—A.—Cattle.

Q.—Don't you find that it makes a very big demand on the working strength of your cattle at certain seasons of the year?—A.—Not by the system which I have got.

Q.—You work it continuously day and night?—A.—No.

Q.—What area have you got under cane?—A.—About forty acres.

Q.—What kind of cane are you growing—the local kind?—A.—Yes.

Q.—Do any of your neighbours also grow cane?—A.—Yes.

Q.—Supposing you had a small power-crushing plant, do you think that your neighbours would be ready to bring their cane to you and have it crushed?—A.—I do not think so. The holding under the cane is small.

Q.—What area does each cultivator grow?—A.—One acre. But you never know when it may be stopped. Personally, I do not think it is paying.

Q.—Why stopped?—A.—Owing to water rate. Compared with other crops it does not pay us.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—What is the system in the Punjab? Do the cultivators themselves bring the *kapas* to the market or do they sell in advance to the *Banias* and *Soucars*?—A.—The *Bania* has got in hand certain cultivators in the village. He advances them money and he practically fixes the rate.

Q.—On his own choice?—A.—On the so-called market rate which is, in my opinion, not correct. It is only a nominal rate.

Q.—He advances money as soon as *kapas* arrives?—A.—When the *kapas* is ready to be marketed.

Q.—Really speaking, the poor cultivator gets nothing. It is the middleman who earns the whole profit?—A.—Yes. The cultivator is at their mercy entirely.

Q.—All the profits made in the Punjab go to the middlemen?—A.—So far as the smaller cultivators are concerned.

Q.—Are there big cultivators here?—A.—Yes.

Q.—Are you also having *kapas*?—A.—I include myself among the larger cultivators.

Q.—About the ginning factories, you think that only the reliable and approved people should be allowed to have factories?—A.—Yes.

Q.—Don't you think that it would lead to preferments? Approved by whom? You mean approved by Government?—A.—Approved by Government experts who are capable of judging the same.

Q.—If it were to be approved there might be some chance of preference being given?—A.—Yes.

Q.—Are the ginning and pressing factories in the hands of the middlemen who take hold of the *kapas*?—A.—No. They sell to the ginnery.

Q.—Don't you think that if there are more ginneries there will be more competition and the *kapas* can get better rate and the ginning rate will be less?—A.—I do not think so, because it is only a question of each factory working for quantity regardless of quality.

Q.—You say, "Without the surplus factories or presses, the factories would earn about Rs. 12,000 or more each and the presses about Rs. 20,000 or more each." Don't you think that they will have to work 9 or 10 or 12 months in the year to

finish the whole crop if you want to restrict the factories to a smaller number?—A.—That is what they are doing at present. In the districts referred to there are 41 ginning factories. Eight of them work and the remainder are closed down. There is no work for them. The factories work during the cotton season.

Q.—Can you tell us what is the average earning on the pressing and ginning : 5 per cent or 6 per cent?—A.—According to this pool system they earn about 3 per cent.

Q.—Are they still having the pool or are some independent?—A.—You have got to differentiate between the speculator and the man who is dependent on pool distribution. The man who depends upon pool distribution goes on contented. The speculator in cotton makes Rs. 10,000.

Q.—What foreigners have got ginning factories here? Ralli's and others?—A.—They have leased factories and I think they have just bought one as well.

Q.—In the second paragraph of your written evidence you speak about the co-operative societies. Are not these co-operative societies able to finance these poor people who are going into the hands of middlemen?—A.—They have done a considerable amount of good since their formation.

Q.—Have they got banks to finance them? Are there any big banks?—A.—The co-operative banks under the system on which the Government is working them are gradually asserting themselves.

Q.—You think there ought to be more staff under the Government for this work?—A.—Yes.

Q.—Have you been cultivating staple cotton?—A.—I cultivate purely staple cotton.

Q.—Where do you sell it? Do you send it down to big centres like Karachi?—A.—I sell it at my godown to exporters.

Sir F. H. Stewart.—Q.—Are you a tenant of Government?—A.—Yes.

Q.—You say that you would like to see the Department of Agriculture and Industries strengthened and more experts in it?—A.—Yes.

Q.—If they were separated, would that set free the agricultural experts to devote more time to agriculture?—A.—It would enable the agricultural experts to devote more time to agriculture.

Q.—I do not quite understand about this pool system. Who starts these pools? Do the proprietors of the different ginning factories get together and start a pool?—A.—If there are 5 or 6 ginneries erected in a town or district and they compete with one another regardless of the profits to themselves, they endeavour to call a meeting to bring about a combination. No single factory owner would go over to the other factory to bring about this combination, but they would go to an agency run by Europeans to bring about a meeting and decide to have a pool.

Q.—How much capital is required roughly to start one of these ginneries?—A.—In pre-war days it used to be Rs. 1,000 per gin and a factory with 30 gins would cost Rs. 20,000.

Q.—And they should have some kind of working capital?—A.—Yes. It is necessary at the time of the cotton season when cotton is required. A good business-man may be able to manipulate the requirements of his factory with another Rs. 20,000. So on the whole it would be about Rs. 50,000.

Q.—Cannot these ginneries, which are already in existence, keep others out?—A.—I do not think they could. The other factories that are started simply go out and buy 5,000 maunds or 2,000 maunds and start the business and there is a certain amount of commotion in the locality. They would rather lose than combine with you.

Q.—And you think the remedy is a system of licensing by which the Government should not allow more than a certain number of gins in a certain district?—A.—Yes.

Q.—With the increased production of cotton is there any likelihood of the demand for gins overtaking the present number? Are there far too many gins and is there no question of more being required?—A.—No likelihood.

Q.—It seems to me that the man who starts a new ginning factory in a place where there are plenty runs a considerable risk of losing all his money.—A.—More or less. That is speculation and the man takes his chance.

Mr. C. E. Low.—Q.—You sell your staple cotton to export firms?—A.—Yes.

Q.—Are you satisfied with the price you get?—A.—No.

Q.—Have you made enquiries as to what the corresponding rate would be in a free market like Bombay or Ahmedabad?—A.—Yes.

Q.—And you do not consider that you are getting an equivalent treatment?—A.—No.

Q.—Did you apply to the Agricultural Department or anybody else for help in the matter?—A.—I think the Agricultural Department have done more than they can possibly be expected to do under the conditions in which they are endeavouring to market the produce. When you have only three buyers the price is low because there is no other buyer to pay a higher price. I do not think the Agricultural Department can do possibly more than that they are doing.

Q.—You have not, any of you, attempted to combine and ship direct to Bombay?—A.—No. As a business-man myself I have taken the opportunity of trying in the Bombay market, but I do not think that is possible for every zamindar or cultivator to have that knowledge.

Sir F. H. Stewart.—Q.—Have you any supplementary remarks to make?—A.—With reference to this question of marketing staple cotton in the Punjab at the present moment there are 250,000 acres under American long staple cotton. The Agricultural Department have done all they possibly could to help the cultivator and to show him the advantage of long staple quality against short staple. They invite buyers from all parts of India to come to these auctions and some of the biggest buyers in India attend. I may be mistaken but I do not think that some of them are quite aware of the various qualities which are marketed. For example, at the recent auctions there were only two buyers and there were no other buyers to compete against. That is a point that I think would require the assistance of exporters as well as of Government.

Q.—How long have these auctions been going on?—A.—They started on the 22nd October at intervals of three days. In order to advance the industry and market the cotton Government has been holding these auctions at various centres. These auctions have been going on for the last five years.

Q.—Are they widely known?—A.—Yes. The Bombay people and the Nagpur people are aware of them.

Q.—Have you any definite suggestion to make as to anything more the Government could do or the buyers could do?—A.—A system of selling agency.

Mr. C. E. Low.—Q.—Have you approached the British Cotton Growers' Association in the matter?—A.—I discussed the matter with the Secretary very often.

Q.—They have expressed themselves anxious to step in and keep the prices up?—A.—They are very anxious to see that a good quality is grown and adequate price is paid for it so far as the producer is concerned.

Q.—Did they make any practical offer or suggestion as to how that end can be secured, such as by the establishment of selling agencies?—A.—That was their idea.

Hon'ble Mr. H. J. Maynard.—Q.—Is it not rare for only two buyers to be present at any of these auctions?—A.—We have more buyers.

Q.—In the one that I attended there were many and my impression then was that the competition was pretty keen.—A.—It was very keen. That was last year.

Q.—But there was something special in the conditions of this year for the competition not being keen?—A.—Yes. I am not bringing up this matter from the point of view of the individual buyers. I want to bring it before you more with reference to the independent cultivator, the smaller *abadkar*, in order to try and better his lot.

Q.—I take it that owing to special circumstances of this particular year there was not a keen competition.—A.—The conditions of last year and this year have been entirely different.

WITNESS No. 367.

THE HON'BLE MR. C. A. H. TOWNSEND, I.C.S., *Director of Agriculture and Industries, Punjab.*

*WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

Capital.

Q. 2.—Trade, and land with its produce, have, until recent years, absorbed much of the available surplus capital of the Punjab, and, of these two, investment in land absorbed the greater proportion. The Alienation of Land Act had the indirect effect of diverting, to some extent, capital from land to trade and industry: the success of the Swadeshi movement, and the expansion of Indian banking and industry between 1902 and 1912, shows this. But much of the surplus capital of the province still concerns itself with the produce of agricultural land, or with real estate in large cities. At present what capital there is invested in industries in this province is provided by moderately wealthy respectable shopkeepers, bankers and contractors, and to a less extent by professional men, particularly lawyers.

There is undoubtedly a very great deal of capital lying untouched throughout the province, in the form of gold, principally with bankers, and to some extent with the more prosperous agriculturists. This tendency to store capital has been accentuated by the recent failures of commercial enterprises in this province. Broadly speaking, it may be said that the Punjabi has no experience in investments, and is generally loath to trust his money out of his sight. He will put his money into a bank and leave the bank to do the work for him, trusting it blindly, until suddenly seized with some wild and unreasoning panic, when he will withdraw all his money at once (see the report, already referred to, on the recent causes of failure of economic enterprises in the Punjab). As a result of these failures, I direct the Commission's attention to the fact that at the close of the financial year 1911-12 there were 194 registered companies in this province, with a paid-up capital of Rs. 1,94,37,219: at the close of the financial year 1915-16 there were 81 such companies with a working capital of Rs. 1,46,41,772.

Q. 3.—Undoubtedly, there have been far more cotton-ginning factories, and, to a less extent, cotton-baling presses, started in the province in the last ten years than was necessary. The matter is being dealt with in detail by Mr. Taffs, the Inspector of Factories, who will give evidence before the Commission. I will content myself here with noting that a cotton-ginning factory was, until the boom in them started, an easy way of making money, which did not require a great deal of capital, and could therefore be financed by a Hindu joint family, or a small party of friends. So it appealed to the public. These factories and presses nearly all belong to "pools" now, and one or two factories have never been worked since their erection and yet have proved fairly lucrative to their owners, thanks to the income from the "pool."

In the newly-developing Lower Bari Doab Colony Government has more power in this matter of ginning factories than elsewhere, and has under consideration proposals to ensure that no more sites are sold by it for the erection of such factories than will be required by the cotton requiring ginning: the factories to be erected will almost certainly have to comply with certain requirements as to space and general design, whose object is to ensure cleaner and purer cotton leaving the factory than is now the case. The matter will doubtless be dealt with by the Cotton Committee now touring through India.

Government assist-
ance.

Q. 4.—The experience of this Government in the way of subsidizing industrial enterprises has been very small and not fortunate. A subsidy was promised to the Ambala Glass Works in 1911 on condition of training a certain number of apprentices, to be nominated by Government, in approved methods of glass-making. For the purposes of this training Austrian experts were to be entertained. The experts were entertained, but only for a short time: no body replaced them: it was found that the apprentices were not properly taught: and, in short, the whole enterprise was a failure. It was brought to a speedy conclusion.

Similarly, Sir Louis Dane's Government gave in 1910 a grant to the Salvation Army Weaving School at Ludhiana for teaching improved methods to weavers. The grant was not renewed at the end of the five years for which it was given in the first

*My replies are merely my own opinions and should be taken to be in no way binding on my Government. I direct the Commission's attention to—

- (i) Mr. Badenoch's monograph, just published, entitled "Punjab Industries, 1911-1917," bringing Mr. Latifi's "Industrial Punjab" up to date; and
- (ii) A note, already in the Commission's hands, showing results of enquiry made by a small committee into the recent causes of failures of industrial enterprises in this province.

instances. Frequent visits to the school convinced me that it was not appealing to the weaving classes of the province: and that the Salvation Army was, perhaps, pushing unduly its own loom with the weavers against the more satisfactory "fly shuttle loom," and, in short, that Government was not getting value for its money.

Q. 5.—Government in this country has to discharge very many functions which in more advanced countries are undertaken by the public itself. I am therefore distinctly of opinion that Government aid should be given to existing or new industries, especially the latter, in India to a greater extent than would be done, say, in England. How that aid should be given I have no very clear ideas. It appears to me that all the various methods of giving such aid that are suggested in this question might be tried, that being adopted in each particular case that seemed best suited to it.

Suggestions Nos. (1) and (3) could be employed with advantage in helping a new or existing enterprise, already properly supplied with capital, over some particularly thorny part of its path, where some initial difficulty had to be overcome, or to enable a small industry to expand to an extent that would secure it the advantages of production on a large scale. No. (4) should generally be the method adopted to aid new enterprises. Loans might be granted, without interest at first, afterwards bearing interest which would gradually rise to the market rate: instalments of principles also would be demanded at the latter stage. Such an idea is already recognised in the advances by Government for agricultural purposes—*taccavi* system. What is now wanted is industrial *taccavi*.

Suggestion No. (5) is suitable for small industries, where machinery is simple, and not expensive. Suggestion No. (7) would seldom be applicable, although there seems no reason why it should not be applied to a large new undertaking, the first of its kind in a particular province.

The adoption of suggestions Nos. (3) and (6) would require much consideration. Should Government follow either of them, the Indian public might possibly understand the procedure as an absolute Government guarantee of the undertaking, and invest money accordingly. Should, subsequently, such enterprises come to grief, Government might be placed in a somewhat difficult position.

Q. 6.—Government supervision would have to be applied to a greater or less degree if any methods of Government assistance are invoked. Far more Government control would be necessary if suggestions Nos. (3) and (6) in question 5 are followed, than would be necessary in the case of the other suggestions. I should not, however, make such control or supervision stricter than the absolute minimum. Government would have to run its risks like other people. I assume Government would have a large staff of well-paid experts to advise on industrial enterprises applying for assistance. On that assumption, and also assuming the advice so given to be followed, I do not think that any form of Government supervision should be applied save in the case of suggestions Nos. (3) and (6) in question 5. If they were followed, I should have a Government director on the enterprise concerned.

Q. 7 and 8.—The experience of the Punjab in regard to pioneer factories is hardly one on which a general policy can be framed—so limited is it. The only pioneer factory possessed by Government is the Government Resin Factory at Jallo near Lahore. This venture has met great success, having within two years paid off its original outlay and made, in addition, a handsome profit. But there were special reasons for success in this case. The process of manufacture is a simple one; there is no highly-complicated machinery, no very involved processes. Hence, it can well be run by a Government department, which, as yet, has little specialised experience in this particular industry. Again, Government has, to a large extent, a monopoly of the raw material, the resin obtained from the "*pinus longifolia*." With complete control over large areas of forest, Government can control better than could a private agency the collection and transport of the raw material.

It would thus appear that this is a case in which Government should never close down the factory, nor hand it over to a private capitalist. The industry is not capable of indefinite expansion, and were it handed over to private enterprise, it would merely be the gift of a monopoly to a private firm which would be more likely to abuse it than Government.

The conditions were, however, in this case, as already said, exceptional. Where such conditions do not exist, it is extremely doubtful whether much successful pioneer work can be done by Government. To pioneer a complicated industry requires a specialised knowledge and experience which Government can rarely command. A large firm which has already fought its way to the forefront of the world's industry is much more capable

of pioneering industries than is Government; witness, e.g., the skill with which Steel Brothers of Rangoon are developing the mineral oil question in the Attock District; and in connection with the possibility of alkali manufacture on a large scale in this province, it seems at least worthy of consideration whether a firm like Brunner Mond & Co. would not do the work better than Government. As showing that Government is not well fitted for this type of work, I may quote the case of a small mineral oil spring in the Mianwali District, which has been worked by the Military Works Department with crude and old-fashioned methods for many years. Some years ago, to increase the supply of oil, that department sunk a well directly over the spring in question. No result followed. As was pointed out by the Director-General of the Geological Survey, the well was sunk at the very place where a free flow of oil could not be expected. In other words, the Government department had not the experience necessary for this kind of work.

Financing agencies. Q. 9, 10 and 10 (a).—I have nothing to add to what is said on the report on the recent failures of commercial enterprises in this province.

Co-operative societies. Q. 11 and 12.—The Registrar, Co-operative Societies, Mr. Calvert, will doubtless give evidence on these points. Weaving and shoe-making have been helped by co-operative societies to some extent in villages in this province. The results so far attained are not great, partly owing to shortage of staff.

Technical aid to industries.

Demonstration factories. Q. 19.—Tanning, match manufacture and the manufacture of tiles, cheap crockery and acid jars, all suggest themselves as suitable for demonstration factories in this province. As regards the first, there is abundance of raw materials, but the methods followed are bad. Troup's monograph on matches contemplated a successful future for this industry in the Punjab. And, as regards tiles, cheap crockery, etc., the Eureka Porcelain Works, Lahore, have proved that their manufacture is commercially possible: but the methods followed in those works could doubtless be improved.

Industrial surveys. Q. 25.—The existing surveys are more general than particular: more geographical than industrial. In a general survey it is difficult to give adequate attention to one specific detail. As an instance of our present defective information I can refer to that of trees with tannin barks in the forests of the province. Some years ago the then Director of Industries asked the Conservator of Forests for some specific information on this point and was informed that to collect it a special staff would be necessary. The information is not yet forthcoming.

Little definite is known regarding the clays and glass sands of the province, and I do not think that the Salt Range has yet been thoroughly explored from a geological point of view.

It is most important for such surveys as I have here in mind that the instructions for each survey should be precise and not general, that each survey should be for a definite industrial article in relation to its industrial purposes. Were the general results of such surveys made known through the Press, attention would be more widely directed to the official reports.

Assistance in marketing products.

Commercial museums. Q. 29.—I do not think a commercial museum would be of much practical use in this province. Prices are always fluctuating and it would require good organization to keep the information at such a museum up-to-date.

Sales agencies. Q. 30.—I paid a short visit to the "Village Industries" Emporium at Cawnpore recently. I think a similar institution would be useful in this province.

Exhibitions. Q. 31.—The small exhibition of improved weaving appliances that tours for some six months every year through important weaving tracts of this province undoubtedly does good, as many weavers, for whom these improved appliances are meant, live in villages, and such an exhibition is the only possible agency of bringing home to them that improved appliances are possible.

Trade representatives. Q. 36.—I see no particular advantage in the Punjab having trade representatives in other provinces.

Government patronage. Q. 38.—The rules are not quite as easy in this respect as they might be. At one time I remember it was desired to get Government patronage for a small cutlery manufacturing concern, in so far as the provision of desk knives, etc., was required. Nothing came of the proposal on account of difficulties raised by the rules. I am now again in correspondence with the Controller of Stationery on the subject.

Other forms of Government aid.

Q. 41 and 42.—Undoubtedly, difficulties are thrown in the way of the acquisition of land for industrial concerns, not so much by the land policy of Government, as by the customs of the people, to which almost the force of law has now become attached. Mr. Armstrong of the Dhariwal Mills has suffered in this matter and will doubtless explain his case to the Commission. In the first place, the Pre-emption Law throws difficulties in a purchaser's way: a co-sharer in the village brings a case in which he alleges that he, as co-sharer, is entitled to buy the land instead of the industrial enterprise concerned. The result is endless litigation and worry for the enterprise. I would emphasize that, more often than not, the cases such co-sharers bring are merely to blackmail the enterprise, and not really with the object of getting the land. This difficulty, under the Pre-emption Act, however, does not arise when the sale in question has been of agricultural land by a villager: as in such cases the Deputy Commissioner has to sanction the sale in question under the Land Alienation Act; and, in the case of land alienated with such sanction, no right of pre-emption can exist—*vide* section 9 of the Punjab Pre-emption Act of 1913.

Land policy.

But the Customary Law of the Punjab peasantry here opposes another obstacle to the industrial concern trying to extend its operations, and for that reason wishing to add to its land. Ancestral land—that is land which the seller did not purchase himself, but inherited—cannot, as a general rule, be sold save for valid necessity. Otherwise, those to whom it would descend in due course can bring a case to set aside the sale. Many cases have been brought in the Punjab courts on the point as to what was “valid necessity.”

But the possible worry and expense to the industrial concern wishing to increase its land are obvious. And here again I would emphasize the fact that such cases are as often as not brought with a view to blackmail.

Government has not in any case that I can find so far ever put the Land Acquisition Act in force to help an industry in acquiring more land. Sections 40 and 41 of that Act have always stood in the way.

The remedy for all these troubles should be, to my mind, a short enactment, giving the Local Government power to acquire land for industrial concerns when satisfied that it was to the public interest (in its widest sense) that such acquisition be made. The provisions of Customary Law should be definitely debarred from applying to such alienations. I attach much importance to this. I have before me as I write a record of a case in which a proposal to establish a large spinning and weaving mill in the Gurdaspur District came to nought owing, *inter alia*, to difficulties in the way of acquiring land.

This Government has, I may note, recently agreed to reserve an area of 5,000 acres in the new Lower Bari Doab Colony to provide in the future land for peasants expropriated from their original land by industrial concerns.

Q. 43 (a).—Government in this province can help industrial concerns by the supply of power from the waterfalls in canals and rivers. The Dhariwal Mills and the Amritsar hydro-electric scheme, which the committee will examine on the spot, are cases in point. The former being a concern that requires a constant supply of power has had to instal a standby steam plant, to provide power for such periods as the canal is closed for cleaning, etc. Power, therefore, from canals, being periodic, would appear better adapted to the working of agricultural wells, which do not require to be continually working—this is the case with the Amritsar hydro-electric scheme—than the working of concerns which require continued power. For them the possibilities of the Punjab rivers merit consideration. But in this connection it should be borne in mind that these rivers run very full in the summer, and with very much lower supplies in the winter.

Training of labour.

Q. 46.—Mr. Heath will give evidence about industrial schools in the province—so I leave that part of the subject to him. I am inclined to think that industrial schools should be under the Department of Industries and not that of Education. But the latter department should either be represented on the “Advisory Industrial Board of the Province,” and would thus have a voice in the management of industrial schools, or should be given some other way of making its voice heard in large matters of policy as regards the management of such schools.

Industrial schools.

Official organisation and administration.

Q. 56.—There is in this province a combined Director of Agriculture and Industries, who is also at present Controller of Munitions. There is abundant work for two officers, and the office of Director of Agriculture should be separated as soon as possible from that of Director of Industries.

There is an Advisory Board of Industries, but it never meets, and is at present, at any rate, of no use. It could, however, undoubtedly be of use were a whole-time Director of Industries appointed. It should be merely advisory, without executive functions: these should be left to the Director of Industries. As to the latter I would take the best man offering, be he business-man, non-expert official, or a technical specialist. The circumstances of one province differ from those of another, and the circumstances of a province do not remain the same. Hence, I deprecate any hard-and-fast rule being laid down that the Director of Industries must be a business-man, or *vice versa*. And in this province, I foresee considerable difficulties in getting a suitable business-man to fill the post, who would be willing to accept the salary Government is likely to attach to it.

There should be an Imperial department also with various specialists attached to it, e.g., in glass-making, paper-making, pottery-making, tanning, etc. To them the provincial industrial departments should refer for advice when any case in connection with those industries came before them. At present I have a case before me in which a local firm asks for advice re glass-making. In this matter I need the advice of a glass expert's but the only man available is the glass expert attached to the United Provinces Government. I am asking my Government to ask the United Provinces Government kindly to let their glass expert advise in this case. But whether that Government will agree is another matter.

Cottage industries.

Cottage industries are certainly of some importance here: but they are mainly "luxury" industries. I have no very clear ideas as to how they should be developed. The enamel and pottery work of Multan, the inlaid carpentry work of Jullundur and Chiniot and the jade work of Bhera are a few that suggest themselves to me as worthy of encouragement. The travelling exhibition of improved weaving appliances certainly does, as already said, useful work.

Technological institute.

Q. 71 and 71 (a).—I can see no need for a technological institute in this province, though I consider there should be one such central institute for the whole of India, thoroughly well-staffed, and completely fitted up, to which Provincial Departments of Industry could send students. The possibility of lads who have passed through the course at such an institute thinking themselves entitled to Government posts merely because they have done so should be borne in mind.

College of commerce.

Q. 80.—The Punjab is not yet sufficiently advanced financially and industrially to support a fully constituted and equipped college of commerce. Were one to be started at this stage there would be considerable danger of turning out a too expensive article, for which there is, at any rate at present, no demand in the province. The present situation is, however, by no means satisfactory. The "Clerical and Commercial Examination" of the Punjab University serves no very useful purpose. Most offices prefer to engage a lad who has passed the Matriculation Examination, and count on his acquiring a clerical and commercial education afterwards. But great need has been felt in the past, and greater need will be felt in the future, for a more educated type. The staffs of most of the Swadeshi banks knew nothing about banking: and, if Indian banking is again to raise its head, it must be supplied with an Indian staff of branch managers with education and experience in banking methods. So also in the case of auditors: there is a growing need for reliable Indian auditors: and a more highly qualified clerk than has as yet been available will soon be demanded in all Government offices. There are institutions which are attempting to supply the necessary product, but at present their energies are not co-ordinated and they have no standard to work to. A pioneer effort is, however, being made so far as Government institutions go by Mr. Ernest Smyth, Headmaster of the Joint High and Clerical and Commercial Schools of Amritsar. In a two-years' course he is giving a much wider and more thorough training than the present Clerical and Commercial Examination contemplates. What he now asks for is a proper diploma to work for. At the same time the Punjab University has now under consideration a scheme for a two-years' commercial course, specially calculated to supply the demand of Northern India for a not too elaborate finished product. This seems the proper course to adopt: extend a curriculum something like Mr. Smyth's to other high schools, and at the same time institute a diploma course at the University. The whole course should take no more than three years as a maximum, either two years at school and one at the University or *vice versa*. Particular and careful attention should be paid to modern commercial English, correspondence, proofs, and office routine, and a minimum standard in such should be insisted upon.

Local bodies.

Q. 81 (a).—The present general system of municipal taxation, octroi, is a hindrance both to trade and to industry. Municipalities can assist by substituting a terminal tax, or some other form of taxation on property, for it. The matter is gone into in more detail in Mr. Badenoch's monograph "Punjab Industries, 1911-1917."

Municipalities can also help in starting industrial schools—if run on proper lines—and by giving scholarships for technical and commercial scholarships elsewhere.

Q. 83.—My experience is small, but I not infrequently have correspondence with the Director-General of Commercial Intelligence, and have received assistance from that officer. Commercial Intelligence.

Q. 84.—Occasionally, I find the *Indian Trade Journal* suggestive, but it is generally rather vague, and consists too much of extracts from other papers. Trade journals.

Q. 85.—I think the Imperial Specialists in glass-making, etc., who I have suggested in my replies to questions 58—62 might well publish monographs on their various subjects, suggesting improved methods, which should be circulated to all engaged in those industries throughout India, in the various vernaculars, copies being also sent to the various provincial Directors of Industry.

Other forms of Government action.

Q. 89.—Considerable regret has been expressed in the province at the refusal of the Government of India to adopt a system of hall-marking for silver. Many people have insisted on the necessity of granting certificates of quality. In addition to silver the necessity for hall-marking *pashmina* shawls has been urged. These beautiful shawls are made, as is well known, from fine wool from Thibet. Before the war, however, many shawls sold as *pashmina* were made in Germany, and, as the product was not good, the trade was beginning to get a bad name in Europe. The Ludhiana merchants, who are the principal dealers in these articles, declare that they would willingly pay a small fee for the privilege of having a certificate for these goods. Certificates of quality.

Q. 95.—It has been suggested, and the suggestion, I think, merits consideration, that articles patented in India should be manufactured in India. I perceive of course the many difficulties inherent in the suggestion. Still it might be considered. Patent Laws.

This province can never, I think, be a great industrial province. The great reason militating against this is the scarcity of labour which is a very great problem to many factories. The high price of Bengal coal here owing to the long railway lead compared with other provinces must be borne in mind. Perhaps the discovery of oil in Attock, and the possibilities of our water-power may solve this difficulty. But our mineral resources are very limited. Limestone, hides, oil and cotton-seeds appear to me to be raw products, the careful examination of which should be made. They occur in abundance in the province. General.

Factories, *qua*-factories, will not add to the happiness of the province, but as increasing the wealth of its people should be welcomed, and I should therefore be glad to see their establishment to a reasonable extent.

Finally, I would note that Mr. Carter Speers, the Chemist attached to the Forman Christian College, is most anxious to assist the Department of Industries, and I am indebted to him for advice on chemical matters in connection with a small dyeing school recently established at the Central Weavery. He is, I understand, erecting a laboratory at his college in which special attention will be paid to industrial problems. I understand co-operation of this manner between Government and research establishments is not uncommon in the United States, America. Something like it might perhaps be usefully developed in India.

I am much indebted to Mr. Badenoch's aid in drawing up this note.

ORAL EVIDENCE, 8TH DECEMBER 1917.

Sir F. H. Stewart—Q.—How long have you held this dual appointment?—A.—Three years.

Q.—Was it dual appointment before that?—A.—Yes.

Q.—How long have industries been associated with agriculture in this way?—A.—Since 1911.

Q.—That was the first appointment?—A.—Before that there was a Director of Industries and Land Records. Sir Louis Dane started that.

Q.—You refer to the Alienation of Land Act that is a Punjab Act?—A.—Yes.

Q.—Can you tell us very shortly what it is?—A.—It was brought in in 1901. There had been great agricultural problems; it was said that all the land was passing into the hands of money-lenders. The zemindars used to mortgage land to money-lenders. They wanted to get money and signed any documents put before them. It was found that 20 per cent. of agricultural land was passing into the hands of the money-lending classes, who became land-owners. There was great agricultural discontent in consequence, and the problem was considered for a very long time. Lord Curzon took it up, and the Land Alienation Act was passed. The Act is briefly to the effect that an agriculturist cannot part with his land to a

member of the money-lending classes. A money-lender, who is an owner of land, can sell it to anybody he likes.

Q.—It was introduced in the interests of the agriculturist?—A.—Yes, and has been exceedingly successful.

Q.—Had the Act the effect of setting free a great deal of capital for industries?—A.—Yes, that was the idea. Undoubtedly, it did set free a lot of capital.

Q.—Not much capital comes into this province from other parts of India?—A.—My experience does not point that way. There is, however, a spinning and weaving mill in the province of which most of the capital was subscribed in Bombay.

Q.—That is the one referred to in this book, which is being attended with a certain amount of success?—A.—Yes.

Q.—Do you find that the professional classes invest money in industries?—A.—Such money as is invested in industries does come from the professional classes.

Q.—It does not come from zemindars and land-owners?—A.—To a very small extent.

Q.—Do you think the position is altering for the better, or is it pretty much the same as what it was before the crisis?—A.—It is altering very slowly I should say.

Q.—You refer to the Salvation Army work at Ludhiana. You are inclined to think that perhaps they made undue efforts to push a loom of their own invention?—A.—That was my impression.

Q.—And it was too expensive also?—A.—Yes. The plant was expensive. When I assumed my present duties I was dissatisfied with the school. I found it was not earning its grant at all. There were nearly all Christian boys there, and the school was not getting into touch with weaving in the province as a whole.

Q.—The grant has now been discontinued, but they are left with the use of the building?—A.—The grant was given for three years, and I recommended that it should not be continued.

Q.—Does your department recommend any special loom?—A.—We have the fly-shuttle loom, which is meeting with a certain amount of success. It goes out into the villages when we send our men on tour in the winter.

Q.—With these travelling demonstrators?—A.—Yes; we are just touching the fringe of the problem. It is quite successful, but the people want encouragement. They are a very slow and backward class.

Q.—The fly-shuttle loom is a good deal cheaper?—A.—Yes, cheaper than the Salvation Army loom.

Q.—Then you refer to this Resin Pioneer Factory. A good deal of the success of that is due to the war?—A.—I have nothing to add to what Mr. McIntosh has said.

Q.—Do you agree with Mr. McIntosh that it is a case in which Government should retain control of the industries?—A.—I do.

Q.—For the same reason that the raw products are Government's?—A.—Yes.

Q.—Is permanent damage done to the trees by tapping them for resin?—A.—I cannot tell you. Mr. Badenoch says no.

Q.—With reference to match-making, you refer to a monograph on matches, of which we have heard a good deal. Perhaps the recommendation of the wood in that was not a very happy one?—A.—We have no experience in this province. I have seen the Bareilly match factory two or three years ago when it was a great failure on account of the *simal* wood used. Mr. Badenoch tells me that one man in the Punjab tried *chil*, which was also a failure.

Q.—You think it would be useful to have here similar sales emporia to that at Cawnpore?—A.—Yes, for all village industries.

Q.—Is there a sufficient number of village industries in the Punjab?—A.—Not so many as in the United Provinces, but quite enough to keep one sales emporium going.

Q.—It is rather a question of keeping alive than of developing?—A.—That is it. They make things and want to come in touch with the market.

Q.—With reference to the question of land, you say, in answer to questions 41 and 43,—“This Government has, I may note, recently agreed to reserve an area of 5,000 acres in the new Lower Bari Doab Colony to provide land in the future for peasants expropriated from their original land by industrial concerns.” Is Government considering the advisability of acting under the Land Acquisition Act?—A.—I don't know that it has gone so far as that.

The Dhariwal Mills, which are really the only successful enterprise in the province, are anxious to extend, but they cannot come to terms with the villagers. The manager is still negotiating. The villagers are sticking out for very exorbitant terms. They want the same amount of land as they have got, and, in addition, want full price for their land.

Q.—Then you refer to your Advisory Board of Industries, which you say "never meets and is at present at any rate of no use. It could, however, undoubtedly be of use were a whole-time Director of Industries appointed." How many members does that Board consist of?—A.—I am sorry I cannot tell you; it is such a large Board. You will find it in Mr. Badenoch's monograph. I find that the Board never really came into existence.

Q.—It is too large to be practically useful?—A.—Yes.

Q.—To be of real use such a Board should be small?—A.—Undoubtedly.

Q.—And it would mostly have to consist of men usually resident in Lahore?—A.—I don't think that is necessary. A business-man could come from Rawalpindi or Ambala. Personally, I would deprecate having Lahore men entirely on it.

Q.—Do you think you could get suitable business-men to serve?—A.—Yes.

Q.—Would you give the directorate power to make special enquiries and to appoint special committees for specific purposes?—A.—Yes.

Q.—One criticism we had was that it would not have the knowledge to help village industries properly?—A.—That would depend upon the weight you attach to village industries. I do not attach much weight to them in this province.

Q.—Is the Industrial School at Amritsar a private enterprise?—A.—It is run by the Municipality.

Q.—The Principal wants a diploma. Government would merely be asked to counter-sign it?—A.—Either Government or some authority such as the Punjab University, or the Department of Industries when properly organised.

Q.—With reference to certificates of quality, you think that Ludhiana merchants would welcome the introduction of Government certificates of quality?—A.—Yes.

Q.—You would only have them voluntarily; you could not enforce them?—A.—You would have them voluntary; you could not make them compulsory.

Q.—Are there any other classes of trade for which you think they could be introduced with success?—A.—I cannot think of any at present.

Q.—You would not contemplate it for raw products?—A.—No.

Q.—I don't quite understand your answer to question 95, about articles patented in India. Are you suggesting that articles manufactured outside India should receive no protection?—A.—The suggestion was made by Mr. Maynard. I think the idea originally came from what was done in England some years ago; they passed a law that many articles manufactured in Germany got only provisional protection in England for a few years. To get permanent protection they had to be manufactured in England.

Mr. C. E. Low—Q.—Is there any possibility of growing beet sugar in the Punjab?—A.—Yes, it has been considered, and it can be grown quite successfully.

Q.—Is the inability to set seed here a fatal objection? Is the seed rate too low?—A.—I think so.

Q.—The thing has not gone far enough to be able to compare it, as an economic proposition, with the growing of sugarcane?—A.—No.

Q.—Do they keep sugarcane in earthen clamps in any part of the province, the same as they do in the North-West Frontier Province?—A.—Yes.

Q.—That was being considered in the Frontier Province as a means of extending the sugarcane-crushing season by crushing standing cane, beet, and then clamped cane?—A.—When you say "put in clamps" do you refer to the seed cane, or whole cane? I do not think the whole cane has been considered.

Q.—What is your opinion about the prospects of the sugar industry here generally?—A.—My opinion is that this can never be a large sugarcane province, on account of the cold climate. Mr. Barnes, our late Chemist, was of opinion that the only part of the province to grow sugarcane was the south-east, where the cold is not so great as in the north. We have a proposal to start a small sugarcane factory somewhere down there. Sugarcane will not seed in the Punjab. It does not seed except in South India.

Q.—Have you had any of the Coimbatore varieties up here?—A.—We have had two and are trying them experimentally. It is as yet too early to say anything.

Q.—A difficulty struck us in connection with the compulsory acquisition of land by Government for industrial undertakings and that was that it would be very hard to find a

proper criterion by which Government could decide whether compulsory acquisition should be practised or not; and a criterion has been furnished to us recently by a very responsible source, something on these lines:—Government may acquire, if it is satisfied that the development of the industry is in the public interest, and the industry cannot be developed without such acquisition. What do you think of that?—A.—The criterion is all right; it all depends upon the satisfaction of Government. One Government may be more satisfied than another; it depends upon the personal equation of the man to be satisfied.

Q.—You are in favour, I gather, of some sort of legislative provision to enable a land-owner to give a clear title when he wants to sell for industrial purposes?—A.—Yes.

Q.—And for that, statutory legislation is necessary?—A.—Yes.

Q.—You are in favour of it?—A.—Yes, and I would also have an enactment to take up land compulsorily. The Dhariwal Mills have got to extend, and the owners are sticking out for exorbitant terms.

Q.—You recognise that the criterion I mentioned would not help the Dhariwal Mills?—A.—I do not know that I do recognise it. I don't know that it would not be in the public interest that the Dhariwal Mills should extend. It is the only one in the Punjab.

Q.—Some doubt arises in your mind as to whether an industry is to be considered as a general question or a local one?—A.—I should consider this one to be both.

Q.—Have you considered any views on the subject of the alleged hoarded wealth of the Punjab?—A.—The impression I have is that there is a great deal of money. I was Settlement Officer in one of the poorest districts of this province. I was once trying a case where a poor man had 200 sovereigns in his house, and I was informed that all the villagers had money hoarded up. On another occasion a wealthy *Bania* stated to me that he had all his money buried.

Q.—You don't think that these cases that come to light from burglaries are due to the detective action of the burglars?—A.—I do not think so.

Q.—With regard to this question of the over-creation of cotton-spinning factories. Are these combines registered under the Companies' Act?—A.—I do not think so. I am fairly certain they are not.

Q.—With regard to this fly-shuttle you were speaking about, is it simply the slay you are putting out, or the whole loom?—A.—The whole loom.

Q.—Have you seen any of the efforts which are being made in Bombay to popularise the same type of loom?—A.—I have not.

Q.—You work by means of peripatetic parties?—A.—Yes, there are four of them going out now.

Q.—Do you work in combination with existing credit societies among weavers?—A.—To some small extent.

Q.—You speak of various ways in which Government might give financial assistance to industries. All these methods presuppose—don't they?—the capacity on the part of Government to form a well-informed judgment on the probabilities of the success of any particular enterprise?—A.—Yes.

Q.—And as an essential condition for anything of the kind, the existence of experts must be presupposed?—A.—Yes.

Q.—That is to say, that whether it is proposed to give financial assistance by Government, or by actively assisting such industries in the way of pioneering, or by technical assistance, the whole matter depends on a number of experts properly organised and made properly available?—A.—Certainly.

Q.—Take an industry like the glass industry—I believe it to be the case that you cannot get an all-round glass expert, and to start the industry you want the advice, not only of chemists, with regard to your raw material, but of furnace-makers, pot-makers, furnace men who deal with the melting of glass, blowers, and, of course, if you are going in for moulding, of moulders. It will be very unwise to risk the starting of any glass enterprise on a large scale without having the question examined by an all-round lot of experts. Does it not strike you that it would be uneconomical to have a complete outfit of glass experts like that for each province?—A.—It does.

Q.—Don't you think that in a case of that sort it would be extremely advisable to have your experts attached to an Imperial department in the first instance? I think you bring out a similar point?—A.—Yes, I state that in my evidence.

Q.—The point is that experts are a practical necessity, and you want an adequate supply of them, and unless you are going to waste a great deal of money, you must in the first instance, and until things get on to a more established basis, have a considerable proportion of the experts attached to some form of central organisation where they would be available?—A.—Certainly.

Q.—You say, "Little definite is known regarding the clays and glass sands of the province, and I do not think that the Salt Range has yet been thoroughly explored from a geological point of view." With reference to clays, have you sent any specimens from here to the Bombay School of Art for investigating the pottery possibilities of materials?—A.—I do not think so.

Q.—In regard to Government patronage, how do you think a Stores Department in India, a part of whose policy would be the purchasing of Indian manufactured articles, would work?—A.—I think that is the only way you can work it, otherwise if every department was allowed to purchase, you would get competition, and Government would have to pay high prices.

Q.—Your position as Controller of Munitions strengthens that view?—A.—Yes.

Q.—Would you like to see some sort of arrangement on the present lines, with reference to the purchase of Government stores in this country, continued, such as is now being worked by the Munitions Board?—A.—Yes.

Q.—You say, "I can see no need for a technological institute in this province, though I consider there should be one such central institute for the whole of India." Have you considered another possibility, viz., specialised technical institutions? Supposing you had a technical institution at Sakeldi which specialised in metallurgical research work?—A.—That seems quite a good idea.

Q.—You recognise the special facilities that would be afforded, both to the students and the professors, in dealing with problems on the spot, and being in immediate personal touch with men engaged in industries, who would present their problems as they arose?—A.—Yes.

Q.—Is there any particular line of research which you think could be usefully specialised in here?—A.—Our oil-seeds and tanning industry. We have enormous potentialities in limestone.

Q.—Turning to the question of oil-seeds, is there any local market for cake?—A.—Very little. There is a market, but not for machine cake.

Q.—Is that dislike justified on chemical grounds?—A.—It is due to the machine, which expresses more oil than does the country press.

Q.—Have you seen analyses of the country oil-mill cake?—A.—I have seen such analyses.

Q.—Was the oil that remained in the cake very excessive?—A.—It was very much more in the country cake than in others.

Q.—Do you know that agricultural chemists consider that a lot of the oil fed in the form of cake to cattle is wasted, and that it would be more economical on scientific grounds to feed the cattle on mill cake?—A.—I have tried experiments in that line myself.

Q.—With what results?—A.—My predecessor got up an oil factory in Lahore to make cotton cake. The zamindars said that the cows would not eat it.

Q.—Do the Agricultural Department feed their cattle with mill cake?—A.—With cotton-seed, not cotton cake.

Q.—Do you feed your cattle with any form of cake?—A.—Rapeseed cake.

Q.—Is that from country mills or from factories?—A.—From country mills.

Q.—Is any attempt being made by the Agricultural Department to popularise the use by cultivators of factory-made cake for feeding their cattle?—A.—Not at present; we are taking up more important things.

Q.—You realise that, as a condition precedent for each factory, that it must have a local market for its cake?—A.—Undoubtedly. We are quite prepared to take the problem up in time.

Q.—How far is there any direct foreign trade from the Punjab; how far do merchants here consign direct to any foreign country?—A.—In the Canal Colonies there are commercial firms as Rallis and Volkarts—these have agencies all over the country. They export to Karachi and Bombay.

Q.—I was alluding to the Indian merchant. I understand that some of your dealers in hides and skins consign their goods to foreign countries?—A.—There is a certain amount of business between Amritsar and America direct.

Q.—They consign direct, and some, I suppose, consign through Bombay and Calcutta houses?—A.—Yes.

Q.—Do such men find difficulty in corresponding with foreign firms?—A.—I have not come across any case of difficulty. We have carpet manufacturers in Amritsar who make carpets on direct orders from America.

Q.—Has anything been done ever to help and increase that kind of thing here?—A.—Nothing so far as I am aware.

Q.—You are aware no doubt that the Board of Trade will give you a list of approved firms dealing in certain kinds of articles in America or anywhere you like? Has any attempt ever been made to obtain such lists?—A.—No, because the question has never been raised.

Q.—Do you consider it desirable to try and get local Indian merchants into direct touch with foreign firms beyond seas in respect of their exports?—A.—Yes, so long as the firms beyond seas are good ones, certainly.

Q.—With regard to this question of hall-marking, do you think it practicable, supposing Ludhiana merchants wished to have these goods stamped or otherwise certified for them, with a little assistance from Government, to organise their own system of stamping or certifying? You are aware that in several places where there is a large market for hand-made piece-goods, the merchants themselves have their own committees for checking and certifying these goods?—A.—I think they would certainly want a good deal of Government assistance.

Q.—I have in mind a case where a committee of merchants certify to the weave and quality of silk and gold thread. It was certainly their own idea and Government had nothing to do with it?—A.—Was that in India? If these people could do it, it would be an excellent thing. In the initial stages some Government backing would be required. You want Government to push them through.

Q.—Either Government could pass an Act and make people do it, and take a good deal of responsibility about it, or one or more Government officials might bring people together, talk the thing over with them, and put them in the way of doing it themselves. Do you think the latter idea possible; or do you think it should be the first?—A.—I think the first.

Q.—Then of course you have the difficulty that you will be passing legislation before you have consulted all the parties, and there would be considerable opposition when you passed the Act?—A.—In any case it would be optional for anybody to take advantage of this marking. All I have in my mind is optional marking.

Q.—Of course, this case I had in mind was optional; only the man who tries to sell without that certificate gets extremely low prices?—A.—It might be opposed, but I don't think there would be any honest opposition.

Q.—Has there been any attempt to work up a certifying system among themselves with the help of individual Government officers?—A.—They did propose it for silver work at Gujranwala. Nothing came of it. There was a distinct wish on the subject.

Q.—Has any attempt ever been made on the part of co-operative societies engaged in more or less artistic industries to get up some system of hall-marking?—A.—I have not heard of any such attempt.

Q.—Have you any co-operative artistic industries to which this system of marks would be applicable?—A.—There are none.

Hon'ble Mr. H. J. Maynard.—Q.—Didn't a Municipal Committee in some place certify certain articles, gold and silver wire work, either the Municipal Committee of Jullundur or Amritsar?—A.—I forget. I will get the case out and look the matter up.

Sir F. H. Stewart.—Q.—For what purpose was that; was it to certify the quality of the thread?—Hon'ble Mr. H. J. Maynard.—A.—For the purpose of certifying the quality of the goods, including the quality of the thread which may or may not be genuine.

Sir D. J. Tata.—Q.—In reply to question 4, you say, "A subsidy was promised to the Ambala Glass Works in 1911 on condition of training a certain number of apprentices, to be nominated by Government, in approved methods of glass-making. For the purposes of this training Austrian experts were to be entertained. The experts were entertained, but only for a short time; nobody replaced them; it was found that the apprentices were not properly taught; and in short the whole enterprise was a failure." What was the reason? Were they not good enough?—A.—I believe that one killed the other.

Q.—I heard somewhere that Japanese experts were brought in, but that they were not willing to teach people in this country.—A.—There are Japanese experts at Ambala. I have been all over the factory, but have seen no disposition to conceal their methods. They are really willing to teach.

Q.—We were told somewhere that Japanese experts did not like to show their methods to any of the apprentices?—A.—I have not heard that.

Q.—When you bring in experts, do you ever make a condition that they should teach all the people that are put under them for that purpose?—A.—What sort of experts?

Q.—Any kind, and for anything?—A.—I have not got any.

Q.—With reference to these Austrian experts, was any condition made with them?—A.—Not with them, but the proprietor of the factory who employed them.

Q.—Did he make conditions?—A.—That is my impression.

Q.—If you make it a condition with any expert that he should teach, and if he did not succeed, his services should be dispensed with; could an arrangement of that kind be come to?—A.—I see no reason why it should not.

Q.—Our main object being to bring up our young men and make them help our industries, should not every attempt be made to train them in the proper way? And if every expert is made to sign an agreement that he should teach, and if he fails to teach and instruct those under him, should he not be dismissed?

Q.—In answer to question 29 you say, "I do not think a commercial museum would be of much practical use in this province. Prices are always fluctuating, and it would require good organization to keep the information at such a museum up-to-date." What is the primary use of a museum; is it not just to open the eyes of people? To a great extent it may be useful inasmuch as it shows people who visit it the various commodities that are made elsewhere or in this country?—A.—Perhaps I was influenced by the word "commercial." A museum, such as you suggest, would be a good thing.

Q.—One witness told us that in Japan at every railway station of any importance there were show-cases put up, showing the commodities and articles that were manufactured in that place, and anybody passing through would see them. That had its uses, and all said it had done a good deal in developing the industries of Japan. That is the idea; that plays the part that a museum would play in a small way?—A.—Yes. There is something like that at present among metal workers who have stalls at some railway stations in this province.

Q.—In answer to Mr. Low you said something about a decorticating plant. Is there decorticating plant for cotton oil-seeds anywhere?—A.—I do not think so.

Q.—With reference to hydro-electric schemes, the Punjab is an agricultural country; has anyone's attention been drawn to the fact that an hydro-electric scheme would be very useful in drawing nitrogen from the air, producing nitrates for fertilizing purposes?—A.—I have not heard that scheme advocated in the Punjab.

Q.—Perhaps where you have no industry your hydro-electric power might be utilised for drawing nitrogen from the air and supplying it to the agriculturist as a fertilizer. You know that Germany owes her position to her intensive agriculture by intensive manuring. Has any thought been given to that idea?—A.—No, I see two criticisms of that idea:—one is that nitrates are not so valuable here, on account of the great extremes of temperature and, secondly, that hydro-electric power can be used for agricultural wells and raising sub-soil water. You save canal water, and the fact that the wells only work at the same intervals that the canal is working is no harm, because the peasant does not want water always.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—What becomes of the money brought into the province from the sale of produce? Does it go direct to the cultivators, or to the money-lenders or shroffs?—A.—No cultivator in this province deals direct with the buyer, but always with the middleman, and a good deal of the money sticks to the money-lenders.

Q.—He does not get much in cash; it goes to the middleman?—A.—I would differentiate between the Canal colonies and the rest of the province. In the Canal colonies the cultivator gets a good deal of money.

Q.—What do they do with it? Do they use it for improving their agriculture?—A.—To a small extent; but for the great part, they bury it.

Q.—Do you think the Land Alienation Act has diverted the money to these industries?—A.—It has to some extent.

Q.—After all these bank failures, how is the money utilised—is it still going back to industries?—A.—Very slowly.

Q.—With reference to your answer to question No. 3, you say, "These factories and presses nearly all belong to 'pool' now, and one or two factories have never been worked since their erection, and yet have proved fairly lucrative to their owners, thanks to the income from the 'pool.'" Has ginning proved lucrative to the owners? We were told this morning that they did not get more than 3%?—A.—They did a few years ago.

Q.—But now there are too many?—A.—Yes.

Sir I. H. Stewart.—Q.—Would you support the proposal that a Government license should be required for ginning factories?—A.—In this matter I should differentiate between factories already in existence, and those to be put up in future. It is emphatically a matter for consideration whether such licenses should not be required. We are imposing restrictions on factories. We also do not propose in the newly developing Lower Bari Doab Colony to sell too many sites, but only in proportion to the cotton to be ginned.

Hon'ble Sir Fazalbhoy Currimbhoy.—Q.—To whom are you going to give preference, to cultivators or outsiders?—A.—The cultivator has not asked for sites. If a co-operative society of cultivators wished to put up ginning factories, their application would be received most favourably. No co-operative society has yet put a ginning factory. If they did so, we would be glad to help them.

Q.—The sites are given to them?—A.—Up to six months ago the sites were sold by auction to the highest bidder.

Q.—By selling sites at a higher price at auctions, don't you think a man will still raise his rates?—A.—I cannot say that we are selling at a higher price than has been realised by auction.

Q.—Is it fair that "approved" parties only should be given a chance. By whom are these parties "approved"? Supposing a consumer comes and says, "I want to put up a ginning factory here." Do you think it right for Government to stop his ginning factory; if he loses, that is his own concern?—A.—If Government is of opinion that there will be more ginning factories in that place than the cotton produced, I think it perfectly right for Government to interfere.

Q.—Does the ginning owner knowingly go there?—A.—Our experience is that in such cases they will form a pool. A pool has the monopoly. These factories have never worked, and the interest on the capital must be therefore paid by the cultivators.

Q.—Do you think that if there are only one or two men, they will be able to lower the prices? My fear is that, suppose a foreigner comes here and has ginnings put up, he can take cotton away from the country, and the man who wants it will not get it?—A.—We have no preference for foreigners.

Q.—You say that you give it to Halli's without auction; that is preference over others, is it not?—A.—Those who buy by auction are not bound by conditions; those who pay a fixed price are.

Q.—If there is a pool and people are making money, do you think the cultivator is having more charges on his cotton by having more ginnings?—A.—Undoubtedly I think so. Last year, until we had the first cotton auction in the Montgomery Colony, cotton was being bought by local ginnings at Rs. 10 and Rs. 12 a maund; at the auction, it fetched Rs. 17 a maund. This showed that the cultivators were not getting full price.

Q.—Is it not the reason that staple cotton has been lately grown, and that people are gradually coming to know of this?—A.—The local ginnings will not, unless they are forced, give full price for cotton.

Q.—Do you think by restricting ginnings you can benefit much?—A.—I think so.

Hon'ble Mr. H. J. Maynard.—Q.—Is not all this land Crown land?—A.—Yes.

Q.—Does that not create a special responsibility in Government as to the number of factories of particular kind that it brings into existence?—A.—Yes.

Hon'ble Sir Fazalbhoy Currimbhoy.—Q.—Do you restrict the rates at which they should gin or press?—A.—No. Suppose we find factories not giving cultivators the full price we get into touch with other firms and ask if they want to put up factories.

Q.—It comes to the same thing; more factories and more competition? With reference to the Salvation Army looms, were they of higher price than ordinary looms?—A.—They were.

Q.—How much did they cost, Rs. 25 or Rs. 30?—A.—Rs. 80 to Rs. 120.

Q.—In answer to question 6, you say, "Far more Government control would be necessary if suggestions 3 and 6 in question 5 are followed than would be necessary in the case of the other suggestions." What more control do you wish Government should have? Do you think they should have a Director on the Board?—A.—Yes.

Q.—Or do you want the Government veto?—A.—I have not thought out details.

Q.—In answer to question 38 you say, "Nothing came of the proposal on account of difficulties raised by the rules." What are those rules?—A.—I really forget the facts of the case. I know that they raised a lot of difficulties in the matter. I got a lot of samples of pen-knives and penholders.

Q.—The difficulty is that they want to have the thing by order from the Stores Department?—A.—This was raised some years ago before the war.

Q.—Then about this Land Acquisition Act. You were just answering Mr. Low's question that they will have hardship. You tell us that the Dbariwal Mills cannot get the land adjacent to them unless they pay fabulous prices?—A.—Yes.

Q.—Do you think the Dhariwal Mills is a concern for which the Government should acquire land?—A.—I do.

Q.—Is that for public purposes?—A.—The Dhariwal Mills bring a great deal of money into the neighbourhood. Such industries help the people and from that point of view they are in the public interest.

Q.—Then every industry is for the public purpose? My cotton factory in Bombay is also the same.—A.—Looking at it broadly, yes.

Q.—Don't you consider the case of the poor cultivator; it is his choice. The Dhariwal Mills can have the land at some other place or pay the price demanded. Why should you give them the land under the Land Acquisition Act?—A.—I do not agree with you that the Dhariwal Mills can go elsewhere; they cannot go miles away.

Q.—Don't they get the price that they want for their wool and cloth, then why should not the man who has land; why should he not also get the price he wants?—A.—That difficulty has been met by this Government. We have secured 5,000 acres for the expropriated peasants.

Q.—Suppose land is acquired for this purpose; don't you think there ought to be more safeguards in acquiring the land?—A.—I am quite prepared to have safeguards.

Q.—The man should also get his price, and if he does not want to sell, only in the case of a new industry in the country you should acquire the land.—A.—I want the man to get his full price, but not a fictitious value, just because his land happens to be near the Dhariwal Mills.

Q.—He has got the situation and wants his price. Then you say in answer to question 43, "I have before me as I write a record of a case in which a proposal to establish a large spinning and weaving mill in the Gurdaspur District came to nought, owing *inter alia* to difficulties in the way of acquiring land." What was that difficulty?—A.—My predecessors wished Government to acquire it under the Land Acquisition Act. Government said they could not do so, because it was not for public purposes.

Q.—Was that the only land?—A.—It was near water, and they could get water-power.

Q.—He could go down still further?—A.—It was also near a railway.

Q.—Then about the Board of Industries. Why was not a meeting called?—A.—I had too much to do. I am Director of Agriculture and also Controllor of Munitions.

Q.—Was the constitution of the Board such that it was useless?—A.—It was rather too big.

Q.—What is the number?—A.—It is in the Appendix, I think.

Q.—How do the members come in?—A.—It was long before my time.

Q.—Are they appointed or elected?—A.—As a matter of fact the Board never came into existence: there was merely a proposal to appoint one.

Q.—You think the Board should be merely advisory, without executive functions? Suppose the Board of Industries meet, and if the Director wishes to carry out a certain thing; if the Board does not agree, then he can do what he likes. Is that your view?—A.—I think that in the first instance I should leave the actual decision in the hands of Government. I should tell the Board that Government would consider favourably any suggestions made by it up to a certain amount. I should like to make it clear that I do not want an official majority on the Board.

Q.—Have you got any Indian Chamber of Commerce here?—A.—The Punjab Chamber in Delhi.

Q.—Is that an elected body?—A.—I don't know, but it has not proved particularly useful.

Q.—What do you think ought to be the salary of the Director of Industries, if he is an expert?—A.—Rs. 1,500 up to Rs. 2,500.

Q.—About cottage industries; is the carpet industry thriving here much now?—A.—Not since the war started, because the American wealthy man is putting all his money into the War Loan in America.

Q.—What is the general average wage that a man in a carpet factory gets?—A.—They mostly work on piece work. There is one contractor who has 6 or 7 men working under him. A good man can get 12, 14 and 16 annas a day. It varies.

Q.—You have no Government technical institute here?—A.—No.

Q.—You don't think it necessary for this province?—A.—Not for this province alone.

Q.—You have got electric installation in many of your cities?—A.—In Lahore and Amritsar.

Q.—Where do you get the men to work there?—A.—They are Europeans.

Q.—I mean the assistants.—A.—They are trained locally.

Q.—And the motor mechanics: have you got any Punjabis as motor mechanics?—A.—Yes.

Q.—And the Assistant Engineers of the Public Works Department?—A.—They mostly come from Roorykee. We have an Engineering College in this province which trains the lower grade Engineers.

Q.—In answer to question 95 you say, "This province can never, I think, be a great industrial province. The great reason militating against this is the scarcity of labour." Is labour very short?—A.—Yes.

Q.—Wages are not very high?—A.—This province has no industrial traditions. Cawnpore has a very large factory population. People will come in and work for a short time. Coolies are now getting 12 annas a day. The great amount of land under cultivation is another reason. About labour, I have a note here about the Bhiwani Spinning Mills. The manager says labour is the chief difficulty; there is very little local labour available there. Very recently Government has permitted a settlement of criminal tribes for work on mills. There is one at Dhariwal. Last year they had some labour trouble at the Dhariwal Mills.

Q.—Do they work 24 hours?—A.—No, they do not.

Q.—Don't they work by two shifts?—A.—The mill works for 24 hours, but not the men.

Q.—Of course, you need more men for irrigation and such works, but if industries needed more, they won't go to the fields, but will come to the industries?—A.—Yes, but you will not get a Sikh peasant, who has been brought up in the fields, to go and work in a factory, even if he got more money.

Q.—Then about the coal difficulty. Don't you think that owing to oil, the coal difficulty will be removed?—A.—If the oil is successful. I have got a note about the oil that I will give the Commission. It is in the experimental stage.

Sir F. H. Stewart.—Q.—Is there any other point that you wish to remark on?—A.—I would like to leave it on record that I do not agree with the views put forward by one witness as to the possibilities of the Punjab as a sugar-producing province.

Hon'ble Mr. H. J. Maynard.—Q.—About this question of grant of factory sites on special terms, there was a difference suggested between the foreigner and the non-foreigner. Has any such factory site actually been given to a foreigner?—A.—No.

Q.—Have two been given to those who were not foreigners?—A.—Yes.

Q.—As regards the Chamber of Commerce, there is one at Lahore and one at Amritsar?—A.—Yes.

Q.—Did either of them, when there were great difficulties in regard to railway goods traffic in the Punjab—and we held meetings with the railway authorities to discuss the subject—did either of those Chambers of Commerce make any representation, or move at all in the matter?—A.—No.

Q.—Do you know if one particular resident of Amritsar was asked if they could not be induced to move?—A.—Yes.

Q.—Do you know what he said?—A.—I don't remember.

Q.—Did you get the general impression that they were entirely apathetic in a matter affecting their own common interests?—A.—Yes.

Sir F. H. Stewart.—Q.—Have you been in touch with the Queen Mary Technical Home at Bombay?—A.—I have had correspondence with them.

Q.—With reference to suitable trades to teach the men? A good many of them are from the Punjab?—A.—I believe so. I have had correspondence with them.

Q.—Would you be able, when the men come home, to look after them?—A.—We will do our best. A similar proposal has been put up to me in this province.

Sir D. J. Tata.—Q.—How many scholars do you send every year?—A.—One every year. We have got the history here of five of them.

Q.—Have you any idea what previous experience these people had, for which they got scholarships. Was the man who was sent to study the cotton industry in a cotton mill previously?—A.—His father had a cotton-ginning factory, but he was not in a cotton mill.

One gentleman is an Assistant Chemist, one is managing a tanning business in Bombay, another is managing a flour mill at Lyallpur; one man who was sent to study tanning came to grief. In one case this year we had selected paper-making, but Government said they would not send him unless he had had experience in a paper mill. We sent him to Lucknow.

Hon'ble Sir Farukhoy Currumbhoy.—Q.—Don't you think it would help students if after the examination they were to get at least one year's further scholarship so that they can be put into a factory and get a chance of learning the business? Don't you think it would benefit the students much more?—A.—I certainly think so.

Note by the Hon'ble Mr. H. J. Maynard, C.S.I., I.C.S., Financial Commissioner, Punjab on the Khaur Oil Spring, dated 12th October 1917.

WITHIN the area of some four square miles at Khaur for which the mining lease has been drafted, the Attock Oil-Company has "proved" something over half by sinking of wells at intervals. One good oil-bearing stratum exists at 400-500 feet, another at 1,200-1,000 feet. Some of the wells (five in all) tap the former, some the latter. The manager, Mr. Cameron, is confident that the area bounded by these wells will be rich in oil. He says that 2,000 wells might be sunk there. Let us halve this and say 1,000.

2. When last I spoke to Dr. Hayden, Director of Geology, on the subject, a year ago, he said that the prospects were promising. There was some little disappointment afterwards because a good deal of water is from time to time mixed with the oil. Apparently, this is a thing to which expert borers are accustomed. They deal with it by using cement in the borings in the water-bearing strata. The manager tells me he has refined small specimen quantities of crude oil and it contains 70 per cent. of kerosine—presumably a fair proportion.

3. The million gallon tank now has about 800,000 gallons of crude oil in it. It is useless for the company to attempt to extract more oil until arrangements can be made to refine it. The storage accommodation is very limited and there is no market for crude oil. In the meanwhile the expenses of a very large establishment mount up. The geologist, Mr. Pinford, receives a salary of Rs. 1,800 per mensem. There are four Californian borers who draw each Rs. 700 a month with Rs. 175 messing allowance. Much money has been locked up in plant and expensive boring tools (one of these weighs 11½ tons). The impression made upon me at my recent visit to Khaur (October 9th) is that the managing firm, Messrs. Steel Brothers of Rangoon (a well-known and influential firm) are prepared to spend money and to go on with the exploitation.

4. The crude oil contains a proportion of light oils with a low flash point which it is dangerous to use in locomotives (or perhaps for any other engines, though a certain amount is being used as fuel for pumping purposes at the oil-fields). A letter received from the Locomotive Superintendent, North-Western Railway, shows that nothing can be done as regards locomotives until arrangements can be made for refining.

5. A refinery is a very big business. The plant must be set up where there is plenty of water, and it would have to be either at Rawalpindi or Jhelum, with a pipe line the whole way from Khaur. The pipe line would cost 5 rupees per foot at peace prices and perhaps three times that amount now. The establishment would be anything up to 5,000 workmen. The manager said the cost might be as much as 50 lakhs. Let us halve that.

6. Short of a complete refinery, it might be possible to do something with what is called a "topping plant," to be erected locally. But this would not give any substantial relief to the fuel supply.

7. A 1,600-feet well may cost anything between half-a-lakh and 2½ lakhs, according to the character of the strata. Anyhow the expenditure on boring, say 100 wells, even if half of them tap the nearer of the two oil-bearing strata, must be put at about 30 lakhs.

8. Last year's railway difficulties show the great importance of a fuel supply alternative to Bengal coal. Moreover, a fuel supply is a necessity to anything like an industrial development for the province. I think it may quite fairly be said that the development of the Khaur oil-field (and possibly of other adjacent fields where oil has not yet been struck) is a matter of far more than local importance, and of some urgency.

Note on the effect of the Punjab Land Alienation Act XIII of 1900 by Mr. A. C. Badenoch, I.C.S., Assistant Commissioner, dated 9th February 1917.

It is difficult to trace the action of the Alienation of Land Act on money-lenders' capital and savings. The material is very scanty. Income-tax figures, etc., depend on so many different factors that it is very unsafe to generalise.

Two sets of reports contain frequent references to the action of the above Act on re-directing capital—(1) Reports on the Administration of Civil Justice, and (2) Reports on the Land Alienation Act (discontinued from 1909 and replaced by the Land Administration Reports).

In the first set of reports the references are vague. The immediate effect of the Act was to make money-lenders, etc., wind up their dealings with agriculturists. The credit of the latter class was considered to have suffered and in the immediate years succeeding the passing of the Act there was a drop in suits brought by money-lenders against agriculturists, indicating a contraction in the advancing of money. In 1904, however, it was noticed by at least one Divisional Judge that money-lenders were accepting the security of houses and sites, rural or urban—the Act did not affect the village site. By 1905, arguing from and reduction in the number of suits brought by money-lenders against agriculturists from 105,058 in 1901 to 62,769 in 1905, the report went as far as to say "a reasonable inference that might be drawn from these figures is that the money-lender is finding new investment for his capital. . . . There must be obviously a large amount of capital diverted from its former uses which should now be available for investment in industrial and commercial undertakings, but there is nothing in District Reports to show that it is actually so employed." In 1906, it was definitely noted by one District Judge that money-lenders were then investing money in houses and factories, in preference to lending to agriculturists, and later reports repeat the same in more general and more emphatic terms.

The opinions expressed in the reports on the working of the Alienation of Land Act are more explicit. The immediate effect differed according to the class of *sahukar* (banker). The small *sahukar* dealt with the produce of the land rather than with the land itself. On him the Act had little effect. The wealthier *sahukar*, who dealt in money not in grain, found his operations restricted by the Act, and could not adequately recoup himself by increasing his rate of interest on loans which he would advance only on security such as jewellery, etc. This situation forced him more and more to devote his capital "to a more healthy and legitimate class of business in the direction of dealing wholesale and retail in food-stuffs and other commodities." The redirection was towards trade rather than industry, for the obvious reason that opportunities for investment in industry were very limited. The immediate effects were twofold—(a) curtailment in the village of extravagant expenditure on ceremonies, and (b) reduction of profit in such trades as food and piece-goods. Thereafter, about 1905, it was noticed that *Banias* were lending more to industrial concerns and to contractors. The conclusions are that undoubtedly a large amount of capital had been released but that its diversion into industrial channels must necessarily be a somewhat slow process dependent on the field for investment.

The following figures are taken from reports on Joint Stock Companies :—

Year.	Number of new companies divided into shares which were instituted	Number of companies limited by guarantee which were instituted.
1900-01	50	12
1901-02	51	11
1902-03	49	12
1903-04	87	19
1904-05	59	14
1905-06	84	15
1906-07	87	16
1907-08	96	18
1908-09	125	18
1909-10	138	22
1910-11	149	24
1911-12	194	23
1912-13	155	33
1913-14	146	24
1914-15	90	28
1915-16	58	25

The following figures are, however, still more instructive :—

Year.				Nominal capital in above companies.	Paid-up capital in above companies.
				Rs.	Rs.
1900-01	1,56,81,000	73,53,752
1901-02	1,58,96,000	79,34,487
1902-03	1,61,56,000	83,45,086
1903-04	1,80,89,000	89,14,029
1904-05	1,87,85,400	1,01,78,237
1905-06	2,02,75,400	1,06,32,154
1906-07	2,85,40,400	1,16,82,061
1907-08	3,36,54,000	1,39,25,753
1908-09	4,84,56,500	1,49,41,122

From 1909 issued capital is split up into two heads—(1) actually paid-up and (2) nominally paid-up :—

Year.				Nominal capital in above companies.	PAID-UP CAPITAL IN ABOVE COMPANIES.	
					Actually paid-up.	Nominally paid-up.
				Rs.	Rs.	Rs.
1909-10	5,88,01,000	1,72,56,667	1,79,84,590
1910-11	5,80,11,000	1,85,95,421	2,76,74,300
1911-12	6,22,81,940	1,94,37,213	2,90,55,015
1912-13	6,35,00,940	1,67,12,925	2,57,11,100
				54,71,000	82,43,441	36,35,700
1913-14	7,57,51,940	1,62,28,397	2,68,40,235
1914-15	4,42,56,940	1,49,69,002	2,14,08,305
1915-16	4,04,98,840	1,46,70,772	1,98,70,190

In 1912-13 the two sets of figures are for the Punjab proper and Delhi province.

The above figures would show that the number of companies (registered) and the invested capital increased largely after 1900, and fell off after 1913 on account of the banking and commercial crisis.

I have also examined the triennial returns of income-tax, particularly tax from companies and tax from bankers and money-lenders. Under both heads there is an increase in each triennial report, an increase however due to so many causes, that I do not think it worth consideration.

Such is the material available. Opinions given in response to personal enquiry are conflicting. A gentleman in Amritsar who goes in for dealing in house property informed me that while the *Bania* invests very largely his actual savings in house property his business capital goes into piece-goods and grain. An Indian auditor told me that his opinion was that the money-lender and the zemindar had readjusted their relations, but that the bulk of the *sahukar's* capital was still in land or the produce of land; that, originally suspicious of the statutory forms of mortgage, he now accepted them freely. One's personal experience supports this to a certain extent. At the same time there is no doubt that the Act is frequently evaded, that though the land does not get into the money-lender's hands the produce of land does. At the same time I am convinced that the popularity of the People's Bank, etc., the cotton boom, and the over-capitalisation in cotton-ginning was very largely an indirect effect of the Land Alienation Act. It was in 1901 and 1902 that Swadeshi banking began to attain some considerable proportions. Cotton gins, ata mills, rice-husking mills are owned by the wealthy *sahukar*. The figures showing the number of, and capital invested in, registered companies confirm me in this opinion.

My impression is that the crisis of 1913 has forced the *sahakar* back to the land, and to trade. He speculates in food-stuffs, urban real property, and lays up capital in stocks more than he did before.

Everyone agrees that there is a large surplus of money still awaiting investment. Barred by the Land Alienation Act from the land, there only remains to devise the means again to elicit it.

Note on the State Technical Scholars by Mr. A. C. Badenoch, Assistant Commissioner, dated 27th January 1917.

In this note are included those recent scholars who have returned to India after study. The statement as to Sheo Parshad is incomplete, and we have not been able to get the parenthesis with regard to No. (1) on the list.

The list and the remarks by me of the scholars themselves speak sufficiently.

Four out of the eight have passed into Government service. Of the others Nawab-ud-din has been a conspicuous failure up to date. Mohammad Amin has never put his training into practice, and conducts an ordinary cotton agency business for an alien firm. Lahori Mal Khosla finds that he has more knowledge than is necessary. Lakshmi Das Keshhar is the only hopeful case. So far he has done well as a manager of a tannery, but he is lost to the Punjab. One cannot really object to this, provided the Punjab's loss is really India's gain.

The general and strongest complaint is concerned chiefly with the impossibility of gaining practical experience in England. A three-years' apprenticeship would be of infinitely more service than a three-years' course. The scholarship in the first place does not provide sufficiently for both theoretical and practical training—it has never been held for more than four years. In the second place English firms refuse to part with their trade secrets to Indians. They were once generous to the Japanese. The advantages taken of this generosity by Japan has closed the doors of English factories to all Asiatics.

A few months ago a miserable Bengal State scholar begged from you employment; as you remarked "the frequent sad end of the State scholar." For the Punjab State scholar at present, besides Government employment, there are few openings. As a rule these men have no private capital, nor have they business belonging to their fathers which they can improve. No bank will give them money, and partners will not trust them. As far as the development of industry goes the results up to date are nil. Merely to send young men home and bring them back is to create more malcontents, since the treatment obtained socially in England is better than that in India.

My view is that if Government does not intend to do anything more for a State scholar, it must make an essential condition for a State scholar that he can command certain capital, or can enter a certain business.

Name of scholar.	Parentage.	Residence.	Caste.	Date of birth.	Educational attainments and in subject for which scholar had before going to England.	Year in which scholarship given.	Time (in years and months) spent in England.	Institution in England in which studied.	Rough sketch of work done abroad.	History of scholar after return to India.	Any special remarks.
Indra Krishna Kaul (Mera Work).	..	Lahore.	Brahmin (Kashmiri Pandit)	October 1882.	Punjab B.A. Examination, Head Master, Hindu Technical Institute, Lahore. Licentiate Mechanical Engineer and electrical Engineer and Licentiate Electrical Engineer, Bombay Technical Institute.	1907 ...	2 years and 4 months.	Universities of Liverpool and London University College.	Bachelor of Engineering. Degree course at Liverpool University. B.Sc. degree course at London University.	Employed in Public Works Department in Leeds and Holdings Branch from September 1910 to May 1916. Now in Bahawalpur State service as Electrical and Water Works Engineer at Rs. 750 per mensem with a yearly increment of Rs. 50.	
Sheikh Muhammad Asim (Textile Industry).	Sheikh Haji Muhammad.	Kaur.	Sheikh	June 1884.	Undergraduate from Muslim Christian College, Lahore. Passed F.A. in 1906. Worked in his own spinning factory for two years as manager.	August 1908.	2 years and 2 months.	The Manchester School of Technology.	Worked with Messrs. Sutcliffe and Sons for two months after leaving the School.	Worked for about 6 months in Bombay in various mills for experience and practical knowledge and at his own factory up to 1912-13 when took a factory at Havela (near Lucknow) on lease and ran it for one year. Working his own factory at Kaur since then, and in addition Managing Agent of the Japan Cotton Trading Company, Bombay.	As there was no field for Textile Industry in the Punjab, he took up cotton and has not then been able to utilize knowledge gained in England. Found difficulty in England in getting practical experience. Mills not very ready to take him as an apprentice. Wants to start a mill in India but would like Government to audit his accounts and hallmark his balance sheet. Died in 1914.
Shao Farhad (Textile Industry).	Mohs	1891 ...	Undergraduate. Engaged in piece-goods at Delhi and had practical knowledge of textiles. Passed Middle School Examination. Translator in Chief Court, Punjab, for 2 years. Worked for 8 years in English Office at Gurdaspur. Practical work of 4 years in the factory of his father. Science student in Government School, Amritsar.	August 1909.	2 years	Textile Assistant to the Director of Agriculture and Industries, Punjab.	
Nawab-ud-din	..	Amritsar.	Khatik	1875	August 1909.	3 years and 4 months.	Leather Sellers' Company's College, 170, Tower Bridge Road, Bermondsey, London.	After passing from the College worked in Soles and Company, Julius Thomson and Company, Melbourne Mar and Maurities factory. Also went to America and studied at New York.	Returning in 1912 was helped by Government to start an improved tannery in Amritsar. The business never promised well and finally partnership was dissolved by order of court. Nawab-ud-din then took post as Manager in Waxmatad. Proved unsuccessful and was dismissed. Has now been lost sight of.	Enquiries have proved to me that Nawab-ud-din was deficient in practical capacity, and in business ability. He quarrelled with his partners, his employers, his workmen. He had not sufficient practical experience in European tanning methods, although he brought very good certificates from both England and America.

Name of scholar.	Parentage.	Religion.	Caste.	Date of birth.	Educational attainments and practical training, if any, he had before going to Eng- land.	Year in which scholarship given.	Time (in years and months) spent in England.	Institution in England in which studied.	Rough sketch of work done abroad.	History of scholar after return to India.	Any special remarks.
Kachl Parshad Thakral (Textile Industry)	Lala Narsik Chand, Thak- ral.	Lahore	Arora (Thak- ral).	28th August 1885.	F. Sc., Punjab University. Failed in B. Sc. examina- tion. Started hand-loom weaving factory in 1904 at Sialkot; together with this he was dealing in general commission agency and dealt also in different kinds of yarns, silks and cottons. Five years' practical experience before going to England.	1909 ..	3 years and 6 months.	Municipal School of Technology, Manchester. 4 months' prac- tical work with Messrs. George Hartnady and Sons, Limited, Yorkshire. Also worked in a Mill at coloured weaving work, and for 3 months in Milan practical work in a sartener's mill.	In different branches of textile engineering, sericulture, cigarette- making industry.	From 1st January 1912 to 1st October 1914. Managing Director of K. P. Thakral and Company, Lahore, Hand- loom Factory, Machinery Im- porters, Commission Agents, and General Suppliers of all requisites in the Textile line. Now Textile Assistant to the Director of Agriculture and Industries from 1st October 1914.	
Hasmat Rai (Alkali manu- facture).	Mahla Tapan Das.	Kabror Pakha, Dist- riet Mul- tan.	Hindu.	1st De- cember 1896.	B. A., 1906 M. Sc. (Physics), 1908. M. Sc. (Chemistry), 1910.	1910...	3 years 6 months in Eng- land, 8 months in Ire- land and 3 years and 2 months.	The Municipal Laboratory of Physical and Electro-Chem- istry Univer- sity of Liver- pool, Messrs. A. Friday & Co., Ltd., Soap, Candle and Glycerine Works, Belfast.	Advanced lectures on Electro-Chemistry, Physical Chemistry and applied Electro- Chemistry. Practical. Inorganic Quantitative Physical Chemistry and Electro-Chemistry. Research Work. 1. Electrolysis of am- monium aloxide solutions. 2. Catalytic reduction of cotton seed oil.	Was appointed Assistant Pro- fessor of Chemistry in the Government College, Lahore, before he left London.	Went home to study Alkali manufacture. He found it impossible to get practical knowledge of the manufac- ture. Brunner Mond would let him into their factory only if he gave an under- standing never to go to India. He got into Finkley & Co. only after presenting them with the results of research, and giving an understanding not to do anything against the firm in the United King- dom.

Lakshmi Das, Kochhar (Tanning).	Lala Bisham- Das, Kochhar, Pleasant, Gujrat (Punjab).	Gujrat	Kochhar, Hindu Khatra	September 1889.	B. A. Examination of the Punjab University in Economics, English, History and Applied Mathematics. Approved in M. A., passed in 5 papers. Economics a special subject. Received practical training in banking and tanning before going to England.	1913...	4 years.	Leather Sellers' Company's Technical Col- lege, 170, Tower Bridge, Ber- mondsey, Lon- don.	Spent 3 years in Col- lege, passing all ex- aminations in first class and with honours in the City and Guild Institute, London. Received practical training in Germany and at Messrs. J. T. Hart and Sons, Lon- don, for 12 months.	3. Catalytic bleaching of palm oil and sallow getting out. English patent No. 17784, 1918. 4. Preparation of nitro- gen chloride by a new method. 5. Continuous supply of nitrogen, Laboratory method. 6. Working with Fin- lay's cell for elec- trolytic caustic soda and chlorine. 7. Practical experience in soap, candles and glycerine manufac- ture. Machine drawing and design.	Visited most of the tanneries in Bombay and the Punjab. Is working as Manager of the Poonawala Tannery, Dharam, Bombay. Working November 1916. Working at Army Leather.	Remarks by Scholar. I have specialised in the leather required for general Army equipment and accessories purposes. Since I returned to India I have had offers from various places and have been offered fixed salary and partici- pation in profits.
Lachori Mal, Khoda (Flour Milling).	Bai Be- hadr Beli Ran, Sani or Assistant Surgeon (retired).	Lahore	Khatra	November 1890.	Studied up to F. Sc. and got training in the run- ning and erection of flour mills for two years.	1913	2 years and 2 months.	(1) Horie Mills, London. (2) Bultwood & Pioneer Flour Mills, Vande- worth. (3) Polytechnic of Western and Manches- ter.	Practical work in the mills every day to- gether with the book- keeping and theoretical training in winter sessions at evening classes.	Started erecting a flour mill at Lyallpur but owing to dis- agreement gave it up. Now miller-in-charge of the Delhi Flour Mills Company under Mr. Bell; has remodelled the mill.	Remarks by Scholar. My western education has en- abled me to put up and run a flour mill to the most up-to- date style. But the market requirements of India do not want so elaborate an arrange- ment as required in the west.	

WITNESS No. 868.

MR. W. S. HAMILTON, I.C.S., *Deputy Commissioner, Karnal.*

WRITTEN EVIDENCE.

Financial assistance
from Government.

My experience is that it is very difficult to induce Government to give any kind of financial aid to industries.

I can give three instances :—

- (1) There was a sugar factory with modern machinery in Amritsar. The proprietor had not sufficient capital to improve his processes according to the advice of the Agricultural Chemist. I applied for a grant of Rs. 20,000 subject to conditions which would secure the improvement of the processes under the supervision of the Agricultural Chemist. Government refused all aid though the Government of India had made a special grant of Rs. 1,20,000 to the Local Government to be spent partly on the sugar industries and this was unspent.
- (2) A man of good family with some capital, who had been trained in England as a Government scholar and has since been appointed textile expert under the Director of Industries, applied for a loan of Rs. 25,000 to be used in starting a handloom factory. It is pretty certain that the handloom weaver can survive only if he is organized in factories. Government refused the grant.

Both these were sound projects.

- (3) The Ambala Glass Factory was in 1911 given a grant of Rs. 5,000 per annum on the condition that they would employ a chemist and an expert (Austrian) blower and would train apprentices. This grant was not enjoyed as the European blower left the factory. The proposal was revived in 1915 but the Government of India then objected to the grant.

As the factory is probably the best glass factory in India and the competition is from Japan and enemy countries, there would seem to be every reason for giving assistance and none for refusing it.

2. There seems to be no reason why each of the methods of Government assistance mentioned in the Commission's question 1, 5, should not be adopted on different occasions. But there are political objections to Government subscribing capital whereby it makes it financially profitable to upset the Government and tempts to disloyalty. In all cases of Government financial aid, the Department of Industries should have a right of inspection through its experts and the aid should be liable to be withdrawn if the department is dissatisfied.

Pioneer factories.

Pioneer factories should be established, as only in them can the profitableness of a new industry be worked out in practice. The factories should be continued until the success or failure of the venture has been definitely ascertained. The Cotton Oil Factory in Cawnpore was disposed of prematurely. A pioneer factory, if a success, should be sold; it should never become a permanent Government enterprise except when the products are almost entirely consumed by Government.

A pioneer factory should be established at or near Basul, where electric power and salt can be obtained cheap, for the manufacture by an electrolytic process of carbonate and caustic soda. This matter was investigated by Mr. Barnes, late Agricultural Chemist, in 1912 who recommended the project, provided an expert chemist who had seen the process (a modification of the Kastner-Kellner process) at work in America could be obtained. The capital necessary would be about 10 lakhs of rupees.

Other pioneer factories necessary are :—

- (1) For pulping the spruce and fir of the high hills somewhere in the Himalayas by the riverside.
- (2) For the utilization of bones.
- (3) For cotton oil—I have tried to get a private capitalist to undertake this with a Government guarantee to purchase the oil cake, but without result.
- (4) For making tinsel by the methods followed in France and Russia, the products of which have almost killed the indigenous industry.

There is absolutely no danger in the Punjab of Government pioneer factories discouraging private enterprise. There is no objection to subsidising an industry if it will compete with an established external trade; it is to kill the import of goods which can just as well be manufactured in India that the pioneer factories are required.

No further industrial survey is required in the Punjab. We know the resources and the needs of the Province very well, what we require is capital in the hands of people with imagination, expert managers and honest workmen; and then we can develop those resources. Further surveys would merely delay practical work. Industrial surveys.

It is not the lack of primary education that hinders industrial development but the fact that the only kind of primary education available is one which spoils any boy for any kind of manual labour. The cleverer sons of artisans go to these primary schools and are lost to industry; the other boys are not educated at all. Effects of education.

There should be special elementary schools for artisans' boys in all towns. Just as for agriculturists we require village schools where the teaching will be by observation and practice not to any great extent by letters and figures, so for artisans' boys we require industrial schools where hand training will be from the beginning the main object, not memory training.

The three R's will be taught as part of the industry and just so far as they are a necessary part of the training of a good artisan. I attach a copy of a note which I wrote on industrial schools in 1911. During the last two years I have had experience of an industrial school on rather an ambitious scale at Gujranwala. The chief lesson learned there is that if we are to get artisans' boys into these schools we must begin with them from the earliest years. If we try to get artisans' boys of 10 or 12 years of age, who are able to read and write, we cannot find them. So we must take them younger and teach them reading and writing.

So far industrial schools have done little to improve the labourers' skill and efficiency. The reason is that the failure of the Indian artisan is a moral failure; he has little sense of honesty and aims only at making as much money as he can with the smallest effort. The teachers of our industrial schools must be men of high character who can inspire lofty ideals in their pupils. Industrial schools.

I regard industrial schools as the most important need of the present time. It is not a question of industrial schools versus apprenticeship. All artisans' boys should go to industrial schools; after the schools the boys should in some industries become apprentices.

Industrial schools should be under the Department of Industries not under the Education department, for only so can we ensure that they will not degenerate into mere factories of literates with a little manual training.

The provincial Department of Industries should consist of—

- | | |
|--|----------------|
| 1. A senior member of the Indian Civil Service | .. Whole time. |
| 2. A chemist | .. Do. |
| 3. A mechanical and electrical engineer | .. Do. |
| 4. An inspector of industrial schools | .. Do. |
| 5. A business expert | .. Part time. |
| 6. A financial expert or banker | .. Do. |

Provincial organization.

The director would be a member of the Indian Civil Service. It is absolutely essential that the head of a department of experts should not be an expert himself. This is the only way in which jealousies and one-sidedness can be kept out. In the Agricultural department we have ample experience to guide us. The chemist and engineer should be men of imagination with a practical bent. I have known two men who would both have been excellent men for the post of chemist—the late Mr. Barnes, Agricultural Chemist, and Professor Mount Jones of the Government College, Lahore. The time of the business and financial experts could be paid for at so much a meeting, as is the practice in England.

The department or board should be an executive body with a large separate budget. They should have full power of giving grants for industrial projects up to the amounts available in their budget.

There should be no civilian control over the board except by the Lieutenant-Governor himself: the Director of Industries should act as a Secretary to Government in regard to the few questions which would have to go before Government. The reason I say this is that my experience as Director of Agriculture has shown me that civilian secretaries and under-secretaries cannot refrain from sitting in judgment on the proposals of experts as if they were qualified to criticise them and condemn them. As I have said in a letter "The day of the experts has set in and we civilians find it difficult to accommodate ourselves to the new conditions. In the Industrial department as in the Agricultural

department a large body of experts is required and their opinions must meet with far readier acceptance on the part of the civilian than is usual at present."

The functions of the Board of Industries would be to publish information of all kinds, to investigate the problems of all established industries and to give grants to enable workers to introduce improved methods.

Imperial Department of Industries

There should be an Imperial Director of Industries assisted by two or more expert chemists and engineers.

This Director of Industries should be a business man on a footing of a Member of Council and should be independent of civilian control. He should have a considerable budget for experimental work, should investigate industries which are of more than provincial importance. He should have correspondents in all foreign countries whose goods are sent to India or to which Indian produce goes in quantities and he should keep the Imperial Government and also all provincial Directors informed of trade movements which are likely to affect India in any way. For instance with a Director of this sort we should have been informed in the year in which Russian barley failed (? 1911) that there was likely to be great demand for Punjab barley. As it was, we knew nothing of it till the buying began.

In the late Mr. Noel Paton, the Government of India had an ideal Director-General of Industries—a man of farseeing imagination who did not fear the drudgery of detailed investigation; but he was written down a failure, solely because he was subordinate to the civilian element in the Government who refuse to give him responsibility to act independently of them.

I wrote two letters to the Punjab Government about the organization of an Industrial department:—

No. 1910 of 2nd August 1910.

No. 2793 of 11th September 1914.

I would ask that copies* of these should be obtained from the Punjab Government.

Cottage industries.

It does not appear necessary that there should be a separate department for cottage industries. The same department can assist them. In carpentry, iron work and weaving, it is education of a proper kind that is necessary. In weaving co-operative societies for the purchase of yarn and the sale of the finished products are needed as well as education. The tinsel industry must be organised in factories: at present the division of labour prevents all progress.

NOTE REGARDING INDUSTRIAL EDUCATION.

Scope of enquiry.

1. In this note I wish to detail the matters to be enquired into by the committee, which has been appointed to consider and report on the measures desirable for the furtherance of industrial education in the Punjab. The opinions expressed are mine and do not bind the other members of the committee in any way.

In the first place higher technical education, which may be defined as instruction in the principles of science and art applicable to industries, is outside discussion on this occasion. What we are concerned with is the training of handicraftsmen and artisan in better methods of workmanship and in higher notions of industrial rectitude and energy.

Resolutions of Industrial Conference.

2. The resolutions of the Industrial Conference of February 18th, 1911, were as follows:—

* * * * *

"10. That the Conference, while recognising the value of the resolutions of the sub-committee quoted below, is of opinion that there has not been sufficient time in which to frame an adequate scheme of industrial education. It therefore recommends that Government should appoint a small committee which shall, after considering the resolutions passed by the sub-committee and after inviting opinions from persons competent to give them, frame a practical scheme of industrial education.

"The Conference further recommends that Government should inform the committee what funds will be available for industrial education in the near future in order that such a scheme may be prepared as may be introduced at once.

Resolutions of sub-committee—

"(i) That industrial schools should be established at the centres of important industries where up-to-date methods (under expert management) especially applicable to the industries of that locality be taught—

- (i) to boys and girls from five years old and upwards ;
- (ii) also to adult men and women ; and
- (iii) that to the more flourishing of such schools advanced classes of a more technical type be added, as occasion demands.

"(2) That the said schools should endeavour to train instructors, who could subsequently be employed in promoting the introduction of improved methods and appliances in trades carried on by artisans working in their own houses or in small workshops.

"(iv) For the schools contemplated in resolution 10 the proportion of working hours should be as follows :—

First stage.— $\frac{2}{3}$ general education and $\frac{1}{3}$ craft education.

Second stage.— $\frac{1}{2}$ general education and $\frac{1}{2}$ craft education.

Third stage.— $\frac{1}{3}$ general education and $\frac{2}{3}$ craft education.

" Provided that any boy if the Principal of the school so decides may devote the whole of his time to craft work.

" *Proviso I.*—These proportions should by no means apply to the adults mentioned in resolution 10 nor to the advanced classes mentioned therein, who would devote all their time to craft work.

" *Proviso II.*—'Physical drill' and 'Object lessons' as the expressions are understood in the Education department, should not be included in the proportion devoted to craft work.

" *Proviso III.*—For the purposes of this resolution literary education shall (apart from drawing and clay modelling and such practical instruction) be understood to mean only education in ordinary vernacular, reading, writing, arithmetic, and elementary geography (of India), and in the third stage a little English, comprising reading, writing and conversation so as to enable foreman's orders and instructions to be understood.

"(iii) There should be no restriction on the classes of boys admitted to the schools except that boys who are not the sons of artisans should be charged fees, which should be pitched low.

"(iv) That Government schools should not be conducted as workshops working for a profit, and that in any case, the products from such schools (if so conducted at all) should be sold to private orders and at prices which will not under-sell the general market.

"(v) That grants by Government to private industrial schools should be regulated by the efficiency of the schools and given under grant-in-aid rules and not according to the profit or loss being made by the schools, and that the grant-in-aid system requires further development.

"(vi) That the individual or body contributing the funds should manage the schools and that the functionary in immediate charge of each individual school should be a man who has received a technical education such as is contemplated by the schools now recommended, only to a higher and collegiate standard.

" For example, (a) a man might be sent for training at the expense of Government or of a local body to the Victoria Technical Institute, Bombay, the Roorkee College, or to the Serampur Weaving School, Bengal, or to other similar institution in India, or (b) it might be found more satisfactory to entertain such graduates of these institutions who had actual practical experience, or (c) even to entertain experts imported from foreign countries.

" 11. That the industries in which schools are required are—

- (1) Pottery ;
- (2) Metal work including outlery ;
- (3) Wood work including carpentry and cabinet-making ;
- (4) Cotton weaving ;
- (5) Spinning and weaving of silk and wool ;

- (6) Knitting and hosiery,
- (7) Lace and drawn thread work, } particularly for women workers.
- (8) Kandra and gold and silver lace work.
- (9) Nickel-plating.
- (10) Lacquer work.

"That it should be left to the Advisory Board to advise in what places the schools should be established.

"12. That industrial education should be administered by the Director of Industries and the Advisory Board assisted by an expert industrial inspector imported from Europe."

Indian conditions
differ from Western.

3. Before going further, it is necessary to note that, whilst European and American experience of industrial education is of the utmost value to us, conditions in India differ in two very important respects. In the first place we have to inaugurate a system of education for a class which is almost entirely uneducated, whereas in Western countries trades schools are usually for those who have already obtained a general education and, secondly, we have the fact of caste and caste occupations. In the West carpentry and metal working and a little pottery have been adopted as the means of manual training: weaving has not been used, probably because handloom weavers are few. In India it would be taking the most difficult road if we tried to give weaver boys manual training through carpentry. Caste too would step in; and still more so in the converse case of training a carpenter by weaving. The easiest way is to give each class of artisan manual training by means of trade to which his parents belong, provided the processes of that trade are suitable instruments of education.

"Trade" schools, "Craft" schools, "Manual training," "Sloyd" schools—all have special connotations and we had better avoid these terms and call our schools simply "schools for artisans."

A cobweb.

4. There is another cobweb too which must be brushed aside. We are sometimes told that we cannot teach a trade except in a workshop, and that we cannot create an industry in a school. Both statements are true. We do not wish to create industries, and therefore we may have trade schools only for those trades, which are already established, and in those places which are the head-quarters of trades.

We are going to teach trades and therefore our schools must also be workshops. I shall return to the trades to be selected and the localities to be chosen later on; there are first some general principles to be noticed.

Only certain trades
are educative.

5. Our schools are to teach manual dexterity in established trades. But intelligent manual dexterity cannot be acquired unless the intellect also is trained and character built up, and so our schools must be literary as well as manual, educational as well as instructive. This is a point which need not be laboured as the fallacy to be combated is the interpretation of education as synonymous with literary instruction, and no one desires to exclude literary instruction altogether from education.

Then again, the manual processes in some trades are suited to develop a boy's intellect and will, as well as to give him manual dexterity, while in other trades they are not. On the one side stand weaving, carpentry, metal work and some others in which the ordinary processes provide a very high training of mind, hand and eye, and compel them all to work together; on the other side comes a trade like tanning, the processes of which require little nicety of hand or eye and are hardly educative at all; in between lie pottery, gold-thread making, silk reeling which certainly demand touch and a sense of proportion, and can perhaps be used as a means of education, but afford much less variety of effort than carpentry and weaving. We cannot have trade schools in those trades of which the processes are not educative. Mere practice is not education, and must be acquired in factories; and if there are no existing factories, instruction in these trades must wait till commercial factories are established. So the trades, in connection with which we can have schools, appear to be weaving, pottery, carpentry, iron and brass work, gold thread making, and working. Whether there are any others or whether some in this list should be cut out as unsuitable is one of the questions that need an answer.

Locality of schools.

6. Now we can go on to consider where the schools should be. The answer depends on facts not on theories. The facts to be ascertained are (a) in what towns are there collected together the largest number of artisans of each trade? and (b) how far are the

artisans in those towns ready to send their boys to school? Probably enquires will lead to a list of this sort:—

Carpentry schools.	Weaving schools.	Metal work schools.	Pottery schools.	Gold thread schools.
Jullundur.	Multan.	Panipat.	Gujranwala.	Delhi.
Hoshiarpur.	Jhang.	Rawalpindi.	Delhi.	Lahore.
Sialkot.	Kalabagh.	Wazirabad.		
Amritsar.	Lahore.			
Gujrat.	Khushab.			

There is no use in blinding ourselves to the fact that in the beginning the greatest difficulty of all will be to induce parents to send their boys to the schools. They cannot be spared; they are needed to mind the gluepot or to wind the pirns will be the answer. Or the old ways are better and we can teach them as much at home will be the retort of custom-bound incredulity, to which there is no reply but "Come and make trial." Even in Germany the local industries were at first opposed to the trade schools and resented any attempt to interfere with their methods of manufacture. Only later did they begin to recognize the advantages of the instruction afforded. With this warning before us and knowing the difficulties already experienced in the Punjab it is most necessary that each school should have a large artisan population to draw upon in the immediate neighbourhood.

Will boys go to the schools?

7. But not only are we limited to the places where schools will be welcomed and boys will come to them; we are also confined by the abilities of the public purse and the contributions of those who are willing to assist in the great work of education. It is quite certain that Government by itself will never be able to provide all the schools which are needed for the artisans of the province by birth or by choice. It is to be hoped that private generosity will come forward to assist, not only by giving contributions, but also by founding schools. There are indeed peculiar advantages in schools, which are also manufactories, being private institutions aided by Government grants. Muhammadans and Hindus alike are vitally interested, for while most artisans are Muhammadans or Sikhs, it is Hindu capital which lies unproductive because of the lack of capable, educated and honest labour.

Limit of cost.

8. The disbeliever or the scoffer may enquire what will be the good of educating the artisan. Probably it will be admitted that the curse of all Indian skilled labour—I do not include art workers—is its lack of conscientiousness. There is little pride in doing work as thoroughly and as quickly as it can be done; but there is everywhere patent dishonesty in not working to sample, in passing off inferior material, in not devoting the time that has been paid for, in saving a shameful pice by misplaced putty, size or stuffing of some sort. The rickety chairs, the misshapen keys, the shoddy lungis all find their source in this moral defect. The Indian workman is quick with his fingers and can do wonders with the rudest of tools, and it is less his hand than his character that calls for education. An Indian in the coal mines turns out 100 tons of coal in the year while an Englishman can mine 268 tons and a German 370 tons: in the weaving mills in India it takes 5 or 6 men to do the work of one Lancashire operative, for in Lancashire a weaver looks after six looms and turns out 6 x 78 lbs. of cloth in a week, whereas in India a weaver can look after only one loom and turn out 70 lbs. of cloth. These moral defects make Indian labour expensive, though it is low paid; but we hope to eradicate them by a suitable system of education. It can be done by instilling method and working against time, by inculcating concentrated attention, by rewarding exactitude and honesty and punishing scamping, by insisting on perfection in the lower details before passing on to the higher, by teaching each boy to use his will as well as his hand, by showing through payment or promotion that good work pays.

The advantages of education.

9. It is no easy matter to frame a curriculum which will accomplish this. It is because the work is so difficult that a committee has been appointed. We have at least models from India and elsewhere, where a similar plan has been tried, and we must select the best of each. But first let it be clearly understood that what we aim at is nothing very

Curriculum.

novel; it is merely a system of elementary primary education suitable for artisans, which will fit them better to love and practise their craft, when they are grown to manhood, and not tend to lead them away from craftsmanship to clerkship. A similar scheme of primary education for zamindars is no less necessary, but that is not our business.

Age of boys.

10. I propose that the boys should be at school from the age of 5 to 14 years. No shorter time will suffice for a thorough training of character; and by the end of this period the boy should be a skilled enough workman to be able to command good wages from private employers.

Details of instruction.

11. The instruction must include reading and writing in the vernacular and a small quantity of arithmetic but not beyond compound division, fractions and the rule of three. The sums should largely be in terms to be used in the trade—for instance, in weaving the length of hanks and knots, the yarn used for warps of a certain number of ends, the weight of yarn in relation to its count and so on. History is not required nor is geography except in its barest generalities to which actuality can be given on the map of the Punjab. A little natural history will widen the view and weaken superstition. Drawing is essential; and that and the practice of the trade should occupy more hours than all the rest together. I will return to these two branches later.

Hours of work.

12. The hours of work can be longer than in a purely literary school, as manual labour is not so exhausting as brain labour, and in any case the change from the one kind of occupation to the other affords a rest. I suggest the following time-table for boys from 8 to 14:—

Reading in the mother tongue	6 hours a week.
Writing	2 ..
Arithmetic	2 ..
Geography and natural history	2 ..
Manual employment	18 ..
Drawing	6 ..
Religious teaching, optional	$\frac{1}{2}$ hour a day.

Drawing.

13. Drawing is now generally regarded as the foundation of all manual training. Its value as a means of education is double in that it trains the eye to observe things accurately and it trains the fingers to be flexible and the hand to be ready and firm in the use of pencil or of tools. Moreover, the teaching of it can be begun at the very earliest age as there is no child that does not love the power of creation which lies in a pencil or coloured chalks and a piece of paper. Free arm drawing on a black board is a feature of many Froebel institutions.

Drawing should be from real objects, from nature, not from copies. Geometrical drawing by eye, geometrical drawing with instruments, free hand drawing of flat objects and perspective drawing are all a necessary part of the education of every boy, but the importance of each will vary with the trade to be learned. The carpenter must be skilled in the use of the rule and in proportion; whilst the art of the potter requires facility in the free drawing of curves and in the designing of tiles and vases; and the weaver in the proportion which underlies all patterns in cloth. The objects to be drawn should be those which the boy has around him, but too early specialization should be avoided and only gradually will the models be confined to those which pertain to each boy's trade. But at the same time drawing and making should go hand-in-hand as the one interprets the other. The copying of drawing should be almost if not quite eliminated. Appendix X to the report on industrial education by Colonel Clibborn's committee is of value.

Methods of handicraft instruction.

14. As to the method of instruction in each handicraft it will be necessary to draw out a syllabus and course for each class of school. The Director of Public Instruction is arranging for a collection of models used in other schools and countries; and it will be the business of the committee to select and combine from the most suitable of these. For the smallest boys the training will be by Froebel's methods, the basis of which is that the development of a child's mind depends upon arousing and directing voluntary activity. The teaching is teaching through play. As soon as the boys are able to handle their tools at all they will begin to make articles of use starting with the simple and easy and gradually working on to the complex and difficult. If the trade is carpentry the boys should not be allowed to cut purposeless squares of wood or make useless dovetails. Everything they work at should be a part of a whole, and they should carry through the work to the end. The end may be very simple, 4 square pieces of wood joined together to form a support for a flower pot or a plain box or, in a later year, a chair or table. Only by working

to an end can interest be kept up and intelligence aroused. Nothing could be more disheartening than the aimless chipping at pieces of wood destined for nothing but the rubbish heap, which now constitutes a considerable part of the carpentry teaching in our industrial schools. If the school is for weavers, the boys will begin on the simpler operations, the winding of bobbins and pirns, the assisting in warping and sizing, the mending of breaks in the warp. They will then weave plain narrow cloth on country loom, fly-shuttle loom and Salvation Army loom. Next they will go on to more and more elaborate patterns and finer materials, until they have mastered every branch of handloom weaving. Perhaps dyeing should be included; finishing certainly must be. Whatever the industry the success of the teaching will depend very greatly on the suitability of the detailed course which must be drawn up by the committee.

15. Probably the boys should be divided into classes for ease of management: but it should be laid down that promotion from one class to another should not depend on time nor on literary qualifications, but should be given as soon as the boy has made each of the articles included in the course of the class up to the desired standard of workmanship. When a boy's manual dexterity either much exceeds or lags far behind his intellectual development, there will be difficulties of arrangement, but these are not insuperable.

Instruction by
classes.

16. We all have an impulse to express admiration at the marvellous results achieved by many Indian workmen with the rudest tools, and there is a danger that we should regard the rudeness of the tools as being in itself an excellence. Certainly the merit of the worker stands out the more manifest, but the use of inefficient tools means, even for him, a loss of power and speed. There is nothing but gain in using the best tools which diminish the labour to be performed, increase the accuracy and the output of the work and last the longest. Supremacy of workmanship depends on excellence of tools. So in our schools only the most efficient European tools should be found. Firm handles, good steel, convenient shapes alone should be admitted. If they are imported wholesale, the extra cost will be trifling.

Tools.

In schools of carpentry and metal-working we should have sawing and planing machines, as soon as the work done in the schools is such as can be more efficiently performed on them than with hand tools. Similarly in weaving schools labour-saving machines will often be required.

17. Whatever the boys make should be their property and should be sold for their benefit; they should get the price realized less the cost of the raw materials. This personal interest in the works of their hands will induce them to labour their best, will encourage rivalry, and will also teach them something of the market and the public demand. They would of course have their own accounts and enter up the profit and loss of each individual article. Whether the money should be drawn term by term or accumulated till a boy leaves the school is a matter for discussion. A large accumulation might tempt a parent to remove the boy. An important side consideration is that boys are likely to remain on longer at school with their parents' consent if they are earning wages.

Boys to own by
their work.

18. A certain amount of difficulty in selling the articles made may be anticipated. If the schools were to compete in the market with the parents of the boys whom we wish to attract, disaster would be certain. On the other hand, the success of the schools depends largely on finding a good market, so that the labour may be remunerative. I think the difficulty can best be surmounted by taking orders through the local artisans or wholesale dealers. Flourishing private businesses would often be able to undertake much more work than otherwise, if they could pass some of their orders on to the school for execution. The independent firms will then secure to themselves the retail profit; but the schools will probably be sufficiently independent to save themselves from being sweated.

Sale of articles
made.

19. In the beginning at least the sons of artisans should be charged no fees. But scholarships will be unnecessary, for the price received for the articles made should after the first few years be of more value than a scholarship.

Fees and scholar-
ships.

From the sons of other than artisans I think small fees should be taken, not because we wish to discourage such from coming to these schools, but because they can usually afford to pay and we do not wish to attract them by the comparative cheapness of the schools.

20. Probably the greatest difficulty in introducing any form of industrial education, which will be of real use, is to find the teachers. The fact, never to be lost sight of, is that manual instruction is to be used not merely to train the fingers, but as an instrument for the shaping and development of character. To quote from the report of the Commissioners from New South Wales on technical teaching. (Report of 1905, Chapter I, paragraph 9):—"It is required in educative manual training and Sloyd that the instruction must be systematic and must be given by a special teacher, who is an educationist and not

Teachers.

merely an artisan or good workman."....." An instructor in 'fitting or turning' ought to be something more than a good fitter and turner. Besides being an expert workman, he should be theoretically well-informed in his own sphere of work and everything relating thereto: he should have some knowledge of educational principles; should understand the far-reaching aims of educational systems, *etc.*, those which touch the question of character, the building up of national efficiency, the creation of a class of workmen who will be enthusiastic as to the quality of their own handiwork." We cannot expect this of the Indian mistri, however good he may be. He may be able to teach the handy use of the chisel or the shuttle, but he cannot inculcate the love of truth, and the virtue of precision and the satisfaction of persistent application. He has not learned it himself; so how could he? Nor would a mistri working under a headmaster such as we now find in most primary or middle schools be more successful. The latter would have little appreciation of or sympathy with manual labour as an instrument of character building; and even if he had that rare gift of sympathy how could he inspire his own enthusiasm into the teaching of another? My own opinion is that the only suitable head for our schools will be found from among the well-educated superior artisans of England. They have gone through the mill of technical education themselves; they know the value of hard work, and they are made up of that thoroughness which is most wanting in the Indian artisan. But then these men would cost Rs. 200 a month and would at first be ignorant of the vernacular tongue and of Indian prejudices. Missionary bodies are fortunate, and perhaps are for this very reason more successful in industrial education than others, because they can obtain artisans of this sort; who have all the greater educative influence because they deliberately devote themselves to the bettering of their fellows, and only through that look for a livelihood for themselves. Would it be too much to spend Rs. 19,200 a year on European headmasters of 8 schools for artisans, when the Punjab contains some 80,422 carpenters, 51,743 iron-workers, 766,687 weavers, 79,174 potters and 9,122 gold thread workers on whose education practically nothing has yet been spent? Failing a European artisan headmaster for each school, it might be possible to find a few suitable Indians trained in some of the Indian Technical Institutes. But certainly an English artisan inspector, who could visit each school within every few weeks, would be indispensable.

Control.

21. As to the control of the schools I am strongly of opinion that it should not be vested solely in the present Department of Education. I do not wish to express distrust of individual members of that department; but I do fear very greatly the uncontrolled supremacy of the ideals of the department. A man cannot serve two masters, and those whose whole interests are bound up with literary education will never give manual training a fair chance. Moreover, practical difficulties would arise owing to the impossibility of employing the subordinate staff of the Education Department in these industrial schools. If there were a separate Director of Industries for the Punjab, he would be the man to be in control. But the present combined Director of Agriculture and Industries is already over-burdened with work. I can only suggest that there should be a separate Board comprising the Director of Public Instruction, the Director of Industries and one or two non-officials in each town to control these schools.

Existing industrial schools.

22. Most of the existing schools are of little use. The best, such as the Lahore railway school, might be made much more useful by complete and radical reform of the schemes of work; many might well be closed.

ORAL EVIDENCE, 10TH DECEMBER 1917.

Sir F. H. Stewart.—Q.—I understand you preceded Mr. Townsend as Director of Industries; how long did you hold that appointment?—A.—I was for 3½ years Director of both Agriculture and Industries, and was a great deal longer Director of Industries, about 5 or 6 years.

Q.—You give in your evidence instances in which Government help was refused; can you also give us the reasons why that help was refused?—A.—In the first case the Government said that the man must improve the processes and then get the grant: I said that the grant should come first as the proprietor had not money to improve the processes without a Government grant.

Q.—Was he a substantial man?—A.—Not very substantial financially.

Q.—Had this fact a certain bearing on the proposal?—A.—Undoubtedly.

Q.—Did this case arise after an unfortunate experience in another province?—A.—I do not think there had been any other just at that time.

Q.—What date was it?—A.—That was in 1915.

Q.—What happened to the factory?—A.—It failed. They worked only for a short time, they could not obtain cane at reasonable prices,

Q.—With reference to the next case, that is, the man who wanted to start a handloom factory, what happened?—A.—It was simply this. The house which the man offered as security was estimated by the Public Works Department to be worth a few hundred rupees less than the amount of the loan. I think Government really took advantage of that. There was no very real reason for refusing the loan: the man had very strong personal security, he has got a brother an Extra Assistant Commissioner who would have given full security for the man.

Q.—That man has since been appointed to a Government billet?—A.—Yes.

Q.—Is he doing useful work?—A.—I think so. Mr. Townsend will know about that more definitely than I.

Q.—Then in the case of the Ambala glass factory why was assistance refused?—A.—The Punjab Government sanctioned a yearly grant on condition that apprentices were trained, but the Austrian blower would not teach apprentices and asked for a rise of pay which the proprietor would not give; so he went away. That was only professional jealousy.

Q.—Then was the factory shut down?—A.—No. The Punjab Government did not refuse the grant, they sanctioned it originally. But subsequently when the proposal was revived by the Punjab Government the Government of India refused the grant.

Q.—But the proprietor of the factory was a rich enough man to put in the money himself, was he not?—A.—He was not at all successful in those days. I do not know whether he is really a rich man; of course he owns a flour mill and is the managing director of a bank and has got a certain amount of money.

Q.—In this case Government assistance was really provided in order to train apprentices, was it not, and the apprentices were not trained?—A.—Not quite. The grant was given in order to assist a struggling industry: the condition about apprentices was really introduced in order to bring the grant within what was then the policy of the Government of India regarding industrial grants.

Q.—You refer to the constitution of the Department of Industries and its several experts: would these experts be attached permanently to the Provincial Industries Department, or would they be borrowed from the Imperial Department?—A.—I think we should have provincial experts. Of course there is no reason why we should not also borrow. You cannot get a chemist who is an expert in all industries. So in many cases the provincial department would have to borrow the services of the Imperial chemists.

Q.—Could you afford a sufficient staff of experts in each province, or you would have experts only for the major provinces?—A.—My experience is that a good chemist can give a great deal of assistance in very many industries of which he has not perhaps first-hand practical knowledge: I mean a man like Mr. Barnes as I have said later on; he is the sort of man who could help any industry although he is not an industrial chemist in any particular industry; but he could give a great deal of help in many cases.

Q.—About pioneer factories you say that they should be sold if a success. You say also that the cotton-seed oil factory in Cawnpore was disposed of prematurely: has it since proved a success?—A.—I believe it has.

Q.—Government in that instance worked through a local firm, that is, the firm managed, was it not?—A.—Yes.

Q.—Would you recommend that procedure as a rule?—A.—Yes, certainly if you could get a local firm. But in the Punjab we have got practically no European industrial firms.

Q.—Who would manage such pioneer enterprises if you started the factories in the Punjab?—A.—The difficulty is to find and maintain your European; you have to import your European as a rule; for instance the proposed soda factory would certainly have to import an expert chemist. I think you would very seldom be able to find a man in the Punjab.

Q.—Supposing you have got a firm to manage such a factory, would you give that firm the first option of taking it over?—A.—Certainly.

Q.—Then with reference to the manufacture of carbonate of soda by electrolytic process at or near Rasul, you say that the capital required for a pioneer factory for that industry would be 10 lakhs of rupees; is it your idea that Government should find that capital?—A.—Government may have to find a great deal of it. Capital will not come forward for new industries of that sort in the Punjab.

Q.—Supposing that one of these pioneer factories was successfully established, would you give the firm which would manage it the first option of taking it over? or would you dispose of it by private treaty or by public auction?—A.—I do not think that matters. If you could not get rid of it at a suitable price, you would have to go on running it. Of course it is assumed that it is successful; if it is unsuccessful, you would have to close it.

Q.—With reference to your cotton-seed oil project, you say you tried to get a private capitalist to take this up, but there was no result: who was it who would not see the thing through, was it the Government or the private capitalist?—A.—Government made a good offer to buy up all the cake and I sounded a number of people who had cotton-ginning factories and others, but there was no response. They anticipated difficulty about marketing the oil more than the cake. I understand that the marketing of the oil is not difficult in other provinces.

Q.—With regard to industrial schools, you would put them under the Industrial Department?—A.—Yes.

Q.—The Punjabis have a distinct taste for mechanics?—A.—Yes.

Q.—Do you think that that taste would develop into ability in the higher branches of Engineering?—A.—It is all a question of education. They have very good fingers, but they have not the brains.

Q.—Your idea is that you should catch the boys really young, teach them the three R's and then apprentice them?—A.—Yes, after a course of schooling they should be put into works.

Q.—Then you can give them further theoretical training after schooling?—A.—Yes.

Q.—With reference to your proposal for a Provincial Department of Industries, you say that the Director should be a senior member of the Indian Civil Service; that is presumably of course he will be acquainted with local conditions and yet will not be influenced at all by local interests?—A.—Yes.

Q.—Do you think you could get a senior civilian to accept such an appointment?—A.—I do not see why you could not. He would be of the same status as the Director of Agriculture.

Q.—But continuity of service would be very important, don't you think so?—A.—Very.

Q.—Would it be worth the while of a senior civilian to take up such an appointment and stay in it for a number of years?—A.—I think a man with 15 or 18 years' service should be quite willing to take it up.

Q.—Would you give such a man a higher pay than he would get in the normal grade of his service?—A.—You would have to give him about the same pay as the Director of Agriculture: he would get an allowance.

Q.—What is the business expert?—A.—Well, our notable business expert was Lala Harkishan Lal. He would be a man, for instance, like Lala Panna Lal, the headman of the Ambala glass works, a man who is in touch with the capital of the province such as it is.

Q.—Do you think that a Department like this should include, say, the Inspector of Industrial Schools which is a new appointment which you recommend, the man being brought out from home?—A.—Yes.

Q.—The inspection of these industrial schools would be one of the principal difficulties in putting them under the Industrial Department?—A.—At the present time we have got a man in the Punjab who would do admirably. Mr. Heath of the Mayo School of Art is the sort of man I have in mind.

Q.—And then you would say that this Department should be executive: do you mean the Director or the whole board?—A.—They think the Board should sit on any proposal to give assistance to a factory or to start a factory. Their recommendation should go to the Government through the Director. It would be a recommendation by the Board, not by the Director himself.

Q.—Suppose there was a difference of opinion between the Director and the Board?—A.—There might certainly be a recommendation made by the Director but if it was not supported by the Board it would not carry much weight.

Q.—Then you would give this Board several lakhs of rupees annually to spend?—A.—I should think so.

Q.—You think the amount must be really adequate for the Department to do any real good?—A.—Yes, there is no use giving small amounts.

Q.—Would you impose any limitation on the amount of money which they might earmark for any particular project? Supposing they had two lakhs or three lakhs in the budget for the year, you would not allow the Board to spend as much as they wished out of it on a particular project without further reference to Government?—A.—I would lay down rules for that, limiting them to a certain extent.

Q.—Then when you come to the Imperial Department you think that the head should be a businessman?—A.—Yes.

Q.—Do you think there is need for having an Imperial official purely for industries?—
A.—Well, I think the Member for Commerce and Industry has not fulfilled the purposes for which he was created. It was originally intended I think that he should be a businessman and gradually it has come into the control of civilians.

Q.—Do you think it would be a good thing if the Imperial Department had a staff of experts under its own control to be loaned out to the different provinces?—A.—Yes.

Q.—Do you contemplate that?—A.—Yes.

Q.—Then it would have to be assisted by more than two?—A.—Probably.

Mr. C. E. Low.—Q.—In any of the three instances which you give showing where Government declined to give financial assistance or where the proposed grant fell through, were the proposals supported by expert advice of the type which would justify an ordinary businessman putting his money into it?—A.—No, I do not think so. Mr. Barnes saw this sugar factory several times and he pointed out the defects, and said till these defects were remedied the factory could not be worked as a business proposition.

Q.—Mr. Barnes, though a man of conspicuous ability as an industrial chemist, was not a sugar factory expert?—A.—No, but he was more of an expert in sugar manufacture than in almost any other industrial process.

Q.—He would not know much about the chemical engineering side of it?—A.—No.

Q.—In all these Government attempts to help industries, either to give financial assistance or to get them to start on their own, has not the weak spot always been the lack of adequate expert backing?—A.—Undoubtedly.

Q.—Without which no convincing proposals can be made? You understand Government, especially the Finance Branch of it, look at industrial proposals very much in the same way as a private individual would if he were asked to put his money into a concern. Suppose for instance a mining project was put on the market and the prospectors included the name of a chemist and not of competent consulting or mining engineer?—A.—Undoubtedly I think there is weakness of expert advice.

Q.—Have you any idea as to the cost of power in this proposed caustic soda factory near Rasul?—A.—I do not now remember what the canal authorities asked for, but it was absolutely prohibitive.

Q.—During your time in charge of the Agricultural Department was there any mill here actually producing cotton oil and cake?—A.—Yes, there was one in Lahore. It has gone into liquidation as I saw in the papers the other day. It was not devoted solely to cotton oil and cake, but included many other enterprises.

Q.—Has the question of popularising the use of mill-made cotton oil cake ever been before you as Director of Industries?—A.—I have distributed a great deal of cotton cake to different markets but without success. I tried also when a new factory on the Bombay side was started. I wrote to it for a quotation, but the railway rates were prohibitive.

Q.—You never tried the method of demonstration in the same way as you demonstrate your agricultural products which you are pushing?—A.—No, I never tried it at exhibitions or anything of that sort.

Q.—Are your agricultural assistants asked to demonstrate the use of factory-made oil cake?—A.—Not in popularising it. The difficulty is perhaps the railway.

Q.—Quite so, but supposing you got a mill started here, the mill must see its way to sell the cake?—A.—Yes.

Q.—And it would be difficult to take the cake to Bombay and sell it there: You must have a local market?—A.—We must have a local market. But the conditions are different in the Punjab where we consume all our cotton seed and import more. Therefore if you start a factory it must temporarily raise the price of cotton seed against itself. Of course ultimately the establishment of a factory will cheapen cake.

Q.—What about your other oilseeds, toria, sesamum and so on? Are any of these made into mill cake locally?—A.—Yes.

Q.—How do they sell?—A.—They sell freely. There is no feeling against them now-a-days.

Q.—They are taken by the cultivators for milch cattle and so on?—A.—Yes.

Q.—Well, the only thing they are sticky about is the cotton cake?—A.—Yes, at present they prefer cotton seed as cattle food.

Q.—Somewhat further south in India where they grow very large quantities of cotton I could imagine the position is the same as you describe it here. You don't grow a large

amount, you import: they grow a very great deal of cotton seed and they consume most of it locally?—A.—Cotton seed is cheaper everywhere else than in the Punjab.

Q.—Is it particularly dear?—A.—Yes, because of the large demand for it for food.

Sir D. J. Tata—Q.—May I ask whether this cotton seed is imported for cattle food?—A.—Yes.

Mr. C. E. Low—Q.—With reference to your proposal regarding industrial schools, unless you teach them to produce articles for which there is a demand by methods superior to the bazar methods, there is no prospect of success, is it not?—A.—Yes. It is no good teaching them bazar methods.

Q.—It is a common complaint against industrial schools and the methods followed by them that they simply teach the boys exactly what they can learn in the bazar, and they probably do it quite so well?—A.—Quite so.

Q.—How would you propose to improve those methods?—A.—I do not think it is so much the actual manual methods which have to be improved as the moral character of the worker. He takes no pride in his work; for instance, if he spoils a joint instead of using a fresh piece of wood he puts in putty; it is that sort of thing you have got to root out more than anything else.

Q.—I will come back to that later. You do regard it as a matter of considerable importance to teach them methods superior to ordinary bazar methods?—A.—Undoubtedly.

Q.—How do you propose to work out those methods?—A.—Well, as I said just now, it is merely a question of character. The ordinary Indian carpenter, for instance, is probably better with his fingers than the ordinary English carpenter. He can do everything with his fingers, he is very efficient with his tools; so it is not his methods that have got to be improved, it is his honesty. Of course when we come to more elaborate things we have got to introduce improved machinery undoubtedly.

Q.—I can only speak from my experience of one industrial school, but we did find in that case that the ability to teach methods superior to the bazar methods had a tremendous moral effect on the boys and on their parents?—A.—The important thing is to find a teacher of higher attainments to improve both manual work and character.

Q.—Do you think that a man of that sort could be obtained who would also have the ability to work out methods superior to bazar ones?—A.—Yes.

Q.—And competent to teach these people?—A.—I think so.

Q.—And you make certain definite suggestions which on the whole coincide with my experience in one particular case as to the type of man you have to get?—A.—I propose a European artisan, one imbued with the missionary spirit.

Q.—Well-educated superior artisans in England who have had technical education themselves: but they would cost more than Rs. 200 a month; a man of that sort could get at least Rs. 600 in a railway workshop, and he would not come on to a Government job on Rs. 200 a month?—A.—You get the class of European in the Horticultural service; that class of men get about Rs. 200 or 250 initial. I think that is what he starts with.

Q.—Usually these people get a number of allowances?—A.—They get a certain number of allowances, but they start on about Rs. 200. They are the same class of men as the artisan we want.

Q.—If you get him you can give him improved prospects?—A.—Yes, undoubtedly.

Q.—But in this question of schools you say in our schools only the most efficient tools should be found, and then you go on to say in paragraph 16 "in schools of carpentry and metal working we should have sawing and planing machines as soon as the work done in the schools is such as can be more efficiently performed by these than with hand tools," how are the boys going to get hold of these things when they leave?—A.—They may not be able to get hold of these if they work in their own houses; but, on the other hand, there are factories also.

Q.—I am not quite clear what you have in your mind: do you want a person to teach the cottage worker or the man who is going to take a place in an organised industry?—A.—At present practically all the carpentry work is a cottage industry in the Punjab; but there is no harm in a man being trained in the use of machine tools: he will be quicker and more efficient by being able to work them. There are a certain number of machine tools in the province, in Ambala there is a carriage factory in which machine tools are used, and there are other places.

Q.—You get a man to learn to use a mortising tool or something of that sort costing 80 rupees or so, or you teach a boy who is going to be a blacksmith how to use a small hand forge costing about 200 rupees; well as long as he works as a cottage worker, will he be in

a position to buy these things?—A.—The Punjabi artisans are well off and earn high wages and many of them could buy these tools.

Q.—Do you think any specific attempt ought to be made to find a means of giving them capital either by a system of deferred pay or something of that sort?—A.—I think it would be a very good thing to introduce a plan of that sort, but of course carpenters with improved tools could make earnings very rapidly.

Q.—Then you think they will derive distinct advantages by learning to use machine tools too?—A.—I suppose a great many of them would not take to machine tools, but I do not think it would be any harm if a certain proportion of them, that is, the best men, learn the use of machine tools, so that they may be enabled to get better employment. I suppose gradually the cottage worker will have to give place to works in factories.

Q.—I do not think it is at all necessary in the case of blacksmiths and carpenters. Even in most highly organised countries they have their village blacksmiths and village carpenters?—A.—Such village blacksmiths and carpenters are a very small proportion of the total in England, but here it is 100 per cent. nearly.

Q.—But still very few of the villages have more than one village blacksmith or village carpenter. Is there any complaint that the village artisan of the cottage type is deserting his village for the town?—A.—I do not think so.

Q.—Turning to another matter, you object to what I may call non-expert noting in the Secretariats on proposals from expert departments. I think the Director of Agriculture will not be found usually to be an expert being generally a Civilian? Also you don't mean to object to criticism in the Finance Department?—A.—Of course not, there must be financial control undoubtedly, but projects ought not to be rejected on the ground that they are technically unsound.

Q.—Have you had any experience of agricultural pumping, power pumping with small power plant for irrigation?—A.—We have a plant in Gurdaspur. There is one in my present district of Karnal.

Q.—Are the people working it well?—A.—Yes; the owner told me he made 25,000 rupees in the first year by breaking up and irrigating new land.

Q.—What horse-power was it?—A.—I do not know about the power. It is an Ashford tube well and a steam engine.

Q.—Do you know if these pumps are at all numerous?—A.—There have been very many tube wells put down. I have had personal experience of a good many; they nearly always fail because the owner of the plant has not a sufficiently large area of land under his control. Also reliable mistries are hard to get.

Q.—In other provinces they get hold of the ordinary intelligent coolie for 8 rupees a month, pay him say Rs. 12, teach him to run an oil engine, thus hundreds are being worked in other parts of India?—A.—I know the mistries ought not to be a difficulty. But they do spoil the pumps and engines. There is a pump and oil engine in the hospital in Karnal which have been irreparably spoiled in 3 years.

Q.—Have you no department of Government like the Pumping and Boring Department of Madras to advise you? Have you no agricultural engineers?—A.—I had no personal experience of working with an agricultural engineer. An agricultural engineer was appointed just when I ceased to be Director. It took 3 years' correspondence to get him appointed.

Q.—Would you keep a man like that under the Agricultural Department or under the Industrial Department?—A.—I think under the Agricultural Department.

Q.—Even when you get a good Industrial Department going?—A.—I think I would keep him under the Agricultural Department. I do not think it is a matter of very great importance, but I think the Agricultural Department to be the more important.

Q.—But these failures which you mention occurred owing to the man not adjusting his power to his land, the use of unsuitable type of power, unsuitable with reference to the lift and the volume of delivery or something of that sort: was the agricultural engineer in existence at that time and was he advising people?—A.—That is exactly what I mean, they put down pumps each capable of irrigating 200 acres, but they had only 50 acres there. That was the reason why the plant did not succeed.

Q.—Is it not the duty of the agricultural engineer to advise?—A.—Undoubtedly. I think they had unsuitable pumps.

Q.—Is anything of that sort run on co-operative lines?—A.—No.

Q.—Do you think there is any scope for that?—A.—Well, it would have to be run on co-operative lines if it is to be introduced into a district where the holdings are small and

where cultivation has reached its limit. In a district like Jullundur it will have to be done on co-operative lines. There is no other way of distributing the water raised by a big central pump.

Hon'ble Mr. H. J. Maynard.—Q.—Is there not an American Mission School at Gujranwala which is an industrial school practically? Does that in any way serve the objects and ideals that you have got in your mind?—A.—Yes, on a small scale. It has got the kind of man at the head of it that you require to have.

Q.—In that case it is an American who teaches?—A.—Yes, he is an American.

Q.—And he actually teaches how to make particular articles?—A.—Yes.

Q.—Then I wanted to ask you about what the Education Department is attempting to do now: it is attempting to train its teachers in hand and eye teaching and so forth, and it has established a workshop in the central training house in order that its teachers may have some idea of the kind of instruction in hand and eye teaching I think you have in view: is it not possible for the Education Department for those methods to introduce generally into schools the kind of improved instruction that you have in view?—A.—They could not introduce instruction suitable for the artisan any more than they could introduce instruction in agriculture suitable for the cultivator. They could give that kind of smattering of hand and eye training which is suitable for people who are not going to devote themselves to manual labour.

Q.—Then you don't think that kind of hand and eye training can be made the basis of industrial education later?—A.—Certainly not.

Q.—And you don't think that is the right way of imparting industrial education?—A.—I am against that method.

Q.—That is one of the theories on the subject, is it not?—A.—Yes.

Q.—And that is the way to get your industrial training, that is, general education accompanied by some hand and eye teaching?—A.—That undoubtedly is the theory, but I think that it will fail necessarily in the Punjab. The difficulty is to induce the artisan to send his boy to such a school. I do not think that you could ever bring our carpenter boys and our weaver boys into schools, where the education is literary with only some hand and eye training thrown in. That is why I want schools which combine training in an industry with literary instruction from the very beginning.

Q.—Suppose you simply gave purely literary education?—A.—It would not attract the right boys.

Q.—You mean it would not attract artisan boys?—A.—No.

Q.—Supposing you had a Standing Committee for technical and industrial education as in the case of a school started in Bombay, is that the sort of machinery by which you might get your improved industrial schools? You have in this province people like Rai Bahadur Ganga Ram to work that sort of machinery?—A.—An advisory committee would be very useful.

Q.—I think you said, didn't you, that there is a prejudice on the part of cattle owners against mill-made cake—only against cake which is mill-made?—A.—There was a prejudice against cotton cake not against other mill-made cake. I do not think there is any prejudice now.

Q.—There is no prejudice?—A.—There are a number of factories in the province, there is one in Amritsar, one in Lyallpur, and half a dozen other mills in the province that turn out a good deal of cake, and I do not think any of them find much difficulty in marketing it.

Q.—There is no prejudice against the cake?—A.—I do not think so. There used to be, but I think it has died out; in fact a good deal of cake is imported from the United Provinces into the Punjab.

Sir D. J. Tata.—Q.—You speak about a cotton oil company in Cawnpore which you say was disposed of prematurely, and later on you say a pioneer factory for cotton oil is required. What was this oil factory in Cawnpore? Was it a pioneer factory, or a private-owned factory?—A.—Pioneer factory. I understand it was financed by Government and run by Messrs. Begg, Sutherland and Company.

Q.—Was it financed by Government?—A.—Government undertook the risks.

Q.—But then why was it given up? Government undertook the risks, and Messrs. Begg, Sutherland and Company ultimately bought it, is it so?—A.—I think it was auctioned by Government; somebody (not Messrs. Begg, Sutherland and Company) bought it.

Q.—What do you mean when you say that it was disposed of prematurely?—A.—I do not think it was carried on long enough to find out whether all the products of the mill

could be marketed with commercial success. I went to see the factory just before it was sold, and at that time they did not seem to know very much about it themselves or whether they had established a successful proposition.

Q.—Then you want a pioneer factory for cotton seed oil to be established by Government. After the failure of the last experiment you want another experiment to be made?—

A.—I do not think that experiment was at all a failure. It was very successful so far as it went. But the conditions in the Punjab are very different owing to the high price of cotton seed. We have to pay much higher price for cotton seed in the Punjab than in the United Provinces.

Q.—You have got a remark in your evidence which I am afraid is likely to give some offence. I refer to the paragraph about industrial schools in which you say "the reason is that the failure of the Indian artisan is a moral failure; he has little sense of honesty and aims only at making as much money as he can with the smallest effort." Don't you think that expression "little sense of honesty" is perhaps a little too strong?—A.—No, I hardly think it strong enough.

Q.—I am sure you do not mean that the artisan is really dishonest, and tries to deceive? Don't you think that in the instance which you give where he uses a bad piece of wood, or uses putty, it is due to ignorance or indolence, simply because his ideals are not as high as that of the other workmen?—A.—I think there he wants deliberately to make money by any means he can.

Q.—For instance, when he is making a chair, as long as he makes it fit to sit upon and does not care much about the finish, I imagine there is no attempt at dishonesty. According to his ideals it is fit to sit upon, and that is about all that he cares for. A statement like this that he is dishonest might give offence. May I put it to you that you might revise this statement, and alter it in such a way as not to give room for such offence?—A.—It is moral obliquity, it is intentional, that is my definite opinion. I do not think that it is anything at all but deliberate dishonesty.

Q.—Well, that is dishonest in this sense that his ideals are not high. Perhaps it would be dishonest if he deliberately tried to deceive. I mean he does not mind whether it is properly finished or not. The Indian artisan never finishes a thing because he does not realise that the finished article is better than the unfinished article. Is it not too strong, therefore, to call him dishonest straightaway?—A.—I am afraid he is unfortunately so.

Q.—I am very sorry. It will give offence to have a whole class of people dubbed dishonest simply because they do not know any better. It is not due to dishonesty, I think, but simply to low ideals, if you like.—A.—I am afraid it is not. I am afraid I cannot agree at all.

Q.—When you talk of object lessons, you mean nature study, don't you?—A.—Yes.

Q.—In one place you talk of little children of 5 and 6 being taught, what would you teach them in that line at that age?—A.—That is usually what we call kindergarten.

Q.—Is that all you mean?—A.—Yes.

Q.—Coming back again to that thing about dishonesty, I see you have got a paragraph which seems to express the thing much better than that. You say here in paragraph 8 under the heading "Advantages of education": "It can be done by instilling method and working against time, by inculcating concentrated attention, by rewarding exactitude and honesty and punishing scamping, etc." So it is merely want of exactitude and the desire to scamp work, I would rather, therefore, you didn't dub it as dishonest.

Mr. C. E. Low.—Q.—Supposing a man hangs about his work, it is not because that he is dishonest, but has no very good plan and method, which you well know. In one way you may call him a dishonest artisan, but it is not moral dishonesty in the true sense of the word, is it?—A.—No, it is not moral.

Q.—It is not rather the same kind of dishonesty which deliberately uses bad materials because the man gets them cheaper which is a common thing in western countries. On the other hand, the Indian artisan does not very much care what kind of wood he puts and he is very indifferent. That is, if he sees the thing will serve the purpose, he does not mind putting in putty somewhere. There is no intention to deceive, that is the point. It is not deliberate?—A.—It is deliberate in the sense that he puts money-making before anything else; that is his object; he has to make money, so he will do it in the cheapest way.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—You speak of a handloom factory: was that a fly shuttle factory?—A.—Yes, fly shuttle.

Q.—You wanted that Rs. 25,000 should be given to the man: the man had no capital with him. How many looms do you think he is going to put up to make it a successful handloom factory?—A.—I forget how many he was going to put in; it would be about 20 or 30.

Q.—Only 30 looms?—A.—I do not remember what the number was.

Q.—The cost of the looms would be Rs. 25,000, and the man had some capital with him for some looms and a portion of yarn: what kind of cloth was he proposing to produce?—A.—I think he had chiefly in his mind silk suitings; that is the sort of handwoven cloth which pays well.

Q.—I did not quite clearly understand what you said in answer to a question by the President about the pioneer factories: you say a pioneer factory if a success should be sold: how should it be sold, by public auction?—A.—To an approved party or by public auction. I do not regard it myself as a very important matter so long as Government does not continue to compete with private enterprise.

Q.—You know a Government factory is established from the people's money, and if it is given over to somebody as a matter of preference, don't you think that it will be unfair?—A.—I would only make the offer specially to the firm which had been running it. I do not think that is unfair preference.

Q.—There is some chance of partiality, is there not? If it is sold in auction then there is no partiality because Government has proved the pioneer factory to be a success?—A.—I think any one who undertakes to work the factory should have a prior claim to purchase it.

Q.—But won't a pioneer factory be conducted in this way, that one party should run it and Government should finance it?—A.—That would be the best way of running it.

Q.—Government not starting it themselves?—A.—Private parties can always run a commercial factory better than Government. In the case of a pioneer factory it can be run by a private party and Government can help; that would undoubtedly be the best way.

Q.—Do you think Government are not fit to manage?—A.—They are not good managers in industrial enterprises.

Q.—Then about the provincial Industrial Department you mention altogether six people: who do you think should be the Indian representative among these, the business expert? What class of business expert will he be, will he be a banker?—A.—I do not think there need be any special Indian member. If there is a well-fitted Indian, he might be appointed in exactly the same way as a well-fitted European. I do not think I would reserve any of the posts for either Europeans or Indians; there is no necessity.

Q.—You do not think that the representatives of commerce should have representation there by election?—A.—No.

Q.—On this side perhaps it might be so, on our side we have got representatives of the Chamber?—A.—This is an executive body, and there is no question of election at all. The men would have to be chosen by Government for their professional qualifications in one line or another, like the staff of a department or a board of directors.

Q.—You want a member of the Indian Civil Service as the Director, and you say there should be no civilian control over the board except by the Lieutenant-Governor himself; but don't you think the chairman of the board being of the Indian Civil Service will also have the control?—A.—He will be a member of the board, he will be more a mouthpiece.

Q.—Just like the others?—A.—He will not be over and above them. He will be a member of the board, but have greater influence as chairman.

Q.—Then you say something about Mr. Noël Paton; what are his schemes which you very much admire?—A.—Well, cotton oil and wheat elevators and sugar were his three chief lines.

Q.—He was a Director-General of Commercial Intelligence in 1911, was he not at the time when the Russian barley crop failed?—A.—Yes, I think so.

Q.—Then you say "it is not the lack of primary education that hinders industrial development": do you think primary education is not essential for the people?—A.—I do think it is, but not in its present form.

Q.—Do you include that in your scheme?—A.—I undoubtedly think primary education is most necessary.

Q.—Then you say "industrial schools should be established at the centres of important industries where up-to-date methods specially applicable to the industries of that locality should be taught to boys and girls of 5 years old and upwards, etc." Don't you think that 5 years is too young an age for that?—A.—I merely took the age at which the child now goes to its primary school; usually they begin at 5.

Sir D. J. Tata.—Q.—You propose two sets of schools, ordinary elementary schools and industrial elementary schools. Is that not your idea?—A.—Yes.

Q.—You want to disconnect industrial education from ordinary elementary education?—*A.*—Yes.

Q.—Would you combine both in the same institution?—*A.*—I should have the schools for artisan boys distinct and separate from the schools for ordinary elementary education.

Q.—As far as I can gather you want in the industrial elementary school a little elementary education?—*A.*—Yes.

Q.—But in the elementary education you don't want industrial education?—*A.*—I think it would be an excellent thing if there was hand and eye training, which Mr. Maynard spoke of, in all the elementary schools; but that is not enough for artisan boys.

Q.—Then in the industrial schools you say there should be two-thirds general and one-third craft education in the first stage; half general education and half craft education in the second stage; and, finally, one-third general education and two-thirds craft education?—*A.*—I do not want to be bound to that. It was written sometime ago and I might not adhere to that now exactly, but it is roughly right.

Q.—So you want two sets of schools, industrial elementary and ordinary elementary?—*A.*—In fact I want three classes: ordinary elementary schools for boys in the towns like what there are at present; then (2) agricultural schools for cultivators' boys and (3) industrial schools for artisans' boys.

Hon'ble Sir Fazulbhoy Currimbhoy.—*Q.*—Have you any knowledge about the ginning and pressing factories? I think you inspected a great many of them? Do you not think there are too many of them on the spot?—*A.*—Far too many.

Q.—How should it be remedied? Can you suggest any remedy? Have you mentioned anything in your note?—*A.*—The remedy is to allow them to fall into ruins. In Karnal there are five of them in ruins; in three the machinery has been removed in order that they may fall into ruins.

Q.—Do you think that the Government ought to step in and stop this business and take some measures to that effect?—*A.*—Well, I think everything that has happened has happened. I do not think people are foolish enough to build any more ginning factories.

Sir F. H. Stewart.—*Q.*—With reference to your provincial chemist and engineer, what sort of pay do you think you can get a man for?—*A.*—Same pay as for the chemist in the Agricultural Department; he begins at Rs. 500 and leaves off at Rs. 1,000; that is not high enough, the maximum will have to be higher.

Q.—And for the engineer?—*A.*—The same thing.

Q.—Rupees 750 to Rs. 1,500?—*A.*—Yes.

Q.—About your proposal for an inspector of industrial schools, one man would take a tremendous time to inspect all the schools, which would greatly reduce his value, would it not?—*A.*—You can have assistant inspectors like the present inspectors of schools.

Mr. C. E. Low.—*Q.*—Is it not very strongly urged against bringing out teachers from home that a man brought out from home and put in charge of schools has got to improve, and he is not useful at first generally?—*A.*—I think he must necessarily be of very little use at first; we are all of very little use when we first come out to India.

Q.—You say that yourself, and you suggest there is a gentleman in this province who could do that work, but I do not suppose he could be spared? Is this not a whole-time job?—*A.*—Undoubtedly.

Q.—The officer you mention is not at all likely to be spared?—*A.*—He could not be spared. I went round some industrial schools with him about two months after he first came out to India and had a chance to see him and his methods and he seemed to me to jump on the right thing at once.

WITNESS No. 869.

MR. L. H. TAFES, Inspector of Factories, Punjab, N.-W. P., Delhi and Ajmer-Merwara.

WRITTEN EVIDENCE.

In the Punjab where there are but few large industrial concerns, there is, in my opinion, no great difficulty in obtaining capital for sound enterprises, backed by reliable persons or for concerns where good profits are obtainable without the necessity for much technical knowledge or experience, even though there may be a certain amount of risk; the rapid growth of ginning industry is a good illustration of this; as a matter of fact, I believe, that from the numerous enquiries, I have received when on tour, there is a great deal of unused capital in the Province.

Financial aid to industrial enterprises.

The great handicap to industrial development in the Punjab is the lack of scientific and technical knowledge and of business training. The lesson of the Bank failures has made the small capitalists wary of sinking capital in enterprises of unproved worth, but if a really efficient and properly constituted department of industries giving expert technical advice on the industrial possibilities of the Province, could win the confidence of the small capitalists, there will be no lack of available capital.

I am not in favour of money grants-in-aid or of bounties, which would tempt capitalists to invest in unsound undertakings. It is true that Japan uses these methods to bolster up an export trade, but she has limited natural resources. India should, for the present, be content to supply, as far as possible, her own needs from the raw material available here. Government loans at low rates of interest would be a great advantage to industries for extensions. The splendid Tata scheme for a big industrial Bank will be a great boon to any factory languishing from lack of capital; the high rate of interest demanded by money-lenders has formerly been a great handicap to industrial development. In order to contend with Japanese or European competition which would kill a new industry, subsidies would be necessary in some new industries especially when the undeveloped raw material is under Government control, or in cases where industries would produce an article necessary for other manufactures. The best protection in such cases obviously would be the imposition of import duties.

Other ways in which Government might assist are—

- (a) exemption from income-tax and octroi dues on raw material required for a new industry;
- (b) supply of machinery or appliances on the hire-purchase system for village industries;
- (c) institution of a Government audit department which would secure the confidence of the capitalists;
- (d) for large enterprises, e.g., hydro-electric power schemes, sugar factories, etc., Government should give support by providing part of the share capital and loaning the services of their technical experts at a nominal charge and perhaps providing a skilled managing director;
- (e) give strong support to any industrial banks, e.g., Tata's, and enlarge the scope of co-operative credit banks.

Pioneer factories.

Pioneer factories are specially desirable in India, where the technical knowledge and expert advice, which are absolutely necessary to make a specialised industry a success, are difficult to obtain.

The Industrial Development Board for India, having access to the best expert advice and technical research and possessing a detailed knowledge of the resources available, would be in the best position to initiate, in co-operation with the provincial organisation, experimental factories in order to prove or disprove the commercial practicabilities of the new enterprises. When proved successful, they would be sold to private capitalists; others would not be slow to follow suit, though precautions would have to be taken to prevent the pioneer factory from being killed by competition for raw materials and markets.

Such pioneer factories would be a source of skilled workers trained in the particular trade or industry. Instances are numerous of such industries springing round one pioneer concern, e.g., the sports works at Sialkot; the foundries for the manufacture of the lathes and sugar-crushing mills at Batala; the carpet factories at Amritsar; the tanning industry at Cawnpore.

In cases where the raw material is only obtainable by Government, e.g., the Resin and Turpentine industry in charge of the Forest Department, or in other cases where Government is the chief consumer of the manufactured articles, the concern might remain in Government hands, but in general, successful pioneering factories should be given over to private capitalists or companies in order to avoid competition with private enterprise.

Pioneer factories financed by Government should only be undertaken when private capital will not take the risks, but once a Government pioneer factory is started, steps should be taken to prevent imitation or competition during the years of experiment. I assume that the Provincial Industrial Departments being under the control of the Indian Development Board would not be allowed to compete with each other.

If a pioneer factory has been started by private enterprise, Government should not compete with it, but give it support by technical advice, and in some cases,

by guaranteeing the purchase of products. Should a privately-owned pioneer factory persistently refuse to adopt the latest methods and fail to be profitable, Government should either buy it up or erect an up-to-date pioneer factory of its own.

It would be advisable for Government when transferring large concerns, in which technical skill is necessary, to ensure that the skilled staff should be retained for a term of years by the private company or capitalist. Government-controlled pioneer factories as opposed to privately-owned ones, would have the advantage that Government could check foreign competition, which might otherwise immediately stifle them; Government would also have better facilities for securing trained staff and other labour. Moreover it could more easily secure convenient factory sites in suitable localities.

Suggestions for some pioneer factories are included under the 'General' heading below.

The following special note has been prepared at Government's request, to show that there is an excessive number of ginning factories in the Province, and that the ginning industry is very seriously handicapped by overcapitalisation. I append statements showing—

Excessive number of ginning factories in the Punjab.

- (a) the number of working gins in the Province, the number of available gins, the percentage of working gins and the number of gins necessary to deal with the crop grown and exported from the province each year;
- (b) detailed particulars for the districts of Multan, Lyallpur, Hissar, Shahpur and Rohtak, in which the overcapitalisation of the industry is most marked.

It will be seen that the number of machines kept idle each season has varied from about 800 to 3,500 or between 25 per cent. and 50 per cent. of the available number.

The number of machines required in practice for any particular crop can be approximately calculated; a single gin turns out between $4\frac{1}{2}$ and 5 maunds of cotton per day if the factory is working legal hours; during a season of 4 to 5 months factories work on the average about 100 days, the intermittent working of some factories being balanced by the double shift working of factories in other districts. Four hundred and fifty maunds of cotton may, therefore, be taken as the average output per gin per season; I am informed that it is scarcely profitable to work a factory unless such an output can be obtained; and as a matter of fact the gins of a considerable number of factories give a much larger output. The figures in line 8 of the statement, therefore, give the maximum number of machines which can be reasonably employed to deal with the particular crop.

From an examination of the table it is clear that at no time during the last 12 years do these maximum numbers ever exceed or even touch the corresponding numbers of machines available for work; indeed the excess of those available in the Province over those really required varies between 400 and about 3,900. The facts can be more easily realised by reference to the graph* appended.

That this statement really errs on the side of moderation, can be seen by a reference to the Liquidators' report on the failure of the People's Bank in which it is stated, "Practically all the funds were employed in the one industry—cotton manufacture—and since the funds available exceeded the requirements of that industry, it became hopelessly overcapitalised. It is safe to say that there are at present (1914) four times as many ginning factories in the Punjab as the crop required."

This regrettable overcapitalisation of the ginning industry dates from the season 1904-05, when the crop was a record one and was followed by what might be termed a boom in the ginning industry. Indian capitalists are very prone to put capital into concerns which are a proved success; they fight shy of new ventures involving special technical knowledge. Moreover, the amount of capital required for a ginning factory, which is usually constructed on the cheapest possible lines, is well within the means of small capitalists or of a partnership of bazaar traders.

The ease with which large profits could be obtained without the necessity for special technical knowledge or skilled management was a great attraction, and as a result, factories increased out of all proportion to the probable crop.

This overcrowding of factories and consequent undue competition for *kapas* and labour resulted in many failures, a considerable number of factories being compelled to close down after being worked at a loss. This state of affairs has forced ginning factory owners in many districts to adopt pooling arrangements as a means of protection, whereby a portion of the profits made by the working factories goes to pay interest (about 12 per

cent.) on the capital vested in the factories remaining idle. In some cases combinations were even made between owners for the purchase of *kapas*, resulting in the artificial local control of prices and injustice to the zamindars.

This uncontrolled pooling system, originally adopted as a remedy, has, however, become worse in its effects than the evil itself; in order to earn sufficient profits for the remaining idle factories, working expenses have to be cut down to a minimum and necessary repairs neglected; cotton is watered to increase its weight; cotton seeds are crushed in the attempt to secure more lint; the wages of the employes are lowered and little is done for their general welfare; while the provisions of the Factory Act designed to prevent overworking of women and children are deliberately and persistently disregarded in order to save labour expenses; and as really efficient management cannot be afforded, the evil works in a vicious circle.

Yearly many factories have been erected merely to threaten the pool and force a share of the profits, and in many cases there has been no intention of working them; nor can the evil be checked without legislation. During the last 3 years, in spite of comparative stagnation in the industry, no less than 16 new factories containing over 400 gins have been erected; many of them in localities where factories are already standing idle for lack of work.

The detailed statements for the five districts in which the superfluity of ginning factories is most marked, explain themselves. Multan is a glaring example, the number of machines has more than doubled during the past 10 years, though the average crop has not increased. Of the 43 factories in the Multan pool only 17 are working—nor do the working factories work full time or use the maximum number of machines. In spite of this no less than 5 new factories are now under erection in that district.

In the case of Hissar the superfluity is due solely to the great decrease in the cotton output—10 years ago all the factories were working; now, hardly one-third can be profitably worked and nearly 1,000 machines are standing idle.

In the district of Lyallpur the erection of many new factories on the Jaranwala line which was laid down about 10 years ago, has attracted a portion of the crop which formerly went to Lyallpur factories. Thus though the district crop has not decreased, many factories have to remain closed. The only remedy is to remove the factories to districts where the crop is increasing more rapidly, and to prevent the erection of any new factories in localities already over-crowded.

In the case of Shahpur District, where the whole of the factories have been worked within recent years, there is some hope of matters adjusting themselves when the crop increases to its former maximum.

Rohtak has suffered from a great decrease in the crop during the last few years and also from the fact that the North-Western Railway, in order to attract export trade, to their long 'lead' to Karachi, offer specially low rates for raw cotton from all stations on the Southern Punjab Railway to Kasur and Raewind. In 1916-17 the imports of cotton into Kasur were 2 lakhs of maunds—Rohtak factories thus suffer severely by this preferential treatment, while Kasur factories in good seasons work as long as from September to May.

From a survey of the above facts there can be no doubt whatever, even after taking into account the practice of keeping a reserve of gins to cope with sudden rushes of *kapas* when prices rise suddenly, that there is very serious overcapitalisation in the ginning industry, which not only handicaps the industry in every way, but is a big waste of capital which might have been utilised in financing more profitable concerns.

It would be safe to state that the capital lying idle in factories which are kept closed by pooling arrangements or other agreements, cannot fall far short of 10 lakhs of rupees, and if this incubus could only be removed from the industry, factories could make splendid profits without overworking their employees to the extent that is now so prevalent.

I believe there is a consensus of opinion among factory owners that little can be done to remedy this deplorable state of affairs without help and action by Government and I would put forward the following suggestions for restraining the evil to some extent, and preventing its expansion:—

- (1) A system of licensing factories should be introduced which could be administered by the Department of Industries; no permits for building new factories should be granted in any locality already overcrowded with factories, if the owners of the idle factories are willing to offer them for sale either by auction or at a price assessed by the Department of Industries.

- (2) That a license to work a factory should be cancelled if the factory is kept closed for longer than 3 continuous years, provided that if more factories are found necessary as a result of an increase in the local crop, the owners of the existing factories shall have the opportunity of restarting theirs before a permit for a new factory is issued. In this way no idle factory would earn interest on its capital, and would not be in a position to blackmail the working factories.
- (3) Though it would be a drastic and probably an impracticable step to make pooling systems illegal, the above licensing system would have the same practical result. A simple legislative method of preventing the excessive working of a few factories under the pooling system would be to make section 27 of the Factory Act inapplicable to localities in which more than 30 per cent. of the gins in factories within 10 miles are idle. Power could be given to Local Governments to issue such notifications when found necessary.
- (4) The importing of ginning machines could be prohibited except under permit from the Industries Department.
- (5) In the case of new canal colonies, sites should not be granted for more factories than can be maintained in full employment; a clause should be inserted in each agreement making the license to build a factory void unless the factory is built and worked within 5 years. There is reason to believe that factory sites have already been granted in new canal colonies far in excess of those necessary for any probable crop.
- (6) Government or municipalities when granting lands for factory sites or when considering applications for licensing the erection of new factories should give preference to those applicants desirous of moving their factories from districts already overcrowded.

During my enquiry into this question I have ascertained the views of many of the prominent factory owners in the Province, and I feel sure that the majority of them would welcome the adoption of any proposal which would put an end to this evil, which so seriously handicaps the ginning industry and is the main cause of the regrettable sweating of women and children.

The services of Government experts as advisers should be freely available on payment of reasonable fees, but the object of the Industries Department should be to disseminate detailed technical information as widely as possible and induce capitalists to erect pioneer factories; the actual terms under which the license to run a pioneer factory would be issued, would be decided by the Industries Department according to the nature of the project—Government would probably put the services of its experts at the disposal of pioneer factory owners for a nominal sum to cover expenses.

Technical aid to industries.

Special researches carried out by Government experts at the Central Research Institutions in India at the instance of private concerns should be paid for and should not be published except with their consent before the elapse of a year from the date of making the report to the firm. For pioneer factories started under Government auspices and in the case of established factories, imposing no restriction on publishing the results of such researches, the fee should be on a lower scale.

When a Government pioneer factory has been proved a commercial success, it should be used as a demonstration factory until taken over by a private capitalist; due precautions being taken by means of licensing system to prevent the establishment of an excessive number of such factories. Demonstration factories would, therefore, vary in size from such large pioneer factories to small workshops attached either to Government workshops or to secondary trade schools which should be established at the larger industrial centres, e.g., Lahore, Rawalpindi, Amritsar, Ambala and Multan, wherein improved methods or appliances could be demonstrated.

Demonstration factories.

It would be found that factory owners would gladly allow their factories to be used for demonstrations of new methods, appliances or processes.

The following are some suggestions for demonstration factories and workshops:—

- (a) A well-equipped tannery, run on modern lines should be established in the vicinity of Lahore. In one sense this would be a pioneer factory, for the reason that though tanneries are undoubtedly successful in Cawnpore, they might not be commercially successful in the Punjab under different conditions. There is, however, a very great demand for well-tanned leather.

especially belting for factories, and if labour difficulties could be overcome, a Punjab Tannery having a constant supply of hides should prove very successful.

- (b) A modern ginning factory at one of the larger ginning centres. It should contain the latest machines provided with dust-removing fans, if possible, and should demonstrate the best ventilation and lighting arrangements and the most efficient methods of guarding machinery. It should also be a model of business management and a pattern to all in the treatment of its employees.
- (c) Soap and glass factories run on the very latest methods under expert advice, and supported by a Government Alkali factory worked by the electrolytic methods.
- (d) A salt refinery.
- (e) A match factory, supported by the Forest Department and aided by cheap railway rates.
- (f) A bone manure factory; at present bones are exported, while bone dust and fertilizers are imported in considerable quantities.
- (g) Workshops should be established separately or in connection with secondary trade or technical schools to demonstrate improved methods and encourage new designs in such special industries as the Hoshiarpur inlaid furniture trade, the cutlery trade at Wazirabad, the pottery and enamel work at Multan and similar indigenous industries, some of which are stagnating owing to the use of bad designs, the substitution of inferior material and the lack of skilled advice and business management.
- (h) The commercial practicabilities of factories for the manufacture of such articles as buttons, mill bobbins, bamboo furniture, cotton hosiery, linoleum, cement and glazed tiles, should be investigated and demonstration or pioneer factories established where necessary.

Research institutions and industrial surveys.

There should be well-equipped research institutions for India, which should be staffed in all departments by experts from home, which should be distinct from scientific colleges and controlled directly by the Industrial Development Board. They should keep in close touch with the provincial industrial organisations and also with the Advisory Council for Research in England, through which facilities for keeping acquainted with the latest scientific developments would be afforded. There would be no need for a Research Department for India in England, but the best experts obtainable should be brought out on short terms of service to investigate special problems and the possibility of success of any big industrial undertakings proposed by the Development Board.

Through the Development Board difficulties experienced by the provincial industrial staff would be admitted to the research institutions for solution, and these institutions would also investigate from the chemical, mineral, botanical or agricultural point of view, any raw materials brought to light by industrial surveys.

In order to avoid duplication of work, local scientific colleges should not ordinarily concern themselves with industrial research work, though they might attempt minor researches if deemed advisable by the Local Board.

These colleges could provide skilled chemical assistants to work in the central research institutions. There are obvious advantages in concentrating research work under one head directly controlled by the Development Board, but as research work expanded, it might be found necessary to establish one for each province.

The existing knowledge of the available resources of the country should suffice to keep the new Industrial Development Department busy for many years, but it would be easy for the Development Board to order fresh surveys in particular cases when necessary.

Assistance in marketing products.

Industrial museums or permanent exhibitions of raw materials and products should be established under the control of the Provincial Industrial organisation in the more important industrial centres, e.g., Lahore, Amritsar, and Delhi. These should be quite separate from the ordinary local museums and should also have sales agencies, especially for organising cottage industries as is done in Cawnpore.

Travelling industrial exhibitions should be sent to the more important commercial towns not having museums of their own, and use might be made of big fairs for advertising purposes.

There should be no need for trade representatives in the various provinces as the work of the provincial industrial organisations would be thoroughly co-ordinated by the controlling Industrial Development Board.

Trade information bureaus should be established at the provincial industries department office. Catalogues should be published half-yearly giving the quantities and prices of all important articles bought by Government Departments and the Railways; there should be lists prepared of imported commodities, the raw materials for which are already available in India. Such catalogues and lists should be sent out regularly to all industrial museums, sales depôts, public libraries and chambers of commerce. Government buying departments should not be allowed to import manufactured articles which can be obtained in this country.

The procedure of ordering European stores at the India Office should be entirely discontinued: such procedure only results in delay and unnecessary expenditure without any compensating advantages. European firms would then establish their own agencies in India or even erect factories here to supply the Indian market.

The complaint is a general one among factory owners, that suitable land is difficult to obtain for industrial purposes at reasonable prices, owing to the operation of the Land Alienation Act. Government should have the power to acquire land compulsorily for industrial purposes, and a stiff tax should be imposed on all undeveloped land kept out of use near townships. When concessions of land for industrial purposes are granted by Government, i.e., when granting land in new colonies, a clause should be inserted in all agreements stipulating that the permit to use it for industrial purposes shall lapse if not acted upon within 3 years. Land policy.

The development of industries is in my opinion handicapped more than from any other cause by the lack of trained supervisors, as well as of efficient skilled labour in the lower grades. Compulsory primary education would undoubtedly aid the development of industries. The industrial education of the Province should be completely reorganised by an expert educationalist from home having scientific and engineering qualifications, who should be experienced in the organisation of trade schools, technical classes and polytechnics. Training of labour.

The primary industrial schools should be properly equipped, well staffed with teachers who not only know their craft but have had training in teaching; the curriculum should be designed to improve dexterity and develop the intelligence of artisans' sons and give them knowledge of economical and improved methods and of efficient tools. It should be in close touch with the industry of the locality, e.g., metal work, furniture-making, pottery, etc.

While the aim of such schools should be to turn out efficient skilful artisans, there should be opportunities for the cleverer boys of receiving supplementary literary instruction so that they could pass by means of scholarships to the secondary trade schools and even to the polytechnics giving advanced education in telegraphy, mechanical and electrical engineering, applied chemistry, etc., to be founded later.

Secondary trade schools should be founded in such commercial centres, as Lahore, Amritsar, Ambala, Hoshiarpur, Multan, Ludhiana, Sialkot, and it is essential that they should be in charge of skilled Europeans, who could be selected from soldiers discharged in India after the war. Such schools would provide skilled labour and supervisors for particular industries as is done by the Railway technical schools. Existing Mission industrial schools could also be brought into the scheme.

Evening technical classes at moderate fees should also be organised in such schools, which would also act as demonstration workshops for spreading the knowledge of efficient methods, the use of improved tools and the processes of finishing articles properly.

Such schools as well as the technical colleges, to be established later, should be organised and financed by the provincial Education Department, but they should be opened to inspection by Inspectors appointed by the Development Board for India.

At present the sources from which skilled managers for industries necessitating technical knowledge and scientific training, are but few, e.g., the M.Sc. classes at Government College and Forman Christian College (especially the Applied Chemistry section of the latter) and the Roorkee and Rasul Engineering Colleges. These should be more strongly supported by additional grants from Government and the curriculum should, as far as possible, be brought into line with the requirements of developing industries. These should also be instructed by industrial experts from the Development Board and by the Provincial Department. Training of managers and supervisors.

It would be a splendid idea if courses in business management could be started in all University Colleges and trade schools and diplomas granted. Holders of such diplomas should be given the preference in deciding Government appointments, and all indus.

trial concerns assisted by Government should be required to take a certain number of men educated in science colleges and to give them a full technical training in the particular industry.

It is my experience that managers of the smaller factories are usually quite incompetent; the majority are uneducated and quite unable to keep accounts; they have little idea of handling labour or of saving working expenses. Such men should have been through a trade school and have had some instruction in business methods and management.

Special courses (both day and evening) should be started in the existing colleges or in a new technical institute in such subjects as electrical engineering including house-wiring, motor engineering, telegraphy and telephony, applied chemistry, steam engines including repairs, machine drawing, surveying, building construction and house decoration, etc. Metal and wood-work classes could be carried on in the Mayo School of Arts as at present. For such classes it would be most essential to have well-paid European instructors, many of whom could be obtained after the War from the Army, which contains many skilled craftsmen willing to accept posts in this country. Examinations could be conducted under the auspices of the City and Guilds Institute, London.

Mechanical Engineers.

The examinations for the factory mechanical engineers' and engine drivers' certificates now held in the various provinces should be made uniform by having one examining body for the whole of India with local committees for the practical test. By this means certificates of proficiency could be issued in small provinces like North-West Frontier and Ajmer-Merwara and Delhi, which are now unable to afford separate examining bodies.

The importance of and necessity for improving labour conditions.

It is apparently not generally recognised that the importance and advantage of industrial development to a country lies in the fact that it keeps a portion of the population healthily and happily employed; mere developments of its natural resources in order to build up wealth for the few, cannot result in any real lasting benefit to the country, if the price of such industrialism is the misery, degradation and physical deterioration of the workers. There is a tendency to judge the success of industrialism by the increase of production, without sufficient attention being paid to the welfare and mental and physical development of the employes. In my opinion, the most important factor in industrial development, is the building up of a class of efficient contented operatives working under humane and healthy conditions.

To obtain a permanent class of efficient skilled industrial workers, in a country where the prejudice against manual labour is very strong, it is most essential that the labour conditions should receive more attention from employers of labour and from Government, and I would strongly urge the following for the amelioration of the lot of the factory workers:—

(a) *Raising the age-limit for children.*

The maximum age of children allowed to work on machinery in factories, especially in textile mills, should be raised immediately from 9 years to 11. In England, the half-time system has already been abolished and the minimum age raised to at least 14. The strenuous dehumanising conditions under which tiny mites of 9 years work in ill-ventilated spinning mills is nothing short of slavery, and cannot but result in serious physical deterioration of the workers. Compulsory primary education should be introduced as soon as possible.

(b) *Ventilation.*

The Factory Act should be immediately amended so that reasonable ventilation may be enforced in textile factories, in which the atmosphere is usually unbearably stuffy and foul.

(c) *Compensation for accidents.*

A worker who is seriously injured for life owing to negligence of the owners to guard dangerous machinery, has practically no remedy under the present law. To protect the industrial workers from owners, careless and unscrupulous enough to risk the lives and limbs of their employes, merely in order to save a little on the working expenses, the introduction of a short Employers' Liability Act is most desirable, if only in the interests of industrial development. Japan has already protected its workers in this way, and a similar measure of justice is badly needed in this country.

(d) *Housing conditions.*

The conditions under which workers in the large factories are usually housed are deplorable in the extreme. The squalor and generally unhealthy conditions under which these wretched operatives exist, must materially reduce their efficiency and earning power. It should be made compulsory for owners of factories above a certain size to provide dry, clean, well-ventilated and healthy dwellings for their employees at reasonable rents.

When large Government pioneer factories are established model villages should be erected for the employes with provision for education and healthy amusement, as well as a savings bank and a co-operative store.

(e) *First-aid.*

Numerous deaths have occurred from small injuries in factories owing to blood-poisoning. Provision of first-aid by employers should be made compulsory.

(f) *Prohibition of liquor shops.*

The erection of liquor shops within the precincts of a factory of cooly lines should be prohibited.

(g) *Provision of washing accommodation* should be made compulsory in all factories employing more than 100 persons.

An association for the encouragement of cottage industries on the lines of the Bengal Cottage Industries Association should be established in this Province.

A special official appointed by the Development Board would be in charge of the improvement and encouragement of cottage industries. The trade schools and demonstration workshops would give aid in improving their methods, designs and materials, while the commercial museums and sales depôts would enable them to secure wider markets for their goods. Government orders could be given in some cases on condition that apprentices were taken.

Machines could be granted by the Industries Department on the hire-purchase system, where necessary. Chick-making, embroidery and basket-making could be introduced as cottage industries for girls.

GENERAL ADMINISTRATION AND ORGANISATION OF THE INDUSTRIES DEPARTMENT.

(a) *Imperial.*

I am assuming that the Munitions Board will be enlarged by the inclusion of additional special experts, and will become after the War the Indian Industries Development Board, the President of the Munitions Board becoming the Director-General of Industries, who would be the Member for Industries in the Executive Council. The Board would have separate budgetted funds and would be organised into separate departments. I would suggest the following :—

Direction, Chemical, Forests, Transport, Commercial Intelligence, Textile, Surveys and perhaps Cottage Industries.

At the head of each department there would be a scientist capable of organising his department thoroughly and solely responsible for its efficient working.

The Direction Department would control, co-ordinate and advise the Provincial organisation, and make all appointments to the Industrial service, whether Imperial or Provincial. Additional technical specialists would be appointed by the Development Board from home, preferably on short-term agreements and their services would either be lent to the Provincial organisations or the research institutions, as found necessary. They should be given frequent opportunities of taking short leave to study conditions and new methods at home and in other countries.

The Central Research Institutions should be under the control of the head of the Chemical Department of the Imperial Board. He would have an expert technical staff organised into groups for convenient working. Local Governments should not engage any technical experts without consulting the Development Board. Indians from scientific colleges could be appointed as Assistants in these research institutions. The representative of Forests on the Board would take over charge of the industrial work of forests and would co-ordinate his department with the Forest service through the Chief Conservator of Forests.

The Head of the Transport Department would work through the Railway Board, which would have powers to adjust railway rates, etc. Other departments.

The existing Department of Statistics and Commercial Intelligence should be made into a department of the Development Board. In order to increase its efficiency it would be strengthened by the inclusion of persons having knowledge of industrial matters. The lack of such supervision is the cause of the failure of some of its publications (*vide* the scathing criticism on its list of factories on pages 391-394 of the September, 1916, issue of the Indian Journal of Economics). The publication of the Indian Trade Journal should be continued and monographs and reports of investigations should be freely published, especially in the vernacular of the particular Province.

As much of the industrial development carried out in the provinces would be of an Imperial nature, the Imperial Board should have ample funds allotted, so that grants could be made to Provincial organisations for special projects, the cost of which Local

Governments might not be able to afford; otherwise the provinces in which the need for industrial development is greatest would be seriously handicapped.

(b) *Provincial.*

Director of Industries.

The Provincial Director of Industries would be a member of the new Industrial Development service (comparable with the Forest service). He would most emphatically have to be an expert, preferably from home, who has had wide business experience, and if possible, a training in Applied Science, Engineering and Economics, so that he could himself understand and deal efficiently with industrial problems. He should be the Secretary to Government for Industries, and be directly responsible to the Lieutenant-Governor for his policy and the expenditure of funds allotted by the Local Government. He should be assisted by an Advisory Board, which would include the Director of Agriculture, the Development Board Technical Advisers attached to the Province, the Director of Public Instruction, a Forest Department representative, a Railway Traffic official, the Inspector of Factories and 6 non-officials actively interested in industries. Others could be co-opted as found necessary. The non-officials should perhaps receive a small honorarium for their services. The recommendations of this Board would not have executive force, but copies of any proposals made by it would be sent to the Development Board for consideration as well as to the Local Government.

To obtain a Director of Industries with the requisite qualifications, Rs. 1,500 a month rising up to Rs. 2,500 should be offered as a minimum. This should be sufficiently high to attract the right type of man from home, who should be keenly interested in the work rather than in the pecuniary emoluments. He should be eligible for the higher posts on the Development Board. It would, however, be a very short-sighted policy, considering the great issues at stake, to attempt to economise on salaries of important experts and so obtain inferior men.

Assistant Directors.

Assistant Directors of Industries who would have had a scientific training should be on a scale from Rs. 500 to Rs. 1,250 with opportunities of promotion to Directorships and posts under the Development Board. They should be sent on deputation for research work at the Central Research Institutes as opportunities offered. Though Consulting Engineers might be temporarily appointed, the whole Industrial Development service should be Imperial and self-contained. To import amateurs having no scientific or business training, however skilful administrators they might be, would only result in inefficiency.

There should be frequent conferences between all departments, and the Indian Science Congress should also be encouraged to stimulate public interest.

Aid by municipalities.

Municipal authorities could aid industries in the following ways:—

- (1) By exempting machinery from octroi duties.
- (2) By initiating housing schemes for industrial workers.
- (3) By providing cheap electric power.

There should be an opportunity of appealing to the Industries Department against the imposition of unfair octroi duties by municipalities on raw materials required for industries.

Hydro-electric power surveys.

Further investigation should be made into possibilities of obtaining cheap hydro-electric power from canal falls. Water-power should be let to factories by the canal department at much lower rates than at present.

Jail competition.

The object of Jail industries should be to fit prisoners to find employment after release; this does not appear to be the policy at present.

Jail workshops which now work on antiquated methods should be made into demonstration workshops for the most improved methods in smithy, carpentry and metal work, etc. The practice of employing forced labour, e.g., Jail prisoners and criminal tribes alongside ordinary workers at very low rates of wages, should be stopped. It unfairly depresses wages and degrades industry.

General.

In addition to those mentioned under the heading "Demonstration Factories," the following may be suggested as possible industrial developments requiring investigation:—

- (1) The establishment of a silk industry under skilled supervision.
- (2) A modern cotton-seed oil refinery.
- (3) A wood pulp factory in the Kangra District.
- (4) Calico-printing works.
- (5) Bleaching powder works in conjunction with an electrolytic Alkali plant.
- (6) Potash salts from the neighbourhood of Khewra.
- (7) Industrial alcohol.
- (8) A glass factory worked by modern methods.
- (9) Development of fibres available.
- (10) Tinned fruit industry at Quetta or in the hills.

ORAL EVIDENCE, 16TH DECEMBER 1917.

Sir D. J. Tata—Q.—In your opening sentence you say, "There is in my opinion no great difficulty in obtaining capital for sound enterprises, backed by reliable persons." So, practically it comes to this, that you should have people with business training and aptitude who should start them in order to promote industries in any particular district. It is not the people who subscribe to things so much as the captains of industry who really make the industry possible in the particular province?—A.—Yes.

Q.—So it is really business men that are wanting here?—A.—Yes.

Q.—The traditions of the Punjab are against this sort of training. Bombay has advanced because it has special facilities of commerce and trade being a port and has been in contact with industries so that it has produced industrial and business men. Is not that the idea?—A.—Yes.

Q.—If you had business men you would probably find no difficulty in getting people to invest capital in industries?—A.—Good business men put their own money into a concern and run it. The point is that the people would not put their money into any concern even if it is really sound unless they can trust the person who is promoting it.

Q.—You have to find the men whom you can trust, and who have shown their capacity for managing business concerns successfully, and if you get these there will be no difficulty in getting capital?—A.—No difficulty at all then.

Q.—Later on, in connection with the ways in which Government might assist, you say, "Government should give support by providing part of the share capital and loaning the services of their technical experts at a nominal charge, and perhaps providing a skilled managing director. Where is that skilled managing director to be found by Government?—A.—In promoting pioneer factories I assume that in some cases Government must give capital to help.....

Q.—I am asking you about the skilled managing director?—A.—Unless they had a skilled managing director it would not be a success. Government would get one from home, otherwise the pioneer factory could not be a success. If there was a man who wanted to promote a certain industry and came to Government for help, Government could lend that expert.

Q.—Anybody to manage a business with success should have a certain amount of local experience?—A.—I don't think so. Suppose they wanted to start a pioneer sugar factory or something of that kind, they would put that in charge of a skilled managing director not necessarily of local experience.

Q.—Should that man be brought out from home?—A.—It would all depend upon the particular factory. In the case of sugar, yes.

Q.—You say, "Though precautions would have to be taken to prevent the pioneer factory from being killed by competition for raw materials and markets." What sort of precautions?—A.—You would have to have a form of licensing. There would be difficulties in giving pioneer factories to private enterprise unless you had some means of preventing competition: for instance Government could supply raw materials to the pioneer factory or guarantee to purchase the products.

Q.—You say "Government-controlled pioneer factories as opposed to privately-owned ones, would have the advantage that Government could check foreign competition, which might otherwise immediately stifle them." How can Government check foreign competition?—A.—By an import duty on the manufactured goods. Government would then take interest in it and they would have power to do so. A private individual would not be able to impose any import duty.

Q.—At the end of that paragraph you say, "Moreover it could more easily secure convenient factory sites in suitable localities." How could they get these? By acquiring land from private owners?—A.—Government has a lot of land at its disposal I believe.

Q.—It may not be suitably situated?—A.—If they cannot get land they should take it compulsorily.

Q.—You are for land acquisition by Government for industrial purposes?—A.—At a fair valuation. I think it is a great difficulty in the Punjab. You cannot get land.

Q.—You say, "A system of licensing factories should be introduced which could be administered by the Department of Industries; no permits for building new factories should be granted in any locality already overcrowded with factories, if the owners of the idle factories are willing to offer them for sale either by auction or at a price assessed by the Department of Industries." When they are sold who is to buy them or what is to be done with them? Are they to be put up anywhere else? What is to happen to them if they are sold?—A.—I mean that if the original owner is willing to auction it another man should not be permitted to put another up. He should buy the one there already. Under the licensing system I suggest, idle factories would obtain no profits and therefore would be going at cheap prices: cotton buyers might buy them; the point is there would be no parasitic idle factories, and licenses would only be granted if a factory was really going to be worked.

Q.—And put it up somewhere else?—A.—Possibly. If a man wants to put up a factory at a certain place it means that the crop is increasing in that place and there will be work enough for another ginning factory there. As in paragraph 6 of my suggestions he could move to another district.

Q.—He is to be allowed to buy a factory from some other district?—A.—I mean in the same place in the paragraph quoted.

Q.—Why should one man sell to another for the same purpose in the same place? It does not matter who owns it? You say that he sells it to another who puts it up there?—A.—In order to work this licensing system I think you must have something of that sort.

Q.—You say that no permits for building new factories should be granted. That means that no more factory should be allowed to be put up in that particular district and if a man wants to sell a factory he should be allowed to sell and he sells it, and it simply means that it goes into the hands of another and there will be the same number of factories?—A.—If he puts up another one that adds one more in the district and will increase the difficulty because he will come into the pool. What happens is this. They put up factories and they do not intend to work them and it is an additional burden on the pool. I was trying to prevent that. The new man would buy an idle factory and work it.

Q.—Selling it to another man does not alter the situation?—A.—That prevents the addition of one new factory. Instead of putting up a new factory he should be compelled to buy the one already existing.

Q.—And he does not work it either and so the conditions are the same.—A.—He would work that one, because under the system suggested he would have no profit otherwise.

Q.—You presume that in a particular district where there should be five factories there are fifty factories more put up by people in order to share in the pool. How will it be a remedy to allow one of these being sold to some one else in the same place? You say that in a new district if a man wants to put up a factory he should buy an old one from where it has not been worked? That is what you mean here, I presume?—A.—I think it is clear: under the licensing system the pool would be broken and there would be no idle factories parasitic in the working factories.

Q.—With regard to researches by Government experts you say, "Special researches carried out by Government experts at the central research institutions in India at the instance of private concerns should be paid for and should not be published except with their consent before the lapse of a year from the date of making the report to the firm. You limit the period to a year. Do you think that is sufficient?—A.—It will all depend upon the concern. In one case it may require a longer period and in another case it may not require any at all.

Q.—You do not want to fix the period generally for every case?—A.—I would not insist on a fixed period.

Q.—One year seems to be too little.—A.—It will depend on the particular concern.

Q.—You say, "It would be found that factory owners would gladly allow their factories to be used for demonstrations of new methods, appliances or processes." Would private factory owners allow their factories to be used as demonstration factories?—A.—If there is a new method I think factory owners would be quite willing to have their factory tried by the new method.

Q.—They would not like outsiders to come in and pry into their business? If they tried a new thing, they would try to keep it to themselves, and I do not think they would allow outsiders to come and see the process.—A.—How is Government to show a new method or practice? There may be factories already existing working under antiquated methods and I think that in that case they would be willing to allow others to come and see the process. They might want conditions that they should have the first opportunity of putting that process into operation. Government could give compensating advantages.

Q.—With regard to tanners, you say, "There is a very great demand for well-tanned leather especially belting for factories." Are there so many factories in the Punjab that there is a great demand for belting?—A.—Yes. It has gone very high in price.

Q.—What sort of factories? The existing ginning factories and others would require this belting?—A.—I think so.

Q.—I do not know the number of factories that there are in the Punjab.—A.—In the Punjab, including every factory there may be 300.

Q.—You say, "It should also be a model of business management and a pattern to all in the treatment of its employes." That is all very well. You say also, "It should contain the latest machines provided with dust removing fans if possible, and should demonstrate the best ventilation and lighting arrangements and the most efficient methods of guarding machinery." Where are we to get these model business men? Who is to find these model men to manage the business? Would he be a Government servant or a private business man?—A.—You will pick up a good man and set up a

model factory. The factory owners are only willing to adopt changes when they can see them, and then they will act upon and follow them. If a model factory were put up they would be willing to visit it and see the things for themselves.

Q.—It is the absence of business management that makes failures and if they could be got, of course the model business men would be able to do all these things themselves. The difficulty is to find them. Where are we to find them?—A.—The business man would not necessarily do all this.

Q.—The success of an industry would depend on the man who runs it on good lines, and the difficulty is to find the right kind of man.—A.—That is one great difficulty in the Punjab, but a model factory is not meant to make the greatest possible profits. There are other considerations as I have emphasised.

Q.—Are there any bone manure factories in this province?—A.—I do not think so.

Q.—And do you know of any in India?—A.—No. A good many places export bones.

Q.—Do you know of any bone manure factories which have met with success?—A.—There may be in the Bombay side.

Q.—I do not know if they have met with success. I believe they crush bone and export. You propose that it should be made into manure and not simply crushed?—A.—That would be successful if it were run properly.

Q.—And you convert it into fertilisers?—A.—I am informed that there is a large quantity of bone manure imported and I think we have bones here and they may be used. There are several little places. Multan, for example, exports bones and they come back to India as fertilisers.

Q.—You have no idea of the quantity of export of bone-dust and of the manure imported?—A.—I cannot remember exactly the quantities.

Q.—You think there is an opening for a bone-manure factory?—A.—Yes.

Q.—You say with reference to potteries "that they are stagnating owing to the substitution of inferior material and the lack of skilled advice and business management." Are you aware that in the Bombay School of Art Mr. Fern advises on clay and soils and things of that kind, and there is now a department in that school, which advises people about the different kinds of clays and soils and so on.—A.—We want a man like that in the Punjab.

Q.—Do you know Mr. Fern's work?—A.—No.

Q.—That is the sort of man that you mean in that paragraph?—A.—These industries need a man to look after them who could go round and help them with regard to these three points that I have mentioned.

Q.—Among the factories that you propose you mention a linoleum factory. What facilities are there for that manufacture?—A.—I do not know the practical manufacture of linoleum, but I believe cotton-seed oil can be used.

Q.—What are the raw materials needed for linoleum?—A.—I think cotton-seed oil comes into linoleum manufacture. It is made in Dundee and it can be made here I think. I only gave these factories as suggestions for investigation.

Mr. C. E. Low.—Q.—Jute in the first instance, linseed oil and some colouring materials, I think. Is it used largely here?—A.—It is not used to a large extent, but it would be a good thing if it could be cheaply made in India. I think the raw materials are produced here.

Q.—Don't you start on that basis whether the raw materials are produced or not?—A.—Yes.

Q.—Sir D. J. Tata.—You say, "Local scientific colleges should not ordinarily concern themselves with industrial research work though they might attempt minor researches... These colleges could provide skilled chemical assistants to work in the central research institutions." Would these students who come from the colleges become chemical assistants straight off without first undergoing some sort of apprenticeship or getting some experience of research?—A.—The students of the M. Sc. section of the Applied Chemistry of the Forman Christian College would be a very good material.

Q.—You know the Institute of Science at Bangalore which takes science graduates. They go and train themelves there for research work, and after they have been through a course of three or four years they become fit to become assistants. Would it be good to make them assistants straight from the college of science?—A.—The men at the central research institute will decide that. They may be on probation on a small pay at first and the pay may be increased afterwards when they become of more value to the industry.

Q.—They would not be fit assistants straight off from the college?—A.—I do not mean straight off.

Q.—You say, "Government buying departments should not be allowed to import manufactured articles which can be obtained in this country." Isn't that only if the quality

will serve? Anything made in this country should not take the place of the imported article simply because it is made in this country?—A.—I mean of serviceable quality, but you should try and improve the quality.

Q.—What price would you pay for this home-made article? Same as the imported article? Would you be prepared to accept a slightly lower quality as long as it is serviceable?—A.—They should try and improve the finish even then. If the buying department cannot get a suitable article in India I should imagine that it will be a good thing to inform the Industrial Board. Then there will be gradual improvement and then they will buy. There is at present no machinery at all for that, and they go on rejecting Indian-made articles because of the lack of finish.

Q.—You would not buy simply because it was Indian made but you would buy if the quality would serve the purpose?—A.—Yes.

Q.—You say with regard to secondary trade schools, "They should be founded in such commercial centresand it is essential that they should be in charge of skilled Europeans who could be selected from soldiers discharged in India after the war." What sort of knowledge would these soldiers have?—A.—I think there are a large number of soldiers in India who have engineering qualifications and have knowledge of crafts and so forth. Quite a large number of them are employed already in many works. They provide very good material as instructors.

Q.—Why is it essential that they should be in charge of a skilled European?—A.—I think the skilled European will be a better man, having more skilled experience.

Q.—Can you not find a skilled Indian? Are there not enough skilled Indians to take up the work? I do not know if you can get discharged soldiers who will be competent enough to do this work.—A.—I think you can and if you cannot you can obtain them from home.

Q.—I do not know why you mention discharged soldiers because I do not believe that you can find among them sufficiently skilled artisans to carry on this work of teaching in schools?—A.—A good number are working in munition works now. There is an organisation for the employment of these after the war. A register is now being prepared of the men who are prepared to take up posts in India after the war.

Q.—Of men willing to work in India when discharged?—A.—Yes.

Q.—I suppose these secondary trade schools will be fed by the primary schools. The man that comes into the primary school will go into the secondary school later on or would you put him straight off into the secondary schools?—A.—You will have a certain proportion coming in direct to the secondary school. It would not be fed altogether by the primary industrial school. In fact, the primary school would be for the lower grades of labour.

Q.—You say, "It should be a splendid idea if courses on business management could be started in all university colleges and trade schools and diplomas granted?"—A.—I think that would be a good thing.

Q.—How could you teach business management?—A.—In some of the polytechnics at home they have short courses for business methods and management. I think that is quite possible.

Q.—Surely business management is a natural aptitude and it cannot be taught?—A.—I think you can teach a good deal of the elements of business management.

Q.—A man very highly educated and trained may not make a teacher. He may not be a successful teacher though he may have taken higher degrees in college, and in the same way business management seems to be such a difficult thing to be taught. A business manager is born and not made.—A.—A teacher requires a lot of training before he is put into a teaching post. Unless a teacher has training in psychology and educational methods he is not much good.

Q.—You say that there are schools where business management is taught?—A.—In London. One polytechnic in London runs a course for business management—the methods of management. If a man had that course he would be more fitted to run a factory afterwards.

Q.—Can the man be so trained that he can run an oil mill or a tannery?—A.—A knowledge of business methods would be of help.

Q.—He would have to gain expert knowledge in that particular thing afterwards?—A.—Yes. Even though he may have expert knowledge he has no idea of business methods at all and things fail because of that.

Q.—The examination for factory engineers should be uniform?—A.—Yes.

Q.—How are the examination papers to be issued?—A.—You will have centres in the various provinces for the examination. The examination will be held on one day in all the centres and the same papers will be circulated.

Q.—Is there not some fear of leakage?—A.—You will have to guard against leakage. Surely you can do that. It is a practical difficulty that engineers come from other provinces

and cannot be made use of in factories here until they have got a certificate in this province. That is waste of time.

Q.—The man who gets a certificate in Bombay cannot go to Madras and so forth?—

A.—No, and in some provinces they have no certificates of any kind.

Q.—As regards the prevention of accidents, does not the factory inspector go round the factory and see that there is provision against accidents by way of guarding against dangerous machinery? It is provided for in the Factory Act?—A.—Yes. Directly the factory inspector turns his back they may be taken off.

Q.—Once the guard exists and is placed there, what is the reason for removing it? Money is spent on the thing. I believe that in every factory the factory inspector sees that there is some guard against dangers in machinery?—A.—This is already done. I think that there are still a large number of preventable accidents owing to unguarded machinery.

Q.—I fully endorse the idea of compensation for accidents, and a good deal has been done in this direction. You say, "Japan has already protected its workers in this way and a similar measure of justice is badly needed in this country." Can you tell us what Japan has done?—A.—I have not got the Japanese Factory Act with me, but I could send it to you.

Q.—You know this is done in Japan?—A.—Japan has just brought out a Factory Act, and it includes compensation for accidents.

Mr. C. E. Lowe.—Q.—Has Japan any factory inspectors to speak of?—A.—I do not know, but Factory Inspectors would be needed to administer the Act.

Q.—It works with as few factory inspectors as possible?—A.—Is that so.

Sir D. J. Tata.—Q.—As regards housing conditions, you say, "The conditions are deplorable in the extreme. . . . It should be made compulsory for owners of factories above a certain size to provide dry, clean, well-ventilated and healthy dwellings for their employes at reasonable rents." Is it made compulsory in any other part of the world?—A.—We have not got the same conditions here as in other parts of the world. I am not certain about other countries. The municipalities make provision at home for factory employes. In India the workers are ignorant and should be protected from being exploited.

Q.—Does the mode of living of Indian workmen render this task free from difficulty?—

A.—You think it is due to the employes themselves? I do not think so.

Q.—It is due to the employes themselves. They frustrate any attempt to house them. If you give them ventilation, they will choke up every hole that they can possibly get at; they will overcrowd. . . .—A.—It will be up to the employers to have the things done properly. The same plea was not made before the passing of the English Acts.

Q.—I believe the employers are willing to do something for them but it is the labourers themselves who really will not accept the things that are provided for them.—A.—I think not. It is not my experience.

Q.—Their habits are not cleanly and they do not particularly care to keep their surroundings clean. For instance when you provide ventilation in any dwelling that you go into they will put pieces of cloth and close the windows and they overcrowd. That is the difficulty. The employer is anxious to improve their condition but the difficulty lies with the labourers themselves.—A.—I do not think that is so. Directly you give them good conditions you will improve their habits.

Q.—If they are better educated. Our difficulty is want of education.—A.—Give them primary education as well, but employers should be compelled to provide proper ventilation and housing accommodation.

Q.—If I were asked to sum up the labours of the Commission I should sum it up in three words, educate, educate, educate.—A.—If the operatives are educated they would insist on having decent conditions, but Government should protect them before they get this education.

Q.—You talk of apprentices with cottage industries. You say, "Government orders could be given in some cases on condition that apprentices were taken." Who would take apprentices? Cottages?—A.—When I say cottage industries I do not mean merely those done in cottages but those done in bazaars, because the men will not teach others and sometimes the industries die, owing to processes having been kept secret.

Q.—It is simply handed down from father to son?—A.—Yes. If Government is going to help such a man one condition should be that he should take apprentices.

Q.—He will never do that.—A.—I would not help him in that case, but I would give him every inducement to divulge his secret by guaranteeing purchase of his outturn.

Q.—You say referring to hydro-electric power surveys, "Further investigation should be made into possibilities of obtaining cheap power from canal falls." You mean cheap hydro-electric power?—A.—Yes.

Q.—Then you say, "Water-power should be let to factories by the Canal Department at much lower rates than at present." Do you mean hydro-electric or water-power?—A.—Both, water-power as well as hydro-electric power. The Canal Department insist on getting 50 per cent. of the expenditure they made previously. They are not out to help industries.

Q.—For water-power only?—A.—Yes.

Q.—You propose that these rates should be lowered?—A.—Yes. They try to get good profit on the hydro-electric power too instead of giving fairly low rates.

Q.—Under "General" remarks you suggest calico-printing works. Do you mean power works or hand-printing?—A.—Both.

Q.—You suggest, "Bleaching powder works in conjunction with an electrolysis alkali plant." Where would you place them?—A.—These are only suggestions. We could manufacture alkalis in the province, and bleaching powder would be a bye-product.

Q.—I thought that bleaching powder works should be placed near the sea.—A.—That would be a difficulty here, but not insuperable, I think.

Q.—In the Punjab you could not place them very conveniently?—A.—I am not certain about that.

Q.—You suggest, "Development of fibres available." What fibres and for what purpose?—A.—I do not know the practical details. I have merely noted down the points that I have obtained from factory owners.

Q.—You know nothing of the fibres of this district?—A.—I think there are fibres in the Punjab which could be utilised.

Q.—What can they be utilised for?—A.—Rope-making and paper-making.

Hon'ble Sir Fazlulhy Gurrinbhoy.—Q.—You have now been transferred to Delhi? Who is doing your work?—A.—I have been transferred on military duty.

Q.—Who is doing your work here as Inspector of Factories?—A.—No one.

Q.—Is nobody inspecting factories?—A.—Nobody who can do it properly. The Director of Agriculture will be the nominal Factory Inspector.

Q.—How long have you been in this country?—A.—Four years.

Q.—What were your qualifications when you came out here?—A.—I took a first class in the Natural Science Tripos in Cambridge, chemistry, physics, botany and physiology, and I took engineering also there and in London and I went into teaching. I took a diploma of teaching at Cambridge also. Then I was in the Home Office for a certain time as Inspector of Factories. I have had both science and engineering training.

Q.—You say, "I believe from the numerous enquiries I have received when on tour there is a great deal of unused capital in the province." Who are the people who have got this unused capital?—A.—Factory owners, cotton-ginning and other factory owners. They are always asking what other concerns they could put their money into?

Q.—Because they are tired of these ginning factories?—A.—Yes. They want something else to put their capital into.

Q.—You say, among the other ways in which Government might assist one is, "Exemption from income-tax and octroi duties on raw material required for new industry." When they make profit should they not be liable to income-tax?—A.—They may not make a profit next year. Pioneer factories might be excused income-tax.

Q.—What about the ginning factories? You have stated everything in detail. You say, "During my enquiry into this question I have ascertained the views of many of the prominent factory owners in the province and I feel sure that the majority of them would welcome the adoption of any proposal which would put an end to this evil, which so seriously handicaps the ginning industry and is the main cause of the regrettable sweating of women and children." Is your opinion generally based on the complaints and other hardships from prominent factory owners or have you just put down your own views about that?—A.—Some of them might object to my views but the majority would welcome any action to prevent the erection of an excessive number of ginning factories.

Q.—You say "The majority of them would welcome the adoption of any proposal." What profits are they getting?—A.—They are on the whole getting about 10 per cent.—Idle ones 10 per cent.—the working ones anything from nothing to 50 per cent.

Q.—We were told the other day that they were not getting more than 3 per cent.—A.—I do not think so.

Q.—If they are getting 10 per cent. why should Government interfere and protect them? There is no need of protecting them at all?—A.—In some places they cannot get 10 per cent. I am not suggesting protection. I want the pools broken which force up ginning prices and cause all the excessive over-working of women and children.

Q.—If they are generally getting 10 per cent I do not think that Government ought to interfere. 10 per cent. is a very good rate of interest?—*A.*—Some have to work their operatives like slaves in order to get 10 per cent.

Q.—They might be dealing in cotton and other things, but others want to have their pool money and keep quiet.—*A.*—Those would object.

Q.—If there are ten ginning factories in a place and if another man wants to put up a ginning factory, he should have to buy one from one of the willing sellers of the existing factories?—*A.*—Yes. I would stop putting up a new ginning factory at a place where the crop is not sufficient. It is getting worse and worse.

Q.—Worse in what way?—*A.*—They are going on putting up new factories where there is already an excessive number.

Q.—It is the survival of the fittest. If I want to put up a new factory because I want to buy cotton, why should I not be allowed? Why should I be prevented by Government?—*A.*—My idea is to break the pool system and have no idle factories.

Q.—If there are too many, they will break themselves?—*A.*—They will do their utmost to absorb the extra one by keeping it closed.

Q.—If I am a buyer of cotton and come to your district and put up a gin, you would not allow it?—*A.*—I would not allow you to put up any gin. You could not make your factory successful in that place where there are already a large number of factories.

Q.—I do not go there to make a profit out of ginning. I go for my cotton trade, and why should I be prevented?—*A.*—You can gin at the existing factories, or buy an idle factory. If there were no idle factories you would be allowed to erect a new factory.

Q.—Why should I come into that pool? I do not want to make a ginning profit. Instead of paying more to the ginning factory I prefer to pay more for the cotton?—*A.*—The pool is not between the cotton sellers, but the ginning people. If the crop was sufficient you would be allowed to erect a new factory.

Q.—I do not want to pay the ginning factory the charges which they fix for the pool, and I would like to see that the cultivator gets a profit, why should I be prevented by Government from putting up my own ginning factory?—*A.*—I do not see where is the force of your argument. You would not be prevented if the crop were sufficiently large and there were no idle factories for sale.

Q.—Suppose Messrs. Ralli's want to put up a new ginning factory?—*A.*—They have not any. The cotton owners have not got their own ginning factories.

Q.—I am speaking of cotton buyers.—*A.*—You want an exception made in the case of cotton buyers who want to have a ginning factory. It is not necessary in this province, but you could make an exception in that case.

Hon'ble Mr. H. J. Maynard.—*Q.*—Is it not the case that Messrs. Ralli's have asked for leave to put up a ginning factory? I think you said that they had none of their own. They have at all events applied.—*A.*—I do not know that. As a matter of fact, they usually lease them.

Hon'ble Sir Fazulbhai Currimbhoy.—*Q.*—You say "The complaint is a general one among factory owners, that suitable land is difficult to obtain for industrial purposes, at reasonable prices owing to the operation of the Land Alienation Act? What remedy do you suggest? You want a clause in the agreement stipulating that the permit to use it for industrial purposes shall elapse if not acted upon within three years. Is not the Act doing good to the people here?—*A.*—It might be generally, but land granted for industrial purposes should be so used within a reasonable limit of time.

Q.—You want that factories must be allowed to acquire land?—*A.*—You want to know the meaning of that last suggestion that I put forward. They get permission to put up a factory but they do not act upon it for years and then blackmail the existing factories.

Q.—You desire that the permission should be only for a limited period?—*A.*—Yes.

Q.—You say "It would be a splendid idea if courses in business management could be started in all university colleges and trade schools and diplomas granted." You want special colleges for this purpose?—*A.*—It will all depend on the demand. You may try it in one or two colleges at first.

Q.—You want colleges for the higher technical and commercial education. That is your view?—*A.*—Scientific and engineering colleges. I would have a polytechnic like the ones in London.

Q.—You say, "It should be made compulsory for owners of factories above a certain size to provide dry, clean, well-ventilated and healthy dwellings for their employes at reasonable rents." Would you apply this only to factories or to all the employers of labour?—*A.*—Do you mean other than factories? I am dealing only with factories.

Q.—Railways, Municipalities, Government?—*A.*—Yes. To Government and Railways also. If there is a compulsory enactment it must be applied to all employers of labour and not only to private factories.

Sir F. H. Stewart.—Q.—Your experience is confined to the Punjab and your evidence is dealing solely with the Punjab?—A.—Yes.

Q.—Are you also Inspector of Boilers?—A.—I have nothing to do with boilers.

Q.—What are the majority of factories in the Punjab that you have to inspect?—A.—The majority are cotton-ginning factories and presses.

Q.—With reference to this examination for mechanical engineers' and engine drivers' certificates you think that it would be a good thing if it is made uniform and central. The examination should be run from the headquarters?—A.—I would say, have one examination in each province if there is any difficulty about examination papers.

Q.—But they should be set by a central examination board?—A.—Yes.

Q.—In Bengal and Madras they have no examination, and they confine themselves to inspection. Do you think that would work in the Punjab?—A.—In Bengal a man can be an engineer of a factory without any qualifications? I think that qualifications should be insisted on here.

Q.—The responsibility is on the employer? I do not think there are more accidents in Bengal than in other parts of India?—A.—I do not know.

Q.—What department are you working under?—A.—Under the Director of Agriculture and Industries.

Sir D. J. Tata.—Q.—You say, "Numerous deaths have occurred from small injuries in factories owing to blood-poisoning. Provision of first-aid by employers should be made compulsory." You mean dispensaries in every factory?—A.—In the case of a large mill I would make something of that sort compulsory.

Q.—How would you provide first-aid? Just train a few people?—A.—Yes, in first-aid dressing.

Q.—Some men who would know how to utilise first-aid dressing?—A.—There would not be any hardship to have a man trained in first-aid in the factory. My experience is that a large number of fatal accidents occur just for the lack of first-aid dressing.

Mr. C. E. Low.—Q.—What is done, as a matter of fact, by any industrial concerns here by way of housing their operatives?—A.—In some spinning mills they have chawls, but they are insanitary.

Q.—Are they in towns or outside the towns in the open country, in those places?—A.—Here in Lahore? I do not think they have any houses for operatives.

Q.—When you say chawl, do you mean a sort of four or five storeyed building?—A.—I do not know exactly the definition of a chawl. It is single storeyed, very cramped and overcrowded.

Q.—Why do they house them? Is it because they are far away from any town or place where the operatives cannot get accommodation or is it to attract them?—A.—Partly to have the labour close and handy.

Q.—If they do not build buildings what would happen? How much would a millowner be the worse off?—A.—Probably he would not get his labour. It depends upon the particular place. In one district they put them up in order to accommodate labour from the United Provinces. If the owner provides accommodation for his own advantage, then it should be sanitary and not overcrowded. That is my point.

Q.—Do the Government or the big railway companies house their labour?—A.—The railway workshops have fine quarters.

Q.—Only for the menial staff or the superior staff? Suppose there is a fitter on Rs. 30 or Rs. 40, do they house him?—A.—I think they do.

Q.—The housing accommodation looks as if it were the most appropriate for that class of labour?—A.—Yes.

Q.—Any other big industrial department of Government? Any arsenal?—A.—Not arsenals because they could not have them inside.

Q.—The postal peons and the telegraph peons in Lahore, are they housed?—A.—I do not know.

Q.—Are the house-rents very high for that particular class of persons?—A.—Yes.

Q.—Have you any idea as to what they are?—A.—The general complaint is that they are very high. I think in certain places Rs. 4-8-0, and I do not know whether this class of dwelling would be taken up by factory employes. In mills they charge a nominal charge, Rs. 1-8-0.

Q.—Do you know of any other country in the world where there is an obligation on the employers to house their labour?—A.—I do not know that it is obligatory, but in India owners find it indispensable, and it should then be sanitary and fit for human beings.

Q.—Is it the case in the United Kingdom?—A.—The Englishman will protect himself.

Q.—Is the English employer obliged to house his labour?—A.—I do not think so, but there are other facilities by means of municipalities and other bodies.

Q.—But there is no obligation on the employer as such except that he is to contribute to schemes for the betterment of the lot of employes?—A.—There are welfare boards.

Q.—That is a war proposition, but outside the war?—A.—I cannot say for certain. The factory owner would get the municipality to do it, and he would probably give a grant towards it. In Lancashire it is so I think.

Q.—That would be a purely optional business?—A.—India wants guiding more than England, and ignorant Indian coolies need more protection from unscrupulous employers.

Q.—At present if you restrict the number of gins in a district or elsewhere do you realise that you are creating a valuable vested interest in the gins belonging to the remaining people?—A.—Yes, but the restriction is only partial.

Q.—The result of that is likely to keep up the rate of ginning cotton rather than put it down? Your average rate for ginning cotton is I understand here 10 annas?—A.—By breaking the pool you would get cheaper ginning.

Q.—There is nothing to stop a pool if you limit the number of gins?—A.—My method is to break the pool, and make idle factories work and increase competition among ginning factories.

Q.—I do not quite see how your method will break the pool?—A.—There would be no longer any necessity for pools. They would not get any advantage. Those that are lying idle now would be compelled to work. If they are not worked for three years the license would be revoked, and the pool would lose its object.

Q.—Do you think as an ordinary abstract proposition that the reduction of the number of gins would have that effect of breaking the pool?—A.—It would prevent an increase in the total number of gins. And instead of working four or five very hard day and night you will have eight or nine working normal hours. The number of working gins would increase, thus increasing competition.

Q.—You propose to stop any new gin starting unless the state of cotton crop warrants it?—A.—Yes.

Q.—That means you will have fewer gins than you would have if you did not apply any measures at all. The fewer the number of gins the higher will be the rate for ginning? May I give an actual instance. Messrs. Ralli's declined to have anything to do with pools because what they said was that they wanted cheap cotton for export and they wanted to encourage cotton business in every way, which meant more money for the cultivator and cheaper cotton for themselves; and they declined to enter into the pool because they said that the pool business kept up the price of ginning and therefore of cotton. If you limit the number of gins and if you create a vested interest don't you create a protection for the pool that you are trying to stop?—A.—If Messrs. Ralli's broke up the pool it would be an advantage. The licensing system would increase the number of gins actually working. The 3,000 gins now idle would be worked and pools would be unnecessary.

Q.—How are Ralli's going to do that if you do not allow any more gins to come in?—A.—You can put up extra gins for that purpose. My suggestion would result in idle factories being worked or their owners would lose money, while in districts in which the crop demanded it (and Ralli's would not want to put up a factory unless the crop demanded it) new factories would be allowed. (Here the witness explained his statistical tables.)

Q.—Are the existing pools registered under the Companies' Act?—A.—It is not compulsory now. A pool is not a company. It cannot be classed as a company. From my own point of view the operatives suffer and work like slaves under this pool system.

Q.—Is it not a better remedy to show people how to invest their money more profitably?—A.—Yes.

Hon'ble Mr. H. J. Maynard.—Q.—As regards your idea of licensing ginning factories, one of your conditions would be the fixing of the charge or the maximum charge for the price of ginning?—A.—Yes. The Cotton Committee is dealing with this point.

Q.—They are as a matter of fact dealing with it in full. As regards the lack of good dwellings for workmen, may I know whether the Dhariwal factory is also guilty of not providing housing accommodation for its labour?—A.—They provide good dwellings. New ones are just being built.

Q.—They are attempting to do it?—A.—Yes, but they have always had good dwellings.

Q.—As regards what you were asked about fibres, do you know that the Agricultural Department is already investigating the question of fibres, but the real difficulty is to get enough water for retting purposes?—A.—I suggest that the Industrial Department would have more opportunities of conducting the work. I merely put this forward as a suggestion.

Q.—Did you know about this enquiry that was going on? Did you know about the difficulty of getting enough water for retting purposes?—A.—I did not know.

Q.—As regards silk of which you speak of in your written statement it has been dealt with by the Agricultural Department?—A.—Yes, and I think it ought to be continued. If there is a special Deputy Director on the job it would be a good success.

WITNESS No. 370.

Mr. E. D. DIGNASSE, *firm of Messrs. Neison, King and Simson, Lahore.*

WRITTEN EVIDENCE.

I propose to confine my remarks to certain aspects of the relation of finance to industry in this province.

It must be remembered that here the cult of joint stock enterprise and even of commercial banking is of comparatively recent growth. The local notoriety of certain failures during the last few years, particularly that of the People's Bank, has perhaps led to the idea that the Punjab has already played a considerable part in the joint stock activity of the country. So far from this being the case, the paid-up share capital of companies registered and working in the Punjab in 1917 represents only 2½% of the paid-up share capital of the companies registered and working in the whole of British India; and the proportion probably did not exceed 8% even prior to the failures mentioned.

Such failures naturally engendered a wide-spread feeling of distrust and uneasiness throughout the province; this has to a certain extent decreased, but it is questionable whether complete restoration of local confidence can be looked for until there exists some machinery for experienced supervision of existing and new joint stock activity, or so long as pending liquidation proceedings involve the payment of calls upon shares with only remote prospect of any portion of the same being returned to the unfortunate investors.

It must be admitted that the Punjab is geographically handicapped in the industrial race, situate—as it is—so distant from the ports and the large coalfields. So far, I believe, as at present known, its indigenous coal is negligible, and it has no metals. These disabilities must needs render the cost of production by machinery and the introduction of products to foreign markets very high. But the possibility of restriction for some time at least to home markets forms no excuse for a supine attitude towards industrial advance. The staple industry of the province is essentially agriculture, and has created the sphere for the allied activities of ginning, spinning, weaving and milling.

Doubtless however the Commission will receive expert evidence as to other important natural resources capable of being exploited by industry to the communal benefit.

As to the amount of untapped capital which is, and economically should be, available for the development of industry, it is difficult if not impossible to form any estimate; but reliable opinion seems to point to the conclusion that the amount is very large.

But for the reasons I have given I regard the Punjab as being, commercially and financially, in a very primitive stage; and the method of linking up finance with industry to the best advantage may differ very considerably from that most adapted to the requirements of other provinces.

In most other provinces industrial activity, upon the lines of limited liability, has made giant strides in several directions; and there exist large firms of Managing Agents having the requisite experience, machinery and resources fully to investigate any new project; and, while it makes no formal guarantee, the hallmark or imprimatur of any of the leading firms upon a new issue is at least evidence to the investing public that the enterprise in question has been carefully investigated, and an earnest of good management.

Such a system has its defects, no doubt, but it has much to recommend it.

In the Punjab, where—it must be borne in mind—many of the educated classes yet regard a career of commerce with disfavour, we have to endeavour to ensure that new projects are thoroughly and carefully investigated both by technical and financial experts, and, fortified thereby, to coax into circulation the capital necessary to finance the development of such projects.

There can be little doubt but that the direct assistance of individual joint stock or private credit banks cannot properly here be sought, at any rate so far as finances for buildings, machinery and the like is concerned. A large portion of the funds of such banks are upon demand or short call, and the banks obviously are not in a position to assume large enterprise risks of a permanent nature. Moreover, once a credit bank is heavily involved in a particular industry or group of industries; it may be compelled, unless prepared to sacrifice much of its original investment, to maintain or even to increase the financial facilities it has offered in the past.

Such a position was peculiarly exemplified in the case of the People's Bank, to which I have already referred. This bank was formed for the specific purpose of promoting

and maintaining industrial enterprises upon Swadeshi lines ; but it stood practically alone in this respect, and, as deposits increased, and it could find no outlet for a wide distribution of its funds and so average its risks, a very high proportion of the funds were employed in one industry—cotton. This, followed as it was by considerable private enterprise in the same direction, led to over-capitalisation of that industry, to the embarrassment of the bank and private capitalists when the inevitable slump set in and many factories were making losses.

Other and potent factors contributed to this failure ; but I consider the main cause to have been the losses incurred by the cotton concerns.

A credit bank, moreover, would not ordinarily have the machinery for the requisite careful preliminary investigation into projected developments.

Attempts to secure the necessary finance by direct offer to the public of shares in a single enterprise by or through an individual promoter, unless such promoter were of known ripe experience and unassailable financial standing, would, I venture to think, now have but a meagre chance of success in this province. But even if successful the interest of the promoter is likely to be limited to making the actual floatation a success, and not to extend to the subsequent good management.

The provision by Government, in the earlier stages of funds, or the grant by Government of special facilities or concessions for the development of particular industries appear to me open to objection in that Government would always be liable to the criticism of favouring certain districts or branches of activity more than others ; and, unless a very elaborate department for the collection and expert use of information were set up, Government would not have facilities for so co-ordinating industrial movements as to ensure the even progress of the whole. So far as my own experience in this province goes, the activities of Government in connection with purely commercial questions have not hitherto been of a particularly helpful nature : to some extent by reason of the lack of such facilities.

In Germany, in which country the association of banking with industry is probably more intimate than in any other, the credit banks have formed themselves into powerful groups for the finance of industries. The combined experience and resources of a group of credit banks enable it, and its direct interest in industrial activities compel it, to include in its functions, enquiries into foreign markets in relation to the industries with which it is concerned, expert investigation into projects for expansion and development, and the actual promotion and control of industrial companies. Under these conditions the individual investor is financing industry, in the first instance, through his deposits in the credit banks.

Such methods would not, I apprehend, appeal to credit bankers in this province or country, as they involve the banks in duties which are ordinarily regarded as outside the sphere of legitimate banking ; and, moreover, although the risks may to a certain extent be averaged, their permanent assumption by credit banks must, as I have already endeavoured to show, constitute a source of weakness to the banks' resources for bill and other fluid business.

In order then to endeavour to ensure complete preliminary investigation and thus to safeguard the potential investor whose capital is wanted for industrial development, there is required, in my opinion, an organisation in the shape of a large financial institution having for its object the examination into new projects, the development of the same until ripe for direct public investment, the maintenance of close touch with local and foreign market conditions, and questions of shipping and rail facilities as affecting the indigenous industries within its sphere. Such an institution would in short combine the functions of a Chamber of Commerce, a research bureau, and a commercial intelligence department with company promoting business, and should be run on purely business lines.

The initial capital required would not be large but the credit and financial backing of the institution would have to be unexceptionable. Such credit and financial backing might, I think, be obtained if the capital were subscribed by the leading credit and exchanged banks, and it is here that banking would become linked up with industry in a manner advantageous to both. The banks would look, not so much to immediate return on their investment as to the indirect benefit accruing from the development of local industries upon sound lines, and the consequential increase in stock finance, exchange, bill and other legitimate banking business.

The subscribers to the capital would of course be represented on the Board of such institution which would employ technical experts for investigation work and business experts for company work.

To provide, upon a funded basis, resources for its activities from the dormant capital of the province, the institution should be empowered to issue debentures to an extent not exceeding in all say 8 times its subscribed capital, such debentures to be guaranteed by Government both as to interest and a sinking fund rendering the debentures redeemable by annual drawings in 30 years. The rate of interest would necessarily be higher than that of Government loans, and would, I think, appeal to a new section of the public. The guarantee would not involve Government in much risk, as it in turn would have the security of the capital subscribed by strong financial houses.

The institution would, as a commercial concern, depend for its expenses, for serving its debentures, and for its profit upon promotion and management fees.

The institution would have to be represented on the Boards of the companies floated under its auspices.

The hallmark of such an institution upon any new issue would constitute not a guarantee of success, but evidence that everything humanly possible to achieve success had been done in the launching and would be done in the management of the venture.

The desirability of the establishment of one or more such institutions, though without Government co-operation, in the United Kingdom after the War has been freely discussed at home; though for a different reason, viz., to popularise the support of indigenous industries with the investing public which has hitherto exhibited a marked preference for foreign and colonial securities.

As to the effect upon what is commonly referred to as private enterprise, I consider that so far from stultifying private enterprise, the existence of the organisation outlined would be a valuable aid both to the capitalist or the inventor, either of whom might well be at a loss without expert advice, the former as to ways and the latter as to means.

The problem of personnel for the proper conduct of the institution would be admittedly a difficult one, as also the provision of responsible directors for enterprises launched.

If I may speak from my own experience in connection with commercial enterprise, it has been my privilege to meet and learn much from a few Punjabi gentlemen having a wide knowledge and experience of commercial finance, and the necessary singleness of aim to apply such knowledge to the public advancement. But it is my deliberate opinion that the combination of these qualities is at present the exception and the tendency to subordinate real efficiency to personal considerations and convenience the rule. The satisfactory solution of the personnel problem therefore would doubtless connote a considerable European element in the earlier stages, especially so as the functions of the institution must be semi-educational in character.

The activities would necessarily embrace a live interest in—

- (a) the general primary and manual education of labourers and operatives.
- (b) the work of industrial and technical schools; commercial and Accountancy schools and colleges.

The schools and colleges should, I consider, be under the control of a Director of Industries. Such officer, preferably a business man, would of course be in intimate touch with and have all reasonable facilities for inspection of the activities of the suggested main organization and would form the link between Government and industrial progress.

Other collateral activities which suggest themselves are in connection with—

- endeavouring to educate directors and potential directors of public companies to a proper appreciation of the duties and responsibilities attaching to that office;
- endeavouring to raise the standard, both of skill and professional conduct generally, of public accountants and auditors.

Generally an institution such as I have suggested would have gradually to work out for itself its most useful sphere and the scope of its operations. Possibly some of its earlier efforts might, with advantage, be directed towards the reconstruction of certain existing industrial concerns which are labouring under varied disabilities. If ever a policy of *festina lente* was indicated, it is, in my judgment, in connection with the industrial expansion of this province in harmony with the circulation to best advantage of its fallow capital; with a view to the evolution of a highly trained and responsible industrial community.

ORAL EVIDENCE, 10TH DECEMBER 1917.

Sir F. H. Stewart.—Q.—How long have you been doing business in this country ?—
A.—About 10 years.

Q.—And your experience is mostly in the Punjab ?—A.—Yes.

Q.—You are in charge of your firm ?—A.—Yes.

Q.—In the Punjab do you think that confidence is reviving and that capital will be set free again for industrial investments ?—A.—I think there is a tendency towards restoration of confidence, but up to the present I fear it has been very small.

Q.—You think that there is a great deal of wealth in the province which might gradually become available ?—A.—I believe there is.

Q.—Can you suggest any means of encouraging it to come forward, or do you think that it must be left to take its course ?—A.—I have ventured a suggestion in my written evidence.

Q.—Would you develop that ?—A.—It is that I feel that Government aid must be sought if the hidden capital is to be brought into circulation for industrial purposes.

Q.—Government must take the first steps ?—A.—I do not say that Government must take the first steps: I say that Government's aid is essential to attract hitherto idle capital for any industrial movement started *ab initio* on a purely business basis.

Q.—What particular form of Government aid have you in mind ?—A.—Guarantee of debentures, I have suggested that form already.

Q.—Would you say as the result of your knowledge and experience that special banking legislation is necessary in India ?—A.—No, the existing Acts go far enough.

Q.—But you refer specifically to the very small amount of paid-up capital in a great many concerns ?—A.—I would qualify that to the extent that a much greater proportion of paid-up capital might be insisted on before the business is started.

Q.—That would require legislation ?—A.—Undoubtedly.

Q.—To that extent you think that legislation might be desirable ?—A.—Yes.

Q.—There is another point: now anyone can use the word "bank" and call himself a banker ?—A.—There is nothing to prevent that now.

Q.—Could you suggest any definition ?—A.—I have not quite understood your meaning with regard to the use of the name.

Q.—The present position is that anyone may set up a bank or call himself a banker and that might deceive the inexperienced ?—A.—Undoubtedly. The term 'bank' is very little understood in this province.

Q.—Supposing it is considered desirable to introduce legislation to regulate the use of the term 'bank' would you suggest any definition? Would you differentiate between bank and bankers ?—A.—I fear I cannot define that off-hand.

Q.—In these liquidations you have come across the work of these concerns prior to liquidation. What opinion have you formed of it ?—A.—Usually the material in their branches, that is, their assistants and so on, has been in my experience very poor.

Q.—Do you see any means by which that could be improved ?—Is it a question of dearth of materials, trained material, is it a question of pay, or what ?—A.—I think in many places it is a question of want of experience and environment; absence of large business-houses from which they can gain experience. A manager of a bank usually in the Punjab is a person coming from a comparatively small station, he may have been brought up in a very limited environment, consequently he may lack experience. I mean the branch manager, not the manager at the head office.

Q.—Some of these banks had a very large number of branches ?—A.—The biggest one had 70 or more branches.

Q.—Was there any adequate system of inspection of branches ?—A.—There was an official of the bank inspecting the branches. I have not seen the system working. Of course that was prior to the liquidation.

Q.—And you think also that an endeavour should be made to raise the standard of competence and conduct amongst public accountants and auditors ?—A.—That I think is a highly important matter.

Q.—Can you make any suggestions there?—A.—I think there should be registration of accountants, before the issue of certificates stricter investigation should be made into the abilities, etc., of the candidates for certificates.

Q.—Do you know anything about the Accountancy course that has recently been introduced in the College of Commerce, Bombay?—A.—Not sufficiently to form an opinion. I have only heard of it generally.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—In the third paragraph of your note you say "some machinery for experienced supervision of existing and new joint stock activity, or so long as pending liquidation proceedings involve the payment of calls upon shares with only remote prospect of any portion of the same being returned to the unfortunate investors:" can you suggest any scheme?—A.—So far as experienced supervision goes that would evolve itself from the scheme which I have later in my written evidence put forward.

Q.—Had any of these Indian banks any qualified chartered accountants as auditors?—A.—No, not in the Punjab.

Q.—Have they now got any auditor with qualifications of any kind?—A.—Yes, there are now auditors under the new Companies Act who hold certificates.

Q.—Are they men trained in some institution or do they hold certificate because they have been practising for some time?—A.—In the majority of the cases they have been admitted to a society in virtue of their having practised for a certain length of time.

Q.—Have they any Indian chartered accountant here?—A.—Not in the Punjab to my knowledge.

Q.—What were the difficulties of these banks which failed? Was it because they put their assets in securities which could not be made liquid at once?—A.—Precisely, that was very largely the cause of the failure.

Q.—Do you think that an industrial bank here will be very useful; that money can be employed in industries here very safely, and industries can be started if the Government starts an industrial bank here in the province?—A.—If that means that it would be a bank with very long term deposits for example then it is desirable; but I very much doubt whether it would find any great activity until there is a really good organisation for preliminary enquiry; it is that that is lacking in this province.

Q.—Do you know anything about the industrial banks of Japan?—A.—I do not.

Q.—You say on page 3 of your note that "the schools and colleges should I consider be under the control of a Director of Industries. Such officers, preferably, a business man, etc." Do you think you can get a well-qualified business man to take up the post of Director of Industries?—A.—I think he would be obtainable.

Q.—What do you think ought to be the salary to tempt him to come?—A.—It depends largely on the duties he would have to perform. I should think the post should carry a salary of say 2,000 a month.

Q.—Then in the last paragraph you say "Generally, an institution such as I have suggested, etc., etc., possibly some of its earlier efforts might with advantage be directed towards the reconstruction of certain existing industrial concerns which are labouring under varied disabilities." What are these concerns which you have in mind?—A.—There are several concerns in this province which are labouring under difficulties, some for want of fixed capital, building and machinery, and some for want of circulating capital, stocks and so on. They have all been under some disability for the last three or four years.

Q.—Do you think a college of commerce here will be useful? Will there be any demand of the kind among the people here?—A.—Yes, I believe there will be.

Mr. C. E. Low.—Q.—About this question of restrictions on the use of the word 'bank' raised by Sir Francis Stewart, do you think that people should not be allowed to use the word 'bank' to describe their business except under certain conditions?—A.—It is desirable that the word 'bank' should be more clearly defined. It is at present a very loose term.

Q.—Would you allow the use of the word 'banker' by a person carrying on banking business in any form, advertisement or letter paper or on his place of business? Would you allow a man to print his letter paper describing himself as a banker or put up on his place of business the word 'bank'? Would you allow him to say that he carried on banking business in the same circumstances or to describe himself as banker? Why I ask this question is that there have been great differences of opinion on that point

among Chambers of Commerce, Local Governments, etc.?—A.—I think it is very desirable to restrict the use of the description 'banker.'

Q.—That is to say, the ordinary local shroff or bania should be restrained from using the expression 'carrying on banking business'?—A.—In my opinion he should be.

Q.—Then what conditions would you make a man comply with before he used this word bank or its derivatives?—A.—I would go so far as to say that he ought to show that his banking firm could be registered. There ought to be registration of banking partnerships.

Q.—You would not necessarily make him come under the Companies Act?—A.—It is desirable he should, but I should not like to kill any private firm of banking provided that such private firm is registered. Only registration of banking firms should be demanded.

Q.—But has there been any particular abuse of the practice of banking at any rate by the ordinary Indian shroff? Are there a great many instances of failure of misfeasance amongst such people?—A.—They have not come very much within my knowledge.

Q.—There have been most striking cases of failure among companies?—A.—They are limited.

Q.—Then you have not considered, as you say, the idea of a definition of banking?—A.—I fear I have not considered that.

Q.—Would you allow anybody to combine other business with that of banking? For instance we have heard of an industrial concern to carry on banking and coach building in Calcutta, I think it had an authorised capital of 10 crores of which only 3 or 4 thousand were paid up?—A.—I should say that the practice is very undesirable.

Q.—Then you say you would like to see some prescription made as to the amount of capital which has to be paid-up: should that have a relation to the authorised or subscribed capital or should it be a definite amount? Would you say that one-tenth and one-twelfth or something of that sort should be subscribed; or must the authorised capital be all paid-up; or should there be say 20,000 rupees or 50,000 rupees definitely paid-up?—A.—Not a fixed amount, but a percentage.

Q.—Have you any figure in your mind?—A.—I think not less than 25 per cent should be called up within a year in the first instalment.

Q.—Is it the case that the leading banks have only a comparatively small proportion of their capital paid up? Is that not usually a source of strength in view of the nature of the shareholders?—A.—That is considered a source of strength, but in India many investors unfortunately have at present very little idea of the thing. For example, 25 rupees paid up on a 100 rupees share very often would represent to them merely an investment of Rs. 25 in value.

Q.—You also talk of the question of the low qualifications of accountants: are you aware, that accountants are allowed to practise not only because they are people belonging to recognised association of accountants but also because they are people who have received an absolute or restricted certificate?—A.—Yes, quite right.

Q.—And that as an interim measure to tide over the time before the supply of trained accountants comes along these certificates were given somewhat freely to people who have been actually practising as accountants. Do you mean that these certificates should not be too loosely given?—A.—I think they have been given without consideration of the qualifications.

Q.—Do you consider there are at present too many of them?—A.—No, they are not too many.

Q.—Is there any touting for accountancy work?—A.—Yes.

Q.—Leading to accountants being put in an undesirable position professionally and to undue reduction of remuneration? I mean undesirably low remuneration inconsistent with the position which the profession has?—A.—Yes, it has a very demoralising effect on the standard.

Q.—You are aware, aren't you, that there is a society of accountants being formed in Bombay?—A.—Yes, I have heard of it.

Q.—Has anybody here so far as you know joined it?—A.—No, not so far as I am aware.

Q.—Turning to points you have dealt with more directly in your evidence, about which Sir Fazulbhoy was speaking, I do not quite see how your proposed Financial Corporation would meet these difficulties in the matter of the supervision of joint stock activities and this question of not fully paid-up share: Would you explain it more

fully?—A.—The question of payment of shares will have to be legislated upon, and the actual supervision would I hope come under the ægis of the Director of Industries. As I have suggested there, he will combine the functions or at any rate be closely in touch with the Registrar of Joint Stock Companies.

Q.—Then you would have his functions merely advisory: how would he educate the opinion of the investors up to the desired point, or how would he educate the management up to the desired point? Simply by personal intercourse and discussion?—A.—Exactly and by the force of the example of the central institution which would be carried on on sound lines.

Q.—Do you consider that there is a great deal of hoarded wealth?—A.—I believe there is.

Q.—Is your belief based on particular individual instances which have come up to your notice, or is it your general impression?—A.—It is my general impression from being in a large number of stations in the Punjab; I cannot speak of individual instances, but taking the whole undoubtedly it is very large.

Q.—That is the impression you formed. You are aware that during the last few days an Industrial Bank has been started on a large scale in Bombay: do you think it would be of assistance in the Punjab, and will that in any way cause you to modify your suggestions regarding this development trust?—A.—If I have rightly read the proposed activities of the bank to which you refer, I think that it could get capital in the Punjab, but I do think that even still, as I have said in reply to Sir Francis Stewart, Government assistance will be required; an ordinary bank will never get it unless Government steps in.

Q.—Is not the first thing for a concern of that sort, whether it is a bank or a development trust, in order to get capital, to put up a certain amount of capital itself?—A.—Yes.

Q.—And to do that has it not got to approve the kinds of industries which it would undertake to help?—A.—Perhaps so.

Q.—And does that not mean a fairly well organised system of experts either employed by or lent to the concern in question?—A.—Yes.

Q.—And do you think that Government should assist to a large extent in that way?—A.—Yes, I think so.

Q.—Do you think it would be desirable for each province to have its own outfit of experts, or do you think you would have an Imperial man whose services would be available or whose advice would be available for the different provinces?—A.—No, so far as the Punjab is concerned I feel that it will want certain experts who would devote their whole time because the conditions in the Punjab are different from those of other provinces: it is more backward for one thing.

Q.—But conditions in the case of chemical or engineering industries are more or less in common in the different parts of this or any other country; so what you say applies to agricultural industries?—A.—That is so.

Q.—And have not we hitherto been, both the Government and the people, working with the lack of a full range of expert knowledge. Take for instance the case of the glass industry; it has been pointed out to us elsewhere that you cannot really decide whether to start the glass industry in any particular place until you have examined it from the chemical point of view with reference to raw materials and freight, and what particular kind of glass your local raw materials in the country would be best adapted to, for which you want experts in different kinds of glass; then there are questions about construction of furnaces and so forth; it means that you have to obtain four or five experts, and that a general all-round glass man would probably be of no use to you: don't you think that in a case like that it is an argument for an Imperial expert?—A.—For a central officer I should rather think it is.

Q.—Of course you recognise that the institution could not be maintained entirely by Government, it has got to make a living, and to do this it has necessarily to do something in the way of promotion of the undertakings which it is putting before the public?—A.—Yes.

Q.—Do you think that these things could be put before the public equally well examined on a cheaper basis by any other means?—A.—No, I do not think it could be put on a cheaper basis.

Q.—Would you have any method of restriction to ensure that they do not overload these things with too much in the way of preliminary expenses?—A.—Yes, the promotion fee might properly be fixed not to exceed a certain percentage on the issue capital of any new venture.

Q.—Promotion expenses of that sort should necessarily be proportionate to the outlay incurred by the trust because the preliminary investigations of a good many of them would not come off?—A.—Preliminary expenses of successful floatations would obviously have to be sufficient to provide for the costs, on average, of abortive researches or enquiries.

Q.—You consider the preliminary expenses on that would not overload the concern unduly?—A.—No, they would not.

Q.—In what way do you think this proposal would be superior to a purely Government organisation initiating concerns with a proper supply of expert information? Do you think it would command more public confidence?—A.—I think that all forms of Government activities in this direction could be more efficient.

Q.—You mean technical expert aid?—A.—That does not connote a very wide range of business knowledge.

Q.—A technical man can also look at these questions from a business point of view?—A.—Quite so.

Q.—Cannot Government associate with their departments a man of that type?—A.—There would have to be a change in personnel to achieve the desired object.

Q.—I am not quite clear what you are referring to in your note as activities which would necessarily embrace a live interest: are you alluding to the development trust or to the Government Department?—A.—I am alluding to my proposed organisation; it would have to evince a very keen interest in all those matters; it has by no means a ready-made scope in this province; it would have to go through the present industrial activities carefully before it undertakes its operations.

Q.—You mean in an advisory capacity to actual or potential employers of labour?—A.—And to the Government Departments.

Hon'ble Sir R. N. Mookerjee.—Q.—You suggest Government help by way of debentures; and in answer to Sir Francis Stewart you said that you would like Government to help industries by taking debentures, have you any idea as to what should be their proportion to the paid-up capital?—A.—I think that Government ought to guarantee debentures, and that these debentures might go up to 8 times the subscribed capital; it might even slightly exceed that amount.

Q.—Eight times the paid-up capital?—A.—Yes.

Q.—Don't you think that would be a greater risk than Government ought to take?—A.—I don't think so. I hold no brief for bankers, but at the same time bankers would be very careful before they risk their capital and the risk to Government is more remote than theirs.

Q.—Government would in that case be taking considerable responsibility?—A.—It takes responsibility for the debentures, but it has behind it the security of the whole capital.

Q.—Would they be equally cautious in lending their money if they themselves were to be responsible for the debentures? Or, in other words, if Government were responsible for debentures to the extent of 8 times the capital, naturally the bank would not be so cautious in their dealings for lending money as if they were themselves responsible for the debentures?—A.—You mean it might render the bankers themselves careless? I hardly think so. I think the risk of their own capital would render any banks fairly cautious.

Q.—How then would it help in raising the first capital even accepting all that you say, namely, that Government should be responsible for debentures?—A.—It would help in the sense that at present so far as my experience goes to the average Punjabee anything that has a Government guarantee has a very great weight; anything that goes simply as a private bank gets of course certain number of investors, but it leaves the great majority quite cold. Government guarantee to my mind is the attraction that is required.

Q.—I quite see that point as regards debentures, but the capital must be raised before these debentures are raised?—A.—I have suggested that the leading banks should themselves put up the initial capital.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—In answer to the President you have said that debentures should be issued up to 8 times the capital and that Government should guarantee interest, what rate of interest have you in mind, is it the rate of interest on Government papers?—A.—It would have to be more.

Q.—And this money of the bank will doubtless go to aid industries under the direction of the Board of Industries, is it not?—A.—Exactly so.

WITNESS No. 371.

PANDIT HARI KISHAN KAUL, RAI BAHADUR, C.I.E., Deputy Commissioner for Criminal Tribes, Punjab, Lahore.

WRITTEN EVIDENCE.

Capital.

Q. 1.—I have no personal experience, but my brother, Diwan Bahadur Pandit Daya Kishan Kaul, C.I.E., has been running a large timber exploitation business, and I can speak from my knowledge of matters concerning his business and of more than one other firm working in the industrial line.

Few people can work wholly with their own capital and great difficulties are experienced in raising capital in the market. Few large capitalists understand the possibilities of industrial enterprise. They prefer safe investments such as G. P. Notes. Owing to the recent failure of companies, it has become extremely difficult to raise capital by floating a company.

I would suggest the establishment of a large industrial bank aided by Government for the purpose of advancing loans to sound industrial enterprises. Projects should be examined by an Industrial Bureau (to be discussed hereafter) before applications for loan are entertained by the bank.

Q. 2.—Capital is now raised either from banks or in the market on hundis. Owing to recent bank failures, the number of banks has diminished. The Indian-managed banks feel shy of investment on industries. The European-managed banks are more business-like, but their hands are generally full otherwise.

Borrowing in the market is unsatisfactory for steady industrial work. Hundis are demanded for short periods, the rate of interest fluctuates violently, and just when money is needed most, the market sometimes becomes tight. Moreover, private money lenders generally ask for an exorbitant rate of interest which is severely prejudicial to the growth of infant industries.

Q. 2 (a).—The only suggestions I can make are that :—

- (i) Government might subsidise promising industries, or
- (ii) until an industrial bank of sufficient magnitude comes into existence, Government might advance loans to such industries by borrowing in the market.

Q. 3.—*Ginning mills*.—Every cotton-producing centre has been studded with ginning mills with the result that all of them cannot work full time and many of them cannot even make sufficient profit to cover the interest on capital and the deterioration of buildings and machinery.

Government aid.

Q. 4.—So far as I am aware direct financial aid is not given by Government to any large private industrial enterprise.

Q. 5.—I would recommend the adoption of all the eight methods in appropriate cases—

- (1) Money grants-in-aid would be appropriate for useful industries which are struggling for their existence.
- (2) Bounties and subsidies might be granted to new industries which are necessary but involve risks.
- (3) Guaranteed dividends would revive companies and if the industries concerned begin to flourish there is no reason why the expenses, if any, incurred by Government should not be repaid.
- (4) Loans with interest should be the commonest form of help.
- (5) Supply of machinery on the hire-purchase system would be useful to promoters of small industries, who could not obtain the machinery themselves. Ordinarily a firm would prefer a loan where with to purchase the machinery, as the rate of interest would be lower in the latter case.
- (6) This would be a *desideratum* where enough capital could not be raised by floating a company.
- (7) Guaranteed purchase by Government is an excellent method of encouraging new industries. Preferential Government purchase would be justified where an industry was receiving Government aid.
- (8) This is very necessary.

I would lay special stress on methods (1), (4), (6), (7) and (8).

Q. 6.—No supervision will be needed in case of methods 7 and 8. But where Government advances a loan directly or indirectly there should be Government control by way of audit and by the appointment of a managing director or a director with defined powers during the currency of such assistance.

Q. 7.—Government pioneer factories are extremely useful in introducing new industries and tapping the undeveloped resources of the country. They should however be worked as pioneer factories only till such time as the industry is proved to be a commercial success and should be handed over to private individuals or companies as soon as suitable applicants undertake to pursue the industry. They should not be maintained as a source of revenue to Government by denying to private enterprise the opportunity of working and developing the industry. Pioneer factories.

Q. 8.—Government pioneer factories should, I think, be confined to manufactures which no private capitalist or company is prepared to undertake. There is a very wide scope of action in the line of chemical products, bleached paper, dyeing etc.

The rest of the question has been dealt with in answer to question 7.

Q. 9.—Several industries, such as match factories, wood pulp, glass factories, leather manufactures, have suffered for want of financial facilities. I cannot give specific instances, as I have not sufficient information of details.

Q. 10.—The best and easiest way of assisting industrial undertakings is to establish an industrial bank subsidized by Government as has been suggested in answer to question 1 and to foster the establishment of commercial banks to facilitate the disposal of manufactures. Banking facilities.

Q. 10 (a).—If banks are established on a large scale a Banking law will be necessary, but I cannot make detailed suggestions on this point.

Q. 13.—The object of Government aid being to promote industries, Government should, before subsidising an industry which is already being pursued by private agency, satisfy itself that by doing so it would not be discouraging an existing concern. Limitations to Government assistance.

Q. 14.—One of the principles which justify free trade being the most economic production of commodities in the country which is best suited by circumstances to a particular industry, there should obviously be no limitation on aid to a new enterprise until it begins to compete on equal terms with external trade. After that stage is reached Government aid can be curtailed or withdrawn in such a manner as to avoid a collapse of the flourishing concern. For years India cannot expect to compete with foreign markets. The development of industries which compete with external trade will therefore, at best, enable the country to produce a fraction of its own requirements, for more than half a century.

Section II.

Q. 15.—So far as I am aware, little aid has been provided by Government in this respect in the past. Matters requiring technical and scientific advice have, I understand, been referred to Government officers, but for want of technical advice the applicant has met with disappointment, and schemes of considerable importance have been jeopardized. Arrangements should be made to provide technical and scientific aid whenever asked for. Technical aid.

Q. 16.—Except in the matter of agriculture where a great deal of good has been done, little noticeable benefit has hitherto accrued to local industries from researches conducted by Government departments. So far as I am aware the results of such researches are not easily accessible to the public, and no steps are taken to place new discoveries within reach of enterprising men with a view to their being employed in industrial undertakings.

Q. 17.—The system of lending the services of experts will necessitate the whole-time employment of such experts by Government. The services of experts should be lent freely to private capitalists, firms or companies on payment, in advance, of the salary together with a percentage thereof as contribution towards pension and leave allowances. Applications for the loan of services of such experts should be scrutinized by the Director of Industries in order to make sure that expert advice is needed.

Q. 18.—The results of researches made by Government paid experts, while attached to a private business, should not be published except with the permission of the firm concerned. These results should remain the private property of such firms unless they are unable to take advantage thereof. In the latter case the interests of the firm as promoters of the scheme or invention should be safeguarded before giving publicity to the results. Publication of results of researches.

Q. 19.—Demonstration factories can be useful mainly for cottage industries which can be pursued with little outlay of capital and without any mechanical power or the

collection of labour. Demonstration of fly shuttle weaving at the St. Louis Lane Weaving School, Ludhiana, maintained by the Salvation Army and at the Government Weaving Farm, Lahore, appears to have done a certain amount of good. Demonstration factories may be opened with advantage for hosiery and industries subsidiary to those pursued at large power-driven factories.

Q. 20.—Yes.

Research abroad.

Q. 21.—See answer to question 16. The discoveries made by the Imperial Institute should be advertised with a view to encourage enterprising capitalists to start new industries. Enterprising men would be glad to launch on schemes of which the commercial value has been established by scientific research.

Q. 22.—Personally I think the country is not sufficiently advanced to benefit, to any appreciable extent, by the establishment of research institutes other than those relating to agriculture. There are hundreds of industries we can learn from the western countries. Until they have been exhausted all energy should be devoted to introducing industries of which the knowledge is certain instead of experimenting in the domain of uncertainty.

Q. 23.—By offering their advice to the Industrial Bureau which I shall propose hereafter.

Q. 24.—The country is not sufficiently advanced for such institutions. The existing research institutes if properly utilized should do for a considerable time.

Surveys for industrial purposes.

Q. 25.—A good deal of material is available but further extensive surveys will doubtless be necessary in order to exploit the mineral and other resources of the country.

Q. 26.—The surveys should be organized by Government, as has been done in the past, but they should be undertaken with the object of facilitating the establishment of industries peculiarly adapted to this country, and the results of the surveys should be widely circulated.

Q. 27.—By the publication of reports and the practical demonstration of results.

Consulting engineers.

Q. 27 (a).—Yes—Consulting engineers would be valuable.

Q. 27 (b).—But they should not purchase plant or machinery for private firms or individuals nor should they be permitted to charge commissions on purchases made from certain firms at their suggestion.

Section III.

Commercial museums.

Q. 28.—Commercial museums are very desirable. They are the means of advertisement of manufactures and, if properly regulated and kept up to date, afford facilities for small industries to capture distant markets.

Sales agencies.

Q. 29.—Sales agencies are a necessity, so far as minor and unorganized cottage industries are concerned. Certain small industries are pursued in the Salvation Army Settlements and they have always found considerable difficulty in disposing of their manufactured goods. I am myself organizing small industries in my Criminal Tribes Settlements and have to take some trouble in finding good prices for the manufactures.

I would suggest that Government should subsidise sales agencies in convenient centres where any cottage industry or industries exist or are started on a sufficiently extensive scale. To begin with Government might help the promoter of the agency with the cost of maintaining the agency.

A fee might be fixed for sales through the agencies at a percentage of sale price (say Rs. 2 per cent) and as the income of the sales agency increases the subsidy can be gradually withdrawn.

A sales agency with a Rs. 2 per cent. fee can become self-supporting if it disposes of goods to the value of Rs. 200 to Rs. 250 a day. I would therefore not recommend the opening of a full sales agency anywhere unless it can be reasonably expected that there would be a constant flow of manufactured articles of the value of say Rs. 100 a day and a corresponding demand for such articles.

Where the indigenous industries cannot supply so much materials, it would be worthwhile to engage some of the local merchants as sale agents subsidising them with a grant (which may perhaps be equal to the 2 per cent. commission which they would be authorized to charge on the sales).

Q. 30 (a).—The utility of industrial exhibitions such as those held recently at Allahabad and Lahore in instructing the general public as to the scientific and technical development of various industries is unquestionable. I would not at present advocate travelling exhibitions on a large scale owing to the expense involved. But canvassers can be employed with advantage to travel with samples of manufactures and to register orders for execution through the sale agencies. District authorities might help the canvassers in exhibiting their goods. Exhibitions.

At a later stage when cottage industries have developed considerably, travelling exhibitions would be very beneficial.

Q. 32.—It would be idle to expect people to organize travelling exhibitions themselves. Occasional exhibitions by individuals or societies in different localities should be encouraged by Government, and when the time comes regular travelling exhibitions should be organized by Government. Till then exhibitions might be held at fairs and large gatherings.

Q. 33.—The exhibitions should aim principally at bringing sellers and buyers into contact, but shows go a long way to attract customers and conduce to the success of exhibitions.

Q. 34.—Yes. It is desirable to appoint trade representatives to represent the whole of India in Great Britain, the colonies and foreign countries. These representatives should possess extensive knowledge of the industrial and commercial problems, and possibilities of the country. Their duty should be to further the cause of Indian industries and commerce. These representatives should be connected with and selected by an Industrial Bureau which should be established in India to organize the industries, and the trade representatives should on one hand keep the Bureau informed of the demand for various raw materials and manufactured articles of India and indicate to it the lines on which the industries should be developed, while, on the other, they should study foreign industries which could be adopted with advantage in India and furnish the Bureau with detailed information about them. Trade representatives.

Q. 35.—Yes.

Q. 36.—Yes. There should, I think, be an Industrial Bureau in each province which should act under the guidance of the Industrial Bureau for India and send its trade representatives to other provinces. These Bureaux should consist of representatives of different industries, who should be mostly elected, but a few members might be nominated by Government to make the body as representative as possible. The Provincial Bureaux might elect members for the Indian Bureau and a few nominated members might be added by Government. The Provincial Bureau should, I think, be presided over by the Provincial Director of Industries and the Indian Bureau by the Secretary or Member in charge of the Department of Commerce and Industries.

Q. 37.—Yes, lists of such articles should be published widely and the articles should be exhibited so as to enable local industries to manufacture them. The information should also be supplied to the Industrial Bureaux whose assistance might be invoked in securing the manufacture of such articles in India so far as possible. Government patronage.

Q. 38.—With a view to encourage local industries all stores procurable in India should be purchased locally instead of being imported and articles which are not manufactured locally should be exhibited so as to induce enterprising capitalists to undertake their manufacture.

Q. 39.—Greater banking facilities, than now exist, are necessary to assist in marketing indigenous products. The banks readily advance money on hundis for clearing goods at the ports on the strength of invoices, but no easy system is at present in vogue for obtaining loans in order to bring the products of local industries into the market at convenient centres. I am not in a position to discuss the comparative merits of the various kinds of banks. Banking facilities.

Section IV.

Q. 40.—The policy of Government should be to charge royalty on the raw material (e.g., forest products) and to allow private enterprise to work the industries based thereon. Government should neither undertake manufactures on commercial lines, nor compete with private enterprise. With a view to encourage the industrial development of the country, the results of researches by Government experts should be made available to capitalists desirous of developing the experiments into commercial success instead of Government monopolising the application of the results of research. From certain questions asked in the Punjab Legislative Council the other day it appears that the manufacture of turpentine from raw resin has been monopolised by Government in the Punjab. Supply of raw materials.

and the United Provinces. This course would be opposed to the policy which I advocate for the development of industries by the people. If competent persons or firms are willing to undertake the manufacture the policy of Government should be to terminate the pioneer stage of the industry and to hand it over to private enterprise, charging a suitable royalty for the supply of raw material.

Land Policy.

Q. 41.—The only check on industrial development imposed by our land policy which I can think of is that of tending to restrict the growth of sugarcane. Sugarcane lands are generally heavily assessed in consequence of the high value of the produce, and the water rates are high, sugarcane being generally included in the highest class of rates. The consequence is that local sugar cannot compete favourably with imported sugar and several sugar factories failed chiefly on that account, some years ago. Owing to a reduction in the import of sugar, the necessity for encouraging sugar refineries has become manifest. A preferential treatment of sugarcane in the matter of water rates would extend sugar cultivation and invigorate the industry.

Section V.

Q. 44 (a)—Yes.

Training of labour.

Q. 44 (b)—No special steps seem to have been taken, in the industries which I have come in contact with, to improve the skill and efficiency of the labourers. They acquire skill and efficiency by experience and lapse of time.

Industrial schools.

Q. 45.—Industrial schools should, I think, be established at all industrial centres. Half the time should be devoted at these schools to primary education and half to learning the rudiments of industries. Grown-up boys should, in the industrial part of their days' routine, be attached to factories as apprentices and should work there as half-timers. In this manner they should develop into skilled workmen from the very time when they start working whole-time.

Q. 46.—I am now training a number of boys belonging to the Criminal Tribes at the New Egerton Woollen Mills, Dhariwal, the Spinning and Weaving Mills, Shahdara, the Cotton Spinning and Weaving Mills, Bhiwani, and at a certain carpet factory at Amritsar.

Q. 47 and 48.—See answer to question 45.

Half-time schools.

Q. 49.—My experience is confined to Criminal Tribes Settlements where all half-timers receive primary education in the school. The advantage is obvious. I can therefore recommend the establishment of schools on similar lines at all industrial centres.

Control of industrial education.

Q. 50.—The industrial schools should be under the control of the Department of Industries, but the Education Department should advise on all educational matters in the same way as is done by them in respect of the Municipal and District Board schools.

Training of supervisors.

Q. 51.—A training school or schools will have to be established.

Q. 52.—A limited number of scholarships should be offered by Government and more scholarships may be offered for the purpose by the local bodies.

Section VI.

Official organization.

Q. 57.—There should be an Industrial Bureau as proposed in answer to question 36. It may be called a Bureau or a Board of Industries and its duties should be to organize the principal and subsidiary industries, to assist in financing them by recommending them to industrial banks or to Government for financial assistance, to obtain concessions for them and generally to assist in the development of industries and trade.

Q. 60.—There should be a Director of Industries and he should be the President of the Industrial Bureau or Board of Industries.

Q. 62.—See answer to question 34. There should be an Industrial Bureau for India under the Presidency of the Secretary or Member in charge of the Department of Commerce and Industry.

Section IX.

Forest Department.

Q. 105 to 108.—See answers to questions 7 and 49. So far as I know the Forest Department is at present worked on purely revenue lines. I understand that raw material of various kinds runs to waste for want of facilities for extraction and for want of concession to exploiters who would undertake to start industries connected therewith. My brother, Diwan Bahadur Pandit Daya Kishan Kaul, C.I.E., Patiala, who has vast practical experience of forest exploitation could probably make useful suggestions.

Jail competition.

Q. 109.—None. Jail products are generally sold at rates higher than those prevailing in the market, although the material turned out is generally superior. It cannot therefore be said that jail industries compete to the disadvantage of outside industries.

ORAL EVIDENCE, 10TH DECEMBER 1917

Mr. C. E. Low.—Q.—I understand that you were Census Commissioner for the last census?—A.—I was Census Superintendent of the province.

Q.—Did you form any opinion as to the relative reliability of the occupational figures in the census?—A.—I don't quite follow what you mean.

Q.—If you remember, there was some discussion before the census, on the part of Sir Edward Gait, as to greater detail in regard to occupational figures?—A.—We did go into greater detail, but still it is impossible to say that they were absolutely reliable. We had to depend upon what the people told us.

Q.—In the course of examining the position of hand-loom weavers, one found the following state of affairs all over India generally; that the consumption of yarn by hand-loom weavers had slightly increased or had remained stationary during the past 20 years, but the apparent number of hand-loom weavers working showed a very large decrease.—A.—I cannot say from memory without looking into the figures; but my impression is that the number of hand-loom weavers was decreasing.

Q.—The figures themselves also, comparing province with province, exhibit very striking differences, which appear to suggest the imperfection of the record, and possibly this may have arisen out of the relative meanings attached to the words "occupation" and "subsidiary occupation."—A.—Quite possible.

Q.—If a man does a certain amount of things it is put down either as his "occupation" or "subsidiary occupation."—A.—Weaving is not a common subsidiary occupation.—One sometimes does weave besides doing other things.

Q.—You mean in this province, it is not?—A.—Yes, but it is quite possible that if a weaver did something else, he would give that as his principal occupation. Weaving is not considered a very honourable occupation. It is very seldom carried on with agricultural labour.

Q.—You don't get people weaving and cultivating other peoples' or their own fields?—A.—Very seldom.

Q.—Another point is that in the last census figures there is no distinction drawn in the census figures proper between hand-loom weavers and those who mind looms in a factory.—A.—No.

Q.—There was a separate census taken but not at the same time?—A.—There was a factory census taken, but in the general returns we did not distinguish between weavers employed by factories and weavers working at home.

Q.—Don't you think it was rather a serious defect?—A.—I think it would have been an improvement if this had been done.

Q.—Take the question of glass: you can conceive it to be very important for the Industrial Department to know how many people can blow glass, as opposed to making bangles or lump glass. These people are all mixed up together in the census figures.—A.—They are. We had not all these details in view at the time; that is why we did not go into all these details. I am trying to indicate Sir Edward Gait's procedure. It was from that point of view that a special census was taken of factories.

Q.—You suggest that these are small details to enter into; but look at the ethnological details entered into. Were they as useful as these other details would have been?—A.—Not from the industrial point of view.

Q.—Not from any point of view, except to the scientist.—A.—They were investigated from the scientific point of view, and as those were the lines on which they were working in the previous census, it was done.

Q.—You are on special duty in connection with the criminal tribes?—A.—Yes.

Q.—Will you describe what you are doing?—A.—Briefly, it is to reform the criminal tribes, a certain number of tribes whose hereditary pursuit has been thieving, and who at the same time take up occupations as a pretence. The object is to control the movements of these people, to provide them with honest, respectable occupations, so that they should have no cause for thieving, and gradually to reform them. With that object, in this province we have notified certain tribes, and most of them we have restricted to certain limits.

Q.—They were previously wandering about?—A.—Yes, and the worst of these people we are selecting and placing in settlements where we provide them with some kind

of labour. I have three places where I am supplying labour to mills; one is at Dhariwal, the other at Shahdara, and the third at Bhiwani. I have got other settlements where we are undertaking industries on a very small scale.

Q.—Turning to what you say about trying to engage your men in mill industries, do you take any special precautions or steps to look after them while they are engaged in the mills?—A.—We have our supervisors who go round and try to get them out of their old indolent habits. They are not accustomed to work. They require a lot of persuasion and coaxing. The ordinary mill staff cannot persuade them to work fast enough or long enough. Our men have to be constantly going about and driving them.

Q.—Do you give them bonuses for increased output?—A.—Yes, most of the men work on the piece-work system. We put them on a minimum wage for 2 or 3 months, and then put them on piece work. They are paid according to the quality and quantity of the work.

Q.—How do they compare with the ordinary mill hand at present?—A.—In some cases they earn more than the mill hand; but in most cases they are not as ingenious.

Q.—They are better physically?—A.—Yes. I don't think, however, that they are physically trained to sustained labour; but they are getting trained to it.

Q.—How long have these men been working in these mills?—A.—We commenced at Dhariwal in April, and at the other two mills we started in September or October.

Q.—I suppose the hot weather is the most difficult season from your point of view?—A.—They find the hot weather easier because the day is longer, and they have leisure to spend in the morning and evening. It is the winter they don't like.

Q.—Do you think the early dark nights are a temptation to them?—A.—They have to get up early in the morning and don't come back from the mills till late in the evening.

Q.—Do the other mill-hands raise any objection to these fellows being in the place?—A.—No, they don't. At first in Dhariwal there was a little trouble, but this was very quickly got over, and there is no trouble now.

Q.—Are mill-hands in this province of low caste?—A.—They belong to all castes, from Brahmins down to sweepers.

Q.—Do they actually mind machines?—A.—Yes, they handle all kinds of machinery.

Q.—Do men of military caste go into the mills?—A.—Yes.

Q.—Even Kshatriyas?—A.—I think so.

Q.—Then you have got some of these people on agriculture?—A.—Yes, I have got some men on agriculture, and mean to establish a number of agricultural settlements. Government have set apart about 12,000 acres of land. We are going to select the best people as a sort of inducement to others to behave well.

Q.—Some you have got on cottage industries?—A.—Yes, hand-weaving. The Salvation Army are doing a little silk reeling, and I have got some of these people doing rope-twisting; others simple carpentry work, cane-basket making and things of that sort.

Q.—How do you manage to sell their products?—A.—The local man has to arrange it; he has to get orders.

Q.—Does he have any difficulty?—A.—Yes, I have said that in my evidence. We find some difficulty, but as the work has not developed very much yet, the difficulties are not insurmountable.

Q.—You have not got many goods to dispose of?—A.—No. The Salvation Army have been complaining of that, but they have not much difficulty, as they have a sale agency at Simla, and send all the goods there.

Q.—What kind of loom are you putting them on to?—A.—In most of the places we have Salvation Army looms. We bought some from them and are using them in other places. They are very expensive. They used to cost Rs. 70, but now they cost Rs. 100. We have got some looms in Lahore at the Government Weaving School, and I selected one or two specimens and will adopt those.

Q.—You are aware that you can get an ordinary fly-shuttle slay for Rs. 10 or Rs. 12?—A.—From where?

Q.—From various places in Madras.—A.—I understand that we can get it fairly cheap here. The figures given us were Rs. 20.

Q.—That is the figure for the complete loom.—A.—They promised to give it to me for Rs. 20, and I intend to get some of these.

Q.—In connection with your criminal tribes you need to start some sort of sale agency?—A.—Yes.

Q.—Have you seen anything of an institution of that sort at Cawnpore?—A.—No.

Q.—Or of the organisation that has recently been set up in the United Provinces, the arrangement for sales in the North-Western part of the Province?—A.—No.

Q.—In answer to question 41, you say, "Sugarcane lands are generally heavily assessed in consequence of the high value of the produce, and the water rates are very high, sugarcane being generally included in the highest class of rates. The consequence is that local sugar cannot compete favourably with imported sugar, and several sugar factories failed chiefly on that account some years ago." Is that the only reason why local sugar cannot compete favourably?—A.—I mentioned that because I was asked if our land policy had any effect. I don't say that is the only cause.

Q.—What are your rates here for sugarcane land?—A.—About Rs. 7.

Q.—Do you know what the rates are in Bombay?—A.—I suppose very much higher.

Q.—Up to Rs. 60, and the industry is very flourishing.—A.—I mentioned the fact as I heard it said by some of the people connected with certain sugar factories that they had failed because the price of raw sugar was high here.

Mr. Law.—That is rather a common experience in places like Bihar, where there is no irrigation.

Hon'ble Mr. H. J. Maynard.—Q.—I understood you to say that agriculturists don't generally do any weaving, and weavers don't generally do any agriculture?—A.—Yes.

Q.—Is that quite correct; at harvest time don't weavers all go out?—A.—That is an exception; anybody will go. What I mean is they don't regularly do other work.

Q.—You don't think that any class of weavers regularly goes out and does agriculture?—A.—No.

Q.—Is it not also the case that in agriculturists' households a certain amount of weaving is done for the family requirements in the way of cloth?—A.—No, they do spinning and certain other processes subsidiary to weaving; but the weaving itself is done by the village weavers.

Q.—So it is only at harvest time that weavers go out?—A.—At harvest time anybody will go out. Even Brahmins will turn out and do a little harvesting.

Q.—There was some reference to the cost of looms; perhaps you did not know that the Industrial Department can provide slays at Rs. 10.—A.—I meant the whole loom cost Rs. 20. I wanted to buy looms and the cheapest recommended to me was Rs. 20. The slay alone would be worth Rs. 10.

Q.—About this matter of sugarcane, what would you take to be the average outturn for an acre of cane of gur? Would 20 maunds of gur be a fair average to take?—A.—Yes.

Q.—And how much would the value of that be, approximately, in normal times?—A.—Rs. 5 a maund. In my own village I take the total outturn at Rs. 100.

Q.—The water rate is either Rs. 7-8-0, and in very few places as much as Rs. 10, so that it would be one-tenth in proportion?—A.—The water rate is based not only on the amount of water supplied, but also on the value of the crop.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—What are your criminal classes; have they got any religion, society, etc?—A.—I have got several tribes of different classes.

Q.—Where are they found?—A.—All over the province.

Q.—Wandering about?—A.—Some wandering, some settled. Some are Muhammadans, but they are as good thieves as the others.

Q.—As a class they are thieves?—A.—Yes; then there are others who have a very rudimentary sort of religion. Some are Muhammadans, and others call themselves Hindus.

Q.—They go about the villages and loot?—A.—The wandering gangs move about. They are supposed to live by begging. They go into the villages and beg, and find out which are the places to attack at night. Then at night they will slip out and commit thefts.

Q.—At the Dhariwal mills how many men are working?—A.—I have got a total population of 1,280, of which there are about 400 odd workers in the Dhariwal mills.

Q.—Did they ask for these men, or did you supply them and ask them to take them in?—A.—I wanted to provide occupation for these people. His Honour happened to go there by chance and he suggested that there was a great opening in this place; I came to an arrangement with the Dhariwal mills and established this settlement there.

Q.—Have you taken up land for that settlement?—A.—We have acquired land for them under the Land Acquisition Act. They have paid for it. They are building houses for residence. The settlement is in our control, as we have placed the men there.

Q.—Are they now free, if they want to go somewhere else?—A.—No, they are under the limitations of the Criminal Tribes Act.

Q.—For how many years?—A.—Till they earn exemption. Under the rules, if for the last 10 years they have not been convicted of any offence, or suspected, and if the District Magistrate considers them fit to be exempted, they are exempted.

Q.—Supposing they want to go and work somewhere else?—A.—Some may be absolutely free after 2 years, if granted exemption. Everyone of them can earn exemption after 10 years. It all depends upon whether he has committed an offence or been suspected of an offence within the last 10 years.

Q.—I just want to know if they will have to live in the Dhariwal mills for 10 years.—A.—Ten years or less, until they have earned exemption. It may be in six months or two years. It will depend upon their character.

Q.—Are they on night duty while working there?—A.—No, under the rules they are not supposed to work more than 10 hours a day, and we make them work for 10 hours during the day, not during the night.

Q.—You want large industrial banks? What capital do you think would be necessary for the Punjab?—A.—I want it to be a large bank, large enough to supply the needs of the industries that may come up in the Punjab. I am not an expert on that point, and am not in a position to advise.

Q.—Have you experience of your brother's business?—A.—A little. Of course I come to know about his business now and then.

Q.—Then you say, in answer to question 22, "Personally I think the country is not sufficiently advanced to benefit to any appreciable extent, by the establishment of research institutes other than those relating to agriculture." I suppose by the "country" you mean the Punjab only?—A.—Yes. I don't mean India. I don't deprecate the establishment of research institutes. What I say is that we ought to devote much more of our energy to what information we can get at present.

Hon'ble Sir B. N. Mookerjee.—Q.—Don't you think the research should go first?—A.—I don't say there should be no research institutes, but what I say is that we have got sufficient information in our hands to develop our industries from the research institutes already established in our country and in other countries. We should make use of our information. I should like the industries to grow up to the standard at which the more developed research institutes would be needed.

Q.—Then you are prepared to alter that; you have no objection to have research institutes first?—A.—I am talking of my own province, and, as far as I can see, the industrial development of this province is so backward that there is plenty of room for development before we begin to need research institutes.

Q.—Don't you think that by having good research institutes, it will give a stimulus to industries?—A.—Unfortunately that is not my own information. What little I know about the effect of research institutes on the development of industries in the past, I don't know that they have done all the good that they should have, except in the agricultural line.

Q.—But you have no research institutes except those pertaining to agriculture?—A.—There are Imperial Research Institutes which are supposed to benefit all the provinces of India.

Q.—Was not anything that may be found in the Punjab the subject of the research institutes?—A.—I have no experience of that.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—In answer to question 2 you say, "The European-managed banks are more business-like, but their hands are generally full otherwise." "Otherwise" what? In financing crops?—A.—I don't know, but they are

having lots to do. I know of half a dozen cases in which European banks have been approached and have come forward in a most business-like manner. In most cases it was found that they had too many things on their hands, but still they did provide for these applications.

Q.—And therefore you want that until industrial banks of sufficient magnitude come into existence, Government might advance loans, etc. In what way should they borrow?—A.—By raising loans.

Q.—Then you are for a sale agency with commission?—A.—Yes.

Q.—In answer to question 34 you say, "It is desirable to appoint trade representatives to represent the whole of India in Great Britain, the colonies and foreign countries." Don't you think that Indians ought also to be employed as representatives?—A.—I have not excluded Indians.

Q.—Don't you think Indians are preferable?—A.—I don't say preferable. You should have the most suitable man, whether Indian or European does not matter.

Q.—Do you want an Industrial Bureau or a Board of Industries?—A.—Yes, you may call it whatever you like.

Q.—You cannot suggest its constitution?—A.—No, I have not had time to go into it.

Q.—In answer to question 40 you say, "From certain questions asked in the Punjab Legislative Council the other day, it appears that the manufacture of turpentine from raw resin has been monopolised by the Government in the Punjab and the United Provinces." What was the answer of the Government?—A.—I don't exactly remember. I just read the question and did not read the answer. I mention that as an instance in which a pioneer factory may be converted into an ordinary factory.

Q.—What do you suggest; should this factory be sold by Government and given to the highest bidder?—A.—I am not in favour of the highest bidder system.

Q.—Don't you think there is a danger of preference, in the case of approved parties?—A.—There is a likelihood. In the open auction there is the likelihood of getting persons not able to run it.

Q.—But if the industry proves a success, men can start similar industries?—A.—But a man may have money, be a bad manager and have no business experience and may ruin the whole concern.

Q.—You may ruin that factory after Government had proved that it is a thing which pays. If a man mismanaged it and sold it off, another man would take it over. Who knows that even he can work it to a profit?—A.—It will be connected with a certain amount of control by Government. Government has to supply the raw product. Government sells this factory to the highest bidder and says, "We arrange with you that we will supply you with the raw products for the next 5 years at a certain price," and that man buys it for 2 lakhs, ruins the whole concern, and for 5 years Government cannot sell the raw products to anybody else. The whole industry suffers. Instead of that, if Government gave it to an approved man who is likely to keep it going successfully, it would be better.

Q.—At what price should Government sell the raw materials?—A.—I have said there should be a royalty. Government should arrange to allow the man a reasonable profit.

Q.—What do you call reasonable?—10 per cent?—A.—Yes, anything from 10 to 20 per cent. No man would come and take up a new industry for less. In the case of an old industry, he would take it up for 10 per cent.

Q.—It has been proved; it is not a new industry?—A.—It has been proved by Government. People have a sort of idea that anything controlled by Government means the perfection of supervision.

Q.—Don't you think that if Government passes raw materials and gives them to this factory to work at a profit of 20 per cent., the result is to make the revenue of the country go into the pocket of one man?—A.—It is a question of bargaining.

Q.—But you say, give it to the approved party?—A.—Government is making so much per cent.

Q.—But Government means the people of the country, and that is one individual?—A.—Still Government expects to make a decent profit over that investment; why should not the other man expect a portion of that?

Q.—Then you say, "Jail products are generally sold at rates higher than those prevailing in the market, although the material turned out is generally superior." Suppose in the jails, something, say, printing, is done by power, don't you think that would compete with outside printing?—A.—My own information about jail presses in the Punjab is that their rates are higher than the rates prevailing in the market. I am subject to correction. I think jail press rates are higher than those of the market.

Q.—Then jail products are fetching higher rates because the material is good; but printing is quite a different thing?—A.—I think the general principle is that the rates are fixed a little higher than the market rates.

Q.—Then how can they sell if the rates are higher: do they still get the sales?—A.—They sell because all Government departments are supposed to buy from them; in fact are bound to buy. That is one of our grievances. We would spend less if allowed to buy in the market.

Sir F. H. Stewart.—Q.—What are the numbers of the criminal tribes?—A.—The total number of tribes is about 150,000 males, females, and children. I am talking of the Punjab alone. They are spread all over India, and there are as many in the United Provinces, Bangoon and Central India. There is a large number in Bombay and Madras.

Q.—This is the first serious effort made to deal with them?—A.—The first comprehensive effort. We have taken action throughout the province. They have got settlements in the United Provinces, Bombay and Madras.

Q.—Do you try to educate the children?—A.—Yes, education is compulsory, and every boy is supposed to go to school. I don't say every boy does go, but we are trying to send every boy to school.

Q.—I suppose you have got a special grant for the necessary expenditure from the Punjab Government?—A.—Yes.

Q.—You have 3 classes; there is a sort of reformatory settlement, an industrial settlement, and an agricultural settlement?—A.—Yes.

Q.—So that, in the course of a generation, you will perhaps have very largely done away with the criminal tribes?—A.—In the course of two generations.

Q.—I see you suggest that, where Government gives financial aid, you might appoint a Managing Director. Do you think it would be wise to give him powers beyond those of an ordinary Director: would it not be apt to interfere with the business management?—A.—I should give him definite powers. I have very little knowledge about the work done by Directors; but still, from what little I have heard, I understand there are certain difficulties which Directors experience, and therefore a Director with more definite powers would be more useful. I agree that audit would be a far more useful form of control.

Q.—In regard to Government experts, you think that the result of their researches should remain the private property of the firm?—A.—Yes.

Q.—Would that be fair, if these were Government employes entertained in the public interests?—A.—I would make the firm pay.

Q.—But even so they are public servants?—A.—Supposing I discovered something which I don't know what to do with, I ask the assistance of the Government expert, and obtain certain results. Don't you think I have a right to the benefit of it?

Q.—Would that not be met by reserving their information for a certain period, say 2 or 3 years?—A.—A year is very little. I don't mind the thing being made public after a sufficient length of time.

Q.—Under Q. 105 to 108 you say, "I understand that raw material of various kinds runs to waste for want of facilities for extraction and for want of concession." What do you mean by "want of concession"?—A.—A man who takes up some kind of raw material wants Government to give him some concession to work it, some concession in terms.

Q.—In regard to your answer with reference to difficulties of transport, you would very much like to see an engineering branch and a commercial staff attached to the Forest Department?—A.—Yes.

Hon'ble Mr. H. J. Maynard.—Q.—Before you took over this comprehensive system of the treatment of criminal tribes, they were subject to some restraint?—A.—Yes, in different localities.

Q.—Although subject to restraint, no arrangements were made for their subsistence?—A.—No, and none for their reformation.

Q.—So one of the important changes that was brought about by locating them at Dharawal is that an opportunity is given them of obtaining a subsistence which under the other system they lacked?—A.—Yes.

WITNESS No. 372.

RAI SAHIB PANNA LAL, Proprietor, Upper India Glass Works, Ambala.

WRITTEN EVIDENCE.

Glass Industry in India.

People read that glassware is made by melting simple materials, like sand and soda, etc., and by blowing the molten mass into moulds of iron or wood or by shaping it without them. They also saw that glassware was imported into the country to an enormous extent. The patriots decided to arrest the foreign trade in this line by starting glass factories in India. The principle of joint-stock companies, also of foreign growth, was called in aid, and a start was made here and there. But what a rude awakening! when furnaces made on foreign plans did not produce glass of the right quality, and when foreign labourers from cold climates with the assistance of country-bred Minhars after being trained to blowing, turned out unremunerative work. This result discouraged the first band of pioneers, whose means of perseverance to further efforts in the shape of inadequately subscribed capital were woefully limited. Factories, one after the other, were closed; some of them were sold many times less than the cost price. Failure was written in large glaring letters on the door steps of glass factories, and proved a sufficient cause to frighten away willing capital. First stage.

For some years a number of glass furnaces remained unignited. But some spirited people, prompted by locally trained but unemployed blowers and newly imported foreign workmen, restarted the works, doing blowing work in the cold months of the year and closing them temporarily during the intense heat of the summer months. These second efforts seemed to be at their last gasp, when the present war broke out, and gave them a new lease of life. Second stage.

The question arises, "will this new lease of life be permitted to the present glassworks in the country after the war? Will somebody—either the Government or the general body of consumers—come to their assistance and protect them from the crushing competition of vastly organised foreign manufacturers? If reassuring answers were confidentially given to these questions, the future of glass industry in India will take on a promising development. More and better equipped glassworks will come into existence, and meet the demand of the country in glassware.

In my paper on Glass Manufacture, contributed to the 12th session of the Indian Industrial Conference held in December 1916, some of the causes of failure were mentioned in detail, and remedies were suggested to overcome them. I recapitulate them briefly as under:— Inefficient management and scanty capital.

- (1) Promoters of the pioneer glass factories did not understand or had no grasp of the essentials of glass industry, and there was a lack of expert management familiar with local conditions and sources of raw materials.
- (2) Foreign labourers had to work in unsuitable climate under unsympathetic management.
- (3) Men of this country trained by foreigners were not accustomed to work at gas or other types of furnaces, having very high temperatures.
- (4) New Indian blowers, who previously made bangles at their old-fashioned furnaces, with comparatively low temperatures, during the cold months and sold them by hawking in hot months, deserted work on account of heat, and left the glass factories to shift as best they could. These idle months caused loss to glass factories.
- (5) Subscribed capital barely sufficed for plant and buildings, and left practically nothing in hand to tide over the initial reverses and difficulties.
- (6) Workmen from the Minhar class, themselves combined workmen and masters, resented the passing of profits of this industry into undesirable hands.
- (7) Capitalists are generally wed to particular places. Better sites from the point of view of colder climates, proximity to raw materials, cheap labour, or distributing centres do not appeal to them.
- (8) Last, but not the least, came the blast of foreign competition that took away whatever of vitality was left in this infant industry.

In the following statement I propose to suggest, to the best of my knowledge and experience, such remedies as will minimise the aforesaid defects and difficulties.

Financial aid to industries.

I have already stated that the failure of the first joint-stock companies, engaged in glass industry, scared away capital. The second efforts, with a couple of exceptions, were made by private individual capitalists. The existent glass factories have not yet recovered their credit. People are unwilling to lend their savings to glass manufacturers or to enter into this industry on their own account. This reluctance on the part of capitalists may be removed by the spread broadcast of reliable information through the agency of Provincial Departments of Industries. These Departments, as at present organised, have not the means of collecting commercially reliable information, and individual manufacturers will not, I fear, help them in this respect, as their doing so will expose them to the positive risk of bringing into existence rival manufacturers. Therefore the next best thing that a Provincial Department of Industry can do to surmount this difficulty is either to enter into a negotiation, with a promise of monetary compensation, with an existent glassworks, to so work the factory as to furnish reliably audited information to the Government for general publication and at the same time to provide facilities for the training of blowers and other necessary staff for the assistance of prospective manufacturers, or to start on Government account a demonstration glass factory at Lahore. The first arrangement for a period of three years will cost Government about Rs. 30,000, and the second one nearly Rs. 50,000, the latter with a prospect of being recovered in the course of 5 or 6 years.

Government assist-
ance.

Government policy with regard to financial assistance to glass or any other new industry has remained so far undefined. Some years ago the Punjab Government twice considered the case of my glassworks at Ambala City and recommended to the Government of India for sanction a certain graduating sum of grant-in-aid in consideration of my glassworks undertaking to train a number of apprentices as blowers, etc. The Government of India viewed this proposal in the light of embarking upon protection, and rejected it as being against its present policy. Here was a clear case for Government of India's active support, because the kind of glass that I was manufacturing did not come from the United Kingdom or from any part of the British Empire; Germany, Austria and Japan were the only competitors. But this was not taken into consideration. In this case no revision of the Imperial customs tariff was involved. The proposal was for assisting a new struggling industry for four or five years only. This is my experience of financial aid by Government to industrial enterprise.

In my opinion Government can assist old or new industries by making for a fixed number of years—

- (1) money grants-in-aid;
- (2) loans on low rates of interest, through the agency of a proposed industrial bank;
- (3) supply of machinery on hire-purchase system, such as automatic blowing machines to glass manufacturers;
- (4) preferential Government purchase of indigenous products for a limited period of ten years.

When Government elects to assist, in combined forms mentioned above or in one of them, especially when hard cash is the medium, it is right for Government to insist that its financial assistance is utilised for objects for which it is made. This object may be secured by reserving to Government the right of having a factory's accounts audited half-yearly and of continuing or withdrawing its assistance as the auditor's report may reveal a factory working up to accepted stipulations or against them.

Pioneer factories.

When the Industry Department of a province or of the Central Government is approached by a person of substance or a group of similar persons, ultimately willing to purchase, if commercially successful, Government may pioneer a new industry, and develop it within 3 or 5 years as the nature of industry may demand. The Government should undertake not to publish the results of its conduct of business until the purchasers by prior agreement have been in possession for a term not less than 5 years, or unless the purchasers have been compensated for by way of reduction in the price ascertained after allowing depreciation on plant and buildings.

I am not in favour of Government turning successful pioneering experiments into permanent Government enterprises. Government is welcome permanently to engage in industrial enterprises, if they be of the nature of "Public Services," and when Government can offer better services on cheaper rates than private management. In the words of John Stuart Mill I beg leave to submit—"When a business of real public importance can only be carried on advantageously upon so large a scale as to render the liberty of competition almost illusory, it is an unthrifty dispensation of the public resources that several

costly sets of arrangements should be kept up for the purpose of rendering the community this one service. It is much better to treat it as a public function; if it be not such as Government could beneficially undertake, it should be made over entire to the company or association which will perform it on the best terms for the public." The first sentence of the quotation lays down what services a Government should perform, and well applies to railways, the telephone and telegraph, the supply of water, gas and electricity, and the second one defines the field of private enterprise.

At present there is a gap between the men with money and the men with practical ideas. Both classes of men are necessary to a new industry. A third class of men able to influence the first and capable of understanding the latter has yet to come before the gap is bridged over. This third class should be composed of men, who are in a position, by virtue of commercial and technical expert knowledge, to bring together in active sympathetic co-operation the first two classes and to lead by efficient guidance the forces of production to successful results. These unifying factors, assembled by careful selection, should have seats on the Board of Directors of a Provincial Industrial Bank. Such a bank should have for its chairman the provincial Director of Industry, and a whole-time man of business appointed by the Local Government as its manager. The capital may be partly subscribed by the public and partly by the Government, the latter to be withdrawn when the public comes forward to replace it, without prejudice to the position of official chairman and manager. This arrangement should have the sanction of special legislation. In other respects the proposed bank should be conducted under the existing law. A bank so constituted *will inspire public confidence*, and be the means of assisting old and encouraging new industries.

Financial agencies.

These domestic industries can stand on their legs only when the labour efficiency of those who engage in them is so advanced as to compete on equal terms with factory-made articles or articles made by highly efficient foreign workmen in quality and price, or when State protection is applied, like America with respect to silk manufacture, in their favour to exclude by prohibitive tariff similar articles from the Indian markets. This government action, applied for a number of years, will promote the development of handicrafts and enable the workmen to gain by practice increasing efficiency as time goes on. A man cannot have efficiency without long practice, and a poor workman cannot persist in wasteful practice, unless he is cheered in his labour by a demand of his articles and at the same time shown the way how to make improvements. Efficiency of cottage workmen will come from industrial schools, and demand from co-operative stores. So long as these essentials do not come with State protection at their back, the lot of cottage workmen will not ameliorate.

Cottage industries.

Credit co-operation is spreading in the country, and is doing a great deal of good. Co-operation in trade, agriculture, and production remain to be tried by the public. These movements have received considerable support, and met with a fair amount of success in the United Kingdom, France, America, and Germany. Unequal distribution of profits between the capitalist, employer and employes has been the incentive to the growth of co-operative societies. Already the occurrence of labour strikes in India clearly indicates the existence of this economic disease and calls for an early diagnosis and remedy. Will "conciliating the conflicting interests of the capitalist, the worker, and the purchaser, through the equitable division among them of the fund commonly known as profit," cure the disease? The three classes of people concerned prescribe the same medicine in varying doses. As every one of them is interdependent, it is in the interest of each party that the spirit of 'give and take' should be the guiding principle in economic adjustments.

Co-operative societies.

Co-operation in trade is the easiest form, and being of distributive nature, attracts member-customers, who always prefer to deal with their stores, knowing that whatever little higher rates they might pay would come back to them as dividends according to the amount of their purchases.

Co-operation in agriculture might start with labour in the fields at the time of weeding and harvesting, and when village people realise as to what joint action means, they may be shown the way to join their individual resources and to invest them in the purchase of time and labour saving agricultural machines for the common use of the village community. Preaching and persuasion in these respects may be undertaken by the Department of Agriculture.

Co-operation in production by artisans' societies, without outside aid will not get a start. In addition to the amount of capital a society may raise among its own members, the co-operative credit societies should further assist them with the remaining necessary capital. The co-operative stores should buy their products as a matter of preference, and the Public Works Departments or Local Public Corporations should assist them with contract work rather than the capitalist contractors.

Trade guilds.

Trade or craft guilds are old institutions in India, and they have weathered the storm of centuries by restricting their membership to their kith and kin, and have been too conservative to admit outsiders and to move and change their antiquated methods of work. The Government can assist them to learn improved methods by providing for them elementary instruction in mechanical and ornamental drawing and practical manual training in their ancestral handicrafts. For this purpose municipalities and district boards, with financial help from Local Governments, may be invited to start industrial schools in important centres of industries. The training should be *free and compulsory* up to 14 years of age, when they could begin their course of apprenticeship in workshops or under competent men of their own caste for a term of 5 or 8 years according to the nature of the handicrafts the apprentices may be engaged in. Personally I shall like them to enter workshops, where a system of a graduation scale of wages combines with an up-to-date training in the use of modernised tools and methods, whereas under individual workmen provided with rude tools they go through more drudgery than training.

Technical aid to industries.

As a glass manufacturer I have received no technical aid, nor I think was the Government in a position to offer any; on the other hand I placed as much information as I had to impart at the disposal of the Government.

Agriculture is the only industry that has received in recent times any attention from the Government. Even in this respect Government action is very much confined to a limited area. Government should enlarge its field of operations, and carry them to the very door of farmers in every district and prove their superiority by demonstrations in selected areas under different climatic and physical conditions. Every cultivator should be permitted to feel that in the staff of the Agricultural Department he has kind expert friends, who will help him out of difficulties if he made an appeal to them.

For an empire of the size of India, no machinery or staff is too expensive, if all the research work that the country needed were carried on here in India. The study of local conditions at first hand and on the spot *will ensure more accurate results and immediate benefits* than if it were undertaken at a distance of thousands of miles under totally dissimilar conditions.

Publication of results of researches.

Analytical work performed by Government experts on payment by private firms should, as a matter of right, be the exclusive property of the latter, and should not be made public without the consent of the firm concerned.

Industrial surveys.

Industrial surveys should now be undertaken, each by a specialist, with the object in view that the survey is to be transformed into a pioneer industry either by the Government or the public. The results of a survey should be published in trade journals of the country, if it was initiated by the Government or they may be communicated to the person who moved the Government in this behalf. The expert surveyor should be associated in his work by a selected or interested man of business, so that the former could receive the benefit of his advice in commercial matters. I shall mention for instance the proposed manufacture of soda and its by-products in this country. The sources of raw materials, their chemical composition, cost of plant and buildings, amount of working capital, manufacturing costs, quantity of outturn, condition of home and foreign markets, and earnings of undertaking may be made the subject of a survey.

Consulting engineers.

A consulting engineer under Government service may be further remunerated by a fixed amount of commission when machinery is purchased on his advice or through him. The institution of consulting engineers is exceedingly useful, and when conducted by men of experience it renders much desirable help. But these should be under private management. My experience is drawn from firms of the latter description. The Government may entertain a consulting engineer in each province, and attach him to the Board of Industry.

Assistance in marketing products.

Commercial museums.

Commercial museums, if kept up-to-date, render great help to manufacturers, middlemen and consumers, particularly the first two classes. These should be spread over important centres in the country, such as Delhi and Amritsar in Northern India. A classified catalogue, showing manufacturers' names, brief description of articles, wholesale and retail prices and trade discounts should be periodically corrected, published and sold for a nominal price. The ministerial staff in charge of a museum should be men with commercial training, well paid for their work; ordinary clerks will be of no use. Museums may be placed under the control of Boards of Industry. The collection in museums should be both of foreign and indigenous make.

The display and sale of indigenous products, unknown in the home markets, may, to begin with, be entrusted to co-operative stores on a system of commission sales or ninety days' credit, when an article is likely to take the market. This arrangement will fit in with the principles of co-operation, and provide patriotic and profitable work for the stores, which may have inter-provincial connections with similar stores in the country, and thus mutually perform the functions of trade representatives. Similar connections may be established with co-operative stores in foreign countries, and occasionally trade representatives may be sent abroad when a need for that action is felt. Indigenous products must in the first instance try to meet the requirements of the home markets before manufacturers take in hand the supply of foreign ones.

Travelling exhibitions is a very good idea, and if carefully developed will prove exceedingly useful. If a travelling exhibition is fitted up in railway carriages of the broad-gauge dimensions, and moved from centre to centre into buildings constructed on railway-sidings, and halting therein for fixed periods for inspection of visitors, it will prove economical in the up-keep and be shifted from place to place in a fixed rotation or be taken to places of industrial fairs, as the authorities in charge may direct. The control of the travelling exhibition on wheels should be left in the hands of the Imperial Board of Commerce and Industry.

I have already said how Government can patronise co-operative societies. This patronage may also be extended to factories in the purchase of articles, which Government imports at present from abroad. Rules and regulations are made to be ignored and set aside; the main change should be in its policy towards indigenous manufactures.

Lists of Government requirements should be published three months ahead, and circulated to manufacturers and published in important papers or Government Trade Journals.

Training of labour and supervision.

Primary and technical education produces far-reaching effects on industrial development; an American Economist says:—"The mere ability to read and write opens at once the whole new world. He who possesses it can learn from the experience of all mankind, no longer from that of his parents and masters only. The extension of such a great improvement as the system of inter-changeable parts has depended largely on widespread of elementary education. A complex tool or machine—a plow, a reaper, a bicycle is made now-a-days on standardized patterns, each part being a precise duplicate of every other part made from the same pattern. When there is a break, the needed part can be replaced at once. The system makes possible the wide use of intricate apparatus in localities distant from repair shops. But its adoption is possible, in turn, only if those who are to use the apparatus have some general intelligence and if they can read instructions." "Under the conditions of the modern world, and especially with the more methodical application of natural science to arts, the laboratory is likely to play a larger and larger part, both directly, through the inventions that come full-fledged from laboratory, and indirectly, through the work of those who have had its training."

. "The engineer gets his fundamental training, not in the workshop or in the field, but in the technological school. The same movement is seen in the extension of industrial training to the familiar mechanic arts. Apprenticeship to a craftsman was for centuries the mode in which these arts were maintained and transmitted. But the conditions of modern industry have made apprenticeship ineffective and virtually obsolete. The 'master' of former times has well-nigh disappeared; he is replaced by the large employer, out of touch with his individual workmen, whether young or old. Those preliminary stages of industrial training which were in former times provided by apprenticeship should now be undertaken by systematic trade schools, and should be a part of the general system of public education. The time is not distant when the normal entrance to a trade will be through such schools."

. "Though reading and writing do not make a ditch digger stronger, and geometry and literature do not add directly to the skill of the mechanic, all education makes for intelligence, discrimination, the utilization of opportunities, the spread of improvements. It makes for sobriety, honesty, and steady endeavour. The more it is directed to uplifting the character and training the faculties, and the less it follows the dull routine, the more does it achieve the ends. Where it fails to achieve them, the remedy, even in the interest of bare industrial efficiency, is not to curtail it, but to improve it. Freedom of opportunity and diffusion of education are the means for discovering those possessing unusual gifts."

I have already mentioned, under "Trade guilds," the course that apprenticeship should take. Non-hereditary boys from 12 to 14 years of age, who have previously received

elementary education and preliminary training in an industrial school, may be sent by the Board of Industry to aided or self-owned factories for further training as skilled workmen. For work managers, foremen, or supervisors, higher education in commerce and applied sciences is essential, as without it they are ill-fitted to undertake the conduct of business or the direction and control of complicated processes of technical industries like glass-making, paper, soap, oil, varnishes, tanning, dyeing, pottery, enamelling, and alkali, etc. Youngmen of education aspiring to occupy posts of responsibility should also go through a course of final training in Government or private factories.

Mechanical engi-
neers.

Local Governments, in the interests of uniformity and factory-owner's convenience, should recognise each other's certificates granted to mechanical engineers and drivers. In the matter of grant of certificates, competency rather than service should be the general guiding principle.

Official organisation.

Provincial De-
partment of Indus-
try.

A Government Department works, I presume, to a declared policy and prescribed rules and regulations. All these may be in existence, but the public knows very little about them, and forms its opinion from the results produced by the said department. These results are very poor. The reason is not very far to seek. The department is still in its infancy, and is poorly staffed. The head can work effectively only when other organs of the body are proportionately in an equally efficient condition. This department has much to learn and must learn that much efficiently before it can be in a position to teach others. It requires considerable improvements in men and methods. I shall speak of methods first, which, if agreed upon, will call for men themselves.

A man with some capital is willing to invest it in an old or new industry; the industry may be new in India but old elsewhere. He naturally applies to the Department of Industry for necessary information. I shall presume for the sake of an illustration that he is interested in glass making. The Department of Industry should be able to furnish him with information on the following heads:—

- (a) Sources of raw materials in India, and of chemicals of foreign and local manufactures.
- (b) Building materials, such as fire-clay, fire-bricks.
- (c) Up-to-date plans of approved furnaces, pots, automatic blowing machines, manual blowing tools, and grinding machinery, with their approximate costs at a certain place of delivery and their sources of supply.
- (d) Country and foreign skilled labour, their ordinary places of residence, their wages by the month or per batch, their conditions of labour and outturn of a day's work.
- (e) Necessary factory buildings.
- (f) Description of various processes and experience of other factories.
- (g) Separate manufacturing costs of chimneys, phials, bottles, etc., and the estimated earnings of undertaking or management.

When a capitalist applicant gets the aforesaid information, he shall be able to decide for himself, and shall stand a better chance to succeed than if he were to start without it.

The collection of this kind of information, its digestion, and casting it in the form of a business prospectus calls for the engagement of a special class of men in the service of the department, and they should be engaged if it is really to be of service to the country.

A Department of Industry should have the following sections, each under a special man with adequate establishment:—

- (1) Hardware and Machinery, (2) Electricity and Electrical Goods, (3) Drugs and Chemicals, (4) Woodware, Toys, etc., (5) Textiles, (6) Pottery and Glass, (7) Tanning and Manufacture of Leather Goods, (8) Stationery, (9) Cottage Industries on smaller scale, (10) Fancy Goods, Jewellery, etc., (11) Statistics and Commercial Intelligence, (12) Trade Journal, (13) Library, (14) Shipping and Railway Transport, (15) Money Market.

A Director should be a business man, whether official or non-official, on a monthly salary of Rs. 2,000 to 3,000 appointed on probation for two years, ultimately serving at least for 5 years if confirmed by a Local Government. He should be assisted by a Board of six or more members, each appointed or re-appointed for term of one year. This time-

limit will facilitate the appointment of new members to serve new interests or prove an incentive to old ones to justify their claim to re-appointment by good results during their prior incumbency. Four of these members may be experts from Government or private institutions, and the remaining two should be purely men of business, carrying on for the time being important industries in a province. Out of the four experts, one may be an Analytical Chemist, another a Professor of Applied Chemistry, the third an Engineer, the fourth the Director of Public Instruction. These expert members should get an honorarium for attending meetings of the Board.

This Board should have power to direct the expenditure of budgetted funds. The Director must be the chief executive officer, who will carry out the decisions of the Board, if such decisions, where Government sanction is necessary, have been confirmed by the latter. A Director, whether official or non-official, should, during the time he works as such, be considered as an officer subordinate to a Local Government.

The Department of Industry, which should be called a Board of Industry, guided by the Department of Education, where purely literary instruction is concerned, should have undivided control over industrial schools so long as the system of public education is not assimilated with the present and future industrial needs of the country. Even then industrial schools will demand a special treatment different from that of a purely literary education.

Elementary industrial education should be imparted through the medium of vernaculars, introducing foreign technical terms where vernacular substitutes do not exist.

Monographs on industries are very good, but being in English they do not reach a class of people who might derive greater benefits. I should like them to be translated in the vernaculars.

Provincial Boards of Industry, subject to the general control of Local Governments, should be in harmony with the general policy of the Imperial Board of Commerce and Industry, which may remain in charge of a Member as at present, but which may be assisted by a Board of experts and men of business. The Board may include :—

An Imperial Department.

Experts :—

- (1) Heads of Imperial Research Institutes, engaged in industrial researches, including in addition Agricultural Chemist.
- (2) Chief Inspector of Mines in India.
- (3) Reporter of Economic Products.
- (4) Inspector-General of Forests, or his representative.
- (5) Director of Geological Survey, or his representative.
- (6) Financial Expert.
- (7) Secretary to the Government of India, Department of Education.
- (8) Electrical Adviser to the Government of India.
- (9) A Civil Engineer, and

(10) Men of business. These may be appointed from amongst the most important captains of industries, giving a chance to every province of having at least one member on the Board.

The Imperial Board of Commerce and Industry may hold quarterly meetings at Delhi to transact such business as may come before it on Government initiation, or as a proposal submitted by a Provincial Board of Industry for sanction, or as proposed by a member of the Imperial Board. Proceedings of the Imperial Board may be subject to the sanction of the Governor-General in Council only when a question of imperial character of far-reaching effect is at issue, such as the amendment of Indian Tariff, the amendment of any other law in force, commercial relations between Indian States and British territories, or commercial adjustments between India and Independent States on India's frontiers. With respect to budgetted funds the Board should have absolute powers to devote them to objects for which they might have been provided.

Functions of Imperial Board.

The Imperial Board should concern itself with (1) investigation of new industries suitable for introduction into India, (2) the improvement of existent industries on modern lines, (3) devising means of protecting and nourishing old and new industries, (4) initiating such research work in India as may conduce to achieve the foregoing objects and aims, (5) propagating accomplished researches through colleges, industrial schools, and publishing

them in trade journals, and (6) assisting the flow of funds, both Government and private, into industrial channels. When success in these objects shall have been gained, and when the supply of manufactured products will exceed the country's demand, the Board shall have to send out trade representatives abroad to discover outlets for India's surplus. Any action before this happy consummation arrives will be an unwarranted waste of public money. Experts engaged in research work may be allowed, when need be, to visit research institutes abroad to verify their own results or pick up better methods or bring back new discoveries.

The Imperial Board should lead the way in establishing technical laboratories, under a well-paid and competent staff, to so handle mineral, agricultural, and forest products as to make it possible to start industries on investigated lines. The Board may start them itself, if need be, but on lines that may eventually lead to their absorption by private enterprise in the form of companies or associations. Imperial experts, when applied for, may be loaned to Provincial Boards to assist them in organising their laboratories or helping a new industry to come into existence. These Imperial Experts may be treated, with a view to their status, as *Advisory Members* of the Provincial Boards, subject to such rules as the Boards might have for their guidance. They may further be required to act under the orders of a Local Government and its Director of the Board during the period of deputation.

Co-ordination of
work of Imperial
and Provincial De-
partments.

It is very difficult to draw a line of demarcation between subjects deserving Imperial or Provincial consideration. Absolutely new industries affecting the whole of India may be taken in hand by the Imperial Board, and those of local concern by the Provincial Board. Similar conditions may apply to old industries. Even this division of labour may be open to several objections. The best way, in my opinion, to get out of this difficulty will be to let the Imperial and Local Boards by mutual arrangement to have the work done by the most capable men, whether attached to Imperial or Provincial laboratories. Upon these bases technical laboratories may work independently of sister institutions elsewhere in the country. When research programmes of the Imperial and several Local Governments are settled and announced to one another, the danger of "overlapping and waste of energy" will hardly be encountered. Two men at different places may be engaged in one line of investigation; one may fail, but the other may succeed. Such instances are not uncommon in the scientific world. One man's waste of time and energy is insignificant in comparison to another man's simultaneous success; the country at large is the gainer at a little extra loss, and can well afford to bear it.

Reference libraries.

Scientific works of reference are non-accessible at present. There must be a liberal supply of such works in the libraries of Boards of Industry, and they may be circulated to established factories for a fixed period or inspected by visitors free of charge.

College of Com-
merce.

Each province may have a College of Commerce, imparting instruction by short courses to men already engaged in manufactures or commerce, and providing complete instruction by a three years' course to matriculates or graduates of any university. People taking short courses should get Professors' certificates of study, but those going through a regular course and after passing the final test, should receive a diploma from the provincial University. The syllabus may consist of principles of Economics, Mercantile Law and Practice, Commercial Geography, Banking Theory and Practice, Organisation of Commerce and Industry, Accountancy and Auditing, and English. An industry has a double aspect—manufacturing and commercial—alumni of commercial colleges will prove better associates of industrial experts than illiterate men of business.

An easily intelligible text book in vernacular on the subjects mentioned in the last paragraph, except English, may with advantage be introduced in the secondary schools, so that students may not be totally unfamiliar with the subjects of college courses, should they ever take up higher education.

Local bodies

Night classes for workmen to improve their elementary knowledge of reading and writing so that they may be able to understand the advanced courses dealing with their several crafts, will fulfil the needs of the country, and these classes may be opened and maintained in each town by the Municipal and District Boards. The courses of instruction should be advanced study of vernaculars, elementary English, and lectures on technical subjects dealing with local industries.

Commercial Intelli-
gence.

One single office of Commercial Intelligence at Calcutta for the whole of India is insufficient. Many duplicates are required. Commercial information must be made easily accessible in each province at the Board of Industry. Information of a general character should periodically find a mention in each provincial trade journal.

Government should lead the way in starting trade journals. A journal devoted to each industry will be a poor show for want of copy under the present conditions. Each industry must grow and multiply before it can have the privilege of an exclusive journal. The general requirements of the country will be met, if trade journals are published in sections headed Minerals, Agriculture, Forest Products, Commercial Intelligence, Co-operative Movements, Exhibitions, Industrial Fairs, Money Market, Researches, Brief Reviews of Technical Publications, Foreign and Indian Industrial Legislation and Advertisements. These journals should be bi-lingual, English matter appearing side by side with Vernacular translations. This arrangement will popularise them and achieve their objects of publication. The journal may be subscribed for entirely or in sections. The rate of subscription should be as low as possible; it should never exceed the cost price, rather it may be under that even. Trade journals.

There must be a very strong back-ground of commercial morality before the institution of certificates of quality can be expected to serve any useful purpose. When foreign exporters are prepared to stipulate for a certain percentage of foreign matter in grain, and themselves encourage the presence of moisture in ginned cotton, there is no matter for surprise if sellers should usually take to these measures as a matter of unobjectionable routine. The remedy lies with the buyers insisting on a better and purer quality. With a change in the methods of exporters, an improvement in the quality of exports will follow as a natural sequence. With regard to articles of food consumed in India, they are generally sold and bought in a loose and unpacked condition. A firm may hold a certificate of quality with respect to a certain analysed article, and yet pass on one of inferior quality that may be inherent in the article itself or it might have been brought on by the adverse influence of decomposing climate. These conditions call for an ever-vigilant machinery of inspection on behalf of the certifying authorities. But where articles of an imperishable nature or those capable of withstanding for a reasonable time climatic ravages are concerned, a certificate of quality reproduced in facsimile may very properly be attached to them. But even this latter class of goods must be subject to periodical inspection. Certificate of quality.

There is a widespread adulteration of ghee, oils of all kinds, atta, sugar, and milk. These articles are the staple foods of labour and capitalist classes; they cut at the very root of productive energy on account of the poor nourishment that they give to the consumers. A general deterrent legislation on this subject is of primary importance, and, when passed, should be worked through the agency of Health Officers and Special Inspectors. Adulteration

Adulteration in chemicals, etc., also obtains to a certain extent, but they escape detection in the absence of analytical chemists. Manufacturers discover them through the poor or ruinous results they produce. Glass industry suffers a great deal on this account; there may be other sufferers as well.

A large number of railways in India are owned by Companies; they invested capital to earn profits. It is too much to expect them, individually or collectively, to cut short their profits by allowing reduction of rates in favour of any industry, in the profits of which they do not participate. With a view to allow the products of a new industry to reach distant markets in the country, where at present non-British goods are holding them, "the Government should give the railways subsidies for carrying " indigenous manufactures from their place of manufacture to specified places " either free of charge or at reduced rates, as is done in some countries." "Some articles, such as Belgian salt-cellar, are actually brought free of charge as ballast. This means that the imported article is subsidised as compared with the Indian article that has to pay freight from inland centres to the sea-ports." Transport facilities.

I have to offer similar remarks with regard to Shipping Freights from Indian ports to China, Straits Settlements and Persia, etc., so far as cotton fabrics, yarn, and wheat flour from Bombay and other ports are concerned. Shipping freights.

Some years ago a scheme to produce hydro-electric power from the Jumna near Jagadhri for industrial application was put forth in the time of Sir Louis Dane, but it seems to have been dropped for reasons unknown to the public. The promoters of this scheme had proposed to supply electric power to factories between Lahore and Delhi. The question may be re-opened by a general survey of the river systems of the Punjab. An enormous amount of energy daily runs to waste in the land of five rivers. Hydro-electric power.

Jail industries have not so far injuriously affected any private enterprise; on the other hand jail initiation in carpet weaving has fostered the latter. In fact jails are rendering exceedingly patriotic service by training the convict labour to useful handicrafts, and that labour on release, with a few exceptions, is absorbed into distant factories and smaller industrial establishments. I might say convicts in jails may with greater advantage be employed on such handicrafts as are at present in sore need of skilled labour. For Jail competition.

this purpose jails may engage outside instructors to impart requisite training to long-term prisoners in glassmaking, glazed pottery and bricks, conservancy gamias, and enamelling. These industries come within the definition of hard labour, and will replace handgrinding of corn and other drudgeries of an unelevating type.

General remarks.

In my preceding statement I have tried to impress upon you that glassmaking in this country has a fair prospect before it, provided the proposed provincial Boards of Industry so equip themselves as to (1) furnish a prospective glass manufacturer with all the reliable information he vainly expects to get from existent factory owners, (2) make it possible for him to obtain a necessary number of skilled workmen trained at a Government demonstration or aided factory, (3) make it easy for him to receive financial assistance from the proposed industrial bank, and (4) assure him by State action that his investment will not be jeopardized by any apprehended foreign competition after the present war. The realisation of these propositions will place, not only glassmaking, but any other industry as well, on sure footing of healthy development.

The manufacture of soda, woodpulp, coal-tar dyes, and smelting and refining of mineral ores into ready chemicals, await development on the ground of raw materials needed for them being available in the country.

Research work.

I have already made a passing reference to research work. This deserves better consideration. I think it will be generally admitted that during the last 25 years a major portion of the discoveries of industrial importance has come either from the universities or from men whose knowledge was obtained therein. This statement applies to other countries than India. India has got to copy their methods, and learn their experience before she can act on independent lines. I have said that laboratories may be started and worked by Boards of Industry. This should be only a temporary arrangement; eventually all laboratories should be attached to universities and colleges. Because "it is from large universities of the world that industry has received in recent years its most valuable gifts. The beneficence of the University extends not only to the solution of an industrial problem, but also to the furnishing of men..... Now, the parlours of adolescent "good men" are the laboratories of the University. There it is that men are "tried out," and there it is too that men are known better than they know themselves..... Wherever there is the smoke of a factory chimney, there are unsolved, exasperating, vitally important manufacturing problems—problems in glass, porcelain, starch, tanning, paints, drugs, iron, oil, metallurgical products—problems wherever man deals with substance. It seems clear that these problems can best be answered by combining the practical knowledge and the large facilities of the factory with the new and special knowledge of the universities, and by making this combination through young men who will find therein success and opportunity. It lies in giving the manufacturer (or his patron, the Government in India) the privilege of founding in the University a temporary industrial fellowship for the investigation of a specific problem, the solution of which would mutually and materially benefit both the manufacturer himself and the public. When, therefore, the University accepts from a manufacturer the foundation of an industrial fellowship, it not only provides an expert intense attempt to solve a problem by the application of the newest of new knowledge, but, as well, it provides for that industry a "good man" whom the industry would do well to cherish....." The successful solution of an industrial problem should carry with it the payment of one-tenth of the net proceeds arising from the discovery of the Fellow, the latter being regarded as the inventor.

There should further be co-ordination and co-operation between universities, industries, and banks. "Apposite to this statement, and indeed typical, is the case of a German University professor who discovered a new process. His first step was to present it to the experts of one of the great factories concerned; his second was to present it to the Deutsche Bank, which employed its own experts to report on the validity and practicability of the process. As a result, the professor with his discovery, the Deutsche Bank with its funds, and the company with its immense facilities for investigating the discovery on a large scale, formed a little company of three for the exploitation of the process."

If the labours of the Indian Industrial Commission result in securing to the present and the future generations of manufacturers all the facilities that make for raising a land full of raw materials to the proud 'position of a manufacturing country,' the universal gratitude of the Indian people shall be the most sincere offering to the members of the Commission. May God and the Good Cause of India guide the Commissioners in their wisdom and fellow-feeling to make such recommendations as may fulfil the intensely-cherished hopes of Industrial India! And may people's Blessings descend on your august heads for your noble mission!

ORAL EVIDENCE, 10TH DECEMBER 1917.

(To the *Hon'ble Mr. H. J. Maynard*.)—A short time ago an offer was made by the Excise Department to the witness to enter into an engagement with him by which the Excise Department would undertake that certain license-holders should be required to purchase a certain proportion of their bottles from an Indian firm on the understanding that the Indian firm would fix a certain maximum price for a certain standard of quality of the bottle. There was to be no undertaking as regards monopoly to the witness. The only undertaking was that the supply should be from the Indian firm. He was asked to quote a figure at which he would be prepared to supply bottles of that standard quality. Owing to the existing conditions of war the present rate at which he could quote a price would be so enormously high that he did not think it possible to make a quotation. He said that he was sufficiently occupied in making little chimneys for the railway and other departments, and was on that account not able to undertake additional work as he was not able to find an additional supply of glass-blowers for the purpose. The witness also said that he was now making lamp chimneys for the railway and other departments, but it was only after the beginning of the war that he was able to do so. Before the war the Government Departments purchased imported articles. He was not able formerly to supply because the articles were imported and the officers of the Departments concerned were not willing to take his products. He obtained a letter from the Director of Industries as an introduction to the Stores Department of the Railway, and owing to this letter and the need in which the Railway Department found itself of obtaining glassware in India he was enabled to secure work from them. Mr. Maynard was misinformed in supposing that the Storekeeper of the North-Western Railway pointed out faults in the manufacture which were subsequently corrected, but what happened was that the draftsmen made mistakes in the specifications and measurements and those mistakes had to be corrected, or something of that sort. The witness also complained of adulteration in the chemicals of which he makes use in his glass works, for instance, in lime and other chemicals which he is using in his works and the bad reputation which this adulteration brings about in respect of his commodity affects his trade. He desired a law for preventing adulteration in the interests of industry.

Mr. C. E. Low.—Q.—What made you take up the glass industry to start with?—A.—A company was started in Ambala in 1894 or 1895 for the manufacture of glass as I saw that all glasses came from foreign countries. The company was not successful owing to absence of expert advice and also to the fact that they could not raise sufficient capital.

Q.—Was there any information or any enquiry made as to whether the raw material available at Ambala was suitable for glass-making?—A.—No such enquiry was made, but sand and lime, the only raw materials obtainable in this country, came from quarries in Dehra Dun. Colouring materials, though existent in the country, such as manganese and cobalt ores are not refined in India.

* Q.—At present what kind of glass are you making?—A.—Chimneys and globes.

Q.—Is there a large percentage of breakages?—A.—The majority do not break now, but a certain number do and apparently will always break.

Q.—Do the Japanese blowers teach you how to blow chimneys?—A.—We knew how to blow chimneys before, but these Japanese do teach. We do not engage them entirely on a system of piece-work, but we have got a system by which they have a share in the profits.

Q.—Do you boil glass in crucibles?—A.—Yes, we melt glass in crucibles; tank system has not been tried.

Q.—Where do you get crucibles from?—A.—We get them from Japan, but before we manufactured locally.

Q.—You do not make local crucibles successfully?—A.—No covered pots are imported from Japan, but open pots were and are a local success.

Q.—Do many break?—A.—Yes, but our local make lasted longer.

Q.—Have you had any correspondence with the Bombay School of Art about making crucibles?—A.—I do not think so.

Q.—We saw specimens made in the Bombay School of Art of pots for glass work and crucibles?—A.—No we only had correspondence with the Jubbulpore people. Before the last two years we were manufacturing our own, some with the German fireclay, and some with the Jubbulpore fireclay, and it has been successful. The Japanese covered crucible is good enough and suitable for our purpose.

Q.—I do not know whether you are aware that the Bombay School of Art had been investigating all the different kinds of clays which they could find in order to see what sort of clay was suitable for making, among other things, these glass-melting pots?—A.—I do not know anything about the Bombay School of Art.

Q.—You have not thought of trying to get into communication with them?—A.—I will try.

Q.—Do you consider that you will be able to go on getting a large profit when the war is over?—A.—For some years I think we can go on, but after that I cannot say anything at present.

Q.—For some years you will be able to go on because the freights will be high?—A.—Freight, and after that I think we require a little help in that respect from the Government. I applied last year and the year before last to the Government of India through the Local Government to give us a contract for ten years at least on the old rates for foreign goods, but we got an answer in the negative.

Q.—Old rate, that is, the rate before the war?—A.—Before the war—five years' rate. In the Telegraph Department and several other departments Government require lots of these glass goods for cells and other things.

Q.—Have you succeeded in making battery cells?—A.—I supplied a few months ago, some to the Telegraph Department and some to other departments. There is one scientific workshop in Ambala which is supplying throughout India to the schools, and that workshop is buying some of its articles from us.

Q.—Do you think that Government could give you a sufficiently large order when the war is over to give substantial assistance to you?—A.—Yes.

Q.—Government is a big consumer?—A.—Yes. Not only that, but there is the reputation that the Government is giving orders to us. Now we are not putting our mark on the chimneys. Previously when we supplied several chimneys to the markets of Lahore and other places with our marks on, the people used to say, these are country-made and we do not want them. Now I have removed the mark and am introducing my goods without a mark, and there is no complaint now.

Q.—I think that you have established your reputation and you can use your own mark?—A.—Yes. We require Government patronage in that respect. People will know that we are supplying Government, and therefore our goods must be good.

Q.—Would not some difficulty arise if other glass concerns were started in India now or after the war?—A.—In my opinion there is much demand and one or two factories cannot meet the requirements of India, but their success or failure depends upon Government policy after the war.

Q.—I was thinking about the available Government orders. Will there be enough Government orders to assist more than one factory?—A.—There are many lines in this glass-ware business. In the Punjab there may be one line, in the United Provinces another, and so on. One factory would make only pane glass, another chimneys, a third, bottles, the fourth, table wares and so on. In that way there would be no competition, and there would be many openings.

Q.—Ambala is close to the boundary of the United Provinces?—A.—Yes.

Q.—Was there not a talk a short time ago of some one opening a factory in the United Provinces in some district quite close to Ambala?—A.—No. Some of my own men or friends have opened a factory in the Muradabad District with the help of Mr. Silver.

Q.—Perhaps you mean Mr. Elland, the Government Glass Expert?—A.—No. Those people had trouble only about finance. Mr. Silver was very keen on the development of this industry, and he promised capital at a low rate of interest. Government also offered me help in that respect which we have not availed ourselves of. It is not at present a question of competition or anything of that kind.

Q.—Why I was asking you about this is this, if Government gives order to two different factories close to each other that will stimulate competition which is not desirable at the present stage although afterwards it may be very good?—A.—Quite so.

Q.—You are now largely occupied with Government orders?—A.—Yes.

Q.—Almost entirely?—A.—Yes.

Q.—Are you getting apprentices?—A.—According to our own system which is this—The boys who come to our work become after a year or two expert blowers, and in that way we are improving.

Q.—How many men do you employ in your factory?—A.—One hundred men altogether.

Q.—Are the boys taught?—A.—We are ready to teach, but in the ordinary course, all these workmen are getting work with the help of these boys and they are learning themselves for their own sake. We have not got any special arrangement now. A few years ago,

in the time of Sir Louis Dane, the Lieutenant-Governor of the Punjab, we adopted the system, but after a few days it was discontinued. Again the present Lieutenant-Governor kindly tried to help us, but the Government of India replied that it was against the policy of the Government to help industry—this glass industry—and that it would interfere with foreign goods or something like that.

Q.—It was not anything like that, because the reply went under my signature?—A.—I do not think so, but Mr. Townsend may remember the exact wording.

Q.—Recently or in 1905?—A.—Only about 14 years ago or two years ago. In your time.

Q.—I am perfectly certain that it was not as you say. We offered to lend some money?—A.—I did not ask for a loan, but I asked for some irrecoverable grant, and I think the Local Government recommended Rs. 5,000 or something like that or a yearly subsidy for apprentices, and we got a reply after a few months that the Government of India said that they did not think it proper to adopt that policy.

Hon'ble Sir R. N. Mookerjee.—Q.—After how many months?—A.—There had been correspondence for fifteen years. After we got this reply that the Government was not ready to help, we had to give up the thing.

Mr. C. E. Low.—Q.—You have not been corresponding for fifteen years on this subject?—A.—On this subject. Not with the Government of India. In the time of Sir Louis Dane we started correspondence about ten years ago, when in the beginning Sir Louis Dane came on a visit to our factory, and I requested then some things, and from that time the correspondence begins.

Q.—Financial assistance was sanctioned under certain conditions which were not fulfilled, and so it did not come off. Then there was a recent application made in 1915 or 1916 and the Government of India offered a loan, and I gather that you did not take it?—A.—The loan had to be repaid. Suppose we lost that money in the course of business it would be difficult for us to return the loan. Four per cent. or something like that the Government offered. No doubt, it was a low rate of interest, but it was difficult to make any promise that we would repay on such and such a date. Rs. 20,000 or Rs. 40,000 we could easily put in our business ourselves, and for the sake of a few rupees saving in interest we thought it was not worth while to have the interference of Government.

Hon'ble Sir R. N. Mookerjee.—In your experience in dealing with the Government on business matters, generally speaking, how long does it take to get a reply from the Government?—That depends on the departments.

Q.—Take the Department of Commerce and Industry?—A.—I cannot write direct.

Q.—Through your Government?—A.—It depends on the circumstances and the subject.

Q.—Can you give us a rough idea as to what is the usual time taken for a reply?—A.—In these two or three matters I have applied, and I think I got a reply on the finance question after a long time—three or six months.

Mr. C. E. Low.—Q.—Whom do you apply to in the first instance? The Director of Industries?—A.—I think I moved the Head of the Local Government, who asked the Director to make enquiries and report. The two Directors, one after the other, commended my applications to the Government.

Sir F. H. Stewart.—Q.—You are fully occupied with Government orders?—A.—In these days, for globes, chimneys, kerosene lights, special globes and some special orders for the Research Institute at Kasauli.

Q.—Are you making phials and bottles?—A.—We have given up that line altogether.

Q.—You think that if Government is to give money aid it should make it a condition that it is given to a person of substance who is willing to put in a good amount of his own money?—A.—It is not necessary that a person who applies for assistance to Government should be a person of substance, but it is necessary that the Government should obtain guarantees that the money will be spent in the industrial enterprise for which it is borrowed.

Q.—You say that "the Government should undertake not to publish the results of the conduct of business until the purchasers by prior agreement have been in possession for a term not less than five years."—A.—Suppose I have got a glass factory and I take some help from Government, the Government will have full liberty to see my accounts and get all the information, but I would not allow Government to give this information to my rivals or competitors.

Q.—That would be your own business?—A.—Yes. If I start a new industry and the Government helps me on condition that I give them all the information, what I want is that for the first five years Government should not disclose that information.

Q.—You want a monopoly for the first five years?—A.—Only for that factory. I am not saying that Government should not give money or any other help to other glass-makers. It can give it, but it should not disclose the information we give to others. Suppose we put five per cent. soda, two per cent. of something else and so on, Government should not disclose that kind of information.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—You have described the railway difficulties. Can you mention any specific cases of hardship? What kind of difficulty have you in mind? A.—About freight.

Q.—What is the freight from Ambala to Jubbulpore?—A.—The exact figures I do not remember at present. In 1908 I think I made a statement for the Industrial Conference in the Punjab.

Q.—I would like to know the present rates from Ambala to Jubbulpore and from Calcutta to Jubbulpore?—A.—About the glass industry what I have in my mind is this. Supposing I have to send stuff from Ambala to Multan I have got to pay a little more money than for the same things from Karachi to Delhi or from Karachi to Ambala.

Q.—The distance is short and you have got to pay more?—A.—Yes. I think I have requested our Director to give us some help in that respect, and I do not remember what the railway answered.

Q.—How many years' experience have you of this glass work?—A.—Fourteen years entirely, and before that something also.

Q.—You will be able to inform the Commission correctly on one subject, and that is this— if there is no war and if the rates go down as usual, do you think that if you start a glass factory in the country without Government help it can compete with the foreign made article?—A.—No, it is absolutely necessary that our Government should protect from now onwards new or old unsteady industries by letting them have reduced inland freights brought about by the grant of subsidies to railways and by raising barriers at Indian ports.

Q.—Do you mean import duty?—A.—Yes, I am in favour of import duty. It is very difficult to ask the railway to reduce their profits, because they are here to earn and not to lose.

Q.—Do you want the railways to be Government railways?—A.—Yes, Government ownership will eventually yield to public control of rates in the interests of indigenous industries.

Q.—Without Government help you cannot start a glass factory in the country?—A.—No, if started, bounty-fed foreign factories will crush it by entering through our practically open door.

Q.—It is impossible?—A.—Yes.

Q.—If you put in a large capital, and bring the best experts from all over the world to work the factory on a large scale with a capital of 15 or 20 lakhs, still do you think, without Government help, it will be able to compete with foreign goods?—A.—We cannot do without Government help. A large amount of capital and foreign experts may prolong the struggle, but will not save the industry from eventual collapse, if Government does not step in to raise up protective fences.

Hon'ble Mr. H. J. Maynard.—Q.—What dividend are you paying?—A.—There is no dividend paid because it is a private concern belonging to myself. Before the war we lost some money, but now there is a certain amount of profit.

WITNESS No. 373.

MR. GANDA SINGH UBEROI, Messrs. Uberoi, Limited, Sialkot.

WRITTEN EVIDENCE.

Training of labour and supervision.

I am interested in the athletic trade only.

My business is affected by matters relating to the following questions:—

Q. 44 (a)—Certainly. I find that the boys who have been to school pick up mechanical knowledge much quicker than those who have not been educated.

Q. 44 (b)—I had to import English experts in various departments to teach my men and to help them to become more efficient and this experiment proved effectual and successful.

Q. 45 (a) & (b)—The first thing necessary is to give them education. Then teach them improved methods through up-to-date practical experts.

Q. 46—I have trained some hundreds of boys for the athletic trade but not as bound apprentices. I find that Indian boys are generally very quick to learn any industry provided they are taught on correct lines.

Q. 47—I have had no experience of boys taken from industrial schools, but I certainly believe that early training at these schools should very greatly help the boys to get first insight and should influence their minds to decide what business they would rather follow and this I consider is a very important factor in their future success.

Q. 48—I think boys should first be sent to industrial schools to ascertain what business they are most fitted for. They should then be apprenticed to a business in which they have shown aptitude and for which they have a liking and more especially as they can get expert training.

Q. 49—Young men who are learning or have learnt their business should be given every facility for attending night or short-time day schools, more especially those who feel that this education will help them to get more efficient.

Q. 50—I think industrial and technical schools should be placed under the Department of Industries. This Department should be assisted by the Department of Education in providing teachers on the Arts side and examining the boys on the said side. But the management must remain in the hands of the Industrial Department.

Q. 51—For the training and improvement of Supervisors and skilled Managers they should be sent to Europe or those countries where their particular business is a speciality or experts from those countries might be imported for this purpose.

Q. 52—Government should make grants to the firms who send men to become efficient in foreign countries. These grants may be in the shape of free passage, or so much a year for the time they are learning or a percentage of the whole expenses.

Q. 53—It is difficult to lay down hard-and-fast lines on which Government can require assisted industries to train technical experts. This can be regulated by an arrangement made at the time the assistance is given and based on the amount of assistance given.

Q. 54—My answer to this question is in the affirmative.

Q. 55—So long as our general knowledge of the elements of Mechanical Engineering is in its infancy, all Engineers in my opinion should be qualified and hold a certificate.

General official administration and organisation.

Q. 56—We have a Department of Industries in the Punjab, but I have never heard of this Department doing anything substantial to help the local industries.

Q. 57—We should have a Board of Industries which should be advisory only.

Q. 58—The Members of this Board should be recognised successful leaders of industries in the province, who should be capable of giving sound advice.

Q. 59—I do not recommend a Board with executive powers in the first instance.

Q. 60—Yes. He should be an executive officer of the Department and should be a thorough business man with a varied and wide experience of organisation and possessing large amount of general information.

Q. 61—The Board should deliberate and submit their recommendations as to what should be taken in hand by the Government. After the Government has accepted the recommendation, the Director will carry it out.

Q. 62—I do not advise one province having anything to do with others nor should I suggest having an Imperial Department which I consider will more impede the progress of some provinces than help them.

Q. 62 (a)—Yes.

Q. 62 (c)—Weaving, hosiery and such like.

ORAL EVIDENCE, 11TH DECEMBER 1917.

Hon'ble Sir R. N. Mookerjee.—Q.—In answer to question 48, you say: "I think boys should first be sent to industrial schools to ascertain what business they are most fitted for." Don't you think it should be the other way about, that they should be put to practical training to find out their aptitude and fitness for the line they select?—A.—First of all their minds must be trained, and that you can only do in the schools while they are very young.

Q.—Irrespective of their aptitude or physical fitness to do the work?—A.—That you can determine afterwards, when the boys are sent to an industrial school. It is there you can find whether there is any aptitude or not.

Q.—How?—A.—Because they will show a liking for various things; one may be fond of carpentry, another of iron work, and so on. When they show a certain aptitude, then it should be determined whether they should be sent to any workshop or not.

Q.—And there they may not prove useful or may be physically unfit?—A.—Boys are very young. How can you say whether they are physically fit? You can only say when they are a little bit grown up.

Q.—What do you mean by your answer to question 55: "So long as our general knowledge of the elements of mechanical engineering is in its infancy, all engineers in my opinion should be qualified and hold a certificate." Do you mean afterwards they should not qualify?—A.—In England everyone can work as a mechanical engineer, but here in India I suggest no man should be allowed to handle a steam engine without possessing some sort of certificate of efficiency.

Q.—You don't refer to boiler working?—A.—I do.

Q.—But then in Bengal and other provinces there is no examination, yet they do the work all right?—A.—I have only knowledge of this province.

Q.—They have no examination and no accident.—A.—We have had a lot of accidents in the Punjab.

Q.—Your experience is only in this province?—A.—Yes.

Q.—You are against having an Imperial Department of Industries?—A.—Yes, I am.

Q.—Don't you think an Imperial Department will be helpful to look after other provinces?—A.—That would be a very bulky affair and would impede progress. If there is a Board it will be required to do so much and no more. There are provinces where people are more active and more practical. They want to do more than people in other provinces who are indifferent. Then again there are certain provinces where the heads of Government take more interest, and where the Director of Industries may be a better man; so I suggest that all the provinces should be left alone to do their best in their own line.

Q.—What about getting technical advice? You cannot expect every province to have a staff of all sorts of technical experts?—A.—I certainly suggest that all provinces should have their own experts.

Q.—Even if you have no work for them?—A.—You cannot have about 8 or 10 experts covering industries all over India. You have to provide the various provinces with various kinds of experts for those industries which you want to take up in that province; for instance, you may have sugar in one province, or the paper industry; then you have to provide only two experts for that province.

Q.—And if there is any industry besides sugar and paper?—A.—I am only giving you an illustration. You have to provide only these experts in those provinces who can deal with those specific industries which it is the intention of Government to put in force. We should have a provincial laboratory in every centre of the province.

Q.—Well fitted up for all industries?—A.—Yes.

Mr. C. E. Low.—Q.—How many people do you employ?—A.—About 250 to 300.

Q.—Do these English experts you have imported teach your employees what they know themselves?—A.—We take the boys as apprentices and teach them at our own factory.

Q.—Are you able to get your men instructed by these English experts sufficiently to enable you to get rid of the imported experts?—A.—Yes, they teach every bit of the thing.

Q.—Are you still employing these men from outside?—A.—I think for some time it is necessary that these factories should be placed under the supervision of English or foreign experts.

Q.—You have not been able to do without them yet?—A.—Not yet.

Q.—How long have you had them?—A.—From 1905.

Q.—And you have still got them?—A.—I had to bring two first, and they could not complete the work. I had to go back to England and bring another set of experts.

Q.—But you have still got these English experts?—A.—Yes.

Q.—They are working as foremen, I suppose?—A.—You can call them foremen. Of course they do two things; they teach the boys and also examine the goods.

Q.—Are you getting any Indians to do the same work that these English people are doing, and accept the same responsibility?—A.—I have not as yet got such men. They have not attained that efficiency. The business is in its infancy.

Q.—Have you tried to train men of that sort?—A.—Yes, I am trying; I am getting men of that kind.

Q.—How long do you think it will take?—A.—It will take another 5 or 6 years.

Q.—What class of men are you getting in; are you getting any educated people in?—A.—A certain percentage.

Q.—At what age do you take educated people in?—A.—From 12 to 14 years generally.

Q.—Simply with primary school training?—A.—Yes.

Q.—You don't take any older?—A.—Those matriculated boys don't do.

Q.—Have you taken in any people from any of the technical schools?—A.—No.

Q.—Were any available, or did you think they would not be of any use to you?—A.—I did not know they were available.

Q.—Have you any idea of training any such?—A.—I shall be very pleased to have a few if I can get them.

Q.—Do you believe in the idea of apprenticeship?—A.—I do.

Q.—Do you find the difficulty that when you have trained your workmen they desert you for somebody else?—A.—That is the greatest trouble at present.

Q.—Do they go away before they have learned their business properly; or afterwards?—A.—In both cases.

Q.—Have you any definite suggestion to make to meet that difficulty?—A.—I think a special apprentice law should be passed on the same lines as in England. They have apprentices in England as their property. I don't know if we can deal with the boys as effectively in this country.

Q.—Have you ever considered the idea of an optional system of apprenticeship, under which, if a boy went through 5 years, or whatever it is, and gave satisfaction, he should then get some form of Government certificate. Do you think that would be any attraction?—A.—You mean to say that he should not be bound? No, I don't believe in the optional system. That will be no good for the boy, and no good for the employer.

Hon'ble Pandit M. M. Malaviya.—Q.—When did you start this business?—A.—Perhaps 25 years ago.

Q.—And you have always found a market for your articles—an increasing demand?—A.—Yes, I have no difficulty in disposing of my articles.

Q.—Are there other branches of the same trade in the Punjab; other firms doing the same business?—A.—Yes, there are others.

Q.—How many?—A.—I cannot give you the number, but there is a fair number in Sialkot.

Q.—Would there be half a dozen?—A.—No, more than that; I should say about 30 or 40, or more, in Sialkot alone.

Q.—Are there any other firms like that, outside Sialkot that you know of?—A.—I don't know if there is any factory for manufacturing athletic goods outside Sialkot.

Q.—Do you know of any outside the Punjab?—A.—No.

Q.—What portion of the cricketing and other gear do you supply to the country? About one-tenth or one-twentieth?—A.—That is a very difficult question to answer, because I am not in possession of the figures.

Q.—Are there special facilities for carrying on this trade at Sialkot; or is it merely because you started it there?—A.—There are no special facilities; it is only because I cannot leave my home.

Q.—I should like to know whether you bring the wood that you require from a long distance or whether you get it in the neighbourhood?—A.—We bring our wood from various places. We bring our wood from long distances in some cases.

Q.—You say that you have had some English experts working under you. Can you tell me how many?—A.—I have got two now.

Q.—When did you begin to employ these English experts; at the very start, or after some years of experience?—A.—I started this business, and when I found that I could not go further. I went to England and brought 2 experts and they helped me to a certain extent; but I wanted something much better. I wanted a man of international reputation. I went back again and brought a man who is one of the authorities in this trade.

Q.—And he is with you now?—A.—Yes.

Hon'ble Sir B. N. Mookerjee.—Q.—Is he an Englishman?—A.—Yes.

Hon'ble Pandit M. M. Malaviya.—Q.—How many years has he been with you?—A.—Now 7 years.

Q.—You said that you are training your assistants under him?—A.—Not assistants; I am training boys.

Q.—Is there any man whom you are training as an assistant to take the place of this expert, supposing he wanted to go back?—A.—Yes, my own boy. He is very nearly ready.

Q.—Have you taken many apprentices outside your own circle?—A.—Yes, I have trained hundreds.

Q.—Are they working now in the other factories that have been started in Sialkot or outside?—A.—Everybody has to draw from me.

Q.—You think then there is much room for the development of this trade?—A.—I do up to a certain extent.

Q.—You say here that education is the first necessity; and then you say in answer to question 47 that you believe in early training in industrial schools, and you think that this should greatly help boys to get first insight, and should influence their minds to decide what business they would rather follow. Do you think that if in these elementary schools drawing and manual training, and a little knowledge of carpentry and smithy were introduced, either as compulsory subjects or as optional subjects, that would promote industrial development?—A.—I do.

Q.—You would then have drawing and manual training in all elementary schools?—A.—I think we should have an 8 hours industrial school, and should give 2 hours to arts and 2 hours to drawing and model-making, and 4 hours to carpentry or metal work.

Q.—That is a matter of detail.—A.—I do believe that industrial schools would be very helpful in developing industries.

Q.—You think that the object which you have indicated in answer to question 47 would be served if boys had this early industrial bent given to their education; they would then be better able to select what business they might follow?—A.—Yes; we can save a lot of waste of time if we had industrial schools. They will be the grounding place to find out whether a boy is capable of doing anything. No boys should be sent to an establishment and apprenticed for less than 5 years. Those boys who are any good can go to central institutions afterwards, and those that are no good can leave the school.

Q.—At what stage would you introduce manual training; after they had learned to read and write and cast up accounts?—A.—Yes, and drawing also. First of all their mind must be trained a bit.

Q.—You say here that you would put the industrial and technical schools under the Department of Industries: what particular advantage would accrue from placing these technical schools under the Department of Industries? Should they not rather be under the general Department of Public Instruction?—A.—No, I think that will be a kind of dual control, because these Arts Inspectors can come and inspect the Arts side. They should have nothing to do with the organisation or management of schools, because the school should be run on business lines.

Q.—That would apply to industrial schools, but not to technical.—A.—Industrial schools as well as technical.

Q.—You say that "for the training and improvement of Supervisors and skilled Managers they should be sent to Europe or those countries where their particular business is a speciality, or experts from those countries might be imported for this purpose." I take it that you will agree that if experts are brought in, they will be able to train a much larger number of Supervisors and Managers than you could obtain by sending men out to other countries?—A.—To some extent; but if you want to train a man to handle a gigantic business, an expert cannot train that man, because there would be no such factories here, to enable him to see all the various departments of it. An expert may go to a certain extent, and a man may become a better mechanic than perhaps the expert himself.

Q.—Then in the case of select men, you would encourage them to go to other countries to study things for themselves there?—*A.*—Yes.

Q.—You say that you have never heard of this Department of Industries doing anything substantial. Have you any idea of what work this department is doing?—*A.*—I don't know. They simply get a few returns. As far as I know, I don't think they do anything, *i.e.*, anything substantial. I doubt very much if they understand anything about industries.

Q.—You say you think that it will be an advantage to the province that the Members of this Board should be recognised successful leaders of industries in the province?—*A.*—Yes, I do.

Q.—In the case of an Imperial Department, what is your apprehension; supposing you had an Imperial Department?—*A.*—It would be a very heavy, bulky machinery, and all provinces will have to go to it for their Directorate: for instance, in some provinces you may get a set of very capable business men as advisers, who may go very quick; but if you have to get instructions from Simla, then you would only be able to do so much and no more.

Q.—You think that for the development of industries in the province, men in the province will be much more useful than men at some distant centre in the country?—*A.*—I do.

Q.—You have suggested two industries, weaving and hosiery, in the shape of cottage industries. Are there any other cottage industries extant in your province which you can recommend? Is button-making taken up?—*A.*—No, I don't know.

Q.—In what form would you suggest this help should be given; in the shape of hand-looms and machines for making hosiery. For weaving in cottages, I suppose you mean that hand-looms should be given?—*A.*—Yes.

Q.—In what way should they be given; on the hire-purchase system?—*A.*—The hire-purchase system would be much better.

Q.—Or merely lent out on hire?—*A.*—The hire-purchase would be better.

Q.—Could not this best be done by forming co-operative societies which might co-operate both for purchase and sale?—*A.*—Yes, that is a good idea.

Hon'ble Mr. H. J. Maynard.—*Q.*—You said that there were about 30 or 40 concerns at Sialkot which make sports goods?—*A.*—There are many more.

Q.—Is not a very large proportion of those firms quite small concerns; are they not very small?—*A.*—Yes; of course if a man has got his own shop and turns out a few tennis rackets in a week, he can call himself a sports manufacturer.

Q.—They are mostly of that type. How many considerable firms are there who employ as many as 50 workmen?—*A.*—I don't think there is any other firm in Sialkot employing anything like 50 men, except my own.

Q.—You told us that your wood comes in from long distances in some cases. Have you ever obtained any help from the Government Forest Department in the matter of your wood?—*A.*—No help. I should say just the other way.

Hon'ble Sir R. N. Maekherjee.—*Q.*—What do you mean? That you were hindered?—*A.*—They don't give us any facilities.

Q.—What do you mean 'the other way'?—*A.*—We draw our mulberry wood from Changa Manga. It is a Government plantation near Lahore, about 30 miles or so. Instead of running the show for the benefit of the sports manufacturers, they do it for their own benefit. They would not cut the necessary quantity of wood, and when they did cut the wood they would do it at such times and in such quantities as to induce artificial competition. For instance, supposing we wanted 5,000 feet of timber, although the timber was there, they would cut 1,000 feet only. All the men would go there, and instead of our having to pay the usual price of 8 or 12 annas, the price would go up to Rs. 3 or Rs. 3-8-0. Everybody fights to get the timber. They know our requirements; they know what we want: if they cut the wood for us and sell it at the depot rate of 14 annas, everybody could get it; instead of that they cut small quantities and let the men fight and fight and keep up the price.

Q.—Have you written to them complaining of this procedure?—*A.*—They are too independent to take any notice of complaints.

Q.—They may have a reason for not cutting such large quantities at a time. Have you ever enquired into the facts?—*A.*—We have approached them two or three times. They say: "Oh no, we will do as we like. Government has to see to its own interests, not yours."

Q.—Have you got any written correspondence about that?—*A.*—I do not believe in written correspondence. I had to go and see them and make representations.

Q.—We take it from you that they auction the wood and don't give it to any particular persons—*A.*—They auction month after month.

Q.—And whoever bids high, they get it?—*A.*—Yes.

Q.—Do you object to that system?—*A.*—I do, because there is any amount of mulberry, and they can grow much more than we require. If we don't buy the wood they sell it at 2 or 3 annas a foot. It is fortunate that we have discovered uses for mulberry; it is useful for making hockey sticks and other things. Now they have got sheesham and mulberry, but if they turned the whole thing into mulberry, they could not only get the necessary quantity of fuel, but they could keep us satisfied, and this industry would be very materially benefited.

Hon'ble Mr. H. J. Maynard.—*Q.*—I suppose you will recognise that the Forest Department has to consider other interests as well as the interests of one particular industry. It would not be possible for them to say that mulberry is benefitted by such and such an industry and therefore we will grow it. They are obliged to weigh one interest with another.—*A.*—But they can serve two or three interests by doing the thing on business lines. What I object to is that there is no sense in it.

Q.—What particular feature of it? Of course the Forest Department is a profit-making department.—*A.*—That is the one thing which comes in first with the department.

Q.—Is that, to your mind, the radical difficulty which prevents it from being useful?—*A.*—They don't take an interest. They say: "We shall run this on red-tape lines; we don't bother whether you come or not."

Hon'ble Sir R. N. Mookerjee.—*Q.*—That is to say, their attitude towards the development of industries is not good?—*A.*—No, they do not take the slightest interest.

Hon'ble Mr. H. J. Maynard.—*Q.*—There is a beautiful museum of different kinds of wood at Dehra Dun. Have you made any use of that?—*A.*—Yes, we have been in communication with that institution.

Q.—Have you ever been to look at it?—*A.*—No, I have not been, and there is no necessity to go. I know pretty nearly everything connected with my business; what wood we require and where it grows.

Q.—You don't think that would contribute anything useful to your knowledge?—*A.*—We have had correspondence with those people, and they admit that what we want we can get only at Changa Manga.

Q.—About this matter of education, I understood you to say that the boys who have been to school pick up mechanical knowledge more quickly. You meant by that that the boys who have been to an ordinary elementary school pick up knowledge quicker?—*A.*—They do. We find they pick up mechanical knowledge quicker; they are more intelligent.

Q.—From having gone through the ordinary literary education in a primary school?—*A.*—Yes.

Q.—You don't mean to say an industrial school?—*A.*—I have had no boys from a regular industrial school, and there are no industrial schools at Sialkot; but generally those boys who have attended an Arts school are more intelligent.

Q.—That applies to primary schools; but what about a boy who has been beyond the primary stage into the middle school?—*A.*—I have replied to this question; because those boys who have passed their matriculation examination don't come. They think it below their dignity. I have had no boys beyond the primary.

Sir D. J. Tata.—*Q.*—About your visiting the museum at Dehra Dun; you say you know all about wood, so you don't need to visit the museum.—*A.*—I did not say I know all about wood; but all about the wood that I use in my business.

Q.—Are you aware that the institute at Dehra Dun makes enquiries into the various kinds of wood, and the uses to which they could be put. Perhaps you might find some other wood which may serve your purpose just as well, by visiting an institution of this kind. You know the general complaint is that there are not enough research institutes scattered about the country to help industries. Here you have an institution close to your door, and you don't take advantage of it?—*A.*—I don't mean to dispute the usefulness of that institution but this industry is a very old industry in England, and we have got here the top experts and they tell us what our requirements are.

Q.—They tell you what are the woods used in England, because they only know the wood grown in Europe. But your expert would not know anything about the woods grown in India. For instance, I might tell you this morning some of us visited the Railway Workshops. A wood is at present being used there for making propeller blades of aeroplanes. This is quite different to any wood used in Europe, and the workshop people find that it is much better suited for propeller blades than the wood used in Europe. This particular

wood does not exist in Europe, but it exists here. In the same way you can find other wood that may suit your business. So, why this attitude of aloofness?—A.—We are using a certain kind of timber which we find is admirably suited to us. So the Dehra Dun men can only tell us of some kind of wood which grows on the Himalayas. The question is whether that wood may be useful to us or not. Then comes in the question of freight; it might not be convenient.

Q.—Is not knowledge of any kind always worth having?—A.—That it is all very well.

Q.—Have you heard about this particular kind of wood I am referring to?—A.—I did not say I have knowledge of all kinds of wood.

Q.—What are the various departments in your sports factory?—You manufacture cricket bats, tennis rackets, hockey sticks, footballs and cricket balls, are all made from materials obtained in this country, or from imported materials?—A.—We import some materials.

Q.—With reference to the expert you have called in; what is he an expert in? In all these things, or only in one or two branches?—A.—In the majority of branches; but there are some things which he has not actually done, but has a thorough knowledge of.

Q.—You mean to say he has gained a certain amount of experience and knowledge after coming into this country, which he did not possess before?—A.—Yes.

Q.—He is not a universal expert, but only an expert in a few branches?—A.—When we showed him various kinds of wood and proved that they were better, he said: "Yes, you are doing very well."

Q.—Just as you proved to him that other woods are better, you might yourself find somebody prove to you that there are woods which might serve your purpose better. You say that you will bring up your own son to take up this work under the experts. Have you ever thought of sending him, or any of your relatives, to Europe to be trained in this business thoroughly?—A.—All my boys have been educated in England, with the exception of one.

Q.—But have they been apprenticed to particular branches of the trade that you have taken up, in any way?—A.—Later on they can go when they have mastered all we can teach them here. Then they can go to England.

Q.—Don't you think that such apprenticing is a great thing for people who are in certain industries to train their own children up scientifically in every branch of it, so as to be independent of foreign experts, and be able to do everything in this country themselves?—A.—Yes, it is necessary, as I have said in my written evidence. Those boys who show promise and who acquire all that we can teach them in this country should certainly be sent to foreign countries to specialize in those subjects.

Q.—Here you have an industry for over 28 years in your own factory. There are ideal circumstances under which you should send somebody to be trained in Europe and specialize in your business. Don't you think you ought to take more advantage of the situation.—A.—I had to struggle first for 20 years to make two ends meet. I had to do the whole thing myself and fight against a hundred and one difficulties. When I made a little progress I said, "it will not be complete unless I go to England and bring out experts."

Q.—Instead of bringing out experts, could you not train your own sons in this profession by sending them to England?—A.—They are very young. They have only become lit now.

Q.—In regard to industrial schools, what sort of education would you have in them? Would you give that education in existing elementary schools as supplementary education; or would you have different schools?—A.—No, different schools.

Q.—So you would have elementary schools giving ordinary education, and other schools where industrial education is combined with manual training. You would not combine the two in the same institution?—A.—No.

Q.—Referring to the question of your workmen, you say that you were the first to introduce this industry; and you trained all the workmen, and that nearly all the workmen employed in other factories have been those trained by you?—A.—I don't say "all"; but the majority, the non-artisan class. There is a certain class in this country called the artisan class, and they generally don't come to me for training.

Q.—Have you any complaints with regard to that? Do you suffer in your business, owing to your workmen being enticed away by others?—A.—Yes, I do.

Q.—Have you any suggestion to make as to how to prevent that?—A.—Beyond a certain age I cannot prevent boys and men going to other factories. I suggest introducing some sort of apprentice law, by which we could keep the boys for a certain period.

Q.—As your workmen leave you, do you go on training more men?—A.—Yes.

Q.—So you get all the workmen you want? You have no difficulty about that?—A.—We have to work very hard and persevere.

Q.—In answer to question 42 you say: "Young men who are learning or have learnt their business should be given every facility for attending night or short-time day schools, more especially those who feel that this education will help them to get more efficient." By whom should this facility be given? By employers like yourself?—A.—Yes, by employers.

Q.—That means you will let them off their work hours to go to school, and pay them during the time they go to school? Is that not what you mean?—A.—I don't mind doing this.

Q.—Have you ever done anything of this kind—let the young men learn a trade under you; give them two hours; pay them for full time, and let them spend those two hours in a school?—A.—Most of the boys are illiterate. I have not done anything in this line.

Q.—You say young men should be given every facility. By whom?—A.—I mean by Government.

Q.—How should Government give facilities to boys in your employ. They are employed by you; you work them for 8 hours; where are they to find time, unless you release them?—A.—They can do that in the evening.

Q.—After working 8 or 10 hours in your factory?—A.—They actually do not work for more than 6 or 7; they do not get exhausted.

Q.—Is it not your duty also to help them?—A.—Yes, to some extent.

Q.—Then why don't you do it yourself? Later on you say: "Government should make grants to the firms who send men to become efficient to foreign countries." You propose that you should send men to foreign countries and that Government should help you to do so?—A.—I don't mean that Government should help me personally.

Q.—By making grants to firms who send men to become efficient, you mean firms like yours; and for the purpose of establishing private industries which are not of national importance?—A.—Not for myself, because I am sufficiently advanced; but for those industries which are in their infancy. Government should help these.

Q.—You say: "These grants may be in the shape of free passage, or so much a year for the time they are learning, or a percentage of the whole expenses." These are private industries; why should Government pay for the education of these men at all. Don't you think the firms themselves should do it?—A.—I think Government should help new industries, because they won't do any substantial thing without Government help. When I was answering this question I was not meaning my own business. I said, new industries.

Hon'ble Sir Fazalbhoy Currimbhoy.—Q.—Were you the first man who started this industry?—A.—I cannot say that I started this. There was this industry, but in a very crude way they used to make badminton and tennis rackets for some time.

Q.—And now you are making the articles as good as the English?—A.—As good as anything in the world. We claim that we make better things. Englishmen in this country say so. I have got in writing opinions from leading English tennis players.

Q.—As you say, this industry has greater scope for expansion in India; if so, you can make more and send outside India and compete with others. At what price have you been selling; at a lower price than imported articles?—A.—Yes.

Q.—How much lower 10 or 15 per cent.?—A.—Yes, we sell them cheaper; we sell them in many cases at the same prices, and in some cases at cheaper prices.

Q.—What is the highest price you get for a racket?—A.—The highest is Rs. 25.

Q.—Have you got any school in Sialkot like the Government Railway School here? Have you seen the Government Railway School here?—A.—I have not been to that school, but I know there is a railway school somewhere near the railway station. We have no technical industrial school in Sialkot.

Q.—I would advise you to visit this school; it will interest you a lot. Having no industrial school, you have to take raw boys?—A.—Yes, we have got to take raw boys.

Q.—And apprentices come to you; do you start them with any pay?—A.—We take him for a month or two to see whether he is any good.

Q.—At what age does he come to you?—A.—We take him at any age, but not under 12 or 13. We train all classes.

Q.—What is the highest pay an Indian draws in your place?—A.—Do you mean Indian workmen?

Q.—Yes. What is the chance for an apprentice if he comes to you; in how many years does he reach the highest pay?—A.—He can make about Rs. 50 or 60.

Q.—What does your English foreman draw?—A.—Rs. 400.

Q.—You brought him on an agreement of 4 or 5 years?—A.—Yes.

Q.—And he gets lodging free?—A.—Yes.

Hon'ble Sir R. N. Mookerjee.—Q.—Your work is piece-work?—A.—We have both systems, piece and daily wages. Generally we run our factory on piece-work.

Q.—When you say a man gets Rs. 60, he earns Rs. 60?—A.—Yes.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—You give out work on piece-work?—A.—Most of the work is piece-work. It is very difficult to get work out of the workmen without any system. You will require so many more supervisors.

Q.—What is the chance of a man becoming an overseer of the works? You must have many Indian overseers to work under the European?—A.—Yes, we are training them.

Q.—What is the highest pay the man who is under your European foreman draws?—A.—We give them sometimes Rs. 70 and Rs. 80.

Q.—Where do you get your machinery from; is it English? Have you got English machinery?—A.—Yes, a lot.

Q.—Is the Japanese article competing with you?—A.—I don't think they can turn out athletic goods.

Q.—But are any Japanese goods coming which compete with you?—A.—I think they are sending some sort of tennis rackets.

Q.—Are you suffering any railway difficulties in sending your articles to other places at high rates?—A.—Yes, very much.

Q.—Suppose you have to compete and send your articles to Bombay, competing against European goods, then do you send by railway from here to Karachi and from Karachi to Bombay by sea?—A.—We are very handicapped; we have to pay much more freight from here to Calcutta than perhaps from London to Calcutta. I don't supply English goods to the Calcutta Branch, but have to ask my London agents to send, because it is cheaper. Freight from London to Calcutta is less than from here to Calcutta.

Q.—You think that a man who has learnt this business is a better man to be sent to Europe to learn that profession with the help of Government scholarships?—A.—What I meant was that, supposing a man has learnt all he could under an expert, and he showed promise, Government should come, not in the interests of that employer, but in the interests of the country. If they get hold of a man who shows he is efficient, he should be sent to England or some other country to specialize, because he may be a better man than their expert.

Q.—Now Government are sending scholars to England and other countries by giving scholarships?—A.—Most of them are no good.

Q.—They get a man from college and ask him what profession he wants to learn?—A.—That is a great mistake.

Q.—They ought to take a man who has learnt the business here?—A.—That is why we are getting a kind of set-back. These men, when they go to foreign countries, learn nothing. If a man wants to learn, nobody can stop him from learning. If a man is the son of so and so he is selected and sent to England, that is a wrong system.

Q.—About apprentice law, what is this apprentice law that you want to have?—A.—They have a special apprentice law in England. The apprentices are in a way the property of their employers for the time being. Supposing a boy runs away, they can inform the nearest magistrate, and the boy will be fetched back at once. We have no system here, with the result that much of the time and money spent on these boys is lost, because before they have made any headway, they run away.

Q.—For how many years do you want these people to be apprenticed?—A.—5 to 7 years to get very efficient, because a boy requires 3, 4 or 5 years to learn it, and then he gets very efficient after 7 years.

Q.—Are you suggesting that to your Government here?—A.—Yes.

Q.—How many hours does your factory work in the day?—A.—We work 8 hours.

Q.—You just said about the financial help. You had no Government financial help to make a very large factory from the beginning?—A.—No, not only no financial help but not even the requisite knowledge. Here people are setting up businesses without any knowledge at all, with the result they fail.

Q.—Are there other factories as big as yours in Sialkot, employing European supervision?—A.—No.

Sir F. H. Stewart.—Q.—Your business is a success now?—A.—I should think so.

Q.—And you have a good many branches in different places?—A.—I have 4 branches, Calcutta, Madras, Lucknow and Delhi.

Q.—When you started, I suppose most of the sports for which you supply goods, cricket, football, hockey, etc., were confined to Europeans?—A.—Yes.

Q.—Indians did not play them much in those days?—A.—Indians knew these things before I started, and that was why I took it up.

Q.—Do you make golf clubs?—A.—Yes.

Q.—Have you found suitable timber for golf clubs, shafts and so on?—A.—Hickory, which is American wood.

Q.—You have not found suitable wood in India?—A.—I made experiments, but did not get.

Sir D. J. Tata.—Q.—Did you try Dehra Dun?—A.—No.

Hon'ble Pandit M. M. Malaviya.—Q.—You said that the Forest Department think of their own profits and do not think of helping the trade?—A.—I don't say the only difficulty is their profits. They don't take an interest except in their own department.

Q.—Did I understand you to say that they have been raising the price of the wood that you require, as the requirements of your industry have been growing?—A.—They are not raising. They are doing the business in such a way that the raising of the price is the result.

Q.—Is the wood that you use required very largely for other purposes, so far as you know?—A.—So far as I know it is not used for any other things.

Q.—You said that they would sell a thousand feet at one time and then hold up and sell another thousand feet later on, when there would be a great demand in the market for it, instead of fixing the price and allowing people to order as much as they wanted, in which event you and others in this trade could get wood cheaper and on fairer terms?—A.—Yes, because we could send in our indents.

Q.—What you would wish to be recommended is that a certain price should be fixed and that indents should be taken in hand and the wood supplied when the demand for it has not risen in the market. Would you recommend that the price should be fixed when the demand is not very high in the market?—A.—Do you mean, generally speaking.

Q.—You say they send out a thousand feet at one time; then you wait and the thousand feet are to be shared by half a dozen firms, so the price rises. What do you recommend; that the thing should be available throughout the year, so that anyone indenting may get it on fair terms without there being this keen competition for it?—A.—Yes, somewhat on those lines.

Q.—Have you any other suggestion to make, in order that this difficulty should be avoided?—A.—I think that the place is big enough for keeping the sports trade running all the year round, and they can perhaps get more wood than we require, if they took an interest in the thing. I admit in some cases perhaps mulberry wood is not as much as is required, but if they took an interest and if they grew the wood, I mean on business lines, they could get much more than we want, and there is great scope for that.

Q.—Would you put in your suggestions in a definite form as to what you would want the Commission to consider as a possible recommendation to help your trade, and send it to the Secretary. We would like to know how help can be given to this trade, in order that it should develop.*

Mr. C. E. Low.—Q.—You suggest that people should be allowed to indent for mulberry wood at a fixed price?—A.—Yes.

Q.—Should they be allowed to indent for as much as they wanted?—A.—You mean that it may be abused? You mean a man wishing to "do" other firms "collars" the whole thing and sells it at a higher price? Is that what you mean? That can be provided against.

Q.—I am afraid it is not so simple as you think. That is also the difficulty, that Government may be accused of favouritism?—

* Not received at the time of going to Press.

WITNESS No. 374.

LALA HARKISHEN LAL, *Bar., at-Law, Lahore.*

WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

I have had, so far as the Punjab, Sindh, and parts of United Provinces are concerned, considerable experience of the raising of capital directly as share-capital of industrial joint stock concerns, and indirectly through banks and insurance concerns. I have found difficulties in raising, in these parts, share capital to any very large extent by public advertisement because of—

Capital.

- (1) the want of experience in the investing public ;
- (2) want of means of large and extensive publicity ;
- (3) limited number of people who could or would invest in industrial concerns, the result of which had not been demonstrated or established ;
- (4) limited resources of investors ;
- (5) non-attractive terms as to return on their money by ordinary industries, as all the industries which could be started without speciality of knowledge or speciality of privilege were exposed to unlimited competition from outside the country and in the country itself ; and lastly because
- (6) absence of recognised underwriters, brokers and canvassers.

Raising of capital indirectly, however, through shares and deposits of joint stock banks and insurance concerns was, comparatively speaking, easier, but I am afraid that day has also gone, on account of the folly of the majority of people concerned, and wickedness of some Indians and Europeans, want of sympathy on the side of authorities (not to use any stronger term) and the spirit of competition of Anglo-Indian banks. Therefore it is not only essential but imperative that this source of raising capital should be revived by all legitimate and effective means, as no civilised industrial country has done much or can do much by way of industrialism or commercialism without banking backing. Even in England they are now feeling that efforts in this direction are needed to improve their own industries and trade. So far as the Punjab is concerned, the only source of real wealth of the people at present being agriculture, co-operative banks movement ought to be strengthened, extended, improved, localised and capital drawn from this source to industries ; as savings of town trade people are generally very meagre and the official world cannot amass sufficient wealth to give a real impetus to industrial enterprise.

I have no personal experience of any financial or other aid by Government to any industrial enterprise, but I think for the conditions brought about by world competition, and by the recognition of the fact that financial State aid has been given to industries in old countries it is essential, considering the low industrial level to which we have been brought, that very liberal financial aid by Government should be afforded, and the method of giving Government aid should not be confined to any one or two of the methods suggested in question 5 ; but all the methods should be declared permissible ; one or more, most suited to particular cases, to be resorted to when applications for aid are received and approved. Government interests and public interests require that the aid afforded from public funds should not be wasted, misapplied or waylaid, and measures should be taken to guard against such risks ; but no hard-and-fast rules are required, nor any greater precautions are necessary than in the case of money lent for such purposes by such institutions as the Bank of Bengal and the Bank of Bombay. Government caution sometimes degenerates into a regular interference and this must be avoided.

Government assistance.

I am not acquainted intimately with any industry pioneered by Government in these parts, but I know that Government does its own dairying, runs extensive Railway Workshops in connection with North-Western Railway, and owns a Forest Distillery (Turpentine). In my view Government should directly pioneer industries where—

Pioneer factories.

- (a) Government-owned raw materials are going waste and are not being and are not likely to be utilised for industrial purposes ;
- (b) Government is a large consumer of manufactured articles, and they have to be bought out of India where they are produced at an enormous cost, though they could be produced in this country at a much smaller cost ;
- (c) similar undertakings, in private hands outside of India, are on an enormous scale requiring skill and labour beyond private control ;

(d) a flourishing industry carried on on obsolete methods is languishing and requires special skill and organization to revive; which private enterprise is unable to undertake;

(e) In short in exceptional cases only, where it was not possible to induce private enterprise to come in.

Government pioneer enterprise should be limited only to such time that the chances of creating private enterprise to undertake the same are not forthcoming, excepting where for considerations of political and financial necessities, a State monopoly becomes desirable.

Banking facilities.

I am afraid that the existing banking agencies in the Punjab are useless to render any assistance to existing or future industries in the land, and for reasons of banking failures of 1913-14 special efforts are needed to organize purely Indian banks with avowed objects of helping trade, agriculture, industry, and social requirements, respectively, with suitable organizations, and suitable capital.

The existing Company law is quite sufficient, and I am decidedly of opinion that no further legal interference is either needed or desirable. The laws recently passed such as Prime-Movers, Factory Inspections, Boiler Inspections, even the Railway Act are worked unequally, and hamper rather than help or guide; and lead in many instances to positive discouragement.

Limitations to Government aid.

In my view Government aid should not be refused to any new enterprise, simply because it would compete with an established external trade; otherwise in the present condition of things Government aid will not be available in all the numerous directions which are indicated by the ever-increasing list of imports.

II.—Technical aid to industries.

So far as the Punjab is concerned no technical or scientific aid has ever, to my knowledge, been afforded by the Government to any industry, nor are there any industries excepting wheat-grinding and cotton-ginning of any magnitude worth mentioning. But leaving the execution of research aside for the time being, it will be very useful for the Province if Government started demonstration industries connected with oil-crushing, and industries arising out of oil, and also metal industries so far as every-day needs of the people are concerned, both for the urban and rural populations.

Other aspects of the inquiry would be premature for this Province, but as it is not likely that the Government would institute any periodical surveys of the industrial situation it is necessary and essential that an Industrial Board on the lines of City Improvement Trusts, be instituted fully representative of Indian interests, and a Technical Education Board be organised on the lines of Senates of Universities like the Cambridge and Oxford, which Senates and Boards will thus combine the functions of enquiry commissions and organizing institutions, with liberal finances at their disposal.

III.—Assistance in marketing products.

Exhibitions.

I have some experience of an industrial exhibition as I was the General Secretary of the 1909-10 Punjab and North-West Frontier Exhibition held at Lahore, and I can testify to their utility, and I am of opinion that in each Province, industrial exhibitions should be held every 5 years to mark the progress made in the provincial industries in the interval; and Government should not hold but aid the idea of local periodical exhibitions, and aid and co-operate liberally to enable the exhibitions to be held. If held at regular intervals these exhibitions will help emulation and ambition, raise the standard of efficiency and excellence, introduce varieties, help marketing and create expert critics. These exhibitions should combine the features of popularity and utility in bringing buyers and sellers together. They may in addition to local exhibits invite exhibits from outside only in such lines as may be useful for the development of provincial resources or meet provincial needs. They should not be an immense and merely random collection of what could be collected as a show.

Government patronage.

I certainly think that the lists of Government requirement should be published in each Department and samples exhibited in Commercial Museums.

IV.—Other forms of Government assistance.

Land policy.

Pre-emption laws and land alienation laws are drawbacks to industrial development, but as the means of industrial development are otherwise limited the effect of these laws is not fully understood.

If Government and Railways should be prepared to find free land near the Railway Stations and give facilities in finding sidings, such help would be much appreciated. The

present policy of auctioning lands in new colonies for industrial purposes is not at all fair as the least informed generally bids the highest, and makes a mess for himself and for the better informed and equipped.

V.—Training of labour and supervision.

This is a very entertaining and interesting subject to write a book upon, but as even a beginning has not been made in industrial enterprise in these Provinces it would be useless to write about what might be, but the most pressing problem is the scarcity of labour.

VI.—General official administration and organization.

So far as I am aware there is no organization in the Punjab for the development of industries, excepting that the Director of Agriculture is also the Director of Industries. What he actually does in this respect is not known to me, or for the matter of that to any man having anything to do with industries.

I recommend the institution of a Board of Industries and of a Board of Technical Training with executive powers and budgetted funds, sufficient for the growing needs of industries as they develop. They will certainly have to be assisted by experts and executive officers. The senior of them who may also be the Secretary to the Board may be designated as Director of Industries.

He should certainly be a man of industries and not a mere non-technical official.

In order to consolidate the separate activities of the various provinces I think periodical conferences should be devised, and an Imperial Department under a Member of Industries might give special impetus and save much duplication of Government aid.

So far as the Punjab is concerned I think special measures should be adopted to encourage and foster house and cottage industries specially suitable to women workers; as woman in the Punjab, for various economic and social reasons, is becoming an article of luxury merely, and a drone. Cottage industries.

VII.—Organization of technical and scientific departments of Government.

I think not only the technical and scientific experts engaged in the industrial enterprise of the country, but the proprietors and managers should also be encouraged by money grants and by arranging opportunities for them to visit foreign lands, and to study the methods of production, the efficiency of the organizations, the superiority of the articles produced, and methods of marketing, etc. Study of foreign methods.

I have had, in my earlier career, to consult endless catalogues, booksellers and others to discover authoritative works on industrial and financial matters, and therefore I am of opinion that libraries of such literature would prove useful, but such libraries should be, public or part of public libraries and not exclusive. Reference libraries.

If an Industrial Board such as recommended and some industrial institutions are started I think a College of Commerce will also be needed to train accountants, secretaries, auditors, agents (sale and purchase) and afford opportunities to directors and proprietors to study the business side of undertakings. Colleges of commerce.

If a Provincial Industrial Board and a Technical Education Board are fixed, the Municipality and Local Boards may then help only in the holding of district exhibitions, starting district industrial and commercial museums, encouraging local enterprise by advice, grant of aid, and recommendations to Industrial Board, Trade Commissioners, etc. If the Provincial Boards are not appointed then these authorities might make a beginning in the way of aiding and originating industrial schemes. Local bodies.

VIII.—Government organization for the collection and distribution of Commercial Intelligence.

All I can suggest in this respect is that the statistics may be published separately, province by province, in some cases, and in the case of new and growing industries they ought to be instituted early. They ought to be published in the dailies and weeklies by arrangements with the papers. The same should apply to the Commercial Intelligence. "Indian Trade Journal" is not so well known as it ought to be, and Government should certainly assist purely industrial and trade journals, at any rate up to a time that they become self-supporting. They should be helped with money and if required with information and intelligence. I have had several shots at these, but had to give up the enterprise for lack of support.

I have perused many monographs issued by Government but do not recollect to have ever received any practical help of any kind. It may be my own fault. This applies to Forest, Geological and Provincial Industries monographs. Their chief fault is that they Special monographs.

are not practical. In the compilation of these I would suggest that in addition to departmental activities, outside activities should also be utilized.

These and trade journals should be published in the vernaculars of the provinces where their usefulness may be conceived.

Government should publish information regarding the 101 industries and trades of foreign countries, more frequently and more generally than the information available in the country, as this would in some cases help the foreigner more than the people here.

IX.—Other forms of Government action and organization.

Adulteration.

Penalties should be imposed in the case of adulteration of all raw materials, whether they are wheat, cotton or anything else.

Prosecution, however, should be at the complaint of the users and not at the instance of the police or of any special department; but the inspection may be compulsory at the complaint of the user by a body of expert traders.

Registration of partnerships. Transport facilities.

I do think a system of registration and disclosure of partnerships would prove useful.

The transport monopoly of the North-Western Railway does hamper people a great deal. The roads are fairly good near about large towns, and they should be improved in the villages. Waterways were very useful at one time; and if the canals be adopted to this purpose trade and industry will be grateful.

Railway rates.

The railway freights are open to the following criticism:—

- (a) They have been designed to help the export of raw-materials and to discourage the export of manufactured Indian goods, and practically vice versa so far as the foreign goods are concerned;
- (b) They have shown and can give preference;
- (c) They help the ports at the expense of the internal cities;
- (d) They are enhanced and reduced arbitrarily without notice, and sometimes these alterations effect great and real damage to industries.

I would say railway rates should be in the hands of a special board and subject to certain rules of appeals.

Railways are being extended all right.

Shipping freights.

Shipping freights to Egypt on flour were found to be very disadvantageous.

Hydro-electric power.

There is I believe in the Government record room, much information in connection with hydro-electric power of which the public knows very little.

Forest Department.

I have nothing specific to say, excepting that I plead for sympathy in the Forest, as in all the Government Departments, more of the commercial and less of the magisterial tone in their dealings with traders and industrial people; if something in this direction is really intended to be done.

New industries.

New industries, which could be started in the country.

General.

1. Woollen industries.
2. Glass-making.
3. Wine-brewing and distilleries.
4. Leather manufacture.
5. Metal works.
6. Machinery-making.
7. Oil industries.
8. Railway requirements, excepting perhaps rails and heavy iron.
9. Hundreds of articles of stationery.
10. Food industries.
11. Medicinal industries.
12. Ceramic industries.

All raw materials exported, excepting perhaps some minerals, could be worked into manufactures here, if the people had the capital and the enterprise, and for sometime protection and not free trade was the economic policy of the Government.

ORAL EVIDENCE, 11TH DECEMBER 1917.

Sir F. H. Stewart.—Q.—You describe yourself as a merchant*.—You are also a Barrister-at-law?—A.—Yes.

Q.—Which were you first?—A.—Barrister-at-law.

Q.—How long have you been engaged in mercantile enterprise?—A.—Exclusively for the last eighteen years.

Q.—You do not practise the law now?—A.—I am not a practising Barrister now.

Q.—Would you enumerate to us some of the principal industrial enterprises with which you were connected in this province?—A.—Ginning, spinning and weaving, flour-milling, glass-making, match-making, metal, brick-making, oil-pressing, timber industry, I think these are the chief ones.

Q.—In what capacity usually?—A.—Usually as a director or managing director or partner or proprietor.

Q.—Did you find yourself able to devote the necessary time, knowledge and attention to so many different interests?—A.—In some cases I was not personally looking after the concerns and in some other cases I was personally looking after the things. Whether I looked after the things personally or not, I could find time to supervise.

Q.—With reference to the difficulty which you found in raising capital directly for industrial concerns you mention one factor, "absence of recognised underwriters, brokers and canvassers." Would you like to see a regular stock exchange in the big centres?—A.—I do not think that could give much aid. At present underwriters do not exist, but when underwriting did come that would help. Brokers and canvassers would come in the natural course of progress.

Q.—Official stock exchange quotations would be of help?—A.—Yes.

Q.—Is it a matter to which you have given any thought?—A.—Not much.

Q.—With reference to the raising of capital indirectly, you speak of the 'folly' of the majority of people concerned. What do you mean by 'folly' there? Do you mean ignorance?—A.—Ignorance and not taking proper steps to enquire as to the exact position of the banks.

Q.—You mean on the part of investors?—A.—Yes, investors and depositors.

Q.—You speak of the wickedness of some Indians and Europeans?—A.—Yes.

Q.—What do you mean by that?—A.—I mean a conspiracy set up with the determined object of destroying the banking of the Punjab, in which officials and non-officials joined, and made every possible effort, and took every possible measure to destroy banking which would have really done immense good to the province and to outside.

Hon'ble Sir R. N. Mookerjee.—Q.—Would you use the word 'conspiracy'?—A.—Yes.

Sir F. H. Stewart.—Q.—On the part of officials and non-officials?—A.—Yes.

Q.—That is stronger than what you say in the next sentence, "want of sympathy on the part of the authorities, and the spirit of competition of Anglo-Indian banks." Do you mean more than the ordinary competition for business which naturally exists?—A.—Yes. A great deal more.

Q.—What do you maintain was the object of those people? You say they desired to destroy banking industry in the Punjab?—A.—They would know their object themselves, but I could say that they did not want Indian banking to flourish, and very likely they thought that left to itself it would prove a formidable opponent or competitor to their business. And I have a shrewd suspicion that there had been some effort made that the banking in India should be the monopoly of a certain class of people and as that monopoly was likely to be broken by the efforts made by the Punjabees in banking enterprise they naturally thought of and took whatever steps they could to destroy it.

Q.—You mean to say that there was an organised opposition to the growth of banking in this province by people who were endeavouring to establish monopolies?—A.—Yes.

Q.—After the unfortunate crisis of four years ago there was a natural sudden withdrawal of confidence on the part of the investing public?—A.—Yes.

Q.—Do you see any signs of that confidence beginning to revive?—A.—I do find an improvement in the situation of the banks that exist, but not very much.

*In his original statement witness described himself as a merchant.

Q.—Do you believe yourself that there is much personal wealth in this province that might be made available for industrial undertakings?—A.—I do believe there is a surplus income in the agricultural colonies especially, which might be utilised partly for industrial enterprises.

Q.—And more than that surplus, is there not a great deal of accumulated personal wealth in some of the districts?—A.—I am not aware of that.

Q.—How do you think that this wealth might be possibly tapped? Do you think that it must be indirectly by reviving the confidence in banking?—A.—I should think for a long time that would be the right process.

Q.—You do not think that it will be put directly into industries?—A.—Not for a long time.

Q.—The Punjab being primarily agricultural?—A.—Yes.

Q.—In the event of Government financial aid you do not want hard-and-fast rules or any greater precautions than are laid down in the case of such institutions as the Banks of Bengal and Bombay?—A.—No.

Q.—We have had plenty of evidence tendered to us with the idea of proving that under the Presidency Banks Act these banks are prohibited from lending as much assistance as they might wish to industries. Do you know anything about that?—A.—I know that the Act does prohibit it, but I know this that they do lend money where they want to do it.

Q.—You say—"Government should directly pioneer industries where similar undertakings in private hands outside India are on an enormous scale requiring skill and labour beyond public control."—You mean beyond public control or private control?—A.—I mean public in the sense of non-officials. 'Private' expresses it better.

Q.—Under the heading 'Banking facilities' you say—"The existing company's law is quite sufficient." You have also told us something about the folly mainly based on the ignorance of the investors. Don't you think that they require further protection in the way of legislation, special banking legislation perhaps?—A.—I do not think so.

Q.—You admit that in very many cases it is extreme ignorance? The investor is extremely ignorant as to the nature and limitations, potentialities and risks of joint stock enterprise?—A.—But that does not come in. There is nothing special which really affects him in dealing with the joint stock banks. Joint stock banking, so far as he is concerned, is to become a person under the company's law, but beyond that it is as good or as bad as any other banker. There is nothing special there that really makes difference in the case of a bank started under the joint stock system to an ordinary banker.

Q.—But would it not be in the interests of the ignorant to prevent any one who may wish to start a bank from doing so?—A.—No case has been made out to prove this.

Q.—Because he might deceive the ignorant?—A.—He has not deceived them in the past.

Q.—With reference to the Industrial Board that you recommend I do not quite follow you there. You say that you would like to see something of the nature of a City Improvement Trust. Do you mean that there should be an official executive with elected and nominated members of the Trust?—A.—I was not thinking in the way of constitution, but I was thinking of the initiation. The Improvement Trust goes about a thing without being moved from outside. That is what I had in view, that this Board should take steps on its own initiation and move in the matter of starting, helping, encouraging and initiating enterprises without being moved from outside. That was what I was thinking of and not of the constitution.

Q.—Your idea is that you would like such a Board constituted and you would like it to have as ample funds as possible budgetted and placed at its disposal and leave the initiation of projects to it?—A.—Yes, in some cases to initiate projects also.

Q.—Would you place any limitations? Supposing the budget of such a Board was two or three lakhs of rupees in a year would you place any Government limitation and say that if it wanted to spend more than Rs. 20,000 or something of that sort on a certain undertaking it should not be done without going to Government for sanction?—A.—That might be done provided that does not waste time. That would not do any harm.

Q.—What position would your Director of Industries occupy on that Board?—A.—I have suggested as Secretary.

Q.—Do you mean as Secretary in the sense of being the servant of the Board so far as its projects are concerned, or would he be the President of the Board?—A.—Not the President of the Board. As a Secretary subordinate, but not necessarily a servant, to the Board.

Q.—But he will be a whole-time man?—A.—Yes, in many municipalities there are secretaries who are whole-time men, but the Secretary is not the President of the Municipality. He does look after the executive as well as the administrative work.

Q.—In municipalities the Secretary has well-defined powers?—A.—Those well-defined powers could be developed in this case also.

Q.—Supposing there was a difference of opinion between the Director of Industries and the members of the Board how would you meet it?—A.—The Board ought to prevail.

Q.—Without reference to Government?—A.—Yes, without reference to Government.

Q.—Under other forms of Government assistance you say, "pre-emption laws and land alienation laws are drawbacks to industrial development." We have had evidence tendered to us that the introduction of the land alienation law diverted a good quantity of money from agriculture to industries. What is your comment on that?—A.—I am not aware of that.

Q.—You would not accept it?—A.—No, I am not aware of any money having come into industry from agriculture because of the Land Alienation Act.

Q.—But if there was a man who had a certain amount of spare money his first idea was to put that into land, and if he was prevented from acquiring land by this particular Act he might turn round and say, 'I will put it into industry'?—A.—That might be an exceptional case. It has no universal application to all classes. There are certain classes who are free to sell land. I am not aware of any real effort by any individual or individuals to divert their money from agriculture to industries.

Q.—Under 'General official administration and organisation' you recommend the institution of a Board of Industries and a Board of Technical Training. Two separate boards?—A.—There might be one. Why I wanted to have two boards is that in the one case more industrial people will take part in the board and in the other case more educationists will come in who will be entirely useless in an industrial board as such.

Q.—The technical training would be directly under the Industrial Department?—A.—That is a matter of convenience. There is no matter of principle involved.

Q.—Does it not involve a matter of the principle that you do not want two masters?—A.—Masters of whom? Masters of the students? In one case masters of the students and in the other case masters of the workmen. They are two different things.

Q.—Are we not trying to turn more students into workmen?—A.—You might. That is another matter. I do not see that there would be any conflict and I do not see that there would be any difficulty. If any serious effort is made to tackle these two problems seriously the work would be enormous and therefore I think there should be two boards.

Q.—Who would preside over your Board of Technical Training?—A.—The president whom they elect, or the Government appoints as the constitution may be settled.

Q.—You do not think that it is necessary that he should be the Director of Industries?—A.—No.

Q.—With regard to cottage industries you want some special steps taken to encourage and foster them?—A.—Yes.

Q.—Would not that naturally be done by the Board of Industries?—A.—May be done by it.

Q.—They might, if necessary, have special sub-committees or something of that sort to deal with them?—A.—Yes.

Q.—With reference to the collection and distribution of commercial and industrial intelligence you say that more use should be made of it. Would you apply your remarks to vernacular papers also?—A.—Yes.

Q.—Would it answer its purpose if you disseminate information through vernacular papers also?—A.—It would be a great deal more useful.

Q.—That is in preference to publishing monographs?—A.—Yes.

Q.—In section IX you say that you think that a system of registration and disclosure of partnerships would prove useful. Do you see any great difficulty in the way of

that being brought about?—A.—No very great difficulty; occasionally when a suit is brought in court we do find some real parties missing or wanting not to come forward and we miss the big fish. That does happen sometimes.

Q.—But you think that this difficulty can be got over?—A.—Yes, by registration.

Q.—And you think that Government should legislate?—A.—I do think so.

Q.—It would too, in your opinion, promote business relations?—A.—It would facilitate matters.

Q.—About railway rates you would like to see these in the hands of a special board?—A.—Yes.

Q.—You would like that board to have non-officials on it?—A.—Naturally.

Q.—Would it have to be a permanent board or a standing committee or what?—A.—I think it would be much better if it is a standing board because they will get the experience. If it is changing constantly it may not get the experience. But it would not matter much if the system of appointment of directors is followed, i.e., some people to retire after a certain time as it happens in the senates of the universities and Boards of Directors and then a few other people are nominated or appointed to this board.

Q.—You would like a standing committee that would meet once or twice a year to revise rates generally?—A.—Once a year provided the rates are not chopped and lopped every day as they are done now. Otherwise they should be sitting every day.

Q.—You said that some Indians and some Europeans jointly tried their best to put down banking in the Punjab. At the same time the management was defective, was it not?—A.—No; on the contrary I think it was an ideally good management. It was not only good management but ideally good. It was without any fault whatsoever. It was much better than of many European banks.

Q.—Was it not a fact that these banks took money on short deposits and lent it to the concerns on machines and other securities, and when the money was called for by the depositors the banks were not able to pay?—A.—You are quite right so far that they took money on deposits and lent it on machinery and buildings, but they followed the splendid example, or the good example of other banks managed by Europeans existing in the neighbourhood in the Punjab and the United Provinces and in Calcutta also.

Q.—Is the money lent by the banks in this way?—A.—Yes money is given in Calcutta on the security of debentures. Debentures are issued for very huge amounts and money is lent by banks on the security of these debentures.

Q.—Are they exchange banks or Presidency banks?—A.—Presidency banks as well as other banks.

Q.—The Presidency bank under the law cannot give money on debentures?—A.—On the security of debentures they do advance.

Q.—Are they lending money on debentures in Calcutta?—A.—Debentures are collateral securities.

Q.—The Presidency bank?—A.—Yes.

Q.—The failure was not on account of the depositors demanding their deposits and the banks being unable to pay?—A.—Every bank would fail in that way. The people wanted their deposits back and the banks could not pay them back.

Q.—You say that the securities were ample and that shows that they could have paid?—A.—Yes; several have paid sixteen annas. In spite of the bad management of the liquidators they have paid sixteen annas to the depositors.

Q.—And the people who had invested in the concerns and commercial enterprises, did they get anything?—A.—You mean the share-holders of the banks?

Q.—And of the industrial concerns. Did they get their money?—A.—How would they get money? They had to pay being debtors.

Q.—Have the share-holders of the banks got their money back?—A.—Not the share-holders but the depositors have got their money back in many cases.

Q.—Share-holders did not get their money?—A.—The share-holders would have got their money if the liquidation had been more careful and more scientific. But in some cases they will get back a portion. The consideration of the share-holders was set aside from the very start by the liquidation.

Q.—You were a director of the People's Bank?—A.—Yes I was the managing director.

Q.—You were up to the last?—A.—No, up to 2½ or 3 months before its failure.

Q.—This bank had a good many branches up-country?—A.—Yes.

Q.—Were those branches paying?—A.—Excepting perhaps 10 per cent. of the branches all the other branches paid. Every branch became paying within 8 or 12 months or at the utmost 18 months.

Q.—Why did you leave the bank three months before its failure?—A.—I felt then that in my own board and in official circles I was not liked. Some of the directors were carrying tales to the Government officials, and I thought that I might retire for the good of the bank.

Q.—Money which comes from the Punjab through the sale of agricultural produce, how is it utilised? Is it at present deposited with the exchange banks?—A.—Part of it. There is only one exchange bank, the National Bank of India at Lahore but the Chartered Bank has also a branch at Amritsar, but the exchange banks are not spread over the province. The other banks which are not really exchange banks are spread over and they are receiving some deposits.

Q.—What is the general discount rate for the hundis?—Are the Multani shroffs here?—A.—One is permanently here.

Q.—Is the general hundi business carried on by the Multanis or also by the Punjab people?—A.—When the Punjabi banks were really flourishing hundi business had been taken over from all kinds of bankers and Multanis by these banks.

Q.—At what rate generally the banks used to take money here on deposit?—A.—Ranging from four to six per cent.

Q.—And they were giving out at what rate?—A.—7½ to 9 per cent. generally.

Q.—Is the rate governed by the Bank of Bengal rate?—A.—No.

Q.—It depends upon the seasonal demand?—A.—Yes, and influence with the directors.

Q.—Is the Punjab money deposited with the Presidency banks outside the Punjab?—A.—I do not know whether it is invested outside the Punjab very much, but it is deposited very largely with the Presidency Bank here.

Q.—Was there any co-operation between the Indian banks when they failed?—A.—No, there was no co-operation. There was fighting.

Q.—Did the Government try to help these banks at the time of difficulty, to get money from the Bank of Bengal or some other concern?—A.—They did nothing of the kind, but I should say if possible they put obstacles in the way.

Q.—What is the reason of that? Because there was no business knowledge on the part of Government officials?—A.—The reason I think is want of sympathy, altogether want of sympathy. The Registrar of Joint Stock Companies was in the hands of the Anglo-Indian banks at the time.

Q.—If a proper industrial bank is started here, will it get industrial business?—A.—Started from outside.

Q.—From here or outside?—A.—Do you mean to ask whether if capital came from outside there was any scope for investments? Is that your question?

Q.—I am talking of Government starting an industrial bank in your province. Will it help industries?—A.—Yes; capital always helps industries, and it follows that the industrial bank will help industries in this province also.

Q.—Will people take advantage of it and start industries?—A.—I should think so.

Q.—On what line should the Government start an industrial bank for the province? Do you now think that if Government start such a bank the people will have more confidence after this crisis?—A.—I do think that some Government co-operation is needed.

Q.—On what line ought the bank to be started? I ask you that question because you are the proper person to give us some scheme. Do you think that Government should put in their reserve funds or subscribe to the capital?—A.—I do not believe in paper schemes at all and therefore I have not thought over one. If the Government wants to start a bank the matter can be discussed at the time.

Q.—It is the duty of the Commission to suggest to Government what sort of a bank they should start?—A.—I have not thought over it. I have not any scheme because

I do not believe in paper schemes. You might recommend but your recommendations will be considered by officials who will have less experience or knowledge and therefore it is useless really to develop any scheme.

Q.—We want to do our own duty and we want other men to do theirs?—A.—I do not think it worth while to take trouble, and I have not taken any on it.

Q.—Do you want the Industrial Board to be on the lines of the City Improvement Trust of Bombay?—A.—Yes, I do not lay so much stress on the question of what its constitution ought to be as on the point that it should have the power of initiation and the capacity for initiation. That is my point. Whether it is on the lines of the Bombay Trust or Calcutta Trust or some other Trust it is immaterial to me.

Q.—You say—"Government caution sometimes degenerates into a regular interference and this must be avoided." Have you any experience of this Government interference?—A.—I could not at this time give you any particular instance. That has been my general impression from the many things that have come to my knowledge; the long correspondence that goes on and the conditions that develop, practically the whole thing falls to the ground.

Q.—Have you studied or have you seen the working of the hypothec banks of Germany and Japan?—A.—I have not seen that, but I know something from book knowledge on the subject.

Q.—Do you think that the banks should be started on that principle?—A.—I think so.

Q.—You say that you were the General Secretary of the Punjab and North-West Frontier Exhibition held at Lahore in 1909-10. Was it a financial success?—A.—It was a financial success. Government gave us one lakh of rupees and we gave back Rs. 70,000 to Government.

Q.—Do you think that museums should also be established?—A.—Yes.

Q.—About the railways, do you think that the Government should appoint a committee to go into the question of railway rates and that would solve the problem?—A.—Yes. That would be one way of getting over the present anomalies.

Q.—You say—"Penalties should be imposed in the case of adulteration of all raw materials whether they are wheat, cotton or any thing else." You want legislation?—A.—That is the only way to penalise offenders.

Q.—Don't you think that it would work hardship on the cultivator?—A.—No, the cultivator deserves it if he does the adulteration. I say further that the initiation should not be taken at the instance of the police but the party aggrieved. If the agriculturist or cultivator cheats other people he deserves to be penalised as much as anybody else.

Sir D. J. Tata.—Q.—You have just told us that you are the managing director of several industrial companies?—A.—Yes.

Q.—When you started these industries were they new to the country?—A.—By the country you mean the Punjab?

Q.—Yes.—A.—They were not quite new.

Q.—You felt that there was an opening for them, and that the time was ripe to start them?—A.—Yes.

Q.—In starting these companies did you investigate fully into the possibilities of success?—A.—Yes. As far as I could I took all the possible pains and I enquired into the question of raw material, labour, finance, and especially when I was starting a spinning mill I visited Cawnpore, Ahmedabad and Bombay, and I took advice from your revered father before I started it.

Q.—You said you were the managing director of most of these. Did you have any technical knowledge of any of these industries; or did you work them on the strength of your general business knowledge? Did you have experts?—A.—I had no technical knowledge in detail of any of these things, but of course I had a general technical knowledge, but not really deep technical knowledge.

Q.—You had expert advisers?—A.—Yes. I always employed trained people from Bombay or Europe.

Q.—Those industries did not succeed mainly for want of capital?—A.—That was one of the reasons. It is not true that these industries did not succeed, because in flour-milling we have not altogether failed. In ginning we sometimes succeeded and sometimes we lost money as other people do. But in the case of the Lahore Spinning Company it was very unfortunate, but it was due to a series of accidents.

Q.—Accidents of what kind?—A.—Floods, fires, bad markets. That concern has been very unfortunate from 1908, but another concern of a similar kind which I handled at Moradabad was a success.

Q.—I want to take up your reply to Sir Fazulbhai's question before I come to other questions. You said that the management of the banks that were started was ideal?—A.—Yes.

Q.—Who were the directors of the banks, and how were they selected?—A.—They were mostly selected at the beginning from people who had done no banking.

Q.—Did it lead to ideal management?—A.—Yes, because they took pains and studied and they were cautious.

Q.—Who nominated them?—A.—They were the promoters to begin with. They started the things on patriotic grounds. The first bank that we started now exists as the Punjab National Bank. That was started purely on patriotic grounds and by people who did not care merely for money. They wanted to start banking and do banking and they did it.

Q.—Were the directors largely interested in the capital? Did they subscribe themselves?—A.—Yes. To start with they were.

Q.—Was their holding just sufficient to qualify them as directors, or was it a substantial one?—A.—Not substantial in the way in which Bombay people would look at it, because there was not much money; but still sufficient for their means and much beyond what is required for a director's qualification.

Q.—About what proportion of the capital?—A.—I could not give you that. At one time in the Punjab National Bank one director held as much as Rs. 40,000 or nearly about that out of two lakhs.

Q.—Paid-up capital or authorised share capital?—A.—Not exactly. The whole capital was not called up. Whatever was called he had paid, nearly Rs. 20,000 probably.

Q.—In your written evidence you say that one of the difficulties of raising capital is want of means of large and extensive publicity. Have you not newspapers?—A.—The best known newspaper in the Punjab published in English has not larger circulation than 2,200.

Q.—Of course you issued circulars?—A.—Unless you know the names of likely parties it is no use.

Q.—You say that another cause is "the limited number of people who could or would invest in industrial concerns, the result of which had not been demonstrated or established." That means you wanted people to subscribe from patriotic motives?—A.—At that time.

Q.—Naturally people would not subscribe unless they felt sure of a good return on their investment?—A.—Now that is the tendency. When I started my career in this direction it was patriotism pure and simple on my behalf and on behalf of the investing public.

Q.—As to the class of investors you say—"So far as the Punjab is concerned the only source of real wealth of the people at present being agriculture, co-operative banks movement ought to be strengthened, extended, improved, localised and capital drawn from this source to industries; as savings of town trades people are generally very meagre and the official world cannot amass sufficient wealth to give a real impetus to industrial enterprise." Who then will subscribe?—A.—Agriculturists so far as the Punjab is concerned.

Q.—They have the money?—A.—Yes. They are the favoured persons at present and they are making money in every possible way.

Q.—As regards Government assistance you say—"Government interests and public interests require that the aid afforded from public funds should not be wasted, misapplied, or waylaid and measures should be taken to guard against such risks." What sort of measures?—A.—The thing ought to be secured on proper documents and proper enquiry should be made, and I state that the measures should not be more stringent than in the case of the Presidency Banks.

Q.—You say—"No hard-and-fast rules are required, nor any greater precautions are necessary in the case of money lent for such purposes by such institutions as the Bank of Bengal and the Bank of Bombay. Government caution degenerates into a regular interference and this must be avoided." You mean something beyond the precautions you allude to?—A.—No. My experience is that the Government is very nervous in launching out a new scheme so far as the people are concerned. That has been my impression all through my life. They make so many enquiries, so many investigations and lay down so many conditions that the thing never comes to pass.

Q.—Government is not a business body?—A.—It should be.

Q.—From the very nature of its form do you think Government can be?—A.—I think the scope of the State now is very different. In Europe it is socialism that is developing and we expect the State to move on socialistic lines in the East also.

Q.—You say: "For reasons of banking failures of 1913-14 special efforts are needed to organise purely Indian banks." If purely Indian banks had been established they would have avoided failures?—A.—These were Indian banks which failed. I do not say that at all. Now that they have failed, to bring them into existence again further assistance is required, and further I say that instead of having a bank of all sorts there should be banks, say, one with the avowed object of helping agriculture, another for helping industry, a third with the distinct and avowed object of helping social requirements, and so on.

Q.—By social requirements what do you mean?—A.—If a man wants to build a house or marry his daughter.

Q.—Surely the State is not concerned with marrying anybody's daughter to anybody else?—A.—That is my view. I will explain my point. It is not my point that the State will marry daughters of its people. But if banks come into existence with the assistance of Government at present, then the object of one of the banks will be in some cases to help in social matters and another for agriculture and so on.

Q.—Why do you say—"to organise purely Indian banks?"—A.—I do not know of Bombay, and from the little I know there is a great deal more co-operation between the Europeans and Indians there, but here there is a wall between, and for that reason I say purely Indian banks.

Q.—Then you say—"the laws recently passed such as Prime-Movers, Factory Inspections, Boiler Inspections, even the Railway Act are worked unequally and hamper rather than help or guide and lead in many instances to positive discouragement." You talk of many instances. Could you give us one or two?—A.—Instances in which the railways hamper?

Q.—Laws relating to prime-movers, factory inspection boiler inspection, etc., are surely meant to help in every possible way?—A.—I will give you one instance in which I would have been hampered. The Factory Inspector came to a spinning mill and told us to keep the windows open for twelve hours all the year. In January here at six o'clock he wanted the windows to be kept open when the temperature is below zero. If I had followed him I would have had to stop my factory.

Q.—It is perhaps not due to the laws so much as to the way in which they are administered by ignorant officials?—A.—This particular official was an M.A. of an English University.

Q.—The law did not actually demand this. You do not want to change the law so much as to get a better class of officials?—A.—The Factory Law has been in existence for sometime and I have never received any good suggestion or a workable suggestion from any Inspector that I have met.

Q.—You do not see the thing from his point of view?—A.—He should see it from my point of view, if he is to help my industries. He comes to me and I do not go to him. He comes to me and he should see that he comes to help me and not to hamper me.

Hon'ble Mr. H. J. Maynard.—Q.—Is there not a certain amount of conflict of interest between the employer and the employé, and is it not one of his duties to protect the workpeople?—A.—In my factory that question has never arisen. A conflict between the workpeople and the employer has not arisen yet in my experience of about 20 years in this Province.

Sir D. J. Tata.—Q.—You are very happy. Why then do workmen strike at all?—A.—I have never had to face any strike.

Q.—Is it not natural that the interests of the employer and the employee should sometimes conflict?—A.—Theoretically I would admit, but that question has not arisen

here, and the Factory Inspector has never helped the workman or helped me in any way. I do not know what might happen in the future, but that has been the past.

Q.—There are little points like guarding dangerous machinery?—A.—People are at loggerheads sometimes without any sufficient cause.

Q.—In section II about technical aid to industries you talk of metal industries. Is there any opening for metal industries in this province?—A.—So far as metal industries are concerned my view is that metal industry is required everywhere and especially in the Punjab where we are accustomed to use a great deal of metal in making household utensils. They used to be manufactured locally but now in some cases enamelled ware is taking their place though it is quite worthless. That kind of industry exists all over the country, especially in the Northern India. I do not know Southern India and I do not speak for it. In Northern India the metal requirements for household purposes are very large and industries relating to these could be organised and developed in many ways. Not only that, but there are a lot of metal things like bicycles in daily demand. That is a metal thing. I do not know whether an industry of that kind cannot flourish in every province.

Q.—What about the raw products?—A.—What raw products do you want for bicycles.

Q.—For all metal industries you must have raw products?—A.—That might be in one case true, but not true in this case because the quantities of metal required in most metal industries is small and the quantity of labour and skill is a great deal more. Therefore a metal industry of that class can exist and flourish anywhere if properly organised and properly worked.

Q.—You talk about liberal advances at the disposal of the board. How do you propose to get these liberal advances? By more taxation?—A.—Why more taxation? Why not by retrenchment in the present waste of money that goes on in several departments of Government?

Q.—On the subject of other forms of Government assistance, you say—"The present policy of auctioning lands in new colonies for industrial purposes is not at all fair as the least informed generally bids the highest and makes a mess for himself and for the better informed and equipped." What other method do you propose? Would that not mean favouritism?—A.—Anything which is not auction is not favouritism. My own view is that if anything is done reasonably and rationally in the public interests without auctioning the thing it is as fair as auction and perhaps more.

Q.—Does it not seem that the only fair way is to put it up to auction?—A.—Not necessarily.

Q.—The fault is not with the method?—A.—Would you like mining concessions also to be put up to auction? May I ask that question?

Q.—It is not for me to answer questions?—A.—All over the world mining concessions are not put to auction. The present rule I understand is that there should be approved applicants and the theory of approved applicants knocks the bottom out of the auction theory at once. Then they have to be selected.

Q.—There is a question of priority of application; but we need not enter into that?—A.—Very well.

Q.—I do not quite understand what you mean when you say about the Secretary of the Board—"He should certainly be a man of industries and not a mere non-technical official." You mean that he should be a non-official with technical knowledge?—A.—I say he may be an official if he is a technical man. He ought to be a technical man. That is my point.

Q.—About the organisation of technical and scientific departments of Government you say—"Proprietors and managers should also be encouraged by money grants and by arranging opportunities for them to visit foreign lands." Do you mean that public money should be spent for the benefit of privately-owned concerns?—A.—I do mean that.

Q.—These proprietors of concerns ought to be monied men?—A.—Not necessarily. Supposing a man starts an industry like pencil-making, he need not be supposed to have a very large capital in his hands; if he is given an opportunity of going to and studying the thing in America he might do a great deal of good.

Q.—Would it not be better to give a scholarship to somebody who has shown an aptitude?—A.—Why suppose that proprietors are not likely to show aptitude? Why not take the right man? Scholarship comes out of public funds. The industry is there

and if the proprietor who has spent money and studied the subject ought not to be helped, but a raw young man should be helped, that would simply be a wrong application of the money.

Q.—We had witnesses who said that the scholarship should be given to a man in a particular trade who has also shown some aptitude for it?—A.—That is my view also, and that is what I have been suggesting in my preceding answers.

Q.—I asked the last witness why he did not send his son to England to be trained in his own line. Is that not the type of man that should be sent on scholarship?—A.—Father or son?

Q.—Son?—A.—I say the father now, and then perhaps the son later. I am a businessman and my son wants to be a poet!

Q.—Keep him on short rations and under restraint! You say that he should go over there to study the methods of production, the efficiency of the organisations, etc. You know there is a general complaint that the people who are sent out to foreign countries do not get opportunities?—A.—That is no doubt the complaint, that they do not get the facilities, but efforts should be made in this direction also.

Q.—Is there no remedy?—A.—You must provide the remedies.

Q.—A little lower down you say—"A college of commerce will also be needed to train accountants, secretaries, auditors, agents and afford opportunities to directors and proprietors to study the business side of that undertaking." Do you propose that proprietors of business should go to the college of commerce and study there?—A.—I am now thinking of the son and not of the father; the son who is not going to be a poet.

Q.—You mean his son would be sent to learn?—A.—Yes.

Q.—You say that Government should assist purely industrial and trade journals. Might they not as well start them themselves?—A.—In some cases they would make a mess of them if they started these and therefore they ought to help people who start these things. I might explain one thing. You think that Government assistance ought to be as little as possible. My belief is otherwise. As foreign competition has brought about the state of affairs under which we exist, it is the bounden duty of Government to help us in every possible way; and that explanation will be a clear answer to many of the questions that you have been putting to me. I believe this that the action of the State to a very large extent has brought about the condition of things above-mentioned, so far as the economic side is concerned. The establishment of industries is a question of politics. It is the bounden duty of Government to assist us in every possible way whether it is by creating industry, by giving scholarships for going abroad, or by starting museums, etc. Everywhere Government aid is needed and ought to be forthcoming.

Q.—Don't you think that a child is able to walk better if left to itself than if helped too much. If you constantly hold the hand of the child, and make it walk you will find the child walk at a much later age than if left to itself to make its own effort to walk. In the same way, don't you think that if the person who wants help is allowed to rely more on his own resources and makes his own efforts he would be stronger?—A.—That illustration would not apply. If I do not give the child food, whether I hold his finger or not it is useless to expect him to walk. The whole question is of the food. If I do not feed my children could they walk?

Q.—Do you want to put the food into the child's mouth, or would you like the child to learn to eat its food?—A.—There is very little difference. The food must be provided, that is the point.

Q.—With regard to railway freights, is there any general complaint in this district about them?—A.—Every trader and every industrial man who really goes into this matter has some complaint, and I personally had any number of complaints and any amount of correspondence with the railway authorities almost all my life.

Q.—I ask you this question because I came across a sentence in a book which has been published by Mr. Badenoch on "Punjab Industries" recently in connection with the visit of the Commission. It says—"The members of the Provincial Committee were asked to give details of any instances where the railway rates were unfair and not a single reply was received."—A.—He did not consult me. I can give you a number of instances. The freights on cotton work out per mile a great deal more to the Lahore Spinning Mill than to Cawnpore Mills. All the Cawnpore Mills had special rates for both wool and cotton.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Special rates?—A.—Yes, special concessions for Cawnpore Mills.

(The witness here promised to send in a statement* showing discrepancies in railway freights.)

Q.—They have shown preference as between whom?—A.—Between Europeans and Indians and between Indians and Indians; between the man who salams and the man who does not salam.

Hon'ble Sir B. N. Mookerjee.—Q.—The railway company has shown preference?—A.—Yes, and especially the North-Western Railway.

Q.—You say—"I would say railway rates should be in the hands of a special board and subject to certain rules of appeal." You want to go outside the Railway Board for fixing them?—A.—When I say a board it might be a representative board of various companies.

Q.—You want a special board?—A.—Yes.

Q.—You know there is the Railway Board?—A.—But it has not the time to go really into these rates.

Q.—They simply leave it to the Traffic Manager?—A.—Not only generally but always.

Sir D. J. Tata.—Q.—There is only one more question I want to ask you. About hydro-electric power you say—"there is I believe in the Government record room much information in connection with hydro-electric power of which the public knows very little?"—A.—I do not mean as a complaint. I state that there is a good deal of information.

Q.—Is it not the fault of the people themselves rather than that of anybody else if the information exists and they do not go and seek it?—A.—It is the fault of the people of the other provinces because we have not got money enough here in this province to handle these things.

Hon'ble Mr. H. J. Maynard.—Q.—I am not quite sure that I caught one thing that you said. Was I right in thinking that you said that the Anglo-Indian banks were leading the movement against joint stock companies?—A.—They were in the movement.

Q.—Against joint stock companies?—A.—Against banks.

Q.—Did they object to the success of the Indian banks?—A.—Naturally that is the inference.

Q.—Were they generally unsympathetic to the Indian banks?—A.—From 1913 and perhaps 1912 I found that, but not before.

Q.—What I wanted to ask you is this in particular. The Anglo-Indian banks as one may conveniently call them, have got a common clearing list of their own, or a common clearing house?—A.—I think they have one now.

Q.—Is it not rather a convenience and a good thing to be on that clearing list for business purposes?—A.—Yes.

Q.—You know the Punjab National Bank?—A.—Yes, and I knew that very well at one time.

Q.—It is one of those purely Indian banks?—A.—Yes.

Q.—Do you know that the Punjab National Bank has been admitted to the clearing list of the Anglo-Indian banks?—A.—I do not know it except from you. Recently it might have been admitted.

Q.—That was not an unsympathetic action on the part of the Anglo-Indian banks?—A.—I do not think there is any concession involved there. There is no favour involved. This is simply for the convenience of transacting business. I do not think it is a favour one way or the other because their cheques will hang on at the Punjab National Bank, if out of the clearing house. I do not think that would meet my point.

Q.—It is a privilege which is rather a coveted one and it has been extended to this bank?—A.—It is as much a privilege from the Punjab National Bank to those banks as from them to the Punjab National Bank.

Q.—It is admitting them to a sort of friendly relations?—A.—Yes. Very likely they might have done it now.

Q.—I think the Punjab National Bank is one of those which did survive the banking crisis?—A.—Yes. It exists and therefore it survived.

Q.—It has not been reconstructed since?—A.—No.

Q.—That, of course, is another alternative?—A.—It has not been reconstructed.

Q.—Do you think there were any particular reasons why the Punjab National Bank survived when the other banks failed?—A.—I think that some of the directors of the Punjab National Bank who were leading the movement against the other banks foresaw this and did not invest money a year beforehand, and they had all their available money in the till. I think this comes out from their balance sheet.

Q.—You do know I suppose and probably you have heard that the Punjab National Bank was sufficiently imperilled to have to make certain enquiries regarding the possibility of raising money on its Government pre-notes?—A.—Yes. I know it as a fact.

Q.—Is it not like as though they too were in danger?—A.—That might be taken as a precaution or it might be a danger, but the further argument is that they were not helped either.

Q.—At all events they felt themselves sufficiently precarious?—A.—I know this that they tried to negotiate a loan on Government paper with the Bank of Bengal which was refused at first, and it might have been done as a precaution or it might have been because they felt a difficulty.

Q.—At all events they felt that it was necessary to take precautions?—A.—Evidently.

Hon'ble Sir B. N. Mookerjee.—Q.—Refused on account of margin or absolutely refused?—A.—I do not know the inner working of that thing, but so far as my information goes it was absolutely refused at first, and it was not a question of margin.

Hon'ble Mr. H. J. Maynard.—Q.—We did have evidence on this particular point from the Punjab National Bank and we were told by the witness who gave evidence relating to this particular transaction of that year, that the local manager of the Anglo-Indian bank gave them sympathetic reception but the head office at Calcutta refused the loan?—A.—Possibly. He would know that particular fact better than I do.

Q.—That particular witness, at all events, seemed to have the impression that the local manager was not unsympathetic, though owing to ignorance and distance the remote manager was not sympathetic?—A.—I am not familiar with these facts.

Q.—It is a point that one might fairly draw attention to in connection with the attitude of the Anglo-Indian banks?—A.—There is a great deal more to be said against the Anglo-Indian banks.

Q.—I suppose you will have an opportunity of saying anything further and I should like to ask you just a question or a few more. You think that the Anglo-Indian banks really wanted to injure the Indian banks?—A.—I do think that.

Q.—Can you tell me this? Is it not rather a dangerous thing for one business-man or a business corporation to do anything to bring about a state of affairs in the commercial world or the money market which might possibly react on himself or itself?—A.—Sometimes it is dangerous.

Q.—Would not you for that reason *prima facie* expect that a reasonable man who is after all actuated by considerations of profit and so forth, would he not be rather nervous of doing anything to bring out a crisis in the commercial world or the money market?—A.—If everybody was as wise as you put it now I should agree with you, but there are other motives which really guide human life than wisdom every time, and I do not know whether they ever thought at the time that the rush would go on to the Anglo-Indian banks, but it did go.

Q.—They actually imperilled themselves?—A.—Yes.

Q.—Do you think that the men of business who are generally fairly dispassionate did not foresee this risk and they were carried away by some sort of strange passion?—A.—That I do not know.

Q.—But you expect reasonable men of business not to venture in that way?—A.—That ought to be their future conduct.

Q.—That being what one would expect of a reasonable man of business, have you got any tangible facts on which you ground your belief that these banks did act contrary to the ordinary principle and that they did act in a hostile way quite apart from want of sympathy which is a different thing? I am speaking of a deliberate wish to bring injury to another which is different from mere aloofness and mere unwillingness to help?—A.—I have proofs that they did talk very much against Indian banks to almost every customer that called on them in those days, and I have reason to believe that some of the officials were really taking counsel with them at the time, and there are such things as competition, jealousy and envy in the world.

Q.—You mean Government officials?—A.—Quite so. I also know that an application was made by an European to an Anglo-Indian bank for loan and he was first asked to state that this loan would not benefit any Indian in any form or shape or any existing bank in any form or shape; and he was told that if he assured them of that the loan would be negotiated, otherwise not. Such things came to our notice very frequently in those days.

Hon'ble Sir R. N. Mookerjee.—Q.—Are you prepared to give any names?—A.—Yes, and not only that, but my informant is present at this gathering.

Hon'ble Mr. H. J. Maynard.—Q.—I understand you really to say that these banks which were managed by businessmen were really actuated by a sort of racial passion?—A.—That is my impression and I have not hesitated to express it in those terms.

Q.—Do you think that this was a sort of racial passion that suddenly came into existence?—A.—I do not know whether it came into existence suddenly, but I was aware that in official circles this racial element existed for a long time.

Q.—It is very important really to know exactly what you mean. We all of us can understand if you talk of official aloofness but you talk of something like a definite hostility. Are you at liberty to say with your experience of the official that over and above his aloofness and his possible lack of sympathy you find him definitely hostile?—A.—I did find it in my case. I do not know of other cases. I know certainly that there was hostility in my case, so far as my institutions and myself were concerned. There was a theory started that I was getting too powerful and official hostility started on that account. I was told that by a high official who at one time held a very high position—and heard from another who held a very high position also in this province—that that was the feeling among the Secretaries of the Punjab Government at one time and among many other officials.

Q.—You think it was a matter personal to you?—A.—That is No. 1. No. 2 is that a theory was started that these banks were finding funds for sedition; and this came out to me from a gentleman who came to make enquiries from me and who is supposed to be a C. I. D., an Indian, who is a titled man and a very favoured man.

Q.—You think that there was a special feeling against yourself on the ground that you were too powerful?—A.—Yes, against myself; as well as against banking, and that one ground was given to me by a man who came to make enquiries whether these banks were not fomenting sedition and finding funds for sedition. Hardly had our career as joint stock bankers started when some European officials and non-officials took an adverse attitude.

Q.—Could you be more specific?—A.—If you want the names I do not mind to give them even in public.

President.—Q.—You are giving your evidence publicly and you are bringing grave charges and you are a lawyer?—A.—Yes.

Hon'ble Mr. H. J. Maynard.—Q.—You would naturally not wish to mention names, and I have asked you whether there was anything specific?—A.—The specific thing was that when I first broached the idea of an insurance company—that was the first Indian insurance company in India—the attitude taken by the official Europeans and by some commercial Europeans in the Punjab was hostile. One official especially discounted me and wrote that I was hardly out of my teens, and that I was the leader of a gang of robbers, that remark very likely still exists in the official records. That was in 1896 before I had any opportunity of robbing anybody.

Q.—I suppose the management of this insurance company is another about which it is quite possible to have a great many criticisms, is it not? It is quite possible, I mean in perfectly good faith?—A.—In perfectly good faith there may be criticisms, but it would be bad faith to call a man who wants to start an insurance company a leader of a gang of robbers; and the remark in question was made before this company had existed three months.

Q.—If you mention this statement publicly it would in some manner affect your reputation. Would it not be advisable to tell this privately?—A.—It was reported to

Government by an official who had absolutely nothing to do with insurance, that is to say, by a gentleman who held the position of a Deputy Commissioner in the Punjab, and he wrote this to the Government.

Q.—Now you have told us you believe that the Anglo-Indian banks were hostile to you in particular?—A.—To me in particular as the leader of a movement.

Q.—Not merely apathetic but really hostile?—A.—Quite so.

Q.—Now in giving your reasons I think you told us what their feeling was: is there any reason for supposing that these banks had such a feeling towards you personally?—A.—I know this much from the way some of the banks treated me that there was no question really of injuring their business interests. For example, I wanted to open a bank account and I sent the money, the account was refused.

Q.—What date was that? Was that when the Indian joint stock banks began to get into trouble or before? Can you give us approximately the date? I think the crisis took place in 1913?—A.—Yes.

Q.—Can you give us the approximate date?—A.—I began to feel the hostility in 1912.

Q.—Can you say that there was anything in 1912 which would explain the hostility which apparently did not exist before?—A.—I do not know whether it did not exist before, but it was not so pronounced.

Q.—Was there anything in 1912 which explains its becoming more pronounced?—A.—The dealings that we had, we had dealings with these banks, namely, the treatment of cheques, and of hundis and drafts and all these, suggested their attitude.

Q.—But didn't you have business with these banks, wouldn't they be pleased to get business from whatever quarter it comes?—A.—That is perhaps probable; whether they would be pleased or not or whether they did their duty or not, I can't say but they discouraged it; they not only discouraged it but made remarks which really did harm and were being brought home almost every day to me.

Q.—Is it not rather dangerous to have these caves-droppers and to be too ready to listen to stories brought by people which are not quite true?—A.—I think that you are right as a matter of philosophy, but there is no other way of getting at the information.

Q.—Coming back to the point I was asking whether you are aware of anything in 1912 which gave rise to this feeling?—A.—That is what I am saying. Ever since 1912 I began to feel that hostility.

Q.—That is what I wanted to get at. Is there any particular cause of that something appearing in 1912 which did not appear before? That is all I want to know—A.—Cause, special cause, any feature of my conduct?

Q.—I do not say that, I do not know what it was?—A.—I think they began to get concerned and very likely they found the leader of a movement or leaders of a movement that will carry it on and then . . .

Q.—That is what I wanted to get at. They are also normal business men, this new business must have assisted them too? Why was it that at a particular time they apparently did not assist?—A.—That question ought to be asked from them rather than from me, why they refused it, but I felt that they were refusing. I have found that they were discouraging and all that; but why they did it that of course it is for them to answer, not for me.

Q.—You really cannot suggest the reason I understand?—A.—Well, the reason is hostility I have suggested it, but whether A was employed or B, or how it appeared I must go behind the scene.

Q.—The reason of that hostility you cannot suggest, is it so?—A.—The reason of that hostility I have suggested; that it is rivalry and competition; that I was getting into popularity and all that kind of thing, and that Indian banking was really going to oust European banking and also the joint stock banks excited the jealousy of the co-operative banking movement which really the Government wanted to back. If you want to hear all that, I can write out everything for you; there was a great deal at the back of it.

Q.—You think it was simply growing rivalry?—A.—I cannot say, but possibly so.

Q.—Hostility produced as I understand by rivalry?—A.—Well, that is how I look at it, but they may have some other reasons.

Q.—That is your suggestion?—A.—That is my suggestion.

Q.—At the time it made its appearance in 1912, were you still succeeding or were there beginning to be some little doubts as to whether...?—A.—I do not know.

Q.—Was Swadeshi business as successful as before the crisis came in 1913?—A.—The crisis came in 1913 no doubt. It was not a crisis which came, it was brought about—I think I must use the word that the crisis was brought about in 1913. It did not come. If we use that language then of course we understand the position better.

Q.—What was the date of the beginning of this feeling?—That is the dispassionate way of putting it?—A.—The date of it was 1912.

Q.—What I meant was this—Do you think that it was due to suspicions and doubts in the minds of these Anglo-Indian banks regarding this business; was that the reason of their unfriendly attitude?—A.—You again ask me what really passed in their minds, what information they got or what attitude they had, I cannot say unless I enquire from them.

Q.—But I put it to you?—A.—It is a question of fact, what really took place; I am not aware of that fact, I am aware of the consequence, and therefore what might have been the fact in their mind I cannot say.

Q.—I just put it to you as a thing would actually happen with business for profit—Was there anything else when they began to have no regard and held aloof?—A.—I do not know whether doubts began or that they were considering how to crush me then; I cannot say, very likely they were.

Q.—You think it possible that they might have doubts regarding...?—A.—Well possible, anything on the face of the earth may be possible, that of course is a quite different thing.

Q.—From the ordinary business point of view the simplest explanation is that they could have had no motive except one of business?—A.—If the men were really guided by no other motive than of pure business, your suggestion may hold.

Q.—All I wanted to get at is, supposing their action were actuated by business principles, the simplest explanation of their holding aloof and not doing business with a particular man would be that they had some suspicion or some doubt of his solvency?—A.—Holding aloof from business was not the only evidence, but they were doing a great deal more, and therefore I can't accept your suggestions.

Q.—I should like to pass on to another point if I am not keeping you all too long. I am not quite sure that I get you right over this. I think you said that Government officers were in the hands of the Anglo-Indian banks, did you say that?—A.—I did say that at any rate somewhere?

Q.—You did say?—A.—Yes.

Q.—Now is that a suspicion, or have you definite information?—A.—I had information at the time.

Q.—You had information; now of course one does not ask how a particular person brought the information, but one wants to know generally what was the nature of that information and the nature of the sources from which you got it?—A.—Nature of the sources was some of the letters that were passing between some people.

Q.—Some of the letters?—A.—That were passing between people and some information that people brought to me, people who had every reason to know the real thing.

Q.—Some of the letters which were passing between people; were they letters between the banks and their customers?—A.—Banks and officials.

Q.—Banks and officials, but it seems to me they might have been officials in the capacity of customers, men who borrowed money?—A.—No, they were letters on the question of Indian banking, i.e., how the agitation ought to be kept up and so on. You see I told you that the crisis was brought about, the crisis did not come. Therefore, when I use the word "brought about" then you will understand what I mean by letters from and to banks or information or consultations or articles in the newspapers or proofs or figures, you will understand that.

Q.—Now what I have not quite understood is, and I think what you just now said has not shown what you really mean, when you said that Government officers were in the hands of banks, you don't mean to say as I understand that particular Government officers were indebted to the banks and on that account in the hands of the banks?—A.—No, I beg your pardon, what I meant to convey was that they were being influenced. I should withdraw the words "in the hands" if they mean "in debt."

Q.—The actual interpretation of the words "Government officers were in the hands of the banks" means that they were so much indebted?—A.—No, I should withdraw those words if they meant as you interpret them.

Q.—I need not ask any more questions. You don't mean to suggest that?—A.—I don't mean to suggest that.

Hon'ble Pandit M. M. Malaviya.—Q.—When was the People's Bank started?—A.—It was started in 1901.

Q.—How many branches did it have when it was closed?—A.—Nearly 70.

Q.—Can you say roughly what was the capital which this bank dealt with at the time?—A.—The paid-up capital was about 18 lakhs, the reserve was about 6 lakhs and the deposits when the agitation started were about a crore and a half.

Q.—In all the branches?—A.—Yes.

Q.—Can you also tell us how many industrial concerns it helped?—A.—Well about two dozen I should say in a way, but if you like I can work out a list.

Q.—Two dozen in all the branches and the head office?—A.—Of course that business was part of the business, but there were people who in the ordinary course of business borrowed money and did remittance business.

Q.—But the concerns that were helped financially were about two dozen?—A.—Yes.

Q.—Now, did the crisis which happened, or which was brought about as you put it, come in the way in which such crises have come to other banks in other countries? I mean was there any commercial circumstance, circumstances connected with the money market and the trade which brought about the crisis?—A.—No, it was engineered.

Q.—I take it then that at the time when the bank began to be assailed, there was no commercial crisis which would have brought about its downfall?—A.—No.

Q.—When did the bank begin to be assailed in the *Arya Patrika*?—A.—In January 1918.

Q.—Were many articles written to say that the bank was in a bad way?—A.—Yes. Many articles in that, and later on some articles in the *Civil and Military Gazette*.

Q.—In the *Civil and Military Gazette* also? How long did this go on? Did it go on very long before the bank closed?—A.—The bank closed in September, the newspaper agitation had started in January and some agitation privately and by word of mouth had started earlier, and so it took about 10 months or more to kill the bank.

Q.—During all this time when the bank was being assailed, I suppose you must naturally have made every endeavour to keep up the bank?—A.—Yes. Every endeavour possible was made by me and by some of my colleagues to keep up the bank; when the bank closed some of the colleagues were not with the bank.

Q.—Do you remember when the Specie Bank failed? Was it before the failure of your bank?—A.—I think it was after.

Q.—This then was the first bank that failed?—A.—This was the first bank that closed its doors.

Q.—Did you apply for or receive any financial help from the Bank of Bengal or the Government to tide over the crisis?—A.—No, we did not apply for and we did not receive any.

Q.—Do you think that if there was a State bank, or a provincial bank, which could have rendered you financial assistance, you would have tided over the difficulty?—A.—I should think so.

Q.—You were the Chairman of the Punjab Provincial Conference which met recently. I find in your address the following statement: "Some semi-officials and officials make out that the Swadeshi banking was a swindle, pure and simple. It was therefore condemned. . . . It is not perhaps time for me to defend the same with facts and figures, illustrations and examples, documents and proofs. But I may remark that it was nothing of the kind, and so on." Is that a dispassionate statement of the case?—A.—When I wrote it I was actually feeling like that, and I still adhere to it; I challenge anybody fairly to study the whole thing, and I don't doubt that he will come to no other conclusion but the conclusion to which I have arrived.

Q.—Is it a fact that at the time of the banking crisis the Government of India helped the Bank of Bengal and the other Presidency Banks with money to enable them to help banks that were likely to be affected by the crisis?—A.—That is what I was told.

Q.—I thought it was a well-known fact, not a secret at all, that the Government of India advanced money to the Presidency Banks in order that they should help banks which were in need of money?—A.—Very likely it is a fact.

Q.—You have said in answer to Mr. Maynard that probably the Anglo-Indian banks, which held aloof, or which according to your statement joined the attack upon the People's Bank and other institutions like it, did not at the time foresee the risks which might arise by their doing so. Did not they too come very near the danger, and did not many of them have to apply for help themselves?—A.—Some of them did.

Q.—Some Anglo-Indian banks?—A.—Yes, some of the Anglo-Indian banks also.

Q.—Which were managed by Europeans?—A.—Anglo-Indian is all right.

Q.—Is it within your knowledge, or do you as a matter of fact believe, that some of these banks, European-managed banks also, felt the stress of the crisis?—A.—Yes, they did.

Q.—And do you know or believe that the Presidency Banks did lend a helping hand to some of them?—A.—Yes.

Q.—Is it a fact that if such help were not given some of these banks might have been closed?—A.—Owing to cash difficulties very likely they would have closed.

Q.—Now can you account for the attitude of the Bank of Bengal, their Agent at Calcutta refusing on any business consideration to advance money to the Punjab National Bank on the security of Government Paper?—A.—Well if I was in his place I would not have refused it.

Q.—You have large experience of banking business—Can you suggest any reason which might have led the Agent of the Bank of Bengal to refuse to advance money in those circumstances?—A.—You mean any legitimate reason?

Q.—Legitimate reason for refusing to advance money not on the security of immovable property which they would not be able to get properly assessed, or moveable property or personal security, but on the security of Government Paper?—A.—I cannot suggest any business consideration excepting of course one, which I don't believe at all to be the case—that the bank itself might be in difficulties. If I was the Bank of Bengal and I was in difficulties, I would not advance money outside, otherwise I would advance money on Government Paper.

Q.—And if it was the fact that the Government of India helped the bank so that it might help other banks?—A.—Quite so. I do not suggest that is the only reason that will prevent me as a banker or as a businessman from lending money on Government Paper when I had got sufficient funds and I knew that the bank wanted it urgently.

Hon'ble Mr. H. J. Maynard.—Q.—This question was put to another witness, the Manager of the Punjab National Bank, before, and I understood him to say that there was not an actual refusal, but they simply sounded the Bank of Bengal whether in certain conditions an advance could be made, and they got from the head office an unfavourable reply; it was not favourable I understood the witness to say?—A.—Is there any difference?

Hon'ble Pandit M. M. Malaviya.—Q.—Did it come to your knowledge, of course you were most concerned, that the news of the fate which overtook the People's Bank was received with ill-concealed satisfaction in some Anglo-Indian papers in the country?—A.—I know that for a fact there was rejoicing not only in newspapers but elsewhere also.

Q.—On your failure?—A.—Yes, on the day that the People's Bank closed there was a dinner somewhere! I don't mention the people who attended, one of my friends was present at that dinner—there was great rejoicing. If you want to know more, I can give you the information.

Q.—Was it within the Punjab that this dinner took place?—A.—Within the Punjab, but not at Lahore.

Q.—It is not at all pleasant to go into it, but it is a matter of public interest and we have to put aside delicate considerations. When you say there was a dinner, was it a dinner of Indians or both of Europeans and Indians?—A.—Both were present.

Q.—When you spoke about the Anglo-Indian press, did you mean the Anglo-Indian press of the Punjab alone or outside the Punjab also?—A.—Outside also.

Q.—There was practically jubilation over the failure of the Swadeshi banks?—A.—Yes; as I said, not only in the press but otherwise also.

Q.—You have already said that.

Sir D. J. Tata.—Q.—Do I understand you to say that some dinner took place at which the news was announced, or there was . . . ?—A.—No, it was not given in honour of the failure of the banks.

Hon'ble Pandit M. M. Malaviya.—Q.—Some very disinterested people regard want of business knowledge and experience in company promoters, managers and the staff as one of the primary causes of the failure?—A.—You mean business capacity of the company promoters in the Punjab?

Q.—I am dealing with the People's Bank?—A.—Well, I do not agree with that at all. I think it is the other way round.

Hon'ble Sir R. N. Mookerjee.—Q.—Was it a fact that the manager of the bank was also a company promoter?—A.—What do you mean by a company promoter?

Q.—One who has a personal interest in other banks?—A.—Yes.

Hon'ble Pandit M. M. Malaviya.—Q.—Do you think that is an unexceptionable rule?—A.—Well, I think there are two ways of looking at it. One way is this—when the Chinese Loan was negotiated in Europe the lenders said that on the railways and other concerns on which that money was to be spent, there should be representatives of the lenders as directors. That is one view. Another view is that any man who is connected with any bank should not be concerned with the borrowing party. In Germany the whole thing is done or was done by financiers and others who were not only company promoters but railway leaders and great industrialists themselves. In America Mr. Morgan had the same idea, and I think he says in some of his writings that, in the interests of banking, the bank directors should be directors of the concerns to which they lend money. American finance shows that in all those big foreign institutions to which American banks have lent money, American representatives are there; that is one view which runs in the financial circles.

Hon'ble Sir Fazlulbhoj Currimbhoj.—Q.—May I ask another question? Suppose you are the managing director of a concern and you are at the same time managing a bank; do you vote on it or recommend or do you remain silent?—A.—That depends on circumstances.

Q.—But suppose you are concerned in a mill or a cotton gin, and also in a bank?—A.—If I am the managing director of a bank and of a mill, practically my voting does not affect; that is only a technical thing; really the man himself arranges it.

Hon'ble Pandit M. M. Malaviya.—Q.—I may tell you that this view of yours was supported by the Finance Committee which was appointed in England to promote financial facilities for trade. I find it stated in the Report of that Committee as follows:—"Such an institution could also take a leading part to assist in connection with machinery and overseas business; in the case of German manufacturers it frequently happens that on the board of the manufacturing company there is a representative of the bank, and there seems little doubt from an examination of the information that is available that the chairman have exercised" etc.?—A.—I might tell you two things before you go further—one is that in all my actions I got my precedent from America or Europe. I did not always work on English precedents. Another thing is that the present day banking ideas of London are no doubt different from the banking ideals of the rest of the world, but they are not very ancient ideals. The modern banking ideas of London are not more ancient than 40 or 45 years at the utmost.

Q.—Is it a fact that the system of banking which is prevalent in England is very different from the system of banking by which manufacturing and business concerns are promoted? Is that more distinctively the German system?—A.—That used to be the British system also.

Q.—Before the present war began—what would happen after the war is a different story—did London bankers look with suspicion upon a bank which would lend money to industrial concerns which could not repay the money at short intervals?—A.—No, not looked with suspicion, but they would not like to lend money in that way, but confined their business to what they called short paper. That of course became a favourite practice. But there are instances even in England where large industries have been helped by banks. Well, one patent instance is that of the Baring Brothers, who are one of the leading bankers, and they did come to grief at one time when their money was

lent to mines in South America and South Africa. When I was in England as a student the Baring Brothers felt difficulties, and it transpired that though they were in the class of the leading bankers in London they had financed many industrial concerns.

Q.—Do you know of a company which is now at work in India, an English bank which is taking up some other banking institutions with the object, among others of helping industrial concerns?—A.—Yes.

Q.—But on the whole it seems that the Germans went much further in the direction of having banks which would help industrial concerns than our English fellow subjects did before the war?—A.—Well at the present stage I think the Germans did more in this direction but at an earlier stage the Scotch people did a great deal more than the Germans did. Very likely the Germans took their cue from the Scotch banks.

Q.—Let me come to my point. You think then that the want of experience and business capacity in the management, if there was any, was not such as to account for the failure of the banks?—A.—No.

Q.—As you are a student of banking can you give me an idea, roughly, as to how many banks managed by Europeans have failed in this country during the last 100 years?—A.—Perhaps three or four dozens.

Q.—And some of them were very big banks too?—A.—You see banking 50 years ago was not so common all over the world as it is now: therefore those banks which were very big banks in those days may not be very big now.

Q.—Will you also tell me whether the crisis which overtook the People's Bank and its branches was anything of the kind of the commercial and banking crisis in Germany in 1907 or in America about that time?—A.—No, nothing of the kind; that feature has not been experienced.

Q.—What you say points to the conclusion that if there had been a State Bank to lend a helping hand to your institution when there was a run upon it, you would have been able to tide over the difficulty?—A.—Well you are quite right, but why a State Bank, if any bank had come to our assistance in money, not a very large loan, then of course we would have tided over, whether it was a State Bank or any bank.

Q.—Do you know that whenever there has been a commercial crisis like that, banks in London and banks in America have combined their resources and their credit in order to help other institutions to get over their difficulties?—A.—Yes, when there is a general crisis they do; but in this case there was not even a general crisis: the thing was easier to manage.

Q.—You have said that some of the banks have paid 16 annas in the rupee. Could you name any?—A.—Yes, the Marwar Bank has already paid 16 annas.

Q.—Is not the Punjab Co-operative Bank also one?—A.—The Punjab Co-operative has very nearly paid 16 annas, not quite fully paid it, a little amount remains over.
(Here the Hon'ble Sir R. N. Mookerjee handed to Pandit M. M. Malaviya a copy of the latest liquidator's report.)

Q.—I find it stated that the Doaba Bank has paid 12 annas and has to pay a lakh and 90,000 in full settlement now?—A.—Very likely that is correct.

Q.—The Marwar Bank too has paid 16 annas?—A.—Yes and something is left over for share-holders also.

Q.—And the Lahore Bank, Limited?—A.—I do not know exactly, I do not know the figures, but I do know that some have already paid 16 annas; without exception every bank would have paid or would pay 16 annas if they had not been very crudely and rudely and mercilessly handled.

Q.—Now do you ascribe this attitude which you describe by these epithets to any general feeling of antipathy among the banks and the officials here?—A.—Yes, they started with that antipathy, and they began to disregard the share-holders.

Q.—They started with the idea. . . ?—A.—They started with an unsympathetic attitude.

Q.—Has that attitude had any great effect in the matter of liquidation too?—A.—A great deal of effect.

Q.—Do you imply that the interests of the share-holders would have been better served if there was an attitude of a dispassionate consideration of the facts?—A.—Yes, not only that, but I believe that all the banks could be restarted, all of them perhaps

excepting here and there a small tiny little thing—all the banks could have been restarted if the attitude on the liquidation side had been a little more considerate, not even favourable but considerate.

Q.—Do you think it possible now with the facts which have been established and which show that these banks were not brought to the pass to which they were owing to any inherent defects of their own, but owing to other circumstances, do you think it possible now by any help which Government might give to revive these banks?—A.—Well, yes, some of them could be revived; for example the Co-operative Bank could be revived any time, it is only a matter of 5 lakhs of rupees for which they are sticking. If 5 lakhs were forthcoming it could re-start at once even though it is crushed, the People's Bank could be re-started also with a little assistance; and I have been asking my friend Rai Bahadur Ganga Ram to re-start the Marwar Bank, but he does not listen to me; he does not want that it should be re-started; and other banks also in the same manner.

Q.—In view of the great injury which has been inflicted on a large number of people by the closing up of these banks, and in view of the evident need for banking facilities for trade and commerce, do you think that if the Government helped to revive two or three banks there will be a general feeling of returning confidence created in the province?—A.—Yes, certainly, that would help more than the starting of new banks. If some of them were revived, that will bring confidence earlier and more rapidly than by starting new banks.

Hon'ble Sir R. V. Mookerjee.—Q.—What do you mean by the little Government help, what sort of help?—A.—I mean cash, cash deposit on security for some time.

Q.—Only by way of deposit?—A.—Yes; only by way of deposit secured on mortgage, Government can take a mortgage on the assets if it likes.

Q.—You don't mean that Government should take shares?—A.—No, there are assets, sufficient assets, and if the Government secures these and gives money, so that the depositors would be paid, the banks could re-start, and very likely some of the depositors would not take back their money under the circumstances.

Q.—And Government by doing so would not be taking much risk?—A.—No; one sees no risk in this.

Q.—What security will it have?—A.—Immoveable property in most cases. In most cases you will find there were large reserves also in addition to share-holders' capital. For example, take the Co-operative Bank as an illustration. The Co-operative Bank owes 5 lakhs of rupees to the depositors and has assets of about 22 lakhs. Government can take up 10 lakhs worth of securities as security to lend 5 lakhs, Government runs no risk whatsoever; the bank can be re-started; very likely the deposits would come back before a year or 18 months, that is the whole risk.

Hon'ble Pandit M. M. Malaviya.—Is the absence of banking facilities to which you refer in your written note, really seriously hampering trade in this province?—A.—Not the least doubt about it, and especially in these difficult times, war times, if banking had existed, both the public and the Government would have been assisted to a very large extent.

Q.—Both the Government and the public?—A.—Yes.

Q.—What would you suggest as a practical means of putting this matter before the Government? Would some of you gentlemen who have experience and business knowledge sit together, formulate proposals and submit them to Government for their consideration?—A.—If we felt that the attitude of Government would be favourable.

Q.—Let us start with the assumption that it will be?—A.—That may be your assumption, it has not been mine up to now, I might change my opinion to-morrow.

Q.—Assuming that the Government will be willing to consider proposals, do you think?—A.—I think workable schemes can be forthcoming in no time.

Q.—Which will bear scrutiny?—A.—Yes; on business lines.

Q.—You suggest the development of co-operative banks?—A.—I mean the existing co-operative banks.

Q.—Yes; you suggest their development? You say they should be strengthened, extended, improved and localised; what do you mean by localised?—A.—What I mean is that they ought to be worked more or less not on one line but according to local conditions, that is one thing; and the other thing is that the vernacular ought to be the predominant feature.

Q.—You mean their business should be carried on in the vernacular?—A.—Yes; and if there are any local requirements and tendencies and so on, they ought to be studied and encouraged, that is what I mean by localising.

Q.—Subject to the supervision of the Inspector, you would also have the management of these banks conducted more and more by the men of the locality?—A.—Yes, quite so.

Q.—You think that that will inspire confidence and facilitate the growth of co-operative banks?—A.—Yes, certainly if they are in the right hands.

Q.—You have spoken in support of the idea of an industrial bank?—A.—In a general way.

Q.—In view of the great need for industrial development, particularly after the war, and in view of the fact that besides our English fellow-subjects, other nations, say, the Japanese, the Americans, are flooding this country with their imports, do you think that the need of industrial banks is paramount?—A.—Yes, and I say further that there is need not only for industrial but for agricultural banks and all kinds of banks, I have said that.

Q.—I am asking you particularly about an industrial bank?—A.—Oh yes, an industrial bank is very urgently required.

Q.—Would you recommend that it should be worked on the lines of the Japanese and German banks?—A.—When I was answering Sir Fazulbhoj, I said I have not devised any scheme at present.

Q.—You recommended a board on the lines of City Improvement Trusts—a Technical Education Board. Would you have such a board in the capital of the province for the whole of the province, or would you have it in more than one place in the province?—A.—I should have one at present in the capital to start with. Of course in certain places there might be a special board required where industrial development is likely to go faster than at other places, but at present I should be quite satisfied with provincial boards.

Q.—And the sphere of their influence will be the whole of the province?—A.—Yes.

Q.—What are the facilities which exist at present in your province for promoting technical and industrial education, apart from the Hindu Jubilee Technical Institute?—A.—I think that is all. There are some railway workshops of course.

Q.—Apart from these two?—A.—There is nothing else.

Q.—Is there no other institution in this province to impart technical and industrial education?—A.—I am not aware of that. Perhaps the Salvation Army may have got something, but I am not aware.

Q.—Considering the natural resources of your province and the capacity of your people to take part in the development of industries, do you think that there is a great need for a higher technical school or technological institute in this province? Take for instance the chemical industries and the cotton industries?—A.—You see that this is a hypothetical question. Unfortunately the difficulty is that supposing the men are trained, where is the money to come from for industries. But granting that labour would be forthcoming and that capital would be forthcoming, I would certainly reply, yes; but if the other conditions are wanting, mere technical educational institutions won't do much, except train up Punjabis to take service elsewhere.

Q.—I appreciate the importance of your point?—A.—Very well, granting capital and labour and raw material, certainly I would recommend it.

Q.—Is it not a fact that many Punjabi young men go out to foreign countries for education?—A.—They do.

Q.—Are they taking to industrial and technical education or do they largely go to the Bar?—A.—They used to go up to about 6 or 7 years ago exclusively for the Bar and Medicine; but now a fair proportion go for technical and industrial pursuits.

Q.—Do you think if there was a technical college imparting industrial education, training mechanical engineers and electrical engineers, etc., it will be popular?—A.—It won't lack students, its benches will be full, but where will the men get employment?

Q.—That will depend upon banking facilities being promoted?—A.—Yes, of course the rooms will be full.

Q.—You have recommended a college of commerce?—A.—At a certain stage I have said in the movement for industries that would come about, then a commercial college would be needed.

Q.—Commercial and industrial movements ought to go together?—A.—Certainly; but then that stage is not guaranteed; if you guarantee that stage I say at once a commercial college is required.

Q.—I want to know whether in your opinion this province needs a college of commerce in addition to a technical college, in order to train its youths for commercial undertakings and in order to develop the industries of the province. I want to know whether there is a need for both of these?—A.—The other conditions guaranteed, the answer is naturally yes.

Q.—You say here, the transport facilities of the North-Western Railway do matter a great deal; do you want any other railway line competing with it or what?—A.—That would not be a bad thing in some cases, but my idea seems to be that canals ought to be developed also for transport purposes.

Q.—You think that canals can be adapted for the purposes of trade and industry? Do you mean new canals should be created or that existing ones should be adapted, for this purpose?—A.—I am not an expert, but I think existing canals could be adapted to transport work also.

Q.—But you think that canals should be more largely utilised than they are at present?—A.—Yes, for transport purposes also.

Q.—With reference to what you have said regarding railway freights, would your object be gained if on the Railway Board there were non-official representatives of Indian trade?—A.—Doing what?

Q.—Representing the Indian point of view?—A.—If they are concerned with the freight, then this thing would be done; but if they are concerned with something else, then they will be like the Member for Commerce and Industries, that has been created: I think that he is expensive, his time is spent in looking after post office, telegraph system and so on and does not do much for the trade, that is my impression; you may have two or three non-officials on the Railway Board, half a dozen if you like if they are going to inspect sites and stations, then they won't do freight work.

Q.—I am speaking with reference to the question of freight, the removal of inequalities of freight of which you have complained?—A.—Quite so, I want an organisation, whether it should be part of the Railway Board or whether it should be a separate entity, that does not matter to me, but I want an organisation which will look after that part of the business.

WITNESS No. 375.

MR. H. CALVERT, I.C.S. Registrar, Co-operative Societies, and Joint Stock Companies,
Punjab.

WRITTEN EVIDENCE.

Introductory.

In the Commission desire to have any points supported by actual instances, I should be obliged if I could be informed in time. If for instance the Commission desire evidence supporting the view that the collapse of companies in 1913 was really due to unsound business methods and bad finance, it will be necessary to select clear cases.

I may add here that I am in favour of a new Act for small companies, something on the lines of the English Industrial and Provident Societies Act. The main features would be limitation on the holding of a single individual, limitation of the dividend; control by the Registrar or other authority and concessions by Government to encourage industries. These small concerns would thus be in financial leading strings, they could secure independence at any time or after a stated time by registering under the Companies Act, upon which they would lose all concessions.

Experience of this office shows that shareholders display marked apathy and seldom attend meetings; one reason for this seems to be the practice of the Directors or of the Managing Directors of securing sufficient proxies to control the meeting, so that individual share-holders are deprived of all power. The Directorate falls into the hands of a small circle and the interests of the shareholders are sacrificed. The Directors try to pay big dividends by (a) omitting allowance for depreciation, (b) appreciating the value of property, (c) omitting to spend adequate sums on repairs and maintenance and (d) omitting to make reserve for bad debts, etc. A company run on these lines is going into liquidation from the day it starts.

Financial aid to industrial enterprises.

Capital.

1. I speak from the records filed with me. From these it appears that the system of reserve liability does not work satisfactorily. The shares are frequently so small that

the danger of loss does not excite any interest; while the sum uncalled is too small to sue for in a Civil Court. The costs of a suit for a small call would exceed the sum involved. In liquidation proceedings, liquidators seem unable to call up this reserve liability which is therefore useless.

I would feel inclined to divide companies into two classes under two laws; those that come under the existing law should be compelled to have a minimum paid-up capital of, say, Rs. 50 or Rs. 100 per share.

The other class should be small concerns which may have small shares, but the whole of the share capital must be paid up or for all there might be a minimum paid-up capital per share which might be fixed at Rs. 50. The idea is to give each shareholder a substantial stake in the company which is not provided by shares of Rs. 5 each, of which Rs. 2 is paid up.

2. Punjab indigenous companies seem to raise capital not so much by appeals to the public as by touting among friends and acquaintances.

The shareholders are usually pleaders, contractors, Government servants and small merchants. The majority seem to be Hindus and of these again the majority seem to be of the Khatri caste. As a body, the zamindar has not been attracted into subscribing capital.

Witness here gave confidential evidence.

There can be no money aid from Government without strict Government control. The joint stock concerns under Indians in the Punjab seem to be run on thoroughly unbusinesslike lines. The one idea seems to be to pay high dividends, whether earned or not. Depreciation is practically never provided to the extent which a well-managed concern would consider adequate and there is seldom anything put to reserve. The expenditure on repairs seems to be insufficient—it may be even lower than $\frac{1}{2}$ per cent. on the capital value. If full allowance were made for depreciation, reserve and repairs, then I doubt if any existing indigenous company in the Punjab would ever pay a regular dividend. Such being the case it is obviously undesirable that Government should grant financial aid without strict control. Government assistance.

Under certain safeguards I would feel inclined to favour such aid under control.

There would have to be some assurance that the manager was qualified for his post, and that the capital was expended honestly and economically on buildings, machinery and plant. The dividend would be strictly limited to, say, 6 per cent. for a period of years, and anything earned above this (after allowing for depreciation, insurance, etc.,) would have to be separately invested as a reserve against loss.

It might be possible to devise a co-partnership arrangement whereby the capital contributed by the Government received only interest, capital publicly subscribed in the first place receiving the same, and all further profits being divided over public capital and the workers. I am inclined to think that a share in the profits would stimulate the employees to better work.

Certain minor industries could most suitably be fostered by loans with or without interest, provided there rested with the Registrar or Director of Industries power to liquidate for good reason. The application of oil-engines to replace hand-power might be fostered in this way.

The requirements of Government departments, such as the Army, might be used as a bait to encourage enterprise, but I deprecate this constant intrusion of the idea that the industrial development depends on Government action.

5. The control of Government might take various forms. For instance, the appointment and dismissal of the manager might be subject to Government approval. The Registrar of Joint Stock Companies or other authority might be empowered to veto or curtail the dividend until certain requirements as to depreciation, insurance, etc., were fulfilled.

Government under section 138, Indian Companies Act, can already appoint Inspectors but cannot insist on any action being taken on their reports. Where in the opinion of the Registrar or other authority, proper action is not promptly taken, it should be possible for the authority to apply to the court to place the company in liquidation.

I favour the idea of pioneer factories but the factories should of course be small. Pioneer factories.

The objects should be not only to show that the industry is commercially profitable, but to teach the staff to comprehend the essentials of success.

Where such a factory has proved successful, I would advocate a co-partnership arrangement whereby the workers could gradually take it over. It must be remembered that the industrial classes are not the same as the commercial class, and it seems to me that one factor in the Punjab failures was that the commercial class took over industrial concerns about which they possessed inadequate knowledge.

Government desires to see industries, the commercial class wants to see big profits, and the two views are not always compatible. It should not be too hastily assumed that pioneer factories will be taken over by capitalists, more success would probably attend efforts to hand them over to members of the industrial classes.

Financing agencies.

10. It must be remembered that the Punjab is not commercially organised. We have no proper banking system; quite valuable property may be useless as security as it is not readily saleable. The idea of requiring full security of a readily realizable kind for every loan is not acceptable. It seems to be the opinion of many that a bank exists to help others, and that the others have a grievance if the bank insists on safeguards.

It is a commonplace to say that a litigant's troubles begin when he has got his decree; which merely means that he had not obtained proper security. The results of execution proceedings show to what an extent this failure to insist on proper security prevails. Whatever else, there must be security, not only adequate in amount but of a readily realizable kind, e.g., a share in a jointly owned house may be of value, but the value cannot be easily realised and so the share is not a good security.

The long liquidation proceedings of the various Punjab banks indicate that these institutions failed to insist on proper security. I believe existing banking institutions will lend aid if adequate security of a proper kind is forthcoming. As Registrar of Joint Stock Companies I have gathered the impression that very large sums were advanced on quite inadequate and unsuitable security. These sums were advanced to companies which neglected vital business principles and collapse was merely a matter of time.

Banking law.

10. (a) I think a strict banking law is needed. I should enforce stringent conditions on all concerns dealing with the money of the public. It should fix limits on the proportion of capital which can be loaned for periods exceeding six months, on various classes of securities. It should limit dividends until reserves are built up and should insist upon an adequate reserve; and power should be given to the Registrar or other authority to apply to the court for liquidation in case of failure to observe these conditions. True credit demands confidence and the strictest adherence to sound rules. It should be illegal to advance money without provision for amortization. It should be illegal for Directors either as persons or as firms to borrow from their own bank and it should be illegal for the bank to advance money to other concerns under the control of their Directors. The system of one man borrowing from and lending to himself in various capacities has been tried in the Punjab and has proved disastrous.

If the Punjab is to have banks in the proportion existing in Europe, we shall require about 4,000 banks and branches. Even allowing for the minor importance of industry, we should require 1,000; and it is obvious that these banks and branches should be fostered on the soundest business lines; it would be a grave error to sacrifice security to speed.

Co-operative societies.

12. Co-operative societies should be encouraged —

- (a) for dealing with agricultural produce, e.g., rice-hulling and making preparations of rice; wheat-grinding for flour and preparations thereof; rope making or dealing with other fibres, oil-pressing, cotton-ginning, wool-scouring, silk-winding;
- (b) for introducing extra power (e.g., oil engines) into village industries such as an engine-driven lathe for carpentry and wood-work; improved machinery for iron workers, small cotton-spinning and weaving machines;
- (c) for introducing new industries connected with agriculture such as the manufacture of glazing materials from the white of eggs, if investigation showed this to be feasible.

The co-partnership organisation would probably prove the most successful, the capitalist (or the State) receiving interest on capital and the workers a wage and all profits being divided between these. Where the workers were able to borrow, a pure co-operative organisation might serve but pure co-operation has not succeeded in industry.

Surveys for industrial purposes.

25. I think detailed and elaborate enquiry is necessary —

- (1) to discover whether more profitable use could not be made of existing products;

(2) to discover whether use could be made of products now regarded as useless, e.g., wild plants like the hemp (for hyoscine) or products at present wasted, e.g., wheat husks and straw for cardboard, etc.;

(3) to discover whether there are not crops or plants that could be grown profitably in India but have not been grown because there is no market for them in India. For instance, could not potato cultivation be extended so as to supply all the starch and cheap spirit at present imported? Could not a good saponifying oil be produced.

We want also to turn skins to greater value and prevent the waste involved in the present system of exporting uncured skins.

III.—*Assistance in marketing products.*

I think the whole question of marketing products requires careful and thorough investigation. There seems to be an organised system for marketing wheat but none for marketing rice, fruit, fish and minor products.

It is a very large subject. The minor industries such as poultry farming, ghee making, etc., are open to great development if proper methods of marketing can be organised. It seems to me that much preliminary work could be got through if Government offered substantial rewards for monographs dealing with this subject and if the Colleges and Universities took these up as subjects in economics.

In this connection the question of railway rates crops up and the hopeless intricacy of the present tariff must be taken into consideration.

VI.—*General official administration and organisation.*

57. The Punjab is essentially an agricultural province, poor in minerals and peculiarly void of any considerable through trade. A land-locked province in a corner has limited opportunities for commerce. It therefore seems to me that any development on the industrial side must depend on the progress of agriculture. The industries must be largely concerned with the products of the soil so that they cannot be severed from agriculture. I favour a Board. The President should be a Development Commissioner of rank not less than that of Financial Commissioner, and his whole time should be devoted to the work of this Board. Directly under him would be Directors or Registrars for—

- (1) Agriculture (i.e., production),
- (2) Co-operation,
- (3) Veterinary work,
- (4) Industries and Companies, Factories,
- (5) Fisheries,
- (6) Forests,

and there should be also either a Senior Secretary or a Personal Assistant of senior rank who would act as liaison officer between this Board and the Irrigation Department and the Railway so far as their activities affect agriculture and industries.

In the Punjab this would mean little more than a third Financial Commissioner who could devote his whole time to the development of the Province. He would have to be a senior officer in close touch with the Lieutenant-Governor and as free as possible from interference from the Secretariat. This latter suggestion is solely intended to ensure expeditious disposal of business, as projects would be subjected to full examination and criticism by the Board before submission to Government. The Board would be given annually funds sufficient to meet current needs of administration plus expansion and development. The Financial Department should have no control over the expenditure of funds once allotted to the Board.

60. The question as to whether the Director of Industries should be a businessman or not, depends on the duties to be allotted. For instance the duties of Registrar, Joint Stock Companies and Insurance Societies, must be performed by some one, and as they are not sufficient to occupy the whole time of one official they must be added to the duties of another official. I would rather allot them to the Director of Industries who should be a non-expert official with expert assistants.

Qualifications of
Director of Industries

The ordinary businessman could hardly be expected to be master of every industry ; he would be difficult to get and to replace (e.g., in a leave vacancy) and as the usual avenue for promotion would be absent, he would be constantly trying to secure a better post.

A Civilian Director would be better able to dispose of the administrative work and to prepare schemes in forms likely to secure approval of the Board ; he would deal with Joint Stock Companies, and would have under him Inspectors of Factories, Boilers, etc., and experts in particular industries. He would probably form a small non-official Committee for advisory purposes.

The only alternative that would work would be two Directors of Industries, one technical and the other non-technical for companies, factories, boilers and administrative work.

I venture to express my belief that industries will not develop in this Province unless they are made the sole care of an officer or Board.

LX.—Other forms of Government action and organization.

Railway rates.

98. The North-Western Railway goods tariff seems to me to be unnecessarily intricate. It is certainly beyond the power of the average layman to understand.

I understand the rates adversely affect the development of certain industries, e.g., it would probably be of benefit to this Province if it could export flour instead of wheat, and oil instead of oil-seeds ; but I am informed that the rates for wheat, oil-seeds, etc., to Karachi are so much lower than the rates for flour, oil, etc., that they have the effect of a bounty on the export of the raw product.

Ordinarily the cost of transport of manufactured goods from the sea port to the Punjab should serve to protect local industries against foreign competition and the extent and influence of this protection requires investigation. I may add that the prevalence of dishonesty amongst the Railway staff acts as a direct tax on trade and commerce. Last year over 200 Railway employees were convicted of theft, and there were probably other cases in which guilt was not brought home.

ORAL EVIDENCE, 13TH DECEMBER 1917.

Hon'ble Sir R. N. Mookerjee.—Q.—You say, " Experience of this office shows that shareholders display marked apathy, and seldom attend meetings." Is it not a sign of a good management. When companies are well-managed, shareholders hardly take any notice ; it is only when the company is not well-managed that they take notice and attend the meetings and make complaints ?—A.—I don't agree with that at all. The shareholders show no interest because they are not allowed a voice in the management.

Q.—The articles of Association give them a voice. ?—A.—They are powerless.

Q.—All companies must be registered under the present Companies Act, and that Act gives shareholders very great power if they only exercise that power ?—A.—The shareholders are all more or less arranged in rings. The managing directors arrange for rings, arrange to get proxies in that ring to overrule any shareholder who comes to ask questions.

Q.—Do you think any Act can prevent that ? If I don't take an interest in my own affairs, what Act can make me do it ?—A.—As I have said in my written evidence the practice of securing sufficient proxies to control the meeting deprives shareholders of all power. There should be two classes of companies, those with a minimum paid-up capital of Rs. 50 or Rs. 100 per share, and the other for small shareholders with the whole of the share capital paid up, or a minimum paid-up capital of Rs. 50 per share. This would give the shareholders a substantial stake in the company which is not provided by shares of Rs. 5.

Q.—I believe you are aware that most of the coal companies have Rs. 10 shares. You cannot prevent a man from taking one share, or 5 shares. How can you bring that in, and especially if the object is to encourage small people to take an interest in the development of industries. The face value of shares must be very low, otherwise they cannot come in ?—A.—I don't understand the point. The idea of limited liability surely is to allow fairly well-to-do people to combine their capital ; it is not necessarily to allow small people to come in with Rs. 2 and Rs. 10 shares.

Q. When a promoter makes a limited company he knows the best way to promote that company. Practically almost all the coal companies have Rs. 10 shares. They are well-managed companies, most of them pay very good dividend. The face value of the share is only Rs. 10. No Act can prevent a man from buying one share, and if he buys one share, all that he has to pay is Rs. 10. How does this recommendation of yours

set? You cannot make an Act that the minimum face value of the shares should be Rs. 100?—A.—I state a fact here, that "experience of this office shows that shareholders display marked apathy, and seldom attend meetings." I state that as a fact; that is not my opinion; that is the actual fact.

Q.—There are many companies with which I am connected, where we cannot get the shareholders to come to the meetings: if they know that they are going to get 7 or 8 per cent. dividend, they don't want to bother?—A.—I am only stating facts.

Q.—It won't appeal to the public that way. We find in Bengal that whenever a company is not paying, or is being mismanaged, then the shareholders begin to take an interest and exercise their right. When the company is well-managed, nobody bothers?—A.—These shareholders here don't even attend meetings when the company is in a bad way.

Q.—You must educate people; that is the only remedy. No matter how stringent the Act is, you cannot get a man to come to the meetings. If I am satisfied with investing my money in certain concerns and don't take an interest in it afterwards, no Act will make me do so?—A.—I merely state the facts. You seem to object to a statement of facts.

Q.—That is a universal fact: in other Provinces people don't suffer from what you say?—A.—My impression of Lancashire is that shareholders took a very keen interest in everything.

Q.—In answer to question 6, you say, "The control of Government might take various forms," and you cite the different forms. You mean only in cases where Government helps an industry, not otherwise. That is you don't mean that in every company registered under the Companies Act, Government should take control?—A.—That is in the case of a Government-aided industry.

Sir F. H. Stewart.—Q.—How long have you held this appointment of Registrar of Co-operative Societies?—A.—Since April 1916, 18 months ago.

Q.—You refer to the English Industrial and Provident Societies Act. Can you give me very shortly the main lines?—A.—The English Industrial and Provident Societies Act is an Act specially intended for small concerns. No person is allowed to hold more than £300 interest, either as a deposit or as capital, and it is subject to certain control by the Registrar. He has the power of inspection, and also of liquidation.

Q.—And limitation of dividend, or to veto the dividend?—A.—Yes, he has very full powers of inspection.

Q.—Do you think that would prove feasible out here?—A.—If you are going to have those small companies you must have them more under control. You must have two types; one type who know their business, and those who don't. The type you wish to bring up must be under the Board's supervision.

Q.—You think that would train shareholders to take an interest in their own affairs?—A.—Yes; you have to teach shareholders that they are really responsible.

Q.—You would like to see these two forms of companies introduced, quite irrespective of Government aid?—A.—If you are going to have any industries at all in the Punjab, run by Indians, you must have them under control. I have said that they should register under the Companies Act.

Q.—You use the word "apathy"; is it not rather "ignorance"? They are not apathetic about their money, even if it is a small amount?—A.—They don't attend meetings. Most of the meetings here are attended by Harkishen Lal alone.

Q.—Then you refer to Directors paying too big dividends: is this not partly at any rate a matter for the auditors?—A.—An auditor has no power over the dividend; all he can do is to comment on irregularities.

Q.—He can and should state in his certificate that sufficient allowance has not been made for depreciation, etc.?—A.—He is not allowed to fix depreciation.

Q.—Is it not the auditor's duty to point it out if the affairs of the company are being conducted on an unbusinesslike basis?—A.—A large number of auditors in their reports put in a separate report, saying: "We don't think that sufficient allowance has been made for depreciation."

Q.—Hitherto in the Punjab that has not been done; auditing has not been sufficiently careful?—A.—Prior to the Act it was absurd: we received balance sheets which did not balance.

Q.—Have you since then seen a marked improvement?—A.—Yes, they are working fairly well: now they are beginning to insist upon depreciation.

Q.—With the result that public confidence is returning?—A.—It cannot return unless we have got rid of these liquidating companies. Until that takes place, I don't see how you can begin again.

Q.—With reference to the question of Government financial aid, you say: "There can be no money aid from Government without strict Government control." The evidence we have had, both from officials and non-officials, shows that there should be Government control, but not excessive. It might take the form of audit, inspection of accounts, and possibly the appointment of Directors, with equal powers to the rest of the Board. You want something more than that?—A.—I have suggested two things: one is that we should have the power to veto and curtail the dividend, and the second is co-partnership. Government should advance the capital and be a sort of co-partner, and be gradually bought out.

Q.—Is it not a question whether you are going to destroy business initiative and the interest of the management and private shareholders in the concern; whereas you want rather to develop it?—A.—You have to build up from the very beginning.

Q.—You think that industrial concerns must be kept in leading strings for some time?—A.—I have taken the point further. There has been, I think, a confusion between what you might call the commercial class and the industrial class. What you have had in the Punjab is the commercial class. You must work up from the industrial class, as they do in Lancashire. The spinning mills were run by the weavers themselves. They were not run by banks or money-lenders.

Q.—What you aim at seeing here is a similar growth, beginning from entirely fresh beginnings?—A.—Start with the industrial classes; train them more and gradually build up from them.

Q.—With regard to the question of banking law, you think a strict banking law is needed for the purposes you indicate?—A.—I think so.

Q.—Would it also deal with the employment of the name 'bank,' or the term 'banker': that is rather a vexed point. It has been put to us that ignorant or apathetic shareholders are apt to be deceived by the misuse of the name 'bank.' Would you also include provision in your suggested Act dealing with that point?—A.—You would have to define the application of the Act, wouldn't you?

Q.—Could you give a definition that would meet the case?—A.—The legal definition of a bank is one that receives deposits from the public and pays them out on cheques. In this case you might say "who takes deposits from the public and re-pays them on demand."

Q.—Would your Act provide for the proportion of capital which was to be paid up?—A.—I should put a very high minimum. We have had banks with paid-up capital of Rs. 300 and 400, which was absurd.

Q.—And what proportion of the subscribed capital?—A.—Nothing at all. Fifteen lakhs nominal and Rs. 400 paid-up. I don't think limited liability was ever intended to take cases like that of Rs. 400 paid-up capital.

Q.—You say the President of your Development Commission should rank not below the Financial Commissioner. He takes the place of the Board of Revenue in Bengal, does he not?—A.—Yes, my idea is that the Development Commissioner should have almost overwhelming authority, and should not be subject to criticism.

Q.—Then you suggest that under him there should be these different Directors. Would you have sufficient work for them; the Director of Fisheries, for instance?—A.—There is enormous work in the Punjab. We have a Warden of Fisheries now. There is also tremendous scope for Veterinary work. There is a Chief Superintendent under the Director of Agriculture.

Q.—Then you have got your Financial Commissioner at the top; then the Director; and in the case of industries you would like to see a small non-official Advisory Committee?—A.—If you have an official head, you must have technical advisers.

Q.—Are you not putting your Advisory Board rather low in the scale, subject, first, to the Commissioner, then to the Director? It is no use your having an Advisory Committee unless it is composed of the best businessmen in the Province. Do you think they would be willing to serve in such a subordinate capacity?—A.—I don't think they would object.

Q.—Would this be a Standing Committee, or just be consulted from time to time ?—

A.—I have not gone into such details. I would propose a Standing Committee.

Q.—Would such an organisation as you suggest be able to devote sufficient care and attention to village and cottage industries ?—A.—I think so. You have got co-operation and industries. Those two between them would be able to take up cottage industries. They are partly under me on the co-operation side, and partly under the Director of Industries.

Q.—You would be a member yourself of the Development Board as Registrar of Co-operative Societies ?—A.—Yes. The idea is that our training as officials does not teach us to spend. We are taught to control and collect. We are not expert spenders. What we need is a man who would be an expert spender. His whole idea would be to spend.

Q.—This Board would have its budget ?—A.—It would have its allotment. All the allotments would be collected together and handed over to the Development Commissioner.

Q.—Would you give it a free-hand in the spending of allotments ?—A.—Once the budget was passed, the Development Commissioner would have absolute power.

Q.—In the case of disagreement, he would have power to decide without further reference ?—A.—Yes.

Q.—I don't quite understand your suggestion about railway rates. Do you want to see a committee that would meet from time to time, and go into railway rates generally ?—A.—I don't know what the present North-Western Railway rates are based upon ; but they are certainly not designed to help on the work of the Province. I think they are designed for some ulterior motive. If you want to ascertain the cost of a wagon, you have to consult six volumes. The railway people themselves cannot make head or tail of their own rates.

Q.—Do you want to see pressure brought to bear on railways to adjust their own rates more equitably ; or do you want to see some central authority dealing with the question of rates ?—A.—I think the North-Western Railway should be brought under the Local Government ; it should be considered as part of the economic development of the Province.

Q.—Would you like to see this Development Board consulted in this matter ?—A.—I have suggested that there should be a liaison officer between the Board and the Irrigation Department and Railway, who would be able to consult the Railway freely.

Q.—How many co-operative societies have you ?—A.—About 3,500 ; they are mostly agricultural.

Q.—Do they assist in marketing produce ?—A.—We are just experimenting with marketing.

Q.—Do you find the members of those societies capable of running their own affairs ?—A.—We have some societies which are run entirely by their own committees, and run very well ; but the majority need a great deal of assistance yet.

Q.—Do the societies of weavers require special assistance ?—A.—At present, yes.

Q.—Are they developing ?—A.—The weaving societies have practically come to an end, owing to the fact that we cannot get dyes. The weavers are getting such heavy wages to go to Mesopotamia that they are ceasing to weave and taking to other work. That is mostly owing to the war. The weavers are a very backward class. The Punjab carpenters are very progressive. We have no societies among them yet.

Q.—What is the procedure about starting a society : do you give the initiative ?—A.—We have a staff of inspectors paid by Government, and sub-inspectors paid by the societies. Each society contributes to a fund from which sub-inspectors are paid. Government has agreed to bear the cost of sub-inspectors to open up new areas.

Q.—If they think the locality was suitable for a society, do they get hold of the people and try to start a society ?—A.—We decide where to go, and send sub-inspectors there to start.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—I suppose all your experience is in the Punjab only ?—A.—Yes.

Q.—Referring to these failures of companies and banks, was not this the first effort of the Punjab in having industries started ? In the case of all these companies which started, was not this the first industrial attempt ?—A.—I don't think so.

Q.—Were industries first started even before 1900?—A.—I think there were companies in existence prior to that. I should not like to be absolutely certain. Are you referring to indigenous companies?

Q.—Yes, banks and other registered companies?—A.—The Punjab National Bank came into existence in 1894.

Q.—But generally this impetus dates from 1900, when the People's Bank was first started?—A.—We may say it expanded from then.

Q.—But there were only one or two banks, and not many indigenous companies before 1900?—A.—You mean as limited liability companies? I could not tell you.

Q.—With your experience of this beginning, you want to have all these regulations and safeguards?—A.—We wish to save the Province from a repetition of the *debacle*.

Q.—With reference to the experience of the defects you have found out, does not that happen all over the world? In England thousands of banks have failed?—A.—The English system is built up on the unlimited liability system. Limited liability was only introduced into England with the advent of railways.

Q.—I think in the beginning of any industry in any country, there are bound to be failures and experience has to be gained before attaining success. In Bombay we have also had failures. The big English commercial houses were not founded on limited liability, but on unlimited liability. After our first failure we have now revived and are on a sound basis in Bombay. We have got our experience and now safeguard our money. But in the beginning everyone has failures; there is no question about it. To get experience you have to pay something, and you want to safeguard entirely against people getting that experience so that there may not be a repetition of failures and you want Government control over everything, so as not to give people who have had previous lessons a free hand?—A.—I would not put it that way at all. We have got to recollect that, prior to 1854, in England, all big industrial concerns were of unlimited liability, and in the course of the last 60 years, a very complicated system of company law has been built up, which is exceedingly rigid. Out here we began with the Companies Act which was very slight. That Act proved insufficient. We have got another Act in 1912, slightly more rigid, but nothing like the English law.

Q.—But this is the beginning of industries in this country, and you don't want to make it very rigid to start with.

Hon'ble Sir R. N. Mookerjee.—Q.—The new Act is on the same lines as the English Act?—A.—Nothing so rigid.

Mr. C. E. Low.—Q.—The Act is identical, almost word for word, with very little difference. There may be a difference in the way it is worked and applied, but I think it is the same?—A.—We have no banking law out here.

Q.—What banking law is there in England; only about banks practically; not much about the regulation of banking companies?—A.—A great deal about the relation between the people and banks, but not about banking companies; or at least very little. You may take it from me that the English and Indian Companies Acts are very nearly identical.

Hon'ble Pandit M. Malaviya.—Q.—Have you compared the two?—A.—Only casually. We have had questions raised. I have taken the rulings from England and asked if they applied to India, and it was held they did not apply.

Mr. C. E. Low.—Q.—Such cases are few, and as a rule are of no importance.—A.—The power to pass resolutions is more simple in India than in England. An Indian company can change much easier than an English company can. We had a case the other day in which we thought the company was doing something illegal. We found that, according to the Indian Act, it was perfectly legal, although according to the English Act it would not be.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—You want small companies with a separate Act?—A.—I think it would be wiser to have a separate Act.

Q.—You want to apply this Act to all the people in this country, Indians and Europeans, alike?—A.—I don't understand the question.

Q.—Do you think the law must be applied to all new companies, wherever started in any part of the country?—A.—With option to the company to register under the small or the large Act.

Witness here gave confidential evidence.

Q.—Are you in favour of an industrial bank to help industries here?—A.—I am not quite certain. What do you mean by an industrial bank.

Q.—A bank with a Government guarantee of dividends, or in which the Government has its own capital or by the raising of debentures, and in that way financing industries?—A.—The People's Bank was an industrial bank, and the People's Bank was practically failing 6 or 7 years before it actually failed. It was bad from the start.

Q.—Supposing you have a bank where you have got experts on different industries, and after enquiries by the bank, from its own experts or from the Board of Industries, the bank lent money to a concern, would that be safe?—A.—What I propose is co-partnership in the case of Government aid. Government should come in as co-partner and have a voice in the administration.

Q.—In what way would that give an impetus to people to start industries? The share-holders are only investors; they have no experience; they don't learn anything; they don't give an impetus to industries?—A.—Government would not manage the whole thing; Government would only be co-partners.

Q.—With the power of veto; the Government voice is there. Do you think any respectable man would be a director there?—A.—My impression is that you would get more respectable men.

Q.—In the Punjab, but not in other parts of the country. That will not give an impetus?—A.—Who are the people to whom you are to give an impetus?

Q.—The people who would have industries here; the people of the Punjab. Take the case of the Punjab National Bank. Do you think if there was Government control over that bank, the members would be there?—A.—The Punjab National Bank was rather pleased to have Government control for the last few years. You must have some idea as to who are going to do the business. Not the people of the Punjab. There are 675 castes in the Punjab; which of those are going to undertake the industry? All are not going to do it.

Q.—In Bombay we have several castes who go in for industries, and do very well. Nearly every concern is managed by Indians and most successfully, like any European company. In Bombay, when we commenced, our banks went "fut," but now we are alright. Many European companies also went "fut" and were purchased by Indians, and are worked successfully. In the Punjab they will be able to start business concerns after the failures they have had. They must be put in the way. That is the cause of this enquiry. We must give an impetus to Indians, and ascertain in what way Government can help in getting the industries of the country developed by Indians. You say "I believe existing banking institutions will lend aid if adequate security of a proper kind is forthcoming." Do you think present banks can help industries?—A.—I have no reason to think otherwise.

Q.—Do they advance money on buildings and machinery?—A.—I don't know. I am sure they advance money on any realizable security.

Q.—That is not helping industries?—A.—Do your Bombay banks advance on unrealizable securities?

Q.—Therefore you need industrial banks, to advance on buildings and machinery, not on liquid assets, cotton and sugar, but on the factories themselves?—A.—The question is not there; the point is that the banks which advanced money on buildings and machinery never realised interest for years.

Q.—Then you want a Board of Industries with a civilian at the head, and you want an Advisory Committee working under him?—A.—Yes.

Q.—Supposing the Advisory Committee and the Director differ, what should they do?—A.—I suppose the whole views would then go to this Development Commissioner, the President of the Board.

Q.—Has he the power of veto?—A.—He has powers. It is a question of spending Government money.

Q.—In other provinces we heard quite differently; that if the Board of Industries and the Directors differ, then the matter goes to Government. The Director has no voice to overrule the committee?—A.—My idea is to have a Development Commissioner, who takes the place of Government. You have the same thing in England at present. I wish to introduce the English system into India.

Q.—England and India are quite different?—A.—In some cases.

Q.—The whole legislature and everything is quite different. Then about the railways you say, "I may add that the prevalence of dishonesty amongst the Railway staff acts as direct tax on trade and commerce." I think that is on account of the poor control?—A.—I think it is due to inadequate control.

Q.—You say "Where such a factory has proved successful, I would advocate a co-partnership arrangement whereby the workers could gradually take it over."—A.—Yes, my idea is that if you are going to have better work, you must train your workers up to our new methods and gradually train them to take up the concern as a co-partnership concern.

Q.—I will give you one instance of a man who started a factory in Bombay and made the shares Rs. 10 each, and asked my labourers, who were working and getting nearly Rs. 25 pay, if they would take up one share by paying Rs. 1 every year, and even then they refused?—A.—That is a difficult question.

Q.—They all like to have their cash first. That would be a very good system, if the workers can take a share each?—A.—(No answer.)

Sir D. J. Tata.—Q.—I was going to ask the same question about co-partnership. It is ideal, but do you think that the people of this country are educated enough to take up this idea of co-partnership?—A.—So far as I know, there are only four methods of running an industry, viz., unlimited liability, a limited company, co-partnership, or on the co-operative system. The unlimited liability system is frequently practised, and the majority of our small industries are being run by them. The co-operative industry has generally proved a failure. You have therefore two methods left, limited liability or co-partnership. Limited liability has failed, owing to dishonesty, and you have left co-partnership. I am only talking about the Punjab.

Q.—About this co-partnership system, do you know of any place in India where the system exists, and where workmen have taken to this idea of co-partnership?—A.—There is co-partnership existing in all villages between the village *lohia* and the weavers.

Q.—That is hardly co-partnership; it is merely exploiting workmen. Do you think it is possible in India, or even in England? These sorts of things are not so numerous?—A.—You have special difficulty out here. You have here what is called the commercial class, who object to working with their own hands. They at present have a monopoly of the brains and the capital. On the other side you have the industrial class, very uneducated, who have not got capital. What are you going to do; you must combine them somehow.

Q.—Then you come to the rock-bottom idea of education?—A.—Industrial education.

Q. Both industrial and also a little general?—A.—Yes, but I put the industrial side first.

Q.—You say; "The requirements of Government Departments, such as the Army, might be used as a bait to encourage enterprise, but I deprecate this constant intrusion of the idea that industrial development depends on Government action." Have you any idea where Government action should begin, and where it should end? Have you any suggestions to make? You admit that Government must give some aid to industries; but you say that there is too much idea of depending on Government for everything. What is the province of Government in developing industries? Where should Government aid end, and where should the people begin their own efforts?—A.—I understand the idea varies in different countries. In England Government does not interfere in any way. Out here there is a certain demand for Government to nurse industries.

Q.—Because the people themselves are not competent to take these things up themselves. So, for India, and for your own province, how would you like Government to "interfere"? To what extent, and where are they to stop their interference?—A.—I suggest a way for that. I think Government should take up investigations on a very large scale. That is very much needed out here.

Q.—By investigation you refer to a survey for industrial purposes? You think that one of the duties of Government should be a survey of the industrial possibilities of the country?—A.—I think investigation would be needed.

Q.—Then these things would be laid before the public, and it would be for them to take up anything out of these, that looks promising?—A.—That is one way.

Q.—But not further?—A.—I have suggested that Government should start pioneer industries on a co-partnership basis, and gradually allow itself to be bought out.

Q.—You think it better for people to be allowed to stand on their own legs, that they would succeed better if they tried to help themselves?—A.—I suggest nursing these industries: as people showed themselves capable of running industries by themselves, Government should gradually withdraw themselves.

Q.—Going back to what Sir Fazulbhoy said about the failures here, I believe what he meant was that you cannot make an omelette without breaking eggs; and probably he thinks that these failures will ultimately conduce to the welfare of the country. Because, don't you think, we learn more from our failures and mistakes than from our successes?—A.—I think failure is a very useful lesson, but you need not break the omelette as well. In the Punjab they break the omelette as well as the eggs.

Q.—Don't you think that these failures will lead to further caution, and induce people to take more interest in future in the business in which they have made investments?—A.—The effect of failures has been practically to stamp out all enterprise. No one will come forward to put money into a limited liability company run by Indians, without Government supervision. Of course if you are willing to wait for 50 years for them to come round, as in Bombay, that is another matter.

Q.—Our recovery was not so long as 50 years?—A.—If you asked these gentlemen privately, they will tell you their great difficulty is to find honest managers for all their concerns.

Q.—With reference to railway rates, I don't quite understand what you mean by "the hopeless intricacy of the present tariff." Do you suggest a universal rate for all commodities?—A.—No, I refer to two things, in the first place the railway rates should be fixed with some regard to the economic interest of the province. At present they are fixed with the sole idea of getting dividends, and not competing with other lines: secondly, I think the present appalling complications should be simplified. I quote two instances here. You may have evidence on that later. I think the question of the wheat and flour rates has been submitted to the Commission from Delhi.

Q.—With reference to your answer to question 60, you say: "I would rather allot them to the Director of Industries who should be a non-expert official with expert assistants." In the very next sentence you say: "The ordinary businessman could hardly be expected to be master of every industry"; much less the official. Is it not so?—A.—The official would not pretend to be a master of industries, that is the difference. Have an official Director with masters of industries on his Council.

Q.—The Director of Industries, you say, should be an official; because an ordinary businessman cannot be master of every industry. That seems to be a contradiction?—A.—In one case you have got to have someone to do the work I am doing now; someone to do the administrative side of the Director of Industries. Half his day is spent on purely administrative work. You have either to get two men, or one. If you have two, you can have your businessman Director and your non-businessman Director, and then put your businessman on the Council.

Q.—You say: "Government desires to see industries, the commercial class wants to see big profits, and the two views are not always compatible." What do you mean by that?—A.—I mean the primary cause of the failure of industries in the Punjab was the desire to put dividends above safety.

Q.—Naturally anybody who starts an industry would like to see some profit?—A.—But you must not take your profit out of the capital.

Q.—That is perfectly true. Do you say that the Government desires to see industries, even if there are no profits?—A.—The object is to see industries, which give work to the people, quite apart from the shareholders.

Q.—And the province of Government is to find work for workers?—A.—Not necessarily.

Q.—Who would invest if they could not get a return for their money?—A.—It is a question of a reasonable return.

Hon'ble Mr. H. J. Maynard.—Q.—As regards that last point, I understand you to mean that there is a distinction between profits and dividends? Profits would not necessarily take the form of dividends?—A.—I wish to see both.

Q.—Primarily what you want to see is profit, not a larger proportion of dividends than is justified by the true position of a business concern?—A.—May I put it in this way? Being very anxious to see this province developed, I would like to see the industrial advancement of this province gradually taking place. Other people would like to put in a hundred rupees in a concern, and start drawing 12 per cent the next year. If the man who put in Rs. 100 would be content to wait for 2 or 3 years, and take a small dividend until the industry was built up, it would be all right, but the danger is that people expect dividends right away.

Q.—You would like to see an adequate proportion of the profits put to depreciation, and an adequate proportion to repairs?—A.—Yes. I should prefer to put safety before my 6 per cent.

Q.—There was some question about the two Acts, the two forms of Act for the two companies. Did I correctly understand you to mean that it would be entirely optional with any company, which was small enough to do so, to register under the stricter Act, or less strict Act?—A.—I would allow them option.

Q.—No one would be bound by the stricter Act, unless he accepted some measure of Government control?—A.—Yes.

Q.—As regards the method of making railway rates more consonant with the economic interests of the province, at present, as I understand, there is a maximum and minimum rate fixed by the Railway Board, but within those limits each railway fixes its own rates?—A.—Yes.

Q.—If that is so, I suppose that some representatives of industries sitting on the Railway Board would perhaps be able to influence the actual rates as imposed by a particular railway. Would that meet the case? A representative of industries sitting on the Railway Board, which, as I believe, controls the maximum and minimum rates. Would that suffice to give you a sort of agency to determine the railway rates which you would wish to get?—A.—I should first like to have the question of railway rates thoroughly examined, from the point of view of the economic interest of the province. I would like an investigation made before giving an opinion.

Q.—I was thinking of machinery; a sort of permanent representative of industries sitting with the Railway Board, or being associated with particular officials of, say, the North-Western Railway, who do the actual determining of the rates. Would one of those methods be likely to be efficacious?—A.—Have a representative of industries on the Railway Board and a certain amount of Local Government control over rates in the province.

Q.—Control is one thing and the association of the Director of Industries with the particular authorities who determine rates is another. Would that railway give you what you want? If you sat with the General Traffic Manager, or somebody, and you had an opportunity of making your representation, would that be the sort of way to get what you want?—A.—This railway is an Imperial department. In my answer to question 57 I have simply suggested a liaison officer. I did not suggest that the Traffic Manager should be a Member of the Board of Industries. That is an obvious thing to do.

Q.—And conversely, the Director of Industries should be a member of some committee who determines the rates?—A.—Yes.—That would tend to progress.

Hon'ble Sir R. N. Mookerjee.—That won't solve the difficulty. A man sitting on the Railway Board would not be able to control rates of any other railway like that. Unless there was a special committee, taking all the rates and revising them, and submitting them to the Railway Board for sanction, it would not work.

Hon'ble Pandit M. M. Malaviya.—Q.—How long have you been Registrar of Co-operative Societies?—A.—Two years in co-operative work and 1½ years in joint stock companies.

Q.—Did you make any special study of this subject of co-operation?—A.—Yes, I had studied that in Ireland on furlough.

Q.—The first time you were appointed Registrar was in this province?—A.—Yes.

Q.—You refer here to the practice of securing sufficient proxies; are proxies secured with the object of controlling meetings, or of obtaining a quorum to get on with the business?—A.—What I understand actually happens is this: the Managing Director appears; he says, "With reference to resolutions 1, 2 and 3, we have sufficient proxies. I pass the resolution," and the meeting ends. There is no discussion.

Q.—Have you attended many meetings of shareholders since you were appointed Registrar?—A.—I attended none.

Q.—Then this is from hearsay?—A.—From gentlemen coming to my office.

Q.—Have many gentlemen said that such things happened at meetings, that the Managing Director said to them, "I have got proxies, I over-rule the discussion?"—A.—Yes.

Q.—You say here: "The Directors try to pay big dividends by (a) omitting allowance for depreciation, (b) appreciating the value of property, (c) omitting to spend adequate sums on repairs and maintenance, and (d) omitting to make reserve for bad debts, etc." How do they appreciate the value of property in your experience?—A.—They write up the value of buildings and machinery. Sometimes, say, there has been a bad year, and no profits to pay dividends. They write up the land value as having risen this year, and pay dividends out of that.

Q.—They don't do it from the beginning; they wait until some bad time comes, and then to tide over the difficulty, they have recourse to this method?—A.—As a matter of fact you assume there was a time when these companies were making profits.

Q.—No, I don't. I want to know whether they start appreciating the value of property from the first year of their balance sheet, or do they do this when they wish to show that they can give a dividend when they really cannot. Do they have recourse to this practice in the normal course?—A.—Dividends are paid from various funds; dividends are seldom paid out of profits. They put down a certain sum as preliminary expenses and pay dividends out of that; they say land has risen in value and pay dividends accordingly. Sometimes they forfeit a few shares and pay dividends out of that. I am speaking entirely of the Punjab.

Q.—Will you give us any instance where a company showed Rs. 10,000 as preliminary expenses and distributed the amount as profits?—A.—There are cases of Multan companies which were run on that principle. The Bank of Multan was one. This is the only case I know where the shareholders took part in the proceedings. They met and discussed matters and dismissed the man, and proceeded to put the bank on a sound footing, but it was too late. That was started in 1907, and went on for four years under that particular management. The new management was trying very hard to restore the position, but it was too bad. The same man had a group of companies in Multan. He went into liquidation.

Q.—What were the dividends paid?—A.—The dividends don't always come to me. Enquiry was made, the man was prosecuted and sent to jail.

Q.—Can you tell us what dividends were paid during those 4 years. Have you any information to tell you that dividends were paid in those days?—A.—I have only made notes. From actual enquiry which was held in these cases, he showed a profit in those years. The Bank of Multan paid 7 per cent., 7 per cent. and 5½ per cent. He met his dividends out of forfeited shares and preliminary expenses.

Q.—In regard to the second company?—A.—I have got the profits but not the dividends. It was a small company. He used the preliminary expenses to cover his losses and show his profits.

Q.—Can you tell us of any industry in which the same thing happened, viz., putting up preliminary expenses in order to pay dividends?—A.—Or to cover a loss? The Bank of Peshawar. That paid 6 per cent. That man has gone to jail also. This is the Liquidator's Report. There was really a loss of Rs. 28,000 but he added Rs. 49,000 forfeited shares, Rs. 15,000 were forfeited from two Directors, Rs. 35,000 from preliminary expenses.

Q.—Will you kindly confine yourself to the question whether dividends were paid?—A.—I have not made a note of the dividends.

Q.—Is there any other company in which this was done? How many companies have you had to deal with during these years?—A.—There are about 68 companies in liquidation at present, and there were 150 altogether.

Q.—Apart from these, were there any others?—A.—I have got a company which put up its price of land, in order to declare a profit. I have not got the file here.

Q.—You say: "From these it appears that the system of reserve liability does not work satisfactorily. The shares are frequently so small that the danger of loss does not excite any interest." You know the Punjab Co-operative Bank; what was its subscribed capital?—A.—For what period?

Q.—Up to the time when the bank was closed?—A.—The paid-up capital was Rs. 8,25,000.

Q.—Up to the time that it closed?—A.—December 1913. They suspended payment in December 1914.

Q.—What was the value of the shares roughly of this company: how many shareholders shared these 8 lakhs?—A.—The number of shareholders was 1,139, of whom 300 were defaulters.

Q.—You have then about 800 and the shares would be about Rs. 1,000 for each holder?—A.—These defaulters were probably defaulters in the last call. This Punjab Bank received its capital every year.

Q.—I am confining myself to the time it closed. You would not say that the shares were small in that case, looking at the average holding of the shareholders?—A.—The Punjab Co-operative Bank was rather different from most banks, in that the shares were, on the whole, better distributed. They had a very large number of members holding 10 and 15 shares.

Q.—In the case of Lala Harkishen Lal's Bank, what was the average holding of shareholders. Take the People's Bank and the Amritsar Bank, I understand those were the two principal banks?—A.—I can send you any records you wish. I have only brought notes. In regard to the People's Bank, there were about 15 odd companies run by Harkishen Lal. Some of these held large holdings; the vast majority held one share each only. Then Harkishen, under the name of the Pioneer Investment Company, held 11,000 shares.

Q.—I think that a better course would be if you could give us a statement showing the capital paid-up, deposits, loans, expenses, etc., of Indian banks which have been in liquidation here?—A.—This is one relating to the People's Bank, which may give you some information. (Hands statement to the Hon'ble Pandit M. M. Malaviya.) I can only give you statements filed with me.

Q.—The object of my enquiry is that we should know exactly what were the causes which led to these failures, so that we should be in a position to know what to recommend to Government for the future. You said that there was one company in which Rs. 400 was paid-up, and 15 lakhs was the nominal capital. Which bank was that?—A.—The bank with an authorised capital of one crore, and a paid up capital of Rs. 8,500.

Q.—At what time was it closed?—A.—Twelve months after it started.

Q.—So that you cannot say that it was properly floated?—A.—It was founded in April 1913, and failed in March 1914, at the time of these failures.

Q.—Are there any other companies like that: Banks which existed when the People's Bank failed, in which the paid-up capital was disproportionately small compared to the nominal capital?—A.—The Punjab Mercantile Bank, founded in 1909, with an authorised capital of 5 lakhs failed in 1914 with only Rs. 7,000 paid. The Public Banking and Insurance Co., was founded in 1909 with a capital (nominal) of 10 lakhs, failed in March 1914 with a paid-up capital of Rs. 1,964.

Q.—Was it working all this time, or merely nominally in existence?—A.—I cannot tell you. I will look up the record and let you know.

Q.—You refer here to the difficulty in calling up this reserve liability as being practically useless. In the case of the People's Bank, the amount of paid-up capital was 18 lakhs out of 22?—A.—Rs. 12,52,000.

Q.—That was out of the 22 lakhs of the subscribed capital?—A.—Yes.

Q.—Was 4½ lakhs realised by the liquidators?—A.—I believe something like that.

Q.—Judging from what they have paid-up, about 4 lakhs was realised?—A.—I believe so.

Q.—Was this largely done by letters sent and not by suits?—A.—A large number of suits were filed.

Q.—What was the amount realised largely by letters?—A.—My recollection is that they had a lot of suits as well.

Q.—Can you say that the great bulk of it was realised after the suits?—A.—I don't think the liquidator in his report has shown the amount paid-up by suit and the amount paid up by letters.

Q.—Evidently they had not much difficulty in realising the amount?—A.—He has been going for four years and has not got that balance yet. Most of the liquidators in their reports say it is not worth while attempting to call up the uncalled liabilities.

Q.—I understand the liquidators say they expect to pay 16 annas in course of time?—A.—It depends on what you mean by the "course of time."

Q.—Have they held out the hope that they will pay 16 annas?—A.—I don't know. I think you had better examine me confidentially about this.

Q.—You say the majority of these shareholders seem to be of the Khatri caste. Have you any information about it, or is it a mere conjecture?—A.—It is a fact. I have not worked it out percentage, but it is roughly 90 per cent of the shareholders who are Lalas. Lala in the Punjab usually means Khatri.

Q.—Do you know Lala Mool Raj? Is he a Khatri?—A.—I don't know.

Q.—You say here in regard to joint stock concerns that liquidation has taken a very long time in the case of some of these. Towards the end of that page you say: "There is seldom anything put to reserve." Do you know what the reserve of the Punjab National Bank is?—A.—I have not made a note.

Q.—I understand it is 10 or 11 lakhs?—A.—You had better ask me that confidentially.

Q.—And also about the Punjab Co-operative: do you know what is its reserve?—I will tell you confidentially.

Q.—The People's Bank reserve was Rs. 2,75,000?—A.—The whole of that reserve disappeared.

Q.—You speak about long liquidators' proceedings. Do you think they are very abnormal, these proceedings, in their length? Do you remember the time the Bank of Calcutta took for liquidation?—A.—I only speak from my records. I have no record of the Bank of Calcutta.

Q.—Nor do you know of the liquidation of any other bank outside the province?—A.—These are from my records. I am not giving you my opinion.

Q.—You think the time it has taken is very long, and that it could be done quicker?—A.—Yes, I think it could be done quicker.

Q.—You say: "I deprecate this constant intrusion of the idea that industrial development depends on Government action." Will you kindly explain what you mean? Do you want no Government help to be given to industries?—A.—I think the industry would be a more sturdy plant if left to grow itself by the independent action of the people.

Q.—Have you studied the industrial growth of companies in Japan, Germany, etc., and do you know how Government help has fostered industries there?—A.—I have read about it.

Q.—Don't you think that the desire to ask for reasonable Government help is based on experience, and justified by the experience of other countries?—A.—I happen to come from Lancashire, and in Lancashire we are very independent of Government aid.

Q.—Are you not aware that even in England it is being recognised now that Government aid is essential to enable British manufacturers to hold their own against the competition of manufactures of other countries?—A.—No, I don't know that; they are developing agriculture by Government aid, not industries.

Q.—You say here that the control of Government should take various forms and you mention them. Do you think Government should take the responsibility of selecting managers for concerns?—A.—No: I would not say that at all; but occasionally a manager may make himself unpopular by making full allowance for depreciation.

Q.—You suggest that the appointment or dismissal of the manager might be subject to Government approval.—What means will Government have to find out the competency or otherwise of a particular manager?—A.—Government will be in an impartial position. In these Punjab companies you find a Director who gets appointed first and studies the industry afterwards.

Q.—Are you not putting a great responsibility on Government in asking them to approve the appointment of a manager? The concern might come to grief?—A.—Government does not select the manager; Government would simply see that the manager had certain qualifications.

Q.—But suppose the company does not feel satisfied that approval has been withheld for good reasons?—A.—The company will select the man and Government would see his record after they select him.

Q.—You think that Government should get all the information necessary about the man to be appointed and then express their approval or otherwise?—A.—I think the Directors would be rather more careful about their selection, if Government had to approve of the manager. That only refers to companies in which Government is giving assistance.

Q.—You say: "These sums were advanced to companies which neglected vital business principles, and collapse was merely a matter of time." What principles had you in mind in that sentence?—A.—The money was advanced to companies which practically never earned a profit. Those companies practically never paid any interest on the sums advanced. Interest was just added to the principal of the loan. That went on for a period of years, so practically the bank was every year lending more and more money to companies which were really worked at a steady loss. That went on, in some cases, for 8 years.

Q.—In many cases or in a few only?—A.—In most of the cases in which the People's Bank was concerned.

Q.—Have you got any statement showing, as far as the People's Bank is concerned, these advances, and the condition of the companies to which they were made?—A.—Some of these companies are not yet in liquidation, so I had better not give the details.

Q.—Can you give me details later on?—A.—I don't mind handing across the notes. Here is a company which began with a small borrowing in 1905, and went up to 9 lakhs of rupees borrowed. Those 9 lakhs rose by exactly the amount shown by interest; practically they were adding interest and showing it as paid. That went on throughout this time though if they had shown depreciation, they would have shown a loss.

Q.—Did you find out whether there was good security when the money was advanced? Does the account show it?—You will agree that it may be possible that a company which may have started under very hopeful conditions may fail to make a profit for some years. That may happen even when very good security was taken by the bank?—A. This company was paying a dividend all the time.

Q.—The test would be whether there was sufficient security for the advance when it was made?—A.—Not necessarily: if your loan is increasing every year by large sums, and your security remains the same, that indicates the unsoundness of your position.

Q.—That would affect the question of the loan being withdrawn?—A.—In this particular case the loan rose from 9 lakhs to 22 lakhs by adding interest on to it. They never allowed for depreciation, but paid dividends.

Q.—Does it also show how the assets were growing during that time?—A.—Buildings and machinery, by 70,000 a year?

Q.—That means they had added to the buildings and machinery. Have you satisfied yourself that the buildings and machinery did not grow?—A.—Where did the money come from? Look at the balance sheet; if you see investment on capital account, you will ask where did that money come from?

Q.—Did you satisfy yourself that the buildings and machinery were not added to during those years?—A.—We know that on the whole the assets had not increased. This happened to be a company which brought down the People's Bank. Twenty-two lakhs were locked up, and they could not pay anything back. The actual cause of the failure of the People's Bank was that it had enormous sums of money locked up, which could not be recovered.

Q.—Under paragraph 10 you say: "It should be illegal for a bank to advance money to other concerns under the control of their Directors." That is one of the things you want to provide against by the new law. Do you know that in some countries, particularly in Germany and America, it is the practice that the directors of a bank, which is interested in an industrial concern, go on to the Board of that concern as directors, in order to see

that the money is properly spent, and to be able to exercise a certain control? Do you know the case of Baring Bros. and of Morgan & Co. That practice is recognised as sound?—A.—I don't think that this Punjab practice would be recognised as sound in any country in the world. The People's Bank advanced 75 per cent of its capital.

Q.—You are not aware of that practice?—A.—I am quite certain that this would not be regarded as sound practice in any country in the world.

Q.—That is another matter. In practice it may be deviated from; but the rule which you attack here is regarded as sound there?—A.—I think it is abused here.

Q.—It may be abused, like any other rule, but the question is, is it wrong in principle?—A.—The idea is to try and build up industries on sound lines. I have given suggestions here to develop industries on sound lines. I understand the American custom led to very grave crises, and they have recently passed a Federal Banking Act.

Q.—Do you know the Deutsche Bank? The Directors of it are members of over 200 concerns, to which they have lent money?—A.—I know in America that inter-lending led to an Act being passed to stop it.

Q.—You say: "The Punjab is essentially an agricultural province, poor in minerals and peculiarly void of any considerable through trade." And then you say: "It therefore seems to me that any development on the industrial side must depend on the progress of agriculture." What amount of cotton do you export out of the Punjab?—A.—It does not come under me.

Q.—You know a large quantity is exported?—A.—I think so.

Q.—Don't you think it could be worked up in the province, spun into yarn and woven into cloth?—A.—I am not an expert in cotton. I believe there is some difficulty in the dampness of the climate.

Q.—Cannot the wool trade also be developed here?—A.—Possibly; we have not much in the Punjab.

Q.—You suggest a civilian Director: do you think a civilian Director would have the training necessary to be the head of industries, as Director of Industries?—A.—I am taking a practical view. I don't see how you are going to get your ideal businessman.

Q.—And you think that in the absence of an ideal businessman, a civilian will supply the necessary qualifications?—A.—A civilian with a Board of businessmen would be better than a businessman.

Q.—Don't you think that in many matters the presence of a non-expert man at the head is likely to lead to injury and loss?—A.—Possibly. I am talking about the practical side. Somebody must do joint stock companies; somebody must do administrative work. A businessman would not care to do it.

Q.—With regard to railway rates, don't you think that there should be representatives of trading interests and of the general public on the Railway Board in order that rates should be settled in a fair way?—A.—I think a Member of the Industrial Department will do.

Q.—Don't you think that a representative of industrial concerns and a member of the general public should be represented on this Railway Board to see that the rates should be properly settled through the Board?—A.—No: I don't think so. I have never heard of it being done anywhere.

Q.—You don't think it would help to adjust differences?—A.—I don't think so. There would be too much divergence of view.

Sir F. H. Stewart.—Q.—Do you think there should be an Official Liquidator in India?—A.—The difficulties of liquidation are very often personal. You may have a case of a managing director of a bank who is also appointed a voluntary liquidator of banks. As a managing director he may have lent out large sums of money, perhaps several lakhs, to certain millowners; and when it comes to liquidating, he is very apathetic in recovering the money which he himself has lent. In that case possibly an Official Liquidator may be more useful.

Q.—I am asking you to give an opinion based on your experience?—A.—Liquidation work is very unsatisfactory, so that I think an Official Liquidator would be of great benefit. We have at present 68 companies under liquidation. I don't see how you can establish credit and begin to start your industries exactly the same.

Hon'ble Pandit M. M. Malaviya.—Q.—Is it within your knowledge that where you have had an Unofficial Liquidator in these companies under liquidation, the results have been more satisfactory than when you have had an Official Liquidator. In the case of the Punjab Co-operative Bank has not the result been more satisfactory?—A.—I think I would like to answer that confidentially.

WITNESS No. 376,

PANDIT BALAK RAM PANDYA, Auditor of Accounts, Lahore.

WRITTEN EVIDENCE,

It is usual in such cases to begin with a statement of one's credentials. My credentials may be stated in a few words: I am no industrialist; nor have I any first hand knowledge of industries, their promotion, management and control. On the other hand I am an auditor by profession, and I may claim to have acquired some knowledge of those aspects of the problems of industrial development with which I have been brought into touch in the exercise of my vocation. The firm of Messrs. Basant Ram and Sons, of which I am the managing Proprietor, is of about twenty years' standing. The companies, associations and corporations whose accounts have at sometime or other been or now are audited by my firm comprise banks, spinning and weaving mills, cotton presses, factories, insurance companies, flour mills, trust societies, coal mines, public libraries and newspapers and last but not least manufacturing and trading companies, railway and other co-operative stores, recreation and other clubs, literary, learned and such semi-Government bodies as the Punjab University, the Punjab Text Book Committee and the Punjab Public Library. Of the banks now in liquidation we have been auditors of the People's Bank of India, Limited, the Amritsar Bank, Limited, the Punjab Co-operative Bank, Limited, the Doaba Bank, Limited, and the Gorakhpur Bank, Limited, while of the banks which have outlived the crash, we are auditors of the Punjab National Bank, Limited, the Benares Bank, Limited, the Lyallpur Bank, Limited, the Frontier Bank, Limited, and the National Bank of Upper India, Limited. It will thus be seen that while such knowledge as I have of the problem under investigation by the Commission is confined mainly to those aspects of it that relate to the working of banks or of joint stock industrial enterprises, I may claim to have intimate knowledge of these particular aspects. I shall, therefore, be best consulting the wishes of the Commission if in giving evidence before it I dwell mainly upon these aspects, and only secondarily upon some of the more general aspects.

Reasons for failures.

It is a matter of common knowledge that during the last four years the cause of banking as well as of industrial development has received a great setback in this province. A large number of banks and allied concerns have gone into liquidation and capital, by which industrial development is strictly limited, has admittedly become shy. As auditor of some of the most important of the concerns which have failed I have had special opportunity of studying the causes that have led to their failure. I do not think I could better or more profitably utilise the opportunity which the Commission has afforded to me than by drawing their attention to these causes. After all it is only when we know the causes of past failures that we can provide against failure in the future. So far as the Punjab is concerned I am perfectly certain that no progressive step is possible until the causes of past failures have been properly studied and the defects and shortcomings responsible for them have been at least partially removed. Accordingly I have gone as deeply into the matter as my opportunities permitted and have arrived at certain conclusions which I venture to lay before the Commission for such use as they may choose to make of them.

As regards the bank failures I attribute them to the following main causes:—

1. Shareholders.

- (a) Apathy and indifference of the shareholders, and their not taking care to appoint a competent Board of Directors with practical business experience.
- (b) Absence of any control on the part of shareholders.

2. Board of Directors.

1. Lack of practical banking experience and technical knowledge.
2. In some cases the Directors owed their seats to the Managing Director or to the Management or to active canvassing among the shareholders with the help of the Management. They were thus unable to exercise their independent judgment.
3. The Board of Directors had practically left the entire management in the hands of the Managing Director or Managers without providing proper check or safeguards against abuse of power and authority.
4. The appointment of men as managers, agents or other officers in immediate control of business who had no practical knowledge or experience of the business.
5. In some cases men had by vigorous canvassing secured seats on the Board; and they lost no opportunity of utilising the position thus gained to help their relatives, friends and protégés to further their personal interests and otherwise to benefit themselves.

3. *Management.*

1. Managers had little or no practical experience of banking.
2. Men who had worked merely as subordinates in other institutions and knew little more than routine work, were placed in charge of the banks and their branches.
3. Low-paid Managers, Accountants and clerks who became willing tools of their employers.

4. *Methods of business.*

1. Slavish imitation of what was done by other banks irrespective of requirements and resources.
2. Readiness to embark on speculative adventures of a dangerous character.
3. Combining other business of a miscellaneous character with legitimate banking.
4. Authorised and unsubscribed capital was out of all proportion to paid-up capital.
5. (a) Lending money on insufficient or no security.
(b) The combination of lenders and borrowers in the same person.
6. Making advances on mortgages and long-dated loans though the deposits received were repayable at short periods.
7. Not holding sufficient cash for liabilities payable on demand.
8. Not keeping sufficient funds in easily realisable or liquid securities.
9. Absence of sound public criticism.
10. Locking up funds in concerns belonging to the Directors or in which the Directors had a direct or indirect pecuniary interest and excessive inter-connection and inter-dependence of concerns under common Directors.
11. Receiving deposits at high rates of interests, and the consequential necessity to accept risky investments.
12. Large borrowings by the Directors for their own private speculations.

5. *Bad account keeping.*

1. Account keeping was entrusted to inefficient men.
2. A defective method of book-keeping. The accounts were not posted regularly and thus the dues were not properly dated for collection.

6. *Miscellaneous.*

1. Lack of support from well-established banks at a time of stress and want of mutual combination or co-operation.
2. Adverse criticism, and the efforts made by those connected with the banks that had failed to bring about the downfall of concerns which had withstood the first crash.

As regards the industrial failures the causes are these :—

- (1) Want of technical knowledge and business experience.
- (2) Deficiency—(a) Capital.
(b) Capacity of the plant.
- (3) Heavy borrowings at high rates of interest and the undue facility with which money could be borrowed.
- (4) Heavy commissions and fees paid to the Managing Directors or Agents.
- (5) Non-provision of maximum limit of expenditure in connection with the cost of manufacture.
- (6) Absence of all consideration for finish and taste in manufacture.
- (7) Want of promptitude and punctuality in the execution of work.
- (8) Over-valuation of stock.
- (9) Production or manufacture irrespective of the requirements of the market.
- (10) Over-stocking.

(11) Manufacture being made subsidiary to speculation in raw materials.

(12) Combination in one person or group of persons of the functions of Director, Managing Director, Managing Agent, Partner, Lessee, Contractor, Supplier, Legal Advisor, Insurance Agent, etc.

It will be seen that in both cases inexperience and defective methods on the part of the management had much to do with the failures. The fact is that banking in the western sense was essentially a new enterprise in the Punjab; and so were the industries that failed. This is at once the reason why there were so many honest mistakes and also the reason why in a number of cases selfish or dishonest men succeeded in obtaining the upper hand. Success in every sphere of life is determined by the amount of ability or cleverness which men bring to bear on their work, and India is not the only country where ability and cleverness on the one hand and unscrupulousness and a spirit of self-aggrandisement on the other sometimes go hand in hand. Indeed, when we compare the recent bank and industrial failures in the Punjab with similar incidents in other countries we are astonished at the comparative small proportion of cases in which the failures in our case were due to dishonesty or selfishness. The price we have paid for our inexperience is undoubtedly heavy, but it is by no means heavier than what other countries have paid before us. If we have only learnt the lesson which the disasters of the last four years so impressively teach, there is surely no room for despondency.

I will now pass on to a subject which is allied to this subject of bank and industrial failures, the attitude of certain European banks towards Indian enterprise. It is a matter of common knowledge that some of the failures would never have occurred if the European-managed banks had been more sympathetic than they were. The most conspicuous case is that of the Punjab Co-operative Bank. By common consent the Punjab Co-operative Bank was one of the best-managed institutions in this Province, both its investments and its business methods being generally sound and above reproach. And yet when the hour of trial came, this bank failed to obtain the support that would have saved it from going into liquidation. And there are similar other cases. It must be said in this connection that the attitude of Government officials was all that it could be, but they were helpless. It was the Presidency Bank and other European-managed banks that alone could have rendered effective help and it must be said with regret that they entirely failed to rise to the height of their duty. There is a widespread belief that this was due to the existence of a policy of discrimination in favour of European and against Indian enterprise. So far as the Presidency Bank is concerned, there is absolutely no justification for such a policy, for they are extensively assisted by the State out of public funds. One remedy for the present deplorable state of things lies in making State-aided banks accept an adequate number of Indians both on their board of directors as well as on the management. It is inconceivable that if the Bank of Bengal, for instance, had Indians among its responsible officials, it would have acted in the unsympathetic way it did in one of the most critical periods in the Punjab's financial history.

There should be at least one bank helped by the State in each important Province. At present there is only one such bank for the whole of Upper India, the Bank of Bengal, with the result that the Local Government have no control over this bank. If the Punjab had its own bank, that bank would have been more susceptible to local official influence than the Bank of Bengal proved to be during the recent banking crisis and would in all probability have come to the rescue of the better-managed banks, the Punjab Co-operative Bank for instance.

Industrial banks.

But while a Provincial Bank doing business on a large scale and making no discrimination between European and Indian enterprise would undoubtedly be beneficial to the cause of industrial development, it is obvious that it cannot by itself go a very long way. The cause of industrial development in a country requires a vast army of workers, most of whom could, under no conceivable circumstances, be directly benefitted by either Presidency or other banks doing business on accepted commercial lines. Such banks could finance industries only with a part of their working capital, and this they could do only on the security of their stock of raw materials or other similar assets. They cannot possibly give facilities in the shape of fresh capital needed for extension of business. The officers of an ordinary bank, moreover, have not the requisite fitness to judge of the value of such securities as most industrialists are able to give, nor are the securities such that if the banks failed to realise the loan when it fell due, they could be sold as easily as other forms of securities with which commercial banks are familiar. Lastly, and this is the most important point to be borne in mind, in the very nature of the case such banks cannot afford to lock up their funds for long periods, which is precisely what they would have to do if they wanted adequately to help industries. In all these aspects industrial banks would not only admirably serve the purpose of industrialists, but could alone serve those purposes. These banks would borrow for long

periods and would, therefore, be able to lend for long periods without incurring any risk. They would, moreover, have a staff capable of judging whether the concerns they are asked to help are sound from a technical and business point of view. I have no hesitation in recommending the establishment of at least one such bank with Government aid, if necessary in every Province as a condition precedent to the industrial development of that Province.

Next to capital the thing that is most needed for industrial development is technical, industrial and commercial education. At present the provision for such education either does not exist at all or is extremely inadequate in this Province. Commercial classes are maintained in connection with certain educational institutions and a commercial examination is held. But the education that is imparted is of little or no practical value, while the examination is perhaps the least popular of all examinations held under the auspices of the University. It is a highly significant fact that while for every other examination the number of candidates has actually doubled during the last decade, the number of candidates who appear at the so-called commercial examination either stands exactly where it did a couple of decades ago or has actually gone down. And this in spite of the fact that there is not only a real and insistent but a rapidly growing demand for what is called practical education. This deplorable state of things is largely due to the fact that commerce and industry are interests which practically go entirely unrepresented on the Senate of the University, and as a natural consequence commercial teaching is still in the elementary stage. If commercial education is to serve the purpose which it does serve in other countries, it is clearly essential that it should be imparted on an improved as well as an extended basis. It is perhaps their recognition of this fact that has led the authorities to contemplate the institution of a higher examination in commercial subjects than what exists at present. But it seems to be forgotten that if the higher examination is to be more successful and more popular than the lower one has been, those who conduct the examination must be either men of commerce themselves or at any rate actively in touch with commercial development; and that of such men there are at present very few in the University Senate. The same is the case with industrial and technical education. Here, as in the case of commercial education, what is necessary is to equip men not for clerkship, but for an actual industrial career, to turn out managers, supervisors and organisers. For this it is essential that there should be at least one great technological college in each Province. Everybody knows the part which such Colleges have played in the industrial development of other countries; India must follow the example of those countries if it wishes to achieve the success they have achieved.

Commercial education.

Much injury, it seems to me, has been done in the past by the idea that India is destined to remain for all time an agricultural country. To my mind the appointment of the Industrial Commission is a practical protest against this idea. That agriculture must remain one of India's most important industries, if not the most important one, is probably true, but that does not mean that there is not the same room for a good many other industries in India that there is in other countries. India is a vast country, with practically unlimited resources both in its raw materials and in those human energies that are to turn these materials into finished products. It is mainly on account of lack of organised, systematic and intelligent effort that these resources have hitherto remained undeveloped. If the Government and the leaders of the community will co-operate in making this effort India will soon rival, even if it does not out-distance, most countries with which at present she competes so unfavourably. And there is no direction in which such co-operation is more essential or will do more real and immediate good than in organizing a comprehensive system of technical and industrial education. Such education will not only enable the country to make the best use of the capital that is already invested in industries, but will have the effect of drawing more capital into the field of industrial development and will make it possible for India to outgrow the purely agricultural stage more completely than it has been able to do so far. I have never taken any part in company promoting but I cannot be wrong in thinking that would-be investors would immensely prefer industries which are under the management and control of trained and experienced men to those which are run by inexperienced enthusiasts. Here I may parenthetically state that the existence of a system of sound industrial, technical and commercial education would have prevented many of the banking and industrial failures of the last four years with all their incidental results, the most disastrous of which has been the increased shyness of capital and the shaking of credit.

Industrial development necessary.

This leads me to remark that a wider diffusion of primary education is quite as essential to the highest development of industries as the organization of a comprehensive system of technical and industrial education. The success of an industry under modern conditions depends nearly, if not quite, as much on the efficiency of the ordinary skilled and unskilled labourer as on the competence of the few men at the top. And the efficiency of the ordinary labourer whether skilled or unskilled, is, to no small extent, dependent

upon the general education which the labourer has received. Nowhere are ignorance and illiteracy a graver danger or a most formidable obstacle to progress. From this point of view the movement which has simultaneously begun in almost all the several important Provinces towards making elementary education compulsory is a matter for sincere congratulation. All that is necessary is to accelerate the movement.

I have said that the thing most needed for industrial development after capital is a sound and comprehensive system of technical, industrial and commercial education based upon universal primary education. It remains to add that even when these indispensable requisites have been supplied, something else will still be necessary before India can take its place among the great industrial nations of the world. The State in India must do what the State has done and is doing elsewhere. Opinion may differ as to the best form that State aid can take, but it is essential that the State should take its rightful place at the head of the industrial movement. I take the appointment of the Industrial Commission to mean that the State is now fully alive to this duty. The Commission itself, I rejoice to find, has framed a number of very important questions under this head and has, indeed, given the foremost place in its list of questions to those under the heading "financial aid to industries." It is a pity that by the terms of reference to them the Commission are precluded from including in its investigation what is perhaps the most important question under this head, namely, the advisability or otherwise of a protective tariff. Most educated Indians hold strong opinions on this subject but as this matter will come up for consideration later, I will not say anything further in regard to it beyond expressing the hope that no undue delay will be made in taking up this supremely important question.

**Financial assistance
from Government.**

Of the several forms of State aid referred to in question No. 5, I may say in a general way that all of them are legitimate and all of them may be tried according to the circumstances of particular cases. I am particularly in favour of the last four being more or less extensively tried, while the third and the fourth may be tried in a limited number of suitable cases. The nearest approach to a protective tariff is the seventh, because like protective tariff it is calculated to discourage imports and to induce intending investors to part with their money. In the case of a new and promising industry, especially if it happens to be one in respect of which there is keen competition with foreign industries, the factor that retards investment is the lack of confidence that the indigenous commodity will find purchasers. With a certain amount of guaranteed purchase this retarding factor will largely be minimised. The great advantage of all these forms of State assistance is that the knowledge that the Government is investing money on a business basis will encourage others to come forward with their investments. At present men are sometimes reluctant to invest money in an enterprise, even if they have the money and are willing to invest it on reasonable terms, because they have not the means of judging of the soundness or otherwise of a proposal regarded as business proposition. Government, before it either invests money in a concern or lends money to it or supplies machinery on the hire-purchase system, will, it may be hoped, assure itself that the proposal is reasonably sound; and the Government action will be a safe criterion by which private capitalists will regulate their own action. In every case in which the Government lends financial help to an industry it should, in my opinion, exercise a certain amount of supervision and control over the conduct of the industry. The best form of such supervision and control is by means of an independent audit. In those cases in which the Government provide a portion of share capital they should clearly have the same rights and privileges as other classes of shareholders.

I certainly think the Government can and ought to pioneer industries, but they should do so only in those cases in which an industry is likely to be extensively useful, in which it appears to Government to be promising, and in respect of which for reasons, which appear to Government to be unsound, private capitalists and companies have shown their reluctance to take the initiative. In such cases the Government may either hand over or close the factories as soon as the experiment has served its purpose and the shyness of private capitalists has been overcome. There is one thing which the Government should not do, and that is to compete with private enterprise.

**Limitations to
Government aid.**

There is just one other question in regard to which I would say a word. I refer to question No. 14. I can think of no circumstances under which it can be the duty of the State to impose any limitation upon itself in respect of assisting an indigenous industry merely because it competes with an established external trade. As a matter of fact, nowhere is State aid more needed than in the case of industries which have to compete with an established foreign trade. Of course such aid would be protection simple and undisguised, and would belong to precisely the same category to which protective tariff belongs. But it was time the Government laid aside its scruple definitely in this respect. If India is to be an industrially developed country in the modern sense, the Government must be prepared to be frankly protective in every

case in which protection alone can enable any industry, for which the country has adequate facilities, to stand on its own legs. I am in favour of both a Director of Industries and a board of industries, the latter being a representative body. But I am of opinion that the Director should be selected from among men with actual experience of industries and should wherever possible be an Indian. In any case he should be a man with no racial or political prejudices and should be one who would make it his chief business to encourage and assist the employment of Indian capital under Indian management and control. The Board should have executive powers with budgetted funds, the Director should be its head, but he should have no power to override the decisions of the majority of the Board. The Local Government should have general control over the operations of the Board, but should, as far as possible, adopt a policy of non-interference except in cases of obvious misuse of power by the Board.

ORAL EVIDENCE, 13TH DECEMBER 1917.

Mr. C. E. Low.—Q.—You are speaking of the apathy and indifference of shareholders and their not taking care to appoint a competent board of directors with practical business experience; do you think in practice that shareholders really do appoint directors in that way?—A.—Not in the beginning, but at a subsequent stage they can if they care.

Q.—Do you think they actually do in the end?—A.—In a few cases in the Punjab the shareholders have exercised that power and they have been able to appoint.

Q.—You have no experience of any concerns of that sort outside the Punjab?—A.—No, I have not.

Q.—And you know no place where as a practical matter apart from the legal aspect of the case shareholders ever do really appoint their directors? Usually the directors are appointed by the promoters or their representatives? Is it not so?—A.—It is so.

Q.—You speak of the combination of lender and borrower in the same person: without mentioning any names, could you give instances?—A.—I do without mentioning names, there are mills, there are banks, there are factories, so many concerns in which there have been common directors.

Q.—By lender you mean what, lending company or bank?—A.—I mean the managing director being both the manager of the bank and of the company.

Q.—Do you know at all whether directors in industrial concerns in Germany control these industrial concerns completely? Do they really represent their banks on these concerns?—A.—So far as I know, at the stage when the industrial concerns wanted the amount the directors were appointed for the time being, that is so long as money was outstanding; what I mean is they were not directors from the very beginning.

Q.—They were directors *ad hoc*. Now in these particular cases in the Punjab these directors completely control both borrowing and lending?—A.—Yes.

Q.—There were large borrowings by the directors for their own private speculation: is it not necessary under the law for the directors to show themselves as borrowers in the company's balance sheet?—A.—Yes.

Q.—Was that done in such cases?—A.—In some cases it was done, in other cases technical devices were adopted so that the fact did not appear in the balance sheet.

Q.—What kind of technical devices do you allude to?—A.—I mean just floating a joint stock company and transferring the loan to the name of that company.

Q.—In which the real borrower had a leading interest?—A.—Yes.

Q.—Under the head "miscellaneous" I notice you give a number of causes, but you don't say anything about the important one. We have heard other witnesses say that these banks lent too much to a certain industry, namely the cotton industry?—A.—I do not think any one particular bank ever financed a single industry too much.

Q.—You do not attach much importance to that?—A.—No.

Q.—In speaking of the Punjab Co-operative Bank, you say "when the hour of trial came this bank failed to obtain the support that would have saved it from going into liquidation"; I suppose you mean that it could not obtain a temporary loan?—A.—Yes.

Q.—What was the nature of the security it was offering?—A.—They had mortgage deeds, they had demand promissory notes. They did deposit the title deeds, which they had sent to the Bank of Bengal and the Bank of Bengal had practically got them endorsed in favour of them, and when they were sent to the head office of the bank the head office refused to grant the accommodation.

Q.—The Presidency Banks can only lend on the security of two names, they cannot lend on real estate?—A.—Technically they cannot.

Q.—They want two names?—A.—Practically one name in many cases, and the other is merely nominal.

Q.—But one has to be substantial?—A.—If they had asked, probably that would have been complied with.

Q.—But did they put this alternative of security in Government paper? Could they offer substantial security, security of real estate, mortgage deeds and title deeds and so on?—A.—As a matter of fact the whole of these securities were placed at the disposal of the Bank of Bengal and it was the Lahore Office of the Bank of Bengal who selected the very best they wanted.

Q.—Had the Presidency Bank previously been ready to advance on the same class of security, do you know?—A.—I know in one instance the Punjab Co-operative Bank had approached the Bank of Bengal for a loan a few months prior, and owing to the influence of an official they advanced a lakh of rupees.

Q.—The Co-operative Bank has been now completely liquidated?—A.—No, not yet.

Q.—How much has it to pay?—A.—They have paid 8 annas to all the bigger depositors and to all the other smaller depositors up to Rs. 1,000 in full.

Q.—And there are still assets to be realised?—A.—They have got assets of the value of 21 lakhs.

Hon'ble Pandit M. M. Malaviya.—Q.—How much still remains to be paid?—A.—In the last balance sheet of 30th June the deposits amounted to Rs. 6,24,000, but just at present they have only to pay deposits of 5 lakhs.

Mr. C. E. Low.—Q.—You say if the Punjab had its own presidency bank that bank would have been more susceptible to local official influence than the Bank of Bengal proved to be. Do you think that the Bengal Government has any more influence over the Bank of Bengal than the Governments of Bihar and Orissa, of the United Provinces or the Punjab?—A.—I believe the Government of India has a lot of influence over the Bank of Bengal.

Q.—I say Local Government?—A.—I cannot say whether they have got any, but I believe it might be so because some of the local directors in Calcutta are on the board there.

Q.—Members of the Bengal Government?—A.—Not members of the Bengal Government, but at least some of the non-officials are and they are in touch.

Q.—Have you no local directors here?—A.—We have not any local directors.

Hon'ble Sir R. N. Mookerjee.—The directors are in Calcutta.

Hon'ble Sir Fazulbhoj Currimbhoy.—Q.—You say you are an auditor; have you passed any examination?—A.—I have not passed any examination.

Q.—How long have you been in business?—A.—The business was started by my father, who was an accountant.

Q.—An English accountant?—A.—No, he was an accountant in the service of the Government of India, and after he retired he started this business. Now I am qualified according to the new Indian Companies Act.

Q.—Then you say "the firm of Basant Ram and Sons of which I am the managing proprietor": is that an auditors' firm?—A chartered accountants' firm?—A.—An accountants' firm.

Q.—We were told by one of the witnesses here that the present liquidation which is carried on is not satisfactorily done or less sympathetically done or else the shareholders would have got more dividends for their capital than they did: is it so?—A.—Well, I would rather not pass any remark. I am myself a liquidator.

Q.—Then you say, you audit railway and other co-operative stores, what railways ?—
A.—North-Western Railway co-operative stores.

Q.—Then you say "lack of support from well-established banks at the time of stress and want of mutual combination or co-operation." Do you think the failure was mostly due to the jealousy of the European banks? Was that so?—A.—No, I do not believe that.

Q.—Don't you think that confidence was lost by the public when they were rushing for their capital for the money deposited there?—A.—Of course there was loss of confidence, and public wanted back their money.

Q.—And what was this due to, can you tell us the cause? Was it due to the bad management of the banks, or owing to the opposition of certain people against the leaders in the press?—A.—Well, it was due to bad management no doubt, but that bad management gave a handle to people to criticise.

Q.—To accentuate it?—A.—Yes.

Q.—Then you say "indeed when we compare the recent bank and industrial failures in the Punjab with similar incidents in other countries we are astonished with the comparatively smaller proportion of cases in which the failures in our case were due to dishonesty or selfishness." Do you think that the failures were more due to inefficient management and lack of experience than to dishonesty?—A.—Yes, in the case of the majority of them.

Q.—You desire that your province should have its own bank just like Bengal has got its own?—A.—Yes.

Q.—Do you think if the Government starts another bank here on the same principle, under the Presidency Banks Act, that people would subscribe to the capital?—A.—I think they will.

Q.—Of course there is no guarantee of Government you know except that they deposit a certain amount of money?—A.—I know that.

Q.—You say, "I am in favour of both a Director of Industries and a Board of Industries, the latter being a representative body, but I am of opinion that the director should be selected from among men with actual experience of industries and should wherever possible be an Indian." How do you think the Director should be appointed?—A.—Well, the director is always appointed by the Government, and the Government alone will make the selection for the Committee.

Q.—They should nominate them?—A.—Yes, not elected.

Q.—Have you got any Chamber of Commerce here?—A.—Yes, we have, but practically it is not doing any work.

Q.—It does not consist of commercial people?—A.—A few, but there are hardly any meetings. They hardly take any interest.

Sir D. J. Tata.—Q.—Referring to the attitude of certain European banks towards Indian enterprises, you complain that they did not look with sympathy upon the efforts being made in the development of industrial enterprises? Can you account for this attitude? What is this attitude due to? Was it actually adopted, or was it only a surmise on your part? Can you give instances? You say that if the European banks had been more sympathetic than they were, these failures would have been averted. Then you say: "The Presidency Banks could have rendered effective help and it must be said that they entirely failed to rise to the height of their duty. There is a widespread belief that this was due to the existence of a policy of discrimination in favour of Europeans against Indian enterprises?"—A.—My experience is this, that when the banks failed some of the good banks, for instance the Punjab Co-operative Bank, could not get money; but I know that in the case of a European bank when the money was needed the other European banks came to their help.

Q.—They did come to the help of the European bank? If similar help had been extended to the Indian banks they would have tided over this difficulty and would have stopped the run. Did not the Indian banks work hand in hand with the European banks?—A.—There was no co-operation whatsoever.

Q.—Do you think that the Indian banks were looked upon as rivals in business who might damage the prospects of the European banks? Was that the reason? Was there any chance of rivalry between the two?—A.—There was to a certain extent, but not to a great extent.

Q.—But the Indian banks appeal more to the small investor, and the small man than the European banks do, which deal with the larger commercial bodies and

larger commercial men?—A.—Yes, but so far as depositors were concerned the same classes of people go both to the European banks and to the Indian banks.

Q.—Same people go to both?—A.—As depositors they do. If a man has something to deposit he sometimes likes to distribute it over several banks.

Q.—Isn't there also amongst the educated classes a distrust of the European banks? Is there no feeling of that kind?—A.—No.

Q.—Then what is this hesitation on the part of the European banks to help them due to?—Simply trade rivalry?—A.—Well, I cannot say exactly what was this due to, but the fact is there.

Sir F. H. Stewart.—Q.—How many members of your firm are there?—A.—Now I am the sole proprietor. I have two Assistants.

Q.—Are they all qualified men under the new Act?—A.—Assistants are not required to qualify under the new Act. The responsible part of the work is done by me.

Q.—You grant the certificates?—A.—Yes.

Q.—Is there any system of training for auditors or accountants in this province?—A.—No.

Q.—Any facilities for such training?—A.—No. We had some colleges started by private individuals, but after some time the students got disgusted, and they left these colleges—for practically they were colleges nominally. The education imparted was not quite up to the mark, and since then we have practically none.

Q.—Do you know anything about the accountancy course recently started in the Bombay College of Commerce?—A.—I know.

Q.—Do you think that is valuable?—A.—I think it will be.

Q.—Would you encourage students to go there?—A.—Yes.

Q.—Would they find employment readily?—A.—I think the commercial people prefer to have qualified men rather than men who have had no experience.

Q.—Then you give instances of the causes of failures of banks some years ago; would you add to the ones which you have given "want of provision for depreciation for bad debts" and so on?—A.—I think I have said somewhere that adequate depreciation was not provided in certain instances.

Q.—Did you as auditor bring this want of provision to the notice of the directors?—A.—Not only to the notice of the directors, but I mentioned this in my reports also.

Q.—Did you mention specifically in your reports that adequate provision was not made?—A.—Yes.

Q.—Did you have occasion to refuse certificates altogether?—A.—No.

Q.—Do you think that special banking legislation is necessary in India?—A.—I do not think so.

Q.—Why do you think it is not necessary?—A.—Well, even in an advanced country like England where there have been so many failures it is not found necessary, therefore I do not think such a restriction should be placed on Indian banking in this country when already we have got so few banks to finance industries; if legislation is put in we will have finance only from European banks, there will be difficulty in having our own banks and it will be rather a restriction of banking business generally. I am strongly opposed to banking legislation.

Q.—But you are very anxious about industrial development, and banking facilities are very necessary for that purpose, and past experience in this province has proved that the banking facilities have not been what they should be; do you agree with that?—A.—Yes.

Q.—You would not like to see a provision made for the future that the interests of the public should be safeguarded?—A.—The interest of the public should of course be safeguarded; we have had failures; but they are not so many that we should take measures to stop banking entirely.

Q.—Have they not been so many as to destroy the confidence of investors?—A.—Yes, the confidence of investors has been destroyed.

Q.—Do you think that special legislation would help to restore that confidence?—

A.—Confidence can never be restored by legislation. Confidence is a thing which should come gradually. No legislation can create it.

Q.—Do you think confidence is reviving?—A.—Very slowly.

Q.—How will it be shown?—By following the advice and example of a man who is trusted?—A.—No. I see for instance that in the case of the Punjab National Bank the deposits are rising, that clearly shows that confidence is reviving.

Q.—Then you deal with the question of industrial education. You say it is not represented on the Senate of the University. Would you like to see commercial and industrial education separated from literary education altogether as far as possible?—

A.—Well, I would be glad to have a separate college of commerce here, and degrees of commerce introduced in the University.

Q.—What form would that take? Would that simply be that the University countersigned the certificate granted by the College of Commerce? You don't want that the University should hold any examination?—A.—I do not think there is any harm if they have examinations. The college can be affiliated to the University.

Q.—Do you think that would be of practical value?—A.—Yes, because a certificate from the University carries greater weight than a certificate merely from a college.

Q.—Is there any course of commercial instruction in the Punjab now?—A.—At present there is an examination held which is called clerical and commercial examination, but that examination is not at all popular.

Q.—Who holds that?—A.—The examination is held by the University.

Q.—Why is that unpopular?—A.—Because the curriculum has never been revised, the text-books have never been revised, the present requirements have never been looked into, there have been no representatives of commerce up to the present on the Senate.

Q.—Do a considerable number of students take up that examination?—A.—For the last 12 years I have been an examiner for that. In the beginning when I was appointed examiner the candidates were about 50 or 60, gradually they rose to about 150, but again within the last few years they have gone down to 60 or 70; that clearly shows that it is unpopular.

Q.—The reason you give is that the course is not up-to-date and not sufficiently understood?—A.—Yes.

Q.—Do these students obtain employment readily after passing that examination?—A.—To a certain extent, not very much.

Q.—Do you think it likely that a commercial course instituted and controlled by the University would be a practical success?—A.—Yes.

Hon'ble Sir B. N. Mookerjee.—Q.—According to the Companies Act if a director has any interest in any concern, he has to disclose that interest before he becomes a director, do you think that is a sufficient safeguard to avoid abuse?—A.—No, because that provision is only so far as a private contract is concerned, but if a person is a director in two separate joint stock companies . . .

Q.—He has to disclose that too?—A.—Well, it is shown in the balance sheet that it is due from a company in which he is a common director.

Q.—As far as I know if a man is a director of two companies he has to disclose it before the directors of the second company?—A.—He will merely say that he is a director.

Q.—If he takes any active interest, he has to disclose every item in which he is interested?—A.—To a certain extent he has to.

Q.—If supposing in a case, A is a director of one company, he cannot become a director of another company unless he discloses that fact?—A.—Yes, I think he cannot.

Q.—Do you think that the Act should be amended?—A.—The Act has not been long enough in practice, and I think we should wait for some time and see how it works before making any change.

Hon'ble Pandit M. M. Malaviya.—Q.—In dealing with the causes of banking failures, you say that one of these was "their not taking care to appoint a competent board of directors with practical business experience." That would not apply, I take it, from your answers to other questions, to the Punjab Co-operative Bank?—A.—I do not think so.

Q.—Nor would it apply to the Punjab National Bank?—A.—Well, it will apply to the Punjab National Bank.

Q.—Do you think they have appointed men lacking in business experience?—A.—I won't like to reply to that question, I think it might injure the institution.

Q.—You say here that "the board of directors had practically left the entire management in the hands of the Managing Directors or Managers without providing proper check or safeguards against abuse of power and authority." Are there any banks to which this remark would not apply? I do not want the names of the banks which failed, I only ask if you can say whether there are any banks to which this remark would not apply?—A.—There are banks to which this remark will not apply?

Q.—Are they many?—A.—Not many.

Q.—Could you mention some?—A.—I think it is not desirable to mention all these things.

Q.—You could not say, or you don't want to say, to what banks this remark would not apply? In this case you may mention every such bank, this won't hurt any bank?—A.—It won't.

Q.—You see it is a sweeping remark, you have said that the board of directors have practically left the management in the hands of the managers, I want you to say whether there were some banks to which this remark would not apply?—A.—To some banks it does not apply.

Q.—You don't want to name, you cannot name any such bank which had left the management to the managers "without providing proper check or safeguards against abuse of power and authority." You say that another cause of their failure was "the appointment of men as managers, agents or other officers in immediate control of business who had no practical knowledge or experience of the business." Up to the time when this crisis came in 1912 or 1913, was not the business of all these banks going on well and satisfactorily?—A.—I do not think the whole thing went wrong in one year.

Q.—Are you not one of the liquidators of some of these banks?—A.—I am the liquidator of the Punjab Co-operative Bank, and of no other.

Q.—Have you seen the reports of the liquidators of any other of these banks?—A.—I have seen some of them.

Q.—Have they made this complaint that the management was entrusted to men with no practical experience of the business?—A.—I think I read yesterday the evidence of one of the official liquidators saying that the management was entrusted to inefficient and incompetent persons.

Q.—Has it been said in the case of many banks or in the case of some only?—A.—Well, so far as this point is concerned, in one case I have seen they have mentioned it, and in other cases they have not mentioned.

Q.—You have seen it mentioned only in one case. You say that in some cases they had vigorous canvassing for directorship; does that apply to many banks?—A.—Not to many.

Q.—To one?—A.—Two or three, not to many.

Q.—You say that managers had little or no practical experience of banking: is it the fact that the managers of many of these Indian banks were not empowered to carry on the business without consulting the directors generally; that they used to hold directors' meetings to deal with important transactions?

Hon'ble Sir R. N. Mookerjee.—Q.—Are you in a position to answer that question? Do you know all the details?—A.—Not necessarily.

Q.—Because you cannot possibly know the affairs of every bank?—A.—There are so many.

Q.—That is a general remark?—A.—Yes.

Hon'ble Pandit M. M. Malaviya.—Q.—I wanted to know whether you would qualify the general statement you have made?—A.—There are so many banks every bank had many branches and the rules of one did not apply to another. There was not one fixed rule which was applied to all.

Q.—You cannot then say that your statement is generally true, you can only say that it may be true in some cases?—A.—My statement is certainly true.

Q.—Then you say another cause of their failure was "slavish imitation of what was done by other banks irrespective of requirements and resources." Could you mention in confidence some of these banks which disregarded requirements and resources; later on, not now?—A.—I could give you innumerable instances.

Q.—Would you kindly let us have a little note, because these are facts which affect the future progress of banking here?—A.—Very well.*

Q.—As you have said yourself, we must know the causes of the failures before we can hope for any future progress?—A.—You will please give me a definite memo of what you want.

Q.—Then you speak of their "readiness to embark on speculative adventures of a dangerous character," could you also add some instances of that kind?—A.—Oh yes.

Q.—You say next that their "authorised and un-subscribed capital was out of all proportion to paid-up capital:" let us take up the Peoples' Bank. What was the percentage of the capital that was paid up? Was it about 60 per cent?—A.—It does not necessarily mean that that remark applies to the Peoples' Bank. If you want to hear whether . . .

Q.—I want to know about these particular banks. You admit that it does not apply to the Peoples' Bank. It had 60 per cent of its capital paid up?—A.—Yes.

Q.—I understand that the Punjab Co-operative Bank had 84 per cent of its capital paid up?—A.—Yes.

Q.—And the Punjab National Bank about 50 per cent, the Amritsar Bank about 60 per cent, and the Sind Punjab Bank about 60 per cent?—A.—The Sind Punjab is going on.

Q.—Very well, leave that alone. Therefore in these banks 50 per cent or more than 50 per cent of the capital had been paid up and in one 84 per cent had been paid up. So this remark of yours also would not apply generally to the banks here? It may apply to some?—A.—It does apply to some.

Q.—Then you say "they were lending money on insufficient or no security." Have the liquidators found that the securities cannot be realised, or does the fact that many of the banks are paying 16 annas evidence that those securities were generally good?—A.—In many cases there was practically no security.

Q.—But I want to know whether generally the security has been found to be sufficient or not, judging from the payments made?—A.—Well, if generally the security had been sufficient, probably there would not have been so much difficulty to raise money and to realise it.

Q.—Take the case of the Punjab Co-operative. You said they had excellent security and yet they could not raise money?—A.—I have said that the Punjab Co-operative Bank is one of the exceptions to the rule.

Q.—Another cause which you have mentioned was their "lack of support from well-established banks, etc." I suppose you refer to the Presidency Bank; you have suggested that in your note later on?—A.—Not necessarily Presidency Banks. We had other banks also; they could if they wished have rendered help.

Q.—They did not help?—A.—No.

Q.—With regard to industrial failures, your knowledge of these is derived only from the auditing of their accounts; I take it that you have no personal knowledge regarding them?—A.—I have myself stated that I am not an industrialist.

Q.—You say "when we compare the recent bank and industrial failures in the Punjab with similar instances in other countries, we are astonished at the comparatively small proportion of cases in which the failures in our case were due to dishonesty or selfishness." Do you think that if there was such a bank as you have suggested, a provincial bank which would examine the cases of each of these banks and lend help, many if not all of these failures could be averted?—A.—Oh yes.

Q.—You think so?—A.—Yes.

Q.—You say further on: "it must be said in this connection that the attitude of high officials was all that it could be, but they were helpless." . . .

* Not received when going to Press.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—Do you think that if a provincial bank was started all these failures would have been averted?—A.—Many, if not all.

Hon'ble Pandit M. M. Malaviya.—Q.—Are you aware that after the failure of the Peoples' Bank some of the authorities at Lahore were approached and asked to help the other banks, and that they expressed their inability to do so?—A.—Not within my personal knowledge.

Q.—You have said that "so far as the Presidency Banks are concerned there is absolutely no justification for such a policy for they are extensively assisted by the State," and you say just before the sentence which I quoted 'but they were helpless.' Did the Government put pressure upon the Presidency Banks to help these banks considering that they were extensively assisted by the State?—A.—So far as I know some Government officials did try to get money from the Presidency Banks.

Q.—But they failed to move them?—A.—The Government officials were more sympathetic.

Q.—Some of them?—A.—Yes.

Hon'ble Mr. H. J. Maynard.—Q.—Is it the case that the Directors of a particular bank passed a resolution of thanks to a particular manager of a local European Bank? Do you know of that?—A.—I do not know of that.

Q.—Perhaps you don't want to mention names?—A.—No, I do not know of any.

Q.—Was it the Punjab Co-operative Bank?—A.—I do not know whether the Punjab Co-operative Bank passed a resolution of thanks for the manager of a European Bank, but I know that the Punjab Co-operative Bank was very much assisted by the Registrar of Joint Stock Companies then, and even to-day the managing director and the directors are very grateful to him for the very great assistance he tried to render them, and at one stage he got them a lakh of rupees which was at a previous stage refused; but subsequently when they wanted a large sum of money the Bank of Bengal said they refused to give it.

Q.—Subsequently the Bank of Bengal refused?—A.—Yes.

WITNESS No. 377.

RAI SAHIB RUCHI RAM SAHNI, M.A., F.C.S., Professor of Chemistry, Government College, Lahore, and Fellow of the Punjab University, Lahore.

WRITTEN EVIDENCE.

Introductory Remarks.—I should like to say at the outset that, whatever knowledge or experience I possess of the subjects of present enquiry has been acquired by me as a teacher of Chemistry of over 30 years' standing, as a member of several Industrial and Commercial Conferences and Committees appointed by Government and as Joint General Secretary of the Punjab Industrial and Agricultural Exhibition in charge of exhibits. In the last capacity, it was my duty to travel all over India and visit influential persons interested in industrial enterprises, and arrange for the collection of the best exhibits from each Province. In another connection I visited the principal Agricultural Colleges and Farms in the Bombay Presidency, the Central Provinces, and the United Provinces. This was in 1902 before the present Agricultural College at Lyallpur came into being. This tour occupied me for six weeks. A detailed Report was submitted to the Director of Public Instruction. I am specially interested in the development of chemical industries.

1.—Financial aid to industrial enterprises.

Capital.

Questions 1 to 6.—I have had no personal experience of the raising of capital for industrial enterprises. I believe, however, that, under certain guarantees provided by Government against risk of loss in recovering loans, there need be no serious difficulties in raising capital for small industries from private banks. If necessary, special banks for the purpose could be started on the joint stock principle with or without financial assistance from Government. The nature of the security and protection which such banks should enjoy is indicated in the following rough scheme:—

- (1) The bank should advance not more than two-thirds of the total capital required for the buildings and machinery, at a fixed moderate rate of interest, say, 6 per cent, such advances being made for a period of from five to ten years. The buildings and plant should be insured against accidents,

- (2) The promoters of the enterprise should find the remaining capital required for buildings, plant, stock of raw materials and working expenses.
- (3) A law should be enacted making it illegal for the promoters to mortgage, sell or otherwise dispose of the plant or buildings without the permission of the bank, with the additional provision that, as regards the buildings and machinery, the bank must have the first claim. In case of non-payment of the loan in accordance with the terms and conditions previously agreed upon, the bank must have the right to sue on unstamped paper besides enjoying other legal facilities.

I believe that, equipped with the facilities thus extended to them, the proposed Industrial Banks will be able to attract a larger share of the loanable capital in the market.

I am not in favour of direct bounties or subsidies being granted to industrial enterprises, but I would strongly urge the organisation of a Sugar Department with the following objects :—

- (a) The special encouragement of cultivation of suitable varieties of sugarcane and sugar beets ;
- (b) the purchase and transport of the cane to certain centres ; and
- (c) the manufacture of sugar and allied products under Government management for a period of ten to fifteen years. So far as this Province is concerned, Jullundur and Lyallpur would be suitable centres.

The Sugar Department will also encourage the cultivation of beet root and arrange for the extraction of sugar in suitable areas. I believe there are many tracts in the Punjab which are eminently fitted for beet root cultivation and the manufacture of sugar therefrom. Outside the Punjab, parts of Kashmir seem to be ideal spots for the growth of beet root. A suggestion to the enlightened ruler of the State will, I believe, be welcomed, the more so as Kashmir at present imports from abroad every ounce of sugar that it consumes.

Considering the importance of building up the sugar industry in the country, in my opinion, encouragement might be given to sugar cultivation by reducing the amount of land revenue charged from growers of sugarcane.

I mention the Sugar Department partly as an illustration of the form State aid should take and partly because of the importance of the sugar industry itself. Similarly, a Paper Department might be organised ; for this again Kashmir offers special facilities.

I attach much importance to clause 5, sub-clause 5, but the assistance thus afforded would be of limited value, unless special facilities are provided for the selection of machinery. To a certain extent, and specially in the case of well-known standard machinery, the difficulty can be removed by arranging for the stocking, for purposes of selection and purchase, of various kinds and sizes of lathes, drilling, planing and shaping machines, saws and hammers, oil engines and ordinary tools and plant of an improved kind. These should be offered for sale at fixed and reasonably moderate prices. What is needed is to make these common machines so readily accessible to the ordinary workmen, mechanics, and foremen as to encourage them to study their requirements and make their rough estimates without special expert advice or lengthy correspondence. In this manner, the bolder and more enterprising spirits among them will be induced to set up small factories of various kinds either as individuals or in co-operation with others. I understand that in Japan the system has proved very helpful both as an instrument of general education in the use of machines and as an encouragement to the starting of small workshops.

Questions 7 and 8.—India is so very backward industrially that I am sure fifty different industries could be started in each Province with fair promise of success. But the people lack technical knowledge and financial and other facilities. I should specially like some chemical industries to be started by Government. I would recommend the manufacture of alkalis, porcelain and glass-making and glass-blowing, and tanning. It is not necessary for a good start to invest more than 1 to 2 lakhs in any of these concerns, and a fair beginning might, in many cases, be made for purposes of demonstration with a very much smaller capital. As soon as the factories become going concerns and their commercial success is assured, private companies will be coming forward to take them up.

I should like only very large industries, such as the Sugar Industry, to be in the hands of Government for a period longer than ten years.

Questions 9 and 10.—Banks should offer special financial facilities by collecting the cost of machinery and material required for industrial concerns six months after the presentation of the invoices.

Co-operation in industrial development.

Questions 11 to 14.—The rapid development of Banking in the Punjab during the past few years shows that there is no lack of the co-operative spirit in the people, and the existing inactivity is, in my opinion, largely due to ignorance and the consequent want of confidence.

II.—Technical aid to industries.

Industrial research and industrial surveys.

Questions 15 to 27.—I entertain the highest possible opinion of the value of scientific research for industrial advancement. But as I have already indicated above, we here are so backward that no research either in England or in India is of much practical value to us for many years to come. Nor am I in favour of further industrial surveys being undertaken at present, though I am fully conscious of the many hitherto undiscovered industrial resources in this country.

In my judgment, the immediate usefulness of research is of a limited character, and more attention should be given to industries that can easily be developed by means of known products and processes.

When, as is the case at the present time, articles of every-day use are selling at ten times their normal cost, one can easily see that it is not protection, nor research that we want badly but expert knowledge and facilities for utilizing that knowledge when acquired. In my opinion, even in the midst of the war, steps should be taken to improve the existing state of things, so that we may be ready to start a few industries at least soon after the return of peace conditions. I think this is only possible, if the present Industrial Commission will issue an *ad interim* report and urge upon the Government to take it into consideration at once. We have already lost much valuable time.

III.—Assistance in marketing products.

Commercial museums and exhibitions.

Questions 28 to 39.—Commercial museums and exhibitions are certainly helpful in bringing the manufacturer and the seller into touch with each other, but the small trader does not at present take full advantage of them, and, as I have mentioned above, there are, at present, no large industries in the country. There should be one commercial museum in each Province and it should be managed by a Sub-Committee of the local Corporation or Municipality. It should be the duty of the Committee of Management to circulate a list of the exhibits with some important particulars of the principal trades in the Province. One day in the month may be fixed specially for the trade visitors when the officer in charge should be present to give fuller information regarding exhibits in which individual traders may be particularly interested. Manufacturers may, if they choose, also attend on any of these occasions or send representatives.

The exhibitions can do a lot of good work in the same direction if—(1) they are organised on a small scale, (2) they are held frequently in different centres, (3) special arrangements are made for bringing the manufacturers and traders into touch with each other. Like the museums, the exhibitions should be organised by local bodies through a special Sub-Committee, which qualified non-members may be invited to join.

Indians of commercial experience should be largely appointed to the higher posts in the Government Departments for the purchase of stores and some of them should visit the manufacturing centres in this country. A number of trade representatives in Great Britain and the Colonies should also be Indians.

I press the claims of Indians not only because they will be better acquainted with the industrial needs and conditions of this country but also because the experience and special knowledge which they might acquire during their period of service would be of use to the people even after their retirement.

V. & VI.—Training of labour and supervision and official administration and organisation.

Questions 44 to 62 (a).—The lack of adequate spread of primary education is at the root of a great deal of the industrial backwardness of the country. Besides, the present system of education—primary, secondary and collegiate—is too literary and unpractical. I have no hesitation in saying that so far as the industrial interests of the country are concerned, it is doing a great deal of harm.

There are no industrial schools worth speaking of in this Province with the exception, perhaps, of only one or two. Of technical schools there is not a single one in the province.

Several official Industrial Conferences have already suggested the establishment of trade schools teaching certain crafts or industries in particular centres, but so far the Dana Weaving School at Ludhiana is the only one which has been opened, and for certain reasons this has not done as much good as it should otherwise have done.

The "urgent recommendations" of the Conference on Commercial Education held under the chairmanship of Sir D. P. Masson in 1905 should receive early consideration.

The question of the administration of industrial and technical schools is not a pressing one in the Punjab. We should first have the schools and any kind of administration will do for a long time to come. Here, again, it would be a distinct advantage if qualified Indians are associated in the organisation and control of nascent industries in the Province.

I believe that the recommendations of the Punjab Industrial Conference held in 1911 included the establishment of a Technological Institute at Lahore, but in any case, I submit, that such an Institute should be established in the Punjab at a very early date.

Question 62 (b) and 62 (c).—This is a most important question. The Punjab Department of Industries has already done something in popularising the use of the handloom in rural areas. Costage industries.

What is wanted in my judgment is—(a) the training of artisans, (b) the standardization of mechanical appliances, material and finished products, (c) facilities for the purchase of the appliances and material required as well as the sale of the finished products. I will explain what I mean more fully with reference to the extension of the handloom industries.

I would have half a dozen different kinds of standard handlooms numbered 1, 2, 3, etc. No. 1 may be of a suitable kind for producing coarse *dhotis* of a standard size in which a standard quality of yarn is used. Similarly, No. 2, will be specially suited for producing a *lungi*. No. 3 may be for turning out handkerchiefs. No. 4 for silk cloth of a standard width and quality.

These handlooms may be made by private firms and sold at fixed prices. Similarly, the standard yarn, plain as well as coloured, required for the several products should be available for sale in each large village at fixed prices through the existing village Co-operative Societies or some other convenient agency. The same agency should purchase the outturn of looms at fixed prices and supply them to the trade in larger villages and towns.

The same system, with the necessary modifications, might be adopted with the following industries and others which may be readily suggested :—

- (1) Weaving of *niwar* and tape and making of ropes of superior qualities of cotton, hemp and other fibres. Weaving of *durries* and towels.
- (2) *Hosiery*—Socks and underwear (cotton, silk and wool). For this purpose a central *depôt* where the necessary machinery may be obtained at fixed prices will have to be organised. This industry is suitable for the larger villages only.
- (3) Wire-matting for sanitary beds.
- (4) Glass-blowing (in the sub-montane districts only). Other articles of glass not requiring the operation of blowing. This will require a small class where artisans for different classes of work may be trained. (Here again I would emphasize that the production of only standard articles should be encouraged.)

This list can easily be extended and the different districts will find it easy to discover for themselves which industries will suit each of them best.

VII.—Organisation of technical and scientific departments of Government.

Questions 63-81 (a).—As I have already explained, India is not yet ripe for taking advantage of Research Institutes for industrial purposes. We do not want "Technological

Research Institutes" (Q. 71) as much as a Technological Institute in each Province for training managers, foremen and superior workmen, for industries. Research will naturally follow the establishment of schools and industries.

Questions 74 and 80.—I have dealt with these before.

VIII.—Collection and distribution of commercial intelligence.

Very valuable information is doubtless being collected and published by the several technical departments of Government, but I am afraid very little use is being made, or, in the existing circumstances, can be made of it. I do not think wider dissemination of the information through the various vernaculars will be of much use at the present stage of industrial development.

Technical scholar-
ships.

These should be awarded only to persons who furnish adequate guarantee that they would on their return be able to find sufficient capital to start the industry for which the scholarship was awarded. In several cases the scholarship-holder has not been permitted to obtain access to works and has consequently returned to this country without any training whatsoever. I would recommend the adoption of what, I understand, is the Japanese system, viz., that large manufacturing concerns which supply their products to India should admit a certain number of scholars from this country to their works as a condition for the continuance of Government patronage.

ORAL EVIDENCE, 13TH DECEMBER 1917.

Sir D. J. Tata.—Q.—In section II you say: "I entertain the highest possible opinion of the value of scientific research for industrial advancement. But as I have already indicated above, we here are so backward that no research either in England or in India is of much practical value to us for many years to come." Would you explain?—A.—I have explained it. I want for the present to limit ourselves to known processes and products. So much has already been done that more time need not be lost in carrying out further research. There is such a vast scope for industrial development on lines that are known, with processes that are well known, with products that are available that we need not give more time to further research before these industries are started. I fear that if further researches are undertaken, the plea will be advanced that this thing is being investigated and that thing is being experimented upon, and in this way the industrial development will be retarded rather than accelerated. As I have said in my written statement I am not against research work, but what I am really against is that the research work should stand in the way of early steps being taken towards the industrial development of the country. Industrial surveys have already been undertaken in most provinces, and we have now a large mass of information at our disposal. While the whole world has been doing a great deal in the way of industrial development, there seems to be no reason why we cannot start something on similar lines. The subject of industrial development has been discussed by several successive Conferences, Committees and Commissions during the past 37 years, but nothing practical has come out of these discussions and recommendations, and I should be very sorry if in the name of research and industrial surveys more time is lost.

Q.—If the information available is not utilised that is not the fault of research work?—A.—I have said that.

Hon'ble Sir Fazulbhoj Currimbhoy.—Q.—You say "I do not think wider dissemination of the information through the various vernaculars will be of much use at the present stage of industrial development." Do you think that the literature on industries ought not to be given in the vernaculars to the people?—A.—I go much further and I hold that the whole educational system should be through the vernacular, both industrial and literary. But at the present time, there are no industries in this province worth speaking of, the people are very backward in general education and, in consequence, they cannot understand even the bulletins and monographs that are available. I have myself translated some on agriculture into Urdu but the people do not understand and appreciate them.

Q.—What people? Agriculturists?—A.—Yes, I mean the common agriculturists in this province cannot make much use of vernacular translations because of their defective general education. The same remark holds good of bulletins in all industrial subjects. I am now merely illustrating my view with reference to agriculture.

Q.—You talk of the farmers and the cultivators?—A.—Yes.

Q.—But the poor people are not taught even the vernaculars. How are they to read in vernacular? That is their difficulty.—A.—Quite so, they are very backward. That is my whole point.

Q.—With regard to people in big cities like Lahore and other places, if you give the information in vernacular to shroffs and other businessmen who do not know English they will be better able to make use of it.—A.—If these bulletins are to be of any value, they must be written on scientific lines and must deal with scientific principles. But the general level of education of the common people is so low that they would not benefit by them. What I want is there should be arrangements for a regular course of instruction through the vernacular and then they would benefit.

Sir D. J. Tata.—Q.—If they cannot understand much English, do you think there are enough scientific terms in the vernacular to make the things very clear?—A.—Yes, if there is a regular course of instruction. I have tried it myself. I am not merely giving an opinion. I am expressing my confirmed conviction. I have given popular lectures in the Punjab and can say that the people can understand you if you explain the things to them in a popular way. The terminology will grow in the vernacular as it has grown in European languages.

Mr. C. E. Low.—Q.—With reference to what Sir Dorab Tata was asking you on your statement: "We here are so backward that no research either in England or in India is of much practical value to us for many years to come," do you mean that to apply to the whole of India or to the Punjab only?—A.—I am speaking mainly about the Punjab and not the whole of India. I say that sufficient research has already been done along several lines for various industries to be started all over the country without further delay. My point is that the industrial development of the country should not be allowed to wait on the carrying out of research whether in India or elsewhere.

Hon'ble Pandit M. M. Malaviya.—Q.—I take it that you want Government to provide banking facilities, to provide educational facilities, to give patronage to goods manufactured here and also protection to such goods. That is what it comes to?—A.—Yes. Certainly.

Q.—You think that with such aid from Government, industries in the Punjab will have a bright future?—A.—I believe a very, very bright future. I am a great optimist in that respect.

Q.—You think that the natural resources of the province can be usefully and beneficially worked up in the province if such facilities are provided?—A.—Government reports show that it is so.

Q.—What are the particular industries that you would recommend to be specially attended to?—A.—I have named certain chemical industries.

Q.—You think there is great room for expanding the chemical industry in the Punjab?—A.—Yes. I have specially mentioned beet root, paper pulp, wood pulp, mineral acids and alkalis.

Q.—Are you making any stationery in this province?—A.—No.

Q.—Have you any factory for it?—A.—No.

Q.—Do you think there is room for that here?—A.—Some people have lately started making inks. I have just now one man in my mind. He gave up Government service where he was getting something like Rs. 30 or 40, he worked in the Government College laboratory for a few months, and he is now making an income of Rs. 300 or 400 a month by making and selling inks.

Q.—Would you wish Government to provide industrial and technical education by one provincial college, or by a provincial college, and a system of schools in districts where particular industries would be taught?—A.—I believe that the whole system, if you would allow me to say so, requires remodelling, the whole system of education. I have purposely put that in that strong form to attract attention.

Q.—You say that the education given, primary, secondary and collegiate, is too literary and unpractical, and my question is meant to ask you in what particular directions

you would wish the system to be modified with a view to divert the energies of the youths of the province to profitable industrial pursuits?—A.—In the first place, I would begin from the beginning. In the primary schools I would give the boys along with the ordinary instruction in the three R's, something to do with their own hands. It might be a school garden attached to the school, or some drawing, or some clay modelling and so on, the object being two-fold, one training the hand and the eye and the other, the equally important work of familiarising the student with manual work, and teaching him the dignity of labour. The object is not to teach trade there. Going higher up to the secondary class, I would have several types of schools.

Hon'ble Sir R. N. Mookerjee.—We are not dealing with the question of general education.

Hon'ble Pandit M. M. Malaviya.—Q.—Would you introduce industrial schools? At what stage?—A.—At the secondary stage.

Q.—Are the boys to be trained in the elementary schools ordinarily and then put into the industrial schools?—A.—With just that preparation for industrial work that is, hand and eye training.

Q.—And then you would have these industrial schools scattered in the districts?—A.—I would have them scattered wherever there are ordinary schools.

Q.—And you would have a college at the centre of the province where higher industrial education would be given?—A.—I might explain a little further. I should like to have a college with, say, three sides. You may have separate colleges, a commercial college, a college for something that leads to mechanical engineering and civil engineering and things of that kind, and a college that leads up to chemical technology. They may be in different places but it would be more convenient to have them in one place if other considerations allow. That is a matter of detail.

Q.—Do you think that students will be attracted to a college for electrical engineering here?—A.—I believe there will be a rush. It will be difficult to provide room for all the students.

Q.—And also for mechanical engineering?—A.—Yes.

Q.—And for chemical technology?—A.—Yes.

Q.—You think that many of our young men who go to the bar at present will be diverted to these channels?—A.—I am quite sure of it.

Q.—Supposing you do not have all the three branches combined in an institute such as you have suggested, do you think there is a necessity in this province for a college of commerce and for one of technology?—A.—I would start with a college of technology, but in the lower classes I would give just a little training in accountancy and banking and a little economics up to our intermediate standard. I might mention, and I have referred to it in my written note, there was a conference on commercial education appointed by Government in 1905. I was one of the members and the chairman as one of our very best businessmen. That conference in 1905 recommended that an Institute of Commerce, teaching up to a standard equivalent to the university Intermediate, should be started immediately. I think the conference called it an "urgent necessity." That recommendation remains where it was.

Q.—You have mentioned that in your note?—A.—Yes, I have.

Q.—You think that there should be first a technological college and then a college of commerce?—A.—Yes.

Q.—Are many of your students going to foreign countries to acquire technical education?—A.—Some even go without any money and go and earn their living. In America I know of several students who have gone and worked, or intend to go and work as private servants for earning their living.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—You talk of academical knowledge and what about the practical side?—A.—I was going to develop that side.

Q.—You want that workshops ought to be there in order to teach them?—A.—Without industries, the technological institute will be of no value, and, in fact, industries must precede technology. Industries should be there. Each one should precede the other; it is like the hen and egg puzzle. If you want to start with one, I would start with the industries and not a technological college because it is in the former that practical training ought to be given to the students. A better course would be to start a technological institute with demonstration factories attached to it.

WITNESS No. 378.

MR. PETER CARTER SPEERS, *Professor of Chemistry, Forman Christian College, Lahore.*

WRITTEN EVIDENCE.

What I shall have to say, is based on my experience with Indian students, with assisting certain manufacturers with technical advice: on a certain amount of knowledge of technical training as carried out in America, and of manufacturing conditions in America.

Financial aid to industrial enterprises.

It is my opinion that Government could greatly assist industries already started, and in certain cases, proposed industrial undertakings by loaning money to them, subject of course to more or less careful supervision of the use to which the money is put in the industry. This would imply, in the case of existing industries, a careful examination by Government of the plant of persons asking for such loans. I should say that the main requirements for granting such loans should be (a) the importance of the industry to the country, (b) the energy and ability of the men in charge of the work, (c) the likelihood of the success of the enterprise if carried out properly, rather than any great emphasis on collateral. In the case of proposed enterprises, it should be given only to men of experience in the line of the proposed industry, and of proven ability and energy. I should say that these loans should be given at a fair interest rate. Unless the men carrying out an enterprise have experience and energy no amount of Government aid will help to put the scheme on its feet.

Money grants-in-aid, bounties, guaranteed dividends, etc., all tend to make the enterprise dependent on some outside body for the driving power necessary for success. Unless these undertakings and enterprises have the necessary driving power and initiative within themselves, they will not make a success of the scheme. To be successful, an enterprise must be able to fight for its place. It seems to me that anything but loans at interest, with technical assistance if possible, will tend to foster dependence rather than sturdy growth.

Pioneer factories should be undertaken not as purely Government concerns, but rather as private concerns, backed by Government, with capital loaned at interest, and help in getting the necessary machinery.

Pioneer factories.

Pamphlets dealing with definite industries, showing the raw materials necessary, their cost and sources; the machinery necessary, approximate cost, and firms from whom it may be obtained; output and cost of manufacture, and selling price and available market for the product, would be much more useful, as pioneering agents than costly factories run by Government.

Technical aid to industries.

A great deal of help can be given by Government experts in a purely advisory manner. Visiting factories, at the request of the management and pointing out wherein the process might be improved, and advice as to sources of published information, and better methods, new sources of raw materials, and available markets, etc., would be a legitimate service in such matters. If the expert is to be lent to a private concern, it should be only when that concern pays to Government either all or the larger part of the expert's salary for the time loaned, with perhaps some sort of bonus scheme for the expert.

Demonstration factories, if run as part of a technical institute, would be of great help in the better development of a large number of industries, as well as the establishment of new ones for India. Oil refining, and products from oil, alkali by the Solvay process, contact sulphuric acid, leather finishing, dyeing, and others would be greatly benefitted by this sort of thing. In certain of the technical institutes in America, this kind of training is being given very successfully. For example, Pratt Institute in Brooklyn, New York, gives a most excellent course of this variety. The actual training consists of the working in the institute of a number of small unit factories. This sort of thing would seem to me to be by far preferable to the establishment of distinct factories here and there through the province, for this or that industry. In such an institute the training can always be available. In demonstration factories proper, it will only be available freely for the space of years before the factory is closed or turned over to a private concern. It would be much easier in such a scheme also to bring out the inter-relation of different industries, and enable the men studying any particular industry, at the same time to become somewhat familiar with the industries on which his particular one is dependent either for raw materials, or for marketing raw materials. The scheme being undertaken by the Punjab University and being worked out at present by the Forman Christian College, is along this line. Small plants will be set up and will actually manufacture a number of different things on a small factory scale, thus enabling the men not only to see how a process works, but also to experiment with the machinery and reactions involved.

Demonstration factories.

This would not be possible in a demonstration factory, being run on a commercial basis. A demonstration factory not run on a commercial basis would of course be valueless.

It seems to me that the biggest need at present is not a lot of very advanced research on this problem or that, but the actual training in the fundamentals necessary to operate a factory properly. Such training can be gained or should be gained in this country, and for some time to come, probably always, research in the matter of the actual manufacturing processes should be carried out in this country. The Imperial Institute could be of great service in research on such matters as the availability of Indian materials for use in other countries, but for working out processes, overcoming difficulties met in manufacturing, work in this country alone will be valuable.

Training of labour and supervision.

Lack of primary education in itself does not very greatly hinder industrial development. While primary education would without doubt help greatly, still it would do so mainly as the foundation for a higher education. A better education than merely primary education is necessary to greatly improve the labourers' efficiency.

It seems to me that the establishment and development of industrial schools is of far more importance than a scheme of apprenticeship. Apprenticeship systems are bound to limit an industry very greatly, for they can at best provide for the training of a very few men, while industrial schools can provide for as many as are needed. If some scheme could be worked out here whereby the men studying in industrial schools would have access part of the time to actual factory work, it would be an advantage. This would however be rather hard to accomplish. The best scheme in my opinion is the industrial school made up of a number of small factories.

If it were possible to have a joint board to control the industrial schools, it would probably be better than having either the Education Department, or the Industries Department to control them. If the industrial training can be given as a part of a man's regular school or college training, so that the men being trained would not have to devote several years to it after their regular college or school work is finished, it would greatly increase the numbers of men going in for it. To be a part of the regular educational system, it should of course come under the Education Department, but since this department cannot be in as close touch with the needs and opportunities of the industrial world as the Industries Department, the latter should also have a certain control over the work. Schools controlled by the Industries Department alone would lack the connection with the regular educational system which is in my opinion necessary to get the best men to take the training.

If the present system of Government scholarships could be extended, and somewhat altered, the question of foreign training for the men in charge of industries could be helped. These scholarships should be made available to those alone who have had actual experience in this country, of the work for which study abroad is to be undertaken, and have proven their initiative and resourcefulness. Further, these scholarships could be made much more valuable, were the men given them more closely directed in their work by Government. While receiving such scholarships the men should be directed by Government, as to the place where they should study, and the work they should do. Particularly do such men require help in being placed in factories at home for the really valuable work that has to be done. Training abroad, without first having experience in this country, is likely to do more harm than good, for the men do not realize the conditions and difficulties they have to face, and will not pay particular attention to those things in their study abroad. Further, they are likely to come back with ideas altogether too large, having studied only going concerns, which have passed the initial stage, and will get the erroneous idea that they can start an industry full grown, immediately. The result is of course failure, and the discouraging of others who might have taken up the work on a small scale and made a success of it.

In the matter of research, the best scheme I know of, and which would be applicable to this country, is the scheme in use in the University of Pittsburg, U. S. A. started by Professor R. K. Duncanson, and described in his book "The Chemistry of Commerce." By this scheme, a company with a certain problem to be investigated, pays the University a certain sum, for a fellowship for a year or two years. The Director of the Department selects the man who in his opinion is most likely to succeed with it, and puts him to work on the problem, in the University Laboratory, and under his direction. The money given by the company goes as a stipend for this man. There are other conditions, whereby both the company and the actual investigator co-operate, to each others advantage. With proper technical schools, this same sort of thing could be undertaken to advantage in this country.

Technical schools should, it seems to me, be separate units, though making public the results of their work, for other technical schools to profit by. A big system, with Central Research Institute, etc., etc., is likely to be so unwieldy that the man actually wanting help would not be able to obtain it easily.

To sum up, it is my opinion, that Government can help to the best advantage, by—

- (1) loaning money to enterprises already started, and in need of expansion; this to be done only after the approval of the enterprise by Government experts, and accompanied by Government help through its experts acting in an advisory way only;
- (2) the establishment and development of industrial schools of the type suggested, namely, a group of very small factories established for teaching only, but working under commercial conditions as far as possible;
- (3) the extension of the present scheme of Government scholarships, with the limitation of actual experience in this country for those to whom scholarships are granted, and greater direction of the scholars while studying abroad;
- (4) in general making an enterprise pay in some way for the help given.

ORAL EVIDENCE, 14TH DECEMBER 1917.

Hon'ble Sir B. N. Mookerjee.—Q.—Under the heading of training of labour and supervision, you say, "The best scheme in my opinion is the industrial school made up of a number of small factories." Are these factories for educational purposes or should they be run on commercial lines?—A.—Possibly a combination of the two. I mean they should be primarily for the educational side of the thing, but they ought to be able to run on commercial lines. They may not absolutely pay for themselves, but practically they should.

Q.—Would it not interfere with private enterprise?—A.—They would be so small that I do not think they would. For example, if you are working on an oil industry and turning half a ton a day that would not be sufficient to interfere with any private business, but would be sufficient for the training of the men who would be studying in that industry.

Q.—About your suggestion in the next paragraph that these industrial schools should be controlled both by the Education and the Industries Departments, don't you think that it might create friction between the two departments?—A.—If there was a common board between the two to control it, I do not think it would meet with much friction. It is very necessary to have the educational side in connection with the regular educational system.

Q.—By industrial schools you do not mean a technological college?—A.—I practically mean that.

Q.—You do not mean that in every province or every division there should be a technological college?—A.—No. My idea of an industrial school will be one in which the students take practically all the subjects that are ordinarily taken in an ordinary school and along with that, they take a certain amount of industrial training. If a man has only industrial training he is not worth very much unless he has had the other training at the same time.

Q.—That education seems to me would be a sort of primary education, and don't you think that if you have two departments to manage one school there will be friction?—A.—I think it is necessary for the man to have more than primary education. It depends upon what sort of people you are training. If you are training only workmen then it would be very much simpler.

Q.—Your scheme is both for the workmen and the better class of men?—A.—I have nothing to do with the artisan class. I am dealing with the better class of men. I think that men should have passed one of the regular educational examinations. It will depend upon the nature of the school. It would be at least F. Sc.

Q.—What will be the curriculum of this school?—A.—That would combine both, certain of the subjects that are taught at present in B.A. or B.Sc. as well as distinct industrial training.

Q.—At what age would the boys be able to go to that school?—A.—18 or 19.

Q.—If they come to that school at 18 or 19, after two or three years' theoretical training they would be 21 or 22, and they would have to put in practical training in workshops?—A.—Our idea is to have the actual training going during those two or three years.

Q.—If you put them in the workshops they cannot possibly be in the college?—The workshop will be a part of the college. They will be actually doing these things on a more or less commercial basis in the college.

Q.—In England and other places these lads are sent for practical training when they are 16 or at the utmost 17 because the parents think that that is the proper age for them to have that training?—A.—You mean the workmen.

Q.—All the big engineers who come over to this country, mechanical engineers, they begin their practical training just after the school age, about 16 or 17?—A.—They usually begin after they have taken their B.A. They may take civil engineering.

Q.—You are quite right about civil engineering, but what about mechanical engineering?—A.—The mechanical engineer, the civil engineer and the chemical engineer are all about the same. They will take first of all a two years' more or less general training in their college course and in the last two years they have practical training.

Q.—We have received evidence from several experts to the effect that there are two classes. One class goes to the college first and that has not so much practical training and their work is to go and teach. But you want in India primarily men who can work engines, or work as foremen, that is practical mechanical engineers?—A.—The man who is going to do that must be well trained in the whole thing in the first place. A man to be a good foreman cannot be without education.

Q.—He must have some knowledge before he goes there. All these mechanical foremen, managers, loco. superintendents, they start life in exactly the same way. They go to the shops at the age of 16 or 17 and do practical work and attend evening classes and as they learn both the theory and practice they gradually improve their knowledge?—A.—What I think is this, that, if the training is only dependent upon going to the shop and developing there, it limits the number of men who can do it. Only those who can go to the shops and do the work there can possibly get the training.

Sir F. H. Stewart.—Q.—What is your Indian experience?—A.—Very small. I have been only three years in the Punjab now.

Q.—You refer to a scheme just being undertaken by the Punjab University and being worked out by the Forman Christian College. Is that college affiliated to the University?—A.—Yes.

Q.—And who bears the expenses of the scheme?—A.—Our college is at present bearing the expenses entirely.

Q.—It is self-supporting?—A.—What I hope for is that it will be self-supporting or practically so.

Q.—Your idea is that these small factories would be almost entirely for teaching for educational purposes?—A.—Yes.

Q.—Is it not possible that they might be rather misleading and that they might not give a correct idea as to whether an industry would pay on a commercial scale?—A.—They might possibly, but if they were in charge in every case of a foreman or a man who would be a teacher and not a student, then I should think that he could use the students as workmen and show how the thing could be worked on a commercial scale.

Q.—You would say that if these small factories show that a process could be worked successfully on commercial lines, *a fortiori* it would be much more clearly successful on a larger scale?—A.—Yes.

Q.—With reference to the pamphlets that you recommend, do you think that they would be widely appreciated and read?—A.—From the experience I have had with the students I certainly think that they would be.

Q.—These again are for the more highly educated?—A.—Yes.

Q.—You do not recommend that they should be published in the vernaculars?—A.—I do not think so because practically all your information is published in English.

Q.—How would you distribute them?—A.—Through colleges, through the Industrial department or the Commercial Intelligence department.

Q.—With regard to the export services you say that they should be loaned to private concerns which would pay to Government either all or the larger part of the export's

salary for the time loaned. Are the results of the expert's work to be published?—A.—If the private company was paying the salary of the expert I think they ought not to be published if he has worked particularly for that firm. If he went to another firm he should be quite at liberty to repeat the same work in that firm.

Q.—These experts will be Government servants or public servants, and don't you think that the work should be made known at any rate after a certain period?—A.—Yes.

Q.—After one year or two or three years?—A.—Or even longer.

Q.—With regard to the Pratt Institute which you mention can you give us more details? Do they take apprentices?—A.—No. They practically don't have the apprenticeship system at all, and the men that come in there are of two classes, those that finish their high school course, at the age of 18 or 19, and have had a certain amount of practical experience in the industry first of all. The other class would consist of men who have spent a larger part of their college course and go and prepare themselves more particularly to take the lighter posts.

Q.—Do they go through a regular course?—A.—They go through a regular course. It is two years, for instance, in industrial chemistry which includes a certain amount of physics, power transmission, design of machinery, factory design, as well as a great deal of work on industrial chemistry. In that way they do the actual manufacturing themselves on a small scale.

Q.—Is it whole time?—A.—Yes.

Q.—Is that institute self-supporting?—A.—It is an endowed institution. As far as the industrial chemistry goes, the work that they do practically pays for itself.

Q.—With regard to the Imperial Research Institute have you known of any case in which the work of the Imperial Institute has been of service to people out here?—A.—No, I have not known of any case.

Q.—You are afraid that a central research institute in India would be too unwieldy?—A.—It could not be available to the man that needs it most.

Q.—But if you had three or four in different parts of the country each dealing with a particular group of subjects, one with chemistry, one with metallurgy and so on, do you think that would answer?—A.—Yes, particular industries taken up in particular institutions.

Q.—You have personal experience of the working of the scheme at Pittsburg?—A.—Not exactly personal experience, but only through others.

Q.—You believe that it has worked successfully?—A.—I am certain that it works very successfully.

Q.—Is there any institution in this country so far as you know which could do that work now as at present constituted?—A.—What we were aiming at in the F. Sc., that is one of the things that we hope to do.

Q.—Would you confine yourself to a particular group of studies or a particular class of research?—A.—No. We hope to take up six or eight at the beginning and if there is a desire to take up any other we hope to take it up also.

Q.—Is this scheme entirely under you?—A.—Yes.

Q.—Have you got qualified assistants to help you?—A.—We expect qualified assistants from America. It has been held up on account of the war.

Q.—I could not quite hear your answer to the President with reference to industrial schools. Would you not agree that it would be difficult to have two masters?—A.—In that case I would leave it under the Education Department. I am quite convinced that it ought to be a part of the means of regular educational training. You could differentiate between the ordinary education and industrial education, but I think that a man to be of much use in industrial work needs the other education as well.

Q.—Are you aware that that opinion conflicts with many that have been given to us?—A.—No.

Q.—The evidence till now given tended to show that it should be separated from the Education department and put under the Industrial department?—A.—I should like to see a combination of the two, but if it is to be one or the other, I would leave it under the Education department.

Q.—With regard to Government scholarships you are quite clear that they should be reserved for men who have had actual experience in this country of the work for which

study abroad is to be undertaken and have proved practically their initiative and resourcefulness?—A.—Yes.

Q.—You think the scheme up till now has not been so successful as it ought to be?—A.—That is certainly my opinion.

Q.—A suggestion has been made to us that it would be a very good thing if these scholarships were continued after the students return to India to enable them to go round and have an idea of the particular industries in this country?—A.—I should think it would be a good thing except for the fact that the man who would be taking that scholarship all that period ought to have practical experience first, and if he had practical experience first he would practically always go back to the company with which he had been before.

Q.—This extension will be subject to Government control, e.g., the man will not be allowed to idle away his time?—A.—I think that would be a good thing.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—You think that money grants-in-aid, bounties, guaranteed dividend etc., should not be given because you believe they tend to make the enterprise dependent on some outside body for the driving power necessary for success?—A.—Yes. That might be a little bit strong, but I do feel strongly that too much help is a bad thing.

Q.—Suppose a steamship company is started in the country, which is a new concern and needs a lot of money, do you think that it can compete with the outside world without bounties or subsidies?—A.—So far as the steamship company is concerned I think it should not apply.

Q.—In exceptional cases you are in favour of such aid?—A.—Yes.

Q.—When the central research institute is started, do you think that college researchwork should be carried on there?—A.—I should hope to see the research institute as a definite part of the various colleges, and I do not think it ought to be entirely separate because its qualified men should come from the colleges.

Q.—Do you think that college boys should be admitted into this institution?—A.—Yes.

Q.—And research work should also be continued in the colleges?—A.—Yes.

Q.—Do you think that the industrial schools ought to be under a dual-control?—A.—Yes.

Q.—You may have a combined body. But who would be the head—the Director of Industries or the Director of Public Instruction?—A.—I should think a third man altogether may be elected by themselves or otherwise.

Q.—You say, "While receiving such scholarships the men should be directed by Government as to the place where they should study, and the work they should do. Particularly do such men require help in being placed in factories at home." Do you think that home factories will take them? What is your experience? Do you think if a student is sent from India to America to learn in some specialised work the factories in America will take him?—A.—I think the students will be taken in certain factories. In the larger factories they can be taken. The factories should only realise that by having the students they will increase their business with India.

Sir F. H. Stewart.—Q.—Does the Government give any direct aid in America towards industrial development?—A.—No.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Forty per cent. import duties is quite enough.

Mr. C. E. Low.—Q.—Have you any idea as to the kind of chemicals that may be made by hydro-electric power in connection with the Salt Range in this Province?—A.—Alkali for one in connection with many other products—sodium hydroxide.

Q.—Has the electrolytical process for that proved itself?—A.—Decidedly. It makes a very much purer product. It is easily obtained and works out just as cheaply as the other.

Q.—I was under the impression—I may be wrong—that the existing process rather holds the field at present. Are they doing anything in other parts of the world than England, with electrolytical process?—A.—They are using it a great deal more in America and Germany than before.

Q.—When you refer to alkali you refer to—?—A.—I refer to sodium hydroxide and sodium carbonate.

Q.—Do you think that it would be able to compete with the soda imported from Magadi?—A.—I do not see why it should not.

Q.—You have not studied the relative prices?—A.—But still you pay freight and carriage all this way and I should certainly think it could compete.

Q.—There is lime there, but not coal?—A.—There is a certain amount of coal at Dandot.

Q.—Don't you require pure carbon for calcium cyanamide? What about charcoal? That would be too expensive?—A.—I do not think it would. Of course, for those purposes ordinary sawdust works just as well. In the cyanamide process they usually use sawdust.

Q.—Have you carried out any investigation here with reference to the production of wood charcoal by dry distillation?—A.—Yes.

Q.—Do you know whether there is any locally-worked-out information on the subject?—A.—No.

Q.—In connection with the results obtained by the expert loaned to a private company, the only thing that the company get when they pay for the man is the atmosphere that this man works in, but in this country they will get the selection value of the man whom the Government have selected and his facilities for making research and so on, whereas in the other case the company will have to fetch a man and pay a higher rate?—A.—The company is getting more than in the other case.

Q.—Have you considered the idea of specialised research institutes in different parts of India in contact with the industries there in actual working. Say, for instance, a metallurgical institute at Sakchi where you would carry out metallurgical research and the Sakchi works would be available both for the presentation of research problems and for testing the solutions on a commercial scale and also for the training of students at the research institute?—A.—Is it not a little bit previous?

Q.—We had specific proposals put before us to that end by very responsible people in connection with those works?—A.—That sort of thing is being done at another place. Take the General Electric Company. Their school is practically the best electrical school in the country.

Q.—That is their school. But this thing at Sakchi would not be the Tata Iron and Steel Company's school but would be a Government institution with the assistance and support of the company. It might be concerned with metallurgical problems, not only on iron and steel going on there, but also on zinc and copper, and there is also the question of byproducts and the treatment of refractory furnace materials, and all these things would be going on either absolutely on the spot or within a very short distance, and that would at any rate have the result of keeping the problems to be investigated very closely before the eyes of the local research people and it would enable them to pass their young men through the shops?—A.—If such institutions would mean helping other companies, I should think it would be a very good idea.

Q.—It is not a private institution but quite the reverse?—A.—One should think that the individual company should do that work for itself.

Q.—The individual company is concerned with iron and steel and to a small extent with the byproducts, but the other companies will have these other matters?—A.—I certainly think that would work very beneficially.

Q.—Turning to this question of small factories, it has been placed before us very strongly that it is absolutely necessary in India owing to the conditions which obtain here for the time being to pass the men who are going into industrial life through the shops and that the industrial atmosphere which exists in Europe and America does not render the same thing such an urgent necessity as it is here. One is inclined to wonder whether the small factories you propose would provide the necessary atmosphere. Would the working of the small factories be continuous?—A.—It ought to be continuous.

Q.—Do you think it could be arranged in such small factories?—A.—I would certainly think that continuous working could be arranged for.

Q.—The impression we have got from one or two of the very few small factories that we saw run under Government was that it did not seem to give the same shop atmosphere, working in the most economical way as regards labour, time and material which

gives the man a kind of eye for the job which is wanted for a foreman or chargeman ?—
A.—My idea of these small factories is that they would give just that training. In the Pratt Institute what is done is this. A group of managers is assigned to one particular industry. Suppose they make soap. They go on for a month or so doing that and nothing else in that part of the work, and by turns they become foreman and the other foremen become workmen, and they are asked to make so much toilet soap of the given description and the foreman gives his directions and assigns work to the other men and they see how well and economically they can carry that out. It seems to me that is just the sort of training that is needed.

Q.—That seems to postulate either a considerable power of independent thought on the part of the students or a very careful and highly-organised skilled supervision from above ?—*A.*—I certainly do not think that any of these schemes can be worked out unless there is independence of thought on the part of the men going into them, and unless a man has got that initiative and independence of thought I do not think he can make a success.

Hon'ble Pandit M. M. Malaviya.—*Q.*—You say in your written statement that Government ought to assist industries by lending money to them. Would you prefer direct loans being given to industries or loans being given by some bank which the Government would assist ?—*A.*—I should think that some sort of an industrial bank, practically a Government concern, should be formulated to handle that sort of business.

Q.—The managers of the bank will have some experts to guide them in selecting what industries they should help ?—*A.*—Yes.

Q.—You say that pamphlets dealing with definite industries showing the raw materials necessary, their cost and sources, etc., would be much more useful than costly factories run by Government. Is that the system which is widely pursued in America, supplying information through information bureaux ?—*A.*—No. It is not very widely used there in industries, but it is increasing. The conditions are so very different that they are really not needed.

Q.—You speak here of demonstration factories being run as part of a technical institute. You think that if there are such factories, they will give opportunities to students, after they have received instruction in the principles or the theory of an industry, to have sufficient practical training in working the particular industry ?—*A.*—I certainly think it can be arranged in that way.

Q.—In order to make students work with a view to economise time, labour and material, you think that special marks should be awarded to them for work done in a satisfactory way, taking into account the time in which the work is finished and the quality of the work which is turned out ?—*A.*—It will have to take all those facts into consideration in making its report of what he had been doing, and they would of course count in favour of the student if it came to the question of marks ; but I do not think that very much would be accomplished unless the men are actually doing it for the sake of doing it, and not for the sake of getting marks.

Q.—Anyhow, you think that these conditions could be established in these small factories ?—*A.*—I certainly think that they can be with the additional value that the man can try things in two or three different ways.

Q.—So that this is a special advantage under the system you propose that the students will draw upon their own resources and will have to find out ways of working out things ?—*A.*—They will have that opportunity. I would not exactly say that they would be able to go ahead, but they would try different ways of making soaps, say, and if they could think of any possible refining they would have an opportunity in such a factory of trying it, whereas in ordinary factories they would probably not have.

Q.—Have you prepared any regular scheme of which you speak in the written statement ?—*A.*—We have a scheme for it.—It has still to be tried.

Q.—Can you send us a copy* of it ?—*A.*—Yes.

Q.—You say, " It seems to me that the biggest need at present is not a lot of very advanced research on this problem or that, but the actual training in the fundamentals necessary to operate a factory properly " ?—*A.*—Yes.

Q.—You think there is need primarily for making the results of research already done widely known among the people here and then following it up with research such as

* Not received at the time of going to Press.

you have suggested?—A.—Yes. It is a question of spreading a knowledge of what has been done in the many years past rather than of any particular research work now.

Q.—You say that a better education than mere primary education is necessary to improve the labourer's efficiency. What have you in mind?—Do you mean that there should be an industrial turn given to education from an early stage, in the elementary stage, for instance, by introducing drawing or manual training?—A.—I certainly think that that has got to be done. It seems to me that primary education alone would not greatly benefit the man.

Q.—Unless you had this special feature in it?—A.—But then after that, it seems to me he needs greater education than that.

Q.—But do you think it will be an advantage to all students, whether they are going to be industrialists or not, that they should have a little drawing and a little manual training introduced in the early stages of their instruction?—A.—The students that come to the laboratory—many of them have not been sufficiently trained in the control of their fingers, and that training only comes from taking up carpentry or clay-work or weaving as part of their general education from the very beginning.

Q.—The main reason for your recommendation for a joint-board to control the industrial schools is that a larger number of students is likely to be drawn if they are connected with the Education Department than if they are not. Am I right in thinking so?—A.—Partially. It is more, however, that the education should be sound education. I mean to say that I do not think that merely industrial education is at all valuable. That is too strong. It is valuable but it is more valuable if it is a part of, or if it has along with it, general education which would give the man the ability to profit by the industrial education better and make him more qualified in every way.

Q.—You have spoken of the industrial schools here. You said in answer to Sir R. N. Mookerjee that you think that the students might join the schools at the age of 18 or 19?—A.—Yes.

Q.—Am I right in thinking that you were referring to the higher technical schools such as obtain in Germany, Japan and America?—A.—Yes.

Q.—Of the college standard?—A.—Yes.

Q.—They are not of the school standard there?—A.—No. I am referring more to the college standard.

Q.—It is in these higher technical schools that you would give education of a higher kind for training managers and supervisors?—A.—Yes.

Q.—Rather than workmen?—A.—Yes.

Hon'ble Sir R. N. Mookerjee.—Q.—You have no experience of Japan or Germany?—A.—No.

Hon'ble Pandit M. M. Malaviya.—Q.—That is why I brought America in. In industrial schools where you train workmen you would give school education with a distinctly industrial turn, with carpentry, smithy and other things, elementary chemistry, elementary physics and all that?—A.—Yes.

Q.—You recommend that such industrial schools for workmen should spread over the province generally?—A.—Yes.

Q.—And there will be these higher technical schools of the college grade in special centres? It might be only one school to start with?—A.—Yes. It seems to me that if a lot of these things were put in the regular educational system that would accomplish what is desired. In the ordinary public school where I took my course in America we had a good deal of wood-working, making all sorts of things useful and not useful. We had iron work, both lathe work and foundry work. We had pottery work and we made candlesticks, and we had a small amount of weaving but still we had some training in it, and we had of course drawing and things of that kind. Everyone underwent that course. It was not only for the man who wanted to go into industries, but everyone took it as part of the general training which would fit him for future work in anything.

Q.—Judged from your experience of what you yourself went through and what you see of the school education being now given here, you think it would be a distinct advantage

to the youths of the country if they had a system such as yours where industrial training is combined with the general education?—A.—Yes.

Q.—It will draw out and develop intelligence better and character better?—A.—And independence better.

Q.—You refer to the system of scholarships for instruction abroad?—A.—Yes.

Q.—You say it could be extended. Am I right in thinking that you mean that the number should be increased subject to the safeguards which you have suggested?—A.—If there is need for them I should think they should be increased.

Q.—You say that those alone who have had actual experience in this country of the work for which study abroad is to be undertaken should be selected. I think that is one of your cardinal recommendations?—A.—Yes.

Q.—If they are so selected there would be a guarantee that they would make good use of the scholarships given?—A.—Yes.

Q.—And then you want that their work should be supervised and they should be helped in getting into factories in places where they go for their education?—A.—Yes.

Q.—We have been told that there is great difficulty in getting admission for our students in factories. Can you tell us how things are in America?—A.—There is a great difficulty in getting a man into the factories unless they get into them through definite institutions. For instance, in leather work it is perfectly possible to get a student into a tannery in America through the Pratt Institute, and the students are allowed into the various tanneries to study conditions there. Also most of the companies of any prominence at all are quite willing for the different Universities to have their men go round and spend a short time there to study and see how things are being done. Of course, they would not throw open to them everything, but for the ordinary run of things they would permit it.

Q.—They do not make any restriction? Do you think they will take in a large number of students?—A.—They only can take a small number, but there are so many different companies doing the same thing that a large number can be taken.

Hon'ble Sir R. N. Mookerjee.—Q.—You yourself had no practical training in any workshop?—A.—Beyond what we had in school?

Q.—As a chemist had you any opportunity of going and having a practical training as the mechanic or engineer has?—A.—I have had training in a chemical company.

Q.—No practical training on the mechanical side?—A.—No.

Q.—All that you told us is your opinion and not from your experience?—A.—Yes.

Hon'ble Pandit M. M. Malaviya.—Q.—I suppose by that you refer to what you have said about mechanical training and not generally to what you have told us about the system of education that obtains in America?—A.—The system of education is certainly from my personal knowledge.

Hon'ble Mr. H. J. Maynard.—Q.—As a method of inducing foreign factories to take Indian apprentices, do you think it will be a good thing to make it a condition of Government custom that Indian apprentices should be taken by the factories concerned?—A.—With a condition of that kind the man would not get the best training. They will say, "We have got to take that man and we shall give the least that we can." It seems to me that they should realise that by allowing Indian students to come there and study they will really increase their business rather than decrease it. If a man goes to any company at home and studies their methods and so on and comes back here in order to set up the same sort of thing, it might decrease slightly their business here, but I should think very much more likely that it would be increased because he would be a big enthusiast for that company—that company being the company in which he studied—and whenever it came to a question of comparison he would be a walking advertisement for that company in this country, and I should think that his study there and starting the same industry here would tend rather to increase the demand for the particular product and therefore make a larger business possible for the company as well as for himself than in any way spoil that company's business here.—That is my opinion.

Mr. C. E. Lowe.—Q.—Is any difficulty raised by labour as opposed to employers? Do they object to Indians being taken in the factories in America?—A.—No. The labour would not object.

WITNESS No. 379.

RAI BAHADUR GANGA RAM, C.I.E., M.V.O., Lahore.

WRITTEN EVIDENCE.

The only industry of which I have had practical experience is cotton-ginning and pressing. Banking facilities.

In banking I have had a little experience as Chairman of Marwar Bank, which went into liquidation during the great banking crisis. As Chairman of this bank, I came into contact with several small industrial concerns.

Speaking generally no industries can be started or kept going without financial help from banks, and no banks can prosper in this country unless they get substantial financial support from Government.

The last banking crisis has taught us a lesson that strict Government control is required to win the confidence of the people, and to prevent frauds and misfeasance. Yet the growth and spread of indigenous banks is absolutely necessary, as they alone can reach the masses.

In order that the defects of indigenous banks which recently came to light may not be repeated, I propose the establishment of one Central Industrial Bank in each province. These central banks should be semi-Government institutions, with Government share in them, Government Auditors and Government Directors on Board. The Provincial Industrial Bank should be fed by Government who should advance money at 4 per cent. They should also receive deposits at 4 per cent. These provincial banks should act for the purpose of banking, as provincial university acts for education. All indigenous banks should be affiliated to the Central Bank, who should have full control over them. The Provincial Industrial Bank should advance money to indigenous banks subject to proper safeguards at 5 per cent, and the affiliated banks should be left to deal direct with trades and industries. The indigenous banks should be prohibited from giving more than 5 per cent. on deposits. Once this principle is adopted details can be worked out.

Now remains the question as to the source from which Government should feed these banks. For this subject I submit a novel scheme of the redemption of land revenue, which I fully explained in my pamphlet "The Agricultural Problems of India."

I venture to send 10 copies of this pamphlet* for the perusal of the Members of this Commission. If these central industrial banks also adopt the method of issuing receipts for deposits bearing interest at 4 per cent, compounded half-yearly, they will draw a good part of peoples' money.

Unless Government resorts to this source of collecting funds, their own ordinary sources will never be able to spare sufficient to finance the industries, whereas my method will solve the following problems:—

- (a) The great problem of agricultural improvements.
- (b) The great problem of banking.
- (c) The most important problem of winning the sympathies of the masses for the permanence of British rule, as there is no surer and firmer foundation for loyalty than self-interest.
- (d) The problem of the rectification of the mistake, if it may be so called, of giving permanent settlement, as under my system Government will get an increase of 25 per cent. over their present figure every thirty years.
- (e) The problem of unearthing the hoarded money, if there is such money anywhere.

Convinced as I am of the unlimited potentialities of land, such zamindars as are tillers as well as landholders, such as there are in the new colonies of the Punjab, will produce money by intensive cultivation from the land, especially if they are given the facility of payment in 3 years (better 5) with interest at 6 per cent.

If such a system was tried with caution, for areas not exceeding say 100 acres, in the new colonies, I am sure the Government can safely count upon 5 crores (5 lakhs of acres at Rs. 100 an acre) in Punjab colonies alone which they can set apart for industrial concerns.

Having briefly given my views on the method of banking and the sources from which funds could be obtained, there remains only one thing which has brought industrial

development to continental countries, United States and Japan. This is the power of regulating our own tariff of Customs. But as this matter is left out of the scope of the Industrial Commission, I will say nothing beyond mentioning the fact that it is at the root of all industrial progress, and wishing that the Commission could exercise the influence of their good offices with the Home Government, to allow India to impose such duties for the articles consumed in India, and to the extent to which such articles are consumed here. Any surplus manufactures which would have to be exported might be subject to countervailing duties. Our first attempt should be to supply our own wants without going to foreign markets. At present there are hundreds of things required by us, of which raw materials are exported from this country and are reimported after manufacture from foreign countries. I would have no objection in this respect to give preferential tariff to Great Britain, provided we received reciprocal treatment.

Capital.

Q. 3.—Cotton-ginning and pressing in the Punjab is being overdone in places, so much so that the factory-owners find themselves under the necessity of resorting to combinations in various forms, like the pool system, joint-purchase, etc., etc. This enables them to make some factories shut down and earn their profits from such combination funds. This is a system which should be discouraged and if necessary prohibited by law, because the producer pays for the factories lying idle.

No cotton-ginning factory should be allowed to be started in future without the sanction of the Director of Industries, who should see before according sanction whether the produce of cotton in the district justifies a new factory, 1,500 maunds of *Koppas* or one hundred bales of lint per machine should be the standard.

Government assistance.

Q. 5.—From amongst the several methods of giving Government aid, given in this question, I do not recommend any except the hire-purchase system on sufficient security, and with Government lien on the factory till Government debt is discharged. But the trouble, I can say from experience, is not to find capital for starting a concern but to find money at reasonable rate of interest for the working capital. Government can greatly help in this matter, if money is advanced on the security of landed property, and house property under adequate margin.

Co-operative societies.

Q. 18.—Co-operative societies should be established and encouraged for cottage industries, such as—

Envelope-making.

Sock-making.

Weaving.

Lace-making.

Rope-making.

These societies should supply raw material (in case of weaving and sock-making yarn), and take finished products. They should either buy the finished products outright or advance money against them and then settle amounts after sale.

Demonstration factories.

Q. 19 & 20.—In the Punjab a demonstration factory of cane-crushing by an oil engine and making gur is very necessary. There is a factory like this in Poona.

General spread of such factories all over the province will give a great impetus to the cultivation of sugarcane just as cotton-ginning has done to the growth of cotton. Refining factories for making sugar out of gur will then spring up at chief centres.

Research abroad.

Q. 21 & 22.—I get the *Bulletin* of the London Institute. It gives valuable information. It is enough for all research work required in the United Kingdom.

Technical aid to industries.

In the V. D. J. Hindu Technical Institute, Lahore, of which I am the President, we have established a research branch with a grant given by Punjab Government and for the last eighteen months have been investigating the recipes for different small industries, and have been teaching the public. I enclose a list of small industries which we have succeeded in making, and when the Commission comes to Lahore I would like them to pay a visit to the Institute.

These are small industries of a general nature, and a few of them are such as can be taken up as cottage industries. We have been trying to teach them free of any charges, but so far only three or four of them have been taken up—not for want of inclination or capital (as very little is required), but for want of organization. In this respect Government aid might prove useful. The commercial museums should be established all over the country, there should be a central one for a province, with branches at the headquarters of each district.

Assistance in marketing products.

Government assistance is absolutely necessary for the marketing of products, and a Government trade representative should be appointed to boom such products.

In order to do this successfully, all Government Departments should be warned, especially the Railway Stores, the Public Works Department, the Army Stores, the Medical Stores, the Government Stationery Department, that their requirements should be advertised freely for six months in the Trade Journals before indents on England or other countries are passed. There should be one central buying agency for all provinces, like the Munitions Board recently started by Government, to whom all applications for stores should be made.

There should be a Government analyst in each province who should give his advice free of charge on the analysis of a product.

Q. 43.—Acquisition of land for industries should be defined as a *public purpose*. Land policy.
for the application of Land Acquisition Act.

Training of labour and supervision.

Q. 44.—Primary education will greatly help the industrial development, it will train the brain to understand things better, but the primary education should include a little drawing and use of scales.

Q. 44 (a).—My practical experience is rather unfortunate. I have seen sons of artisans and sons of labourers employed in industries, if sent to school, get a sort of abhorrence to manual labour, and generally end in seeking employment as chaprassis, gate-keepers on canals, or forest guards in the Forest Department. On such post they get good perquisites over and above their pay and have practically easy life. But of course it is undeniable that a little education, especially if it is attended with a little drawing, even to the extent of the use of scales, goes a long way towards opening a workman's mind. The present syllabus of primary education will have to be considerably modified for the workmen class.

Q. 46.—The only experience I have had is as President of the Hindu Technical Institute. Facilities are badly needed for training in factories and workshops. But my experience is that private factories won't take such apprentices for fear of their spoiling the articles and tools entrusted to them, moreover there is the important question as to who should give subsistence allowance to these men. Government might help in this respect. Apprenticeship system.

Q. 47.—The industrial schools under the Department of Education established so far in the Punjab, are absolute failures. Industrial schools.

Q. 50.—The industrial schools should be under the control of the Department of Industries, but should be allowed to remain under the management of the Department of Education. In fact, both departments should pull in harmony and unison.

Q. 54.—There is no uniformity at present, but it is very desirable; and the certificates obtained in one province should be recognised by other provinces. Mechanical engineers.

General official administration and organization.

Q. 56.—None in the Punjab.

Q. 57.—Director of Industries, separate from Director of Agriculture, should be appointed in the Punjab, without any further delay. There should be a Board of Industries. It should have executive and controlling powers.

Q. 60.—The Director of Industries must be an official with business habits. I don't see how a business expert can advise on all industries.

Q. 61.—The Director of Industries should be an *ex-officio* Member of Legislative Council and Secretary to Government. The importance of this department should be recognized.

Q. 62.—There must be an Imperial Department, the Director-General of Industries, so that the activities of several provinces could be correlated.

Q. 62 (a).—Cottage industries should be one branch of this department. Cottage industries.

Q. 62 (c).—At present I see no other except—

(a) Making socks and banians.

(b) Envelope-making.

(c) Weaving cloth from yarn.

Other forms of Government action and organisation.

Certificates of quality.

Q. 89.—For textile manufactures, some sort of hall-marking system is absolutely necessary. Details have to be worked out, but there is no doubt that the indigenous manufactures in the textile line (cotton, woollen, silk or embroidery) are dying out simply for want of uniformity and honesty.

Adulteration.

Q. 91.—Ghee and other articles of food should be preserved from adulteration, and penalty should be imposed under proper safeguards against abuse of power.

Q. 94 & 95.—There should be some sort of Government organization in each province who should undertake to write specifications and to furnish necessary drawing and to go through the formalities required by the Act, which, in itself, is faulty inasmuch as it requires the patentee to say too much before provisional protection is given. For the purpose of granting provisional protection, the Patent Law should be simplified.

Q. 96.—No.

Railway rates.

Q. 98.—The railway freights to seaports are reasonable, but they are very heavy for internal trade. It costs one about as much to send his wheat 800 miles to seaport as to send inland 200 miles. This mere fact reacts on agriculture inasmuch that it hinders people from growing things on economical lines. It also reacts on the supply of districts where there is some scarcity from districts having a surplus. Regulation of rates should be under a Board on which trade representatives should have a voice.

Q. 99.—Proposals are to extend feeder railway in Punjab on 2 feet 6 inches gauge. This is a sad mistake, it must be either 5 feet 6 inches gauge or cheapest (2 feet gauge) like the one I have from Buchiana to Gangapur.

Freights.

Q. 101.—Oil industry is very much handicapped for want of suitable waggons and ships to carry oil in bulk.

Oil industry is the one industry which requires to be greatly encouraged, because we want cakes for cattle and for manure. It can be immensely developed if Government adopted the suggestion of making tank-waggons and ships, and also if a pioneer industry was established for making tins.

Jail competition.

Q. 109.—There is unnecessary hue and cry raised against Jail competition. In my opinion Jail industries are very good training schools for labour which would otherwise remain a drag on society, and turn into confirmed brutes. I have observed the Jail administration for nearly 20 years of the period of my service. I have always been of opinion that it is a mistake to give prisoners hard labour like wheat-grinding. It has no deterrent effect on habitual convicts. Encouraging small industries in Jail would have great civilising influence on the criminal population, and a little training in any particular industry will train their mind and hands to industrial labour. But for the carpet-weaving started in Lahore Central Jail, there would have been no carpet industry in the Punjab. It was Mr. Blake, Deputy Superintendent, Central Jail, who on retirement from service carried the experience of carpet industry in the Lahore Central Jail and caused the establishment of a carpet factory in Amritsar.

Carpet-making, printing, brick-making and chintz-printing: These are very good industries for the Jail population.

There is one idea which will greatly foster the establishment of new industries. This is that some sort of protection in the form of Patent Law should be introduced by which a person starting a new factory should be given a few years' start before the special industry is thrown to public competition. I would give any one starting a new industry in a particular place to have the right of claiming that no one else in a radius of fifty miles or so be allowed to start a similar concern. The Director of Industries should be given some power in this respect.

Witness here gave confidential evidence.

ORAL EVIDENCE, 14TH DECEMBER 1917.

Hon'ble Pandit M. M. Malaviya.—Q.—You have given us a very valuable note, and therefore I will not ask you many questions. But there are just a few points which need to be elucidated. And first let me ask you about your Bank. You say here that you were Chairman of the Marwar Bank. Will you kindly tell us why it went into liquidation? We are told it has paid 16 annas to depositors.—A.—To all depositors, yes.

Q.—Why was it that it went into liquidation?—A.—Owing to the general storm.

Sir F. H. Stewart.—Q.—Has it been finally wound up?—A.—No, we still have assets and hope to pay a large part of the shareholder's money.

Q.—Is there any hope of reconstituting it?—A.—I would not have anything more to do with it. I was simply driven into it somehow. I am not going to be a banker any more. I have often been approached by shareholders, as well as depositors, to re-start the Bank. I told them that I would not have anything to do with it.

Hon'ble Pandit M. M. Malaviya.—Q.—You have paid 16 annas to depositors and you say you hope to pay the shareholders a certain proportion.—A.—A good proportion. It all depends, if we can recover the decrees; we have got decrees but cannot recover them through the kindness of a few lawyers.

Q.—Is it the lawyers or the law that stands in the way.—A.—Well, one thing or the other.

Q.—You say here that you think "the growth and spread of indigenous banks is absolutely necessary, as they alone can reach the masses." Therefore, you recommend the establishment of an industrial bank in each province, with branches in different districts?—A.—The other banks need not be branches, but they should be affiliated; that is to say, they should conform to the rules and regulations and some control, just as a university has control of all schools. The schools need not be branches of the university, but simply affiliated to it.

Q.—What Government help would you recommend should be given to this central industrial bank in the shape of shares purchased?—A.—There ought to be a certain amount of interest, just as much as Government has in the Banks of Bengal and Bombay to enable them to appoint their own Directors. The Government should advance them money at a low rate of interest, so that the industrial bank should also be able to advance money to others at a low rate of interest. What really killed the indigenous banks here was the high rate of interest they were paying to depositors, and without that high rate they could not draw the money.

Q.—Do you think you will get many other banks to be established, if there was one such central bank in the capital of a province?—A.—I think so.

Q.—You expect that private capital would be invested in these banks?—A.—Private capital would be drawn and confidence would be restored.

Q.—And now as regards this novel scheme of yours about the redemption of land revenue; it seems on the face of it an excellent scheme. But do you think that people will be willing to pay the necessary price to acquire a permanent revenue-free proprietorship in the land on the plan that you have suggested?—A.—I think so. Whomever I have talked to seemed to be very eager to avail themselves of the opportunity of becoming proprietors of land. They say that improvements in land are simply retarded on account of the dread of settlement which hangs over their heads.

Q.—Are you speaking of peasant proprietors or of zamindars?—A.—No, not of very big zamindars, because I have no experience of them. We have none in the Punjab; but generally of peasant proprietors.

Q.—You expect that in all parts of the province people will welcome such a system?—A.—Yes, but I recommend it being started with caution and from the bottom. I do not recommend that its advantages should be given to big zamindars to start with; but it will be a very great boon to the peasants who are small landholders.

Q.—You expect very great results from this, both in the prosperity of the country and in revenue to Government? Is there any alternative system which you have to suggest for securing the same amount of interest in land among cultivators?—A.—That is a very long question. I cannot say offhand.

Q.—You say that "cotton-ginning and pressing in the Punjab is being overdone in places" and that already the remedy is being found by the pooling system.—A.—It is not a remedy. People had to fall back upon it.

Q.—Don't you think that this will solve it?—A.—It is rather an evil not to be encouraged, because really the cost of the pool falls upon the producer.

Q.—Do you not think that this would solve itself in the natural course of things; or do you think it is necessary to take special steps to check it?—A.—I think it ought to be discouraged by every means possible.

Q.—You have spoken of co-operative societies being established to promote industries. Do you refer to hand-loom weaving?—A.—I am not certain whether it should be restricted to hand-loom weaving. My own opinion is that a small-power-machine weaving will pay in the end much more than hand-weaving; for instance, Huxley's weaving mill started by, say, one or two horse-power engine will prove in the end much more economical than hand-weaving. There is very great room for it. If yarn were supplied to the people, and if their products were taken, the co-operative system could be brought into action in this way.

Q.—Is not the Punjab distinguished even now for its weaving industry for its silk and woollen manufactures?—A.—Not particularly silk, but shawls, etc.

Q.—Is there not a good deal of trade in hand-loom cotton weaving?—A.—We use a large quantity of the products of the mills in Ludhiana.

Q.—If you have co-operative societies to help in this direction, you expect there will be a great development in hand-loom weaving in the province?—A.—Yes.

Q.—You say here: "We have been trying to teach them free of any charges, but so far only three or four of them have been taken up—not for want of inclination or capital (as very little is required), but for want of organization."—A.—That is my information. The boys, who come and learn these things, simply say: "How are we to put our products in the market?" That is their difficulty.

Q.—The difficulty is in the way of marketing?—A.—Marketing and booming, i.e., bringing the things to the notice of the public.

Q.—You speak of the need of yarn here; don't you think you could produce your own yarn more largely than you do at present? You produce a good deal of cotton?—A.—Yes.

Q.—Where does it go to largely? It is not consumed in the province?—A.—Generally all to Bombay.

Q.—What is it that stands in the way of your making your own yarn in this province?—A.—The competition of the foreign yarn, and of Bombay yarn, and also the lack of trained labour. A spinning mill here depends upon labour imported from Bombay and elsewhere, which necessarily becomes more expensive.

Q.—But your cotton goes to Bombay and probably to Japan and other countries, and if they can spin yarn and make a profit out of it by carrying it such long distances, you should be able to do it here?—A.—In cotton-spinning the foreign element greatly comes into operation. The price of yarn does not keep pace with the price of the cotton; the price of

yarn depends more upon the output and upon the demand from China and other places. I don't think in the Punjab, unless the yarn is produced for local consumption, it can ever compete with the yarn consumed in Bombay. We will have to compete with the yarn that Bombay sends here.

Q.—Do you want protection for that?—A.—No, I don't want protection for that.

Q.—Then how do you want to get over that competition?—A.—I am afraid I am not quite competent to give an opinion on that.

Q.—You suggest Government assistance in the marketing of products. Don't you think that that work could be done by co-operative societies?—A.—Yes, it might be, but I want Government assistance in helping us in putting before the public what the Government needs, or in what the Government needs are greatest; and if we can even supply Government needs, that would give a great impetus to the spread of products elsewhere.

Q.—You want Government patronage for these products?—A.—Yes.

Q.—And an advertisement of Government's needs, in order that people may be encouraged to produce the goods?—A.—Yes, that people may know what is certain to sell.

Q.—You suggest that railway stores and other departments should be told that their requirements should be advertised. That should be made a rule, that each of these departments should advertise their requirements?—A.—Yes.

Q.—At present that is not done?—A.—Not usually.

Q.—You suggest one central stores department in one province. Don't you think there may be a danger of partiality to some provinces? Do you think one Stores Department for all provinces in India would be quite sufficient, or would you want a Stores Department in each province?—A.—A Stores Department in each province under a central Stores Department.

Q.—You suggest that "the present syllabus of primary education will have to be considerably modified for the workmen class." In what direction? In the direction of giving an industrial turn to education?—A.—Yes, industrial and commercial.

Q.—Drawing and manual training, and a little elementary chemistry and physics?—A.—No, only drawing and manual training. Once you introduce other subjects you don't know where you are. I would confine it to elementary drawing chiefly.

Q.—Are there many industrial schools in the Punjab?—A.—There are a good many attached to different schools.

Q.—Why have they failed?—A.—Simply because they are trying to teach things which it is impossible for a boy to learn. To begin with, they start boys of the upper artisan class with carpentry. Unless a man is born a carpenter, he cannot be a good carpenter. Such is my long experience.

Q.—You think that the selection of the boys is to blame?—A.—No, but instead of wasting their time in teaching them carpentry, if they taught them drawing, or some elementary thing, which would open their minds to grasp details of anything of the industrial line, that would be much better.

Q.—You speak of the handicap of the oil industry for want of suitable wagons and ships to carry oil in bulk. Has any representation, to your knowledge, ever been made to Government about it?—A.—No, I don't think so; but it is a most important industry, which should receive immediate attention.

Q.—What is it that stands in the way of its being developed?—A.—Simply because we cannot export oil in any economical form.

Q.—Otherwise you think the capital would be forthcoming to take up this industry?—A.—Yes, and it would help agriculture immensely.

Q.—You suggest that anyone starting a new industry in a particular place should have the right of claiming that no one else in a radius of 50 miles or so should be allowed to start a similar concern. —A.—That is my experience. If anyone starts a new industry, people are inclined rather to copy it than to try and discover something new for themselves. First of all they go and watch how much the man makes, then try to steal his workmen and copy the industry. It is a mere suggestion. I am not prepared to give details about it.

Q.—It is not a thing you insist on?—A.—No.

Hon'ble Mr. H. J. Maynard—Q.—As regards fuel, I think you mention the fact that fuel is more or less exhausted?—A.—Yes.

Q.—Do you know that about 40,000 acres of irrigated plantation have just been established by the Forest Department, in order to meet provincial requirements?—A.—I shall quote, if I may, the authority of Booth-Tucker, who has had considerable experience of this. The Forest Department would not deviate from the old lines, and would not try to discover anything which may be more conducive in bringing about the desired results. Booth-Tucker's own expression—he gave me this information—is: "I am going to try on my own land. There is a certain class of eucalyptus which can be grown in 5 years, which makes very good fuel, and which is grown in Australia." I asked him: "Why do you not suggest to the Forest Department to grow this?" He replied: "Whoever heard of the Forest Department trying a new thing?"

Q.—But still you do know that 40,000 acres have been put under fuel, with the object of meeting fuel requirements of the province?—A.—Yes, that is why I mention that if they went about it in the right way, perhaps that 40,000 acres would go long enough; but if they simply put in the old-fashioned things, it would not bring any better results.

Q.—You mean the growing of shisham.—A.—Yes, and those other things in the Changamanga Forest. If you give me that land, I will give you twice the money they are realising. They are not producing fuel enough for that area. I would buy for that twice the amount of coal.

Q.—We were told by a witness the other day, in connection with this matter of wood, that he wanted mulberry wood, and had great difficulty in getting it.—A.—I was present here, and was glad to get that information from him. There is absolutely no difficulty in growing mulberry. It is the fastest growing tree. Zamindars don't grow it because it invites birds; but it can be grown in groves to any extent you like.

Q.—And you yourself are prepared to take it up?—A.—I am. I would recommend that the Director of Agriculture should issue bulletins, and if there is any demand, we shall be very glad to grow mulberry in groves. It is a very fast growing tree and gives a good shade, but it is not a favourite tree with zamindars.

Q.—I see you have made some remarks about oil: you were speaking of vegetable-oil?—A.—Certainly.

Q.—As regards that question of purchase of land revenue, commutation of land revenue, I thought there was a little misunderstanding in what you said. Of course the ordinary cultivators in the province are already proprietors, except to a small extent, in the canal colonies.—A.—In the canal colonies they are all full proprietors now. Of course they pay land revenue.

Hon'ble Pandit M. M. Malaviya.—Q.—I understood your scheme to mean that after they have paid the price of the land, they will not have to pay land revenue?—A.—The price of redemption. They are already proprietors of the land.

Q.—But they have to pay revenue year after year? Your proposal is that they should pay for say, 30 years' revenue and should never be asked to pay revenue again. That is what you mean by their becoming proprietors of land?—A.—They are proprietors already. They only buy up the Government right in the land. The land revenue is supposed to be a share in the produce of the land.

Hon'ble Sir R. N. Mookerjee.—Q.—Only for surface rights, not for minerals?—A.—No, you can reserve the mineral rights.

Hon'ble Mr. H. J. Maynard.—Q.—I think you said that this would cause them to take an abiding interest in the land. Don't you think that they take an abiding interest in the land already?—A.—They do not, my experience and also my information from good sources are that generally it takes 5 years to do the settlement, and when the settlement period is coming to a close, 5 years before that, they begin to lose heart, and try to produce as little as possible, so that the next 5 years he does still less, so you lose the potentiality of the land.

Q.—You know that in calculating future land revenue, the average on which we calculate is spread over very much more than 5 years?—A.—So much the more unfortunate, because if they know how many years it will spread over on that date, they will lose heart over it.

Q.—The great disadvantage of a recurring settlement is this feeling of uncertainty, and a tendency not to produce much?—A.—Yes, what I did say was, supposing you give this privilege, it would result in this, that from the same land from which they are producing ten maunds per acre now, I am sure that they can produce 30 maunds per acre. It is only a question of the number of harrowings, and the labour they devote to it.

Q.—Do you think that the amount of labour would be necessarily given?—A.—Certainly, because there would be no Patwari to make a report which would go against them in the next settlement.

Q.—In regard to the matter of sinking wells, do you think the impending settlement has any effect?—A.—Certainly, although I am aware that for 30 years he is protected from enhancement of revenue.

Mr. C. E. Low.—*Q.*—Do you consider that in provinces which are not liable to revision of assessment a great deal more money is spent on improvement of land?—*A.*—No, I can safely say, if I may, without meaning any disrespect to any one, that in permanent settlement there is less attention paid, because the zamindars really take the last drop of blood out of the tenant.

Q.—You propose that the money obtained by the redemption of land revenue should be invested in Presidency Banks?—*A.*—Yes, and in other improvements. I only quoted this as very desirable, as two objects will be attained: it will tend to give an incentive to the improvement of land, and also to provide facilities for industries.

Q.—Is it not unusual for any Government to invest in a bank like that, instead of redeeming its own papers?—*A.*—It is practically the same thing.

Q.—There is a great deal of difference in the rate of interest?—*A.*—That is a matter of detail. I only propose 4 per cent.

Q.—When you wrote this, probably the rate of interest had not been changed?—*A.*—That is a matter of detail, but from the calculations which I have put in with my note, you will see how the capital accumulated afterwards and provided for all exigencies, and all possible losses.

Q.—Do you think that that security is as good as that of the land which is under the control of the State?—*A.*—I don't know that the security is not better. It is not subject to any vicissitudes of nature; famine may come and you have to think of suspension of revenue; and there may be many calamities of nature, whereas in this case you have fixed revenues, and not only that, but an ever-increasing revenue. I think I am safe in saying you can never show a record by which you have been able, in recurring settlements, to get 25 per cent. more after every 20 years regularly. With my scheme you can get regularly 25 per cent. more.

Q.—I should be inclined to think that, from the Government point of view, land was the better security still. Take the case of Russia, you get civil disturbances, and a demand is suddenly sent to the bank to pay over all the gold that they have in their cellars?—*A.*—I hope we won't come to that.

Q.—The land is still there, and is susceptible of money being raised from it for the public benefit, unless the public have committed themselves not to take it?—*A.*—In this case there is another element. We have foreign rule. My method is the only way of spreading loyalty among the masses.

Q.—We are not concerned with that at present?—*A.*—Only as part of the scheme when you mentioned Russia.

Q.—My example had reference to this that a bank may be destroyed, or very seriously injured; but the land, short of an earthquake or a cataclysm of nature, is always there. You are aware that this idea of redemption of land revenue was tried some 50 or 60 years ago?—*A.*—Yes.

Q.—Do you know why it was not proceeded with?—*A.*—Because they gave very easy terms.

Hon'ble Pandit M. M. Malaviya.—*Q.*—England does not derive its revenue mainly from land?—*A.*—20 years ago it was mainly from land.

Q.—During the last 100 years it has depended for its revenue not upon land but on other sources. The fact that Government would rely upon other sources than land will not necessarily be a disadvantage?—*A.*—No, and by spreading industries all over, Government will have their income from various other sources. All those people who prosper will have to pay income-tax.

Mr. C. E. Low.—*Q.*—Could you give us your experience with regard to the working of small pumping plants in this province for irrigation?—*A.*—How do you mean? I am doing it myself.

Q.—I should like to know what the position is; is it practised by people in general on a large scale?—*A.*—Whenever they get a chance. Our Financial Commissioner is here; he knows how much people like to have a chance of doing it. Up to the time of the War it was faring well. It is a paying proposition.

Q.—In the case of ordinary zamindars, do they find some difficulty in keeping their plant working at a maximum grade of efficiency?—*A.*—Not for want of men, but for want of water. If the pumps fail, it is only for want of water. The source of water has to be very carefully diagnosed. From my experience I can give you very approximately the cost for each lift.

Q.—As a matter of practice, does the ordinary zamindar purchase the best type of pumps for his local want? Does he know exactly about the lift?—*A.*—That knowledge is soon spreading. He has no difficulty in getting men to keep his pumps going.

Q.—You don't think any assistance could be given by an expert staff going round and inspecting them?—A.—Yes, we have an Agricultural Engineer for that purpose.

Q.—You think that the man's work is helpful?—A.—Yes.

Hon'ble Sir Fazalbhoy Currimbhoy.—Q.—You own many of the cotton-ginning mills here?—A.—I own 3 factories in 3 places.

Q.—And you are working on the pool system?—A.—No, I am working my own cotton. I have done a little work for others, but that is only a matter of business. All my cotton gins are working.

Q.—You suggest that if there are not many companies in one place, there will be no pool?—A.—If no more than a certain number of factories be allowed to be put up they won't have a pool.

Q.—If a larger number of people unite together and fix a rate, the small number have more chance to do the same?—A.—If they have sufficient cotton to keep a factory going, they will not enter into that sort of combination. We don't generally combine unless there is necessity for it.

Q.—You mean unless it is necessary to make more money?—A.—If they combine, that does not affect the zamindars. It is the pool which affects the zamindar. The Agricultural Department has started a system to auction *kappas*.

Q.—Do you know what the rates are; where there is a pool, and where there is no pool?—A.—The rates are ordinary rates, *plus* the amount they put in the pools. It is a very simple way to calculate. Supposing they put 4 annas per maund in the pool, the rate will be the ordinary rate, *plus* 4 annas.

Q.—What is the ordinary rate, where there is a pool, and where there is no pool?—A.—I don't understand what you mean.

Q.—You are ginning at one place, where there is no pool. What are the rates of ginning and pressing?—A.—To the ordinary rates add 4 annas.

Q.—What are the actual rates at which you gin and press?—A.—We buy our own cotton. We don't gin for other people. The rates vary according to circumstances.

Q.—So in both ways it does not benefit the cultivator; if there is no buyer, still the rates are high?—A.—A pool is a different thing. What is done in the Punjab is that they impose 3 or 4 annas on the *kappas*, which is put on the combination pool in the end divided into number of machines. This extra comes out of the pocket of the producer.

Q.—Are the rates the same at both places, or are they lower where there is a pool?—A.—That depends upon the competition of the factories.

Q.—About this Marwar Bank; what business was it doing; was it lending money to shroffs or to industrial concerns?—A.—It was doing both.

Q.—Had you a qualified Manager to manage the bank?—A.—There is no examination for Managers.

Q.—By qualified I mean a man with experience?—A.—We engaged the best man we could get.

Q.—Who had banking experience?—A.—Yes.

Q.—And you said that the banks here had to pay a very high rate of interest?—A.—Yes, otherwise they could not get money.

Q.—The Bank of Bengal branch used to get plenty of money at lower rates?—A.—Because people had more confidence in it.

Q.—Where are they now depositing?—A.—They invest somehow or other.

Q.—Do they keep their money under-ground?—A.—No, that time is passed now.

Q.—Then all the money, which is coming for exports into the Punjab, what is it being used for?—A.—Do you mean gold? Some of our peasantry are getting prosperous and are making jewellery.

Q.—About your new system of financing industries through this money of the agriculturists, do you think that without that the money cannot be had to finance industries. Is that the only remedy?—A.—I did not say that it is the only remedy.

Q.—Supposing Government started an industrial bank, with guaranteed interest, do you think the public money will come into it?—A.—It will depend upon what the guaranteed interest is.

Q.—5 per cent. or 5½ per cent.?—A.—5 per cent won't satisfy me.

Q.—You will put in the land; but what about the general people?—A.—It depends how much money a man has got. I may tell you as a whole that in the Punjab there are not very many wealthy people. They are not poor either.

Q.—Individually they are all right, not poor or rich?—A.—There is no overflow of money with the people.

Q.—There will be very soon?—A.—I hope so.

Q.—About your technical school, you say "We have been trying to teach them?"—A.—I was ordered by Government to do that. This research money is purely Government money, and we undertake to do it as a labour of love.

Q.—Those people who can afford to pay are learning without charge?—A.—I got orders from the Director of Industries that I should teach everyone free of charge.

Q.—Then you say, "Government assistance is absolutely necessary for the marketing of products." In what way: should Government become traders?—A.—I explained that; simply by putting before the public the wants of a certain commodity.

Q.—You mean what the Government needs it should help to produce; not marketing generally?—A.—Yes; and give them facilities for the sale of their products.

Q.—You say, "Facilities are badly needed for training in factories and workshops." But at the same time you say "But my experience is that private factories won't take such apprentices, for fear of their spoiling the articles and tools entrusted to them." In what way do you suggest this should be done; by forcing private companies to take apprentices?—A.—No, by giving a subsistence allowance to the boys who go to the factories.

Q.—But if the boy is not taken into the factory?—A.—They will be taken, but they won't pay them anything. They won't pay them a subsistence allowance.

Q.—Then you say, in answer to question 5d, "None in the Punjab," but there is the Board. It is doing nothing?—A.—There is no Board. There is a Director of Industries whose duties are combined with those of the Director of Agriculture.

Q.—You say, "For textile manufacture some sort of hall-marking system is absolutely necessary?"—A.—Yes, that is absolutely necessary.

Q.—You want Government to have the hall-marks?—A.—Either Government or any Board which Government should appoint to put the hall-mark, but on no article which is of uniform quality.

Q.—But the people pay the price, whether it is of uniform quality or not?—A.—The people are not such fools.

Q.—What is the protection?—A.—Simply if Government appoint some sort of system of hall-marking, people would understand that it was of uniform quality.

Q.—Supposing I make a certain article, which is good, but not necessarily of uniform quality throughout. Why should it be rejected?—A.—It ought to be of uniform quality throughout.

Q.—But I am not cheating anybody?—A.—The buyer will never have confidence in giving a larger order; whereas if the quality is uniform, he will at once place large orders.

Q.—If I make a piece of cloth with full gold in some parts and semi-gold in others why should they reject it?—A.—If it is semi-gold, it must be semi-gold right through, from top to bottom. It ought to be uniform. It ought not to have half a yard full gold, then half a yard semi-gold; and so on.

Hon'ble Pandit M. M. Malaviya.—Q.—I understand you to mean that the article should be marked to show what it really is?—A.—Yes, and it ought to be uniform from top to bottom. Uniform is not uniform in quality; not that if the same, or whatever it is, is designed that half a yard is gold and the rest is silver, but that the half yard of gold is pure gold.

Hon'ble Sir Fazalbhoy Currimbhoy.—Q.—About the patent law: Do you want a monopoly?—A.—That is only an idea.

Q.—You want that to help monopoly?—A.—I said that if he was given protection for some little time, the industry will be encouraged.

Q.—For technical instruction you have given a table showing you can produce so many things. How many of the articles are marketable here?—A.—This is on research, and we undertake to teach any boy who comes to learn. I don't go a step further because it is Government money.

Q.—Don't you think that, instead of having these 71 things, if you just tried for commercial use 10 or 15 and make them at a marketable price, that would be better?—A.—That would be going beyond my instructions. Of course that is another branch of research; one would be out to make it; another would be out to put it on the market. They are all made at less than marketable price. In every one of them I have put pre-war rates, and the price at which I could make them. They can all sell at a profit.

WITNESS No. 380.

RAI BAHADUR LALA DAMODAR DAS, *formerly Additional Judge incharge of
Liquidation Work at Lahore, now District and Sessions Judge, Karnal.*

WRITTEN EVIDENCE.

The birth of Indian commercialism in the modern sense of the term in this province can be traced some ten or twelve years earlier than the great Swadeshi boom of 1906-07. The credit for the conception of this idea belongs to Lala Harkishen Lal. Finding that one of the main difficulties in the way of the promotion of indigenous industries was that of finance and capital, inasmuch as the European-managed banks or the old class of money-lenders were generally averse to advance money to Swadeshi concerns except on the most approved securities or risksome conditions, he set himself, shortly after his return from England, to the promotion of his scheme of Indian banks. This principle of Swadeshi banks financing indigenous industrial and commercial concerns is all right, as an abstract proposition, but in actual practice it was perverted in the case of nearly all the banks now in liquidation, to finance the pet concerns of the common promoters or to lend money to the Directors and Managers whereby they could freely indulge in speculations. Large sums of money were advanced by the People's and the Amritsar Banks to such companies as the Upper Real Estate Company, Limited, in Liquidation (which speculated only in land) and the Pioneer Investment Company, Limited, which speculated in shares by inter-company transactions of the concerns allied to the aforesaid Banks, although none of these companies possessed any real paid-up capital. Big sums were again advanced by the Hindustan Bank to concerns like the Punjab Musical Association, Limited, in Liquidation, which was really a theatre, having no capital, and to the Punjab Brothers Company, Limited, in Liquidation, really a speculative shop at Karachi, and other concerns. The Doaba Bank advanced money to the Amritsar General and Flour Mills Company, Limited, and to the Phagwara Mills in Kapurthala State, in both of which the Directors were interested. The National Insurance Company of Amritsar had large transactions with the allied Banking Company and Bajpal and Company, started by the same promoter. The Lahore Bank, Limited, in Liquidation, advanced considerable sums of money to a Director and to its Chief Manager and also to a property dealing company and a leather factory in which its promoters were interested. The Industrial Bank advanced very big sums to its chief promoter and his concerns. All these were generally transactions of an objectionable nature, and the advances to the ginning factories were hardly better indeed. The advances of the Banks' money to the ginning presses and on shares of allied companies could not be called investments in any sense of the term. They were practically speaking speculations, especially as the ginning presses continued, on account of the easy money market, to multiply out of all proportion, and thus began to suffer from the effects of over-capitalisation and they could only be saved from ruin by the pool arrangements organised later on.

Most of the other company-promoters had no ability and qualifications, being generally men of very indifferent education and training and without any influence with their community. They made use of the Swadeshi movement of 1906-07 to serve their own personal ends, and started a number of concerns for their own aggrandisement. Verily, the Swadeshi movement has suffered not a little at the hands of these unscrupulous and incapable men. The motive of these men was as much remote from Swadeshi as the poles. They cared for nothing but to enrich themselves at the expense of a credulous public and as their concerns were invariably carried on at a heavy loss, they adopted a number of devices to cover the deficiencies. One of their favourite methods was to multiply companies, sometimes *shadi* funds, sometimes semi-commercial or other concerns under the same or allied arrangements. This had a double advantage. First, it swelled their own remuneration as instead of receiving it from one company, they could levy it from a number of concerns, and secondly, it enabled them to hide the real state of things by showing large amounts of subscribed and paid-up capital by means of bogus inter-company transactions, such as exchange of shares between these allied companies. Another common method of theirs to show a large subscribed and paid-up capital was to allot shares to men of straw and to take from them pro-notes for the amount of their allotment money, which was thus debited to their pro-notes account and credited to capital account. In the case of at least one Bank, these shares and pro-notes were bogus and the names of the share-holders had to be removed or struck off the register under Section 38 of Act VII of 1913. In order to declare a dividend in these companies, they debited a large portion of expenses to preliminaries, and treating them as assets made out a fictitious surplus, from which a dividend was declared. Sometimes, the device known as window-dressing deposits was adopted, large sums of money were deposited in floating account of various persons a day or two before the half year without any money being paid for the purposes

of the balance sheet, only to be debited to them a few days afterwards. In this way, they managed to manufacture blooming balance sheets, showing a large amount of subscribed and paid-up capital and bulky assets, and to declare dividends, whereas their Banks and Companies were really working at a heavy loss. There was, after this, no hitch to their lending money to themselves, their friends, or to the allied concerns under the same management without taking any security. Nay in many cases, even the formality of a promissory note was dispensed with, and large sums were advanced to men of most doubtful standing on overdrawn floating accounts. The employees of these Banks were corrupt in many cases, and had large sums advanced to themselves or their friends, much in excess of their security, which in several cases was not even taken. Little wonder that all these frail barks foundered at the outset of the financial storm of 1913-14 and all this mere playing ducks and drakes with the money of the public ceased.

As a matter of fact, many of these Banks and Companies were built upon foundations of sand, and the whole superstructure was consequently unstable. They were intrinsically unsound. They generally paid depositors at the rate of 6 per cent per annum and their working expenses could not be less than 6 per cent. As a matter of fact they were more. Although they had generally a small paid-up capital, they usually started a large number of branches and paid liberal salaries, travelling and halting allowances and high commissions to managing agents and canvassers. Against this, their income from debtors and investments hardly amounted to more than 8 per cent, while they generally paid dividends at the rate of varying from 5 to 10 per cent. to share-holders. It is, therefore, clear that the Banks started on these methods were intrinsically unsound and unstable.

Did these Banks help any industries, as is sometimes claimed? The answer must be in the negative. They helped and financed some of the *shadi* funds of the scandalous type and some other concerns equally unsound which toppled as soon as the financial crutches lent by the Banks were taken away. A man like Daulat Rai never meant to start any industry, he cared for nothing else but his own gain. The only direction towards industrialism fostered by these Banks was the ginning industry but the ginning factories were not really industries. Rather most of them were superfluous, and a drag on the market. Owing to the cheapness and facility of credit, the ginning factories multiplied, as already stated, out of all proportion to the cotton producing capacity of the province, and the result was an unnatural competition in which these factory owners raised the price of cotton against each other and incurred heavy losses. Later on, owing to the pool arrangements, referred to above, they ceased work and received their share of profit on the pool. Thus the multiplication of ginning factories, one main result of these Banks, did no good at all to the province. On the other hand, their dubious methods have given a heavy set-back to trade and industries. The actual sum of money involved is well over two crores, but a much more serious result is the misery caused to thousands of poor people including widows, orphans and old men, the widespread loss of credit and the knowledge that the standard of commercial morality and efficiency in these banks and companies has been so low. It is, however, an ill-wind that blows no good. And one effect of these failures has been to stop the activities of unscrupulous men, and to make the public less gullible than before. Of course, it will take some time to recover lost confidence, but the machinery of credit will henceforth be placed on a much firmer footing than before. Legislation has also helped to this result. The Provident Insurance Societies Act, 1912, has been successful at dealing a death blow to the miserable *shadi* funds. The present Indian Companies Act, VII of 1913, will, it is hoped, do something in dealing with all forms of shady finance and strengthening honest and capable management, though it does not go far enough to achieve these objects.

It will be, however, a great mistake to overlook one important factor that is far from being eliminated under the new conditions, viz., the apathy of the general body of share-holders in the affairs of the companies. It will be still possible for some active and energetic directors and managers to get whatever resolutions they want to be passed at any extraordinary meetings of the company and thereby secure validity and sanction to their own acts. From my experience as a Liquidation Judge, I have found that the right of inspection of accounts or of watching the proceedings before the Liquidation Court is seldom, if ever, availed of by the creditors and the contributories, and it remained for me to inaugurate a system of audit and check of Liquidator's accounts and to exercise a thorough and effectual control over each and sundry matters, pertaining to liquidations. Under the new Act, larger powers are given to the Registrar, Joint Stock Companies, and therein lies a safeguard against abuses. But if it proposed that Government should guarantee dividends to the share-holders of a few selected industrials in order to attract the necessary capital, much greater supervision and more effective safeguards will be necessary. I am, of course, not concerned with the questions of policy, free trade, protection or Imperial preference, but I suggest the following safeguard as a condition precedent

to any form of State grant. I propose that a committee of inspection consisting of three members, one representative of the share-holders, the other of the creditors, and a third to be nominated by the Board of Trade and Industry, to be constituted in each province, should have power to inspect and examine the accounts and call for all proceedings of the Boards of Directors and have free access to the property and premises of the companies and where necessary, put their veto upon the proceedings. This committee need not and should not have any power of interference with the affairs of the company and in the case of the directors being dissatisfied with the veto of the committee, they will have the power to refer the matter to the standing Board of Trade, who will be representative of the trade and commerce of the province and will consist of some experts or to the general meeting of share-holders and creditors. The decision of this Board or the share-holders and creditors in general meeting will be final on all matters and they shall have power to annul or rescind any proceedings of the directors. This will provide an effective safeguard against any misapplication or misuse of the funds of the company or reckless speculation. This is, in short, my scheme, the details of which have to be worked out. With such a committee of inspection and Board of Trade and Industry there will be no apprehension of waste, extravagance, or misapplication, and the Government may, if it is so advised, assist any particular industry by guaranteeing some dividends to share-holders or debenture-holders, just as it does in the case of Railways; but I am not in favour of such kind of help, as the Government must provide sufficient safeguards to ensure the proper working of the companies, which will take away all initiative. What is really wanted is to restore public confidence in joint stock concerns and to encourage the flow of accumulated wealth of the country into them.

Evidence before the Committee of Enquiry into the causes of failures.

The Hon'ble Mr. Maynard.—Q.—What are your impressions of the causes which have led to the failure of the Swadeshi enterprises?

Rai Bahadur Lala Damodar Das.—A.—Well, if you want to take the general causes, I will give them. The first cause I have put down here is the high rates of interest which were paid to depositors. This is, in my opinion, the first and foremost cause. The general rate was 6 per cent and in many cases more. The rate of the Bank of Bengal generally is not more than 4 per cent on an average. And this fact may be taken along with the fact that they had started a large number of branches in order to get their deposits from the poorer classes, every little town had a branch and so the working expenses naturally welled and were not covered by the income from the branches, while the money which could not be invested was not earning any interest.

Another factor was that the capital was very small, and the incidence of cost was very high. In the case of many of these banks, the capital was seldom higher than four or five lakhs. The People's Bank had 80 branches. The result was that the money cost them at least 12 per cent, 6 per cent they paid to depositors and their expenses amounted to at least 6 per cent on the capital. Now in order to conceal these things, they resorted to many devices. First of all, they debited the major portion of their recurring expenses also under the head of preliminary expenses. By the articles of Association, it is generally provided that the directors may put down a certain amount of expenses incurred in connection with registration and establishment of the company under the head of preliminary expenses which they may wipe out gradually every year. Instead of doing that, the major portion of the recurring expenses was shown as part of the assets under the head "Preliminary expenses." The gross income was practically taken to be the net income. This was the net result of this device. In order to make up their profits at the end of the year, they would debit the debtor with interest even in cases of known bad debts and add that to the income to show profit, which was thus largely fictitious.

If the amount of the principal was to their knowledge bad, they had no justification to do this and as a matter of fact, they should have wiped out the principal when the report reached them that the amount was not likely to be recovered. An ordinary bank would not do it in the case of a debt known to be bad, and they should not have declared a dividend when the income was less than the amount of expenses. It was costing them 12 per cent, 6 per cent, to depositors and another 6 per cent on working expenses due to short capital, and they could not afford to lend money on less than this rate. If you lend on a high rate, you cannot have good security. As regards Swadeshi, they rather handicapped it. The people formerly placed their deposits with these Swadeshi concerns at 6 per cent interest, but as soon as these Banks started, they put their deposits in these Banks with the inducements offered to them. Among them, there were several poor widows and orphans. The Banks used to pay interest up to 8 per cent under various pretexts. If these deposits belonged to minors, widows, orphans, or charitable institutions, they would give about 8 per cent. Their object was to get money. There has always been a cry for protective duties, but if

you charge a high rate of interest on Swadeshi concerns, you make your concerns weak. Even if Government were to levy the protective duties, it would be more than counter-balanced by the high cost of interest. It would cost the promoters of Swadeshi more to manufacture things which were to compete with foreign articles, if you charge higher interest. That goes to the root of the matter. I can prove these things by actual examples, and if you like it, by facts and figures.

The Hon'ble Mr. Maynard.—Q.—Let us have one example so that we may be quite sure.

Rai Bahadur Lala Damodar Das.—A.—I would take the case of Bank of Peshawar of Multan. There was a loss of about 70,000 rupees after two years' working. In order to conceal that loss, the Manager found after debiting every possible thing, even the recurring expenses, to preliminary expenses and after taking credit for every conceivable source of income that even then there was a deficit of Rs. 25,000 he then gave a personal pro-note for Rs. 25,000 which was debited to him and shown as income. He made it out that it was usual in foreign countries, such as America and other European countries, that the Managers and Directors bore a portion of the expenses, during the preliminary stages of these companies, so that pro-note for Rs. 25,000 may be taken as the profit of the Bank, and his salary, which was Rs. 200 a month, may be increased to Rs. 400. This pro-note may be paid out of the increase in his salary, but if he was dismissed or resigned, the pro-note will become null and void. This man got 4 years' imprisonment for defrauding the public.

The same thing took place in the case of the Hindustan Bank, which was managed by Lala Daulat Rai, elder brother of Lala Harkishen Lal. At the end of the year, when he found that he could not give dividends or show a prosperous state of the Bank, if he allowed to stand as expenses the amount of Rs. 6,000 he had drawn as his remuneration during the year at Rs. 500 per mensem, he credited Rs. 6,000 to the Bank and gave a pro-note of his hand, debiting it to his son as a supposed loan. As soon as the annual balance sheet was passed and the dividend declared, he reversed the entries. I had him prosecuted and he is now undergoing a sentence of 4 years' imprisonment. The actual offence was issuing false balance sheets for cheating and defrauding the public.

The Directors were, in their turn, dupes in several cases. I have had to deal with many of these Directors. I made them pay heavily for their lack of supervision. Many of the Directors were really fools and not villains. They agreed to become Directors for selfish motives or because they were given to understand that they were helping the cause of their country but they did not realize their responsibility as Directors, nor did they have any qualifications.

The second cause is, that nearly in all these cases the real power was vested in the Managing Director. All these Banks were one man shows, and I can also show that nearly all the Managers of these Banks had been trained and employed in the People's Bank or its allied concerns. I am going to give the instance of Lala Daulat Rai. He was Civil Nazir in the Dera Ghazi Khan District. He retired at the age of 45 years on a medical certificate. If he was capable of big feats subsequently by starting different concerns and companies, he was certainly not unfit to discharge the duties of Civil Nazir, and I have got his statement before me. This man got a pension of Rs. 20. When he started the Hindustan Bank, he got his remuneration as Managing Director fixed at Rs. 500 a month, and he started 9 other concerns from which he received handsome remunerations of about Rs. 1,000 per mensem in addition. There was a concern of the Hindustan Bank which was called the Musical Association. They really started a theatre, and that company had a loss of 40 or 50 thousand rupees with practically no capital of its own. The Managing Director of the Hindustan Bank was also the Managing Director of this and other concerns. They were losing heavily every year. The lenders and the borrowers were the same. They advanced money recklessly. I was just saying that the Managing Director of the Hindustan Bank rose to the post of Civil Nazir in the Dera Ghazi Khan District, left Government service after 20 years' service and joined the concerns of his brother, Mr. Harkishen Lal, and afterwards started several concerns of his own, such as Hindustan Bank (registered 27th July 1906 with 20 branches), Punjab Brothers, Limited (registered 1906 with 21 branches), Multan Spinning and Weaving Mills (registered 1908), Ginning Press, Punjab Flour Mills, Bharat Literature, Punjab Musical Association—really a theatre—and Punjab Leather Works. All these 9 concerns were heavily in debt to the Hindustan Bank. I have not been able to get even a fraction of the money that had been advanced to them. He was Managing Director in all these. All these failed on account of bad management. I can show that these Banks and all their concerns have done a great deal of harm to the country.

A gentleman has started a network of ginning and cotton factories and presses and put up flour mills. He has borrowed 10 lakhs from the Punjab National Bank and the Co-operative Bank. The latter Bank thus locked up its money in a big concern like this, and when there was a run on the Bank, it came to grief.

Sound bankers would not advance money to be locked up in iron and bricks. If you go to the Bank of Bengal or the Alliance Bank, they would always like to keep their money in liquid form on good security. Ninety lakhs of rupees out of a crore or so in the People's Bank have been sunk in machinery and buildings, and the liquidators would not get even half of that money in less than ten years. The mill property may be worth 5 lakhs, but if it is sold in the market it would not fetch a fraction of its cost. If all the funds of a bank are invested in immovable property, it is very unsound in principle. If the money is invested in liquid securities and partly in immovable property, it is different.

The Hon'ble Mr. Maynard.—Q.—The fault of these Banks was that they advanced too much money on unliquid security. Was there any liquid security in connection with these industries?

Rai Bahadur Lala Damodar Das.—A.—The advances should have been made on goods or raw material with adequate margin.

The Hon'ble Mr. Maynard.—Q.—What I am trying to get at is this that for the purpose of financing industries, these short-term advances will not be required. This requires long-term advances.

Rai Bahadur Lala Damodar Das.—A.—They may make advances to the extent of 20 or 25 per cent. of the cost of the machinery. But they advanced too much. The concerns were started with insufficient capital. The starters had no capital of their own and had to borrow the whole of the money for working expenses. When the Punjab National Bank was started, the late Mr. Lal Chaud, as a shrewd businessman, objected to advance money more than the paid-up capital.

The Hon'ble Mr. Townsend.—Q.—Unless the Banks had not advanced so much money on unliquid securities, the industries would not have been started at all.

Rai Bahadur Lala Damodar Das.—A.—But these industries have not done any good.

The Hon'ble Mr. Maynard.—Q.—Why did these people not invest in industries, and why did they invest in Banks?

Rai Bahadur Lala Damodar Das.—A.—Many of these depositors were investing in factories. But when these banks were started at their very doors, they put in their money in them. The Banks were able to get the money by establishing numerous branches and holding out various inducements. The Branch Managers adopted all sorts of devices, because their remuneration and their very employment depended upon getting good deposits. The managers were often paid by percentages.

The Hon'ble Mr. Townsend.—Q.—One of the reasons is the want of businessmen as Managers.

Rai Bahadur Lala Damodar Das.—A.—That is very true.

The Hon'ble Mr. Townsend.—Q.—You have no reason that the directors were dupes.

Rai Bahadur Lala Damodar Das.—A.—In some cases they were, but not in all.

I think that the majority of the directors were personally interested. They borrowed money from these Banks themselves and advanced large sums to their friends and relatives without adequate security. I think it is unsound in principle that the borrowers and lenders should be the same persons. In many English Banks' Articles of Association, there is a provision that the director, who is going to borrow any money from the Bank, should not be present at the meeting before which this question is to come up. As a matter of fact, the directors were sitting and passing judgments on themselves. I think that in all sound banking the directors should not borrow money themselves. One chief reason of failure is that the lenders and the borrowers of these Banks were the same.

As to the question of auditors, I think the auditors, whether European or Indian, were no good. I attach little importance to their services.

The clerks of one Bank were checking the accounts of another Bank. They had no training and they were absolutely useless. Had there been proper auditors, I would not have had to take the trouble of checking accounts myself. I have had practically to audit the accounts myself. There is the firm of Messrs. Noison King and Simpson, of which Mr. Dignasse is the head. No one could pay them sufficiently well in order to go into these details. It is not merely checking the accounts. The auditors' duties are manifold. They are at present no auditors in the real sense of the word. They are merely accountants.

The Hon'ble Mr. Townsend.—Q.—We have been told that there is a great need for Indian auditors.

Rai Bahadur Lala Damodar Das.—A.—That is true, but they must be trained. They must all undergo the accountancy test in Bombay or elsewhere. First of all they must receive good educational training and be apprenticed in England or Bombay where there are societies of Incorporated and Chartered Accountants. There is nothing like that in this country and this is very much lacked in this country. For the future, if the companies are to be properly checked, there must be properly qualified auditors to find out these tricks. Had they done their duty, they should have found these tricks long ago. They ought to have pointed out all these things. Such certificates, as they gave, were not correct. They did not go into details. They did not give them after checking the accounts properly. Had they done it, it is impossible that they should have overlooked these clear mistakes and frauds as well as jugglery in accounts.

The Hon'ble Mr. Townsend.—Q.—Has the Indian Companies Act, 1912, been in force long enough to have any result?

Rai Bahadur Lala Damodar Das.—A.—Inappreciable.

The Hon'ble Mr. Townsend.—Q.—How many share-holders turn up at a meeting?

Rai Bahadur Lala Damodar Das.—A.—The Managing Directors and the clerks who have got shares. They form a quorum. They give shares to the clerks to form a quorum. The other share-holders seldom care to attend. In the case that I started in Rawalpindi, the Managing Director gave some shares to his own clerks, giving them the assurance that they would not be called upon to pay, and that he would pay himself. The Managing Director, Mr. Gopi Chand, signed a voucher by which he debited the amount of these shares to interest account. Afterwards when it was brought to his notice that it was illegal then he gave a cheque of his own for the amount in order to relieve the clerks of the liability on the shares. These shares were given to these people simply to have the advantage of forming a quorum, and their votes.

(After reading his written evidence about the Board of Inspection and Control.)

I have taken it from the provisions of the Municipal Act. In the Municipal Act, the Deputy Commissioner as an executive officer has got the power of vetoing any resolution of the Municipal Committee subject to reference to the Commissioner whose decision is always final. In the Imperial Executive Council, the Viceroy is always a member of the Council. If the Council passes a resolution by a majority of votes which the Viceroy does not consider advisable in the interests of the country, he can place his veto upon that matter and refer the matter to the Secretary of State whose decision is final. My scheme provides for the representation of all. Under the law as at present stands, the creditors who have substantial interest have no voice. Under my scheme they have one representative, the share-holders, another and the third man is to be nominated by the Board of Trade as an expert. Therefore, the members of that Committee of Inspection for each Bank or each Company should have the power of calling for the records or books or have free access to them and the property of the Company or its operations. If they consider it necessary to place their veto on any proceedings of the Board of Directors coming to their notice, they should simply intimate to the Directors that they place their veto on such and such of their proceedings. In case the Directors are dissatisfied with the decision of the Committee, they can refer the matter to the Board of Trade or general meeting of share-holders and creditors. In England, I believe, there is a Board of Trade consisting of commercial and industrial experts. The Committee of Inspection I have proposed should act as an intermediary between the Board of Trade and the Directors. Supposing I am a share-holder, I find that the Directors are not acting rightly. All that I have to do is to bring the matter to the notice of the Committee of Inspection. If they find that the Directors are not doing the right thing, they can veto it, but they should not actively interfere with the Directors. We should not take away their initiative. They should simply exercise the power of veto. If the Directors feel dissatisfied with the veto, they can appeal to the Board of Trade or to the share-holders and creditors in general meeting, and their decision will be final.

The Hon'ble Mr. Townsend.—Q.—Have you any view on the subject whether there is much capital available in the Punjab?

Rai Bahadur Lala Damodar Das.—A.—Certainly, there is no lack of capital in the Punjab, though, as compared with the other provinces, it is poor. With the safeguards mentioned above, if the public is assured that there is going to be no mismanagement or fraud, capital will be forthcoming in sufficient quantity. The moral support of Government will be quite sufficient.

The Hon'ble Mr. Townsend.—Q.—It has been suggested to us that Government should institute some system of hall-marking prospectuses of companies before they are allowed to go before the public. These prospectuses should be thoroughly examined in a Government office, and this should be made compulsory under the Companies Act.

Rai Bahadur Lala Damodar Das.—A.—I think it is a sound proposal. I should first create a Board of Trade and Industry for each Province.

The Hon'ble Mr. Townsend.—Q.—You would give the Board the power of passing the prospectuses.

Rai Bahadur Lala Damodar Das.—A.—Yes.

The Hon'ble Mr. Townsend.—Q.—Don't you think that by doing so, it would to some extent involve Government.

Rai Bahadur Lala Damodar Das.—A.—No. Under the new Companies Act, in the case of limited companies which do not go to the public for subscriptions, Government may not enquire anything at all, but if they want to appeal to the public for funds, then Government has a sort of responsibility to the people, and they should see that the conditions are fair and square, because that will restore confidence. The Committee of Inspection and Board of Trade that I have suggested will exercise a sort of supervision or vigilance over the affairs of the Company. It is essential that the Board of Trade should scrutinize carefully the chances of success of particular industries proposed to be started as a limited concern, and give their opinion which will be of great help to the people wishing to encourage swadeshi enterprise on sound lines.

The Hon'ble Mr. Townsend.—Q.—It has been suggested that a sufficient amount is not allowed for depreciation.

Rai Bahadur Lala Damodar Das.—A.—That is quite true. If there was not sufficient income to cover the expenses, how could they provide for depreciation. That is why they have had to resort to all sorts of devices.

The Hon'ble Mr. Townsend.—Q.—Have you anything to say that dividends are paid out of capital.

Rai Bahadur Lala Damodar Das.—A.—I started by saying that all sorts of devices are resorted to in order to declare dividends without real profits. These dividends were generally paid out of creditors' money. Practically there was no capital left, as it was swallowed up in preliminary expenses and bad debts.

I would like to make a certain percentage of paid-up capital compulsory before a company is allowed to start. A certain proportion should be fixed. I should not allow any company to come before the public unless at least half the capital has been paid, not in pro-notes. For instance, I give you an instance. In Multan a gentleman started a company. The Articles of Association provided that as soon as the capital was subscribed to the extent of one lakh of rupees, he would begin drawing Rs. 100 a month as pay. He was a man of straw but allotted to himself Rs. 99,600 shares so that he was entitled to Rs. 100 a month. He got about 7 or 8 thousand rupees as pay from the money he received as deposits. He is now suffering four years' rigorous imprisonment.

First of all he started an Anna Bank. All his figures were in annas. Accounts were kept in annas, and shares were shown as 2,000 annas shares and so on. From that he converted it into a Sovereign Bank.

The Hon'ble Mr. Townsend.—Q.—Have you got any other suggestion?

Rai Bahadur Lala Damodar Das.—A.—I think Government should also make arrangements to give expert advice to people who really want to start industries, and those experts should possess not only the expert knowledge but should also study the industries from the commercial standpoint. Government should have a Standing Board which should examine into the possibilities of those trades and industries along with expert advice, and study the matter from the commercial and practical point of view and then as you say do the hall-marking which may take the shape of a mere advice.

Supposing I wish to start an industry. I am quite new, but the idea comes into my mind. There should be a Board which should advise me and give me expert advice as well as say whether the industry is likely to be successful or not. This is very necessary. There are many men here, men of capital, who want to start, but they are not sure that they will fail or succeed. The real trouble in my opinion is the competition with other countries. Unless the factories started here are on a pretty big scale, there is no chance of success. I do not think there are men with capital in Punjab who will come forward with all this money. Therefore it will be necessary to have joint stock companies. I think people will invest money if Government will lend its moral support.

The Hon'ble Mr. Townsend.—Q.—Lala Panna Lal of Ambala asked me to recommend him for a grant of Rs. 2,000 on the ground that if Government gave it, he would be able to get shares from the people.

Rai Bahadur Lala Damodar Das.—It is true as it will be looked upon as a moral support by Government. I know something of the Ambala Glass Factory. When I was in Ambala, there was one Mr. Kalas, an Austrian gentleman, who was brought out as an expert. The Directors thought it useless to pay so much to that man, and his services were dispensed with. Mr. Kalas brought a suit against them before when I was in Ambala. That man got a decree, but he went away. The result was that they could not work the glass factory, without an expert and came to grief and went into liquidation. It was purchased by Lala Panna Lal or his brother Than Singh. Many of the Swadeshi concerns, in Cawnpore and elsewhere, have passed through liquidation. They have been purchased rather cheap. The cost of glass factory was something more than a lakh, but he bought it for Rs. 25,000.

The Punjab industries are under-capitalized, and there are no proper persons to manage them, because apart from my experience as a Liquidation Judge, I have been in some form or other connected with these mills and factories for the last 25 years. The share-holders of the Krishna Mills, Delhi, asked me to go to Bombay and make enquiries whether they should extend the mills or not. Then I went to Gokuldas Murarjee (who is the Managing Agent of a firm—(Rs. 500 worth shares of whose mills are selling for Rs. 3,000 or so.)

He said that the gentlemen who want to manage the said mills knew nothing about it and that with the present management it is bound to come to grief. He said that there must be an expert who knows how to buy cotton, how to sell its yarn and how to turn it into yarn and cloth and so on. They have experts in Bombay simply because there are big firms. It is absolutely hopeless to start a factory here with a capital of Rs. 50,000 or so.

ORAL EVIDENCE, 14TH DECEMBER 1917.

Sir F. H. Stewart.—Q.—A great deal of your evidence consists of evidence which you gave before a small committee which was appointed by the Punjab Government?—A.—Yes.

Q.—I do not propose to take you through that because we are not concerned with the liquidation of the companies involved. Beyond that it is of importance to our enquiry to find out what were the causes of the failures?—A.—I have stated them in my note.

Q.—I think personally we are fairly clear now, but there are one or two points that strike me. I do not quite understand the Committee of Inspection which you propose. Is that only when a company is going into liquidation?—A.—I say when the company is going to be started.

Q.—All companies?—A.—All companies.

Q.—Do you think that necessary?—Will you get responsible business-men to take up the position of directors?—A.—Why, I do not interfere with the directors at all.

Q.—I am asking you particularly in respect to initiative and responsibility?—A.—I make a provision there; that is, the Committee of Inspection will not interfere with the directors, but if they find it necessary they would put their veto.

Q.—You are not interfering with the directors?—A.—Not actively.

Q.—You are giving this Committee of Inspection a veto over the directorate?—A.—Well, the fact of the matter is, I have proposed this Committee of Inspection, for the protection of creditors we have got larger interests in a concern. Now they have got no voice. Some means must be found in order to protect them. Suppose you have a company with an initial capital of say Rs. 5,000 and there are creditors of the company for Rs. 50,000 and they have absolutely no voice in the management of the company; in such cases some means must be found to give the creditors some voice.

Q.—Don't you think that the Indian Companies Act provides sufficiently for this?—A.—The Indian Companies Act does not make any provision for it.

Q.—The responsibility of the directors is defined there, is it not?—A.—But supposing a director took shares of 5,000 rupees and I advance a lakh of rupees as a loan to that company, but if through some foolish act of that director the company suffers loss, he loses only Rs. 5,000, but I lose a lakh of rupees, being powerless to control his act.

Q.—Do you think that there is any need for special banking legislation?—A.—I think so.

Q.—On what points in particular?—A.—As for instance, the first thing is to lay down the rates of interest, because as I have pointed out in my note, the real trouble in the Punjab began with the high rates of interest, and generally these banks are giving sometimes as much as 8 per cent.

Q.—Would you prevent a bank by law from giving more than a certain rate of interest?—A.—Not by law, but by rules, made for instance by the Board of Industry and Trade.

Q.—I was asking you if you want special banking legislation, and you said 'yes'.—A.—I mean by that legislation to provide by rules to give authority to some body like a board of inspection to try and regulate the rate of interest, though not by direct legislation.

Q.—And you would like to see the proportion of paid-up capital defined?—A.—Yes, before the company is started, because under the new Companies Act there is a proportion fixed.

Q.—You seem to have found the liquidation proceedings unsatisfactory?—A.—Yes.

Q.—Would you like to see a Government of India official liquidator appointed with an adequate staff?—A.—Well, the difficulty has not been due to liquidators, but the difficulty has been due to the muddled state of the companies' affairs, and secondly, there was no trained man to take charge of the liquidation.

Q.—You mean rather that before liquidation the accounts had not been properly kept?—A.—Yes.

Q.—I do not understand your remark about the liquidators in your note, you refer to a firm of local auditors and accountants and you say no one could pay them sufficiently to go into these details; but presumably a business arrangement was made with them by Government or whoever appointed them?—A.—I do not know. What I know is that the companies were paying 50 rupees and 100 rupees to their auditors; no respectable firm of auditors would take up the work for 50 rupees and 100 rupees.

Q.—Anyhow you think there is a great need in this province especially for proper training in auditorship and accountantship?—A.—Yes.

Q.—Is there any means of obtaining that training in the province at present?—A.—None such, it may be had in Bombay perhaps, but not here.

Q.—There has been a diploma course recently instituted by the Bombay Chamber of Commerce. Would you like to see something of that sort here?—A.—Yes.

Q.—I should like to ask you a question about the general trend of your evidence. Don't you think that you are proposing to treat trade and industry too much, as Government institutions. Will trade and industry develop under all this restriction?—A.—What I say is these bank failures caused a great set-back, and we have to restore public confidence in order to attract capital; of course if there are a few men of big capital who will start industries with their own money, that is another matter, but if you want companies to be started with the public money you must restore confidence, there are two means suggested, one is that Government should directly control the staff, the second is, if you have proper control, you may be able to restore confidence; if gradually public confidence is restored this condition may be relaxed, but unless and until there is control by such a board as I suggest, I do not think you will be able to attract capital, past experience shows that.

Q.—And your committee will frame the prospectus. I think that is your proposal is it not?—A.—I do not say so exactly. I simply say Government or the Board of Industry would give advice whether a certain industry is likely to succeed.

Q.—Will they have power to stop one being started?—A.—If they find some industry was not likely to succeed; but the trouble is about capital. Supposing the idea comes into my head to start an industry. I proceed at once on my own idea and a few friends come forward to help me, I may be wrong, I may have no experience, the company or the industry may fail. It is necessary therefore that there should be some expert advice, not from the technical point of view, but the thing must be studied also from a commercial point of view, whether it is likely to succeed. There are many industries which theoretically are possible but their practical and commercial side should be studied.

Q.—And who is going to form a competent opinion on the subject?—A.—That is why I say that you must create a Board of Industry and Trade, consisting of experts and they should scrutinise the chances of any industry, whether it is likely to succeed in a province, say like the Punjab, or not.

Hon'ble Sir R. N. Mookerjee.—Q.—Who will be responsible for the prospectus in this board?—A.—Nobody will be responsible, they will be giving their advice.

Q.—According to the present Act if you make a prospectus you shall have to say that the board of directors or the promoters are responsible for it, but shareholders can sue them: If you have official men as you propose in your Committee of Inspection, will Government be responsible for any mistake in the prospectus?—A.—Not in the least.

Q.—Once Government gives opinion through this official board, Government takes responsibility for the whole of the prospectus?—A.—What I say is before scrutinizing the chances of a particular industry, Government must be able to give their opinion, whether in their opinion it is likely to succeed or not; I make it perfectly clear that it will not bind Government in any way.

Q.—If you put that Government gives opinions without any responsibility, that opinion will be worth nothing?—A.—Never mind, it will have a great deal of influence with the public.

Q.—Even if Government put on the top "We are not responsible"?—A.—Quite so, they do not want a sort of guarantee.

Hon'ble Sir Fazlulhoy Currimbhoy.—Q.—In answer to Sir Francis Stewart you said that special banking legislation is necessary. Do you want this legislation for helping industries of the province?—A.—Yes.

Q.—And you want a Committee of Inspection consisting of three members, one member representative of shareholders and elected by them?—A.—Yes.

Q.—The other representing the creditors elected by the creditors?—A.—Yes.

Q.—And the third an expert nominated by Government?—A.—Yes.

Q.—A Board of Industries will be constituted in each province; it should control the boards of directors of companies; is it not?—A.—If you call it control.

Q.—Suppose the directors of a company want to do some business, will these three people be able to stop it?—A.—The general meeting of shareholders or creditors can overrule the Committee of Inspection.

Q.—May I know how the work can go on; if constantly this inspection is going on and constantly meetings are going to be held?—A.—You presuppose that this Committee of Inspection will be interfering at every step, this is only a sort of precaution.

Q.—They can inspect every time when they want?—A.—Yes.

Q.—Even in banks in every-day business, a committee of directors go every day to the bank but they also allow the manager power to manage every thing. All the big institutions in India have been managed like that, have they not?—A.—Yes.

Q.—Do you think that these inspectors, these three people, which you contemplate, should always, every day be controlling the directors? They will be practically running things themselves?—A.—Why do you suppose they will be interfering every day?

Q.—They have the right?—A.—They have the right certainly.

Q.—And do you think that under the new Act, large powers are given to the Registrar as a safeguard against abuse? Do you not think that a respectable director is as responsible as the Registrar. Do you not think so?—A.—My experience of directors, at least in the Punjab, is altogether different from what it may be in other provinces.

Q.—You want legislation for the Punjab only?—A.—I am speaking only of the Punjab and not of any other part of India.

Q.—By such legislation you will avert banking failures in the Punjab?—A.—Yes.

Q.—But do you know that banks have failed in Bombay, thousands of banks have failed in London too, in Europe, America and everywhere?—This was the first effort here and now don't you think they will be more cautious and they will entrust their money to the management which is best? Is this not human nature?—A.—The fact of the matter is this: banks may have failed in other provinces through losses, but in the Punjab the bank failures have been due not to unforeseen losses but the banks were intrinsically unsound and their failures were no doubt in some cases due to fraud on the part of their directors.

Q.—Even in Bombay we had good expert managers of banks, and they managed great banks, and they turned out as big frauds as others, and the same was the case in

England. When the banks failed, there was a broad open trial in Bombay; the bank of Bombay also failed in the beginning; but with all these failures and without this strong legislation which you recommend we are flourishing and starting banks with 13 crores of capital. Don't you think that your proposal will hinder the progress of banking?—*A.*—I think it will strengthen it.

Q.—This was the first effort, don't you think so, this was the first beginning of banking in the Punjab?—*A.*—That is unfortunately true.

Q.—But everywhere in the world there have been failures at first?—*A.*—Yes.

Q.—You still think that your proposal will not hinder development?—*A.*—I think it will improve things and restore credit.

Q.—Then you say, "I think the auditors whether European or Indian, were no good." Have you European auditors too?—*A.*—Yes. There were some Europeans, but who called them auditors? They were not auditors in the real sense.

Hon'ble Pandit M. M. Malaviya.—*Q.*—Which banks had you to deal with in the liquidation courts in the Punjab?—*A.*—All the banks except the People's and Amritsar Banks.

Q.—All except the People's and Amritsar Banks?—*A.*—Yes.

Q.—Then I take it that your remarks relating to these two banks, the People's and the Amritsar Banks, are not based upon the knowledge derived from your liquidation proceedings?—*A.*—From some companies, which were off-shoots of the Amritsar and People's Banks with which I was dealing.

Q.—So far as these banks were concerned you had not to deal with their liquidation proceedings. I take it then that you have no knowledge as a judge of the affairs of these two banks?—*A.*—None whatever.

Q.—You have given here general remarks regarding the character of the management of the banks with which you have had to deal as a judge, did the managers of the banks have an opportunity of explaining their conduct before you?—*A.*—There was a public examination, they were publicly examined.

Q.—And their books were examined?—*A.*—Yes.

Q.—You say here that one of the causes of the failures was the high rate of interest?—*A.*—Yes.

Q.—And the second cause you give here is that these banks invested their money in industries?—*A.*—No, no, excuse me, I say in industries of which they were common directors.

Q.—That is your objection: you don't object to their having invested money in industries?—*A.*—Certainly not, only a certain proportion of it: what I object to is that these managers were managers of the banks as well as of the industrial companies with which these banks had dealings.

Q.—How many were the banks the proceedings of which were before you roughly?—*A.*—About 50 banks and companies.

Q.—And of how many of these banks you would say that this remark would be true? I just want to know whether it applies generally or only to particular banks?—*A.*—I have given specific instances.

Q.—I do not want all that, I want to have an idea as to the proportion of these 50, whether three-fourths or half or one-fourth or whatever it may be, as to the proportion of these banks to which your remarks apply?—*A.*—Four-fifths I should say.

Q.—That the directors of these banks did, as directors of the companies, lend money to themselves as borrowers?—*A.*—As borrowers, yes.

Q.—What percentage of the directors?—*A.*—I should say about three-fourths or four-fifths.

Q.—Four-fifths of the directors of these banks had borrowed?—*A.*—Directors of the allied concerns.

Q.—I am speaking of banks, let us confine ourselves to that: four-fifths of the directors of these banks, three-fourths to four-fifths had borrowed money from these banks in their private capacity?—*A.*—Not in their private capacity, but as directors of allied concerns.

Q.—Did the directors also borrow money in their private capacity?—A.—Yes, to a very large extent, about three-fourths.

Q.—Do you say that about three-fourths to four-fifths of the directors of the concerns, the proceedings of which were before you in liquidation borrowed money in their private capacity from these banks of which they were again directors?—A.—Yes.

Q.—Was it a very large amount?—A.—Sometimes it was very large.

Q.—But generally small?—A.—Yes, but beyond their means.

Q.—In the case of three-fourths to four-fifths?—A.—Yes.

Q.—You say here that they were generally speculations of a shady character: what was the speculation that you have in mind, generally speaking what was the character of the speculation? Was it gambling in silver, in grain or what?—A.—Are you asking about any particular company?

Q.—You say generally all these were generally speculations of a shady character?—A.—Well, the musical association for instance.

Q.—That is what you mean by speculation?—A.—In leather works and jewellery works and cinema works, where there was nothing practically done.

Q.—I want to get at what you mean by speculation: what do you mean by saying that there was practically nothing done? Was there no leather works started?—A.—I do not say so.

Q.—You will not be positive?—A.—When I came to sell the factory, it was sold for 800 or 400 rupees, the factory had cost something like 20,000 rupees.

Q.—But there was a factory and it did cost 20,000 rupees?—A.—Yes.

Q.—Then why would you call advancing money to that factory a speculation? When the money was advanced there was a factory which did cost 20,000 rupees, was it not?—A.—Of which not more than 5,000 rupees was visible.

Q.—When the money was advanced was it worth Rs. 20,000?—A.—When I said it cost Rs. 20,000, I meant it cost in the books Rs. 20,000.

Q.—You cannot say whether it really did or did not cost so much?—A.—I know that it was estimated, but it was found to have cost not more than Rs. 5,000.

Q.—It had been overcharged, over-priced?—A.—Yes.

Q.—Very well, that is what you mean by speculation?—A.—Yes, speculation in one sense because these companies had no capital of their own.

Q.—You mean to say that these advances had been made on insufficient security?—A.—Yes.

Q.—That is what you mean by speculation?—A.—Yes.

Q.—You don't mean they speculated in silver as in Bombay or in grain?—A.—Not in that sense.

Q.—You say that the present Indian Companies Act does not go far enough to achieve the objects which you have mentioned?—A.—Yes.

Q.—Have you had to deal with many companies which have come into existence since this Act was passed?—A.—Only a few.

Q.—And you base this remark of yours upon the experience you have derived in dealing with those few?—A.—Yes.

Q.—You complain here of the general apathy of shareholders in the affairs of the companies. That is a matter of general complaint, we have heard much about it; but you say that when the proceedings were going on in the liquidation court, not many of them would turn out to see and check accounts. Is it peculiar to the Punjab or is that the story of all liquidation proceedings of banks?—A.—I have not much experience of other provinces, I am speaking of the Punjab.

Q.—Before writing this note and putting it before the committee, did you spend any time in studying the failures of banks in England or in America or in Germany?—A.—No.

Q.—You said you want a revised Act, a more stringent Act, didn't you? You want more stringent banking legislation?—A.—I do, yes.

Q.—And you think that will be a safeguard against failures?—A.—I think it will restore public confidence.

Q.—The Act will?—A.—I mean to say there must be some more control, but that control I do not give to any Government, but I give to the Committee of Inspection and Board of Trade.

Q.—You think the confidence will depend more upon legislation than upon the actual men who are carrying on a business who are engaged in the business?—A.—You want some sort of check, and the shareholders are supposed to exercise that check, but as a matter of fact these shareholders never take any interest; therefore you have got to make some change to check the directors in the initial stages.

Q.—You made a remark in answer to Sir Fazulbhoj that in many instances they were due to fraud on the part of the directors; I did not exactly catch what you said; did you mean the failures?—A.—Yes. I did not say directors, but managers or managing directors; I have said in many cases the directors were quite honest, they were rather dupes.

Q.—You mean that in many instances the failures were due to the fraud of managers and managing directors?—A.—Yes.

Q.—You have spoken of the preliminary expenses being rather heavy: are you aware that in floating companies, joint stock companies and concerns in the west, a certain amount is put aside to meet these preliminary expenses as necessary and unavoidable for advertising, for organisation, etc.?—A.—Quite so, I understand that is so, but then how long? Here you have recurring expenditure for a number of years and the amount of preliminary expenditure exceeding the total amount of the dividends paid throughout the existence of the company.

Q.—But if a certain amount of preliminary expenses have to be incurred, then the mere fact that these were spread over three or four years would not by itself be an objection?—A.—No.

Q.—You object that dividends should have been paid when dividends were not earned, that is your real objection?—A.—Yes.

Q.—But if preliminary expenses must be incurred and if the company has properly shown them as preliminary expenses then there would be no objection?—A.—What I mean to say is that preliminary expenses mean any expenses incurred in connection with the registration of the company and of course expenses incurred in advertising and printing, stationery and such items during the first year. Preliminary expenses do not mean the salaries given to the managing director and other directors for a certain number of years. That is the thing which as I have pointed out has been done here. In any well-regulated company, these preliminary expenses should go down every year, but in the case of the companies I have been dealing with, I can give you any number of instances, that these have been mounting up every year from Rs. 5,000 to Rs. 10,000, Rs. 15,000, Rs. 30,000, Rs. 35,000 and Rs. 40,000 and so on.

Q.—Then it was not a case of one lump sum having been spread over more than one year?—A.—No, no, I do not object to that.

Q.—Speaking of a certain bank and a certain gentleman having started a network of ginning and cotton factories, you say "the latter bank locked up its money in a big concern like this and when there was a run on the bank it came to grief?" Do you know that excepting the Bank of Bengal and the Presidency Banks, many other banks take mortgage of immoveable property and lock up their money in that way for a number of years?—A.—Do they lock up 80 per cent?

Q.—You say that the fault of these banks was that they advanced too much money on unliquid security?—A.—I say if they advanced up to 20 per cent or 25 per cent on immoveable property and industries, there would be no harm done.

Q.—So you only object to the extent of such investment? You don't object to it in principle?—A.—Not at all.

Q.—You say here "sound bankers would not advance money to be locked up in iron and bricks. If you go to the Bank of Bengal or the Alliance Bank they would always like to keep their money in liquid form on good security." Have you any personal knowledge of the affairs of these two banks or was it merely a supposition you stated?—A.—I have no personal knowledge.

Q.—That they keep their money in liquid form?—A.—The bulk of the money, I don't say all. In the case of the Bank of Bengal they are not permitted according to their constitution to invest in immoveable property.

Q.—They are bound by their constitution, but do not the Alliance Bank of Simla advance money on mortgages?—A.—I have no personal knowledge that they do this?

Q.—You say 90 lakhs out of a crore or so in the People's Bank had been sunk in machinery and buildings. I take it that this is not from your personal knowledge?—A.—No, that is what I gathered from the published reports.

Q.—In answer to a question by the Honourable Mr. Maynard, whether there was any liquid security in connection with these industries, you have said here that the advances should have been made on goods or raw-material with adequate margin. Now you are aware that several of these banks have paid up part of their depositors, I mean some 16 annas, some 12 annas, some 8 annas, and so on: are you aware what liquid security there was in several of these banks when they closed their business?—A.—When you are talking of 16 annas, those 16 annas and 12 annas have been paid after recovery from unfortunate shareholders, not from the assets of the banks.

Q.—Is it so?—A.—Yes, in the majority of cases.

Q.—Do I understand you to say that the payment of 16 annas to the depositors has been brought about by drawing upon the shareholders?—A.—Yes, certainly.

Q.—Not from the assets of the companies?—A.—Not at all, in the case of nearly all the banks that I have been dealing with, I have paid at least 12 annas in the rupee and in some 14 annas and sometimes 16 annas and a good proportion of the money was represented by the recoveries which I have made from the directors on account of their misfeasance. In the case of the Peshawar Bank, for instance I recovered Rs. 75,000 for their acts of misfeasance: that is how I was able to pay 16 annas in the rupee.

Q.—Do you say that that applies to many banks?—A.—Yes.

Q.—You say here that these industries have not done any good: that is rather a sweeping observation: is it not?—A.—I refer to those particular industries which were started by the companies in liquidation: I am not talking of all industries.

Q.—You were asked by the Honourable Mr. Townsend "unless the banks had not advanced so much money on unliquid securities the industries would not have been started at all:" and you say here that the industries have not done any good?—A.—I mean the industries which came into liquidation.

Q.—Then in reply to the question "why did these people not invest in industries, and why did they invest in banks," you say "many of these depositors were investing in factories, but when these banks came into existence they put in their money in them:" Was this going on in many places in the province, that these men who became depositors had been investing in industries?—A.—I know a great many instances in Delhi. For instance, in Krishna Mills these people were depositing their money at 5 to 6 per cent per annum.

Q.—That was a general remark?—A.—That was general.

Hon'ble Mr. H. J. Maynard.—Q.—As regards speculation do you happen to know anything about the Upper India Real Estates Company?—A.—Yes, I know something about it.

Q.—What happened in that?—A.—Well, it was started by about 7 or 8 individuals, and the paid-up capital of this company, I think, was about 3,000 or 4,000 rupees, not in hard cash, it was all spent in expenses, and the People's Bank advanced something like 8 lakhs to this company. As far as I understand they were buying up land, and selling land and speculating in land.

Q.—Was there any income at all?—A.—No, it was a one man concern practically, and I think this company was running at a profit inasmuch as the price of land increased mainly afterwards, since it began its purchase.

Q.—But it finally went into liquidation?—A.—Finally it went into liquidation because the company owed 3 lakhs to the People's and Amritsar Banks, and the banks made demand, and then the directors of these banks went into liquidation; afterwards they had made a sort of settlement with the directors of the People's and Amritsar Banks, by which all their property which was profitable went to the directors of the banks.

Q.—You said it had Rs. 3,000 capital: it had as a matter of fact I think Rs. 16,600, and the loan was not 3 lakhs but 15 lakhs; the figures are not quite correct.

WITNESS No 381.

MR. LIONEL HEATH, *Principal, Mayo School of Art, Lahore.*

WRITTEN EVIDENCE.

I GIVE the following views upon industrial matters as a result of my experience as a craftsman at home and here and an Inspector of Industrial Schools in this Province for the last six years. As Principal of the Mayo School of Art I have learnt something of the motives that move a student to seek knowledge in crafts, and I have learnt that in the majority of cases students join that school with the ulterior purpose of getting Government employment as Drawing teachers, craft teachers, or draftsmen. This is not all to the bad; they hand on the training they have received, but it is generally in a very diluted form. I would rather see the craft student return to his home in larger numbers.

I am chiefly interested in the preservation and improvement of village and cottage industries, and I notice that as soon as you take a boy from his village and educate him with book learning he is lost to his hereditary calling. My hope therefore is to see a minimum of book knowledge followed by technical training in a definite direction and to see the craftsman got at in his village with all the resources that science and art gives us. It is with this object that I advocate industrial schools in the industrial districts and taking our knowledge to his front door in the form of peripatetic experts and local exhibitions.

I should like to see appreciated the fund of skilled and artistic taste lying in most cases dormant in the Indian craftsman, to a great extent unspoiled even yet, but which is fast being lost or ruined, first, by his ignorance of changed conditions and taste and, second, by a system of education that has not taken into consideration the peculiarities of his requirements and the value of his traditional craft methods. As a consequence he has fallen into the mistake of copying bad specimens of western craft, this being the only available means he has seen of educating himself.

If the best native industries are to be preserved and encouraged, it is a process in which a little expenditure is useless, and very little of the public funds have been available for it up to the present time. Lavish expenditure in technical and commercial education is as necessary in India to-day as it was in Japan fifty years ago, and would I believe give as profitable results.

II.—Technical aid to industries.

I have no knowledge of any technical or scientific aid from Government that is within the reach of the industrial worker of this Province, agriculture not being included as an industry.

In my opinion Punjabi may be considered to be one of the most skilful, apt and industrious of all India's industrial workers when under direct supervision, yet it is an indisputable fact that most of the industries have failed to maintain their popularity and have in most cases steadily deteriorated in quality and quantity owing as I take it in a great measure to want of technical and commercial knowledge. I will mention a few only that have particularly suffered. Carpet-making, all kinds of dyed goods and printed cottons, woven goods, pottery and tiles, silver wares, and wood-work, especially of decorative quality.

I am aware that these industries have suffered in a great measure through the changes in industrial and commercial conditions, but there is no doubt in my mind that they would have suffered much less if there had been available any sort of technical and scientific assistance.

Dyeing industry.

One industry in particular would be likely to benefit greatly if there were a Government demonstration and research institute, and that is the dyeing industry. Vegetable dyes are no longer so beautiful nor so *pukka* as formerly and a great number of industries and art crafts are affected, notably those mentioned above. The Punjabi has either lost the traditional methods of preparing and using these colours or has through stress of commercial competition rushed the process and so has lost beauty of effect and permanency of colour. Research might surely assist the small producer in economy of labour and cheapness of production. As long as the traditional crafts of India are appreciated and it is desired to preserve them in their traditional forms so long will such aids to beauty as vegetable dyes be required. Experience shows that while science cheapens and perfects production in the commercial sense, beauty suffers from this very quality of scientific perfection. As an instance I may mention the loss of our power to reproduce the beauty of the Persian tile and the comparative crudeness of aniline dyes or again the deterioration in the colour of the Multan tile due to the unalloyed purity of the metallic oxides used which could not formerly be obtained in the bazar and had to be prepared by the workman himself.

One must realise that aniline dyes have come to stay for good or evil, but their uses are not understood, with the result that cheap fugitive colours are the most in vogue and probably even the best way to treat these is unknown or at any rate the worker does not trouble to carry out instructions issued with the dyes. I have it on the authority of Professor A. G. Green, F.R.S., late Professor of Tinctorial Chemistry, Leeds University, who is responsible for the discovery of many of these colours that properly prepared and used aniline dyes may be as permanent as vegetable dyes. That as used in India they are not permanent everybody has ample evidence. Any one who has compared the beauty and permanence of the old woven and embroidered goods with the later qualities must realise how much the workers have to learn of scientific dyeing. For instance, in woven materials look at Rampur chaddars, Kangra and Kashmir pattoos and tweeds or lungis, pagris or kayes from the Eastern Punjab, or in embroidered goods look at phulkaris or Chamba rumals. I think every one will agree that all these have been ruined by bad dyeing, mostly with aniline dyes.

For these reasons I am in favour of having a provincial research and demonstration institute for dyeing in the Punjab. Its aid must be within the easy reach of all workers, possibly on the lines of the Lyallpur Agricultural College. I am strongly in favour of spending the money available by bringing experts to this country rather than by sending Indians to England; my experience being that the Indian returning to India after a year or two in England is only partially trained and has lost all sympathy for Indian workers and only strives to transplant Western styles and methods here without any desire to help in the improvement or preservation of Indian crafts. A system of travelling scholarships in India, something on the line of those of the Manchester School of Technology by which a student is enabled to tour about and make researches into the failures and beauties of their work in other provinces, would do much more to conserve the industries and crafts of this country than any amount of foreign travel, if as I propose there was the expert and scientist at the immediate back of them. Unless it is desired to turn out Indian industries from one Western mould, I am not in favour of increased facilities for research or study in England except in the case of purely scientific work; what we do want is to keep the individuality of Indian industries and to do this we want to encourage the study and appreciation of what is best in them which could be done best by Indian travelling scholarships. There are none so ignorant of what is good in their own country as the Indian students. When the expert staff of such a research institute as I suggest had been able to train Indian Professors, they should be allowed to give a liberal proportion of their time for the purpose of travelling and giving advice to private firms or smaller communities of workers. I think it will be admitted that you do not reach the Indian worker by taking students into a technical college; you must devise some means of bringing your knowledge to his front door. In important industries it may be done from a centre by means of travelling experts or in the smaller industries by means of village demonstrators permanently employed to gather round them the artisans for instructional purposes. This could only be done by a Department of Industries having command of experts peculiar to the needs of the Province. The Director of Industries here has one such expert in his weaving department, but one man can hardly cover a Province like the Punjab. I do not see any advantage in giving the Director of Industries the assistance of young civilians without any technical or scientific knowledge of industries for the purpose of interpreting to the worker the expert's advice and instructions, as was recently done in this Province in the case of certain defects in Multan tiles and pottery. The expert must come in direct contact with the worker if any good is to result.

Pottery and tile work of all kinds is another industry that urgently needs a central research institute not only to improve existing industries but to give assistance to commercial potteries. This is a trade that has a certain future in the Province: the raw materials are here or in adjacent provinces. A small works called the Eureka Tile Works, has already been started by two brothers; formerly students of the Mayo School of Art, after studying in England, but they are handicapped by want of expert advice and capital. I have already proposed this craft as one of those needing initiation in the Mayo School of Art where it was formerly practised, but money has not been available up to the present and this is an industry that requires the latest and best scientific knowledge.

The peculiar circumstances by which metal has fulfilled most of the requirements of the Indian population are not likely to continue indefinitely, and I think one is justified in foreseeing a big future for the pottery industry in India.

III.—Assistance in marketing products.

I believe the original intention of having provincial museums was that they should influence and encourage industries. I know that this was the intention in founding the Central Museum, Lahore. As far as I know this aim no longer enters into policy of any

Technological Institute.

Pottery.

Commercial museums.

provincial museum and beyond the small influence that the sight of beautiful things may have upon the uneducated I am afraid that the existing museums have little or no educational or encouraging effect upon the class we wish to reach.

There used to be a small sale room (*vide* appendix A) attached to Lahore Museum, but it was closed before my time as it was considered to achieve no useful purpose, but in this case there was neither the money nor organisation to touch even the fringe of a very large problem.

I am in favour of commercial museums run on lines which would give proper prominence to both the commercial side and the craft side. It must have a head who could hold the balance fairly between the different communities and interests concerned, the man of taste and the man of business. It might well be under the controlling influence of the Department of Industries if such existed, but I am not in favour of its being run by a Government service man. I am not a business man and I do not know what are the requirements of organised business, but I know that the unorganised craftsmen badly need means by which they can not only find a market for their productions but obtain data that will give them an idea of what is in demand and the changes that are constantly occurring in that demand.

In my experience the Punjab cottage industries die simply because tastes change and the craftsman remains the same; he has no knowledge by which he can adapt his traditional patterns to modern requirements; as cost of production goes up, his work goes down in quality which is the only way he sees of meeting the exigencies of the case; as he has no direct connection with the public he is forced to sell to the middle man and his profit is still further reduced. Such industries as Chiniot and Hoshiarpur wood work, Multan pottery and tiles work, and silversmith work are instances to hand. If commercial museums were formed and connected with local committees in the various craft centres whose duties would be to collect materials to give information in the course of their tours and if too there were a well considered and arranged publication by which up-to-date designs were placed before the craftsman, connected with and circulated by the museum [see my note (*vide* appendix B) on the *Journal of Indian Art and Industry* in reply to endorsement No. 1134, dated 22nd November 1910, from the Financial Department, Punjab Government], we should have the nucleus for a scheme of encouragement and conservation that I think would have far-reaching results.

Exhibitions.

Industrial exhibitions do not appear to have had any very great advantage. In the past they have been too few and far between; before their value becomes known they are over. We want the constant dropping rather than a heavy downpour; the Indian is too slow to change for an exhibition once in ten years to have any effect, but I do think that the idea of travelling exhibitions is a good one in order to bring direct to the worker the needs of the market. I have long felt the same want for the improvement of design and execution in the industrial schools under my control, and I have introduced a similar idea on a small scale by which I circulate to industrial schools through the Deputy Commissioner the spare products of the Mayo School of Art showing articles in wood and metal of improved design and construction, the object being by passing on from school to school to have a constant succession of different objects and so in the course of time to improve the Indian crafts work in these mediums. At present this has only begun and it is difficult for one institution to produce in the school course many objects in the year, but from the results obtained from one industrial school, *viz.*, the Amritsar School, it is evident, the advantage that is obtained from having a high standard to work to. I am convinced that some system of travelling exhibitions in which the work of the special industries of the locality were dealt with would have a beneficial effect, but I am not at all sure that short time exhibitions in small places would be either the most effective or the most economical methods of introducing new ideas, partly because of the difficulty of obtaining housing and partly because of the deterioration the exhibits would be bound to suffer under the travelling conditions of goods in India. On the whole, a system of periodical special exhibitions in the larger centres that might remain open even as long as six months seems to give the most likely chance of good results. I think Government should encourage such exhibitions and they might finance them to the extent of providing the specimens that are to form the exhibition, whether of foreign or Indian manufactures, but I am not in favour of Government paying for the exhibition. The Indian communities should be taught to help themselves and the surest way to ensure them acquiring knowledge is to make them pay for it; therefore these exhibitions should be run by communal or private enterprise. Government policy should be in the direction of giving facilities for the acquisition of new plant or apparatus rather than by financing the workers. For instance, if as a result of an exhibition of pottery and tiles held in Multan, the potters wish to acquire the simple machinery used in the preparation of the various "spurs" used in firing modern pottery, specimens of which would naturally be part of the exhibition, and which are quite unknown in Multan; then I think it should be possible to purchase

through Government the necessary machines on some such system as the hire-purchase, this being a case in which it is impossible to improve the industry without modern appliances and small workers could not obtain the same except by financial assistance. One small spur works could supply a whole district and the potters would speedily learn that instead of 70 per cent of their produce being scrapped or sold as "seconds" 70 per cent at least would be marketable with the help of spurs alone.

The exhibitions in most cases should not be popular in character, but should have the two-fold purpose of showing workers what the market demands and when convenient, how the result is produced, and purchasers what the workers produce, the primary object of what I may call these local exhibitions being the education of the worker into the laws of supply and demand and improvements in design or construction. It should be very helpful if lists of imported articles were circulated and some of them exhibited in commercial museums or local exhibitions.

IV.—Other forms of Government aid to industries.

I have only experience of one raw product owned by Government and that is wood. I do not know if any measures are taken by the Forest Department to ensure a supply of seasoned wood, but early in my service I found it practically impossible to get wood of seasoned quality. Realising that it was impossible to do good work without good material I obtained Government sanction to purchase and store Rs. 10,000 worth of wood, but although this amount of wood was purchased, I received no assistance from the Forest Department in obtaining either good wood or reasonable rates; in every case I was told I could not be supplied. Only in the case of shisham wood did I buy from the Forest Department some logs in the open market at their own price, described as of first class quality, cut in 1912 and sold in 1913, an increase of 50 per cent being charged if any selection was made, only to find it of such coarse fibre and so green as to be useless for purposes of cabinet-making. Neither teak, deodar, nor any of the rarer woods have I been able to purchase through the Forest Department. Teak of all woods is the only one that has any pretensions to be seasoned, and I am told that the reason is that it is ringed and left standing for 10 years before cutting. Whether this is so or not, it is fairly well seasoned in bulk; but as wood cannot be properly seasoned until it is cut into planks or scantlings, it is not what it might be; it is also too expensive a wood for general purposes.

Supply of raw materials by Government.

I think it is general knowledge that wood-work made and purchased in India soon warps and cracks and will not stand being exported home, and also that the quality of material apart altogether from workmanship does not compare with older work.

It is also general knowledge that a firm like Maple's or any other first class cabinet-maker stacks his wood and does not use it for 30 years after it is cut into suitable thicknesses. The lack of any such material here is bound to militate against both good work and its ready market. It is quite impossible for the ordinary producer to stock wood in any quantity sufficient for seasoning and one problem is how to meet his requirements, another is the requirements of Government departments. As far as I am aware the State railways are the only departments that can afford to stock any quantity; certainly contractors under the Public Works Department appear to have no facilities for obtaining good wood.

It appears to me that some action might well be expected of Government who owns such a raw product as wood to ensure that it reaches the consumer in a state fit for use. I realise the costliness of locking up capital for 30 years in central stock depôts, but if Government action is necessary to encourage and improve local industries, I see no alternative than to start with improving the quality of raw material and facilities for getting it to consumers at reasonable rates, especially in the case of unbreakable raw materials such as wood, China clay and gypsum stone for the making of Plaster of Paris. A load of shisham wood logs, value Rs. 1,245, cost me Rs. 265 in freight and cartage from Changa Manga to Lahore, while a truck of 659 maunds of gypsum value Rs. 127-11-0 at Behra, costs Rs. 105 in freight to Lahore and Rs. 37 for loading and cartage.

V.—Training of labour and supervision.

It is possible that the lack of primary education has hindered industrial development, but I do not see that primary education as at present practised will do much to encourage industrial development, though a well considered system might do much. I mean by this a system that should bear in mind the possible finishing of the boy's education at the primary department so that it should be as much as possible complete in itself; not aiming at leading to future literary education, but aiming chiefly at training the boy's intelligence, power of observation, control and initiative, rather than giving him book knowledge, a smattering of subjects, or a little knowledge of English. Primary education could include with the three R's a compulsory training in Kindergarten work, drawing

and general manual training, all on educational lines so as to lead up to special schools for the training in craft work.

Proposals for industrial training.

My report (*vide* Appendix C) on the industrial schools of the province in the appendix to the 1914-15 Educational Report will give my opinion on the work the industrial schools had up to that time achieved.

Since then the question of industrial training has been considered by the Standing Committee on Industrial Education and my proposals to this Committee were roughly on the following lines :—

- I.—That any attempt to teach craftsmanship in Primary Industrial schools should be abandoned, that they should no longer be recognised as industrial schools but as schools of manual training, and so be transferred to the control of the Inspector of Drawing and Manual Training of the province.
- II.—That general education in Middle Industrial schools should be stopped at the V. Primary and the subjects taught in the Primary department be co-related to the craft work of the Middle department.
- III.—That, in order to inculcate discipline and hard work, eight hours should be the working day of the Middle department, six of which should be devoted to craft work and two to drawing, mensuration and special subject related to craft work, such as English related to materials, tools and apparatus or a knowledge of the preparations of materials like wood, metal, etc.
- IV.—That such schools should be under the control of craft-knowing heads, and under the inspection of an Industrial Inspector, not an educational Inspector as at present.
- V.—That such Middle Industrial schools should be fed from Primary Manual training schools and in turn should feed advanced special schools as that proposed for Jullundur on the lines of the Bareilly School of Carpentry.
- VI.—That it would be essential to equip all Industrial schools with up-to-date light power machinery and that the crafts taught should depend upon local demands and that where possible the students, should be apprenticed to local works or Municipal workshops.

As an experimental measure I was permitted to make a test at the Amritsar Industrial school rather more than a year ago, and although I anticipated that the stopping of general education at the V. Primary and the learning of English would greatly reduce the number of students. I also foresaw the prospect of better craft-training bringing back a class of student really anxious to improve his knowledge of practical work. This has proved true, while the increased working hours have shown increased quality and finish.

The experiment at Amritsar is by no means complete for two reasons, first modern machinery has not yet been introduced, and second the proper co-relation of general subjects to the crafts taught has not been commenced owing to lack of the right text-books but the results already obtained go to show that we are now on better lines though sadly handicapped for want of money. This much is at least evident—that the present eight hours working day gives better discipline—one of the first essentials for all industrial training and that if a boy takes the course now introduced he is at least anxious to improve and it does not lead him away from his calling as formerly might easily have been the case.

Combination of apprenticeship with technical training.

I am strongly in favour of combining industrial school training with apprenticeship to works but it is not easy to arrange outside big cities. Something has been done on these lines at the Railway Technical School, Lahore, by apprenticing pupils part time to the Railway workshops and also in giving half time apprentices in shops half time in the Railway Technical School for purposes of giving them theoretic training, mathematics and English; but in neither of these cases has it proved entirely satisfactory. In the first case the students of the schools do not receive more as part time apprentices than they would do if they had had no technical training, and so are not attracted to this form of obtaining knowledge; and in the latter case there has not been enough co-operation between the two institutions, and it has not been found possible to judge of the degree of advantage the shop-students have gained.

Industrial schools.

A wide system of industrial schools for the province has not yet received Government consideration, apart from the Railway Technical School there is not a Government Industrial School in the Punjab. Personally I do not think this form of training will achieve success as long as it is left to local bodies who either have not the funds or else a

settled policy in the matter. The failure of these schools up to the present only shows the hopelessness of attempting industrial training on profit-making lines and without liberal expenditure and does not show that small industries cannot be improved and encouraged by a sound system of industrial schools. It is an interesting object lesson to compare the Railway Technical School with local board schools in other parts of the province. In the first you have a school liberally equipped and supported by Government money where the whole efforts and policy of the Managing Committee is to perfect the training of the boys and to give them a chance of future employment. No attempt is made to make it self-supporting but to train the sons of artisans in the use of modern machinery as an aid to construction and finish. That the school fills an important place is evidenced by its popularity there being at present 400 pupils on the rolls and also by the fact that it attracts the sons of artisans to a greater extent than other schools of this class.

Compared with this we have the various district board schools, starved of equipment and money in many cases, with under-paid staffs and ill-qualified teachers trying to satisfy the supposed demand for literary education and an undoubted demand for more craft knowledge, and achieving neither, because the literary education is in most cases unadapted to the requirements of the artisan and the craft that is taught could be learnt better in the boy's home if he is the son of an artisan—and if he is not, the time given to craft work is not sufficient even to discipline him to hard work far less to good work. Let me give an instance on the teaching of weaving in the Rohtak Industrial School. The district is noted for fine muslins. The only justification for teaching this craft in the industrial school would be that it could be shown that with improved looms and designs the work of the bazar weaver could be better or more cheaply done. What is done is to give an unqualified weaver Rs. 20 per mensem to teach weaving-work that the better class bazar weaver would be ashamed to turn out. The natural result is the failure of the industrial school to achieve any useful purpose.

I am in favour of a department of Industries taking the management of such schools, they would be in no sense educational concerns and should not be in my opinion under an educational authority if there were a properly equipped department of Industries with experts rather than officials at its command. I do not see how the two departments could work in unison in controlling industrial schools.

IX.—Other forms of Government action and organisation.

Under this head I only wish to call attention to silver goods as one of those products that urgently require some system of compulsory Government certificate and severe penalties for the sale of misdescribed silverware. Certificates of quality.

It is well known that the acquisition of silver and gold ornaments is the method adopted by the Punjabi for saving money and that the cost of making such ornaments varies from one anna to 4 annas per tola weight of silver used. If therefore hard times come, money can be raised by sale of ornaments with but small deduction for workmanship, if the original metal was good. Very different however is the case if the metal is dishonestly alloyed which is unfortunately a greatly increasing practice now-a-days.

This practice works harmfully to the industry in two ways: first, it checks the saving of money by buying ornaments: second, it gives the middleman an unfair advantage over the honest worker by enabling him to undersell and so forcing him into the position of a daily labourer instead of being a master craftsman. I do not hesitate to say that some of the silverware sold has no more right to the description "silver" than brass has the right to be described as "copper." This is pushing out the Indian worker and putting all the custom into the hands of European firms and the profit on European silverware is from 50 per cent. to 70 per cent.

The master worker would gladly welcome any system of hall-marking and willingly pay the cost as with his small expenses it would enable him to compete on advantageous terms with the middleman shop-keeper who is naturally not at all anxious in his short-sightedness to have to guarantee his goods.

That the profits of English silverware are so high is evidence enough that people will willingly pay for a guarantee of standard silver, and I think that no one will contend that there is any beauty in the English designs to account for it, though there is in the greater finish.

Latif in the "Industrial Punjab" tells us that up to 1890 there was a system of Municipal hall-marking of silver and gold tinsel in Lahore and in Delhi even later. He quite fairly contends that this system was the bulwark of the industry.

Another aspect of the case is that if hall-marking were insisted upon in India it would help in the employment of Indian workers for European firms who now import every

bit of their silverware from England instead of using the undoubted skill of the native worker.

If municipalities were willing to introduce the assaying and stamping of standard silver it might be left in their hands, with sufficient power of prosecution and penalty in cases of fraud or forgery of hall-marks; but I should prefer to see imperial control and uniformity of policy. Existing Government institutions might be made centres for testing and marking in the case of precious metals, as for instance mints or Industrial Institutions, but I have no knowledge of how hall-marking is worked in Europe.

APPENDIX A.

The object of the sale room was to encourage the artizans and to help the European tourists in obtaining ready-made objects without any difficulty.

The sale room was started in 1887 with a capital of Rs. 1,500 taken from the profits of the Mayo School of Art. Government having sanctioned a monthly allowance of Rs. 25 per mensem to the Registrar. There were two branches of this department termed: (i) Government purchases, and (ii) commission sale:—

- (i) Articles brought by artizans, dealers, and purchased by Government. These were sold after adding a Government profit of 10 per cent. and in some cases considerably more than this.
- (ii) Articles of great value brought by artizans and kept by Government on commission sale. These were sold at the prices fixed by owners but a sum of Rs. 6-4-0 per cent. was deducted from the proceeds, on account of Government profit, before payment to the owner.

This arrangement worked well from 1887 to 1892 as will be seen from the annual profits shown below:—

1887.	1888.	1889.	1890.	1891.	1892.
Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
106	622	805	840	562	245

average Rs. 600 per annum.

In the year 1893 at the instance of the Accountant-General it was decided to pay the allowance to the Registrar out of the profits accrued from the Art sale room. As the capital of Rs. 1,500 was spent in purchasing articles and there was no other fund to pay the Registrar the whole proceeds went to provide his allowance and consequently any articles sold could not be replaced. This arrangement brought the concern to an insolvent condition as the capital of Rs. 1,500 and the profit of Rs. 1,000, viz., Rs. 2,500 had been disbursed to the Registrar, and when the accounts were balanced in March, 1902, there was three months' pay (Rs. 75) still due to him and only Rs. 7 to the credit of the fund. The total loss during this arrangement is as follows:—

1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
17	300	24	149	80	101	229	306	226	204

To stop this unsatisfactory condition, in the year 1904, the Government sanctioned a special grant of Rs. 2,500 for the reorganization of the sale room and put it under the charge of the Darogah who was allowed 10 per cent. on profits (nearly 5 per month for this extra work.)

This arrangement worked well again as will be seen from the annual profits shown below:—

1904-05.	1905-06.	1906-07.	1907-08.	1908-09.
Rs.	Rs.	Rs.	Rs.	Rs.
17	93	92	128	54

In the year 1909 when the Lieutenant-Governor visited the Museum, it was proposed to abolish this department as the small profits did not justify the use of so much space which could be better utilized for the display of sculptures and other antique objects. The department was accordingly closed, articles on commission sale being returned to owners, after recovery of the advances made; those purchased by Government being sold by public auction and the proceeds utilized in the improvement of Economic and Industrial sections of the Museum.

The statement of account at the time of closure was as follows :—

	Rs.		Rs.
Capital in 1887	1,500	Cash in Treasury	4,347
Capital in 1904	2,500	Recoverable advances	331
Liabilities	5,924	Stock in hand	2,268
Profits	2,303	Stock in hand on commission sale	4,533
		Damaged goods	445
Total	12,227	Total	12,235

APPENDIX B.

With reference to the correspondence under consideration and to the Journal of Indian Arts and its avowed aim to promote Indian arts and industries I am inclined to think that, first the original proposals of which the Journal was only a part, for the promotion of industrial arts in India have been entirely lost sight of, and, secondly, that the Journal hardly makes any attempt to improve existing industrial arts which is certainly the first step necessary to their promotion. I consider that the Journal has become a connoisseur catalogue of Indian Industrial Arts as they were and in some cases as they have become in their decadence, but it gives no inkling of what they might be under the commercial and western influences which have to be recognised as here for ever.

Any one who has lived long in India must be aware that the conditions of supply and demand, the cost of labour and materials, the public taste owing to these conditions, and the influence of western taste have forced Indian arts into a channel foreign to its original course and leading only to cheapness and bad art. The idea that the Arts of India can be bolstered up and forced back into their original traditions against the powerful influence of modern conditions is to my mind a fallacy. The arts of a country grow from necessity, the most beautiful specimen of an industrial art must first be useful, and its essential beauty lies in its perfect utility, after that its beauty may be enhanced by decoration, the amount of which must depend upon its cost or commercial conditions. The tendency of all modern effort in the direction of encouraging Indian Arts has been towards trying to force good taste by reproducing and copying *ad infinitum* specimens of art for which there is no longer a demand in the true sense of the word, because such work has become too costly and the taste of the people has changed; whereas all our efforts should be directed towards showing to the craftsman and the people how the beauty of form of Indian arts may be retained, modified or improved to suit modern requirements and taste.

In the Punjab for instance in Hoshiarpur, Chiniot or Jhang the craftsman is struggling to keep his craft alive by reproducing over and over again specimens of inlaid ivory, brass, or carved wood-work, long after either the demand for such work is dead or the cost of production has become prohibitive. He cannot reduce the cost of production by simplifying the design or by reducing the amount of decoration as he has not the knowledge; his efforts all bear in the direction of trying to work quickly, and so bad work kills a craft that was already struggling against overwhelming odds to live.

Does the Journal of Indian Arts meet cases like this and half-a-dozen others in this Province? I am quite aware that when I propose modernising Indian arts on the lines I have suggested that lovers of Indian art will cry out against such a proposal, but I say a live art is better than a dead tradition, and whether we like it or not the conditions of life are powerfully changing the art of the country and our duty must be to direct that change not to try and stop it.

What I advise therefore is that after the war the Journal of Indian Arts should enter upon its second series with the avowed object of being of practical utility to craftsmen and to all who are desirous of improving design and craft work in India, of whom there are hundreds, that it should become the mouthpiece of the Art School, that there should be five central committees in the five art schools centres presided over by the five principals, who should be made responsible that their schools provide working designs for Industrial crafts based upon traditional Indian arts, where possible, but suited to English and Indian modern requirements, these designs to be reproduced side by side with the object that has inspired the design. These five central committees should be the clearing houses for material received from sub-committees in craft centres whose aim should be to collect or photograph good workable designs or craft objects and, starting with the five main centres permanent exhibitions should be founded exhibiting only those things that either show evidence of coming from a live craft, or things that show from their design and workmanship that they are likely to be in demand. The Journal, reproducing from time to time specimens of the finest India craft work, should devote most of its space to articles on craft work and technical subjects of use to craftsmen such as dyeing, weaving, pottery, and tile work, wood preservation and seasoning, metal alloying and metal spinning, bronzing and lacquering

on wood and metal and a hundred other subjects, of vital interest, and to the reproduction of photographs of actual objects of Indian Art with working scale drawings and giving cost of materials and production. In other words, it is essential to have an authoritative journal given up to the true promotion of Industrial Arts in India. It should be run at Government expense published in England where the subject matter for the articles and the contributions can be most readily obtained, it must be run by experts and not by departmental officers, and no expense should be spared in keeping India up-to-date on all matters of Industrial Arts and Crafts. It would help to bring the Indian Art Schools in touch with the whole of India and tend to check the tendency to make them manufacturing concerns and force them to be what they should be, i.e., centres of art, craft, education and design.

I do not wish to belittle in any way the most excellent work done by the Journal of Indian Art which has always been most excellently compiled and edited, and has established a most valuable record of the Indian Art Industries of the past, but I do feel most strongly that it would be a mistake to attempt to continue on the same lines in the future, when there is a crying need for a journal giving practical help to the craftsman of India.

APPENDIX C.

Note on existing Industrial Schools.

There is one thing that must be carefully considered while we are criticising industrial schools and seeking to improve them, and that is that, no matter whether the students are the sons of artizans or not, the vast majority of them is anxious only to obtain some form of Government employment. Even the cleverest of the boys who obtain perhaps a scholarship to enable them to continue their studies in the Mayo School of Art and after three or four years there, having learnt to do the finest craft work which would fit them to open their own shops for the production of really first class work, they readily throw up the practice of their craft in favour of a post as teacher on Rs. 30 a month. It is true they may become good teachers, but if they use all their training for the purpose of training others to become teachers how are the industries of the province benefited. Unless a fair percentage of these industrial students use their training in the continued practice of their craft there is something defective in the scheme of things.

These boys come of a class that usually have no means of commanding money with which to start industrial enterprises. It appears, therefore, that no industrial training is complete unless a system is devised by which a boy can be helped to start his own works when he has completed his training.

Taking industrial schools as a whole the following are the points which strike the observer :—

- (1) that a minority only of the pupils are of the artizan class ;
- (2) that there is no clear idea of the principles on which the schools are to work, that is, whether on educational lines or with a view to training craftsmen ;
- (3) that the buildings are unsuitable and the equipment insufficient ;
- (4) that the crafts selected for teaching are often neither related to educational value or the craft demands of the district ;
- (5) that although Government pay a grant-in-aid the governing bodies appear to have a free hand in appointing teachers, in starving the school of necessities or in trying to make sale-proceeds balance expenditure ;
- (6) that whether considered as a craft school or an educational school, the teachers are often untrained for either purpose ;
- (7) that the discipline is slack and the hours of work have no relation to the future life and labour conditions of the artizan ;
- (8) that the general education given is both in advance of, and unsuited and unrelated to, the work the boys will have to do ;
- (9) that the Headmasters of these schools in nearly every case are appointed by the District Inspector for the general qualifications and not for their craft knowledge so there is hardly a single Headmaster who is either qualified in or sympathetic with industrial training ; and
- (10) that although these are industrial schools or at any rate schools whose aim it is to train the industrial classes, it is the District Inspector and not the Industrial Inspector who represents Government in their management,

It appears to me that there are only two types of industrial schools possible. One is a school in which the Industrial classes shall have an opportunity of obtaining such general education as shall fit them to be better and more intelligent workmen and in addition be trained in the use of modern tools and a systematic course of craft work in order to give them step by step a knowledge ranging from plain work up to the refinements of construction and finish of the best type of work.

In a school of this kind general education should end at the V. Primary, and up to this stage, the whole course, whether general education, drawing or craft work, should be purely educational, but with a distinct bearing upon the future requirements of the craftsman. In continuation of this preliminary training there should follow industrial training in which the discipline and hours of work should be in harmony with those obtaining in the bazar and workshop in which the boys should be taught something of the origin, nature and cost of the material he has to work with, a proper system of estimating value of materials and labour, and honesty and refinement of construction and finish.

The second possible type of industrial schools is that founded with the avowed object of giving boys of the Industrial classes an opportunity of raising themselves by education out of the sphere of life in which they are. This school, I imagine, would lead to the High School and University. In this school drawing and manual training should be used to the utmost and only for the purpose of increasing the boys' general intelligence, powers of observation, self-reliance, and initiative. Such a school cannot properly be called an Industrial School.

With these two types let us compare the existing industrial schools.

While wishing to train craftsmen they give in many cases general education far beyond a craftsman's needs, and there is little or no attempt to give this general education any bearing upon a craftsman's work. At the end of a boy's training after 8 years he has learnt to work perhaps 9 hours a day at his craft when a bazar mistri has to work 8, 10, or 12. The tools he has been working with are little or no better than bazar tools. Even if the teacher is qualified he has no time to teach the boys any superiority of work or finish as he is required by the governing board to produce finished salable articles. With all his general education the boy cannot estimate correctly the cost of such a simple thing as an almirah; he knows nothing beyond the mere names of the materials he has to use. A boy in the Amritsar School, on being asked, said that steel was a mixture of cast iron and wrought iron, and that zinc was used by jewellers as an alloy in the making of silver ornaments, yet a boy from this school is appointed as a qualified carpentry teacher in Raja Sansi where manual training is taught for purposes of raising the boy's general intelligence. A boy in these schools, although he may spend 2 or 3 hours a day in manual work, is often required by the District Inspector to take drill as one of the many subjects he must learn. In the primary schools where the best teachers are required to give the manual training as educational basis, carpenters and blacksmiths are employed at a salary equal only to half what a good mistri can earn in the bazar. Tailoring or shoe-making are taught in some schools without any consideration as to either their educational value or the requirements of the district, for no other reason apparently than that the salary of the teacher is low and equipment little or nothing.

In Kalabagh, for instance, although iron work and weaving are the industries of the district, the industrial school teaches tailoring as an extra craft in addition to carpentry, not because the tailors want it as out of the 61 boys learning tailoring only 4 are tailors' sons, but because the boys like the easy work, and the parents say they can get a few pice as soon as their boys can run a loom or work a machine, then they leave the school.

As far as I can judge it appears that artizans do not send their sons to these schools, because they learn little in them that will be useful afterwards, and the craft they do learn could have been learnt better in the artizans' home, and by their school training they are undisciplined and ruined for hard work, those artizans, on the other hand, who do send their sons, do so not for the craft's sake, but in order to help their children by education to rise above the artizans' calling.

The result is this—by giving too much general education the divorce of the artizan's sons from his calling is assisted and by giving slovenly craft training and too much general education the artizan is made shy of sending his son, and the sons of non-artizans are encouraged to join and to aspire to become teachers of craft or drawing. Also the artizan feels that the proper industrial atmosphere is missing owing to the head not having the necessary training. It is most necessary that both by example and precept the boys should be led to consider craft work as one of the noblest callings.

In brief my recommendations are as follows :—

- (1) That the only official adviser for these schools in industrial subjects and general management should be a properly qualified and appointed industrial inspector with an assistant inspector for general subjects.
- (2) That no Head Master be appointed unless he is qualified in at least one craft besides drawing.
- (3) That all teachers be required to hold a departmental certificate which may be acquired either in a training institution or by proved ability and under recommendation by the industrial inspector.
- (4) That the Department should lay down definite principles governing industrial schools, and that no recognition or grants-in-aid be given unless the schools conform to these principles.
- (5) That general education should cease at the V. Primary standard with a special course in arithmetic for mensuration and estimating later.
- (6) That after passing the general education test all boys be required to work 8 hours a day not including recess.
- (7) That a minimum equipment be enforced together with an adequate contingent grant both based upon the number of boys in the school.
- (8) That a minimum scale of salaries be fixed.
- (9) That all buildings must be passed as suitable by the Inspector.

ORAL EVIDENCE, 15TH DECEMBER 1917.

Hon'ble Sir R. N. Mookerjee.—Q.—Your evidence is very clear on the subject of technical and industrial education, and I do not think personally I need ask many questions. There is one point I would like cleared up about your scheme of industrial education; does that relate to the education of artisan boys only?—A.—No, to the classes I have had personal experience with as an art craftsman, either artisan or non-artisan.

Q.—And their present prospect is or will be to get posts as teachers in industrial schools?—A.—I have said in my written evidence that I do think that is their main object; in the majority of cases I consider that their object is to get into Government service.

Q.—That is their present object?—A.—Yes, their present object.

Q.—But your object is to turn them into artisans?—A.—Our object is, I take it, to bring them into direct contact with the classes they come from with their improved training.

Q.—You have mentioned in one place about financial help; you say that you don't get any help to start any industry, how do you propose to remedy that defect?—A.—I think that an institution such as mine, which you might call the mother institution, and these industrial schools ought to have funds available for aiding boys who wish to work in a definite craft.

Q.—You would like to advance them money on loan?—A.—I think money should be advanced for the purchase of hand tools, to be collected by the district officers afterwards.

Q.—But that can be managed better by the Director of Industries?—A.—It might be if there were a properly financed department at his back; but I think there should be some means of helping the boys whom I knew were not provided with enough means to start on their craft.

Q.—Therefore you think that when they get education and pass from your school they should also get some pecuniary help so that they can start an industry of their own?—A.—Yes. I think it has been done, if I remember right, in a weaving school in Bengal. I have been told about a scheme by which the authorities were allowed to give as much as 100 rupees for the purchase of apparatus, and that it worked well.

Q.—You have no idea as to what the total amount will be, if you could start such a scheme?—A.—No, I have not thought of it, because some boys might only require hand tools, but others might require machine tools.

Q.—From your long experience with these boys do you think there is much risk in advancing a few rupees?—A.—I think it should be done under very careful supervision and enquiry. I think there might be great risk otherwise.

Q.—Even if there is a little risk, do you still think that it is desirable to make advances to prevent people who go out from your school from wasting their craft knowledge?—A.—I do most decidedly; I have thought very seriously over it; it is very disheartening to see a competent, certainly highly qualified craftsman in some directions, in place of taking up that craft and going back to his district or village, preferring to take up a teachership in an industrial school on 20 or 30 rupees often, though he has the chance of earning much more in his own craft.

Q.—Do you think there is any possibility of raising a small fund from the public here who interest themselves in the development of industries and keeping this fund for that purpose?—*A.*—I do not think so. So far as I know I do not see any sign of such keen interest as would suggest such methods.

Q.—So you must rely on Government?—*A.*—I do not see how you can do otherwise.

Q.—You have enumerated here certain defects in the present primary education system; have you reported them to the proper authority?—*A.*—There is my report on the industrial schools which was sent to the Director of Public Instruction. It is a matter of fact that was drawn up after I had made constant complaints of the condition of these schools, and the former Director of Public Instruction said, will you put up a note for the information of Government upon this point? and That note on education which was put up in 1914-15 was the result.

Q.—Have you heard of any action taken upon that report of yours?—*A.*—Yes, I think it also had some result; the Standing Committee on Industrial Education which was appointed by the Local Government took that report of mine as a basis, and many of the recommendations which they put to Government are based upon that criticism.

Q.—Has anything been done on those recommendations?—*A.*—Something has already been done because we have already adopted one or two of its suggestions, namely, that we want more discipline in labour, that craft boys must learn to work long hours, and so on; for that reason we started an 8 hours' day in Amritsar.

Q.—Then generally speaking the Education Department in the Punjab have accepted your scheme?—*A.*—I certainly think so.

Mr. C. E. Low.—*Q.*—Your staff does not admit of your keeping in touch with your ex-pupils in any way, I gather?—*A.*—No, my staff could not possibly undertake such a job, I think it should be undertaken, but I think one man would have to be deputed specially for it.

Q.—This proposal you make about giving boys enough money to purchase tools, that for instance could not be undertaken with any safety unless you had a special staff?—*A.*—I think we should have to have some means of making very close enquiries and some guarantee that the money would be returned. That I think might be done through district officers.

Q.—With the help of district officers?—*A.*—I mean in district like Lahore there might be a special staff of the school for that purpose who might also have some other duty, namely, the duty of keeping in touch with students who had already left the school.

Q.—Of course the trouble will be that if you are dealing through the ordinary district staff they will hold enquiries as to these men's solvency, and so on, so it may cost some money?—*A.*—Certainly, I realise that.

Q.—Then do you think that more could be done to help ex-pupils, get a market for their wares through a selling agency for instance?—*A.*—I think that is one of the most important needs of the whole concern.

Q.—Do they produce the best selling articles?—*A.*—They can only produce the best selling articles by having some means of obtaining information as to what is most in requirement; at the present time they have no means whatever.

Q.—You are aware of the arrangements made in Cawnpore and Madras and possibly in other places to bring articles made by Indian craftsman together where they can be dealt with?—*A.*—By means of an exhibition. I have been to Madras, and I went through that with Mr. Hadaway.

Q.—Have you seen such a thing in Cawnpore?—*A.*—I have not been there.

Q.—The connection between the selling agency there and the craftsman is probably more organic and direct, and they don't by any means confine themselves to artistic things, they sell quite ordinary things too?—*A.*—I do not think it would be necessary to confine it to merely artistic work.

Q.—For instance, we were informed by the manager of the Swadeshi Stores in Bombay that he found this Cawnpore agency a very handy thing to do business with. You think then that a small amount of staff would help you to fulfil all these objects?—*A.*—Well, these objects don't include one of the main objects, that is, to bring the work of an institution like mine into contact with the worker.

Q.—That is very largely a question of increasing the prestige of your school and methods in the eyes of the craftsman, and one way, almost the best way, of doing that is that you would sell his stuff if you find that he follows your advice?—*A.*—My own thought

was that the present effort that we have made to circulate things of good design and good workmanship into the districts would be a much better method than to have a big central exhibition. I must say if there is a district which justifies an industrial school I think it should also justify such an exhibition as would bring the craftsman into contact with the buyer.

Q.—But, is not the craftsman much more likely to follow your advice in any particular, if in another way you could show him how to earn more money? Is not that more likely to gain his confidence?—A.—Well, it is the difficulty of having a centre which is apart from a large number of small workers. I do not see in a country like the Punjab, where the workers are dispersed over large areas, how one central sales or commercial museum would fulfil anything like the objects that it aims at.

Q.—Well, it might fulfil this one object at any rate, namely, that it would be able to sell a lot of their goods. This does not preclude the existence of what you propose?—A.—No, it does not, but what I think is that you won't increase the sale of their goods unless they know what is really required, how the public taste is changed, and how commercial conditions force that change, and that I think can only be done by bringing your market for craft work into actual contact with the workers.

Q.—I do not know, unless the craftsman is materially different from the agriculturist; you have got to show them that any new method which you propose stands on some economic basis. They cannot take risks, and unless they can see their money coming back they are not going to enter into what is to them speculation?—A.—I quite see that.

Q.—If you can show a man that these things are certain sellers, then he will do it; it is not a very idealistic basis, but I think it is perhaps a practical one?—A.—I quite see that.

Q.—Have you ever put any proposals before the Government in the direction of fulfilling these objects?—A.—No, for the reason that I took control of this school only three years ago just before the war began; and since then it has been impossible to propose any expenditure, and therefore my closest experience of the whole work has been practically during the last three or four years.

Q.—Have these craftsmen got any system of co-operative work?—A.—I have never heard of any.

Q.—Are any efforts being made to induce them to take up such a line of work?—A.—Not that I know of, I have never heard of any.

Q.—You speak about the way in which the Indian dyers are turning towards aniline dyes: is it not the case generally that they prefer aniline dyes because the indigenous dyes take a long time to work and do not give very certain results on cotton at any rate when you have prepared them?—A.—I think that is probably the reason.

Q.—They like bright colours, their taste is in that direction?—A.—I think that is so. I think that is due to ignorance and decadence and it follows throughout craft work in India. It is a very natural tendency of the craft-worker to pick up anything new.

Q.—You don't think that their taste was always for bright colours?—A.—I think it was, but not for the cheap aniline type which is a very different type from the type of bright colours, which India produced herself long before aniline dyes were known.

Q.—You are using the word aniline not in its strict sense; you mean synthetic dyes?—A.—Yes.

Q.—You don't think that a proper use and combination of synthetic dyes could be made to give really desirable results?—A.—I have no technical knowledge of dyeing. I only know that synthetic dyes can be made perfectly permanent with a tremendously wide range of colours.

Q.—More permanent?—A.—Very often a good deal more permanent than the vegetable dyes. I know that from my own brother-in-law who is Professor of Chemistry in Leeds, but I have no knowledge of the working.

Q.—You give your idea about pottery works. Are you at all in touch with what has been done in Bombay in the way of research work in the School of Art there?—A.—I know they are doing the work there, I have seen before; they have developed their pottery school, I went through the school of pottery there; that was 6 years ago.

Q.—They are now doing practical research work, and they examined a large number of clays for different purposes; is not that also your idea?—A.—That is my idea.

Q.—Do you think there is scope for it in the Punjab?—A.—I am certain that with the help of some technical assistance of that kind, pottery such as the Multan pottery could be restored, not only restored to its original basis, but there is a possibility of eventually improving it.

Q.—You say that the peculiar circumstances by which metal has fulfilled most of the requirements of the Indian population are not likely to continue indefinitely, what do you mean?—A.—I mean to say that the prejudice against other materials is dying out.

Q.—But is there any prejudice against earthenware and glassware?—A.—I do not think there is, but the habit has been to use brass and copper.

Q.—But they have been using freely glazed earthenware plates and jars for the last 50 years to hold pickles and chutneys and so on in households, there is no prejudice against these?—A.—None at all, I do not mean to infer there is any prejudice against pottery.

Q.—You say "as he has no direct connection with the public he is forced to sell to the middleman and his profit is still further reduced;" one fault of the middleman in respect of special art wares is that he does not increase the range of selling?—A.—I do not think he helps the craftsmen in the least.

Q.—He goes in for the most crude forms of art ware?—A.—That is what I mean; far from helping the Indian craftsman he will take up the crudest of western forms of ornamentation, and lavish them in a most hideous way to the detriment of the whole art.

Q.—You are aware also that various commercial concerns have been opened in England during the last 8 or 10 years for the sale of Indian art wares and they have all been failures?—A.—I have heard that.

Q.—Do you know whether the articles sold in these shops in England represent the best Indian craft, the high range of Indian artistic wares?—A.—I do not think they represent in the least what India can do.

Q.—That is extraordinary?—A.—My impression is that they are goods made specially for the market and not goods made as part of the crafts of the people, which is quite a different thing. There are certain articles specially made for the European market such as Benares brassware, they are not Benares in the true sense of the word at all.

Q.—You are perhaps aware that there are very much better prospects in the United States for the sale of a good glass of Indian art wares?—A.—Yes, I know that many cotton printers have supplied cotton prints. There is a shop here in the bazaar, the man supplies cotton prints more to America than to any other country.

Q.—You can get lists of American dealers from the Commercial Intelligence Branch of the British Board of Trade?—A.—I don't know that.

Q.—And their Trade Commissioners will help you in the matter. Have you ever considered the idea of trying to get more foreign markets for this kind of things?—A.—Well, I have considered it, but it is a practical impossibility.

Q.—Is it a question of finance?—A.—I mean to say that the whole time at the disposal of myself and my staff is absolutely full up with practical work.

Q.—As far as you are concerned, it is merely a question of more staff?—A.—Not entirely! I do not think that business arrangements can come within the province of the work of a School of Art. A business man is wanted. I could not possibly touch that and carry on a School of Arts such as a I have got.

Q.—You want a man very much less highly trained than yourself with more ordinary qualifications who could do this kind of thing? Do you think there is a good field for taking up a vocation of this kind?—A.—I think so, but it ought to be a separate department, I do not think it is a job that you can expect my institution to take up.

Q.—What sort of officer do you consider is required for the inspection of industrial schools?—A.—That is rather a difficult question to answer. He must be sympathetic with Indian crafts, he must be an educationalist, I should say he must have studied the value of manual work as an education, he should also have a knowledge of modern requirements in craft work as against the present work of the different crafts.

Q.—Would you say that the man with the necessary qualifications is to be evolved or recruited?—A.—I do not think he could be recruited. I think that you could recruit a man and he could train himself afterwards. I do not think you could recruit a man with the necessary qualifications.

Q.—Do you consider that a man who would be satisfactory from the point of view of the craft schools will also be able to inspect both craft schools and ordinary industrial schools: don't you think it would be more satisfactory if you had separate inspectors?—A.—I do not quite follow what you mean by the word "craft schools."

Q.—Teaching ordinary bazar work which depends very largely for its sale on its beauty and artistic merit, whereas the other class of school would attempt to teach boys to qualify for organised industries or to turn them out as artisans to make articles of purely simple utility?—A.—I think that an industrial school should not attempt to be an art craft school.

Q.—Don't you think the result of the attempt to mix up the two will lead to the gradual neglect of the artistic side?—A.—I certainly think so, but the Arts Schools of India if properly equipped and financed can look after the art crafts.

Q.—Putting aside for the moment the question of art crafts, what sort of man do you think you want to inspect industrial schools pure and simple?—A.—I think for purely industrial schools you want a well educated man with a knowledge of industries and knowledge of craft work, that is all.

Q.—Do you think it necessary he should be an educational specialist?—A.—I do not think so.

Q.—An industrial man with an instinct for educational methods?—A.—I think the instinct of educational methods will be called out with the instinct of industry. I do not think there is any difference.

Q.—Do you think an educationalist pure and simple could pick up industrial methods and ideas?—A.—I do not think he will. I think you will want a well educated craftsman. He should be attached to a parent institution such as the School of Art in the Punjab until he has learnt his work.

Q.—How do you propose to get over his comparative disability as regards educational methods so-called? You consider that purely educational methods are vicious from the industrial point of view?—A.—I think that the educational methods ordinarily recognised in India are vicious. I mean to say by that that I think that a man who inspects industrial schools should primarily be imbued with the value of industrial schools as a means of training, not with any definite idea of making all craftsmen educated.

Q.—You don't want to improve educational methods in the industrial schools?—A.—I think that is provided for; the boy should be well educated in crafts; in other words, provided you start from the bottom and work up in progressive stages with the definite aim of training that boy to be careful with his hands, observant with his eyes and honest in his labour, you cannot expect more from an industrial school. This prepares him for the road you want him to go.

Hon'ble Pandit M. M. Malaviya.—Q.—You are an Inspector of industrial schools in this province; will you kindly tell us how many industrial schools there are in the province?—A.—There are about 30 industrial schools, they grew from about 10 five years ago up to 30 now, but 23 of these are primary schools; they were called industrial schools and have been industrial schools merely because they practice certain manual training, that is all, but in no sense are they industrial schools.

Q.—23 of these are primary, and you have 7 schools which you might put down really as industrial schools?—A.—Yes.

Q.—What industrial training do they impart in these 7?—A.—Mostly we have wood-work and metal-work only, but in certain districts they have weaving, in one other a small amount of pottery.

Q.—You say in one place in your note that there is no Government industrial school in the Punjab, except the Railway Technical School, then what are these schools, are they under district boards?—A.—They are State-aided schools, by which I mean (I believe I am right) about 2-3rds of the total expenditure on salaries can be given in aid by the Government to district boards running industrial schools.

Q.—You say you recommend that such schools should be established all over the province. I suppose you mean there should be a school in every district?—A.—I mean every industrial district, I do not mean all over the province.

Q.—Any district where there are industries?—A.—Yes, there should be industrial schools.

Q.—Is it your experience that men who do not belong to the particular castes which are carrying on these trades or industries are also taking kindly to industrial education?—A.—That is my experience. A good many do take very kindly to it.

Q.—Don't you think that even where industries do not largely exist at present, industrial schools might develop a taste for industries?—A.—That is really what I mean. I do not attach importance to industrial schools only because they are in industrial centres, but because I believe that industrial training is required by everybody more or less.

Q.—Would you have industrial training imparted along with general education?—A.—That is my point. In the form of manual training.

Q.—You say that primary education is not at present what it should be and that a well-considered system of primary education might do much to encourage industrial development. Under heading 5, you say that "primary education should include with the 3 R's compulsory training in Kindergarten work, drawing and general

manual training, all on educational lines, so as to lead up to special schools for the training in craft work." Is that the kind of industrial schools which you would have, that is to say, general schools with an industrial turn given to the education imparted in them?—A.—No, that is not what we have now.

Q.—That is what you would have?—A.—That is what I would have.

Q.—You suggest that general education for industrial schools should be stopped at the V Primary, I suppose you mean the 5th class?—A.—What is called the 5th upper primary is the 5th class.

Q.—In another place you say "I mean by this a system which should bear in mind the possible finishing of the boy's education at the primary department so that it should be as much as possible complete in itself;" do you think that if you stopped the general education of the boy at the 5th primary it would be satisfactory?—A.—For ordinary craftsmen, yes, I think so, provided always that the general education was related in some definite manner to any craft work that he might possibly have to do. I mean to say his education should be so self-contained or so unconnected with any definite future trade that he could go on with any craft if he did not want to go to a high school. I mean that the general subjects of education in the primary should be co-related to craft work, he should have some knowledge imparted which would inspire interest in craft work, which would help the boy from the very beginning to see that craft work is creative work and is one of the highest professions, not one of the menial professions.

Q.—Useful and artistic?—A.—I want to see a system of education that will give the boy, first interest and then carry on to enthusiasm in craft work, whether he is going to be a craftsman or not; that is my point.

Q.—You know the standard that obtains in England in the elementary schools?—A.—Yes.

Q.—Don't you think that we should aim at that? Of course it will take a long time to attain it, but don't you think that we should aim at that here?—A.—You mean manual training?

Q.—Compulsory elementary education such as you have in England, that foundation which leaves a boy with a general aptitude for pulling on with anything he may put his hand to?—A.—Roughly that is the idea.

Q.—You mention here the desirability of having a provincial research and demonstration institute for dyeing in the Punjab and you also mention the desirability of developing pottery and tile work; I take it that you mean that there should be one technical institute where these different branches of industrial research should be undertaken?—A.—That is my idea. I think on the lines of the Manchester School of Technology.

Q.—On the lines of the Manchester School of Technology?—A.—I mean to say that different provinces should have a technical institute which would deal particularly with the wants of that province, not necessarily only with the industries that already exist but also with those that may be developed.

Q.—For instance you will have chemical industries apart from those denoted by tinctorial chemistry which you have suggested; there may be other chemical industries which might be taught there?—A.—Of course I have not touched that, because I do not know anything of the scientific industries.

Q.—You say here that if Indian industries are to be preserved and encouraged, a great deal of expenditure would be necessary, and you say "lavish expenditure in technical and commercial education is as necessary in India to-day as it was in Japan 50 years ago." I quite agree with that, would you tell us something of the system of technical and commercial education that you have in view?—A.—I could not do that offhand.

Q.—In connection with industrial schools?—A.—In connection with industrial schools I can only refer to the reports that I read on Japan and on Wurtemberg before I came out here; I merely quote from memory; unless I get the reports here I could not give you any details.

Q.—I take it you apprehend no other difficulty except the difficulty of finding the necessary funds, because funds will find the man and the equipment?—A.—I think so; it generally follows that if you are prepared to pay you will get the men you want.

Q.—Do you also think from a knowledge of the boys who have been coming to you that if there was a system of technical and commercial education introduced then many of the students would take to these courses?—A.—Commercial and technical education as against the ordinary literary education? I think there would be a large number who would take up such training because I should say it leads to some definite aim, some definite result, and one of the reasons why I think that industrial education is needed so much is, we want to encourage the boy who is being educated to form early a definite idea as to what his future is to be, and I

think the tendency of industrial education is to encourage the boy to form such an idea, whereas college education very often does not, until his college career is over.

Q.—Do you also think from what experience you have had here that the boy who has received some industrial education is more likely to find a living now than the boy who receives a merely literary education?—A.—In the lower branches you mean, yes certainly, I know many of my boys, many boys from industrial schools, leave before their course simply because they can earn a small wage.

Mr. C. E. Low.—Q.—Supposing that the industrial education is of the type which as far as it has gone is only more or less a foundation for something else, that would not help him?—A.—You mean industrial education such as I propose, no, I do not think that would help him much. I was speaking more especially of the present condition of industrial training.

Hon'ble Pandit M. M. Malaviya.—Q.—Suppose we get a standard fixed after consideration, I take it that that standard will be such that any student who has gone through it will be competent to take up work as a workman or an artisan?—A.—After going through the school?

Q.—Yes, such as you propose?—A.—No, I do not think so. I look upon an industrial school very much as I should look upon a high school.

Q.—Won't he be qualified to be a workman or an artisan?—A.—I do not think his training will be complete.

Q.—Wouldn't you say that the training should be complete so far as the workman or artisan is concerned?—A.—I think his training may be complete, I think his training should be complete, in other words, you may train him to know and to be able to work, but I do not think that without further experience or training in commercial conditions he will be fitted; he is not disciplined.

Q.—I see the distinction you draw as between a workman or artisan and a manager or supervisor of works. Would a student who passed through an industrial school be qualified to take up work as a workman or artisan? I am not asking whether he will be qualified as manager or supervisor.—A.—I realise what you want. I do not think his training is complete, I do not think it is possible to make it so. My experience goes to show that a boy who has gone through an industrial school, however competently he may be able to work, unless he gets some training in discipline in a commercial work, such as an industry, is not really fitted to carry on as a finished man in his craft, not at least of any high order.

Q.—Let us take a concrete case: let us take dyeing or weaving: suppose you take dyeing, you train your student, you will have a workshop attached to your school where he will have some practice; suppose he has gone through the theory and has gone also through a little practical dyeing through such course as you prescribe, don't you think that he will be good enough to go and take up work in a factory where dyeing is carried on? Don't you think he will do much better than one who has not received such training?—A.—I am perfectly certain he will do better, but the difficulty I find in the industrial training in schools is that they are not working under commercial conditions, and you cannot get 8 hours' work out of an 8 hours' day. I say so because I have seen boys in the canal workshops and in the railway workshops here. The work, discipline and labour of boys in industrial schools should be equal, but instead their work is in advance of their keenness for it, and the consequence is that they cannot keep up, they do about half of what a trained workman will do, if he is trained in a commercial workshop.

Q.—It has been suggested to us that if small industries are attached to industrial schools, then the boys will get the necessary amount of work in the shop and would be better prepared to join these commercial undertakings?—A.—In connection with my plan I have often wished it, because we can do the work in the school, but if I were asked to make it a commercial success we should fail in the attempt because we do not get through the amount of work necessary, in fact there is no organisation to make it a really commercial concern; in other words, such and such a man should produce so much per day, such and such workman must print so much, we cannot do that in the industrial school.

Q.—So if you had a workshop attached to the schools that you propose, you think that deficiency would be largely made good?—A.—It might be worked if that could be done without undue competition against bazar workers. Suppose you had an industrial school to train men and then had a separate compartment where orders could be taken and the men were drafted from the training school into the commercial work shop it might be a very great advantage gained, that is, they should be forced as part of their course to qualify through actual commercial work.

Q.—Now let us take a case where it is not possible, where even a workshop is wanting, don't you think even so a student who has had his training in the industrial school will be likely to prove a better workman or artisan, comparatively speaking, than the man who has had no such training?—A.—Certainly, I think so.

Q.—So that even if this ideal condition is not at once established, it would be an advantage to industry if these industrial schools were established and the boys were encouraged to train themselves there?—A.—I have not the slightest doubt about that in my mind.

Q.—You mention in your note that the Punjabi is one of the most skilful, apt and industrious of all India's workers, that is no doubt true.—A.—When under direct supervision.

Q.—Is it your experience so far as you have seen of the Punjab that the finest work of the Punjabi has been done by the Punjabi worker or artisan without any supervision? Surely in the case of all refined work, don't they work it in their homes, in their villages?—A.—My remark here was not intended to mean that they don't do work unless they are under supervision; all I meant to say was, so far as my experience goes, they are good workmen under supervision, and also I might have added when they are working for themselves; they are one of the hardest working people if they have got a definite object in view; for instance, in the Lakkar bazar in Simla you notice the amount of work they do, they would work all night, they are working hard to make money; but if you employ a man by wages that is a different matter.

Q.—That is exactly my point. My point is this, if you take these workers and get work out of them under conditions which will be agreeable to them, congenial to them, they will do good work; if you arrange a cottage industry and distribute your help so that they may work in their homes, they are likely to do more work and better work than if they are working under factory conditions; that is exactly my point?—A.—I think so too. I don't think that the Punjabi is the man that will work under factory conditions nearly as readily as in his own home.

Q.—You say "it is an indisputable fact that most of the industries have failed to maintain their popularity and have in most cases steadily deteriorated in quality owing as I take it in a great measure to want of technical and commercial knowledge." Will you kindly explain what you mean?—A.—I mean they have marked time where commercial conditions should have really forced them to change their methods, not only commercial conditions but modern tastes.

Q.—Do you refer to conditions arising from the additional cost of the articles they produce? Do you mean competition from outside?—A.—I do not only mean that, I mean of course that commercial conditions, for instance, have prevented the Indian Cotton Printers from maintaining any demand for their goods because commercial conditions have planted on them cheap machine work. Now they have not, through lack of technical and commercial knowledge, adapted themselves to the change which means of course change of design and change of ideal both from the commercial and from the artistic point of view.

Q.—For instance you have seen the imitation shawls from Germany; they have killed the trade of the Punjab to a large extent?—A.—Yes, that is my point.

Q.—Such an industry will depend upon the amount of technical knowledge and information available?—A.—And I may add, of artistic skill too.

Q.—You speak here of the Eureka Tile works, where are they?—A.—I think it is on the railway road just near the railway here.

Q.—Are they flourishing?—A.—When I saw them they were doing very good work, but they had no capital; but I think I am right in saying that they could make a profit of 20 per cent. if they got up-to-date plant. Both the brothers, I think, certainly one, were students of the Mayo School of Art, they went to Staffordshire, studied pottery there and came back, they raised I think 20,000 rupees and put up their plant, they are doing quite good work.

Q.—You have advocated commercial museums run on the lines you have indicated, and you have also advocated permanent exhibitions which will last about six months; don't you think the two objects could be combined in a museum, I mean a permanent commercial museum?—A.—I think my idea was that there should be local exhibitions, there might be one central sales museum, a commercial museum, but there should be some means of bringing the information about these museums into direct contact with the worker, and these should be periodical museums lasting a considerable time.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—You say in your opening sentence that you have had experience as a craftsman at home: have you had any training?—A.—I come from a craftsman family, and I was trained from a very young age.

Q.—From what age?—A.—Probably about 7 or 8.

Q.—Have you had any industrial school training?—A.—I had no industrial school training, my father was an engineer before he was an artist, and I worked in his workshop; then later in life I did practical work in a big firm of carvers and sculptors.

Q.—Had you been on the Continent anywhere?—A.—No, I have been in America but not on the Continent except as visitor.

Q.—At what age are boys taken in industrial schools in England?—A.—Well, in industrial schools in England I think not younger than about 12 or 14.

Q.—With reference to technical aid to industries, you say "but there is no doubt in my mind that they would have suffered much less if there had been available any sort of technical and scientific assistance"; what sort of technical and scientific assistance do you refer to there?—A.—With reference particularly to dyeing, printed goods, cotton weaving, etc.; for instance, take pottery, the Mulian potteries, I think that their work would have been more improved if they had had technical information as to why it was suffering from certain defects.

Q.—You say "if there were a Government demonstration and research institute for the dyeing industry"; you want an Imperial Institute, is it not?—A.—I think that the research section should be part of the technical institute which I think the province should have.

Q.—Have you seen the Government weaving school here?—A.—Yes.

Q.—And the dye works? Do they use vegetable dyes?—A.—I have seen them, they have just begun research work in that direction.

Q.—Then you say, "I am strongly in favour of spending the money available by bringing experts to this country rather than by sending Indians to England, my experience being that the Indian returning to India after a year or two in England is only partially trained." Do you refer to the students sent by Government or do you refer to private students? Of which have you got experience?—A.—I have had experience of some of these students trained in England, and the training they have had.

Q.—Have you any experience of students who have gone from your college?—A.—One student of my college has gone and he is now a teacher in the college—Munshi F. Din. He had training for 3 years, his training was good, but did not go far enough; that was what I meant. I could name other instances, but he is the only student of my school who went, but he went at his own expense, that was not a scholarship.

Q.—If he had studied two years more he would have been all right?—A.—I think he would admit that himself, that the training was not sufficient. May I say with reference to that that I had particularly in mind the cottage industries in the province which might suffer from having western designs and lose touch with all their traditional work.

Q.—Do you think you could revive the cottage industries in a province like the Punjab where there is a lot of agriculture and after the harvest is over they have got a lot of time which they waste? Do you think that training in the vernacular would be much better than in English?—A.—I do not want any English so far as craftsman work goes except for giving them the English technical terms for tools and apparatus; that would be simpler; my idea was to stop general education at the 5th primary, because I don't require further education for them.

Q.—But even after training only in the 3 R's, if these young boys in villages are given industrial training, I think they can go on very well without going up to the 5th standard?—A.—You think the 5th standard is not necessary?

Q.—For people in the villages.—A.—Well, I don't object to taking boys who have not gone even up to the 5th primary if they are good workmen.

Q.—I mean if you want to develop cottage industries?—A.—I don't think it is necessary. I didn't mean to infer that the 5th Primary is essential to every cottage industry.

Q.—Are there any vernacular text-books for this sort of teaching, technical text-books?—A.—None.

Q.—Do you think that is a question that ought also to be taken up?—A.—I said that in my report on industrial schools: that there was no connection between the subjects on the general side with the subjects on the manual training side.

Q.—Then about industrial exhibitions, don't you think that if there are big exhibitions just like the Allahabad exhibition, the practical craftsman and the other people can go and see and can find out what marketing value they have for their goods. I mean will not such an exhibition be a form of advertisement?—A.—I do think so, but I think they are too few and far between to have any great influence.

Q.—The big exhibitions cost a lot of money, the Allahabad one cost lakhs, so they cannot be held every year?—A.—I would sooner see provincial exhibitions.

Q.—In every province? But suppose a man from Bombay or Bengal wanted to sell outside his own province, specially certain goods?—A.—I think perhaps I was not clear in my statement. I had no objection whatever to large exhibitions, we all know their enormous value of what they have done to trade. What I really meant was that with reference to small industries a big exhibition would not have the same effect as a number of small exhibitions.

Q.—They won't be of any very great advantage?—A.—I was speaking all the time from the cottage industry point of view.

Q.—Don't you think that such cottage industry exhibitions should be run by private enterprise?—A.—I think so.

Q.—Do you think that is possible at the present stage?—A.—Not possible immediately, but I think that Government should give them support; I think that if they supply the means of collecting exhibits then municipal and district boards would see that the exhibits were well shown.

Q.—Then about your complaint about wood; do you think the present wood for carving is not all right because it cracks?—A.—I was not referring only to carving. I was thinking of construction work in wood; it is practically impossible to get any seasoned wood.

Q.—You have got to keep it a long time to make it fit?—A.—Yes, a firm like Maples keep wood like 30 years before they make furniture. There is no means of keeping wood for such a long period in this country. There is no organisation for seeing that the wood arrives at the store in any state fit to be used.

Q.—Have you got any connection with the Railway School here?—A.—I am on the managing committee and also on the school committee; I am on both committees. I am also the industrial inspector.

Q.—What are the prospects of a boy who goes out of that school?—A.—He has prospects if he stays in the railway or goes to any works; or he may continue his study by going to the Mayo School of Arts if he wants to improve his craft knowledge.

Q.—But has he got any opening when he goes out?—A.—He has a good opening in the Railway Workshops if he will accept the pay.

Q.—They take him if he accepts the pay?—A.—Yes, but there had been complaints about the pay; those who were called literate apprentices, that is, boys going from that school after 5 years, they only got 5 annas a day as apprentices, and they felt that that was not enough pay to invite them to come, and the railway are considering the point; they are proposing to start their pay at 12 annas a day and reduce their apprenticeship from 5 to 3 years.

Q.—But the name Railway Technical School is a misnomer?—A.—The railway is represented on its managing committee and on the staff.

Q.—Are the railway paying anything to the funds?—A.—No.

Q.—But the railway have also a school, is that only for Eurasians and Anglo-Indians?—A.—Yes, not for Indians.

Q.—And these boys are being taken up by them, they are bound to them, and they pay them well?—A.—I believe that is so; there is no agreement.

Q.—Do you think that that school supplies all the needs of the railway?—A.—I have not thought about that matter.

Q.—Do you think that this school should be taken over by the Government or the railway should take it over?—A.—This is a Government school. This industrial school is an absolute success as far as we can judge; the students get employment everywhere; if they don't, they can go to the railway, but very few do, which shows that they obtain employment.

Q.—They are taken on what, 6 annas per day?—A.—They used to be taken as literate apprentices, they began with 5 annas per day up to, I think, Re. 1 per day for 5 years' apprenticeship.

Q.—In the Railway Workshop School do they commence after 3 years?—A.—That I do not know.

Q.—Then about silver goods, do you think that there is a demand in Europe for Indian silver goods? Are they selling these silver goods in Europe or are they not because the finish is not so good?—A.—I do not think it has anything to do with the finish, taking the Benares goods the finish is quite as good; but it is simply a question of increased use of alloys.

Q.—Then about sale agency, you agree about Indian Art Stores at home, you said so in reply to Mr. Low?—A.—Yes, it seems excellent; the only thing that strikes me is that it does not stand much chance of succeeding after the war; there is no guarantee that it would continue in its prosperous condition.

Q.—Then you think the professors from these industrial schools should visit the villages and demonstrate things there to the people?—A.—That is one of the ways in which you can improve industries. I am always seeking some way by which improved methods of conducting industries can be brought to the actual worker.

Q.—Is the old art painting reviving here?—A.—Not at all I should say. I do not see any sign of it; the only sign of that sort of work being done is the making of copies of very old paintings because there is an enormous sale for these paintings and a certain craftsman has realised it and is copying them *ad infinitum*. But there is no revival at all.

Sir H. J. Tota.—Q.—You say, speaking of students turned out from the industrial schools,—“This is not all to the bad; they hand on the training they have received, but it is generally in a very diluted form. I would rather see the craft student return to his home in larger numbers.” Well, if he returns to his home and has improved methods of work, that makes his work a little dearer. Now where is the market in his home for his improved work?—A.—No, I am afraid at present there is none.

Q.—Cheapness is essentially everything in this country, and if he improved his methods until his work would be dearer after he went back to his native village, this improved work would make it out of reach of his customers, and he would not find a sale in his own home?—A.—I do not think it absolutely follows that because his work is improved therefore it is dearer. I mean by improved work very often simplification of design or construction, which he does not understand at present.

Q.—On which he would spend less time, and less labour, consequently?—A.—Yes, exactly. You may take for example, the Hoshiarpur work, inlaid ivory and wood work; enormous time is spent in that work which is quite out of harmony with modern taste at the present time. That time might be spent on doing better work and you can leave out half the design in order to simplify the work and to improve the finish.

Q.—How is he to make the design more simple and get the same effect?—A.—You can get similar effects more in harmony with public taste, and spend the time which would be put on this surface work on better construction, and that applies, I think, to a number of cottage industries.

Q.—Would he get the same price if the ivory inlaying was less?—A.—I think he might; in fact, he would get a higher price because it would be so much more in harmony with public taste, I mean the taste of his purchasers.

Q.—But are there any local purchasers?—A.—I do not think he has much demand locally.

Q.—In this connection we had a witness before us a few days ago who told us that the Indian artisan was dishonest in his work, that all he aimed at was to make money as quickly as possible, and that he scamped his work out of pure dishonesty and when asked to modify it, he held to that view. But is not the bad work or scamping due only to want of knowledge or skill?—A.—I think it is due to his want of education. I am inclined to think that your witness was not far wrong in his view.

Q.—For instance, if he picks up a piece of wood and finds it defective he will use putty, and go on rather than trouble to find a piece more suitable. Now, do you think that he does this simply through intentional dishonesty, or because he knows no better?—A.—I think it is due to lack of discipline of his mind, that is all. I do not think he does so out of intentional dishonesty, but partly out of ignorance which really means that he was not educated to think better, and partly indolence, that is, he does not take the trouble. The result is of course that we are bound to say he is dishonest because he supplies dishonest work.

Q.—Only if he supplies inferior wood?—A.—Of course then there is an element of dishonesty about it from the craftsman's point of view.

Q.—But he does not know. As long as the chair suits the purpose, being suitable to sit upon, he thinks he has given you all that is needed?—A.—He shows a serious want of industrial training.

Q.—That is the point. I could not get the other witness to admit that. I do not quite understand what you say about the system of travelling scholarships. How would you apply that in India? I do not quite follow your reasoning there; can you make it clearer?—A.—I believe the Manchester School of Technology has a system of travelling scholarships. In that case it is a case of travelling outside England. Instead of travelling outside I should have travelling inside in a large country like India. For instance, the

Manchester School of Technology sent a man with a travelling scholarship for 9 months and he was coming to India to acquire cotton-prints with a view to seeing whether the Manchester power printers could not make some of the Indian prints on their machinery. That is a purely commercial effort on their part to compete with Indian cotton-prints. I mean that in India a man might travel from one province to another with a scholarship and learn all that is to be learned in his trade.

Q.—Would you apply this to cottage and artistic industries and hand industries?—A.—To all industries into which art enters.

Q.—Now, you told us that art is deteriorating here, and there is a slavish copying of the old things which are not suited to the present demand, and you say that the student is unable to tour about to make researches into the failures and beauties of work in other provinces. Are there any beauties left to follow?—A.—I do not mean to say there are no beauties in India. They are found, I believe, in India in all forms of comparatively commonplace objects, but they have not any innate knowledge of it.

Q.—You mean the workmanship is beautiful, but it is not suitable to our present needs?—A.—That is what I mean, also the forms are beautiful. It is the case of education again—educate craftsmen to see that cheap and excessive decoration is bad.

Q.—Referring to pottery, Mr. Low asked whether you knew anything of the work done in the Bombay School of Art. Now, is there any system in any of the various schools of art by which people engaged in teaching go periodically from one place to another to see other schools, and to find out how the same kind of work is done in such schools?—A.—That very point came up at a meeting of the principals of the art schools; there are 5 in India we happened to meet; we had a museum conference at Madras and we put up a proposal that the principals of the schools of art should be allowed to meet periodically and to tour, but I am sorry to say that it was not sanctioned.

Q.—Did they make a representation to the Government?—A.—We put in a proposal that we should be allowed to meet periodically at a fixed place with the idea of studying each other's methods, comparing notes upon what was being done and so on.

Q.—In the same section you say: "The peculiar circumstances by which metal has satisfied most of the requirements of the Indian population are not likely to continue indefinitely." I do not quite know what you mean by the peculiar circumstances by which metal has fulfilled the requirements of pottery?—A.—I mean to say that the people in the country have relied upon metal for drinking purposes, eating, cooking, and other purposes in which the European generally uses glassware or pottery.

Q.—But why do you say it is going to be replaced by pottery?—A.—It is being replaced. Before the war foreign pottery was being imported, cheap earthen-ware, china and glass, and all that.

Q.—Is the use of metalware due to the habit of the people in cleaning every vessel thoroughly?—A.—Yes, that is the peculiar circumstance I referred to, but I don't think that the prejudice in favour of metal will continue.

Q.—I believe it is the practice amongst certain people that if they eat off an earthen-ware vessel, after one use the vessel must be thrown away?—A.—I have heard so.

Q.—Because it cannot be thoroughly cleaned?—A.—No, that I take it is due to purity.

Q.—So you think glass and pottery are in natural demand to serve the purpose of household utensils?—A.—Yes; not only for pottery but there is demand for decorated ware, railway tiles, and so on; we could make them here, we have got clay, we have got materials.

Q.—We have been told that it is very difficult to introduce industries into the Punjab as it is a purely agricultural country. Is it due to want of capital, want of labour, or want of technical skill?—A.—It is certainly not due to want of technical skill. I think as a province there is as much technical skill in the Punjab as anywhere else.

Q.—The question I wanted to ask is whether if you want to establish great industries here, should technical institutes follow or precede great industries?—A.—I think that in the case of Wurtemberg the two are carried on together. This is mentioned in the report on agricultural industries in Ireland. Wurtemberg was purely an agricultural State without any previous knowledge of industrial work and in three decades it developed into a highly-qualified industrial State indeed.

Q.—Owing to establishment of technical institutes?—A.—Owing to the initiative of the State.

Q.—There must be some basis on which to build these technical institutes. Must there not be some kind of industry first for which this technical institute was required?—A.—I think the reason was that it was an agricultural State in which the people were very poor and could not make sufficient livelihood on agriculture.

WITNESS No. 882.

LALA MULK RAJ,—Bari Doab Bank, Lahore

WRITTEN EVIDENCE.

Indian Banking in the Punjab.

THE first Indian Bank in the Punjab "The Punjab National Bank" was started in 1895. The People's Bank and Amritsar Bank followed in 1901 and 1903 and the Punjab Co-operative Bank and Lahore Bank in 1905 and 1906, respectively. After 1906 and up to 1912 the increase in the number of Indian banks was very rapid but these banks with few exceptions were small, the three-fourths of entire working capital of Indian banking, viz., 4 crores-and-a-half being in the possession of the above-named banks.

2. In respect of the subscribed and paid-up capital the People's Bank headed, closely followed by the Punjab National Bank. The Punjab Co-operative Bank came third with a paid-up capital of Rs. 8,41,000 against 10 lacs subscribed or 84 per cent.

3. These banks were spread like a net-work all over the Punjab, Sindh and parts of United Provinces where they were helping trade and industry. An idea of their usefulness may be formed from the fact that they had above 200 branches, some of them in remote corners of the Province gathering money from the most shy persons and places. The business was expanding, and it was expected that in a few short years, they would become most important factors in the development of the land. The directorates although not consisting mainly of businessmen included businessmen as also other men of position, ability and wealth. In some cases they were composed of men coming from upper middle classes and wielding great influence in their class. Most of them held large number of shares in the institutions to which they belonged. In the Punjab Co-operative Bank the capital owned by the directorate amounted to about one-fourth. The staff was inexperienced in the beginning but work trained them and about the time of crisis most of them had 7 to 15 years' experience at their back. As for their integrity I may mention that during 10 years' life of the Punjab Co-operative Bank out of a staff of 11 officers only one man was guilty of defalcation of a few hundred rupees. As a rule managers of branches in Indian banks in the Punjab are not given powers to make advances but 3 managers of the Punjab Co-operative Banks were given independent powers to make advances up to Rs. 1,000. I have found loans given by them safe without exception. The worst fault of Indian banks, however, was their disunion. Every one was jealous of the others and spoke ill of them. In their zeal for their own advancement they did not hesitate to denounce the rest. In fact the political history of India got repeated in the attitude of these banks towards each other.

4. Personalities also crept in. Lala Harkishan Lal's wealth and position excited envy in more than one quarter and a class gradually sprung up who commencing with Lala Harkishan Lal and his policy of converting gold into iron and bricks, extended their attacks to embrace everybody styled Managing Director, rich or poor, good or bad and to every institution that employed them. The banks remained inert and did nothing to counteract the adverse effect of these attacks.

5. They also failed to get into touch with British officials who were allowed to form their opinion of Indian banks from reports from interested quarters. This aloofness caused misunderstandings which in absence of a regular channel of communication remained unverified and unremoved.

6. They further failed to secure and cultivate the sympathy of the Anglo-Indian banks in the Punjab whose unfavourable impressions derived from the official world were naturally strengthened by vested interests.

7. These were the formidable forces arrayed against Indian banking in 1912. A genius was required to utilise them for the destruction of all, good, bad or indifferent and such a destructive genius was supplied by the retirement of Rai Bahadur Mool Raj, M.A., from Government service. He exploited and got exploited all the forces that could be commanded for destruction. Tongue and pen were both used freely and a religious paper was got under control and converted into a weapon for the financial ruin of the country.

8. The result is known all over. The fright created mistrust and a run upon Indian banks commenced. The People's Bank and Amritsar Bank after 9 months' struggle and payment of a fifth of their deposits had to close their doors on the 19th September 1913. Bank after bank then tumbled down up to the end of 1914, the Punjab Co-operative Bank amongst them in September 1914, after paying 46 lakhs out of the total deposits of 63 lakhs.

9. It was unfortunate that no attempt was made by anybody to save these institutions. The moneyed men who are not many in this Province were frightened, the vested interests were naturally inimical and Government apathetic. Nobody realised that the existence of the Indian banking was the most essential condition of industrial development of the country and none made efforts to stem the tide of disaster.

10. I have fully described the causes of the disaster in my evidence before the Maynard Committee which may be taken as part of my note. My views were also given incidentally in my speech to the share-holders of the Punjab Co-operative Bank in general meeting held on 9th instant the proceedings* of which are enclosed.

11. I am sorry I did not know till yesterday afternoon that I have to give evidence which is fixed for to-day. The time at my disposal is too short for preparing a detailed statement as to the condition of each bank which I should like to furnish particularly to meet the charge of unsound business methods which has now replaced the theory of insolvent banking of three years back happily exploded.

ORAL EVIDENCE, 15TH DECEMBER 1917.

Hon'ble Mr. H. J. Maynard.—Q. You were the Managing Director of the Punjab Co-operative Bank?—A.—Yes.

Q.—Do you remember a meeting which was held in November 1913. I have got the proceedings before me—where the thanks of the share-holders were recorded?—A.—Yes.

Q.—Do you recollect who they were to whom special thanks were recorded?—A.—Yes.

Q.—They included certain officials, didn't they?—A.—Yes.

Q.—And also certain other persons, as well as officials?—A.—Yes.

Q.—What was your impression of the attitude of the officials towards the bank?—A.—I was promised assistance to the extent of 10 lakhs, out of which one lakh was given to me on my personal security and that of another Director. I had made over to the Bank of Bengal securities worth 20 lakhs for an advance of 10 lakhs. This one lakh was given to me on the security of my own person and that of another. After that no further assistance was given me. This resolution refers to that assistance of one lakh, and not to the full assistance asked for.

Q.—Do I understand correctly that you had the other assistance?—A.—The assistance for one lakh was given us, but not the other assistance. This refers to that one lakh on my personal security and that of another Director.

Q.—Then the other assistance was refused?—A.—Yes.

Q.—One lakh was given by whose help?—A.—That one lakh was given, but the assistance of 10 lakhs was not given, although securities to the extent of 20 lakhs were endorsed in favour of the Bank of Bengal.

Q.—The impression you got then was that those who helped you to get that one lakh had been sympathetic?—A.—They were to that extent.

Q.—Had you any explanation as to why the other 10 lakhs were not given?—A.—I made over a letter to your Committee of Enquiry, in which they said that they could not give any assistance.

Q.—You said that to the Committee of Enquiry?—A.—Yes. I have got a copy of the shorthand notes in connection with my evidence, and there I explained to your committee that the full assistance was refused.

Q.—Without any explanation?—A.—I could not ask them to explain. The letter was handed over to you.

Hon'ble Pandit M. M. Malaviya.—Q. Would you kindly tell us what it is exactly that you said before this committee?—A. I said that I had a consultation with Mr. Warburton, the Agent of the Bank of Bengal, and that the Bank demanded securities to the extent of 20 lakhs, consisting of pro-notes and a mortgage deed. Mr. Warburton recommended to the Directors that the 10 lakhs should be advanced to our Bank, but their head office in Calcutta refused. Mr. Townsend asked if there were any reasons given, and I said there were none. I had the letter and handed it to the Committee.

Q.—Will you kindly tell us how the question of your asking for help arose; at what stage of the business?—When this run began to be made on the bank were you able to meet the demand?—A.—For a considerable time.

Q.—How much?—A.—I cannot say now without consulting my books; but a very considerable sum of money was paid.

Q.—What was the total amount of your deposits at the time?—A.—63 lakhs.

Q.—You say, "Bank after bank then tumbled down up to the end of 1914, the Punjab Co-operative Bank amongst them in September 1914, after paying 46 lakhs out of the total deposits of 63 lakhs." So that you had paid 46 lakhs out of 63 lakhs before you closed?—A.—Yes.

Q.—Was it at this stage you approached the Bank of Bengal, or before closing?—A.—We were trying to get help from every quarter we could. Gradually we were able to pay, but when there was no cash left, we had to stop.

Hon'ble Sir B. N. Mookerjee.—Q.—What was your paid-up share capital at that time?—A.—Rs. 8,41,000 out of 10 lakhs subscribed.

Hon'ble Pandit M. M. Malaviya.—Q.—That is 84 per cent?—A.—Yes.

Q.—What was your reserve?—A.—Something like 4 lakhs then.

Q.—At the time you closed?—A.—Yes.

Q.—In your speech you said it was 7 lakhs?—A.—It is now Rs. 7,86,000; by the end of December it is expected to rise to Rs. 8,41,000.

Q.—What is the amount you have to pay now?—A.—Rs. 4,90,000.

Q.—To your depositors?—A.—Yes.

Q.—What is your security?—A.—Nearly 22 lakhs.

Q.—Including this Rs. 8,41,000 of reserve?—A.—Yes.

Q.—You could not secure any help from any other source?—A.—I tried Bombay, but it was a far-off cry. I went up to Calcutta later and saw a Marwari friend of mine. He said that the war had upset him, and he would not make an advance during the period of war. I wanted 7 lakhs, but the monied men here also were frightened and would not advance.

Q.—How much have you paid to your depositors?—A.—Twelve lakhs on account of deposits, and 2 lakhs on account of interest, since the liquidation began. In the liquidation we are paying interest to depositors.

Q.—When do you expect to pay up the balance, if you don't receive any assistance from outside?—A.—If I don't receive assistance (which I don't need now) we will probably finish the liquidation in November next, if not earlier.

Q.—Will you at that time have paid deposits in full, with interest?—A.—Yes.

Q.—Do you expect that anything will be left for shareholders?—A.—They will have Rs. 2 for every rupee they have put in the share capital.

Q.—I congratulate you on your position, even on your dividends. But what was it that brought about the downfall of your bank?—A.—Because there was a run on all banks. The people got frightened, and they rushed for their money. We tried to make them reasonable, but they would not be reasonable. I may add that I invited some businessmen, at the request of the depositors, to examine the assets of the bank, and nine of them, four from Lahore, four from Amritsar, and one from Alwar State, certified that the bank was very safe, but in spite of that the people would not be reasonable.

Q.—You say on page 3 of the speech* attached to your note, "You will naturally ask why? My reply to your question is that the downfall of Indian banks is too recent an event for a dispassionate judgment being given as to its causes, which must necessarily be many." Then you go on to say, "It will blame the investing public for fright, Indian banks for disunion, Anglo-Indian banks for hostility and Government for apathy." You have spoken of the fright of the investing public, but could you not bring about a combination of Indian banks?—A.—I have also spoken of the disunion of Indian banks. I tried, when there was a rush on the Peoples' Bank, to bring together Indian banks, but failed.

Q.—You speak of the hostility of Anglo-Indian banks?—A.—I am very sorry to say what I have said, but it is well known that there was no love lost between Anglo-Indian and Indian banks.

Q.—To what do you ascribe it?—A.—To vested interests.

Q.—Or to short-sightedness?—A.—No, to invested interests and wrong impressions formed.

Q.—Would their interest have suffered by the expansion of your Indian banks?—

A.—The expansion of Indian banks must necessarily have told on their deposits, if not on their business.

Q.—Do they draw deposits from the same sources as the Indian banks do?—

A.—Yes, to a great extent.

Q.—Do you think if there was a State bank in the Punjab, amenable to the control of the Government of the Punjab, the chances of your receiving help would have been much greater?—A.—I said that to the Maynard Committee, I said that there was no use having the Bank of Bengal in this province, but that we should have the Bank of Punjab.

Q.—You think then that if there was a State bank amenable to the control of the Government of the Punjab, you would have had a greater chance of receiving assistance than you had in the circumstances in which you were placed?—A.—Yes.

Q.—Do you think the public will subscribe to a bank which would be under the control of Government?—A.—Oh yes, there would be no difficulty.

Q.—There would be no difficulty about capital?—A.—Not if there was Government patronage behind it.

Q.—You say in your note that "After 1906 and up to 1912 the increase in the number of Indian banks was very rapid, but these banks with few exceptions were small, the three-fourths of the entire working capital of Indian banking, viz., 4½ crores, being in the possession of the above-named banks." Is that a rough guess?—A.—About the correct figures.

Q.—Then the first banks you have named which came into existence owned 4½ crores, of which three-fourths of the entire working capital was in their possession?—A.—Yes.

Q.—Of these the Punjab National Bank is going on, and you are going to pay depositors with interest?—A.—The Punjab National Bank has also suffered, but is quite stable.

Q.—The other banks have closed?—A.—Yes.

Q.—Are you in touch sufficiently with the affairs of the Peoples' Bank to express an opinion as to the possibility of its being started again?—A.—I think it is probable that the Peoples' Bank can be started with a decent scheme.

Q.—You say in this note of yours, "Payments of deposits are no doubt likely to be made, but they will be not due to, but in spite of, official liquidation." Do you mean to say that payments should have been made?—A.—Yes, payments will be made in full nearly.

Q.—You think that indicates the general soundness of the position?—A.—Yes.

Q.—You express yourself very strongly against official liquidation. Are you not yourself a liquidator of your bank?—A.—This is private liquidation, i.e. voluntary liquidation. I have got another bank to liquidate officially.

Q.—You express yourself very strongly in favour of non-official liquidation. There is no official liquidator, as you know?—A.—They are official liquidators.

Q.—They are not officials of Government. They are liquidators appointed by the court; you mean them?—A.—Yes.

Q.—If you have liquidators appointed by Government, who were paid salaries only, and not by commission, do you think matters would be different?—A.—Yes.

Q.—From your experience and knowledge of liquidation proceedings that have gone on, do you think the present system of liquidation by liquidators appointed by the Court has told favourably or unfavourably on the share-holders?—A.—Very unfavourably in this province.

Q.—Have the charges been reasonable?—A.—The charges have been extravagant.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—How many years' experience have you got of banking in this country?—A.—Thirteen years, including 3 in liquidation.

Q.—What are the causes of these failures?—A.—I have given the causes in my note.

Q.—Don't you think the chief cause was inexperience of the management?—A.—No.

Q.—You say that all these banks lent money to industries; for what time and on what security?—A.—As a rule not for a very long time. In some cases these loans were long. In one case, we lent money for 5 years; on promissory notes or time hundis.

Q.—Which, when the rush came, you were not able to realise?—A.—You must understand that we paid 46 lakhs out of 63. That is all that any bank would have paid.

Q.—Do you want industrial banks, or banks on the system of the Presidency Banks?—A.—There should be as many banks as possible.

Q.—A bank to help industries like the Bank of Bombay or Bengal; or an industrial bank quite separate?—A.—In the Punjab, industries at present do not exist. In the near future any good bank will do, but eventually industrial banks must come in. At present there are scarcely any industries in the Punjab.

Q.—The banks in the Punjab were giving money only for short periods, calculating the deposit period nominally?—A.—Yes.

Q.—Then it was bad management that brought about the failures?—A.—Not necessarily, because the conditions of things in Bombay are different from the Punjab. There you have got a lot of current accounts. The principal funds of the Bombay bank consist of current accounts generally. Here current account is nothing. All deposits are generally from 12 to 24 months, with a little sprinkling of short-term deposits; so conditions are entirely different.

Q.—You have to pay on certain date certain deposits that are due?—A.—Yes, this was calculated and was guaranteed in every case.

Q.—The banks were started with authorised capital of 10 crores, subscribed capital of 4 crores and 12 lakhs, and paid-up capital only 14 per cent?—A.—That does not give you a correct idea. If you will take off the few banks that had a large authorised capital and very little subscribed capital, you will arrive at a proper conclusion. The Punjab National Bank had paid up something like 50 or 60 per cent, so had the Peoples' Bank. Most of these important banks had a very decent amount of capital subscribed and paid up.

Q.—But you think that the banking system was good, although they were not even able to pay?—A.—I beg your pardon, I did not say that.

Q.—Except one or two banks?—A.—The whole system was destroyed. How could you expect them to pay?—The credit of no country can be converted into cash at a moment's notice. That is not possible.

Q.—But you yourself have said that you had no current deposit money?—A.—Very little current deposit money, yet you could not convert the entire credit system of the country into cash.

Q.—But the money you gave on security; those monies were quite safe, and in due time they should have come?—A.—They did come, and that enabled the banks to tide over difficulties. I don't believe that any bank in the world can realise all its assets at an appointed time.

Q.—What are your assets now that you cannot realise 8 lakhs?—A.—I have just told you that I am realising.

Q.—What are they: demand notes?—A.—Demands notes in some cases, decrees in other cases. Demand notes have been converted into decrees.

Q.—You must have given money on one signature?—A.—In some cases on a number of signatures; and in other cases on one.

Q.—Are those people solvent?—A.—Entirely.

Q.—Why don't you realise it?—A.—The whole banking system has been destroyed. Where are the men to advance money?—They have got property, but how can they cash the whole thing? That is not possible.

Q.—But other banks generally manage from borrowed capital?—A.—Which banks? I have not seen any record of other banks which have made capital from borrowings.

Q.—You say, "They also failed to get into touch with British officials who were allowed to form their opinion of Indian banks from reports from interested quarters."

Why were they not in touch? You say, "This aloofness caused misunderstandings, which, in the absence of a regular channel of communication, remained unverified and unremoved." Why?—A.—There was no regular channel.

Q.—You can approach any official of Government?—A.—That was the fault of the banks; they did not approach properly. This is one thing for which I blame them. They did not approach properly.

Q.—You think if an industrial bank is started with a Government guarantee on the capital, the people would put their money in?—A.—Yes, any amount.

Q.—And with Government expert advice on different industries, if Government advanced money, do you think that would encourage industries?—A.—You have asked me if capital would be subscribed; then you want me to reply if expert advice would serve a useful purpose.

Q.—Expert advice to start industries. If Government is satisfied with its expert advice on a subject, say, sugar, and the Board of Industries advises that this industry is all right and safe; and if Government advanced money through that bank to that industry, do you not think the industrial awakening will come to the Punjab?—A.—I don't know I have not thought over this matter.

Q.—Then you want provincial banks for the Punjab, just like the Bank of Bengal?—A.—Yes.

Q.—You think if a Bank of Punjab would have been here, and if the Directors were in touch with the people, they would have been able to assist other banks here?—A.—Yes, I have also said that that bank would have been susceptible to the influence of the provincial Government, which the Bank of Bengal is not.

Q.—Do you think that the jealousy of the European banks came in the way, and they did not help in any way because they had the monopoly?—A.—Vested interests I have said.

Q.—Do you think the present Companies' Act, 1913, is a proper safeguard for banking?—A.—I am afraid more than a proper safeguard.

Q.—Do you think if you have more stringent laws, that would improve the banking and industries of the country?—A.—No.

WITNESS No. 383.

RAI SAHIB LALA MIRI MAL, *Executive Engineer, Raya Division, Upper Chenab Canal.*

WRITTEN EVIDENCE.

I.—*Financial aid to industrial enterprises.*

During the years 1907—12 I had carried out experiments to see if good Portland cement could be prepared from materials available in Northern India. To do this I had to spend a good deal of money on providing a small private laboratory and a good deal of my time in search of materials and conducting the experiments. When I was thoroughly satisfied that very good Portland cement could be made with local materials at very low cost, with the assistance of my friends I tried to form a joint stock company to raise the required capital, but failed to do so. The reasons why I failed were:—

- (a) At that time one or two newspapers of Lahore were bitterly attacking Lala Harkishan Lal and the banking and other concerns under his management.

People in the Punjab were beginning to lose confidence in banks and other joint stock undertakings.

- (b) Most of the capitalists and business men, my friends and I approached, wished us to apply and obtain from Government a guarantee to purchase a certain percentage of our outturn before they could help us in raising the required capital. But we felt diffident to do so.

Q.—2.—Banks, capitalists, Government servants and other small investors?

Q.—3.—Yes. I think in many places more cotton-ginning factories have been built than can be maintained in full time employment. During 1912 there were about 25 such factories in Multan? Only 2 or 3 of these used to work and the others remained closed.

Q.—5.—I think all and every method, described in the question, of giving Government aid is good?

Q.—6.—There should be Government supervision in cases (1) to (6) of Government aid.

Q.—14.—I think if it is desired to give an impetus to industrial enterprise in India, there should be no limitations on Government aid to a new enterprise if it competes with an established external trade?

NOTE.—Witness did not give Oral Evidence.

WITNESS No. 384.

MR. D. HARI GOPAL DUGGAL, Managing Proprietor, Krishna Cutlery Works, Wazirabad.

WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

Capital.

I HAVE personally no experience of raising capital, but I think the capital is mainly drawn in India from—

- (a) Private individual sources.
- (b) By entering into partnership and thus contributing to the common capital in different shares, and
- (c) It is also brought into play by means of forming joint stock companies. Sometimes capital is raised by means of loan, the banks where the hoarded money of the masses is brought into play also lending.

Besides the sources mentioned above Local Funds, e.g., District Boards, Municipalities and also Government should lend money on favourable terms to well-deserving enterprises. There should be started good many private banks with branches in all parts of the country, the Government should supervise the working of these banks with as little interference as possible, commensurate with the safety of the banks, and should support these banks by words and deeds, even sometimes meeting the crisis with money deposits.

Government assistance.

The forms of the system mentioned in question No. 5 are all useful in their own time and place. To start pioneer industries assistances in forms No. 1 and No. 2 and No. 3 are most useful. The assistance should be stopped as soon as the concern started is established as a paying concern. And I would also recommend Government supervision where assistance is given in form No. 1 but where the assistance is given in forms Nos. 2 and 3 the Government should have control but not exclusive—the Government control should be by means of sending in Directors, advising and having a power of veto, which should be very sparingly used. Auditing should be compulsory in all cases where Government monetary aid is given. If the auditing show any mismanagement Government aid should be stopped. Other forms of assistance can usefully be employed even in industries which are going on but require a strong dose of development. In case of pioneer factories form No. 1 should always be used but as soon as there are sufficient factories of the nature, preferential treatment should be stopped but this should always be employed where home industries compete with foreign industries. Auditing should also be a necessary element in cases of joint stock companies.

Pioneer factories.

Government should pioneer industries but should always have the public interested in these such as inviting shares from public at large, the Government contributing the greater share of capital, but they should never be turned into permanent Government institutions as the Government's object should never be gained from these. As soon as the pioneer factory is established as a paying concern the Government should withdraw but if in the meanwhile certain other factories of the same nature are established the Government should close the pioneer factory leaving all to compete fairly. The chief object of pioneer factories should be to draw the attention of the people to train them in certain kinds of industries and they should never go beyond this legitimate goal into the pail of profit.

I have practically no experience of financing agencies but banks serve the purpose very well and as I have said above Swadeshi banking should be encouraged greatly. Existing or new banking agencies can lend money to private traders and firms. I think the banks should not start industries of their own. I think there is a need of Banking Law.

Co-operative societies have helped in raising the status of poor zamindars in our Province, but I think they can very usefully be employed in encouraging and improving village cottage industries such as weaving, etc. As to the organisation of co-operative societies I think simplicity should be the rule and the Government should supervise, help and facilitate the working of these societies.

As I have said above Government aid should chiefly be given in infant trades, and if other private fresh enterprises are started the Government should help these also if possible. Money aid should not be given in so great quantities as to oust all competition except in cases of pioneer factories.

As regards question 14 I think the Government's object should be to defeat external trade and to encourage home trade and so not the least limitation should be placed on Government but it should flow more liberally if the aided industry competes with a foreign one. I would go so far as to suggest the taxing of external commodities in India simply with the object of protecting home industries. Protection is the only thing which can in reality help home industries. Indian industries are still infants and they should in all fairness be protected from the danger of foreign competition and the only remedy is to weaken the opponent by means of heavy taxation.

Technical aid to industries.

The only way known to me in which Government help in the direction has flowed out is awarding scholarships to deserving young men for training abroad. So far these young men have not done much in the way of starting new industries for want of capital and fear of external competition. I also think these young men when abroad are not given the opportunities of learning very much, the factory to which they are sent not liberally helping them. So I think apart from scholarships the Government should see and even should pay to attain the necessary object that the factories give all knowledge which young men going to them require at their hands. These young men should be taken up in pioneering industries and should also be lent to existing or new enterprises, free of cost. The functions of the expert should only be advisory. The experts should be at liberty to popularise the results attained, but it should only be done generally and should never reveal anything which is looked upon in the way of trade secret. As to research work I will deal later on. Agriculture in the Punjab needs demonstration factories most. The Government should undertake the growing of commodities such as yellow cotton, etc., and thus give people an impetus to do the same. The Government should also provide cultivation on improved styles in Government-owned demonstration farms. Raw material plays the most important part in the industrial development of a country and I believe India is very rich in all sorts of raw material and I believe the mineral power of India has not been explored to the extent required. I think more surveys should be carried on by private institutions aided in money and advice and experts by the Government.

Consulting Engineers are very well as an institution but they should never be allowed to purchase machinery and plants for private firms or individuals. They should at the most recommend reliable foreign firms but at the same time these recommendations should never have an element of command in them.

Assistance in marketing products.

As a rule commercial museums are useful in giving information to the public at large. They have also an educative advantage in them. They should be popularised, and at least the headquarters of every Provincial Government should each have one. They should be managed by the Board of Industries (the term I will explain later on). The guiding principle of their working should be advertisement of home products and so I would recommend "Avoidance of foreign products" together with "prominence to not well-known home industries."

To dispose of the cottage industry products there is a class of people known as brokers. Their employment saves time and botheration to the labourer and it may be developed and improved but I cannot recommend any departure from the line. Traveling exhibition of these industries will surely be beneficial and I would recommend that these exhibitions should also have training of improved methods as their objects. Thus I would

like them to deal with the exhibiting of improved methods as well as improved products. They should stay at every village according to the importance of the labourers.

Exhibitions.

As a rule these are beneficial, but again I would like them to have as a special object the education of the people rather than the merely bringing together of seller and buyer. They should care more for showing the process than mere products. I would recommend exclusion of foreign-made goods.

They should be popular in character and managed by the Board of Industry (a term to be explained later on).

Trade representatives.

Trade representatives should be appointed in Great Britain, Colonies and foreign countries. They should be elected by the Board of Industries; their duties should be advisory and they should watch over the interest of India's trade.

There should be Boards of Industries in every province under an Imperial Board formed by the Provincial Boards by means of election. The Provincial Boards should have inter-trade relations.

Government patronage.

No country can develop industrially unless the Government of the country extends its helping hand. Government's clear duty is to buy all its wants at home centres; and giving a claim on call to the people by means of exhibiting the things required will meet with response, and so I don't see any harm if list of foreign articles used by the Government be exhibited in the exhibitions.

Banking facilities.

I think the Government should not monopolise banking; it should encourage Swadeshi banking. Supervision by means of auditing and help in time of need are the two things which will make the banks grow up like anything. I do not want Government to form Industrial Banks. It may extend patronage.

Other forms of Government aid to industries.

Land policy.

The Punjab is an agricultural Province in the main. Short-time settlements invariably accompanied by rise in land rents is a great impediment in the way of good produce. The poor farmer does not care to improve the land as the improvement will bring the greater land revenue, leaving the poor farmer as before. I would recommend settlement at least at an interval of 30 to 50 years.

Land Alienation Act also hampers the purchase of land for industrial purposes. Again for this very Act land cannot accumulate in the hands of educated people and consequently no improvement is made in farming. At least the Government should so modify the Act as to allow purchase for industrial purposes. Or the Land Acquisition Act should be so modified as to admit acquisition for industrial purposes. In short every facility should be accorded for the purchase of land for industrial companies.

Wherever possible the use of water, e.g., as motive power, should be given to companies on long leases on the payment of water rate.

Training of labour and supervision.

I have had no experience of technical or industrial schools, but I can say that a man having primary education proves a far better one than the one who has no education whatsoever. My experience emboldens me to say that a small amount of training as an apprentice turns a Punjabi youth into a skilled labourer. I would recommend that Industrial schools be organised as part of the approved firms. All Industrial schools should be under the Education Department. The Education Department should in all matters of the kind be guided by the advice of Board of Industries.

Training of Supervisors.

As to the training of supervising and technical hands (1) there should be Colleges of Commerce and Technical Schools and Colleges. Deserving and capable men should be sent on scholarships to foreign countries and also in Government-owned and Government-improved factories in India. If anybody wants to go to foreign land at his own expense the Government should see that he gets the required knowledge at the factory he goes to.

It would be better if a uniform standard of an examination is prescribed for Mechanical Engineers, but it should not be a very high one, so that Mechanical Engineers of all Provinces should be interchangeable.

General official administration and organisation.

Provincial Boards.

I think there should be a Board of Industries for each Province and a Director of Industries appointed by the Government for each Province. The Board should be recruited if possible by election or nomination from amongst the leading men in the Province in the industrial line. The Government may, to represent itself, nominate a number of

men to be Members of the Board. The men to be nominated must invariably be experts, technical specialists or businessmen. The Government nominees should always be in minority on the Board. The Director for each Province should be an official appointed by the Government for the discharge of executive functions. The Director should be subordinate to the Board of Industries.

All the work as regards Government aid, training of experts, lending of experts to private firms, the organisation of museums, exhibitions etc., should be in the hands of the Board. The Board should be represented in the legislative council of the Province.

Again an Imperial Board with a Director as above should be constituted, the members coming to the Board by means of election from various provincial boards and Government nominees. The Imperial Board should start and manage pioneer factories, send representatives to foreign countries, supervise the working of the provincial boards. Autonomy on the whole except in matters concerning the whole of India should be the key-note. Imperial Board should be represented in the Imperial Legislative Council. Imperial Board.

The cottage industry should receive the special attention of the Board thus constituted.

Again I would like the Government to leave apart a certain sum of money for the industrial development of the country every year and this money should be spent in conformity with the wishes of the Board. As far as practicable wishes of the Board should be carried into effect but the Viceroy in Council should have the power of veto.

Organisation of technical and scientific departments of Government.

After the formation of the Board of Industries there should be Imperial and Provincial Institutes of Scientific Technical and Technological Research. They should be directly under the Provincial and Imperial Board of Industries. The Imperial and Provincial Boards should organise these research institutes. These research institutes should not overlap in their function but should co-ordinate with one another. The Imperial institutes should be distributing offices and assign to each provincial institute special duties to be carried into effect but at the same time they should serve as advisory bodies to the Boards of Industries. Research institutes should send in men to foreign countries to study foreign methods.

Reference libraries should be started in each province. Local centres where special industries are specially carried on should have all the up-to-date literature on the subject. Each Province should have a commercial college under the provincial university but the Board of Industries should have an important voice in prescribing the syllabus. Reference libraries.

Local bodies, e.g., Municipalities and District Boards, should start Industrial Schools and pioneer industries but with the sanction of the Board of Industries.

Government organisation for the collection and distribution of commercial intelligence.

Every Board of Industries should own an Industrial and Trade Journal. The Journal should not only give statistics but should also undertake educative work, e.g., it should deal with results of researches carried on by different institutes, foreign industries, pioneer and demonstration factories, etc. The cost of the Journal should be mainly met by the Boards and it should have a nominal subscription.

General.

I am engaged in manufacturing cutlery. The chief difficulties I meet with are— Cutlery.

- (a) lack of steel specially in these days of War ;
- (b) want of an instrument in my hand to keep the labourers on to their work, the force of Act XIII of 1859 having been greatly lessened by Chief Court Rulings ;
- (c) want of machinery ;
- (d) the trade being in its infancy foreign competition greatly retards progress and so on.

To avoid these difficulties I would recommend a pioneer industry for the making of steel from Indian iron ore. Tata's, I believe, have undertaken the work but I believe far more can be done in the line.

Law of Labour should be made more stringent.

Machinery should be supplied on favourable conditions, and preferential treatment should invariably be accorded in all Government purchases.

Even for the supply of instruments such as files we depend upon foreign markets. The difficulty should be remedied if possible.

WITNESS No. 885.

MR. WILLIAM RAITT, F.C.S. *Chemical Engineer and Cellulose Expert, Consulting Cellulose and Paper Expert attached to the Forest Research Institute, Dehra Dun, United Provinces.*

WRITTEN EVIDENCE.

In the following statement I have endeavoured to express what is my attitude and opinion generally to those questions in the Commission's list bearing on the establishment of industries which are either new to India or which propose to render new sources of raw material available for old industries, and for which Government co-operation is essential by reason of the necessary primary requirements of such industries—land, raw material, water-power, fuel, minerals, etc.—being wholly or mainly under Government control. The statement is based on my own experience during some years of effort on behalf of one such industry, viz., the manufacture of pulp for the use of paper-making and other cellulose-using industries. I add the following notes of my experience as a whole :—

I am a Chemical Engineer and a Fellow of the Chemical Society who has specialised in Cellulose Chemistry and the manufacture of paper and paper-pulp. I have had considerable practical and commercial experience in the management and direction of factories in England and India. My Indian experience consists of eight years of factory management and ten years devoted wholly to research work and exploration for new sources of raw material. For six years of the latter I have been attached to the staff of the Forest Research Institute as Consulting Cellulose Expert. I have also carried out surveys of the paper and pulp-making resources of one district of Assam and of the State of Mysore, and am now engaged on a similar survey of Kashmir at the instance of the State Darbar.

Industrial surveys.

I think that what is required is a survey of the undeveloped industrial resources of the country. I can best indicate the proper character of such survey by citing a case where it has been done and the procedure of anyone wishing to take advantage of it. An investor in England desirous of engaging in the exploitation of any of the natural resources of Sweden applies to the Swedish Consul-General in London quoting the industry he is interested in. By return of post from Stockholm he will receive a map of the country drawn up with special reference to the industry he is enquiring about. Let us suppose it is saw-milling and wood-pulping. The map will show the unleased forest areas open to exploitation, the rivers and tributaries down which he can float timber, water-falls available for power, sites suitable for factories, lines of communication to seaports for export of products, towns and villages near suggested factory sites which may be relied on for labour, nearest sources of lime and other chemicals required. An accompanying booklet, also drawn up with sole regard to the requirements of the industry, will give him the estimated outturn of the forest areas mapped, estimates of the amount of water-power available, costs of lime and other chemicals, local labour, transport to seaport whether by road, rail, canal, river or lake, building materials, royalties, rents, taxes, customs, duties, etc. He can make up in his London office satisfactory estimates and, when satisfied with the prospects, need only go to Sweden to inspect the one or two sites he has selected as most likely to suit him. If he contemplated similar operations in India he would have to prospect the whole country and because that would take years *he does not do it*. I have observed a greater ignorance among London business men as to industrial possibilities of India than of our Colonies and Dominions. Many of these do advertise what they have to sell on similar lines to Sweden. Such information as is available about India is entombed in departmental reports the existence of which he is unaware. If he should be directed towards it the information given is probably to the effect that here or there so many thousand tons of raw material is available but there is either no information given as to its quality and suitability and to the manufacturing facilities associated with it—water-power, fuel, chemicals, labour, transport, climatic influences—or it is incomplete and not bonded together with regard to the effect of each item upon what should be the cornerstone of the whole effort, viz., an estimate of production cost, or data upon which such an estimate can be made. The departmental officer is invariably most painstaking and exact in the information he gives but his deductions are not necessarily those of an expert in the industry he is reporting on and he invariably misses something which, to the expert, is essential. At the Forest Research Institute a beginning has been made towards drafting reports on such lines but so far, for want of staff and experimental plant, they have been issued in admittedly incomplete form.

2. Where such surveys deal with raw materials which have to be converted into manufactured products by chemical or mechanical processes or both, an important part of the survey work must consist of laboratory investigation as to the suitability of the materials for the intended purpose and the discovery and establishment of methods of manufacture and types of plant calculated to obtain the best results. For it is invariably the case that such raw materials differ markedly both chemically and physically from

those now in use by the industry in question and neither the methods nor the plant in common use are suitable for them. It is necessary to carry the laboratory work into actual demonstration that its findings and recommendations are correct and yield practical results. The point will be clearer if I again quote our Dehra Dun experience. We have been able by prolonged investigation to select certain bamboos and Savannah grasses as being useful sources of paper-pulp, to discover their chemical and physical constitution and the extent to which these differ from materials in common use and to indicate the modifications of plant and treatment which will probably be found necessary when working them upon a commercial scale. On its negative side, that of rejection of unsuitable species, such work is final and conclusive and calculated to prevent money being wasted on them, but on its positive side the prospective manufacturer points out, quite reasonably, that we leave a large field untested and makes such criticisms as the following:—

- (a) May not large scale tests on the lines you recommend only point out the need for further modifications of plant and methods?
- (b) Laboratory work, where everything is under perfect control, does not necessarily tell us what our unavoidable losses will be in raw material, pulp, chemicals, etc.
- (c) We want to be supplied with sample parcels of pulp in sufficiently large quantities to be put on the market to test its value or to manufacture into paper with a like object.

3. The answers to such criticisms can only be supplied by a *demonstration plant* attached to, and a necessary part of, the laboratory equipment where types of plant and manufacturing methods can be tested and compared and laboratory findings proved or corrected. It is not necessary that they should be on a factory scale or worked as commercial establishments with a strict eye to profit and loss. On the contrary they may be comparatively small but always large enough to compel factory methods to be used and to turn out pulp in marketable quantities. The investor does not expect complete balance sheets with costs of labour, freight, oil, packing, repairs and management, worked out to a decimal per ton of product. These minor charges are known and in any case they will vary with locality and the scale of operations and he can work them out for himself. Give him five tons of pulp and tell him it is the product of so many tons of raw material costing so much at a given point of delivery, that it is produced by such a method in such a type of plant at a cost for chemicals and steam of so much and he is satisfied. Such demonstration plants are not primarily intended as schools of instruction but there would be no difficulty in using them as such. For the purpose of demonstrating to the intending pioneer and investor the problems he was interested in or even of allowing him to work out his own ideas in, they would be invaluable. Such plants should be centralised: not Provincial or localised. In the case of pulp one such plant would be sufficient for the whole of India and Burma.

Demonstration factories.

4. An industrial survey on these lines must be Imperial and sectional, the sections being individual industries. One of its important values would be that of comparison, elimination and selection. To be of the greatest value to an industrial pioneer, the reports should indicate to him where his requirements can best be met. They cannot, therefore, be confined to geographical or political limits. I would advocate the creation of an Imperial Industrial Survey dealing solely with the unexploited industrial resources and assets of the country. I am aware that this is an enormous task which will take many years to complete, but would prefer to regard it as one which was not intended ever to be complete, one which is always in process of being extended, amended and brought up to date. If done sectionally, beginning with one or two industries most in the public eye, fairly complete sectional reports would begin to appear at an early date. It would also be of value to the commercial and financial public to know that there was an authority in existence from whom they could obtain information or even special reports on subjects upon which complete reports had not yet been issued. The reporters in each section should be industrial experts possessing a knowledge of the scientific side of the industries they represent. Resources other than raw materials for paper-pulp which occur to me as worthy of survey are *water-powers* both natural and on canals and their relation to other undeveloped resources in their neighbourhood, as also their development electrically for the use of industries at a distance. *Minerals* also require attention, not so much perhaps as to their metallurgical value which is probably already well known, but in their relation to manufacturing industries requiring them. Pulp-making, for instance, is impossible without cheap supplies of lime. Then there are several forest industries which are possible but about which no satisfactory data exists. I instance the series depending upon and arising out of the *destructive distillation of wood*. Among purely chemical industries there is *alum* and *soda*, both of which are now being worked in a very crude and primitive manner.

Surveys must be Imperial.

Subjects for which surveys are required.

Publication of the results of surveys.

5. The need for such surveys becomes greater when we consider for whom the information is required. The native of India, with few exceptions, will not invest in such industries although willing to follow after an initial financial success has been attained. We must therefore rely on the English investor who shows no aversion to them provided he has trustworthy information about them other than that supplied in promoter's prospectuses. We have not, therefore, to cater for an investor on the spot but for one in a far country who knows nothing by personal acquaintance or observation of what India has to offer. Such information as is now issued is not put before him in a manner which compels his attention and I rarely see the publications referred to in questions 82, 83, 84 and 87 on his table. If he receives them regularly most of them are of no interest to his business so he gets into the habit of paying scant attention to any and those which do deal with some aspect of his business are not sufficiently practical really to interest him. Usually he is too busy to read any commercial literature which has not a direct practical bearing upon his concerns but he must read, as a matter of daily or weekly business routine, his financial paper and the technical journal devoted to the interests of his own industry, and it is through these that such reports as I contemplate should be brought to his notice. In the matters we are discussing Government is in precisely the same position as an inventor or manufacturer who has a new line of goods to put on the market. He advertises them in the journal which circulates among the buyers he wishes to reach and gets them noticed or reported on by the editor. If advantage is taken in a practical way of the means of publicity now in existence I do not think there will be any need for Government to add one more to its list of publications which are now received with indifference. We have adopted at Dehra Dun such publication with our recent reports and with the happiest results. They have been published *in extenso* by the journals devoted to the paper and pulp trades and from them have been quoted by similar publications throughout the world. We have to recognise that each one of our unexploited industrial assets is, as a rule, of interest to one section of the commercial community only and we have to bring it to the notice of that section by the method and through the agency by which it is accustomed to receive all new ideas.

Concessions and grants.

6. After having by survey, demonstrations and publication attracted an enquiry from a suitable person the question arises as to how he should be dealt with. The impression current in commercial circles is that such pioneers are not welcomed, at the best, are regarded as a nuisance, at the worst as mere concession hunters. Their applications are dealt with by a perfunctory and leisurely process occupying months and sometimes years. Letters are replied to at intervals extending from 15 to 45 days and negotiations end up with Government showing—in the words of an eminent civil servant—"a desperate terror lest somebody is going to make money out of us." Meanwhile, as capital will not wait, even for Government, the money earmarked for the scheme has probably been diverted elsewhere. Much of the delay complained of is no doubt due to Governments having themselves to acquire some knowledge of the assets they are being asked to deal with, a state of affairs which would be put an end to by the surveys I have indicated, and it is fair to add that such delays are not, as a rule, created by the executive departments (forests, engineers, geologists, etc.) to whom reference has to be made. These deal promptly with questions referred to them and in a spirit markedly different from the calm indifference of the secretariats. Such a system and such treatment is about the best that could be invented to scare pioneers off and gives reason for the maxim current in the commercial circles of Calcutta and Bombay that "if you can get what you want anywhere else in the world or from anyone else in the world don't ask a British Indian Government for it." It scarcely needs to be said that an intelligent system of dealing with industrial pioneers would be the exact reverse of this. They should be welcomed as persons who propose at their own risk—and it is not necessary to advert to the serious risks all pioneers run—to put a value on and make a market for Government property. The rents and royalties Government is to get from them should be regarded as of trifling importance to the enhanced values to be obtained from those who follow in their footsteps attracted by their success, and Government's chief object should be to ensure that success by all the means in its power even to giving its goods for nothing. The inventor or manufacturer referred to in the previous paragraph would not hesitate to give several of his machines or consignments of goods for nothing to persons whose experience with them was likely to help in their introduction to the public at large. The "desperate terror lest somebody is going to make money out of us" should be abandoned in favour of a fear that he won't make money.

Below are a few answers to questions not dealt with in the foregoing statement.

Government pioneer factories.

Q. 8. —Never, unless a very special case can be made out. Governmental systems, methods and atmosphere are not those best adapted to successful commercial management. There is no "do-it-now" about them, no elasticity, and initiative is hedged about by rules

and precedents intended to check it. A local Government cannot pay an Expert Manager more than Rs. 800 a month without referring to the Secretary of State—while the reference is taking its leisurely course the Manager may have found a better job. A local Government declines to pay a Manager by result, i.e., a commission on profits, because some sections of Indian society are supposed to be unable to distinguish between that and *dastari*. A special case would be one in which all the keys of the industry were in Government's hands, in which the prospective profits were so large that even Government methods could not make a failure of it and of which the investing public were shy because it had hitherto been a monopoly of foreign countries. A case in point is the turpentine and resin industry as carried on in Government factories at Lahore and Bhowali, United Provinces. But even in this case I would have given the public an opportunity before deciding that they would not look at it.

To the subsidiary question under 8, when should such factories be handed over to private capitalists or companies? my answer would be—"as soon as ever you can get any one to take them over."

Generally my position would be that if the public does not come forward to pioneer an industry which has been properly prospected and demonstrated by Government experts to have good profits in front of it and which is offered to the investor on terms by Government, then either the terms are not good enough or the investor has discovered some flaw in the argument. If a thing is good enough the public will take it up, if not, neither public nor Government should touch it.

Qs. 5 and 6.—On general principles I am opposed to spoon-feeding of industries. Usually financial help is demanded because the public have not sufficient confidence in an undertaking to provide it with a full set of teeth. But confidence is born of knowledge and the surveys I have indicated are intended to supply this. Special cases may, however, arrive in which it may be advisable for Government to assist in order to prevent the collapse of a promising venture. An honest mistake may have been made as to the amount of capital required to exploit properly and develop the industry. In such a case it is almost impossible to get the public to come forward with a second subscription. If the industry is still considered sound it may be good policy for Government to come forward with help, which should preferably be in the form of preference or debenture capital, with easy terms for redemption. There should be Government representation on the Directorate proportionate to its monetary interest. Government assist-
ance.

Q. 44.—I think the lack of primary education is a great hindrance to the training of native labourers to become overseers and foremen and heads of departments in factories. There is no lack of intelligence; it is trained intelligence which is wanting. In the factories I have been connected with all such posts have been filled by skilled workmen from Home, many of whom could be replaced by natives if primary education was more common. I may refer here to the system of sending natives of India to England with scholarships to study industries with a view to becoming practical experts. I think such expenditure is mostly wasted—say 95 per cent of it—because the wrong class of man is sent and advantage is not taken of opportunities to obtain similar training in India. It is no use trying to make an industrial expert in operations in which skill of hand and eye, an instinct for the feel and movement of things, is essential, out of a man who despises manual labour. Such a man loafs around the British factory to which he is attached with a pencil in one hand and a notebook in the other. A Japanese student in the same factory will be seen stripped to his shirt taking his full share of all the operations. He is learning, the other is merely observing. Such men are sent Home to learn paper-making or pulp-making while there are perfectly well-equipped factories in India where they could at least be given a thorough preliminary test before being sent Home to find out if Home experience was likely to be of any use to them. Industrial experts can only be produced from the class which not only does not despise manual training but is proud of it and, if an effort was made to train the intelligence of such men up to the standard required, they would probably be greatly benefited by a finishing course at Home. Training of super-
visors.

The Patent Laws should be more directly assimilated to those of England, in particular as regards what is, I think, called the Patents Convention, under which all countries joining it agree to register, if desired, patents originally registered in one of them if application is made within one year of the date of original registration. It seems an extraordinary anomaly that India should be outside such an obviously useful Convention of which England is the mainstay. Patent Laws.

AMRITSAR.

WITNESS No. 385.

KHAN BAHADUR SHAIKH GULAM SADIK, *Carpet Manufacturer, Amritsar.*

WRITTEN EVIDENCE.

Pioneer factories.

There are no pioneer factories in the Punjab; in my opinion it would be advantageous if the pioneer factories are opened by the Government for spinning woollen yarns and tanning skins and hides. It is most desirable and important that these model or pioneer factories should be started on as moderate a scale as possible. Materials for both of these two industries are plentiful in the Punjab, all of which are exported to Europe in raw state. I shall write about these later on.

Consulting engineers.

There is no consulting engineer here to help people desirous of opening new factories for manufacturing articles which are imported from outside. The appointment of one by the Government will be hailed by the people of the Province. There will be no harm if he be permitted to make arrangements to purchase machineries for any private person if he so desires. Of course it must be part of his duties to give the addresses of all the manufacturers of the machineries, and full particulars about them and everything required by the purchaser.

Industrial schools.

A few years ago, during the time of Sir Louis Dane, the then Lieutenant-Governor, an Industrial Conference was appointed by the Government, and I had the honour of being one of its members and thereby had the occasion to visit about five or six existing Government Industrial Schools in different districts in company with the then Director of Industries of the Punjab and two other gentlemen. My opinion was that those schools were quite useless and the money spent on them was wasted. Excepting that the boys were educated up to the middle standard, the industries taught were carpentry and smithy of different kinds of an ordinary type, which could be learnt anywhere *gratis*. If these schools are to be maintained the boys should be taught highly skilled workmanship in these and other crafts which they cannot learn anywhere else. New crafts should be introduced and the teachers should be brought from other countries for the existing and the new crafts. Small handworked machines should also be introduced to save labour, so that when the boys leave the school, they may come out as highly skilled artisans. I have seen that boys of these schools after finishing the course seek other employments. Of late an improvement has been made by increasing the school hours on craft's side and limiting the education to elementary standard. Excepting railway workshops we have very few other places where boys can be sent as apprentices, but I suppose these workshops have enough apprentices for their own future work.

Half-time schools.

I have no experience of day schools for short-time employees, but I know something of night schools. I have found that night schools are popular with workmen and wherever opened, sufficient number of men come forward to receive education.

It is very good to train supervisors and managers, but so far as the Punjab is concerned, I think there is no necessity of opening classes for these, as there is no demand for them at present.

General.

There exists no organisation for development of industries in the Province. I have been advocating the formation of some sort of organisation for introducing new industries since many years. I am a carpet maker by profession and throughout my life I have been connected with the manufacture in one way or the other. At present I have a carpet factory in Amritsar and three branch factories in the out-stations. More than six years ago I also took up sericulture with a desire to promote the same. I have also a small filature in Amritsar. So my experience, whatever it is, relates to the industries in which everything is done by hands only.

It is my belief, which is based on the small experience which I possess, that we cannot revive old industries which are worked by hands. Manual labour cannot compete with the machinery. Therefore any attempt to manufacture by hands, the things which can be made by machinery, shall end in a failure. Some two years back I wrote an article on the development of industries which was published in the *Tribune* of Lahore in its issue of September 1915. I have got it reprinted and send now 10 copies * of the same along with this paper. It may not be out of place to mention here that in that article I have given in detail my reasons as to why we should introduce only such new industries which

* Not printed.

can be worked with the machinery alone, and I solicit the favour of the article being perused. The time of industries, which are run by manual labour alone, is gone for ever. It is useless to attempt to revive them. We have still a few cottage industries left. The workmen employed in them are very poor—poor not because they have no capital and cannot improve their lot, but because there is not a great demand for articles made by them, and so they continue to work on small wages.

I may be permitted to write here that the Punjabees as a rule are enterprising people. They are always on the lookout for some new business, whether trade or industry. If they are assured that it is profitable, they are ready to undertake it. Years ago numerous banks and other corporated companies were started in the Punjab. Unfortunately with the exception of a few, all of them were smashed recently. They are still known to the public, but with the addition of "in liquidation" to their names. As all this ruin was caused through the inexperience here and dishonesty there of the managers and the directors of these companies, every new enterprise met with a check. So much so that it is nearly impossible now for any private person to come forward and dare to start a new concern, because the public will not trust anybody now.

Besides this, those who are desirous of starting new industries do not know what and how to do it and from whom to get any information about them. Then in starting factories for new industries, one must be prepared to incur initial and incidental expenses which cannot be avoided which will necessarily be very large in proportion to the capital outlay in an industrially backward country like India. Supposing a man does so and he succeeds in some industry, there spring up against him the competitors, who take advantage from the experience of the first man which he has obtained by spending money. It is therefore high time that the Government may be pleased to take upon themselves the task of showing and teaching the people what and how to do in the matter of introducing new industries.

For the future development of industries in the Punjab my proposal is that a Board of Industries be appointed with the Director of Industries as its President. The Director of Industries may be an Indian Civil Service man, but there must be a wholetime Secretary who must be thoroughly acquainted with business and industries and must have up-to-date information about commerce and industries of other countries. The Board must be provided with funds. Money should be allotted for recurring charges, such as salaries, travelling expenses of the Secretary and of the establishment. The main duty of the Director should be to preside over the deliberations of the Board and see that the money is not wasted and that the Board is not going to be extravagant on its expenditure side. However a certain sum should be sanctioned which the Board can spend for the sake of making enquiries as to which industries may be introduced and what pioneer factories are to be opened. As our aim is to introduce quite new different industries, the Board shall have to bring experts from other countries. All these expenses must be borne by the Board. There must be a separate fund given to the Board for the sake of starting factories which the Board decides to open. The number of members of the Board should not be more than nine, and these should be selected from amongst the manufacturers and merchants of the Province. The Board must not take in hand more than two industries at a time and when these are a perfect success, two more may be taken up in hand. After the Board has started one or two factories and they are working profitably, they may be sold to the highest bidder by public auction. The actual costs of the factory should also be disclosed to those who bid for the same.

Official organization.

If any one requests the Board to erect or start a similar factory for him, the same must be done, but he should be charged a commission of 5 or 6 per cent on the actual cost of the same. My suggestion to sell the first factory of a newly introduced industry to the highest bidder, is to avoid showing any favour to anybody in making it over to him. I am quite sure that once a factory is proved to work profitably, many similar factories shall be opened by the people.

I have written above and repeat it here, that it is most important, that in the beginning only such industries should be introduced, the factories for which can be run with a moderate capital. And if such factories are established which could be worked with small capital, say one-quarter, half, three-quarters, and one lakh, I think hundreds of similar factories shall spring up at different places.

The Board must send a report of their working to the Government half-yearly and before the beginning of each year must send their proposals for what they are going to do during the next year. The factories for spinning woollen yarns, tanning, boot-making, soap-making, enamel-making and for the manufacture of toys, buttons, needles, nibs, penholders, etc., can be opened and worked profitably. There are hundreds of other

small things, for all of which we depend on other countries. I must write here that I have no experience of machineries and cannot say anything about them.

Under the present circumstances when India has made no progress industrially and even the Bombay Presidency, leaving its cotton industry alone, has done nothing to introduce other modern industries in the country, I think there is no necessity of having an Imperial Department of Industries. For the present each Province must begin and work separately according to the commercial ability and the working capacity of its people.

ORAL EVIDENCE, 20TH DECEMBER 1917.

Hon'ble Sir R. N. Mookerjee.—Q.—You think there is no necessity for opening classes for supervisors and managers in the Punjab?—A.—No, there is no necessity. We have got no industries, and don't require managers for the present.

Q.—How will industries begin without manager?—A.—When the industries begin we will have experts and they will manage it. It is quite useless for the present to have classes to show them the work of management of things which do not exist at all.

Q.—Don't you think both should proceed side by side?—A.—Quite so.

Q.—If you want to develop industries you must have men to supervise?—A.—My proposal is that, until Government comes forward, in the way I have proposed, we cannot expect that the people will come forward and develop industries. In my opinion, if we leave that question to the public alone, it will be quite impossible. My idea is that our old industries are dead, and it is quite impossible to revive them. If we do, we must see commercially what would be the effect of that. There is no demand for our hand-made things. At present everything manufactured by machinery is cheaper and nice-looking. People have got the habit of using those things. They don't care about the durability of things, but that they must be nice-looking, and at the same time cheaper, so that they can suit the purse of everybody.

Q.—Are your observations meant for the whole of India?—A.—I have not such experience that I can talk about the whole of India. I can only talk about the Punjab.

Q.—Is the Punjab specially bad that they won't look to durability?—A.—The Punjab is in no way behind other provinces, except that there are few technical and other industries.

Q.—Do you think the way you suggest that Government should help every industry is feasible?—A.—Quite feasible, if Government really desires to help these industries. Two years ago I wrote an article suggesting that that was the only way of developing industries in India. It is very difficult for us in the beginning to have factories which cost lakhs upon lakhs of rupees.

Q.—I see you are opposed to having an Imperial Department of Industries?—A.—What would be the cost of that department? I had purposely left that question alone, because if I recommended that, it will bring the whole machinery into existence before there are any industries. If I suggested that Government must have an Imperial Department, it would cost four or five thousand rupees monthly. If that money was spent monthly to help the opening of new factories as proposed by me, we should do much better. Of course when there are factories of that kind, then you can have one Imperial Department for the whole of India, and Directors for different provinces.

Sir D. J. Tata.—Q.—You say that industrial schools are quite useless, and the money spent on them is wasted. Why do you say that they are useless?—A.—The last time I had occasion to go round with the Director of Industries and visit these schools, I saw that nothing was taught there, except that which was taught everywhere. What is the use of having these schools when you can teach boys the same things anywhere *gratis*.

Q.—You must admit that the teaching of blacksmith's work or carpentry in the ordinary way is not likely to be very useful. In technical schools boys are taught the use of special tools, and improved methods. The efficiency of the tools used by the village carpenter or blacksmith is nowhere near that of the tools introduced by the schools. Does not that make some difference?—A.—In the first place, the boys who are taught in these schools are city boys, a very few villagers' sons and sons of village carpenters. They are only city boys. There is a vast difference between the work done by village carpenters and city carpenters. City carpenters can do everything. They can make every kind of wood-work for buildings, etc., while the village carpenter only repairs carts with big wheels and nothing else: so whatever is taught in the cities, the same is taught in these schools. Whenever a big building is under construction the carpenters who work there take three or four boys as apprentices. In the beginning they only give them tools to sharpen. After some time they give them something to handle. After two or three years they learn enough to help their

masters. The latter get eight annas from the owner of the house as the wages of the boys who after 2 or 3 years are paid a portion of what they earn. In this way they learn everything without any trouble or difficulty. I have seen the same thing being taught in those schools I visited. I have never seen in any of these schools that any machinery was used, or any improved tools. I told Mr. Hamilton at the time that it was waste of money.

Q.—Then you don't believe in improved tools turning out better work?—A.—There are no improvements so far as I have seen.

Q.—Surely, there is a difference between the European tools brought into these schools, and the country-made tools?—A.—No tools are manufactured here.

Q.—Those are European tools brought into this country, the use of which these boys are taught; and with those tools do they not do much better work?—A.—I have not seen that. What is the use of teaching them when they can do the same things you can find everywhere. If you are going to have these schools, have them on an improved system, so that the boys who go to these schools are taught what they cannot learn in cities.

Q.—You say "I have no experience of day schools for short-time employees, but I know something of night schools." You have no experience, because there are no day schools, or because you have not visited any?—A.—What do you mean by day schools? There are no schools for short-time employees.

Q.—But you believe in the necessity of day schools, that if they were introduced for short-time workers, it would be to the advantage of those workers?—A.—Yes.

Q.—You say your night schools are popular with your workmen? Do they get time to attend?—A.—At night; they leave work at 5 or 6, and go very gladly.

Q.—What do they learn?—A.—Reading, writing and arithmetic.

Q.—No sort of technical knowledge?—A.—No, just reading and writing.

Q.—The reason why you say you cannot revive old industries is simply because of the competition. Machine-made goods can be made so cheaply that hand-made goods cannot compete with them?—A.—Yes.

Q.—But aren't there some things which cannot be made by hand, and which can be made by machinery?—A.—No; I have given an instance to you of carpet manufacturing. That work is thriving; at the same time, we don't find any market in India for those carpets.

Q.—There are certain carpets which can only be made by hand, and which cannot be made by machinery?—A.—Our carpets are never made by machinery.

Q.—Except those, you say there is no scope for hand-made industries?—A.—No.

Q.—Amongst the factories you recommend is one for enamel-making. What do you mean? Enamel ware or artistic enamels?—A.—Enamel ware. There are several things we import from foreign countries. These small things we must attempt to manufacture here. I don't recommend big factories where the capital is 25, 50 or 60 lakhs. We must not have that for the present; we must follow Japan.

Hon'ble Sir Fazlulhug Currimbhoy—Q.—You say you are a hide merchant?—A.—No, I have corrected that. I am a carpet merchant.

Q.—You are not dealing in any way in hides?—A.—No.

Q.—Where do you get the patterns of your carpets from? Do you change them very often?—A.—I change them every month. We get the designs from America. I deal solely with America; they have their own designs and their own colours.

Q.—On account of the war is the trade very slack at present?—A.—No, it has not affected us up to now.

Q.—If you follow their own designs and colours, can you get the aniline dyes to get the American light colours?—A.—There is no difference between aniline and imported colours because formerly we had indigenous dyes here, but since the introduction of German colours the dyers forgot all about those Indian colours. We have got a very big dye house and have again revived indigenous dyes, in consequence of not being able to get those German dyes.

Q.—Have you got any expert in dyes?—A.—I am myself, an expert in dyeing.

Q.—Do you think the Indian colours will be cheaper than aniline dyes?—A.—I went to Simla and got every leaf and bark and everything. I tried, but it is very difficult to get all the colours.

Q.—You don't think you will be able to make it cheaper?—A.—It is not the question of cheapness, but the question is whether we have got enough colours here. For the present we use only one or two, viz., pomegranate for yellow and cochineal for red and walnut bark for black, but it is not so black as we desire. Although we are using indigenous dye stuffs, we are still looking after those imported dye stuffs for which we have to pay Rs. 30 instead of Re. 1.

Q.—Will you tell us how much more your indigenous colours cost you, as compared with other colours; the original price?—A.—I think the cost was the same. The pre-war price of the imported and the Indian dyes were the same.

Q.—I suppose German colours were much cheaper?—A.—No, the good in them was that they sent hundreds of new shades every month. They have got experts. We know how to combine the colours and produce different shades by mixing the different colours. We receive designs coloured and find out that there are 20 colours in that. We must make the colours exactly like samples, so we have to produce a combination. What the Germans did was to send their own combinations, hundreds of shades, so the dyers had no necessity for combining these colours. They merely had to take the colours and put them into a basin and use them.

Q.—Are you directly trading with America, or have you got a middleman?—A.—Yes, directly.

Q.—What do you think is the average export of carpets from the Punjab?—A.—Amritsar exports 7 or 8 lakhs of rupees a year to America.

Q.—Do you think there is any chance of developing this industry still further?—A.—There is.

Q.—You make a reference to an Industrial Conference. What was the idea of Government in having this Industrial Conference?—A.—I heard nothing as to what was decided about that.

Q.—What was the object of this Conference?—A.—To improve industrial education, but nothing came out. We sent our report, but nothing was done. It was thrown into the dead letter box.

Q.—If you have no objection, will you tell us what you think, and recommend for the industrial education of the Province?—A.—I gave my opinion. I don't know about the result. We never gathered together again. After we visited these places, we never sat together, and were never consulted about the report. I personally sent a report about these industrial schools, but I don't know exactly what Mr. Hamilton reported, or what Government did. Nobody asked us, and we kept quiet.

Q.—Have you any suggestions to make regarding the industrial schools in your province?—A.—The schools are the same as what I have suggested.

Q.—You are not in favour of industrial schools at all?—A.—What for? You can improve them in a hundred ways. You can introduce hand-machines. There are hundreds of things which our carpenters cannot make, hundreds of things which our ironsmiths cannot make. They make them in a clumsy way. There is vast room for improvement, but they never do anything to improve.

Q.—You say, "it is my belief which is based on the small experience which I possess that we cannot revive old industries which are worked by hand. Manual labour cannot compete with the machinery." In certain things machinery never competes with manual labour.—A.—Yes, but carpets cannot be made by machinery; then we have no demand in India for real good carpets. We must have Mirzapore carpets which are selling at Rs. 2 and Rs. 2-8-0 a yard. I manufacture about 700 or 800 square yards per month, but I never get a buyer to buy nice carpets for Rs. 1,000. Everybody wants carpets for Rs. 40 or Rs. 50. If we are poor we must make things which can be bought by poor buyers.

Q.—Have you got any opinion about cottage industries?—A.—There are no cottage industries, so far as I know, in the Punjab.

Q.—Don't you think that the establishment of cottage industries would be very useful. People in their own small huts could do hand work?—A.—I have no faith in that.

Q.—What do the cultivators do after the season is over?—A.—I don't think they have a long time of vacation between harvest and harvest and crop and crop.

Q.—You think there is not much time that could be devoted to cottage industries?—
A.—There may be but we must introduce things that are saleable. There is no such thing that you may introduce and then find a good demand for them, for which people are willing to pay good prices.

Q.—You say that you don't want an Imperial Department?—A.—Not for the present.

Q.—For big industries like ship-building, an Imperial Department is necessary?—A.—If you have any intentions of that kind, certainly. What I meant was for the small industries it is useless to have an Imperial Department.

Q.—You say, "if any one requests the Board to erect or start a similar factory for him, the same must be done, but he should be charged a commission of 5 or 6 per cent on the actual cost of the same." What do you mean by 5 or 6 per cent? Is that in addition to the cost?—A.—Yes. Suppose you have a new factory and it works well and gives a profit. Then you make it over to somebody, but if anyone wants you to erect a new factory, you may get 5 or 6 per cent commission for the trouble.

Q.—But the charge for the trouble will be included in the cost?—A.—For their services this 5 or 6 per cent may be added.

Sir F. H. Stewart.—Q.—You say you are a contractor as well as a carpet manufacturer?—A.—No, that is a mistake. I am a carpet manufacturer. For the past 5 or 6 years I have also had a small silk filature, which is running in Amritsar.

Q.—Is it progressing satisfactorily?—A.—It should be progressing, but the difficulty is that the people have not taken to it as yet. It is now some 6 or 7 years ago that a Settlement Officer at Gurdaspur got a few ounces of French seed from Kashmir and gave it to the people to be reared. I have two small branch factories in that district. So my people reared the silk worms and delivered the cocoons to that gentleman. Next year I wrote to him, that if Government are not willing to do that work, I am willing to spend money and do it. The gentleman replied that Government were not willing to do that, but were willing to help me. For the first 4 or 5 years I lost over Rs. 5,000, but in consequence of the war, prices have gone up, and I am recouping that loss, but there is a difficulty in introducing new things. I have now got competitors. At the same time I have to recoup my losses. That is the difficulty. The people of this province are willing to do anything if they see other people do it. Just as they did with the banks. They lost 2 crores of rupees putting confidence in men who had just left their colleges without any experience of business. They tried to play with the money of other people. I am one of those men who are willing to introduce new factories, but if I spend 10,000 or 12,000 rupees, other men will come and compete with me and try to oust me. The carpet industry was introduced in Amritsar by my brother and myself. He and I worked together, and introduced it. Nobody knew anything about it in Amritsar. After a few years' other people came forward and tried to oust us from this work, instead of being grateful to us that we had introduced a new work into the city which gives a livelihood to more than 10,000 persons. They tried to oust us from this work, but we stood our ground.

Sir D. J. Tata.—Do you only make raw silk or try to weave it?—A.—No, just rearing and reeling.

Q.—In your carpets have you got any silk at all?—A.—No, it is not required at all. We have carpets of high grade wool, but not silk.

Sir F. H. Stewart.—Are all your carpets factory-made?—A.—Hand-made, all made in our factory.

Q.—How are the weavers paid; a daily wage, or piece-work?—A.—We give them so much per hundred stitches.

Q.—How much on the average can they earn in the month?—A.—The master weavers get Rs. 40, sometimes Rs. 50, sometimes Rs. 30. We have got looms, and with each master weaver we have an account, and give him so much per yard for different qualities. We have about 10 different qualities. The wages are paid at so much per 1,000 stitches, so the wages for a carpet are calculated according to the number of stitches it contains.

Q.—Does the master weaver supply the ordinary weavers?—A.—We supply the weavers and advance the men and everything; but only for the sake of keeping the accounts clear, we make him master weaver.

Q.—How much do ordinary weavers earn in a month?—A.—From Rs. 8, 9, 10 to 15 a month. Boys earn Rs. 7, 8 and 9.

Q.—With regard to the vegetable dyes you are using, are they fast?—A.—Yes, but there are different kinds of fastness. In America they have begun to wash carpets, because

the washing gives a kind of lustre. I know that process, but indigenous dye stuffs don't stand that washing, unless they are dyed in a particular way which we know because in that washing they use alkalies.

Q.—Do you know anything about the dyeing school at Lahore which has recently been started?—A.—No.

Q.—Your opinion of Industrial Schools generally is a poor one?—A.—Very poor.

Q.—Have you kept in touch with them for the last few years?—A.—I am Municipal Commissioner in this place, and we have got an artisan class under us.

Q.—Are you familiar with the work of the School of Art in Lahore?—A.—I have seen that once. It is the only School of Art. I go now and then. It is not so useless.

Q.—And the Railway Technical School at Lahore?—A.—I know nothing about that.

Q.—Or the Engineering College at Rasul?—A.—No.

Q.—With regard to cottage industries, you say that there are some left still, but your idea is that they are doomed to disappear?—A.—They are bound to disappear.

Q.—In the meantime, don't you wish to do all you can to preserve them?—A.—What is the benefit?—The difficulty with us is that we won't get a market for them.

Q.—You don't think that the Department of Industries which you recommend could do a great deal to help them?—A.—I cannot say whether they help them or not; but I have not seen any result up to this time. They may do if they like.

Q.—With reference to your Department of Industries, you say "The Director of Industries may be an Indian Civil Service man." Do you mean he should be, he ought to be?—A.—It is not necessary, he may be. I mean the best man. I want to have a high official at the top, if Government is going to spend any money.

Q.—Otherwise you think Government won't be responsive enough?—A.—Yes.

Q.—Do you think the Director should have the power of veto on the Board as regards expenditure of money?—A.—How can he veto? He will be one of them. I have not kept him separate. If you are going to appoint a Board, the Director of Industries should be one of them.

Q.—You don't want to give him special powers? You say he should see the money is not wasted.—A.—When there is a man on the spot at their deliberations, he can consult with them, give them advice. If they outvote him he can go to Government. There must be some check.

Q.—About your factory you say, "If any one requests the Board to erect or start a similar factory for him, the same must be done, but he should be charged a commission of 5 or 6 per cent on the actual cost of same." What do you mean by this?—A.—Suppose it costs Rs. 50,000. You have to make it over to one man. To whom will you show that favour; therefore I have written, when putting to auction they must be told that it has cost so many thousand rupees, but should be given to the highest bidder.

Q.—You want a reserve price fixed?—A.—No reserve. I don't want to show favour to any one. If anybody asks you to erect a similar factory for him, for future factories you must charge a commission of 5 or 6 per cent.

Q.—With reference to the Imperial Department, you are afraid of the expense?—A.—Yes.

Q.—But don't you think there would be much greater expenditure if all the different provinces had separate provincial Boards, and that without any central control there would be overlapping of work, and wastage of time as well as of money?—A.—I don't think there will be any loss because the beginning is to be in small things. My intention in putting forward this proposal is that I have seen that Punjabis generally look out for new business. If you show them something new, you are quite sure to see hundreds of things of the same kind will come into existence.

Mr. C. E. Loe.—Q.—You say in your evidence regarding industrial schools that "small handworked machines should also be introduced to save labour, so that when the boys leave the school, they may come out as highly skilled artisans." It is not very much good teaching boys the use of improved implements of that sort, unless they are put in the way of getting those implements when they leave school?—A.—Yes.

Q.—How would you arrange for that?—A.—If you have improved machines of that kind? In the first place, those machines which can be used by hand will not be so expensive.

If the man knows that it is beneficial and turns out good things, he will buy a similar machine and use it himself.

Q.—Do you think he can get the money to do it?—A.—Yes, they are well off. They get Rs. 1-4-0 and Rs. 1-6-0 a day in the city.

Q.—Take the case of a mortising machine, a machine for making holes for spokes in the nave of a wheel. Each hole takes him 20 minutes, if he cuts with his hand. If he puts it in a mortising machine, he can make the hole in $\frac{1}{4}$ a minute. Do you think he would spend Rs. 120 in purchasing a machine of that sort?—A.—Certainly. It is not necessary that each man who leaves school should get a machine. They will combine together. One might be well-to-do. He may start a small factory.

Q.—We have received very serious complaints from Mr Heath of the School of Art in Lahore that the boys on leaving school were not able to purchase the machinery which they had been taught how to use in the School of Art?—A.—It is quite possible, his experience may be so, but at the same time I think that those machines must be very costly. If they cost Rs. 50 or Rs. 60, or Rs. 100, it would be very easy for them.

Q.—You don't think it is necessary to have any special system of loans to these students to help them to buy improved tools?—A.—It is quite unnecessary. I am against Government guaranteeing dividends; how can Government do that?

Q.—You say, speaking of half-time schools "I have found that night schools are popular with workmen, and wherever opened, a sufficient number of men come forward to receive education." Have you night schools here?—A.—Yes, we have got a few here.

Q.—Who are they managed by; Government or the Municipality?—A.—No, the Municipal Committee has not got any night schools. There are some private persons who have joined together and opened a night school.

Q.—What class of men come?—A.—Every kind of workmen.

Q.—Do the artisans who work in the bazar come?—A.—Yes, workers who are in the city, shop-keepers: embroiderers, but carpenters don't come.

Q.—The evidence we have had all through India was to the effect that a man who works hard with his hands is too tired and sleepy to benefit by a night school.—A.—I have seen these people walking in the city for hours and hours. I don't think they go to sleep.

Q.—We had it with reference to men employed on laborious trades like engineering?—A.—That may be.

Q.—With reference to people who do lighter work, do they come?—A.—Yes.

Q.—In your silk culture arrangements, do you give out seed to the cultivators.—A.—Yes, I import from France every year and give it to people. Generally cultivators don't come forward. There are weavers who are cultivators also.

Q.—Can those people get mulberry leaves?—A.—Yes, I buy from the District Board. I have got 5 years' lease. I supply them with mulberry leaves free of charge.

Q.—Do many of those people live in one place; or are they scattered?—A.—They generally reside in villages. Sometimes we ask them to go from one place to another, 10 or 20 miles. I get mulberry leaves from the Canal Department, and send people there to get mulberry leaves. The whole work is done in 40 days. Sometimes they get people's houses on rent and live there; sometimes they build small huts.

Q.—And the work takes them 40 days to rear a crop?—A.—Yes.

Q.—Then you purchase the cocoons?—A.—Yes, and reel them.

Q.—What are the chief difficulties you have experienced: were you troubled with disease?—A.—No, never.

Q.—This seed that comes out from France is guaranteed free of disease?—A.—It has proved to be so for the last 7 years. It has not got any disease at all. The difficulty is that people don't take so much to this new work. The Agricultural Department have tried their best; have taken in hand several districts. I had applied to the Director of Industries to give me two more districts, but he did not approve. He said, he would see what I was doing in Gurdaspur. The Agricultural Department did try to increase the number of rearers. Even the States have taken to this now.

Q.—Is there any caste objection on the part of people of high caste?—A.—I have not seen that. There may be. Hindus won't take to it. Sikhs take to it. Millions of these insects are killed. Those against killing insects don't like that.

Q.—The low castes?—A.—They don't do it.

Q.—The people who do it have not always got land of their own?—A.—Sometimes they have their own mulberry trees, and we pay them for the price of those leaves, if they don't get them from the roadside avenues.

Q.—Supposing a man rears a crop in 40 days, how much does he make in his 40 days' work?—A.—I think Rs. 25.

Q.—Of course his worms are liable to damage, not from disease but from wasps and birds?—A.—They take care of that. The only drawback with this district is that everybody desires to get more of the seed, and the difficulty is that they cannot manage that. The consequence of that is the output of the cocoons is less than what it ought to be.

Q.—There is a demand for more seed than there is a supply?—A.—They ask more seed than they can manage, because there must be a large space. Each ounce of seed must have 200 sq. feet of space. They have not got so much space. In 300 feet they put 3 or 4 ounces.

Q.—Have you got a power-reeling plant?—A.—Yes, in my dye house I dye with steam. I have got a big boiler. From that I take the steam for working this also, but the charkhees are worked by boys.

Q.—Do you make twist silk or loose?—A.—Loose.

Q.—You sell to the French houses?—A.—Generally speaking, it is sold in Calcutta.

Q.—Is it exported or used in Calcutta?—A.—I think it is used in Calcutta by local weavers.

Hon'ble Mr. H. J. Maynard.—Q.—You say that we cannot revive old industries which are worked by hand?—A.—Yes.

Q.—You were not thinking of things like pottery, when you said that?—A.—What kind of pottery do you mean?

Q.—Any kind, either ordinary or art pottery.—A.—If you want the pottery that the poorer people use, then there is no necessity of improvement. If you are going to make it just like the imported, that is a new thing. I won't call it an old industry. If you are going to have an industry exactly like what we have, then of course I say it is quite useless to spend any money on that.

Q.—If you were going to glaze the pottery?—A.—It is useless; they are not durable. If you glaze it, what is the use when it has not got a good foundation; it will break at any moment.

Q.—Do you mean to refer also to art industries?—A.—That is quite a different thing. Everything beautiful and costly can be made by hand. The difficulty is that our Indians have no taste for these things. Whatever things are made now, which are costly, must be exported to foreign countries. If there is any buyer, it is there. My experience has been that several times people have come to us for carpet samples to take to Native States. I have said, I don't require such help, because I have got sufficient work. I give them samples and they come back and say the Raja would not pay the price.

Hon'ble Sir Fazulbhoj Currimbhoj.—Q.—You say you are against the Government guaranteeing dividends?—A.—Yes.

Q.—Supposing Government wants to help to establish an industrial bank for the purpose of starting and financing new industries, don't you think, if Government guaranteed interest, the capital for such an industrial bank would be easily subscribed?—A.—It will be Government providing funds for the bank.

Q.—The funds will be provided by the public?—A.—There is no harm. The idea I had of industries was of starting new industries.

Q.—Don't you think Government help should be given to a industry that is new and useful to the country?—A.—The question is who will start that; who will manage that. I am totally opposed to Government giving help to industries by guaranteeing dividends.

Q.—Suppose there were works like the Tata Steel Works?—A.—Yes, especially if they show such large percentage of profits. If Government is quite sure, from making enquiries, that Government must help. It is the duty of Government.

Hon'ble Mr. H. J. Maynard.—Have you got any sort of Indian Chamber of Commerce in Amritsar?—A.—No, I am a member of the Punjab Chamber of Commerce. We have got a small committee here.

WITNESS No. 887.

MR. JOHN ASHFORD, M.I.M.E., Superintendent, Central Workshops Division, Amritsar.

WRITTEN EVIDENCE.

Note on Industrial Development.

When approaching the question of industrial development of a country in which industrial pursuits have but a small part as India, it is advisable to consider the history of industrial development of some of the great industrial centres. A knowledge of the factors which have produced such development may help towards the formation of a policy of a suitable nature. We find that whereas natural conditions, such as the presence of raw material, may in some cases be an important factor, yet more often it is due to the inventive ability and enterprise of some individual. An industry having been established in this way grows by the enterprise of those men who have been associated with the originator, and who may launch out upon similar or related enterprises of their own. Historical.

As a native of Birmingham I am in a position to speak of the industrial development of that town particularly, as well as from information handed down to me by members of my family. It is a well-known historic fact that James Watt became associated with Matthew Boulton when they established their engine-building factory at Soho. Boulton had a small manufactory where he produced coins and other articles and that place is known to the present day as "the Mint." At the time when James Watt introduced the steam-engine, machinery for the manufacture of such engines was practically non-existent. He was faced at every turn with difficulties, and his perseverance and skill as an Engineer were shown even more in the machinery and appliances he produced to manufacture his engines than in the engines themselves. He required large castings and forgings such as at that time had not been produced, and he had to devise means for producing and finishing these things suitably for his work, also he had to train men to do the work. His task was colossal, yet his name is rarely associated with that part of his work.

Finding Watt so able a mechanician, Boulton sought his aid in connection with the other branch of his work, and Watt devised plant for rolling metal, pressing it and stamping it to produce the coins and other articles which Boulton manufactured. At that time Birmingham was scarcely more than a village with little in the way of natural features qualifying it to become an industrial centre. There was, however, one natural feature ultimately developed which assisted in the growth of the place, namely, the Staffordshire coalfield. Although Birmingham actually lay outside the coalfield area, it is most interesting to observe that at the present day, within a mile radius of the old Mint, there are thousands of workshops producing a multiplicity of types of metal goods all using methods of manufacture similar to those developed by Watt. Workmen employed both in the engine works and in the Mint saw openings for their energy and started small shops of their own, and the workshop system that has grown from this initial start is worthy of attention. These workshops for the most part were originally attached to the houses in which the workmen lived and so were essentially cottage workshops.

In many cases these workshops were too small to embody the whole work of producing some particular articles and so this metal trade became divided into many sub-branches. We find separate workshops for work of the following nature :—

- (a) Pattern-making.
- (b) Brass-casting.
- (c) Metal-rolling.
- (d) Wire-drawing.
- (e) Tube-making.
- (f) Tool-forging.
- (g) Die-sinking.
- (h) Stamping and piercing.
- (i) Soldering and brazing.
- (j) Engraving.
- (k) Chasing and embossing.
- (l) Ornamental engine-turning.
- (m) Polishing.
- (n) Lacquering.
- (o) Japanning.
- (p) Tinning.
- (q) Galvanising.
- (r) Electro-plating.
- (s) Card-board box-making and others.

The various workers in these separate shops may not produce any finished article and while they themselves are in an independent position and work when they like, they take work as outworkers from mastermen who are really the business-organisers that make this system possible. These business-organisers may call themselves manufacturers, as for instance brass founders, manufacturing ironmongers, gilt-toy makers, etc. They will buy the metal mixed and rolled in readiness for work and of a quality suitable in colour, hardness, or ductility for what they want. They will have prepared by these outworkers designs and patterns, have castings made or the dies fashioned, have their materials stamped and pressed in their dies, soldered together to make up the article, polished, gilt or lacquered, and finally sewn upon cards and placed in boxes or ornamental cases in readiness for sale. These men, although calling themselves manufacturers, are rather factors or warehousemen, their work chiefly consisting in passing their own material from one to another of the outworkers until it reaches the finished state in readiness to pass into their warehouses ready on sale.

In some cases, where power and machinery are required, buildings have been erected with a multiplicity of rooms and fitted with driving shafting and engines. These rooms are then hired out to individual people as workshops with power, and the tenants carry out their own branch of manufacturing on an independent basis.

This system of working that I have endeavoured to explain is not a fancy system or one relegated to the past. On the contrary it is in active operation in England at the present day.

The metal-working trades that have developed in what might be called the "Watt" country include the manufacture of all kinds of brass and copper goods, such as brass foundry work, lamps, gas fittings, electrical fittings, buttons, toys, furniture fittings, hardware, sheet metal goods, guns, wire goods, needles and pins, jewellery, umbrellas, carriage fittings, nails, screw, and other articles too numerous to mention. There are also great factories for Engineering, Ironfounding, Machine-tool-making, Tube-making, etc. The development of all these trades is traceable chiefly to the work of James Watt.

Thirty years ago Coventry was a country town with but little in the way of industry, having only the remnants of two moribund trades, namely, ribbon-weaving and watch making. A young man of that city, James Starley by name, invented what was then called the "Spider Wheel" which he applied to the bicycle, and with his cousin J. K. Starley he established a small business for the manufacture of bicycles embodying his invention. He did not live long to see the results of his work, and when he died at the age of 26 the business remained in the hands of his cousin. As bicycles began to find favour with the public, workmen engaged with the original firm branched off and started shops of their own and so the cycle industry was founded and became the premier industry of that city. The original concern is still in existence and is known as the Rover Cycle Company. That industry was originated by the genius of James Starley and upon it Coventry has grown to be a great industrial city. On that beginning as a foundation, its cycle trade grew and upon that again the motor-car industry grew, and as offshoots we find factories for the manufacture of steel balls, chains, etc., and a great variety of machine-tool manufacturing concerns, notably the great firm of Alfred Herbert, Limited. The writer of this note was in touch with the trades of Coventry from their early beginnings and has watched their development with keen interest.

The cotton trade of Lancashire did not begin with a natural supply of cotton, and it is generally stated that the development of its staple trade is due to the fact that its humid atmosphere, being favourable for cotton-spinning, was the natural feature leading to the development of that industry. Such was not directly the case. Certainly its wet climate was an indirect cause, because Lancashire farmers found great difficulty in making a living out of their farming from the unfavourable climate, and many of them sought to add to their incomes by weaving during the inclement weather. In this way a cottage industry developed for the weaving of woollen goods. When the importation of cotton from the Levant to the Port of Liverpool made it possible, these farmer weavers added the weaving of cotton goods to their industry, and in the course of time found that they could do better by turning their whole attention to the weaving of cotton-goods, or "fustians" as they were then called, than they could by their farming and wool-weaving. As a natural result the weaving of woollen goods retreated to Yorkshire.

Weaving as an industry did not develop to any extent until there arose, in succession, several men of genius who invented improved machinery, such as Hargraves, Arkwright and others. Even their inventions did not produce their full effect until James Watt came in and gave them the steam-engine which really established the cotton mill industry. Speaking broadly, James Watt was more responsible than any other individual for the broad establishment of industries in Great Britain.

I have said enough to prove my initial points, namely, that the establishment of successful industries has almost invariably been effected by the genius and industry of some individual. Once established, it has resulted in the acquisition of knowledge and experience by others associated with the originator, and they in turn have launched out and established similar or kindred industries. Favourable local circumstances such as the supply of raw materials has exercised but a secondary influence, and from this we learn that the initial effort is the main thing, but that effort must be accompanied by technical knowledge and experience coupled with business acumen.

We find that round each main industry some definite commercial system has grown and I will now summarise some instances of this:—The business connected with every industry may be considered as divided into 3 main parts:—

Complexity of industrial organisation.

Firstly, the bringing together of raw materials.

Secondly, the manufacture of the material into the finished product.

Thirdly, the marketing of the product.

In the majority of industries each of these divisions is very intricate and becomes subdivided into many branches, which fact makes it extremely difficult to plant an industry, *ab initio*, in a new country. Further, around each industry there becomes established subsidiary industries contributing to it; only in the case of extraordinarily large concerns with big capital is it possible for them to contain within themselves the whole of the branches of business and work which makes their existence possible. Consider some simple article of commerce such as an ordinary hand lantern. We find in such articles that the manufacturer needs to buy certain materials with which to manufacture the lantern, and as he will manufacture more than one quality the several different materials will themselves be in different qualities. He will need:—

- (a) Sheet-metal.
- (b) Wire.
- (c) Glass globe.
- (d) Woven wick.
- (e) Tubing (in some cases).

His sheet-metal in the cheaper qualities will be tin. In medium qualities tin or iron sheet electro-plated, and in the best qualities sheet-brass. Some of the sheet-metal will be perforated with a number of holes known in the trade as "perforated sheet." The wire will be iron or for the better qualities, brass. He will also need soldering materials and some chemicals for soldering purposes. Either of these materials traced through from the raw state until they reach the lamp manufacturer will have gone through many hands; therefore, the basis upon which he works is one of other industries, metallurgical and otherwise.

We find in a centre like Birmingham where the working of metals is the main industry, that there are a whole series of industries depending upon each other. In connection with the supply of material there is firstly the metal-merchants who buy copper, zinc, tin, lead, nickel, bismuth, antimony and other such like metals from the importers. We next find metal-mixers, firms who have gained experience in the mixing of the various metals in the right proportions, suiting them for a variety of trades. Such a firm buys the raw material, mixes and melts it and sells it as ingots cast in iron moulds in readiness for rolling into sheet or rod. We then have metal-rollers, wire-drawers and tube-makers. After they have worked upon it the metal is ready to pass into the hands of the man who makes the lantern. The metal of the lantern requires to be cut from the sheet, formed into the correct shape, assembled together, polished and lacquered or electroplated. Many lantern-makers will send the pieces of metal to still another sub-branch of the industry, namely the stamper and piecer who will form the parts by stamping them in shaped dies. The manufacturers of the finished lamps cannot get into touch with the private user, but he sells them in quantities to factors and merchants and these dealing in many other articles will organise a system for selling the goods to smaller distributing houses or retailers. The merchant will organise a distributing trade in other lands usually through large distributing houses, who in turn are in touch with the retailers.

I have explained this matter in order to bring out the complex organisation that has grown up around many industries, and to show that it is practically impossible for one industry to exist without kindred industries, or without the commercial system which makes it possible. The system which has grown about other kinds of industry may be quite different. Take, for instance, the motor-car industry, which has grown up in the form of large factories or concerns, yet even those factories are not entirely self-contained

I do not think there is a single motor-car manufacturing concern in the world which makes the whole of the required details itself. The car is built up of many parts, some of which are manufactured by those who have specialised in that particular branch of industry. To name several—(1) the manufacture of springs is an industry in itself, requiring the selection of specially suitable material coupled with skill and experience in its treatment; (2) the crank-shafts are generally manufactured up to a certain point by the makers of steel, who forge out the crank from a special steel composition, rough machine it and then submit it to a special heat treatment to give it the required toughness. Thus, the crank-shaft may be delivered to the motor-car manufacturer roughly machined for him to finish or he may buy it completely machined. Again, he may require ball or roller-bearings, and these he obtains from firms who have specialised in this production. Such details as lamps, speedometers, gauges, wheels, tyres, he usually gets from makers of those particular articles. Thus, the motor-car manufacturer in reality is but a manufacturer in part though an assembler of the whole.

The commercial system for disposing of the cars is quite different from that already mentioned. Being a manufacturer in a large way of business he endeavours to create and maintain his name by advertisement; by putting his cars into organised races; and by displaying them at shows and exhibitions. His sales are usually effected through agents who are appointed annually at the autumn shows. The shows are organised by the trade as a whole and while it advertises them and endeavours to draw the public thereto, their special use is to fix up agencies for the coming season. The agents who are appointed for a particular town or area naturally desire to secure the best selling cars, so they approach the manufacturer to secure his agency by offering to contract for a certain number of cars for the season. The manufacturer will naturally accept the agency of the man who will contract to sell the most cars, providing he can prove his ability to meet his obligations. The manufacturer thus enters into a series of engagements with a number of agents, endeavouring to sell ahead his season's produce. The agents on the other hand may endeavour to ease their own obligation by keeping in touch with each other and cross-selling between themselves.

The organisation of the cotton trade of Lancashire is still more complex. The raw material is a season's crop and it has to be spread over the needs of the trade for a whole year. It is practically impossible for the cotton manufacturers to buy such heavy stocks at the time the crops come on the market as to last them the whole year; particularly, as they may not be able definitely to forecast the amount of business they will do. It would require too large a capital for them to be able to do this; nevertheless, they have to make forward contracts both in the matter of disposing of their manufactured goods and in purchasing supplies. A manufacturer finds sufficient use for his whole energy within his own establishment and he cannot devote attention to the cotton market to any great extent. His concern is first to know what it will cost him to convert the material he buys into the form in which he sells it again. His further concern is to buy his raw material and sell his produce on a sufficient margin to pay his expenses and leave a profit. If he bought material too heavily and the market rate fell before he arranged his sales he would stand to lose. He will accordingly negotiate contracts with the buyer of his goods and with the suppliers of the material that he may close the same leaving him the margin he needs. In arranging his contracts he may be buying for delivery months ahead and selling in the same way. The risks, attendant on the supplying of material at the rates he can afford to pay, by the manner of his purchase, he passes on to brokers, and importers, whose business it is to study the cotton market and those matters which cause fluctuation in prices. The cotton industry has become divided into a number of branches, namely, spinning, weaving, bleaching, dyeing and printing and each one of these branches is dependent to a large extent upon the other. My purpose in putting this forward is to indicate the complexity of the cotton industry as it has grown up as regards manufacture and in the commercial side connected with the supply of material and sale of produce. The complexity has become necessary because of the wide nature of the interests involved and in order to shift the financial burden of the industry on to many shoulders. There has become established certain exchanges in Liverpool and Manchester where the members of the industry may meet together and arrange their business. The iron trade also has a somewhat similar complex organisation.

My further purpose in advancing these notes on the development and organisation of industry is to examine the same to see if it be possible therefrom to formulate a policy applicable to this country. At first it seems somewhat discouraging, yet I am not sure that it should be so considered. We have seen that many of the staple industries of England began in the form of cottage industries, and in the course of time they became concentrated into large factories.

From the social point of view it is questionable whether the development of a large factory system is desirable. The confined life of a factory doubtless exerts an adverse influence upon a community, creating a spirit of dissatisfaction and discontent. On the other hand a cottage or small workshop industry on lines I will shortly indicate, is far more likely to lead to happiness and contentment for those engaged therein. We have seen that even the larger industries are not wholly self-contained, but that they consist of a number of branches, each dependent on and working in collaboration with others. It is conceivable that certain lines of industry now operating on the factory system could be split up into sub-divisions and be organised into the small workshop system.

One very dominating cause in producing the factory in the past was the necessity for steam-power to drive the machinery required. The need for capital to buy the necessary machinery had also a very great influence in converting the cottage industry into the factory system. In certain trades, where expensive machinery is not necessary, we find the cottage or small workshop system still holds its own, as for instance in many of the light metal-working industries, such as the manufacture of jewellery and other ornaments, light chain-making, etc. The latter is found in the Bromsgrove district of Worcestershire. In Switzerland we find the watch-making industry has largely grown up on the cottage or small workshops foundation, although machinery and power are both necessary therein. The watch details are each manufactured by different people who own the necessary machinery for their work. In the past this machinery in small workshops was driven by water wheels in the mountain streams. The introduction of electrical power has made it possible to distribute, economically, power to small users and there the development of electricity generated from water power has made it possible to carry on and extend the cottage or small workshop system.

Cottage system.

The advantage of such a system is that every man with initiative and energy may be his own master and work such hours and at such speed as he may choose. He may also be assisted by members of his family who thus learn the details of his trade. Such a system calls for certain mastermen who will draw together the product of these small makers, have it completed into finished articles and organise a commercial scheme for disposing of the goods.

A cottage system such as that indicated may possibly be developed on co-operative lines, but it needs initiative and directing brains. There are various places in the Punjab where water power is running to waste, particularly at many waterfalls on the Irrigation Canals. In but a few cases hitherto has any effort been made to utilise this power. It would seem to be within the range of possibility to bring about industrial settlements at places where power can be cheaply developed and distributed at low cost to small users. Great difficulty would undoubtedly be experienced in bringing into being such industrial settlements, and I fear one of the greatest would be the character of the people. In the course of 18 years' experience in this country I have been struck by the great lack of eagerness on the part of workmen to attain skill in their trades. As an apprentice in an English workshop I was in close touch with the men and found that one and all took great pride in the skill acquired in their work. Apprentices strove to attain that skill and competed with each other in their efforts to do a high quality of work. An apprentice was usually bound to serve 5 years in learning his trade, whereas in this country when a man has spent as many months in a workshop, he imagines he has all the skill he requires. The many applications I receive for increments of pay are invariably based on the plea that the applicant has worked for me a certain period of time, or that he has a large family to keep, but never are such applications based upon a claim that skill has been acquired. Consequently, any effort to promote industry must be coupled with a further effort to promote in the workman a desire to excel in his trade and to produce a superior quality of work. This practically means the development of a higher moral standard in the artisan class. It seems to me that elementary education in itself will not give this, but that a system of pupilage or apprenticeship must be introduced. Further, to insure the development of the desire to acquire skill, I would introduce a system of license without which, in the cottage industry system, a man should not be allowed to engage in trade as a masterman and the issue of such license should be based upon proof by test of his ability to produce high class work. In this way a high standard would be set in the industrial settlement, and any man falling away from the required standard should lose his license.

Industrial settlements.

Apprenticeship system.

It frequently happens that a man who is an excellent workman and who has got together the necessary capital to start in business is deficient in business knowledge, with the result that after a while his affairs become involved and he finds himself faced with ruin. I would here digress to put forward a scheme which was at one time worked in a certain industrial town in England. A few gentlemen engaged in industry observing that the moral tone amongst their workmen was not of the best, originated, in connection with a religious institution, a Sunday afternoon class for men. It was of a religious character

Necessity for expert advice.

but of a practical kind. They sought to improve the character of the men by teaching them morality, sincerity, honesty, integrity, probity, sobriety and in general the living of clean lives. The class became a great success and each Sunday afternoon saw hundreds of men in attendance. The organisers, themselves men of high character, in their efforts to get into close touch with the men that they might exert good influence upon them, encouraged them to bring along their private troubles that they might receive advice and guidance. They soon found that many of these men were engaged in business in a small way and the troubles they made known were frequently in regard to their business affairs. This resulted in the establishment of a movement by the organisers, which had for its object the assistance of the men in their business troubles. They accordingly established themselves as a financial syndicate, each contributing to its capital. This syndicate, though founded for a philanthropic object, was handled in a business-like way by business-men. When one of the men finding himself in difficulties brought them to the organisers of the Sunday afternoon class, they took his affairs in hand, investigated them and when they saw his business held the germs of success they advanced him capital, and arranged that certain of their numbers should act as advisers to him in his business. He, in accepting their assistance, undertook to follow their advice and guidance. His business had to pay interest on the money advanced and to refund it when possible. To the help and guidance of this body of men a number of important industrial concerns owe their flourishing existence to-day. The success of this philanthropic experiment goes to show that any attempt to promote industry must be coupled with skilled guidance and supervision, that the industrial enterprises may be steered through the shoals of inexperience and lack of industrial knowledge. This points to the need of a Board of Industrial Advisers and such a Board should include technological experts, business organisers and financiers. It may be safely inferred that no young industrial enterprise can rise to a condition of prosperity without passing through periods of adversity, and, in this country, where the custom is so prevalent of fleeing to the money-lender and usurer, the young enterprise would most certainly be wrecked on its first encounter with adversity were it not guided and helped in a proper way. The very essence of such help is that it should be of an expert technical character. For that reason I fail to see that a Department of Industry under the direction of one who himself is not an industrial expert can be of any use whatever.

Pioneer factories.

I have pointed out that in the history of industries the initiation has usually been effected by some man of genius and special ability. The work done by him has resulted in the training of workmen and the ultimate development of not only that particular industry, but also of kindred industries employing similar methods of manufacture, or otherwise by direct influence. It is not possible for Government to raise the man of genius, but it is possible for Government to accept the risk involved in an effort to establish a pioneer factory. Unfortunately, a ruling of the Secretary of State some years ago prevented the Indian Government adopting such methods. To endeavour to establish an industry by persuading some persons of wealth to put money into it, and who may comply with the expectation of honours or favours to come, is unquestionably an erroneous method. The successful establishment of a pioneer concern is the essential thing, and by successful I mean not merely a concern which can produce or manufacture certain articles, but one which does it with commercial success. Individuals will only exert energy and take risk when they see the prospect of reward to themselves and no better inducement can be offered than that of success achieved by another, and no better training school can be established than that of commercially-successful industrial concerns.

The mere formation of technological classes will not establish industry, although as an adjunct to an established trade it is most useful in assisting its further development. Such classes without the established industry are but a waste of money and effort, and creators of disappointment and discontent.

Most industries to-day call for the manufacture, use and maintenance of machinery, thus every industry with few exceptions calls for men with mechanical knowledge. Unfortunately for the prospects of industry in the Punjab, the people do not show any aptitude for that branch of knowledge. I have employed thousands of workmen in engineering work, yet of that number I cannot point to half-a-dozen who I can consider have any real instinct for mechanics. When a machine is placed in the hands of a workman his tendency is to run it to a standstill. I can point to certain concerns whose existence depend upon machinery, yet where it is neglected and allowed to degenerate to the point where repair is practically impossible. This points to the need, where money is raised from the public, for periodic inspection and enforced maintenance of plant, otherwise shareholders must ultimately lose their money together with their faith in industrial concerns, to the detriment of progress. The whole matter of finance for industrial enterprise rests on the creation of public confidence in such investments and this can only be secured by honest and successful trading. We have seen instances of the juggling of accounts, especially with groups

of concerns under one management, followed by the inevitable collapse which breaks public confidence. This can only be checked by suitable audit under a control which cannot be influenced.

In the matter of financial aid to enterprises, I am of opinion that grants-in-aid, bounties and subsidies are unsound. The effort should be to promote vigorous growth on sound lines. Enterprises should not be founded in the expectation of preferential purchase of products by Government, as, if that is granted, it will check others embarking in similar enterprises without such Government support. Help should rather be given by creating lines of least resistance such as by the raising of a barrier against goods of foreign origin. Government should not expect to create enterprises by putting all the risk upon other shoulders, and it would undoubtedly create confidence if it contributed to the required capital on the same terms as the public, and also took part in the direction of the concern. The advancement of loans or supply of machinery on hire-purchase merely places the risk upon others, whereas, in that it is the wish and to the ultimate benefit of Government that the industry should be successfully established, it should accept its share of risk. Relief from taxation would help a struggling concern and I would certainly stop municipalities placing special taxes on engines or other machinery, which in some cases is now done.

Government financial assistance.

Where Government financial assistance is given in any form it would be necessary that there should be a measure of control such as by the appointment of directors and by audit, but this assistance should not be accompanied by increased expense such as by requiring the preparation of elaborate returns in duplicate for submission to the auditors. Only simple accounting should be required, coupled with graphic methods of indicating results. Definite restrictions should be placed upon directors to prevent them finding well-paid posts for inexperienced relatives and friends, and also to prevent them using the industrial concern as an aid to the private trading of themselves or their friends. The acceptance of improper gratification by any director of a public company to the detriment of such company should be severely dealt with.

Government control when assistance given.

When endeavouring to establish an industry Government should at the same time develop a commercial system around it, of such a kind as to spread the risks of trading over a suitable base, on the lines that have grown around such industries in other countries. Small concerns cannot sustain the expense of systematic advertising, neither can they afford the expenses of a traveller. The Principal's attention is needed to supervise production and the need to go out to seek markets would cause a division of effort to the disadvantage of the concern. It is common for allied concerns to engage a commercial traveller to represent the whole, each paying a share of his expenses plus a commission on the sales effected. Assistance could, therefore, be given at first by subsidising commercial travellers, who should carry a full range of samples of goods. They should move around with Government support, should visit towns and villages on their beat, display goods in a public room, and invitations should be issued in advance by the local Government official to all retailers and others to attend and inspect the goods with a view to purchase, and the establishment of local agencies. Such local displays of samples would be analogous to the motor shows in England where business is arranged on the lines previously explained. Where it is considered that pioneer factories are essential to the establishment of an industry, I am of opinion that preferably, where it can be done, an independent concern should be established in which Government should take a share of the capital to hold until such time as the concern is a success. This would automatically require participation in the direction and in suitable audit, together with the provision of necessary expert advice. When the concern is fully established, Government could at its discretion and by arrangement with the directors, dispose of its portion of the shares, thereafter leaving the company to follow a normal course. When the risk is too great to justify Government following this course of inviting outside capital to participate, it could reasonably establish such a concern accepting the whole risk itself. At a suitable stage in development it could turn the concern over to a public company in which it could hold part share and when that in turn is a commercial success, it could withdraw by arrangement as in the previous case.

Assistance in marketing.

Sales agencies.

Government policy in pioneering industries.

In regard to the provision of technical aid to industries, it may be observed that in different branches of Government work there is a considerable body of technical experts, already in the country, but the conditions attendant upon their appointment largely prevent that expert knowledge being accessible for industrial enterprise. In my own experience, covering 12 years in this country, although I have a considerable fund of technological experience and knowledge, yet it has not been available for the assistance and guidance for those outside Government departments. The advice of medical experts in Government service is available for the benefit of the public on the payment of their usual fees, and it would seem to be reasonable that the advice of technological experts should be available on the same terms or that the scope of their duties should be extended to cover this work.

Technical aid to industries.

Committing Engineers.

I am of opinion in direct reply to your question 27 (a) and (b) that engineers employed by Government should be permitted to give technical advice and prepare plans and estimates for private firms and individuals, providing they do not allow it to affect their duties detrimentally.

At the Central Workshops, Amritsar, I have carried out a considerable amount of investigation and experimental work, particularly on lines associated with Irrigation problems. A number of years ago I embarked upon a series of experiments on pumping water from the sub-soil with the result that I produced a form of tube-well and a series of pumps to work with it which have proved most successful. Their use has developed to the stage which indicates that a new industry, that of manufacturing the necessary parts, making borings in the ground, and installing the necessary machinery has become firmly established and is likely to develop to a large extent. This is an instance where the researches conducted by a Government Department have greatly benefited both industries and agriculture.

Demonstration factories.

In reply to your question 19, my previous remarks go to show that I do not hold with demonstration factories, considering that commercial success is a prime necessity in the initial effort to establish an industry.

Land policy.

With reference to your questions 40 to 43 (a), it has come to my knowledge that various efforts at establishing industrial concerns have failed to mature or have experienced considerable difficulty, through inability to secure suitable land on which to establish their enterprise, and it seems to be necessary that Government should assist *bona fide* concerns to acquire land at a fair market value, and if it already has not the necessary power to acquire land for such purposes, it should be provided.

There does not appear to be any great difficulty in obtaining subterranean water-supply, the development of the tube-well already mentioned having placed such water within the reach of any concern at quite a moderate expenditure. It seems to me, however, that more ready facilities should be given for the development of water-power installations at such sites where it is not actually needed for Government purposes.

Apprenticeship system.

With a view to training mechanics I inaugurated an apprenticeship system at the Central Workshops several years ago. I found considerable difficulty in retaining the services of such apprentices sufficiently long to make them good workmen. So soon as they had gained a smattering of knowledge they imagined themselves quite able to go elsewhere as fully paid workmen. In order to check this, I required them to pay a deposit of Rs. 100 coupled with the conditions that they gave three years' services to learn the trade, with pay on a certain rising scale, and that on the completion of that period of time they would be given certificates to state the service rendered and the degree of proficiency acquired, and their deposit which had been placed in the Post Office Savings Bank should be returned to them with the interest thereon. Objections were raised by the Accountant-General to this procedure, on the ground that it was not authorised, consequently I had to allow my scheme to lapse. Under this scheme, however, six or eight apprentices did pass through the shops and some of the most successful of them were also given drawing office training and they have turned out to be good men. I consider it unfortunate that the scheme was not carried further; only by such apprenticeship system can qualified men be trained, for unless they are actually bound down they will not persevere with their training.

Industrial schools.

I have had some experience in employing students from Industrial schools. While some of them have been good, the majority of them have in my opinion been spoilt by their training. Practical experience is essential for an engineer, yet such students imagine that the possession of certificates from an industrial school or college is a proof of the completion of their training, and that they should be given highly-paid posts requiring no manual labour, yet none of them are sufficiently experienced to direct or control other men in their work, and their knowledge of factory organisation is *nil*. Men suitable for supervising and for managing positions cannot be produced by school training alone. An apprenticeship system is most certainly better especially if it leads up to the higher branches of the work. No supervisor or manager can be considered a qualified man unless he can understand and make drawings and designs: therefore the training should lead up to that. To teach a youth the higher branches of his work before he has learnt the lower is to start at the wrong end, for he cannot so well understand what he is doing and learning. He should learn to use tools and machines before he attempts to draw them. A working knowledge of English is essential, otherwise the great fund of technical literature is closed to them, also means of organisation cannot so readily be worked. It would, therefore, seem necessary that prior to apprenticeship, education to the point of having acquired enough English to read and write should be required. Towards the end of apprenticeship, tuition of a practical character in drawing and designing should be given to these

selected as having proved themselves able and intelligent in practical work. The rudiments of such instructions should previously have been given in evening classes.

The organisers of technical schools and colleges are rather apt to overestimate the value of their own work, and being more facile with the pen and in speech than the factory organiser, they are likely to obtain more ready hearing and support. It is to their interest to boom their methods, whereas the factory organiser's interest is not to attempt to create opinion but rather to make his concern a commercial success. No technical school can compete with a well-organised engineering shop in the production of skilled mechanics and engineers.

A system has been tested of taking selected students from collegiate or technical schools and sending them to other countries at Government expense to learn some particular trade. I have met several such and have formed the opinion that the system is not a success. A student may go to special colleges such as the Manchester Technical School for Spinning and Weaving, the Northampton Institute for Engineering or the Bermondsey School of Tannery and there learn the theory and principles associated with a particular industry, yet upon his return to this country he is not sufficiently qualified to establish the industry here, chiefly because he has not learnt the business, the internal organisation and those practical technical details essential to success which are evolved within the factory and which no factory-owner will lay himself out to teach to others when he knows that by so doing he will create competition for himself.

With reference to your question No. 95, considering that invention is essential to industrial progress, it is desirable that every possible inducement should be given in the way of facilities for acquiring patents and for their maintenance. It is to be expected that no man will concentrate his effort upon the production of improvements and of improved methods, unless he has reason to suppose that it will bring some measure of reward to himself, a reward commensurate with the importance of the invention. The income derived from the operations of the Patent Law cannot be of serious importance to Government, while the encouragement of invention may indirectly produce far greater results. The law which requires the payment of annual fees for the renewal of a patent and the right to use the product of a man's own brains actually penalises invention. It is, I consider, desirable that all such annual taxes should be removed, so that once a patent is granted it will remain in force for its full period, subject however to one condition, namely, that the patent shall not be allowed to become moribund. To insure this it should be required of a patentee that after a lapse of a certain period of time, say five years, he should show that the invention is being produced or worked, or alternatively that failure to develop it was due to no fault of his own or of others who had acquired an interest therein by purchase or licence. I am aware that in many countries such taxes are imposed, yet it is an acknowledged fact that it bears heavily upon the poor man and tends to retard progress. I believe that I am correct in saying that in the United States of America such annual taxes are not imposed, and it is generally agreed that the American Patent Law is a substantial help in the development of industries. In a country like India there is in the employ of Government a large body of experts in various branches of technology and, according to the existing Patent Law, a patent granted to an employee of Government bears the condition that Government shall have the right to make and use the invention without payment, or upon such terms as it may arrange. My experience is that the terms granted by Government are wholly favourable to itself and discouraging to the inventor, for although I have taken out many patents which Government has made and used to a very great value yet I have received no consideration whatsoever in respect thereof. Considering the need for progress, I consider that the law should be framed in such manner as to encourage officers to invent and bring out improvements instead of discouraging them in this way. It does not seem desirable that the law should be so framed that in the case of a Government employee it takes from him the rights of citizenship and assumes that in accepting such employment he has sold not only his services but the entire produce of his brains. It is not every man who has the ability to invent, and it does not seem fair that those who have such ability should be treated as of no greater value than those whose ability is limited to the successful fulfilment of their normal daily duties. I think the Patent Law should be modified to make the exclusive rights granted to the inventor in the case of Government servants apply equally to the Crown as to private individuals, with possibly a clause that the terms upon which Government should use such inventions should be reasonable and in accordance with trade usage where such exists, and in cases of difference of opinion between Government and the patentee, the matter should be decided by an impartial arbitrator. I would further suggest that as an encouragement to invention, Government should create definite rewards for inventors who produce inventions of real value to any industry, to the community in general, or to Government itself, the purpose being to stimulate and encourage invention which is the soul of progress.

Hydro-electric power.

Some movement has been made in the Punjab in the direction of developing hydro-electric power. A considerable amount of water-power is running to waste which could certainly be developed, and we may consider this branch of work is in its infancy in this province. The actual work done consists in the utilisation of water-power for driving the woollen mills at Dhariwal. The power is partly used directly for driving machinery for spinning and weaving and partly for the generation of electricity used for a similar purpose. A second plant has been installed by the Irrigation Department at a canal fall near Amritsar. The power developed is used to pump water for irrigation purposes from a number of my patent tube-wells. A second scheme for irrigation by pumping has been sanctioned on the Lower Chenab Canal, but its development is held up for the present by the impossibility of getting the necessary machinery at reasonable cost. Other similar developments are under consideration and are likely to mature when conditions become more normal. Beyond these instances little has been done in this direction.

Conclusions.

Having expressed opinion on many of the points raised by your list of questions, I will now endeavour to formulate some working conclusions. Inasmuch as industrial development fostered by Government care should aim at producing not only prosperity and wealth, but more particularly a happy, industrious and prosperous people, and the policy adopted should apparently not simply aim at the establishment of large industrial factories. Certain it is that many trades are of such a complex character that they cannot be economically organised in any other way, and when this is the case the aim should be to bring about the establishment of not merely the factory, but also healthy living circumstances for the factory hands. It is too often the case that factory life is but little better, if I may so express it, than paid slavery, which leaves little in the nature of wholesome conditions in their lives. Factory legislation has done much to bring about healthy conditions within the factory, but there appears to have been nothing accompanying it outside. There is always the tendency for the workpeople to crowd into the dwellings in the near vicinity of the factory. Cost of living accommodation and of food, etc., is forced up by landlords and interested parties, seeking to make money to an unreasonable extent out of the factory hands. Many of them become indebted to the *buccia* who demands their wages from them on pay day, so that they live in a constant state of indebtedness to him, so much so that he holds them in a species of thralldom. I would like to see associated with every factory enforced conditions as regards the proper habitations for the factory hands, together with stores run on the co-operative system for the supply of their needs. I would further like to see a system of enforced thrift, something on the lines of a provident fund, whereby a percentage of the earnings of each factory hand should be placed into a banking account. This account should not be touched except upon very definite conditions. It would be necessary to make this account available up to a certain percentage of the individual holding in any one year to meet the contingencies of marriage and death, and I would further create such conditions and rules as would completely discourage or prevent the contraction of debt with money-lenders. To secure such ends Government could well accept the idea that it should contribute to the funds or share capital required to establish the concern.

Industrial settlements.

While the large factory is indispensable in certain cases yet there are many industries which could be developed in industrial settlements. Many industries cannot be worked without machinery and probably those could not be developed on strictly cottage industry lines, but many of them could be developed in what I would call a settlement of small workshops, each with its masterman and a small number of journey-men and apprentices, possibly worked on the family system. I will now endeavour to sketch the lines of such a settlement. Each settlement should deal with one industry or allied group of industries such as work up one class of material, or by similar methods. To particularise:—One settlement might perhaps deal with bone as material. The various workshops within the settlement would produce a variety of different articles each made with bone as its chief element, as for instance bone-buttons, shirt studs, fancy ornaments, tooth-brushes, shaving-brushes, combs, knife-handles, pen-holders, knitting-needles, crochet-hooks, paper-knives and possibly also in the same settlement horn and celluloid could be worked. The waste product from the working of bone could be boiled down into glue or be refined into isinglass, or again it could be converted into fertilisers. Another settlement could work up various kinds of bristle fibres into all varieties of brushes; still another could particularly be devoted to the working up of fibrous materials into string, cordage, ropes, mats, matting, nets, hammocks and even certain species of furniture. Another settlement could deal especially with the working of tin and sheet iron, producing such things as tin teapots, cooking vessels, bowls, toy canisters for storage of food-stuffs, cash boxes, jewel boxes, despatch boxes, papertrays, etc. Others could deal with a variety of articles such as could be produced in dies by stamping and pressing. This would include such things as metal buttons, steel pens, pen-

holders, various other details of stationers' sundries, cabinet fittings, builders' ironmongery, hinges, small electrical fittings and the like. In the near vicinity of the Punjab hills where many excellent kinds of fruit are grown, the canning, bottling and preserving of fruits and fruit syrups could be developed. Convenient sites could be found on some of the great rivers for the organisation of wood-pulping, papermaking, mill-board-making together with variations of the same, such as corrugated mill-board for packing purposes, waterproof packing papers and card-board boxes. Wire would be a convenient material to be manufactured and worked into a variety of wire goods, such as bird cages, rat traps, wire gauze for doors, fencing wire, wire nails, boot springs, small rivets, buckles and harness furniture. The above list does not by any means exhaust the series of industries which could be established in the manner indicated.

The success of such an industrial community would absolutely depend on its organisation. The series of small workshops would probably be largely interdependent and the rules controlling the settlement would need to be framed in a manner to foster industry and discourage sloth. Each such settlement would need to be managed from an organising centre which would control the commercial element both as regards the buying of material and the selling of the products. The organisation would need to be formulated on the lines of a co-operative system yet differing somewhat therefrom. An initial principle would need to be recognised, namely, that no person will give of his best without a proportionate remuneration or reward, and that from a commercial point of view this means payment by results.

The most important man of the community would be the organiser or, as I would call him, the factory manager, and he should be responsible to the Government for the organisation as a whole, and his remuneration should be partly by salary and partly by the results obtained in working the settlement. He would be responsible, under audit, for the correct keeping of accounts, and in his case trickery, fraud and other criminal acts adverse to the interests of the settlement should be subject to heavy punishment including confiscation of property.

The planning of the settlement village would be on the lines of a series of small groups of buildings, each group to accommodate a family or a man and his journeymen. The group would include a small workshop properly arranged and lighted. To insure pleasing surroundings the villages would be planned by a town-planning expert.

In the case of industries needing machinery, and there are few that do not, such machinery would be installed in the workshop together with an electric motor to drive it; it would not become the man's own but he would be allowed to use it in accordance with controlling rules. Electricity would be supplied from a central power station connected with the settlement to all these small workshops. The conditions under which a man would be permitted to enter a settlement or remain therein would initially be, that from the workshop and machinery placed at his disposal, he should produce a certain minimum of work of the required standard of excellence. For this work he would be paid on a special system, carefully formulated to insure the proper working of the plant. A certain minimum outturn per day being required, he would receive pay for that minimum at a certain rate and for all that he produces in the day above that minimum he would be paid at a higher rate. Such a system would be analogous to the premium-bonus system in operation in many factories at home. It might be that one of these small workshops in itself could not produce a complete article, but that it would be confined to producing a part or the part production of one which would be worked to a higher stage in another of the workshops, but the produce of each would pass to the stores at the organising centre and would need to pass close inspection before acceptance.

In connection with the central organisation there would be a store for the supply of the settler's needs and they would be at liberty to draw such goods up to a certain percentage of the earnings placed to their credit. Each month's accounts would be settled so far as production was concerned, and I would have it that at such a settlement a proportion of each man's earnings should be placed in a provident fund. Rules associated with this fund would control its investment and also the issue of loans to meet the contingencies of life such as marriage, sickness and death. By arrangement as to the proportion of a man's earnings retained, the fund could become a combination of provident fund and family pension fund, thereby providing for nominated members of the man's family in the case of death. The maintenance of the plant of the small workshops, the working of the settlement power plant, the expenses of the commercial system, whether it be commercial travellers, agencies or advertisement, would be met out of the settlement fund, the selling price of the goods being fixed to leave a margin for that purpose; thus, the individual running the small workshop only has to produce the goods required from material supplied, while he and the members of his family, his hired workers and apprentices constitute the labour.

The settlement as a whole would approximate to the factory in its system of management, store-keeping, inspection of manufactures, payment of labour, and sale of its produce, but it would differ therefrom in important points. It would be organised as a village settlement without the confines of factory walls or the imperious summons of the factory bell; there would be a measure of freedom for the man and his family; he would not be separated from them while pursuing his labours and they could render him assistance for their mutual benefit and his children would automatically learn the mystery of his trade in early youth. The man could commence his work when he liked, take his food when he pleased, and visit his friends when he wished, his only restraint being that he must produce a minimum of work. He would be relieved of the worries attendant upon the finding of a market for the goods he makes, and the material he needs would be purchased wholesale in the cheapest way rather than in dribblets from the high-priced retailer. He would be protected from the thralldom of the *buzna*; for one condition of his continuance in the settlement should be that he deals not with the money-lender.

It will be observed that the organisation of the settlement should be somewhat on factory lines without the factory. I would call these industrial settlements settlement factories, and the commercial agents who would be the equivalent of the managing director of a commercial concern would be the factor. When the settlement grew to dimensions justifying the arrangement, the factor would be given assistants, firstly a commercial assistant and secondly a production-assistant. The factor would be the head Government official of the settlement and responsible for its whole running and for the maintenance of law and order. He would thus be invested with the powers of a magistrate. His powers would be large and he would need to be a carefully selected and trained man and his remuneration as already stated would be based upon a salary together with a proportion of the commercial results obtained by the settlement.

It would be necessary that the factory manager should be subject to control, as also he might need advice and guidance, both as regards means of production and as to the conduct of the commercial side; such control and guidance would emanate from a body of men appointed by Government, namely, the Board of Industry, who would act in respect of all such settlements in the same way as a Board of Directors would control a number of separate factories, as is frequently the case in England. The chairman or President of the Board would be the Director of Industries and he should be a specially-selected man with broad knowledge and experience of technology and business. Such a board would need to control the necessary funds with which to establish and finance, in its early stages, such industrial settlements and factories, and Government would need to be prepared to lose money in some cases, accepting the same as a fair risk to secure the broad results at which it aims, namely, the development of industries on a system which should produce a prosperous, industrious and contented people.

The profits from running the settlement, when profits there were, would be divisible according to an arranged scale, one moiety going to Government in lieu of all other forms of taxation. The remainder after payment of all expenses, such as in a commercial organisation would be known as "on cost," would be divisible partly to the commercial organisation side and partly to the production side, that is to say, all who compose the settlement would receive a portion of the profits of its work. The payments initially made to the workers for work done and as wages to babus, accountants, travellers and others would in every case be payment in part, the balance coming to them within a certain time of the closing of the financial year, such balance being equivalent to the bonus which is paid to employees by many commercial concerns.

ORAL EVIDENCE—20TH DECEMBER 1917.

Mr. C. E. Low.—Q.—In your written evidence in the paragraph on the apprenticeship system you say "I would introduce a system of licence without which, in the cottage industry system, a man should not be allowed to engage in trade as a masterman and the issue of such licence should be based upon proof by test of his ability to produce high class work." Do you refer here to this system of industrial settlements only?—A.—That is what I had in my mind.

Q.—How would these industrial settlements be financed in the first instance?—A.—I consider the only way in which such industrial settlements could be worked would be by Government. A suitable site where power could be made available should be selected and laid out for a particular class of industry. An industrial settlement should then be established in the same way as an agricultural colony as now settled.

Q.—But in the case of a canal colony, you have not got to incur much initial expenditure; there is a rush to come in, and the colonists pay money for the land, and you don't require to finance these agriculturists to start with; but in this case you have to

get your power and you put down your motors, and then perhaps you have to build them houses and so on?—A.—I would propose to lay it out entirely. In agricultural settlements the people do not build the canals on which they depend but Government does.

Q.—And then for some time after they have started, while they were working up the market and so on, how would you manage to finance their manufactures, purchase raw materials and so on? My point is this—Do you mean to start on a big complete scheme or do you propose to work it up gradually?—A.—The scheme for the settlement should be planned out as a complete whole, but it might be necessary to limit the start to a portion of the scheme, provided that such portion could be worked without the remainder. The portion would then be the foundation upon which the remainder would grow. I have likened the idea that I have put forward to that of a factory. If you are starting a factory you must put down capital for the purpose of buildings and machinery and for the purchase of stock, etc. In like manner such a settlement which I have likened to a factory would need to be established.

Q.—That is to say the finance of it would be exactly the same as the finance of a factory?—A.—Practically. You probably will have observed the main idea I had in my mind in putting forward my suggestions. We have seen the very great drawbacks that attend the development of the ordinary factory, and my effort has been to produce a scheme for the development of industry without the drawbacks of the big factory by doing it on the lines of cottage industries so organized as to make it possible for them to compete with the ordinary factory.

Q.—Can you point to any similar precedents in any part of the world?—A.—I have in the course of my notes given you some historic references, and I have pointed out how in certain industries in England the system is being followed and has grown up.

Q.—Quite so, but you are pursuing this matter rather differently?—A.—You want to plant industries here, and therefore you cannot wait for their development; you have to give them a start. As I have further pointed out, most of the industries at home have begun on the initiative of some individual of genius and special ability and upon his work the industry has gradually grown up; well, as I have further pointed out, Government cannot provide the genius, but it may provide the foundation upon which an industry may grow.

Q.—That is to say, you substitute the organising possibilities of Government for the initiatives of the individual?—A.—Precisely.

Q.—You want a sort of general marketing arrangement for the industrial organisation in the province; it would not be entirely economical to make this scheme of your own rely entirely on its own marketing arrangements?—A.—I have pointed out in another portion of my note that it is by no means uncommon at home for several firms to unite together to finance their marketing arrangements; they will send out a joint-traveller, each small firm paying something towards his expenses, and in addition to that initial expenditure they pay him a percentage on the indents that he books. The small man here in a cottage industry in like manner cannot afford to pay travellers and to seek his market; but a settlement worked in the manner I have indicated could send out travellers and appoint agents, as it would work on co-operative principles.

Q.—In your next paragraph on page 6 you say: "I fail to see that a department of industries under the direction of one who is himself not an industrial expert can be of any use whatever:—what will you have an expert in? When you get your industrial expert, you realise of course that he cannot be an expert in all industries?"—A.—Yes, I quite realise that. When I speak of an industrial expert I mean a man who has been sufficiently associated with industry in some branch and with commercial matters to an extent which enables him to thoroughly understand the organisation attending an industry and its methods of finance.

Q.—Don't you think he will be liable to be obsessed by the particular branch of industry in which he himself is an expert?—A.—There is of course that possible danger, but he should of necessity be a man of broad mind; he would have to be selected accordingly.

Q.—Do you think you can get a suitable man?—A.—That is rather difficult to say. You will perceive by what I have written that a man with the necessary ability to fill such an office would need to be a man of worth. That is to say, it would be no good putting a man into that position who himself has been a failure in industrial matters—you must have a successful man. We see many examples at home in connection with the Ministry of Munitions; the organisers there have been the leading men in the particular industries.

Q.—But in the case say of a man like Lord Davenport who was a very successful industrialist and a very successful commercial man himself, he was a failure in organising food economy and might also fail in any other business to which he was not accustomed ?—

A.—The organization of a food economy campaign is not the organization of industry. You cannot be certain of a man until you have tried him.

Q.—A man like that if he is worth anything would require a very high salary ?—

A.—Presumably he would want a very good salary.

Q.—What sort of salary have you in your mind in a province like the Punjab which you presumably know best ?—A.—Well, I certainly think you would not get a man of the necessary ability under 2,000 to 2,500 rupees a month.

Q.—You go on to say in the next paragraph about pioneer factories.—“ Most industries to-day call for the manufacture, use and maintenance of machinery, thus every industry with few exceptions calls for mechanical knowledge. Unfortunately for the prospects of industry in the Punjab, the people do not show any aptitude for that branch of knowledge.” In small organised factories in the province do you consider that the machinery generally is kept up in a state of efficiency ?—A.—From what I have seen I consider it is kept very low. As I have pointed out, the tendency is to start a machine and run it until it absolutely breaks down instead of keeping it in a satisfactory state of repair. My experience is more particularly connected with the factories of this district and the information that I have gathered in conversation with people engaged in such factories. For instance, I have been to a large mill and looked at the plant. You will see engines, pumps, and machinery, dirty, badly worn and ill-kept while the steam-piping leaks at every joint, the whole being in a condition that would be considered extremely bad in a home factory.

Q.—Could you form any idea, speaking in the widest way, as to what percentage of its efficiency machinery of that sort is losing right through the mill in a very rough way—would it be 2 per cent, or 8 per cent, or 10 per cent ?—A.—It will vary in different factories, but I should think many of them would lose an efficiency of certainly 20 to 30 per cent, or more.

Q.—Do you think that if you had in connection with an industrial department an expert mechanical engineer or two going round, he can help these people to keep their machines in working order ? Or would you say that even then they would not take the trouble ?—A.—I don't think they do know really, but the greater fault I think is a species of indifference. You see people with motor-cars, you hear them rattling and rattling, and they go on rattling until they absolutely break down.

Q.—But apart from making the people more careful, looking at things from a different point of view, if you adopt this comparatively easy preliminary step of giving them individual advice in particular cases of inefficiency, do you think that would be of assistance ?—A.—I doubt that it will be of very great assistance, for they avoid spending any money on machinery in order to maintain it. Their desire is to get what money out of the factory they can and spend as little as possible.

Q.—Take for instance the case of pumping from wells—would they not require advice in the first instance as to the size of wells which it is possible to put down and the amount of power which is required for pumping and the adjustment of the pumps to a proper speed and so on ? Would it not be of assistance to them to have a man locally to do all that for them ?—A.—I agree that in a matter of this kind advice is necessary.

Q.—When they get the thing started, do you think that they are capable of working with a reasonable degree of efficiency or do you think the advice would have to be periodical in that case ?—A.—I think advice should certainly be periodical. Many people who put down tube-wells and pumps have no idea as to why there may be any falling-off in efficiency. I have known cases for instance where centrifugal pumps have been running in connection with a well and after a while the delivery of water has fallen off, and they have sought my opinion on the matter, but it simply proved to be a case of leakage at a gland or joint letting air in, and consequently not working well. I have found such instances where one would have thought the people in charge would have realised the cause.

Q.—Your point is, I suppose, they won't take advice unless the things get really into a bad state ?—A.—That is generally the case. They let the thing go until it is difficult to repair, then they seek advice.

Sir D. J. Tata.—Q.—Is it because the man in charge is not sufficiently capable ? Surely a man who works a pump ought to know ?—A.—It is rather difficult to say. In my own workshops I have men who are supposed to be successful in the use of machines and yet I find, although they know that a certain operation is necessary, they will omit to do it until the difficulty arises.

Mr. C. E. Law.—Q.—You say "Relief from taxation would help a struggling concern, and I would certainly stop municipalities placing special taxes on engines or other machinery, which in some cases is now done." What class of taxes do you refer to? You mean the octroi which they charge on machinery imported into a municipality?—A.—Yes, this kind of thing is charged not only on machinery, but annual taxes put on in some cases.

Q.—On what class of machinery?—A.—On such things as engine and boilers. You must have heard there is actually a municipal tax on steam-engines.

Q.—As regards octroi too, the octroi on imported machines levied by municipalities is not a heavy item?—A.—That is a matter that I have not enquired into; it does not affect me.

Q.—But your impression is that that is being done, and that it presses undesirably on the industries?—A.—That is the opinion I have.

Q.—You speak about the difficulty of handing over a pioneer factory to ordinary management, and you say—"At a suitable stage in its development it could be turned into a public company in which Government could hold shares and when that in turn is a commercial success it could withdraw by arrangement as in the previous case." I think you propose that Government, practically speaking, should put the thing on the market as a limited liability company and sell shares—is that your idea?—A.—I would rather put it in this way. I make a difference in my mind between what you call a demonstration factory and a pioneer factory—a demonstration factory being one in which you merely demonstrate a process without reference to its commercial issues or rather the possibility of its commercial success; a pioneer factory takes the commercial element into consideration.

Q.—Your idea about pioneer and demonstration factories is something rather different from ours. We mean by a pioneer factory a factory which starts an industry with a new process, new at any rate locally, and runs the thing to a commercial success?—A.—Quite so.

Q.—A demonstration factory simply demonstrates something already existing either locally or in a distant place, in order to bring it home to the minds of the people, but in any case on a commercial scale. There is a difference between experimental and demonstration work as in agriculture; that is what we have in our mind?—A.—My idea is quite the same as yours, with perhaps the difference that I look upon a demonstration factory merely as one demonstrating a process without reference to its commercial success.

Q.—We are rather on the other track. A pioneer factory involves both demonstration and experiment, but in any case you should run the factory until it can be shown that it can be run as a commercial success. Now you propose to establish an independent concern in which Government should take a share—would you propose to float the thing as a company and let the public buy shares?—A.—What I would propose would be analogous to gradual withdrawal, the idea being that the factory is not primarily started for direct profit of Government, but merely to prove the process a success, and when success is achieved, shares should be created and part placed in the hands of the public, and then as it proves commercially successful, Government would gradually release a portion of its shares allowing them to be taken up by existing shareholders or by others who wish to buy.

Q.—I suppose the idea is partly to get over the difficulty which exists in this way, that in practice any limited company, especially any industrial company, is really started by a group, it has to command mutual connections in other industries which enables them to work more or less with profit from the start, and practically this group of persons puts the company on the market and the shareholders are simply those who come in—you have here a very close organization ready before the company starts, but if you simply put a proposition on the market as a limited liability company, very likely you would not have your central organization?—A.—I think I might explain what the procedure in western countries would probably be—an industrial concern would be started by a syndicate of men, each would put money into it, and they would develop an industry to a certain point; they would then invite public subscriptions probably holding a certain proportion of the shares themselves; but they require to have their financial organisation over a broad basis.

Q.—And it would create public confidence in the syndicate?—A.—But that public confidence would not grow if that original syndicate proposed at once to withdraw entirely; so I would not suggest, when Government is concerned in a pioneer industry, that it should at once withdraw by selling it right out to some commercial concern, but rather that it should hold a proportion of the shares and gradually withdraw.

Q.—But you leave the Government responsible for building up in the concern a group of persons who would be competent to exercise real control and responsibility?—
A.—A successful concern would attract people of ability.

Q.—Speaking of tube-wells you say "Their use has developed to the stage which indicates that a new industry, that of manufacturing the necessary parts, making borings in the ground and installing the necessary machinery has become firmly established and is likely to develop to a large extent." Are the Agricultural Department taking up the question of tubing at present?—A.—They are doing a little in that way, and commercial concerns are also doing something.

Q.—Are there commercial concerns putting down borings—people who sell pumps?—
A.—There are concerns who put down whole installations.

Q.—And do boring also?—A.—Yes.

Q.—Do they get a fair amount of business? I am not speaking of war time, there is difficulty of getting raw materials, but before the war?—A.—Those engaged in the business get all the work they can handle.

Q.—Referring again to your experience of the apprenticeship system, you say "Under this scheme six or eight apprentices did pass through the shops and some of the most successful of them were also given drawing office training and they have turned out to be good men." What class of men were they—were they of the educated type?—A.—Most of them were not. They were sons of *mistris*, some of them *mistris* in our own department who came and passed through apprenticeships in this way.

Q.—What sort of job do they rise to?—A.—Most of them have now left me. I heard from one about three days ago that he is now in charge of a flour mill.

Q.—Getting about how much?—A.—Probably about Rs. 200 a month.

Q.—Have you experienced much difficulty in training Indians as shop foremen and chargemen? Have you any Indians in such posts in your work?—A.—I have several.

Q.—What pay are they getting?—A.—I am speaking of one of them who is the most successful man of the kind that I have had to do with. He was originally an ordinary *lohar* and when I first employed him 13 years ago his wages were 25 rupees a month, he learnt English in his own time and also drawing.

Q.—Where, in what sort of school?—A.—By private tuition, and he has gradually grown up in our employment until he has done very good work for us and he is now drawing 150 rupees a month.

Q.—Is he of the type of man, for instance, that is foreman in railway workshops?—A.—Many of the foremen in railway workshops of course are Europeans or of European descent.

Q.—Practically all of them. But now, what would be the difference between a man like what you were describing and the European shop foreman as regards capacity for keeping work going?—A.—I would place the difference in this way—he would lack a sufficiently broad technical knowledge. When new work is given to him it would always be necessary to give him very clear explanations as to how that work has to be done. I question whether he would have sufficiently broad knowledge to be able to take up and do new work in the best way.

Q.—Is he all right in controlling labour?—A.—He is quite successful.

Q.—Then what is your idea in regard to training men as foremen and chargemen; how do you think that kind of man can be evolved?—A.—I have mentioned in my note that I think such a man could only be produced through a species of apprenticeship.

Q.—Of course you will find this difficulty that you cannot keep them?—A.—That is so. The demand for men of experience is great and when a man is going through the shops, as soon as he develops up to a certain point he is often enticed away by others.

Q.—Then in any case practical training must precede anything else; he must start with practical training?—A.—Yes.

Q.—Under shop conditions?—A.—I gather that in putting that question you have in your mind the alternative of a species of school training?

Q.—I do not think we have that idea, but some people have it; that has been put before us on several occasions, starting school training first of all and then turning the man out into the works?—A.—I do not think that would be a great success. I have had a very considerable amount of experience in connection both with technical colleges

and with workshops, and it has been my experience that the best men are evolved by an initial training in the workshop followed by technological training. If you take the men who are going through the so-called technical training, they don't realise what they are training for: they don't understand the training and much of it gets lost.

Q.—Would you approve of holding technical classes in connection with Government or railway shops to deal with apprentices as they qualify for it?—A.—I don't know whether I would speak of men connected with a particular shop, but I certainly think that if the men will attend technical classes in addition to working in the shops it is the best way to train them.

Q.—If you get a very large work like a big railway works which gives an amply sufficient basis for a small technical institute, would you be prepared to see suitable men get occasional afternoons off to attend the technical classes?—A.—It will probably help very much in the training.

Q.—And you think in the case of very large works of that sort such a technical institute to train apprentices would be promising?—A.—Yes, if properly run.

Q.—In the case of smaller works as you seem to indicate it would be impracticable?—A.—Because they are too small. May I make a further observation in regard to this technical training. The great fear that attaches to it is that the men's minds will develop to the point where they conceive that they are fitted for something different from workshop work, and that they should be given only some highly-paid job in which there is no manual work. The tendency is not to make them better workmen, but make them aspire to something which they are really not fitted for.

Q.—But under this scheme the student will be fully committed to shop conditions before he begins to get any training?—A.—Yes.

Q.—You go on to speak of Patent Laws. What is it that you object to specially, to the initial fees or to the annual recurring fees?—A.—Not the initial fees but the maintenance fees.

Q.—That is necessary, is it not, to keep out useless applications?—A.—We must have some fee in the first instance, but as I have pointed out recurring fees may press very heavily upon the poor man and in countries where I understand there are no such recurring fees, the Patent Laws have been of very great help to industries.

Q.—You speak about these rules regarding employees of the Government of India. There are corresponding rules I dare say with reference to officers employed under them in England by which the Government have a right on a patent when taken out by Government officers. In practice, do Government make a hard bargain with the man in such cases?—A.—I have mentioned that in my own note. My experience is that it is wholly favourable to Government.

Q.—We have had evidence the other way too, namely, that Government are really liberal?—A.—My experience is that although I have produced many inventions hitherto, Government has taken from me the patents and has not returned me anything.

Q.—In cases where a man has evolved his invention from the facilities and experience he obtains under Government, surely Government have the right to hold an option on the patent like any private firm would?—A.—Government does not employ its officers as inventors. Many men with equal facilities and experience fail to produce useful inventions, thus if it is to be conceded that Government has a right to the inventions produced by its officers, it penalises those with inventive ability. I have produced many inventions which are being used by Government and for which I have received no consideration.

Q.—Did you make any representation, or ask for any relief?—A.—I have made representations.

Q.—And did they give any reason why they should not give you any relief or purchase the patents from you?—A.—The response that I got was that Government was entitled to use my patents as I am a Government servant, and that I must look for my remuneration from other sources. This matter, I might point out, was once carried to the extent that where Government purchased goods made according to my patents from a British firm to whom I had granted licenses, under the English Patent Law, the payment to me of the royalties was stopped.

Q.—That is to say, they invoiced the goods less the royalty charges?—A.—Yes, and I appealed against that action and ultimately it was cancelled. I appealed on the ground that that firm was not manufacturing under the Indian Patent Law, but British.

Q.—Of course you realise, don't you, that in cases where a man is given certain facilities, say charge of establishments, or gets a contract for a certain class of work, there is no doubt he is making use not only of his own brains, but also of those facilities which arise out of his employment under Government?—A.—Not wholly, he would have the same facilities in other employments.

Q.—Then in the case of other employments, does not the employer usually put himself in a specially favourable position in respect of patents taken out by his employees?—A.—I am not quite certain of my ground, but I believe that no employer now under the existing Patent Laws may claim an employee's patent rights.

Q.—Quite, legally I grant you, but if I remember rightly, I was told for instance that motor manufacturers particularly as a rule make an arrangement with their employees to take over patents from them?—A.—Usually the attitude is that the employing firm arranges with the employee that the patent shall be considered a joint one, and that they shall share accordingly.

Q.—You speak about the housing of employees, you say you would like to see "associated with every factory enforced conditions as regards proper habitations for factory hands." Are you aware of any other country where they compel employers to house their labour?—A.—I am not aware of any other country.

Q.—Then you realise, don't you, that it would be rather a strong step to introduce that in India?—A.—It would.

Q.—What are the grounds on which you would justify that?—A.—On the ground that I consider the conditions in India are quite different to those obtaining in other countries. The Indian workman, it seems to me, is more likely to be preyed upon in matters of his kind.

Q.—Because he lacks organisation, and because of his own personal peculiarities, helplessness and so on?—A.—Because of his own peculiarities, peculiarities arising out of the conditions of his life.

Q.—Do you have anything approaching a provident fund for the workmen in your workshops?—A.—No. I have actually talked to the men on the subject and they have expressed a desire for something of the kind, but as yet I have not been able to bring that to the point of definite proposals.

Sir F. H. Stewart.—Q.—Presumably, there are a number of branches of this Central workshop of which you are the superintendent: Is it under the Irrigation Department?—A.—It is under the Irrigation Department, it is within its organisation.

Q.—How many employees are there?—A.—It varies: our present establishment is about four to five hundred—it may run up to 1,000 at times.

Q.—Have you any apprenticeship system now?—A.—No.

Q.—You speak of one which you tried but it was objected to by the Accountant-General. What was his objection, that you took deposits from them?—A.—The objection was that the arrangement was not authorised, and, doubtless, his objection was chiefly associated with the taking of deposits from them.

Q.—Did you carry the matter any further, or did you just drop it?—A.—The matter arose when I was away on leave, and the officer officiating simply dropped the matter; when I returned I decided not to revive it, but I was very greatly disappointed.

Q.—You think that an initial deposit is the essential part of such a scheme?—A.—I consider it absolutely necessary in order to make the men carry out their obligations.

Q.—With reference to your suggestion about licenses, you would not allow a man to engage in trade without a special license, is that the effect of your suggestion? Could you explain it further?—A.—I was particularly mentioning that with reference to my suggestion for industrial settlements, with a view to raising the moral tone of the workmen.

Q.—But supposing in the end they do not conform to the regulations, what alternative do you propose?—A.—Simply require them to withdraw from the settlement. There would need to be rules associated with the settlement to which they must conform; if they cannot conform, they will have the alternative of withdrawing from it.

Q.—Similarly, if a man did not do the amount of work allotted?—A.—Certainly, if you are providing that man with machinery and appliances and so on, and as that particular workshop would be as it were a tooth in the wheel, if that one fails then the rest suffer.

Q.—Do you really think this is at all feasible?—A.—I would not otherwise have suggested it.

Q.—Then you say with reference to the people of this province, "The people do not show any aptitude for that branch of knowledge, that is to say, mechanical." That is rather at variance with the experience of others, and with other evidence tendered to us?—A.—I think that it is probably because many people consider manual aptitude as mechanical aptitude. I would say that the workmen generally have a certain amount of manual aptitude, but not mechanical aptitude.

Q.—Is that not due to want of mechanical training?—A.—Perhaps I might explain what I mean by this. I find very few men able to take an idea in embryo and work it out to its issue.

Q.—What about students from these industrial schools and colleges? You say the majority of them are spoilt by their training; would that apply to the College of Engineering at Roorkee for instance?—A.—I have not had men from that college, that is rather a Civil Engineering College.

Q.—How would you compare the productive capacity of a good workman here as compared with an English workman? Would you say he can do half as much or as much or twice as much?—A.—I would practically place it at the difference between the rates of remuneration.

Q.—That is to say, if that English workman gets twice as much pay, he does twice as much?—A.—Actually it is more than that, what an English workman does in a day the Indian workman does in a week.

Sir Durrabi Tata.—Q.—In respect to manual labour or mechanical skill?—A.—The kind of labour that you have in a manufactory.

Q.—Imported skilled labour, is that what you mean?—A.—Skilled labour certainly. Even if you take such a simple thing as hammering at a forge, the difference is striking.

Sir P. H. Stewart.—Q.—As regards technical aid to industries you refer to the case of Government medical experts; are you aware there is in many quarters very severe criticism of that practice?—A.—Probably the criticism is by other interested persons.

Q.—Anyhow you think it a good case to quote as an argument for allowing Government servants to take up practice in private work: in your case it would be consulting engineering?—A.—Yes.

Sir B. N. Mookerjee.—Q.—Don't you think it would interfere with your own work?—A.—I stated in my note "provided that they do not allow it to affect their duties detrimentally."

Sir Francis Stewart.—Q.—Who is going to be the judge?—A.—Who is to judge if a man has ability or capacity now?

Q.—You mean Government would have to judge?—A.—Certainly.

Q.—Are you allowed to do any outside work in certain circumstances with the permission of Government?—A.—At one time I applied to Government for permission to do consulting work, and it was refused.

Q.—You applied for a general permission?—A.—Yes, to do consulting work generally.

Q.—In cases where people come to you for advice on particular matters, can you not apply to Government and ask for permission?—A.—I know of instances where men have been told that they may do private work provided that they return half the fee to Government. Rather than do that I would give my advice free.

Q.—Is there in your opinion any scope for private consulting engineers in this province?—A.—I doubt whether there is a sufficiently broad field in the Punjab at the present time. My point here was that whereas there are struggling industries at the present time which need expert advice, there is a certain amount of expert knowledge available in this country which is shut off from those who need it.

Q.—If that expert advice is given by Government servants would it be right that the result of any experiments that they may make in connection with their advice should be published for the general good at once in the interests of others engaged in that particular business at that time?—A.—I do not think it will be quite fair to publish the results of investigations into a matter which particularly concerns one firm. For instance, supposing I were a consulting engineer at home and a firm called me in and asked my opinion on some process of manufacture, they certainly would not be willing for me to write to a paper on that particular process with a view to publishing it, nor should it be done here.

Q.—But the hypothesis out here would be that being a Government and therefore a public servant the expert's services should be at the disposal of the public?—A.—Yes, but there will be no purpose gained in creating conditions round it, so that people would certainly not seek advice because they would be penalised by having the process published.

Q.—Do you think they would be withholding the information from the public, say, for a period of one or two years or something of that sort?—A.—I think it is a matter in which the nature of the circumstances should be taken into consideration.

Q.—With reference to training abroad, you don't very much like the scholarship system as it exists now?—A.—From what little I have seen I am inclined to think it is a failure.

Q.—Would you like to see scholars thoroughly trained as practical men before they go abroad?—A.—I think it would be a better procedure to bring the system of training to this country rather than send men from this country to get it.

Sir Fazulbhoy Currimbhoy.—Q.—In the first three or four pages of your note you describe the methods of English industries. Do you want India to follow on that line?—A.—I think I have made it clear in my note that there are certain social disabilities in connection with the development of large factories in this country, and that I should like to see India not going in for it.

Q.—India ought not to go in for any big factories, is that what you mean?—A.—I have said in my note that doubtless there are some industries which could not be developed without big factories.

Q.—Just like steel industries?—A.—Certainly, but that where it is possible to develop them without the factory by all means do so.

Q.—How are the people to be educated in industries and other technical matters? We want big colleges at different centres, do we not?—A.—It is useless to endeavour to teach them to run before they can walk. I would not start with big colleges; I would start with workshop training and technical classes in connection therewith, and leave the colleges until afterwards.

Q.—And about research work, you also don't want research institutes?—A.—I see no object in that at present.

Q.—Have you watched the development of Germany and Japan during the last 50 years?—A.—To a certain extent I have.

Q.—And their educational institutions?—A.—To a certain extent.

Q.—And do you think India will be able to compete with other countries who are fast advancing by going on so slowly? Do you believe in that?—A.—India is a different country to those others; you are starting here with people with quite different aptitudes, you have to gradually change these aptitudes.

Q.—Do you think that Indians are not at present fit to attain to any higher positions in technical matters? Is that your view?—A.—I do not say so.

Q.—Don't you think that technical institutes and colleges should be established so that people who are trained in those institutions may acquire higher positions in the industries of the country?—A.—I say that progress must be made on gradual lines.

Q.—Have you seen the Technical Institute in Bombay?—A.—No, I have not.

Q.—Have you had experience of the boys turned out from that institute?—A.—I have employed one boy from there.

Q.—In what line, engineering? Are you quite satisfied with his work and aptitude, or are you not?—A.—I am satisfied to this extent that if those boys are content to go through a thorough workshop training, afterwards they might do well; but the usual tendency of this training is to make them discontented with workshop work, that is to say with manual employment.

Q.—Because the training is defective—you want big workshops attached to these big institutions, do you not?—A.—I do not.

Q.—If big schools or institutions are attached to big workshops, or established in big industrial centres, the boys can get an opportunity to go and see the works and learn the work also at the same time?—A.—I agree that workshop and technical training should go hand in hand; that is the best thing.

Q.—Then you agree that they ought to be started on that line for teaching Indians?—A.—Yes, they should be associated.

Q.—Would this apply to the higher grades also?—A.—You cannot begin with the higher grade, you must begin with the lower.

Q.—There are lower grades as well as higher grades?—A.—When you have given man a thoroughly good grounding in workshop practice and in the elements of technology

if he has ability in him he will go further. On the other hand if you take a man and put him into a college and give him much book learning you may create in him the impression that because he has passed certain examinations he is straight away fitted for high posts, and thus spoil him.

Q.—He must have good grounding in workshops as in Europe; if he is given the same chance as in Europe for workshop training, do you not think he may be able to do the same sort of work?—A.—I have seen many a man in Europe obtain his workshop training by apprenticeship in the shops and by attending evening classes in technology who has risen to very high positions in the technical world.

Q.—But here if the same training is available, they will have the same chance, is it not?—A.—Yes.

Q.—So technical education and scientific education ought to be imparted on the proper lines?—A.—Provided you don't make a fetish of what you call a college or university or something of that kind.

Q.—Then about the cotton trade of Lancashire, you know things are quite different here from Lancashire; you see in Lancashire the difficulty is that of obtaining cotton; then they have got different divisions, they have got the spinning factory, then the weaving factory and so on, here they are all combined just like America and other places, and their work is quite successful or even better; so you cannot have the same standards everywhere?—A.—My purpose in putting that forward was to indicate the lines upon which industries have developed with a view to examining those lines to see whether they would point out to us the direction in which to move.

Q.—But we have to take other countries also as our example, countries like America?—A.—It is well that we should speak about that which we know. I have lived in Lancashire in the middle of the cotton industry; I have lived in Birmingham and other places. I only speak of those places of which I have personal knowledge.

Q.—Then about hydro-electric power, do you know anything about the schemes of the Punjab Government about hydro-electric power?—A.—Most of the hydro-electric power schemes that have been handled by the Punjab Government have come before me.

Q.—Do you think the Punjab schemes are commercially possible?—A.—That is speaking broadly?

Q.—Can you develop large power here? Schemes have come to you, have they not?—A.—There are cases where we can develop very considerable power.

Q.—How much?—A.—In Amritsar here we have a scheme for a thousand horse-power; I know of other places where we can develop 4 or 5 thousand horse-power.

Q.—You say "Unfortunately a ruling of the Secretary of State some years ago prevented the Indian Government adopting such methods." What methods do you refer to there?—A.—I think it was with reference to pioneer factories; that was after the experience of the Madras case, the aluminium case.

Q.—You say "In the matter of financial aid to enterprises, I am of opinion that grants-in-aid, bounties and subsidies are unsound." Do you know that the French, Japanese and German industries owe their origin to these grants-in-aid and subsidies? Their steamship companies and other big concerns have been developed by this system of bounties?—A.—I believe a great deal has been done in that way, but it does not in any way appeal to me. I don't like what one might call wet-nursing.

Q.—But supposing we want to start a shipbuilding industry in India; other countries have developed it greatly and India cannot compete with them at present unless Government helps to start the shipbuilding industry in the country; in that case Government must give grants-in-aid or subsidies to start the industry in the beginning until it can stand on its own legs. Do you not think in that case Government should subsidise?—A.—I do not know that I would make my remarks absolutely general. My remark was made with particular reference to the development of such industries as could possibly be established in the Punjab.

Q.—Suppose in the Punjab many people are willing to start industries and they can organise successfully if they can get aid from Government, do you think in that case Government ought to help by having a staff of experts and giving expert advice? If there are experts who can say that a certain scheme is good and can be worked with profit, don't you think that Government should give financial aid to that industry?—A.—I think that is a question on which I had better not express any opinion.

Q.—Then you say "Relief from taxation would help a struggling concern and I would certainly stop municipalities placing special taxes on engines or other machinery which in some cases is now done." Where? Is it done in the Punjab? Are the engines being taxed here?—A.—I have stated that it is done in Amritsar.

Q.—Then speaking of Government policy in pioneering industries, you say "When the risk is too great to justify Government following this course of inviting outside capital to participate, it could reasonably establish such a concern accepting the whole risk itself"?—A.—My point there is that I object to the general idea of trying to put the risk on somebody else's shoulders.

Q.—You mean that Government should take the risk?—A.—If it wants to get the thing done, certainly. There are many instances where there is good reason to believe that an industry can be developed, but that probably for several years to come it will have to go through a development period before it can reach success; in that case I think that the risk might reasonably be borne by the Government, and when it has been developed to the point of success then it should bring in private enterprise.

Q.—You say speaking of your apprenticeship system, "Under this scheme, however, six or eight apprentices did pass through the shops and some of the most successful of them were also given drawing office training and they have turned out to be good men." Where are these men employed now?—A.—I have lost sight of most of them.

Q.—Do you think that employers of labour should provide habitations for the hands employed under them? Do you want them to build houses?—A.—I would like to see satisfactory conditions of life made for the employees.

Q.—That is, you would give them good accommodation to live in, is that only what you want?—A.—The tendency where a factory grows up is for the surrounding residential buildings to become congested, for the residential conditions to become insanitary, and also for the people in the neighbourhood to prey upon the factory employees.

Q.—Do you refer to the *bunnias* and money-lenders?—A.—Certainly. I have enquired from many of the men and a large proportion of them live in a constant state of debt.

Q.—Do you think there ought to be co-operative societies amongst these workmen?—A.—I think so. I think that is the direction in which it can be done. I think for instance you will find when you go to the Dhariwal Mills that a great deal has been done on these lines; they provide residences for their workmen and they also have a co-operative society working.

Q.—If they want their employees to go and stay there, they have to provide accommodation, is it not? If they start a factory where they have not got any man to work, they must provide accommodation for the men if they go there, or else they cannot work the factory. Is that not so?—A.—Yes, but if it can be done successfully in one case it can be done in others also.

Q.—What percentage of the men employed in a factory would you like to be compulsorily accommodated under Government legislation?—A.—I do not think it is necessary to particularise in that way.

Sir D. J. Tata.—Q.—I will just continue where Sir Fazulbhoj left off on the question of the housing of operatives. Is it not the fact that there is great difficulty in dealing with this question owing to the long-established habits of these people? If left to themselves, they would not prefer those healthy surroundings that you suggest; they might perhaps be content with more unhealthy surroundings if cheaper? Employers would like to see them occupying healthy buildings. But do you think it is possible to do anything when the habits of the people ingrained for centuries come in the way of this sort of welfare work, if I may so call it?—A.—I think that is rather looking for objections.

Q.—In your instance of Dhariwal, it is possible for a new industry starting in a new place to begin by building healthy quarters for the men. But if you are starting in a congested city where your factory is in the heart of a town, the labourers naturally want to live as near as possible to the factory so as not to have to walk long distances to and from their quarters. In a town, however, the rents are naturally higher, and the value of land is greater, and they cannot afford to pay big rents for sanitary dwellings such as their employer himself would like for them. Consequently, they go to these wretched hovels in order to pay a lower rent? They are not men who have been brought up to appreciate conditions of hygienic living, so they don't mind where they live. It is all due to want of education, is it not so?—A.—In reply, I would say that in the middle of a congested area a large factory should not be started.

Q.—But if the factory is in a town there will always be this difficulty. Where, however, the factory is placed in a locality where the conditions of life are much better and where land is easily available, don't you think it is easier to house the operatives than it would be in a town?—A.—That points to the need for control as to where such a factory should be planted.

Q.—In answer to Sir Fazulbhoj with regard to training abroad, you said that the men should not be sent abroad. Do you think that they might be sent at a later stage?—A. I am afraid that the training obtained abroad is not so complete as you would expect.

Q.—It may be so at the present time but when industries are well established in this country and when we progress and reach a higher stage of development, would not training abroad be necessary there? Even in Europe men who go in for certain industries go, for instance, to Germany, to Italy, to Switzerland and other places to be trained in their particular branches and to get the extra knowledge necessary which they don't get at home?—A.—I would leave that to individual initiative.

Q.—That is true. But still there would be advantages in training abroad later on, if not in the beginning. I agree with you that perhaps in the first instance they are not ripe for being sent abroad; but don't you think that after they have been trained in this country up to a certain stage, if scholarships are given to these men to go abroad and acquire a final polish in their work, it would be of some use?—A.—Certainly, broadened experience is an advantage, but my remark with regard to sending men abroad was with reference to the initial training; and you find that generally speaking when they do go abroad they enter some school or college, pass through its course and return to this country with the belief that they are fully experienced, when they really are not.

Q.—That is the fault of the training. It is not their own fault. If they get the proper kind of training, there would not be this defect?—A.—That is the great difficulty.

Q.—Talking about this training you must go back to Japan. Do you know how Japan developed her industries by sending young men abroad to be trained? The Japanese developed all their trades and industries simply by sending numbers of their young men to foreign countries to be trained in the various industries which they are now able to carry on independent of foreign help?—A.—In making such comparisons we should, I think, consider on whose initiative they did this.

Q.—On whose initiative was it done in Japan?—A.—It was on the initiative of the Japanese people I believe.

Q.—That is to say, the Japanese Government. In the same way don't you think the Government of this country must identify itself with the people of this country?—A.—Yes.

Q.—Now in connection with this, you said in answer to Sir Fazulbhoj that conditions were different in Japan. That is true. But Japan about 50 or 60 years ago was even in a worse condition than India is now. Within this time she has practically educated herself up to the position that she is occupying now. At that time her people were very backward except in the artistic industries in which they were very far advanced?—A.—I always think that the best men are produced by those who have to go through the mill.

Q.—Of all the things that go for developing industries, such as capital, labour, raw material, etc., which do you think is the most essential, technical skill, or capital, or raw material?—A.—Each is dependent upon the other.

Q.—I speak specially with reference to what people say about the development of industries, say in the Punjab. Don't you think that technical skill is the one thing essential that ought to be imparted first? You have labour; you have certain amount of raw material everywhere; and capital is always available. Is not technical skill the most important thing here?—A.—You certainly cannot develop any industry without sufficient expert guidance in the way of technical knowledge.

Q.—Guidance, but at the same time skill in the workmen too who are to carry on the work?—A.—If you have guidance, any lack of skill can largely be discounted.

Q.—What is the guidance for, to give skill? Is it not?—A.—The question depends upon how you visualise this.

Q.—Speaking about the cottage system of industries which you would introduce, you say: "The advantage of such a system is that every man with initiative and energy may be his own master and work such hours and at such speed as he may choose. He may also be assisted by the members of his family who thus learn the details of his trade. Such a system calls for certain mastermen who will draw together the product of these small makers, have it completed, etc., etc." Now, are not all the big trades in America

developed by a system of standardising the parts, and manufacturing them in large quantities; and any system such as you propose can never hope to compete against the large factory system?—A.—I do not agree.

Q.—If a man works in the midst of his family, the family can help him. One member may do one part, and another may do another. That is all very well in the beginning; but do you think you can develop large industries by such system as they do, for instance, in America? They turn out for example watches as cheap as 5 shillings, simply because every part is standardised and they make them by the million, and it is all turned out on a factory scale, every part being separately made and put together?—A.—Similar watches are made in Switzerland largely on the cottage system.

Q.—But at what price are they put on the market?—A.—I have not any exact knowledge. The industry there is flourishing.

Q.—You say, "The mere formation of technological classes will not establish industry, although as an adjunct to an established trade it is most useful in assisting its further development. Such classes without the established industry are but a waste of money and effort, and creators of disappointment and discontent." But to get an industry developed on a large scale, don't you acknowledge that this sort of technical instruction is absolutely necessary to develop an industry to the utmost, and bring it to a state of perfection and that without this special skill no trade can be developed to a very high standard? Take, for instance, such things as cycle-making, and the state of perfection it has reached, for example, in Coventry. Unless you introduced technical institutions where men could be trained to carry on research work, by starting a small factory to develop it to its highest point, do you think such perfection can be reached? In the course of the development of an industry a man may invent a new process, a new method, and a technical institute would be of great advantage. We here may have reached that stage or may not reach that stage for some time; but ultimately, in the end, would not large technical research institutes be of very great advantage in this country?—A.—Large technical institutions and research institutes have their place, but I do not think that position comes in before industries are established.

Q.—Well, I will give you one instance. There is a research institute in Bangalore. The Mysore Government had a large business in sandal-wood which they exported for making oil. Taking advantage of that institute in Bangalore they asked the institute if it was not possible for them to make sandal-wood oil in this country. The institute devoted its attention to this problem, with the result that the Mysore Government is now making sandal-wood oil in the Mysore territory. Here is the case of a research institute which has done very excellent work?—A.—A very excellent one. Research institutes manned by experts have their place, for they can carry out investigations that may influence the establishment of new or the development of old industries. I differentiate research institutes and technical colleges and attach greater value to the former for the purpose in view. The main thing is to get industries established, and research can then help in their development. Without the industries there are no trained artisans and managers to convert the results of research into practical commercial industry.

Hon'ble Mr. H. J. Maynard.—Q.—I think you mentioned some municipal taxation on engines and machinery. There is an octroi of 3 pies in the rupee on the value of machinery, is that what you referred to?—A.—I have no knowledge of this subject.

Q.—When you refer to a tax on some engines, you don't know actually the amount of that?—A.—I don't know.

Q.—It is a license tax simply. I only wanted to know whether it is the same or something different. I am told there is a license-tax of 5 rupees or 10 rupees according as the engine is of 20 horse-power or more?—A.—I only know that such a tax is actually charged, that is, that a tax is charged on machinery.

Sir R. N. Mookerjee.—Q.—With reference to the apprenticeship system, do you pay the apprentices anything after the first year's work, if they continue for a second and third year?—A.—I pay them from the beginning.

Q.—Do you pay them their entire dues monthly or you keep a certain portion and pay at the end of their apprenticeship?—A.—I pay them monthly.

Q.—You asked for a 100 rupees deposit and the Accountant-General did not pass it, and that was your difficulty. I understand that in the Eastern Bengal Railway workshops at Kanchrapara they don't take any initial deposit, but they keep back a portion of the pay and put it in the Post Office to earn interest, and if anyone leaves within the prescribed time he forfeits that amount. If they don't leave till the end of their apprenticeship they get a decent amount of money, 400 or 500 rupees, according to their merit.

This system will necessarily obviate this difficulty of yours, or in other words that would render Government sanction unnecessary as you will not have to ask for any deposit?—*A.*—It becomes practically a deposit.

Q.—The Superintendent of the Kanchrapara Workshops gave evidence before us and told us that the system was working well. I am only suggesting whether that might not meet with your difficulty. We have been told in other places also that the principal difficulty is that these apprentices don't remain the full period, but if you pay them only half of their wages and keep back the other half to be paid at the end of their terms, then they might willingly stay to complete their terms?—*A.*—As the money would remain in deposit, the objection could probably be made.

Q.—Then about your fee for private consulting practice, do you think that when Government told the officer you referred to, that they would allow him only half the fee earned and that the other half should be returned to Government, it was not fair to both parties? Take for instance your case as an example, you are a Government servant, you get a certain amount of pay from Government monthly, you have a pension, you have perhaps a provident fund, and then you give a certain portion of your time to certain consulting work somewhere, you accept a certain fee, and Government asks you to share the fee half to yourself and half to Government. Is it not a very fair arrangement?—*A.* I do not think that I would agree to any such arrangement.

Q.—But can you state any instance where a private company allowed their engineers to practise as consulting engineers without sharing his fee with his proprietor?—*A.*—If a man is employed by a private concern, he is expected to put in certain hours per day at his work or in his office, and outside that office he does as he likes.

Q.—My experience is not what you state. Can you mention any firm of engineers or architects which allows its expert employee to take up private practice as he likes without any condition?—*A.*—My commercial experience has been in England, where I have known men in employment prepare designs and give expert advice outside office hours and earn fees thereby.

DHARIWAL.

WITNESS No. 388.

MR. J. W. ARMSTRONG, Manager, The New Egerton Woollen Mills Company, Limited.

WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

1. The opinion appears to be very widely held that without direct Government aid the industries of India cannot be further developed, and those who cling most tenaciously to this theory and press clamorously for its full adoption generally mean, when all superfluities are removed, that Government should bear in one form or other the financial burden of starting new or developing existing industries. In other words, that the general tax-payer should contribute to the income of any who profess to have hold of a sound proposition but can neither back it themselves nor persuade others to do so.

2. The progress already made in establishing in India industries run on modern lines proves to my mind conclusively that a sound scheme backed by trusted men is not likely at any time to fail for want of capital. And no amount of financial support which Government could grant in order to bolster up private enterprises would be a substitute for the elements of character without which business anywhere cannot prosper. If those who are in touch at every point with the promoters of schemes for starting businesses refuse to budge from their position of distrust, or "timidity," as it is euphemistically termed, then it is extremely doubtful whether a dolé taken from the pocket of the general tax-payer and called Government support would dissipate the existing lack of confidence. And no step should be taken by Government which would retard the day when the bulk of the people would become more self-reliant and mutually trustful.

3. Government should in my opinion be particularly chary of granting any direct financial aid whatsoever to individual concerns or persons whether by grants-in-aid, guaranteed dividends, loans without interest, or exemption from taxation, unless it is abundantly clear that the industry to be helped is of national importance, such as for instance sugar manufacture may be claimed to be, and that Government authority is needed to harmonize conflicting interests. And in the case of industries which on first view it might seem advisable, in the interests of the community as a whole or at any rate a large section thereof, to assist financially through an existing or new enterprise then the prospects of success should be very carefully examined by the best experts obtainable and before any commitment be

entered into on behalf of the State the intention of Government to extend its aid should be publicly announced, and full particulars of the facts on which the decision had been based should also be published—these particulars to include the expert's analysis of the probable working costs and expected results. This would ensure that in addition to those who had propounded a particular scheme others equally interested might have the opportunity of putting their views before Government, and would help in preventing undue waste of public money as well as guarding against unfair competition—by means of Government aid—with existing private enterprise.

4. Government's connection with concerns partly or entirely financed by public money should be sufficiently intimate and authoritative as to ensure that the funds taken from the general tax-payer were being used for the clear well-defined purpose for which alone a grant could be justified. It should in such cases be in the power of Government to exercise some form of control over the purchase of raw materials; ascertainment of real costs of manufacture; the disposal rates of finished products; the sanctioning of commissions paid to officers of the company; and such like matters—the ruling principle to be to interfere as little as possible consistent with the protection of the interests of those whose money Government put into the venture.

Pioneer factories.

5. I do not think that any appreciable progress would follow the establishment of pioneer factories to be completely run under the aegis of Government. There could hardly be the same keenness in such factories as is necessary in order that a business might flourish. The aims and ambitions of those placed in charge would scarcely be the same as those which have actuated the men who have built up successful businesses, and who are assured of receiving the full reward of their own enterprise, perseverance and general business acumen. Dissipation of public funds would I consider be the chief result of the establishment of such factories.

6. If Government financial aid to industries be, as I hold it should be, strictly limited to such enterprises as are clearly in the interests of the community as a whole then it would I think follow that no limitations on Government aid should be imposed simply because of the fear of competing with an established external trade. If the intention of Government to assist a given industry were publicly announced then all those who might consider their interests prejudiced could place their position before Government, though in the original review of the industry to be assisted it would be one of the duties of the Government officials conducting the review to ascertain in what directions and to what extent Government action would conflict with existing interests and to propose methods for harmonizing same.

Cottage industries.

7. To develop cottage industries in agricultural districts the supply of hand-machines on the hire-purchase system might be adopted provided that the agency of Co-operative Societies, registered under the Act, or of some Government Department, be used for supplying the raw material needed for, and in the disposing of the products of, such machines. Cottage industries are, I understand, very greatly handicapped owing to the difficulty experienced by villagers in financing their very small operations except at exorbitant rates of interest, and the Sahukar who at present holds the village worker in the hollow of his hand would probably reap a still richer harvest if Government supplied hand machinery, and nothing further was done to assist the villager. Co-operative Societies are doing a most useful work in promoting the right spirit, and an extension of their activities in the way suggested would I believe be of decided advantage.

8. It is highly doubtful however whether any marked benefit of permanent value to the industries of the country will follow any propping up Government could undertake of the cottage industries of the country. As a means of supplementing the earnings of an agricultural community cottage industries ought to be supported wherever possible, but it seems unwise to imagine that they will, however well organised, succeed in placing the industries of the country on a firm basis.

Assistance in marketing products.

Commercial museums.

9. In my experience there is no great difficulty in the way of bringing saleable goods to the notice of the general public, and I doubt very much whether any appreciable increase in the volume of business done has followed the establishment of commercial museums. They are probably mostly used by the idle and curious to help pass leisure moments. To reach the consumer is not the hard task which, when he is reached, it is to persuade him that it is to his advantage to purchase an article at a rupee which will last him twelve months rather than one at eight annas which will only last quarter the time. The flooding of the Indian markets with cheap tawdry foreign goods, mostly the products of Austria and Germany, though of distinct advantage to the trading community, has not been an unmingled blessing to the country as a whole, as the development of the industries

of the country has no doubt been retarded thereby. The remedy of course lies not in attempting to imitate the inferior goods hitherto foisted on the public but in providing really sound articles at rates which the ordinary consumer can pay. And travelling exhibitions of such articles, made at recognised factories or by cottagers whose work was organised through Co-operative Societies, ought to be of utility to both producer and consumer.

10. Industrial exhibitions such as those held at Lahore and Allahabad in recent years, though probably not productive of much service in the way of bringing buyer and seller together, do I think fulfil an useful purpose, as they must stimulate thought and be the means of developing the desire to see the industries of the country expanded and more firmly established. The result of such exhibitions might not be immediate but none-the-less for their educative value I think Government would be justified in encouraging them. Industrial exhibitions.

11. There is undoubtedly a tendency on the part of some Government Departments to avoid as far as possible taking the responsibility of purchasing goods made in India, and it is not altogether difficult to understand this reluctance. Usually the purchasing officer has little or no knowledge of the comparative values of articles submitted to him, and he is consequently imbued with the fear that he will be "let down" if he accepts an Indian-made article which his organs of sight tell him is not exactly the same as the Home article. Should he be a distributing officer as well as a purchasing one, and this is generally the case, he dreads the criticism of those to whom he will supply his purchases. He knows that the chances of inferior articles being accepted from contractors by his subordinates is at least not less in India than it would be at Home, and the consequence is that the India Office is used to the fullest extent possible, often probably to the complete ignoring of the rules relating to Government purchase of stores. The remedy would lie I think in the establishment of a Department in India, sufficiently in touch with the industries of the country to be able to decide whether goods required by Government could be obtained in India, and sufficiently well staffed by experts to be able to accept full responsibility for the standards to be adopted, as well as for the settlement of disputes which might arise between contractors and purchasing departments. Government patronage.

12. There should be little difficulty in ascertaining from manufacturer what is the best they could offer to meet specific requirements. And the tests applied should be not so much whether the article offered by the Indian manufacturer is exactly the same as that obtainable at Home but if it is really suitable for the purpose for which it is needed. Though its appearance differs will it last as well?

13. Lists of articles imported by Government should most certainly be issued and accurate information of the total cost, delivered in India, of such articles should also be made available. A Stores Department with the powers of the India Office if established in India and judged by the results it could show of having encouraged Indian industries, without at the same time increasing the burden of expense, would no doubt soon get into touch with those capable of meeting the requirements of Government. Publication of lists.

14. The land policy of the Punjab Government which in so far as it protects the agriculturist from money lenders is undoubtedly the best, for the Province has still some drawbacks from the standpoint of industrial concerns. Both the Land Alienation Act and the Pre-emption Act constitute great obstacles to the purchase of land in this Province by private firms desiring to establish or develop industries. A brief account of the difficulties encountered by my Company in acquiring land during the past few years will illustrate this. In 1910 we endeavoured to acquire a block of land in the neighbourhood for further development, and on which we could build more labourers' houses, quarters for European and Indian staff, as well as to provide recreation grounds for all the community, and to assist the various religious bodies under our control to have suitable places for their respective worship and meeting. We informed the District Officer of our intention and he promised us that when the applications for the sale of land to us were put before him by the Zemindars concerned he would certainly sanction the sales. We quickly came to terms with the owner of one of the plots in the block we wished to acquire and the application to sell the same to us was in due course put before the District Officer but was rejected on the ground that there was no need for the Zemindar to dispose of his land. On a fresh representation this order was reconsidered but it was decided that it was necessary, in order to fulfil the law and rulings on same, to give the other Zemindars in the village opportunity to buy the land if they were so disposed and that only in the event of no Zemindar being prepared to purchase the land could sale to us be sanctioned. Information was thereupon sent to the villagers of the intention of the holder to sell his land. Although our rate was 50 per cent above the price ruling at the time some Zemindars came forward and made a higher offer. We had reason to believe that this offer was not a *bond fide* one but in spite of our representation to this effect the District Officer decided to grant those Land policy.

making the offer three months within which to complete purchase at their rate. At the end of this period, just as we expected, the Zemindars withdrew their offer. The owner of the land by this time had become rather disgusted and did not see the use of going backwards and forwards to the District Court. After the lapse of some further time as he really desired to sell the land at the favourable rate we offered, which would enable him to purchase equivalent land elsewhere and still have a considerable sum in hand, a fresh application was put before the District Magistrate and consent was then given to have the sale to us put through. At this stage however some of those who claimed pre-emption rights came forward and opposed the transfer. They had no apparent interest in the land, as though very distant connections of the seller it would have needed a catastrophe in the shape of the death of about a hundred people to have given them any rights of monetary value, yet we had, in conjunction with the seller, to prove to the satisfaction of the Courts—for the first decision in our favour was appealed against—that a child of the seller was actually such! And by the time the case was finally settled four years had elapsed from the date of our opening negotiations. And we have not even yet succeeded in acquiring all the land we need for the developments to which I have referred. We find that the present holders of plots are quite willing to close with us at the terms we offer, but they hesitate to do so owing to the opposition they receive from very remote relatives who threaten legal action unless they are pacified. This really means that the Pre-emption Act is in such cases used simply for purpose of black-mail. I am not prepared with any definite suggestions which would remove these checks to industrial development as I recognise that Punjabee agriculturists should be protected from the clutches of the *bania log* in so far as it is possible to obtain this result by placing restrictions upon the alienation of land. It ought however to be possible for legal luminaries to evolve some fair means of overcoming the difficulties I have mentioned while fully protecting the interests of the tillers of the soil.

15. It would, I conceive, be difficult to extend the provisions of the Land Acquisition Act so as to assist purely private concerns, which only by a stretch of imagination could be considered to be serving a public purpose, within the meaning of the Act, in their efforts to secure land, but if the element of compulsion be introduced at all it might be advisable to give the owner the option of accepting cash equal to the Government valuation of his land (*plus* the usual addition) or of granting a long lease of the land on a rental equal to say 10 per cent of the Government valuation of the land—provision being made for the period within which land so leased must be used for the purpose for which it was obtained—failing which it would revert to the original owner or his heirs.

Power from Canal
Falls.

16. The backward condition of the industries of the Punjab as compared with other Provinces in India is due in part to the disadvantageous position the Province is in owing to its remoteness from the coalfields. One way in which Government could assist the development of industries in the Punjab would be by encouraging industrial concerns to utilize the large amount of water power at present going to waste throughout the Province. I refer more particularly to power which could be developed by using the falls along the Canals, though I believe more ambitious schemes are quite feasible which would, by damming up some of the rivers at selected sites, provide enough horse-power to run some hundreds of factories. There are however certain very serious drawbacks to the utilization of the Canal Falls as a means of developing power for industrial enterprises. The out-of-the-way situation of the stations where power is available, increasing as it does the difficulty of securing and retaining a regular supply of labour, the intermittence of the flow in the Canals and the necessity that therefore exists to have subsidiary sets of generators always ready—all tell against schemes for using Canal Falls. In order therefore that this source of power be utilized for the benefit of the Province it would be necessary for Government to adopt a very generous policy in connection with granting rights to use the water. It does not seem too much to expect that Government lease the water at rates which would not exceed the cost to Government of any work Government might perform in the way of erecting inlet gates, etc., provided that those who desired to acquire the water rights were prepared to spend money on their scheme and to put down within a reasonable time the necessary plant and buildings.

Training of labour and supervision.

17. It is doubtful whether the lack of primary education acts as a check on industrial development. If financially practicable a scheme of compulsory education for children under ten or twelve years of age would certainly be a step in the right direction, but from my experience I would say that the possession of all the knowledge likely to be imparted in primary schools would not materially improve the ordinary worker's attitude towards or outlook on life and it is here that the chief difficulties in the way of increasing

his efficiency and skill lie. Those with the most elementary knowledge of modern factories know that regular attendance of the employé is a primary condition necessary to complete success and smooth running, and it is in this connection that the social customs of this country act as a much greater hindrance to industrial development than does the lack of primary education, technical or otherwise. Those who profess to long for the day when their country will take its place amongst the industrial nations of the world, if they are willing to work for this end, should conduct forthwith an active crusade against the customs which encourage idleness and improvidence, such for instance as the waste of money and time on marriage ceremonies. They would no doubt meet with the clamant opposition of the bania class and others, but they could justly plead for the full support of Government in their crusade. Without exaggeration they could assert that until some of the glaring defects in this direction were removed there was no need for Government assistance in any other direction. They could amply prove that it was by no means unusual for an ordinary coolie earning say Rs. 12 a month to expend five to six years' earnings on a child's marriage. And that after a period lack of any ambition or desire for the improvement of their own condition was the prevailing note of the lives of the poorer classes. They could show that this lack of ambition is one of the main reasons why inducements in the way of increased pay for good and regular work held out by employers were availed of — when at all — in order that participators might have a few more days of idleness in the period subsequent to receipt of the increased pay.

18. The average Punjabee coolie is a very intelligent man and would make an excellent Mill hand, if he could be persuaded to be regular in attendance and attentive to his work. But boys and youths who show great promise rarely advance beyond a certain limited point, owing mainly to irregularity in attendance, inattention to details and general carelessness. So far at any rate as the Punjabee is concerned I believe that the necessary intelligence and skillfulness are not wanting, and that it is due to other causes that there has been difficulty in developing the inherent ability of the worker. I am also convinced that the remedy for this inferiority is not to be found in a simple increase of pay. The employer should rather, as some have done, turn his attention to improving wherever possible the condition under which his workers live. The erection of model villages is certainly one means to this end, and anything which will increase the standard of living and comfort should be done where at all possible. But unless concurrent with employers' efforts there is an improvement in other directions, particularly where social or caste customs encourage improvidence, the Indian workman cannot rise much above his present low level. And it would be folly not to recognise this deplorable truth.

Improvement of
standard of living.

19. The monotony of factory life, even though much better paid than agricultural work, is said to be one of the chief reasons for the preference some workers have for field operations whenever these are possible, though I have frequently found that the hold Zamindars have over the lower classes and the fear the latter have of ill-treatment or of being turned out of the village is a still greater factor in reducing the attendance during harvesting periods. But whatever the cause may be the difficulty exists, and in order to aid industrial concerns to be established on modern lines Government might well consider the propriety of assisting employers to establish better housing and living conditions for their workers.

20. The conclusion I arrive at is that it is very largely outside the factory that influences must work to improve the efficiency of workers. I do not think that under present circumstances there would be anything gained by the establishment of night schools and from my own experience I know it is difficult to persuade half-time workers to attend school during any of the hours they are free. The prevailing procedure appears to be for the boys to be engaged in household duties of one kind or other or sent into the fields to tend cattle when they are not working in the Mills. Nor do I believe that the time is ripe for the general establishment of technical or industrial schools.

21. I do not consider that it would be a correct use of public funds to give financial assistance to employé of private firms in order to enable them to study conditions and methods in other countries, but Government should aid such persons in getting on the track of the information sought for, by providing them with letters of introduction to British or Government of India representatives in the countries visited and by using the influence of Government as far as possible to smooth the way for their enquiry.

Study abroad.

22. I am of opinion that it would be of advantage to have Government activities in connection with the development of the industries of the country under the control of an Imperial Department, with branches in each Province, but I can offer no suggestions as to the way in which the relations between such a Department, its Provincial officers and the Provincial Government should be adjusted. The work which has been done by

Imperial Board of
Industries.

the Munitions Board should prove of great value in this connection and enable it to be affirmed authoritatively whether or not it would be practicable to form an Imperial Industries Department under a single head.

23. Briefly stated, the chief functions of an Imperial Industries Department should be to make a complete study of the industrial requirements of the country and be able through the experts it ought to have at its disposal to examine thoroughly the prospects of success of any projected enterprise for which Government advice or support had been asked. It would also initiate schemes where there seemed a prospect of commercial success which would be of utility to the country. It would control all Government expenditure on industrial work, grants for which should be made from the Imperial Exchequer. It should be sufficiently well staffed with commercial and technical experts as to enable it to undertake special or general surveys of industrial problems. Its chief officers should be recruited from the ranks of business men of proved organising ability, thus enabling it to keep fresh and abreast of up-to-date methods and ideas in the industrial world. It would through its Provincial officers be in close touch with all sides of the industrial life of the country and by comparing results of one Province with those achieved in another be able to see clearly where pitfalls lay and where it was possible to assist further in building up the industries of the country.

24. I do not think that such a Department should be permitted, certainly not at this stage, to embark on any schemes which would require the expenditure of large sums of public money, such as financial assistance to private firms, starting new businesses or the establishment of pioneer factories or the taking over of existing factories would entail. Its work should be mainly educative—and actively so. If thoroughly done the result should be a greater awakening to the possibilities which lie before the country industrially, and a clearer realization of the difficulties which exist—many of which as I have said no amount of mere Government assistance can remove. The responsibility for the successful development of a country's industries depends in the main on the people themselves and this truism needs to be strongly emphasized. All that the State can be expected to do would be to make knowledge easily available so as to help people to help themselves. In no uncertain way should the Government turn aside from the delusions of spoon-feeding businesses and from the perils of State-owned enterprises. In any country these methods would prove a snare and in India most certainly so.

25. Such a Department as I have suggested would be in a particularly strong position and one which would better enable practical views to be taken if to it were entrusted the purchase of all stores required by Government and the responsibility for economies in this connection.

Railway traffic and freights.

26. There should be a greater speeding up of goods traffic. It ought not normally to take three or four weeks for a bale of goods to reach the Punjab from Bombay or Calcutta or to arrive at stations in Bombay or Bengal Presidencies from the Punjab. Relays of bullocks travelling at the usual rate of a bullock cart could very easily deliver goods more promptly than is achieved. I am speaking not of what occurs now in War time but of what was customary in pre-war days. It has not been exceptional for a parcel to take four days to reach Lahore from Dhariwal—a distance of under 70 miles! Not infrequently the opportunity to develop business is lost owing to this cause, and in recent years my Company had to adopt a system of sending a number of bales intended for different firms in various towns in full wagon loads to Calcutta, Bombay and other centres, and through our Agents in these places distributing the bales to their respective destinations. Though freight charges increased the saving in time was very marked, even though on the return journey from the centre a bale had to travel 200 to 300 miles! It should not be impossible to arrange for better organization of traffic so as to facilitate inter-provincial exchange of produce and manufactures. And I am of opinion that this would follow the establishment of large centres to which goods would flow and from which they would emerge again in full wagon loads for their final destination. I advocate the development on a large scale of the plan we have ourselves had to adopt in order to reach our constituents with the least possible delay.

27. It is something akin to working out a Chinese puzzle to arrive at the correct freight chargeable on goods which in order to reach their destination have to travel over several lines, and though greater simplicity in this connection has been arrived at in the last few years, the way in which the classification of goods varies over different administrations still presents a great deal of intricacy which on the surface appears to be quite unnecessary and avoidable. The adoption for purpose of charging freight, of the same classification by all Railways and the establishment of an universal rate for all ordinary goods traffic, based generally on the value of the service rendered, would make I believe for an increase in traffic. And though this matter is one on which expert Railway opinion alone

would be valuable, it seems reasonable to expect that on the whole the greater simplicity would not result in any financial loss.

28. It might be remarked in passing that a staff of trained clerks whose business it is to be familiar with the vagaries to be met with and who know the salient point of the various fly-leaves and pamphlets, has to be kept by large business houses. It is the duty of the same staff to check claims for undercharges presented by the Examining Department of the Railways, but curiously enough it has never to my knowledge happened that their labours were increased by having to test the propriety of accepting refunds of freight paid in excess. It would almost appear as if the Railway staff never erred to the advantage of the Railway administration. In this as in disputes relating to loss of goods in transit the policy of the Railway Administrations is apparently: "Heads I win tails you lose."

29. The export trade of India being of such paramount importance the case for low rates of freight to the chief ports is clear, and a general view of the Goods Tariff shows that the Railway Administrations have not been wholly blind to the interests of industrial concerns. Still the special rates for traffic to ports have been more thorough and of greater assistance in developing this side of India's trade than the concessions granted on traffic to commercial centres have been in assisting industries. Cheaper rates of freight on coal, on raw materials, on imports of Mill stores, and on finished products to the chief centres of distribution are imperatively necessary.

30. In my opinion Jail industries should be confined to those which can be conducted by means of hand-machines and the introduction of power-machinery should be tabooed. I am confident that a case for the use of power-machinery on the grounds of effecting economies would not pass the scrutiny of an Auditing Board. And it would not be difficult to show that prisoners employed on power-driven machines, as ordinarily the latter would be worked in Jails, were receiving preferential treatment for which no very clear case could be made. Jail competition.

31. The products of Jail industries should be utilized by Government Departments, and if as I have already suggested the purchase of stores for Government Departments is taken over by an Imperial Industries Department, then the latter would be the natural agency for receiving and distributing the output from Jails.

ORAL EVIDENCE, 21ST DECEMBER 1917.

Hon'ble Sir R. N. Mookerjee.—Q.—In paragraph 4 you speak of Government having some form of control over the purchase of raw materials and other things. What is that control? Would you have a director or an auditor or what?—A.—It will be necessary probably to have both an auditor and a director.

Sir F. H. Stewart.—Q.—A director with ordinary powers?—A.—Yes, and the Government auditor could put before the Government director particulars of the way in which the business had been worked.

Hon'ble Sir R. N. Mookerjee.—Q.—In paragraph 11, you say that you want a department out here to buy stores. Do you want an Imperial Department abolishing the Secretary of State's man in the India Office?—A.—It would be better to have an Imperial Department.

Q.—And it will have subordinates?—A.—Yes, in the provinces.

Q.—And anything you can't get in India you will have to refer to the Secretary of State?—A.—The Department would do its best to ascertain whether it could get any required article here and if it could not obtain it, it would then see whether there was any chance of developing the industry necessary in order to procure the article, and in the last stage it would obtain it from home, but it would always be on the look-out for getting supplies here.

Q.—In paragraph 14 you speak of the land acquisition policy. What is your idea? Do you want an amendment of the Act? Or do you think that the present Act permits you to buy the land that you want?—A.—The present Land Acquisition Act does not permit of an industrial concern acquiring land.

Q.—Don't you think it would be a little hardship on the proprietors of the land?—A.—That is what I say in the concluding paragraph. I am not prepared with any set-plan as to what can be done to overcome these difficulties. The difficulties exist and in order to develop industries something ought to be possible to remove them.

Q.—In paragraph 18 you speak of the low standard of living and in paragraph 19 you say that Government should help the employers in establishing better housing and living conditions for their workers. Do you mean help in building these model dwelling houses?—A.—Government should be satisfied that the particular concern was of benefit to the community at large and then they might very well aid either by bearing a portion of the cost

of erection of such houses or by acquiring land for such houses, always presuming that the scheme put before them was really for the good of the community as a whole and not simply for the benefit of a particular company.

Q.—But reading your written evidence in the first two or three pages I gathered that you were generally opposed to any Government assistance to foster industry?—A.—The houses would be there and the terms ought to be settled for renting these houses to workers primarily. From the evidence you will find that I am not opposed to Government support of industries provided it is clear that it is in the interests of the community as a whole to grant this support.

Q.—Take for instance your mill here. Supposing Government asks that you should properly house all your workmen, can you say that it is for the benefit of the country or for the benefit of the nation?—A.—I can say that it is for the benefit of the community here.

Q.—Is it not principally for your benefit as you will get better labour and will get better work done by your workmen?—A.—It would at the same time be improving the conditions of housing and the conditions of living and the standard of life of the people.

Q.—Suppose Government help is wanted for a paper mill and it is for the benefit of the province, how can you oppose Government help to that proposal?—A.—I don't quite see that the two things are alike.

Q.—In paragraph 23 you say that the Director should be taken from the ranks of businessmen. Do you think that good businessmen will come out and take such a job?—A.—It ought to be possible, if you give terms attractive enough.

Q.—What pay would you recommend for getting a good businessman to take up that job?—A.—Rs. 2,000 a month.

Q.—Do you think that you will get a good businessman to accept Rs. 2,000? I am speaking of the provincial man?—A.—I think it ought to be possible to obtain a good businessman on that pay to be a provincial assistant to the Imperial Department.

Q.—I come to paragraph 30. You are opposed to using steam for all jail industries?—A.—I am not in favour of steam-power being introduced in jails.

Q.—You say you have no objection if they confine the supply of these things only to Government departments?—A.—No objection.

Q.—Do you not know that steam-power is used for printing work in Lahore Jail? They are printing all these for only Government, and for printing Government forms, etc.?—A.—I didn't have printing work in my mind, but I would still allow my remarks to stand. I don't know sufficient about printing to know exactly what the work is.

Q.—Supposing they have a blanket factory which is to make blankets for all the jail people do you object to that? They don't sell to outsiders, but manufacture for their own requirements?—A.—The objection would certainly be less but still at the same time I am of opinion that the introduction of power in jails would not be altogether justifiable, and I do not think that it would be economical from the point of view of the State.

Q.—It would enable prisoners to be good artisans and skilled workmen and afterwards they (the prisoners) would probably live a good life instead of going back to dacoity or such criminal professions?—A.—If all that was attained it would be of advantage. But I doubt very much whether that would be attained or whether there would be any advantage either to the prisoners or to the State if there was an introduction of power-driven machines in jails.

Sir F. H. Stewart.—Q.—How long have you been in the country?—A.—Thirteen years.

Q.—In the Woollen Mills the whole time?—A.—Yes.

Q.—You were in Cawnpore?—A.—Yes for a short time.

Q.—When did you come here?—A.—In 1905.

Q.—You have trouble in getting labour?—A.—Yes. We have intermittent trouble.

Q.—Do you house your labour yourself?—A.—Not all. We are gradually building houses with a view to housing a majority of them.

Q.—What proportion of the labour do you house now?—A.—About 35 or 40 per cent.

Q.—Is that free or do you charge any rent?—A.—If they put in a full month's attendance no rent is charged. But we charge 8 annas a month per house if they do not. There is only one charge for each quarter.

Q.—Do you provide a bazaar for your labour?—A.—No. We have bazaars that are rented by outside shopkeepers and in addition to that we have a co-operative society

run by mill employees of which I am the President and that acts as a check on the prices of the bazaar men.

Q.—The shops are under your control?—A.—In the sense that we are the landlord of the house that they occupy, otherwise we have no control over them.

Q.—Do you also have a school?—A.—Yes. There is a school. It is an Anglo-Vernacular Middle School run by one of the local mission bodies. The company bears one half of the expenses and the mission the other half.

Q.—Is that a day school?—A.—Yes.

Q.—Is there a night school?—A.—No.

Q.—In your experience would night classes be a success?—A.—I doubt, whether it would be a success here in the present stage. We have over and over gone into the question and tried to arrange a night school but we have never been able to get students.

Q.—In your written statement you think that Government financial aid would rather tend to retard the spirit of self-reliance than help to develop it?—A.—Yes.

Q.—As against that is it not argued that India being still undeveloped from a business point of view the people expect a lead from the Government and if Government come out and help in the first instance that will encourage people gradually to come out of their own account?—A. I think sufficient has been done already in this country in various ways to justify my view that there is no real necessity for that, i.e., financial aid. I doubt very much whether any lead that the Government could give financially would be a factor in developing industry in this country. The tendency then would be the reverse for if you have given a couple of lakhs in a certain district to establish a certain industry and you make it a success, I doubt very much whether somebody else in another district would start a similar industry entirely on his own account because he would say: "Give me also a couple of lakhs for starting this industry," and thus the demands would increase and progress would be just as distant as ever.

Q.—Would you go so far as to say that if Government did do this, the intending Indian investors might possibly say: "We won't put money in private enterprises but we would confine ourselves to one started by Government or initiated by Government?"—A.—There would still be a large number of people who would be willing to place their money in companies established by sound people. I don't think that Government aid to other concerns would prevent them from investing in concerns that they considered good.

Q.—With regard to new enterprises which are going to be started by Government or helped by it you are very keen that all the facts connected with the enterprise should be published in advance. Don't you think it might have the unfortunate effect of discouraging certain people?—A.—Yes, that will have to be guarded against.

Q.—With regard to marketing products you are in favour of industrial exhibitions and travelling exhibitions?—A.—Yes.

Q.—Would you also be in favour of small standing emporia like the one at Cawnpore which you have no doubt seen for the sale of local village products?—A.—I have seen it once or twice. I think an exhibition is likely to create more interest if it is in such places as Delhi, Allahabad or Cawnpore as it would have a more lasting interest if it be at a big place where people might come and see it.

Q.—About your Central Stores Department, do you think that that could be adequately managed and supervised by the Department of Industry which you contemplate? Would they be the right people?—A.—I think it ought to be possible. If the India Stores Department at home are able to obtain the various supplies that are needed here, I think it ought to be possible for a similar department to do it in this country.

Q.—What would that department be? Do you want it to have a separate organisation of its own or do you think that it should be a part of the Department of Industry?—A.—A part of the Department of Industry under their control.

Q.—On the question of land acquisition I am not sure whether your grievances are against the law or against the Government?—A.—I believe that the law, as it stands, is of distinct advantage to the Punjab agriculturists and I don't quite see how the difficulties that I have had during the past few years in acquiring land can be overcome, and at the same time how the interests of the zamindars can be fully protected. The trouble with the law is that the relatives and very distant connections can step in and prevent a sale being put through. You have first of all to get the permission of the local authorities to the sale and having done that, you are worried by the pre-emptors.

Q.—There are clauses by which Government may give exemption from the provision of the Act?—A.—Yes: but there is difficulty in their operation.

Q.—They are not sufficient for your purpose?—A.—No.

Q.—You want further amendments to the Act?—A.—If the present owner of the land was willing to part with the land and the Government was satisfied that the industry would be established and that the land would be used for that industry then there should be no further bar, nobody else should have anything to do with the sale.

Q.—Would you like to put it in this way, that if the Government is satisfied that it is for the public good that this land should be acquired and to that it cannot be acquired without its intervention then Government should intervene and that should give a clear title?—A.—Yes.

Q.—And at present you say Government feel themselves not able to do that under the existing Act?—A.—Yes. Each case is dealt with separately and protracted negotiations have to be carried on. The impression that is created among the pre-emptors is that it is difficult to get the sale put through.

Q.—You say about railway freights and traffic, "It has not been exceptional for a parcel to take four days to reach Lahore from Dhariwal, a distance of under 70 miles." What do you mean by parcel?—A.—Railway parcel.

Q.—You speak of sending your goods down to Calcutta and Bombay?—A.—That is what we had to do in pre-war days very frequently. We have only a seasonal trade for a few months in the year and very frequently we have had bales sent back to us in the early part of the year owing to their not having arrived in proper time to be sold in the winter.

Q.—To what do you attribute that?—A.—To frequent changes at the junctions partly.

Q.—What led you to start this factory here?—A.—I have been told that it was due to the belief that water power would be an asset and that there was easily available a number of weavers and that for these two reasons it would be a suitable place.

Sir R. N. Mookerjee.—Q.—You get water power?—A.—Very intermittent. During a couple of months in the year we have no water power. We also have steam plants and gas plants.

Q.—What notice do you get of the stoppage of water?—A.—That all depends upon what the Irrigation Department are able to give us. They do their best to give us prompt notice. For long closure for annual repair they give us three or four days' notice, but for sudden closures in the middle of the year they have to be guided by the position of the river when in flood.

Q.—Is the steam power sufficient to enable you to manage your mill without electric power?—A.—It is not quite sufficient at the present time.

Q.—You cannot work the whole of your mill without electric power?—A.—No.

Q.—If you had no stoppages you would not require any steam plant or any standby plant? What is the additional cost of having a steam plant?—A.—We have to pay Government for water and we have to keep two sets of prime-movers, and our cost per horse power compares unfavourably with the cost per horse-power in the factories at Cawnpore.

Q.—The water by which you generate electricity goes back into the canal?—A.—We are not allowed to take one drop for any purpose.

Q.—Still the Government charges a high rate for the water?—A.—Yes. They charge Rs. 10,000 per annum for the water we use and they are trying to get a little more for renewal.

Q.—They get full use of the water?—A.—Yes.

Sir F. H. Stewart.—Q.—When was the mill established here?—A.—Twenty-five years ago.

Q.—Before the present company?—A.—Yes.

Q.—Did they have water power?—A.—Yes: free water power. At the time they failed the lease for free water had not expired.

Sir R. N. Mookerjee.—Q.—What is the total cost of the inlet gates that the Government had to put up?—A.—Six months' rent would pay for everything that Government has done. We pay Rs. 10,000 a year and our new lease will be Rs. 2,000 a month.

Sir F. H. Stewart.—Q.—What about labour?—You have criminal tribes?—A.—We have had for some months criminal tribes.

Q.—Do you think that they will eventually be useful to you?—A.—At present the labour is inefficient, but there are amongst the workers some very promising fellows. We always suffer here from the fact that we are in the middle of an agricultural district and we have to fall back upon the villagers and whenever there is ploughing or

some other agricultural work to be done they generally go away, at least some of them, and this means that during that period we have a short supply of labour.

Hon'ble Sir Fazulbhai Currimbhoy.—Q.—Was the mill started here on account of water power only or wool, or on account of the raw product being near or what?—

A.—What I have always understood was that the two main factors with the original projectors were the water power that was available and the labour supply that was available. They also must have known that they were in the middle of a wool district. That would have been another factor.

Sir F. H. Stewart.—Q.—What about the climate here?—Is that suitable for weaving?—A.—It is more favourable than otherwise.

Q.—About the railway rates, the goods classification committee meets every year?—A.—Yes.

Q.—Are you consulted as to what matters should be brought before them?—A.—Yes. We receive intimation through the Upper Indian Chamber and the Punjab Chamber of Commerce.

Q.—Do you find that your representations meet with their attention?—A.—Sometimes.

Q.—The suggestion that has been made to us is that there should be a board which might meet annually or twice a year to go into this question of rates and try to keep them as uniform and equitable as possible, and that it might have commercial men on it. Do you think that would work?—A.—I think it might be tried.

Q.—Do you think that commercial men could be useful on a board dealing with such complicated questions?—A.—I do not think they can make it much more difficult than it is at present. They ought to make it easier.

Q.—This complaint about railway rates is a very general one but it is not usually a very specific one. Can you think of any suggestion you can make which would help us?—A.—I am not sufficiently in touch with the railways, and I would be speaking entirely from my own point of view.

Mr. C. E. Low.—Q.—Referring to railway rates, do you think it is possible to secure uniformity when you have zealous district traffic superintendents all over India proposing all sorts of special rates to increase the traffic on their length?—A.—The difficulty ought to be overcome. We only come in touch with one railway and if we were in a centre like Cawnpore we would have more experience. I have not had experience of anything of that type.

Q.—On the question of power, how often do these closures occur?—A.—It depends entirely upon the water in the river. Last year, for instance, we had them from about the middle of October until about the middle of March, or we had short supplies in the canal. Last year was an exceptional year, and this year we have had about six weeks' closure so far.

Q.—If you could take a fairly typical year and let us have the number of closures it would be of assistance, do you know whether these closures were for distribution of water because some areas were dry or because of repairs?—A.—Both.

Hon'ble Sir R. N. Mookerjee.—Q.—Do they take less money, in that case, than Rs. 10,000?—A.—No.

Mr. C. E. Low.—Q.—What hours does your labour work?—A.—During the pre-war period we worked in winter from 7 A.M. to 5 P.M. with an interval of an hour, and in the summer till 6-30 P.M. The maximum is 11 hours and the minimum 9½ hours with an interval of two hours in the summer and one hour in the winter.

Q.—Do you think that if you increase the hours of labour you will get more output?—A.—No. I am strongly in favour of as far as possible limiting the number of hours.

Q.—Is the man more constant at his work during shorter hours?—A.—It is difficult to say. The inherent laziness is there, and it is difficult to overcome it.

Q.—With reference to your opposition to Government financial aid to industries, does that apply also to "national safety" industries?—A.—No.

Q.—This country is not self-supporting in a large number of requisites such as explosives—and a number of the complicated industries that lead up to them—internal combustion engines and a number of other things which cannot be taken up solely as military propositions. Do you think that Government will be justified in giving grants-in-aid or something of that sort to get these industries started?—A.—Government will be justified in endeavouring to organise them and when necessary Government should have the complete monopoly of the products.

Q.—And be able to switch them on to pure war work?—A.—Yes.

Q.—As regards land acquisition and pre-emption rights, is not the object of the Pre-emption Act, the Land Alienation Act and so on to prevent undesirable people getting hold of agricultural land?—A.—That is the object.

Q.—When this land is to be industrially used that will be no longer agricultural?—A.—No.

Q.—Do you think that for an industry which is *bond fide* it should be possible, apart from whether it is in the public interests or not, to obtain a clear title from a willing seller?—A.—Yes.

Q.—Are the people here anxious to earn more money, or are they anxious to earn only a certain amount of money which suffices for their needs?—A.—The tendency is to work hard for a limited period in order to get a good sum and then to have a few days idleness.

Q.—A man has a figure in his mind that he wants to earn a month and as soon as that figure is reached his desire to earn money is enormously decreased?—A.—Yes.

Q.—Do you attribute that to the low standard of comfort?—A.—I attribute that to the fact that he has a low standard and he does not want any more than a certain amount of money for his needs. His needs are small and when they are satisfied he does not want to earn more.

Q.—Do you consider that education is one of the remedies for that?—A.—It all depends on what education you give.

Q.—In this co-operative society do you take any deposits from them?—A.—We find it is difficult. We have very few who can deposit and they use it more with a view to borrowing than saving.

Q.—On the question of education do any of your half timers go to school?—A.—No. Our factory endeavoured to make them to go to school but were unsuccessful.

Q.—The parents do not allow them to go?—A.—No.

Witness.—In order to encourage our own workers to save we have a bonus scheme for regular workers. We give them two months' pay or six weeks' pay or a month's pay according to their qualifications if they have not been absent for more than the number of days prescribed. We used to pay them in cash, but we found that it encouraged them to stay back and what we have been doing now is that we pay them some amount instead of giving all the cash, and keep the balance in the superannuation fund.

Sir F. H. Stewart.—Q.—Do they approve of that?—A.—No.

Q.—Are they getting superannuation grants?—A.—In some cases we have given a pension to the widow or children of the workers. In the case of a jamadar or cooly working for a number of years we endeavour to help his relatives. We have made monthly recurring grants, instead of giving all the amount straightaway, for a number of years.

Q.—They expect you to provide for your servants?—A.—Yes. Intermittent labour does not always do that.

Mr. C. E. Low.—Q.—Along what lines do you think the problem could be tackled of increasing their desire of earning more money?—A.—I would give them much better housing conditions, better surroundings and shorter working days. I would be in favour of employers assisting their workers to get all the necessities of life at reasonable rates so that the amount of money that the man earns is enough to keep him and his family.

Q.—Do you think that anything in the way of amusements or anything of that sort would help?—A.—Their amusements are very primitive. What we hope to do when we acquire all this land is to have a park for them and an institute for the better educated, and on their rest days or holidays to enable them to have places where they can go and enjoy themselves and all that would tend to make them more settled and desirous of working in the factory.

Q.—Do you think it would be desirable or justifiable for the Government to compel employers to house their labour?—A.—Under the present conditions I do not see how the Government can compel them.

Q.—Is it done in any other country so far as you know?—A.—No. It has not been done anywhere so far as I know.

Hon'ble Sir B. N. Mookerjee.—Q.—You said that Government ought to help in housing the labour. It will be difficult to discriminate between what help should be given to one factory and what help should be given to another factory. Do you think that it would be better if Government made a general rule, and for any factory which wants land, the Government would be prepared to acquire it either at their own cost, or acquire it and lease it or acquire it and recover the purchase money on easy payments in a number of years, and the remaining portion of the work would be done by the proprietors of the

mills?—A.—I would be more in favour of Government granting a lease than giving land outright, so that Government may have the right to step in and take it away.

Q.—A general rule like that would help?—A.—Yes.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Supposing Government acquires land and builds shawls and charges you the rent, it will be a better step?—A.—It will be better from the standpoint of the millowner, but whether it would be to the interests of Government to spend so much money on houses would be another question for if the industry is mismanaged and it fails the houses will fetch nothing. Government should assist the employers who are doing their duty by their workmen to the fullest extent while at the same time protecting the interests of Government.

Hon'ble Sir R. N. Mookerjee.—Q.—Under my scheme the Government will be quite safe. Government acquire the land and give the land and if the industry fails they revoke the lease?—A.—Yes.

Mr. C. E. Low.—Q.—Arising out of Sir R. N. Mookerjee's question, would you make it universally applicable or would you confine it in the first instance to specially difficult areas so as to begin in the worst places?—A.—I think it would be better to have a general rule.

Q.—Don't you think that there would be so much of a rush that it would impose an indefinite budget liability on Government?—A.—Government would be receiving interest on their outlay. It will be a question of ways and means of finding money and I do not think it will be beyond the powers of the Government.

Q.—About the railway-rates, do they charge more favourable rates for taking wool to Karachi or Bombay than they do for bringing it to your mill?—A.—They have special rates to Karachi and Dhariwal and favourable rates to Karachi, but there are number of stations from which wool can be sent at more favourable rates to Karachi than to Dhariwal.

Q.—More favourable rates are given to exporters?—A.—I have worked out the rates just along the lines of your question, and I find that the rates we pay are frequently more than the rates that are paid by the people at Cawnpore or by the exporters on similar traffic.

Q.—Take the converse case. Can an importer of woollen goods from abroad obtain more favourable rates from the port than you can to any port or any corresponding distance?—A.—I cannot say.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q.—Have you got special rates for the Dhariwal mill from the Railway Company?—A.—Special rates for some classes of goods from certain markets to Dhariwal.

Q.—You get wool from Fazilka in good quantities and you are given concessions?—A.—Yes.

Q.—Supposing you send your woollen goods from here to Cawnpore do you have any special rates?—A.—No.

Q.—About financial aid by Government do you know what the Governments of Japan and Germany have done to foster industry?—A.—I have heard that they have done lot.

Q.—Financially they have helped a lot?—A.—I am not acquainted with details of the help.

Q.—As regards land acquisition, supposing the land belongs to a Mussalman and he has given it as *wakf*, under the law how are you going to acquire that land?—A.—I have not come in contact with a case of that kind.

Q.—Supposing the Government is not able to acquire such land surely the Hindus will object to their land being acquired? If the land is held by a Mussalman under *wakf* law it could not be acquired?—A.—I would not be so foolish as to want it to be acquired for me: even if I got it from Government there would be a lot of trouble from the Mussalmans.

Q.—The Mussalmans know that you cannot take it. But supposing you acquire the land of a Hindu it is just the same, if it is governed by the Hindu joint family law?—A.—I am talking about a willing seller.

Q.—You say: "The average Punjabee cooly is a very intelligent man and would make an excellent mill hand." Could he not be a manager if he has good facilities and if he is educated well enough?—A.—Some of them would be. They would make excellent managers.

Q.—Are you employing educated Indians in your factory?—A.—Several.

Q.—As assistants to managers?—A.—As assistants in some departments, and we have some as agents in some districts.

Q.—Have you got any school for your half-timers?—A.—There is a school.

Q.—Is it a municipal school?—A.—The school is run by one of the local missionary bodies and the company built the building for the school and provide half the expenses of running the school. We have endeavoured from time to time to induce our half-timers to attend the school but we have not succeeded.

Q.—Is any industrial class attached to that?—A.—No.

Q.—Don't you think it is essential to make your workmen more efficient?—A.—I do not think that if you had industrial classes it would be possible to get any man to attend them.

Q.—But they have been doing it in the Madras city?—A.—I do not think that they will do much in the Punjab side at any rate in this district.

Q.—Do you think that Government should have industrial schools in big cities?—A.—If any people show that they want to acquire any knowledge at all in order to improve themselves I would certainly give them a chance to improve themselves.

Q.—You say: "Nor do I believe that the time is ripe for the general establishment of technical or industrial school."—A.—For general establishment throughout the country.

Q.—The time is not come?—A.—I do not think the time is ripe for it.

Q.—Do you know anything about the Technical Institute in Bombay, how many students go there and pass through it and go all over the country on higher wages?—A.—I have heard something.

Q.—Still you think that the time has not come?—A.—For the general establishment. But for their establishment at particular places where there are people who will immediately avail themselves of these facilities I would establish them. But I was speaking of general establishment of technical schools all over the country, in every centre in the country. I would say that if there are a number of people at any place, like Bombay, Madras, Calcutta or Cawnpore who are willing to avail themselves of technical or industrial knowledge, that knowledge ought to be placed at their disposal.

Q.—For village industries you do not want village industrial schools for the people?—A.—I do not think they will do anything to advance the interests of the country, but I am speaking with no very intimate knowledge of the cottage industries.

Q.—In paragraph 24 you say: "All that the State can be expected to do would be to make knowledge easily available so as to help people to help themselves. In no uncertain way should the Government turn aside from the delusions of spoon-feeding businesses or from the peril of State-owned enterprises. In any country these methods would prove a snare and in India most certainly so." It has not proved a snare in Japan or Germany?—A.—I do not know. I am not quite sure.

Q.—As regards factory hours, if you fix them at ten hours a day do you think that in the hot weather the workman can work five hours at a stretch without rest?—A. Yes. I think so if he starts early enough, if he starts at 9 A.M. in the morning no, but at sunrise he could.

Q.—Does he not loiter about in the compound?—A.—Yes.—Even if the mill works for two or three hours only you would not get the whole lot of them to work steadily.

Hon'ble Sir R. N. Mookerjee.—Q.—At what time do you begin your work?—A.—Just at present we are working long hours. In the pre-war period in the winter we opened a little after sunrise and closed at sunset, and it would average between 9½ hours in the winter and 11 hours in the summer.

Q.—You are working with an oil engine when you do not get water power?—A.—With gas engine and steam engine and we have an oil engine for electric light.

Q.—You get coal from Bengal?—A.—Yes.

Sir F. H. Stewart.—Q.—It has been put to us that if Government granted certificates of quality it might help some of these weavers, of pashmina cloth for instance. Do you think it is a practical solution?—A.—I do not think so.

Q.—It is said that they used to suffer greatly in pre-war days from cheap shoddy German goods, and that this might help them to keep the trade they have secured?—A.—The difficulty would be to ensure that each article which is put on the market with a certificate of quality attached has been examined and found correct by the authority signing the certificate. There would be opportunities for fraud. I do not think that I would be attracted by a certificate. I do not think that if you go into the market and show the certificate of quality it will be of great benefit.

CALCUTTA.

WITNESS No. 389.

MR. F. J. EDS, A.M.I.C.E., M.I.M.E., *Civil Engineer, Silchar, Cachar, nominated by the Cachar Branch of the Indian Tea Association.*

WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

Q. 1. Have had no great difficulty in financing the various businesses with which I Capital. have been connected—tea estates, saw mills, workshops, etc.

I don't think there are any difficulties to remove, where the concerns are sound.

Q. 2. Industrial enterprises are usually started by one or more capitalists, either as a private Co-operative, or a limited liability Co. when more capital is required. Debentures or Preference shares are issued, or more shareholders are admitted, and in large concerns the financial arrangements are handed over to some expert firm of Financial Agents, either in England or in India, there are many firms who specialize in this.

Q. 5. I am not a believer in Government aid in these districts except in what might be Government assist- called their own department, i.e., railways, agriculture, forestry, and all works connected with the country, and its improvements generally.

Q. 5. (1) I don't approve of this except in very special cases. I do not consider it fair to tax a prosperous industry in order to bolster up a bad one, let the lame ducks go.

There may be special cases due to floods, storms, or famine, when this might be sound, it is not to be encouraged.

(2) Same as above.

(3) This is alright for work developing communications, or the good of the public, generally as against individual help.

(4) Not advisable.

(5) Sound enough in exceptional cases of new industries, but very risky.

(6) No.

(7) If for the public benefit, yes.

Q. 6. In all.

Control by experts of all cash expenditure, and general management, as is done on Tea Gardens by expert Visiting Agents, and Accountants.

Q. 7. This class of work should be left severely alone by Government, except in Pioneer factories very special cases connected with improving Agriculture, etc.

Q. 8. As far as practicable on the Co-operative principle Government supplying machinery, etc.; those helped must either share in loss or their village Panchayats must guarantee Government against loss; the business should be handed over, as soon as those who are taking over can reimburse Government original capital plus interest. Pioneer factories should be closed as soon as the experts are satisfied that they are not sound.

You can only run successful industries with experts, otherwise you lay yourself open to severe criticism.

Successful pioneering experiments should only be made into permanent Government enterprises when there is no means of getting other shareholders to carry on.

Q. 9. I don't know any sound concerns that are hampered by the conditions under which Financing agencies they are financed.

Q. 10. No occasion for more assistance.

Q. 11. I have known many private concerns developed by the co-operation of three or Co-operation. four individuals, frequently eventually turned into a company. Co-operative Societies should be worked by a head, controlled by a committee, for the benefit of those who are co-operating.

Q. 12. Co-operative Societies should be encouraged for the industries which develop the natural resources of the country, and which without Government aid would not be developed at all. Such industries, as the irrigation of the land in the cold weather, all along the banks of the bigger streams, and rivers, by means of pumps and small oil engines by which better or more crops could be grown, and very luxurious grass could be produced, and very much better cattle developed; a very great desideratum for this part of the world.

Q. 13. This depends on your experts and many different local conditions. Government should never compete with private enterprise, unless it is for public good. Limits of Govern-
ment assistance.

Q. 14. Government should not run, or aid a new enterprise which is likely to interfere with the expensively imported and trained labour of an existing enterprise.

Technical aid to Industries.

Q. 15. I have met many scientific officers, who were paid entirely, or partially, by funds Technical aid in supplied by Government. The officers of the Indian Museum, the Agricultural, and Forest general.

officers, Public Works officers, and the officers of the Tea Association, also the Geological Department.

Q. 16. Improvement on tea estates in the way of manuring, removing pests, etc., blights and many other ways, *vide* Dr. Watt, Dr. Mann, Dr. Wood Mason, and others. Private firms and companies besides availing themselves of the officers of the Indian Tea Association to whose salaries they contribute, frequently call in consulting private experts, some companies employ their wholotime experts, and at times avail themselves of Government experts.

Q. 17. They should always contribute a fixed fee, on business lines except in very special cases. In no case should Government paid experts be allowed to compete freely with private experts; this is sometimes done, advice being given without any charge being made, except for out-of-pocket expenses.

Q. 18. No business allows its private affairs to be published. If the results are to be published, it must be with the sanction in writing of the parties concerned. No private expert would ever get employment, if it was found that he divulged the secrets of his employers' business.

Q. 19. No.

Q. 20. No.

Research abroad.

Q. 21. I used to be one of the original subscribers. I stopped subscribing, as I had no use for this Institution, and neither the time nor inclination to wade through its publications.

Research.

Q. 22. All research should "as far as climate, etc., permit" be carried out in India, and as near the spot as possible.

Researches to be conducted in England: this is for each special expert in his own department to decide.

It is impossible to say definitely until the question arises.

It would be useless to experiment on the manufacture of tea in England, when it had to be produced in India.

Q. 23. Cannot do it without great Indian experience, except on the question of what and how the market requires the finished product: this is generally done to sample.

Q. 24. The Scientific Department and existing Government officers have frequently been very useful.

Surveys for industrial purposes.

Q. 25. Very much so.

Q. 26. On business lines by business men who are dependent on results for their livelihood.

The development for the benefit of the people of the materials and resources of nature.

Q. 27. By publication in pamphlet form with good illustrations.

Assistance in marketing products.

Commercial Museums.

Q. 28. Interesting; I don't think any business man would look for what he wanted in the Museum.

Q. 29. They should be central in big towns, and each department run by a practical business man, who has been earning his living by that particular trade or industry.

Sales Agencies.

Q. 30. I have no experience of sales agencies.

Industrial Exhibitions.

Q. 31. Industrial exhibitions are of very little practical value, unless on a large and comprehensive scale, with working demonstration exhibits.

Q. 32. Government should hold them occasionally, but they must have a business man to run them; it is of no use letting a Municipal Commissioner, who has been trained as a lawyer, or doctor, run an industrial exhibition; run it with experts, advertise it with an expert, make it widely known, at least two years beforehand, and run each special department by its own specialists and give special prizes for good exhibits, not for freaks.

Q. 33. Exhibitions should be instructive, and useful to the particular part of the world in which they are held, if they are so, the buyers and sellers will both turn up freely. They should not be run as dime or freak shows.

Trade representatives.

Q. 34. People in trade prefer as a rule to have their own representatives and most of them do. I don't think Government should interfere in these matters, trades associations, and Chambers of Commerce usually fulfil these functions.

Government patronage.

Q. 37. Only 5 per cent. of the imports are by Government, they should call for tenders in the press at intervals, and deal with reliable, and reputed firms.

Banking facilities.

Q. 39. Marketing indigenous products is done by Agents or middle men. The present system works quite well.

Other forms of Government aid to Industries.

Land policy.

Q. 41. The bulk of Cachar is in forest reserve, and is not given out to cultivators.

There are half a million acres of reserve in this District, among this land there are many thousand acres of Bhils, which will never grow good timber; these should be thrown open to cultivation.

Q. 42. Any new industry should have special concessions.

Training of labour and supervision.

Q. 44. During the thirty-six years that I have been in India I have professionally visited General many hundreds of the tea factories, fibre factories, oil mills, saw mills, etc.

I think more has been done in the tea industry than in any other that I am acquainted with.

I look upon every factory which is properly run as the best type of technical school which you could possibly have.

They have been an enormous advantage to the province, and the men themselves.

In most well-run factories there are one or two Europe-trained and fully qualified engineers, who are training Indians, to be expert mechanics, carpenters, blacksmiths, tinmiths, etc. I have myself and with the aid of my staff assisted to train many hundreds of Indian artisans. In many factories you will find men who came to tea as ordinary coolies, five or six years before, now in charge of machinery worth over half a lac of rupees, all the training having been received on the garden; many of these men learn how to read and write, and work to plan and scale.

Not only is the factory a technical school, but the life, routine, and work on the garden is an education in itself, both for the Indian and the young European fresh from home.

They learn what cultivation and tith mean, the reasons for, and the best way to carry out various systems of manuring, draining, etc.

Many of them learn how to grow European vegetables and fruit trees.

These men when time expired take up land in the villages, and the more intelligent of them become very rich, and prosperous farmers. The value of cattle owned by time expired coolies runs into crores of rupees, the sugar cane mills owned by time expired coolies in the Surma Valley alone, are worth over four lacs of rupees.

When I came to India there were practically no iron sugarcane mills in the District, many estates had no machinery at all, there were no oil engines or electric light, plant, or water power plants, no oil mills, etc.

In all the industries I have been connected with, in Assam, Bengal, the Dooars, Chittagong, and Cachar, all the Europeans are constantly training thousands of Indians, and a very good training it is too. This is all being done without costing Government a single penny. I know of cases of ignorant Indian boys starting on four or five rupees a month twenty years ago, now drawing up to fifty rupees a month, as a Cha Mistri Sirdar. I am positive that many people do not know what European Capital and the Tea Industry have done for the Indian, the Tea Industry is now the most prosperous in India, and it only wants to be left alone internally. Externally it wants a great deal.

Q. 45. I think this is in very good hands and should not be interfered with.

Q. 46. Thirty-six years in India and ten years at home. The firm I manage train all their own workpeople, in their own way, and have trained hundreds, many of whom are now earning very good wages.

You cannot beat the apprenticeship system, but help the smarter lads to get as much technical, or as it would be better to call it, scientific, training as possible. When you have to earn your living, by what you make in competition with others in the open market, you realise the advantage of practical manual training. I would make every boy go through some course of manual training before he takes his scientific course, it will harden him up, and make a man of him; we put our apprentices to start with at the smithy. I was at school for some years in England, then went to Germany, and took the first portion of my scientific manual training there, and then continued in shops, and technical or scientific colleges, and night schools in England. An Engineer's education is never finished, and the more he learns the more ignorant he finds he is.

Q. 47. Men from Indian industrial schools are so far of no use to us in our business.

Q. 48. The two systems should be developed according to circumstances, and the nature of the business; we prefer to train our own local men.

Boys to join crafts should go to schools from 6 to 12 years of age, and then be apprenticed. It is a mistake to put them through the technical college first, if they are to be craftsmen.

We take on lads from 12 years old, put them on to forge and light hammer first, to harden them up, and make them physically fit; men of this class do not require higher education; it spoils them, they pick up quite a lot of useful education "not book learning" of their own, whilst learning the manual work.

Q. 49. Let the boys go wholtime to a primary school until they are twelve, and then come into the shops, when the first process is to harden them up. We give apprentices liberal wages starting at six or eight rupees a month, according to the physique, and advance their

wages by a rupee a year, to diligent youths, with free house and medicines. In my opinion the physical training with good feeding is more important than the so-called technical training. In a business where there is much competition, only fit and able men can be employed.

Q. 50. We are of opinion that all firms should run their own industrial school, entirely under their own control. Ten years in a general repair shop, part of the time being spent on erection work, is a first class training to willing and healthy lads.

Training of
superintendents.

Q. 51. Skilled managers are brought out from home by various industries and they train the superintendents, etc. Occasionally ordinary apprentices prove themselves capable of carrying on very important work.

Q. 52. Scholarships might be offered, but I am rather inclined to leave well alone, there is no great demand at present for the higher trained Indian and when there is the man will be there. The best training is obtained on the actual work itself, not in an industrial school making models and toys.

Mechanical
engineers.

Q. 53. There is no law requiring qualifications at present except for engineers on vessels, railways, etc., where there is a chance of the public losing their lives. I suggest that Government encourage all drivers in charge of factories to become efficient and obtain certificates, it must come.

General official administration and organization.

Q. 56. Should be left to the Agricultural and Forest Department, with specialists, practical commercial experts, and trained men.

Q. 57 to 62. I think these would be more in the line of a Government official than in mine.

Organization of Technical and Scientific Departments of Government.

Technical
Department.

Q. 63. With the exception of the Indian Tea Association's "assisted scientific department," and the Forest, and Agricultural Departments with a few very poor survey schools, there is none.

I think this should be left severely alone by Government except Forests and Agriculture. The Forest Department as such is hopeless. One European is in charge of half a million acres; it takes him all his time to check the collection of forest dues. There is no forestry in the Surma Valley, and very little in Assam. If the whole of the revenue for the next thirty years were devoted to forestry some good might be done. All trees of any value have been extracted, within a reasonable distance of the rivers. Why is it that we have to import timber from Burma and Australia? There must be something radically wrong.

No reasonable person would object to such a huge area being in forest reserve *provided* some practical work were done. The better trees in this district spread very slowly, and it is up to the department to take active steps to plant them. They have far too much land in Forest Reserve; if they planted out 1,000 acres a year, it would take them five hundred years to have any show at all.

The only trees which propagate freely are those whose seeds are carried by the wind, or birds, and other animals. I refer to trees such as the simal, acacias, bignonias, and the commoner figs. There are only about six different trees indigenous in this district which are worth planting.

Imperial Depart-
ments.

Q. 64. I think as far as this district is concerned Government had better leave industrialism alone, except in the case of agriculture on a small scale and forestry. The Forest Department is quite capable of absorbing all the Government spare money, and attention, for the next thirty years.

Provincial Depart-
ments.

Q. 68. Communications, sanitation, forestry, agriculture. The elimination of malaria is the most important aid that can be given to industries in this province.

Q. 76. By teaching common sense.

Study of Foreign
methods.

Q. 77. It is useless their doing this unless, when they come out here, Government are prepared to spend money on what they advise.

Reference libraries.

Q. 78. None. Have purchased my own.

Q. 79. A waste of good money, in this district; alright in big towns.

Colleges of
Commerce.

Q. 80. No. There are plenty of very good ones already.

Government organization for the collection and distribution of Commercial Intelligence.

Statistics.

Q. 82. No, have no use for his statistics.

Industrial and
Trade Journals.

Q. 84. I have never seen the "Indian Trade Journal."

Q. 85. Better left alone; those interested are much better at it. There are too many already; they mostly go into the waste paper basket, or to the bazaar to wrap up sweets.

Other publications.

Q. 87. Special monographs are at times useful, but from the point of view of the practical man they are too crude, and don't go far enough as regards industries, etc.

Q. 88. Successful people in trade don't want any interference in their business, but would like better, cheaper and more reliable means of communication.

Other forms of Government action and organization.

Q. 89. Certificates should be given for all comestibles such as ghee, milk, oils, meat, fish, etc., compulsory for ghee and milk. Certificates of quality.

Q. 90. The Local Board or Municipal Sanitary Department should grant such certificates.

Q. 91. Penalties should be imposed for the adulteration of tea and tea waste

Prevention of adulteration.
Registration of partnership.

Q. 92. Yes.

Q. 97. At times, all communications are interrupted except by country boat. The railway to Assam has been a great loss. Timber was being imported from Assam. Roads, Waterways, and Railways all require improving. Many of the roads are below flood level, have insufficient waterways and are breached after heavy flood. The railway is closed after every bad flood causing great inconvenience. Waterways have been almost entirely neglected. Lack of transport facilities.

Q. 98. Freights on produce in bulk such as coal, timber, etc., should be reduced.

Q. 100. All our waterways require improvement.

Q. 102. I don't think anything has been done by Government; private firms have carried out minor schemes; for tea garden factories, etc., and have drawn up various projects which have not been carried out. Hydro-electric power surveys.

Q. 104. Corundum in the Kasia Hills.

Essential minerals.

Q. 105. Absolutely hopeless in Cachar, a little better in parts of Assam and Dooars. Ran on the wrong lines. It is simply a revenue-collecting department as it is now. Many saw mills have been closed, principally owing to the Forest Department. My firm ran a saw mill for many years, but lost a lot of money over it. We had to pay Forest dues on bark saw dust, and had wood; this took away all profit, on the cheaper timbers for boxes, which was the bulk of our trade. Forest Department.

Q. 106. Improvement of rivers, streams, and roads.

Q. 107. This should have been undertaken years ago.

It is time the Forest Department practised forestry.

ORAL EVIDENCE, 3RD JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. For how many years have you been in Assam?—A. 37 years.

Q. You do not think that, in a backward province like Assam, Government should foster industries?—A. I would not call Assam backward.

Q. What industries have you got except tea?—A. Petroleum, lime, coal, oil mills, etc.

Q. These are not developed yet?—A. Lime is very much developed.

Q. You do not think that Government should give any assistance to foster industries?—A. I very much think so.

Q. But you say here in answer to question No. 5, "I am not a believer in Government aid in these districts except in what might be called their own department, i.e., railways, agriculture, forestry and all works connected with the country."—A. That is my point. We want aid from Government in their departments. They have various departments. We do not want interference with private enterprise, but we want aid in the way of communications, sanitation, education, forestry, etc.

Q. And all the industries you have named, coal, petroleum, etc., are European concerns, chiefly of European capital?—A. There are some Indian oil mills and there are Indian firms as well as European firms working lime stone and I think there are some Indian firms working coal.

Q. In your note you say, "In all the industries I have been connected with in Assam, Bengal, the Dooars, Chittagong, and Cachar, all the Europeans are constantly training thousands of Indians and a very good training it is too." What sort of training do these thousands of Indians have?—A. In the tea district there are many experts. Many of the larger companies have got their own experts in agriculture, engineering, electricity, and in various other subjects, the men who work under them are trained by them. They get training in agriculture, engineering, electricity and various other subjects.

Q. Do you mean labour training, or training as supervisors or foremen?—A. We generally take them as young as possible.

Q. What class of people?—A. All classes.

Q. Do you mean that you have got a technical college and you take boys who pass the matriculation or some such examination?—A. We give them a very practical training. When they have done ten years in such a way they earn good salaries.

Q. What is that good salary?—A. Rupees 50 or 60 a month, they join on as ordinary apprentices.

Q. These are of the cooly class? You train those coolies who work there?—A. Not only coolies, but people from the *zamars* and *kamar* castes. I do not know what the definition of a cooly is, in India.

Q. They are the artisan class?—A. They commence as coolies or hammernen.

Q. You do not know what the cooly class is in India with your experience of India for more than thirty years?—A. I know what a cooly does, when he comes to a tea garden.

Q. You say you are doing enough for the training of these men but do you give them sufficient training to be qualified mechanical foremen or supervisors?—A. They very soon rise to that.

Q. Can you tell me any man who has been the foreman of a shop?—A. I can tell you of the men who have been foremen of saw mills, and foremen in tea factories. My experience is not connected with towns. I am only speaking now about Assam and the mofussil.

Q. What education do these boys get beside the practical training?—A. A great many are taken from schools, and some of them attend night schools. The apprenticed boys in our firm all get education. We teach them in English, from the beginning and we do not teach them vernacular. They can rise to the posts of draftsmen. Some of them go away, some of our men have gone to Mesopotamia, drawing Rs. 125 a month.

Q. As what?—A. I suppose they must have gone as part of the Public Works Department, as overseer or something like that.

Q. Have you got a regular staff of teachers, and where do the students get their practical training?—A. A great deal of their training is naturally personal training. We employ about 30 *babus*, and before the war we had anything from a couple of hundred to 500 *mistries* and *mates* working on different classes of work. We take our boys as a rule at the age of 12 and we give a good pay to start with.

Q. What good pay?—A. A boy at the age of 12 starts at Rs. 6 a month. He gets free house, free medicines, and he rises by one rupee a year.

Q. In answer to question No. 64 you say, "I think as far as this district is concerned Government had better leave industrialism alone." You do not want Government to do anything there?—A. Not as regards industries, but we want them to do a great deal in other respects.

Q. To construct roads and railways?—A. We want the district to be opened up. We want sanitation, and education.

Q. We are here to enquire about the development of industries and not about sanitation. It is not within our reference?—A. Very well.

Sir F. H. Stewart.—Q. What is the name of your firm?—A. Messrs. Ede Brothers.

Q. How long have you been in Silchar?—A. Since 1880.

Q. With reference to the various forms in which Government aid may be given you do not think that guaranteed dividends are feasible except in the case of works of public benefit. Would you include under those, things like lighting companies and tramways?—A. I do not think we are sufficiently far advanced for lighting companies and tramways.

Q. Road transport and light railways?—A. That is generally done by the railway companies under Government guarantee. Owing to the war that has been stopped. The Government were very keen on that.

Q. You say that the supply of machinery on hire purchase system is sound enough in exceptional cases of new industries but very risky. But would it not help the smaller people very much?—A. Not all industries. First of all, you must have the raw material and unless you have got it in sufficient quantity there is not much use in starting an industry not unless you develop agriculture to produce the raw material.

Q. But in the way of helping agriculture to produce the material?—A. I agree with you there, Sir, that they can do a lot in that direction. There is a lot of land, waste land, which only wants a little help in the way of irrigation plant.

Q. Has the Engineering department under Local Government dealt with that question?—A. No. I have personally made some experiments in the way myself, and found it very successful. We have got a large number of big rivers and if the Government would take up the matter on a big scale it would be very advantageous.

Q. Who do you think on behalf of Government should conduct these experiments now?—A. The Agricultural Department.

Q. Don't you think that it is advisable to have an Industrial Department which would perhaps deal with it?—A. If the Government have the funds and the staff. The trouble with Assam is want of money and staff. Every department is understaffed and every department has not enough capital. What Assam wants is capital.

Q. Has the Agricultural Department got time and men to devote to purposes of this kind?—A. Not at present.

Q. Your remedy would be to staff the Agricultural Department very much more fully?—A. Quite so.

Q. You do not want particularly to see a new Industrial Department?—A. You must have the raw material to work on. We are very poor in most of the minerals and those

that we have are being worked fairly well, and to get the animal or vegetable products we must have better developed agriculture.

Q. And you think that, that can be done by the Agricultural Department, if it is better staffed and there are more men and so on?—A. I think so. I think that we must begin at the beginning, that is, with the raw material. One of our more valuable products is oil seeds, the bye-product of which is used largely for manuring.

Q. With reference to pioneering factories you say, "Pioneer factories should be closed as soon as the experts are satisfied that they are not sound." But unless the experts were satisfied that they were sound surely they should not be opened?—A. You see we have no experts in Assam. We have Mr. McSwiney and Mr. Mackay in charge of the Agricultural Department, but in the agricultural industries there are no experts in Assam. I suppose, I am the only one who has attempted experiments with power irrigation.

Q. But supposing that these pioneer factories are sound would you hand them over to private enterprise as soon as they have proved to be sound?—A. I take it that it is the general policy or practice,—not to interfere with private enterprise.

Q. Are there many co-operative societies in Assam?—A. We are just starting. Not very many as far as I know.

Q. Those that do exist—what are they for? Agriculture?—A. I have really very little to do with it. There has been one started in Cachar which has not been very successful so far.

Q. Do you think that there is scope for them, or that the people of Assam are sufficiently advanced to realise what good they can get from them?—A. I think that a great many people in Assam are very much more advanced than the other parts of India. I think that the percentage of literate people in the older portions of Assam and the Surma Valley and the Khasia Hills is greater than in other parts of India, outside the towns.

Q. With reference to experts you think that Government paid experts should not be allowed to compete freely with private experts, and the results of their work should not be published. Would that be fair? These experts who would only be entertained by Government. If they were entertained at all, in the public interests—should not the results of their work be available for the public?—A. You are referring specially to the tea industry?

Q. No.—A. My remarks, of course, were naturally with respect to the tea industry; as I am supposed to be representing a branch of the tea industry.

Q. With reference to the tea industry you say that it is pretty well organised already?—A. I do not like to say that, there is no room for improvement. It is still in its infancy, and since I have been in the tea districts the output has gone up to 20 maunds an acre, where the gardens have been worked on scientific lines.

Q. The tea industry has its own scientific organization?—A. They have a scientific department which I do not altogether approve of.

Q. In what respects do you think it should be improved?—A. They should have a practical planter at the head of it. They have highly trained scientific men from home. They have no experience of Indian labour and Indian agricultural systems and things of that kind.

Q. But their functions are entirely advisory?—A. Yes. They have no executive functions.

Q. About the Imperial Institute you say that you used to be one of the original subscribers. Were you a subscriber to the publications or to the Institute?—A. To the publications.

Q. You gave them up because you found them no use?—A. I cannot say that I found them of much use.

Q. With reference to the land that you say is available for cultivation, are there any special difficulties in the way of people who wanted to take up that land?—A. Anything that is in the Forest Reserve is absolutely closed and there is no possibility of getting anything out of it. I was connected with a block of land. In the Hattital there was a block of 20,000 acres and it was proposed to deforest it, a portion to be given to Indians and a portion to be developed by some companies. There was quite a number of Indian and other firms interested in this, and they tried hard to get this by saying that the draining of this Bhil was not an easy matter to the Forest Department and that the people who would take it up would lay tram lines through it and the Forest Department would have the use of this tramway to get its timber out, —

Q. Did they have the support of the Local Government?—A. We had a conference and there were on it the Deputy Commissioner, Subdivisional officer, and the various other officers, and half a dozen planters, representing the various Calcutta firms—respectable people,—and the matter was taken up to the Chief Commissioner of Assam and the Forest Department were naturally against giving up any land.

Q. You do not know what the Assam Government's recommendation was in the matter to the Government of India?—A. No.

Q. How long ago was it?—A. About four years ago when Mr. Jackson was the Deputy Commissioner in Silchar.

Q. Have you any definite system of apprenticeship? Have you any articles or indentures?—A. No. We want no more people to come and work with us. It is a privilege for them to come. They start on Rs. 6 a month and rise by one rupee a year. If the boy is a smart boy and older than twelve we start him on Rs. 8 a month. We start them according to their ability.

Q. Where do they come from?—A. We have all sorts of men, Manipuris, Bengalis, etc. We are not very particular what the caste is. We keep a boy if he is suitable and if he is not we send him away. We have no agreement.

Q. I suppose that these boys when they come to you have had no education?—A. Some of them are educated. Some of them have got primary education. We do not worry about that. We give them a certain time every day for education, and we start with the Roman character.

Q. Do they stay with you after apprenticeship?—A. A great many. Some of them have been with us for thirty years. A great number of them get higher pay. Some of them drift to Government service and tea gardens, and we always lose a few every year. The men who have gone away are getting Rs. 40 or 50 a month.

Q. So far as you are concerned and your firm is concerned your system of apprenticeship works very well?—A. Yes.

Q. You do not think that it will be advisable for Government to institute any system of articles of apprenticeship?—A. Not so far as we are concerned. We have had Government apprentices. They are with us for three years. They are taught drawing and they can read and write. The last man that came to us passed his examination, and on completing his examination he was entitled to Rs. 25 worth of tools to carry on his trade. He refused to take the tools and we asked him the reason. He said that he was not going to be a mistry but a draftsman. He would not take on a mistry's work, but was going to be a draftsman. As far as I know he is now a tracer in the Public Works Department.

Q. What sort of pay is he getting?—A. I could not tell you.

Q. With reference to your remarks about the Forest Department can you tell us what the organisation of the Forest Service in Assam is?—A. They have Europeans and Indians some of whom are forest rangers. In Cachar before the war we had one European and four or five rangers.

Q. Have you a Conservator or a Deputy Conservator?—A. Deputy Conservator. The Conservator I think lives in Shillong who is in charge of the whole province. We have one European in charge of half a million acres.

Q. Is there any provision made in the Forest Department in Assam for commercial knowledge? Is there any one there who has got commercial experience, and knowledge?—A. Not that I know of.

Q. Is there any engineer associated with the Forest Department?—A. Not in the Surma Valley. At the present time our district is in charge of an Indian—no doubt, a very competent man, but he is not a commercial man.

Q. Do you think that your criticism would be met to a large extent if commercial and engineering elements were introduced into the Forest Service?—A. The first thing that we want is forestry. I have been thirty-seven years up here and I have to import my timber from Europe and other places. When there was no war on we used a large quantity of timber in our contracting business, building factories, bungalows, etc.

Q. Why did you have to import it from Europe; because it was not available in Assam, or because you could not get it out from the forests here?—A. In Assam proper there is a certain amount of timber and also in the Lushai hills but it is very difficult to get it out and it takes time to season it.

Q. Is it that suitable timber is not found there or is it the difficulty of extraction and transport?—A. The difficulty in Cachar is extraction.

Q. You say that private firms have carried out certain minor schemes regarding hydro-electric power surveys, and have drawn up various projects which have not been carried out. Are there any special instances which you can give? Have you gone into the matter in detail?—A. The Katakhal for one, the Gogra for another, for improvement of navigation and drainage which I believe has been taken up by the Chief Commissioner of Assam and they are going to attempt something on the Borak river.

Q. Has any reference been made to the Local Government by your association for instance on the subject?—A. They have from time to time. The Commissioner and a number of planters visited Gogra river in connection with its improvement. I think something has been sanctioned.

Q. You mention corundum in the Khasi Hills. Is it not being extracted now?—A. I think some firm has a monopoly. For many years we used to buy what the Indians call *korond potthal* in the bazaar for our carpenters for sharpening their tools.

Q. Did it answer your purpose?—A. Yes. They were crude blocks which are set into a piece of wood.

Mr. A. Chatterton.—Q. Have Messrs. Eds Bros. any workshops at Silchar?—A. Yes.

Q. How many men do you employ in normal times?—A. Actually in the workshop anything up to 50. We do a good deal of work both in Assam, Chittagong and Surma Valley. We used to do contracting work, boiler makers' work, etc.

Q. You are mainly connected with the tea industry?—A. Yes. In fibre factories, tea factories, oil factories, etc.

Q. How many apprentices have you in the workshops?—A. At the present time we have got 12 apprentices.

Q. And 50 workmen?—A. I do not think there are 50 workmen just at present. When there is no war we have fifty or more, sometimes over 300.

Q. You undertake what they call millwright's work?—A. General contracting, and civil engineering work.

Q. Most of the contract work would be in the nature of millwright's work?—A. Would you call building bungalows millwright's work?

Q. No, but working machinery for a tea factory?—A. We do a lot of that. We receive a retaining fee from a lot of companies for doing that work.

Q. For the millwright's work specially do you have to employ European fitters, or millwrights or is it done by your *mistries*?—A. We have no Europeans, at present. We have had as many as six men at a time before the war.

Q. These boys whom you train as apprentices—do they become fit to take charge of a millwright's job?—A. Last year I sent one head motorman and five men to put up a motor electric installation in a new factory. I was on that factory for four days; we completed the work and were paid without any comment.

Q. You were there?—A. Yes. I was up there for four days, to see the work started.

Q. You mention in your written statement that a great deal may be done for the irrigation of land in the cold weather all along the banks of the bigger streams, and you say that you have made experiments in that direction?—A. Yes.

Q. What areas are you contemplating the irrigation of in that way?—A. It will run into thousands of acres. You will have to use oil engines and pumps throwing 10,000 gallons an hour.

Q. What size would that be?—A. Four-inch delivery pipe.

Q. Is there anything of this kind being actually done beyond your experiments? Are there any cases of pumping from rivers?—A. Not on this scale. On the various tea gardens they have small pumps.

Q. That is for supplying drinking water. But are any used for irrigation?—A. To irrigate small areas and not big areas as far as I know.

Q. Would you consider it the function of Government to introduce these engines and pumps?—A. Unless you can find somebody else who is enterprising enough to put in capital.

Q. Have you or any other firm or have planters or any one else attempted to do anything in this direction?—A. I do not think beyond ourselves. I made rather a hobby of this sort of thing, in spare time. I am very fond of gardening and that sort of thing and I took up a certain amount of land, planted jute, potatoes, and sugarcane and things like that, and we had several engines and pumps that were doing nothing and I put the pump down near the river and I laid down a pipe and an oil engine, and I have laid pipes all over the place.

Q. What is the area?—A. The actually irrigated area would not be more than two acres. It is only a small experiment.

Q. Would you recommend the supply of engines and pumps on hire purchase system?—A. I would recommend a start in a small way.

Q. Would you recommend it to be continued once it is demonstrated to be useful?—A. Most decidedly. We are just dying for want of something of that kind. I had a talk with our Commissioner, and he was very much in favour of it, and Mr. McKay who is the Deputy Superintendent of Agriculture for Assam came over to see the work that my men were doing in the way of irrigating the lands.

Q. You would strongly advocate that hire purchase system should be introduced for the supply of machinery and plant?—A. Yes.

Q. That is somewhat different from what you state here. You are a strong advocate of apprenticeship system. You have told us what pay you give your apprentices to start with. What is the pay of the workmen in that part of the country? What do these boys earn when they finish their apprenticeship?—A. Some of them are earning Rs. 50 a month.

Q. You mean immediately they finished the apprenticeship.—A. We reckon a boy as an apprentice for ten years.

Q. At the end of ten years?—A. Rs. 15 or 20 a month according to his ability.

Q. If he is a fitter?—A. It depends upon the district, and it depends upon the man's ability. If he is a good hand he will get Rs. 20.

Q. You draw our attention to the deterioration of the rivers of Assam. What is this deterioration generally due to? Are they silted up?—A. All rivers tend to become more crooked and with the less gradient the more shallow they get.

Q. Is it practicable to do anything to counteract it?—A. In the case of some rivers by removing rocks and cutting a few of the bends. It is practicable to do a good deal, but it is a question whether it would be a commercial success, and whether funds are available.

Q. You think that Government do not do enough to maintain the waterways? A. They do nothing.

Q. Do they do nothing because it is not practicable to do anything?—A. I am afraid they have not got funds. Our association has tried several times to assist in blasting some rocks, but it is so little that it is hardly worth notice.

Q. Are these rocks in the deltaic part?—A. Yes. They are mostly laterite. They are not primary rocks, or anything of that sort.

Q. Hon'ble Pandit M. M. Malavika.—You say in reply to question 14 "Government should not run, or aid a new enterprise which is likely to interfere with the expensively imported and trained labour of an existing enterprise." When you want to develop an industry you have to make the production cheap and if you do not want to compete with the expensively imported and trained labour you may not be able to produce things cheap. Will not industry then suffer if the view which you advocate is adopted?—A. I do not take it that way.

Q. Let me give you an illustration. Take paper pulp. The Surma valley is suited for paper pulp industry? Is it not?—A. Yes.

Q. In some other countries, they make a good deal of paper pulp, and if you want to produce paper pulp which would compete with that made there, you will have to make your establishment as little costly as possible. Now, if you have some firms working very expensively and if the Government does not help the new enterprise the result will be that foreign trade will continue to monopolise your market?—A. What I wish to say is that a lot of our industries have, at a great expense, imported and trained a lot of labour, and they do not wish to see other industries being started and taking away the labour on which they have spent a great deal of money. If Government are going to start an enterprise and bring in their own labour and do not interfere with the labour which has cost a lot of money to import and a great deal more to train,—they do not want that to be interfered with, but beyond that we should welcome any new industries which are going to develop the district.

Q. You say, "People in trade prefer as a rule to have their own representatives, and most of them do." Do you think that a trade commissioner in London will help the industries of Assam?—A. I do not think that it would make much difference to the tea industry. We have got our tea association and most of the bigger concerns have their own experts.

Q. You say, "There are half a million acres of Forest reserve in this district; among this land there are many thousands of acres of Bhils which will never grow good timber; these should be thrown open to cultivation." Do you know what stands in the way of these being thrown open to cultivation?—A. The Forest Department.

Q. Nothing else?—A. No.

Q. You think that the matter has not been properly considered by Government?—A. I would not like to say that. I suppose the Forest Department have their own views on it. I am speaking only from the point of view of the Association I am representing.

Q. Has any representation been made to Government on this head?—A. Yes, by the Tea Association.

Q. With what result?—A. None.

Q. Was no reply received?—A. We received a reply in the negative.

Q. How long has this matter been agitated?—A. For some years.

Sir F. H. Stewart.—Q. Did your Association ask it to be thrown open for tea cultivation?—A. Not entirely for tea cultivation, but generally. I may say that there were some hundreds of applications for this land both from the European tea gardens and from native joint stock companies, etc. There were about 20,000 acres of flat and the idea of the Tea Association was to get this land opened up and to give what the Government might decide as the proper percentage to recognised villagers and open that up in a scientific way.

Q. Are you in a position to send us a copy of the application that was made and the answer that you received?—A. I shall have to refer to my Association. It would be better if the Secretary of the Commission addressed a letter to Mr. W. Cooper, Secretary of the Surma Valley Branch of the Tea Association asking for the correspondence on the subject.*

Hon'ble Pandit M. M. Malavika.—Q. Have you a sufficient supply of labour generally for your tea business?—A. As far as we are concerned (Ede Brothers) there is no labour question in India; so long as you treat your labour well, and pay them well you have more labour than you require.

Q. How do you obtain them? Do you obtain them through sirdars or do they come to you voluntarily?—A. A majority have come up voluntarily. If we want a large number of men for any particular work, say, for a drainage contract, I send my man out and he goes to Behar and other places and brings the men and they come down here during the cold weather and we give them medicines and that sort of thing and we get as many men as we want, and we never had any trouble as regards labour.

Q. Do they come for the cold weather only?—A. We do that work in the cold weather.

Q. You house them yourself? Don't you?—A. As a rule they put up their own shelters in the cold weather.

Q. Do they come with their families?—A. No.

Q. So far as you are aware, is that the general practice, or is it special to your firm—this voluntary coming?—A. So far as I know, it is found in the Mangaldai district in Assam, and in East Duars district and in parts of Cachar. In Cachar in the cold weather a very large number of men come up of their own accord and there is no trouble in getting labour provided you let them earn a living wage, and a good man doing drainage work should be able to earn at least one rupee a day.

Q. These are not necessarily for tea plantations but for other purposes?—A. For the draining of tea gardens or any other land. Our work for the last thirty years has been the development of tea gardens and the draining of Bhils.

Q. Have you any experience of the coolies employed in growing tea?—A. Yes.

Q. Do they come voluntarily or have you to employ sirdars to get hold of them?—A. In some gardens they come quite voluntarily.

Q. What would be the percentage of those that come voluntarily?—A. It depends very much on the district. Almost invariably we have a headman who can speak the language and knows what the sahib's methods are. The ordinary cooly cannot know that. The coolies do not come individually but they come in groups.

Q. Is it the headman who persuades them to come?—A. They come up there. We do not know who persuades them to come. The headman turns up at the office and the sahib wants the work to be done.

Q. You do not know who persuades them but they come through the headman?—A. Yes.

Q. Is the Workmen's Breach of Contract Act in force in your district, and are those coolies who refuse to work or who want to run away, taken before the magistrate and punished?—A. I think it has expired. I think the Act—Act XIII I think it is—is very rarely enforced. I am referring to the Surma valley district, and not to Assam.

Q. In your experience this act is not much put into force now?—A. Many gardens have not put it into force at all. A large number of gardens have now paddy land and sugarcane land. A man comes and says, "Give me a bit of land and I shall settle there and I will hoe and pluck tea for you" and there is a mutual arrangement effected between both the parties. There is no compulsion at all. It is just like a happy family. They get medicines.

Q. Then the work in the Surma Valley will not suffer if this Act were done away with altogether?—A. Act XIII?

Q. Yes.—A. They go right up to the end of the district where they can get fish and rice cheap. They are tired of one garden and they gravitate to their own country and they make a little money and go out and buy a bit of land.

Q. Do you mean to say that in the outlying districts the Act is needed?—A. Yes, specially for new companies.

Q. Have you any experience of these outlying districts?—A. I have been all over Assam.

Q. What percentage of men do you think would be required to be dealt with under the Act in order to work there?—A. The percentage of the whole province.

Q. Of the outlying districts?—A. It is more the outlying gardens than the outlying district. In the outlying gardens if you apply it at all you have to give the manager the option of applying it to the whole labour force, and he would naturally apply the Act to a new cooly, but if he is acclimatised and becomes accustomed to the work on a tea garden, you have some difficulty in getting him to go away.

Q. It is only in the earlier stages when he is not acclimatised that he wants to run away?—A. The cooly that comes up to the tea gardens, is often a man who should be in jail. But he comes up to the gardens and he is trained in discipline and he is taught what it is to be honest.

Q. I do not know that you get many of these coolies from men who would be in jail. Many of them are simple villagers who would not be in jail.—A. I am referring to some of the Arkatti coolies.

Q. Their recruitment is prohibited now in Assam?—A. Yes.

Q. I am asking you about those who come under the present Sardari system, those who you think would run away if they were not afraid of the punishment that would be inflicted on them under Act XIII?—A. On certain gardens I quite think so.

Q. You say that every factory is the best type of a technical institute?—A. That is for our district.

Q. I take it that apart from these factories there is no school which would train these craftsmen for their work?—A. There are quite a large number of minor industries that are carried on by Indians.

Q. I am speaking of schools. There are no industrial schools?—A. The schools in our valley are practically all run by Government.

Q. Are they giving any manual training?—A. We must start with a man who is young. An old man you could not do anything with. You must start boys at the age of twelve, and they become the best men.

Q. You say that all firms should run their own industrial schools entirely under the own control?—A. Firms like our own.

Q. Do these firms, generally speaking, have their own industrial schools?—A. I could not tell you. We are about the only firm of this class in Assam. I do not think there are any more running on the lines that we do. The railway workshops and other enterprises which are more or less State-aided have industrial schools.

Q. Do you think that if you had industrial schools run by Government on proper lines that would be of advantage to your industries?—A. What work are you going to give them.

Q. Work for which you train them?—A. When they come to me from the Government school I have to start and train them again. The training that they get in the Government school is not the training that they get in the shop.

Q. You are speaking of the present Government schools but suppose that there was some manual training given to the boys?—A. I do not think that would be any use for practical work. You can learn practical work under practical men who are earning their living by doing that class of work.

Q. You recommend that boys should go to school from the age of six to twelve and after that they should be sent to a factory?—A. Yes.

Q. Instead of being sent to the factory suppose they were sent to a school with a workshop attached to it?—A. These schools or Government workshops make toys and models and there is no use for them. If you want to train them, the higher technical school comes in, and it is a college and not a school. You train them in higher science pure and applied for higher appointments, but the higher appointments are not there in any number at present and what are you going to do for those students?

Q. You suggest the elimination of malaria as one of the most important aids that can be given to industries in the Assam province. Does this apply to the whole of your Surma Valley?—A. I should say usually to the whole of the Surma Valley and Assam. I know it is a great trouble. In the rains for about 2 or 3 months we have 25 per cent. suffering from malaria of some sort although we give them free quinine.

Q. How long does this epidemic last?—A. With many of your caste people it is rather troublesome. You have to be very careful not to upset their caste prejudices and you cannot compel a certain class of men to take quinine, but some of them may volunteer to do it.

Q. How long does this season of malaria last?—A. It varies a great deal with the way a man lives and his surroundings.

Q. Can you give us an idea of the percentage of men you lose by malaria?—A. I suppose we lose at least two per cent. by deaths and 20 per cent. from incompetent work—from malaria and anaemia combined. We have to keep double the number of men that we actually require owing to sickness, etc.

Q. Referring to colleges of commerce, you say in answer to question 80 "No. There are plenty of very good ones already." I am not aware of any college of commerce here. What did you refer to?—A. I do not think that our province is sufficiently advanced for the establishment of a college of commerce.

Q. But when you say that there are plenty of very good ones already what do you refer to? Not to colleges of commerce?—A. Not to our province.

Q. In answer to question No. 105 you say "We had to pay forest dues on bark, saw dust and bad wood." Did you make any representation to Government on this point?—A. We had an association of saw millers and we made a representation to the Forest Department without much effect.

Q. When was that?—A. That must be twenty years ago now.

Q. Since then do you still continue to be charged?—A. We closed our mill because we could not make a profit on it.

Mr. C. E. Low.—Q. Act XIII of 1859 applies to coolies against whom advances are outstanding and who leave their employment?—A. Yes.

Q. Only in respect of coolies against whom advances are outstanding?—A. Yes.

Q. Are there any Assamese engaged in industries in Assam of this type you mention? You are speaking of petroleum and coal. Are there any Assamese doing that, or is it all done by people from outside Assam?—A. I do not know of any Assamese raising petroleum. I cannot be quite certain about coal. There is a small coal mine being worked by an Indian in the Sibasagar district.

Q. Can you tell me what forest dues are paid on saw dust and how much on bark?—A. It depends on the class of wood. I was referring principally to tea box making. You buy a log as it comes from the forest measured by the Forest Department by the girth.

Q. Your statement is a little misleading from my point of view. I am only asking what the Forest Department charge on saw dust and bark. The point is, how much do they charge on them or whether you are charged on the whole tree.—A. They charge one anna a cubic foot on the whole tree.

Q. I thought the recent practice for some years was to charge so much per box.—A. In Assam proper they are doing that now.

Q. Which do you prefer?—A. We have closed down our mill.

Q. Did the Forest Department assign any reason why they refused to relinquish the flat that you are speaking of?—A. The correspondence in the matter did not pass through my hands.

Q. Would you give us the name of the flat for reference?—A. Hattital, Katakhal Forest Reserve.

APPENDIX A.

Dated Jaffrband, the 11th January 1918.

From—W. K. D. Coonen, Esq., Secretary, Surnia Valley Branch, Indian Tea Association.
To—The Secretary, Indian Industrial Commission.

In reply to your letter No. 4468,* dated Gauhati, the 5th instant, asking for particulars in reference to a case in which the Forest Department refused an application for taking up a flat of 20,000 acres for cultivation in the Katakhal Forest Reserve,—I have the honour to forward for the information of your Commission, copies* of some correspondence that had passed between this Branch of the Association and the Government of Assam, on the subject of deforestation of lands suitable for tea cultivation.

I, as representative of the Tea Association, was one of the party that examined this land in company with Mr. Eds and others in 1913, and though I can find no correspondence in this office to show that Government refused to take any part of this area out of reserve, this has not been done, and I have no knowledge of the reasons given by the Forest Department for objecting to it. Applications for portions of this land have, I know, been put in for many years by various tea companies in this district.

WITNESS No. 390.

Hon'ble Babu
R. M. Dass.

HON'BLE BABU R. M. DASS, *Karimganj*.

WRITTEN EVIDENCE

I would prefer to give my views from the top of the ladder rather than its bottom, I mean the machinery which is to guide the action of the State with regard to the industrial development of the country.

Necessity for such an organisation requires no argument. The State cannot afford to neglect the many problems, I would say the increasing number of such problems, that are bound to crop up with the industrial progress of the country. (Labour must be regulated and protected, technical education must be organised and assisted, new industries will require encouragement, cottage industries will have to be organised on modern lines. These are recognised duties of the State.)

I would for this purpose like to have a Board of Development in each province, with a similar Board in the Government of India. The provincial Board should consist of a Chief Officer or Chairman or any other name given to him, who should be a tried man in the principal business of the province. By principal business I would mean something different from agriculture: that branch of industry should be left entirely with the Department of Agriculture. Other members of the Board should be an agricultural expert, a specialist in statistics to guide the collection and dissemination of all statistical information. This is another appointment that I would like to see created at once. He should be a man who will have both a theoretical and a practical training in the handling of statistics with a thorough grounding of the principles of economics. He should receive a course of training under the Director of Statistics of the Government of India. He might be named statistical officer and need not be an expensive I. C. S. The fourth member is to be the Registrar of Co-operative Societies. Here also I am opposed to an Indian Civil Service officer not only in consideration of the cost but also because I think that an Indian who knows the business, has studied it and takes a real interest in it will do it better than anybody else and the public expenditure will be less. The Sanitary Commissioner and the Chief Engineer and the Director of Public Instruction may be co-opted extraordinary members whenever their advice might be required. The constitution of the Board is to be therefore as follows:—

Chairman.

An experienced businessman.

Members.

- (1) Chief Agricultural Expert.
- (2) A Statistical Officer and Secretary.
- (3) The Registrar of Co-operative Societies.

Constitution of the
proposed Board of
Development.

* Not printed.

Extraordinary Members.

- (1) Sanitary Commissioner.
- (2) Chief Engineer.
- (3) Director of Public Instruction.

I would entirely abolish the appointment of the Director of Agriculture and in such provinces where he is also the Director of Land Records, the latter part of his duty may be transferred to the Excise or some other Department.

Registration of joint stock societies should also be placed in their hands.

Government assistance.

As I have said the Board will advise the Government in all matters relating to industries. But in the matter of assistance to industries the principle must be definitely laid down. I will discuss each kind of proposed assistance separately.

(1) Grant-in-aid.

This can only be given where the gain accruing, benefits chiefly the masses, e.g., which on the lines of Japan, would undertake to organise match industry in the country. This, I foresee, can with great success be started in the Khasia Hills, whose beautiful pine forests would give an ample supply of wood for match making, to whose want is ascribed the failure of the first attempts at working match factories in and near Calcutta. Where the masses benefit, Government may give grant-in-aid and not where a few persons or capitalists are trying to add to their wealth, for one of the chief duties of States in modern times is to combat the evil effects of the otherwise beneficial competitive and capitalistic system of industry. The old age pensions, the eight hours working day, labourer's compensation, schemes of insuring against unemployment are only some among the many duties which the State has been forced to undertake under capitalism. In India the special problem of the Government till now is to create a diversity of industries among the masses. Grant given towards any well organised and approved attempts like Mrs. Graham's at Kalimpong, would be a good investment for State. Nothing that helps to mitigate the dreadful scourge of famine can ever come amiss. I would limit grants-in-aid to such schemes only.

Subsidies are demoralising. Bounties may only be useful where it is necessary to export home-products or when the export trade of the country is threatened by bounties of another Government. But so far as practicable such bounties should be financed from funds raised by compulsion from the members of the trade themselves. There is no reason why the public money should be spent for the benefit of a minority unless there are strong grounds for suspecting that any foreign Government or merchants' association is trying to kill the trade of the country by special bounties or subsidies. But a better course would of course be a countervailing import duty. But such duty can only be of use when there is an industry to protect.

(3) Guaranteed dividend.

The principle underlying guaranteed dividend is that such industries, e.g., railways, etc. which benefit all or most classes of people should be organised even under such conditions. But I cannot think of any other one industry which can come under the same category as the railways. Industrial banks may be organised with profit on similar terms.

But Government can do a great service to industries if after careful investigation and study, the Board can authoritatively declare that a certain industry started with such capital, etc., would yield a maximum of such dividend. A declaration from Government would both attract enterprising capitalists and make it much easier to raise capital for a joint stock company for that industry.

(4) Loans.

Loans of money cannot be advised. Government cannot and need not take such risks. This part of the work would be better done by the starting of industrial banks which would profitably advance loans to industries and know how to handle them without risk. Government may of course give loans or keep deposits in such banks, but the State hardly possesses requisite machinery for working such a banking business. On the question of banks I will give my views separately.

(5) Machineries may be lent to the small capitalist on the hire-purchase system, and this would be highly beneficial in cottage industries where the people labour under ignorance and want and fail not only to select the right kind of machine but to find money for buying them. Government might often easily induce the manufacturing firm to sell machines on a hire-purchase system. In case of the larger industries, Government need not deal directly with the industry but negotiate on its behalf with the manufacturing company.

(6) Subscribing shares except in industrial banks is not advisable. Unless the Government undertake to start industrial banks on their own initiative, they may help to found them by agreeing to subscribe a limited number of shares. But a guaranteed dividend would be more economical.

(7) Guaranteed purchase of stores by Government.

This should be done as such encouragement is not only desirable but one which nascent industries cannot do without. Government would not lose. With proper description given, the right kind of thing would be gladly produced, whose profits would give them the opportunity to risk competition with the outsider.

Pioneer factories are sure to set excellent examples for imitation. The Madras Pioneer factories, aluminium and chrome leather factories have definitely proved the future of those businesses. It is a very common experience that when an industry succeeds the timidity of Indian capital will go, so far as that industry is concerned.

Tea has succeeded and money for capitalising tea concerns is being gladly subscribed. Failure adds to the timidity of capital and the effect is enhanced if it happens in the first attempts. People have no patience with pioneers. Their failure scares away more capital than a failure in an established industry like tea. Therefore if the treacherous ground of pioneering be passed over by factories started from public funds, the work of continuing the work becomes easier.

I will confine my attention to Indian concerns alone. They suffer in most cases from being under-capitalised, unlike the American trusts which are over-capitalised. Many industries are known to be in a moribund condition because they have not the capital to provide themselves with up-to-date appliances. Present method of financing industries.

I would suggest that the Board should as well publish from time to time schemes of various businesses obtained from experts in those businesses. The managers of industries might be given the opportunity of having their schemes criticised, for which a small fee may be charged.

All cottage industries require to be organised on the co-operative system. They are required for two purposes, *viz.*, (1) to organize the sale of the products, (2) to organize the purchase and regular supply of machineries and raw material whether through the Government or independently. I would explain my position with reference to the bamboo mat making industry around Karimganj. This seems to be the only auxiliary business of the Namasodras here. Those people fail to gain a good income because first of all they cannot purchase their bamboo as cheaply as they ought to and secondly they cannot bargain on reasonable terms with the wholesale dealers. Being without the means to wait, they are obliged to sell the mats for what they will fetch; and the merchant takes advantage of any difficulty, that the caprices of the seasons might put him to, to lower the rate. The struggle is extremely unequal for the mat maker depends on advances from the merchants for buying his bamboo. If they could be combined into a co-operative society and get their supply of bamboo direct from the forest, they could get them much cheaper. If the Society further undertook to sell their goods and made advances to producers in anticipation of sale, their profits would be much increased. The same arrangements would greatly increase the profits of hand loom weavers and make the business more attractive. In fact these two defects, *viz.*, of procuring raw materials and of marketing products will have to be met to make cottage industries commercially successful. Co-operative Societies.

Newly started industries struggling into existence are badly in need of technical aid and for this—like Japan—intending experts may be sent abroad: researches may also be encouraged. Technical aid.

Technical aid to industries is imperatively required, especially in those unorganized industries which unlike tea, have no scientific department of their own. In established larger industries much may be left to capitalists to arrange and provide for, but there are others specially those struggling into existence which would require to be advised by experts from time to time. In Japan we are told they have solved this difficulty by arranging to send intending experts to foreign countries and helping them with such further assistance as the influence of the State is able to give them in solving their particular problem. In some industries one small thing will mar the whole, one small trade secret that an expert has failed to pick up will practically spoil his whole enterprise. Such problems can sometimes be solved by experts whose advice may be procured by the Government for money. Government experts might be in a position to give them that assistance. Post-graduate and research colleges might sometimes solve some problems, existing experts might, if sent out on a tour of inspection to foreign countries, pick up exactly what was lacking. But in all cases in which technical advice is obtained through the Government or experts appointed by Government or gentlemen sent abroad at the expense of Government the advice so obtained must become a public property and should be published in trade journals and bulletins.

Factories to demonstrate improved and up-to-date methods of manufacture need only be opened when the masses have to be taught to give up their older methods. Demonstration so made will be more effective than the most widely circulated bulletin, the most energetic missionary. The experience of the Agricultural Department is exactly the same. Field demonstration is easily accepted, but lectures and books are generally received with distrust. Teach a village weaver the use and advantage of an improved loom, the rest would easily be induced to follow him. I would only repeat that improved machineries must be supplied on a hire purchase system. Singer sewing machines have been made popular by this system of sale alone. Demonstration factories.

The sale of country-made goods could be greatly increased by the opening of commercial museums at centres of trade. Not only the price of the goods but the place from where they are to be obtained should be noted. Museums and exhibitions.

Exhibitions should be so designed as to serve the purpose of a museum and a demonstration factory. If such exhibitions would sell only articles of home produce, their sale would be increased.

Co-ordinating with the commercial museum, there need be an agency for the sale of those products particularly which have not yet been organised for the purpose of sale. Provision Sales agencies.

should also be made for the sale of other country-made products on a small commission: for unorganised or petty industries no commission need be charged.

Yet another defect from which the cottage and other petty industries suffer is the want of any standard or quality mark. In those industries which can be organised under a wholesale selling society the work of quality mark may be entrusted to that society.

In other cases arrangements may be made at convenient centres for marking the quality of the goods. But difficulty in the matter seems to be great. The temptations of such an office will be very great; therefore, it will require the services of a well paid officer which the cottage industries may not be able to bear. But the Board may fix some basis of ascertaining the quality of the goods, which the producers may be compelled to adhere to in giving marks.

Banking facilities.

It is notorious how Indian concerns are handicapped for want of banking facilities. Many companies that suffer from being under-capitalised might be greatly relieved of their difficulties if they could obtain banking facilities. In Northern Bengal where the Indian companies are financed by banks started by them they can manage their business with a much smaller capital outlay. Therefore they earn higher dividends. Opportunities of banking business exist in all branches of trade and industry. But this is a branch of business in which a thorough grasp of the business, up-to-date information and supreme caution are required. It is a pity that the existing banks have so far helped Indian concerns but little. I will not impute motives. But the state of things has to be looked at with open eyes and remedied. Failure of a bank creates a vicious circle and brings ruin upon a much wider circle than failure in other business will cause. Caution has therefore been forced on all countries by legislative measures. Industrial banks may be started on guaranteed dividend and their working directed in the same way as railways. Banks affect such large and varied interests that such guarantee will not come amiss. For the work of control and direction as well as financial assistance I would suggest the creation of a State Central Bank for the whole of India. If the Central Bank would make advances and give loans on favourable terms I would hope the need for guaranteed dividend may not arise at all.

Training labour.

The dearth of trained labour is remarkable in India. I would suggest a simple method for improving the quality of labour. After an apprentice has received a preliminary practical training he might be given an idea of those principles which he ought to know for an intelligent working of those machines and implements. The present method of theoretical first and practical afterwards, has the fault of attracting the half-hearted who fight shy of practical training. I would prefer to give the practical training in actually working workshops rather than in schools. This can easily be arranged, if it be a condition of all technical advice and assistance from Government that they must give practical training to a limited number of students every year, the number being determined by the size of the workshop. Neither do I find it unreasonable if law would make it compulsory for every factory and workshop to open their doors every year for a fixed number of apprentices to be sent by the Board.

Evidently I would have industrial schools as well for theoretical training. In the higher grades of industrial training I would think a theoretical knowledge would preferably precede practical, but in any case students should, after actual factory training, have the chance of receiving further instruction whenever they find themselves faced with difficulties. In the higher grades as well as the lower, the industrial schools must of necessity, have its own workshop.

The control of the industrial school should preferably be left to the guidance of the Board, the Department of Education being represented in the Board by its Director.

Assistance to managers to study conditions abroad.

This may be given in two ways:—

- (1) they may be sent as stipendiary of the Government, or
- (2) the Government may only undertake to obtain for them such facilities as is possible by the exercise of their influence.

The first kind of assistance will only be given to those industries that are new and those in which there is a widespread want of up-to-date skill and methods. But in all cases, they would be required to publish the results of their enquiries. Public money must bring a public return.

Loan of experts.

Whenever the Government can offer it, experts may be lent to private companies on such terms as to service as the Board might find fit, but the results of all researches by such officers shall be made public and shall be published for general information. That will be the only benefit that the public will obtain in return for such services and help.

Prevention of adulteration.

In certain trades adulteration has assumed such proportion that it must be put down with a strong hand. Ghee, oil and milk are the worst handled. In case of imported goods it is easier to stop misdescription if only the Custom House will insist on admitting no goods that are misdescribed or are adulterated.

Factories may also be similarly regulated. But the petty artisan and vendor are the most difficult to control. A carefully organised department of experts will have to be formed if the work is to be undertaken. But the need is great and pressing. When this is done, the question of insisting on putting standardised marks of quality will be easy to regulate with the same machinery.

If a Department of Statistics, I mean for the careful collection of all accurate and faithful statistics, specially commercial, be established, they must also be entrusted with the above works.

It is notorious that our market rate statistics are collected by agents and compiled by people who have no idea of the importance of the work they do. It is not enough to have a Director of Statistics to handle and explain the stupendous figures. There must be properly guided organised agency for collecting and distributing them. Every student of economics knows how unreliable many of the most important Indian statistics are and how foolish often it is to base one's conclusions on them.

Moreover statistics are seldom made available to general people in a way that may be useful to them. Much useful information is published in a way that to the majority of people interested are as good as not. Statistics will often appear in annual reports a year and a half after they are collected. The chief remedy lies in starting trade journals in each province, summaries and, if possible, translations of all articles being made available in the principal vernaculars of the province. Articles should be paid for and the subscription of the vernacular editions of these journals must be put at a very moderate sum.

To start with I should like to see a monthly journal in each province, with the ultimate aim of turning them to weeklies in course of time.

Where private enterprise would come forward to undertake a trade journal Government might regularly supply them with such information as is necessary and desirable. Government might further commend such papers to the public and offices subordinate to them, schools and colleges. No further help is desirable. Even in this case I would insist on an organ of the Board itself.

Monographs may be popularised by the combined method of publishing them in the vernaculars and demonstrating before the people their practical value. I would like to see the translations free from those absurd compositions which only end in exciting ridicule and contempt and is preserved if at all as a curio.

So far as the interiors are concerned I would like to see a quicker increase in the number of Post and Telegraph offices. All sub-offices should have a telegraph branch as a matter of policy. Every circle which can possibly support a branch postmaster and a peon should get the privilege as a matter of right.

Want of roads is too well-known but a more serious handicap to trade has been the silting up of many waterways. I would mention only one, viz., the old Barak branch in the Barak-Kusiar river—passing through the centre of the Habiganj sub-division of the district, connecting the interiors with the principal neighbouring marts like Balaganj and Bhairab Bazar. This waterway, if dredged and reopened, would not only improve trade but relieve agricultural people of the whole northern half of Habiganj, of the danger of annual inundation. In low-lying tracts below the flood level more useful means of communication are canals not roads; while canals would afford a means of communication for all seasons of the year, a road is useful only in winter. The embankment of a canal would serve the same purpose equally well. I would therefore suggest that Local Boards and Government do declare it their policy to construct canals in suitable localities and to take them up rather than roads as a matter of policy.

Railways have not as yet succeeded in connecting all the principal markets of internal trade. In Sylhet, Balaganj, Ajmirganj and Chhatak are far from any railway line. The proposed feeders will be of some help.

Reduction of railway freights to help nascent industries may often be beneficial. But all such reduction must in each particular case be done with the sanction of the Government. The unholy combination of trusts and railways in United States of America points a moral too dangerous to be forgotten. I would limit this privilege to cottage industries alone, which are labouring under special disadvantages. They would not be able to turn this well meaning concession into a dangerous weapon for strangling rivals out of the business.

But in case of raw materials whose supply has to come from a long distance by rail a special reduction is necessary. It has sometimes been known to happen that Calcutta has preferred to get her supplies of raw material from Europe rather than the Central Provinces.

Railway freight will account for a large rise in the price of Ahmedabad piece-goods in Calcutta and this has therefore been the subject of complaint by Indian merchants. Though it may not be possible to reduce railway freights to the level of marine rates, they may be considerably reduced. In view of the fact that Indian railways are earning high dividends, reduction of freights would fittingly be taken up now. Such reduction would help to keep the increased freight diverted to railways by the abnormal rise in ocean freights.

Yet another point that I venture to submit is the relation that ought to exist between railways and steamer lines with ordinary distributing trades. When railways and steam lines or their managers are interested in business carried through these lines, the result seems to be to foster an artificial monopoly in those branches of business.

Rival concerns fail to secure, very naturally too, cargo boats which means a failure to carry out a contract for supply. I speak from actual cases that I happened to know. I would like to see the law of the land make it illegal for rail and steam lines or their managers to carry on ordinary business and to take away from them the right of discriminating between customers both as regards the rate and the facility of shipment. The lesson of the United States

of America and our own experience in this country ought to make us wiser in our dealings with monopolistic concerns of the type of railways and steam lines.

ORAL EVIDENCE, 3RD JANUARY 1918.

Mr. C. E. Low.—Q. You don't propose to have any people with any knowledge of industries in the Board of Development which you recommend, Mr. Das, I understand. You propose a Board of Industries with a business man as its chairman, whatever that means, and an Agricultural expert, a Statistical officer, the Registrar of Co-operative Societies, the Sanitary Commissioner, the Chief Engineer, and the Director of Public Instruction as members. You have got about 6 officials without any knowledge of industries as far as I can see, and a business man as chairman. Where does your expert knowledge come from?—A. I have proposed an experienced business man.

Q. Will that one man do? Then what is the good of all these men being members?—A. The Agricultural expert will be an expert in industries, the Statistical officer will be an expert in statistics, and the Registrar of Co-operative Societies must be an expert in industries. I have explained my position fully in the written note.

Q. Then in your note, referring to technical aid to industries, you talk about sending intending experts abroad, and you go on to say "existing experts might if sent out on a tour of inspection to foreign countries pick out what was lacking." What do you propose exactly about these experts? Are you going to wait until these experts are trained, or you are going to get other experts first?—A. I mean that this Department will be under this Development Board and this Board will select.

Q. Will they select intending experts or actual experts?—A. They will select whom they prefer to send.

Mr. A. Chatterton.—Q. Have you had any experience of industrial work, or are you a business man?—A. I am proprietor of tea gardens. I have also some experience in industrial work in this way. I started some small mills and small companies here. We started one weaving company at Sulkia by the name of the Calcutta Weaving Company, Limited.

Q. Is this weaving company going on now?—A. No.

Q. How long ago was it started?—A. It was started about 10 years ago.

Q. How did you run this company? Was it a handloom weaving company?—A. No, it was machine loom.

Q. Were they driven by power?—A. Yes.

Q. How many looms were installed?—A. We had 36 looms at that time.

Q. Did you have any subsidiary machinery such as warping machinery?—A. Yes.

Q. How long did the company work?—A. Only for 3 or 4 years at the most.

Q. Why was it wound up?—A. For want of co-operation.

Q. Co-operation with whom?—A. With the public. It was due to want of funds.

Q. You were unable to sell your products?—A. No, Sir. At first the company did very well, but later on when it felt the want of funds it was handed over to some other party and they mismanaged it; they said that they could not go on owing to want of funds.

Q. What became of the machinery and plant eventually?—A. That had been sold in public auction by the court and it was purchased by the owner of the land where it was situated.

Q. What is he doing with it?—A. Perhaps he also sold it away.

Q. Did you manage it in the beginning?—A. No, not at the beginning.

Q. How much money was put into this originally?—A. About Rs50,000.

Q. Was this factory in Calcutta itself?—A. Yes in Sulkia.

Q. You say in your note that you would like to abolish the appointment of Director of Agriculture, and you also say that agriculture should be left entirely with the Department of Agriculture. Are you going to have an Agricultural Department without a Director, or what do you mean?—A. Perhaps I meant agricultural work and industrial work will be in the hands of the Board of Development and form one branch of this rather than a separate Department.

Q. What I should like to know is this. Who is going to look after the Agricultural Department if the appointment of Director is abolished?—A. There will be the Agricultural Expert of the Board to do it.

Q. You don't want reduction in railway freights given to companies, but only to cottage industries?—A. What I mean is that reduction of railway freights will be very beneficial to the nascent cottage industries at present. Of course if Government can, reduction must be done for all concerned.

Q. You refer in your note to an unholy combination between trusts and railways in America; what was this unholy combination, and what result did it produce?—A. I have explained it in the last paragraph "rival concerns fail to secure, very naturally too, cargo boats, etc."

Q. What have cargo boats to do with the unholy combination of trusts and companies in America?—*A.* As for example here if a railway company or a steamer company are allowed to have any separate businesses, they will try to have their work done first. As for instance I know of one gentleman from our side who had to meet with some difficulty.

Hon'ble Sir R. N. Mukerjee.—*Q.* Can you cite any instance of such unholy combination?—*A.* Messrs. Kilburn & Co. for instance. One contractor from our side came here to take some coal; he could not take the terms offered by Messrs. Kilburn & Co. and he arranged terms with some other company, Messrs. N. C. Sircar or some company like that. At that time boats were not available because they could not supply boats without shipping their own coal. After a long period they allowed him a boat.

Q. Messrs. Kilburn & Co. did not allow their boats to a third man because they had their own goods; do you accuse them for that?—*A.* I do.

Hon'ble Pandit M. M. Malaviya.—*Q.* Will you please explain your meaning?—*A.* That was a special case.

Q. But will you please explain why you accuse them?—*A.* I accuse not only them but the whole system. If a carrying company is allowed to do other business like this, it will prefer to first load its own goods.

Hon'ble Sir R. N. Mukerjee.—*Q.* Can you give us any particular details, any correspondence that you had with them, to show that Messrs. Kilburn & Co., as public carriers neglected other goods in preference to their own? Have you had any correspondence with them on the subject?—*A.* Yes, I can.

Q. Will you take a note and write to the Secretary about it sending copies of the correspondence.—*A.* Yes.*

Sir F. H. Stewart.—*Q.* In what respects have you been chiefly interested in industries? Have you managed any industry, or have you only occasionally supplied capital?—*A.* I happened to manage some small home industries which all failed, such as hand spinning, hand weaving and machine knitting.

Q. Did you manage these yourself as a business man?—*A.* Yes, I did; but I cannot say, I managed them as a business man because these were all experimental and all failed for want of co-operation and also for want of labour.

Q. Are you a member of the local Council?—*A.* Yes.

Q. Are you a nominated member or an elected member?—*A.* Formerly I was a nominated member, but this time elected.

Q. Whom do you represent now in the Council?—*A.* I represent the landholders now; formerly as nominated member I was representing the mercantile community.

Q. Were these small industries in which you had been interested situated in Assam?—*A.* Yes, I speak for the Surma Valley.

Q. Do you know anything about the working of Co-operative Societies in Assam?—*A.* Yes, the movement is slowly going on.

Q. Are there many societies?—*A.* No, not many.

Q. What industries are they promoting, weaving or what?—*A.* They are only just trying weaving looms; it is not yet fully successful I believe.

Q. Is there one for this bamboo mat making industry that you refer to?—*A.* No, they are managing their own business themselves.

Q. You say that demonstration is easily accepted: is anything done in Assam in the way of sending round for instance an expert weaver to show the weavers in the villages how to work?—*A.* Yes, I think some two or three students who were sent to Serampore to learn weaving are doing this with the help of one instructor.

Hon'ble Sir R. N. Mukerjee.—*Q.* Were they sent at the expense of Government?—*A.* Some at the expense of Government, and some at private expense.

Sir F. H. Stewart.—*Q.* With reference to this old Barak branch of the Barak-Kusiam river, has that matter been put before the Government?—*A.* Yes.

Q. With what result?—*A.* I do not remember exactly what was the reply given, but I think it was deferred for want of funds.

Q. Was it recently?—*A.* It was I think four years ago.

Q. Has anything been done since?—*A.* No, nothing.

Hon'ble Pandit M. M. Malaviya.—*Q.* You say on the first page of your note that the match industry can be started with great success in the Khasia hills?—*A.* Yes, I believe so.

Q. Have you in your mind the idea of starting a match factory, or do you mean that it should be worked in cottages?—*A.* I prefer cottage industries.

Q. Do you think that cottage made matches would be able to compete with the machine made matches which are now being imported?—*A.* I believe so if the pine wood was allowed to be used. The pine wood is available in Shillong hills.

* Witness subsequently wrote to the effect that no papers on the case were forthcoming.

Q. Do you think that making matches by hand and carrying through all the processes involved in doing so by hand would enable manufacturers to compete with foreign matches?—A. I believe so.

Q. Has this been tried on any scale at any time?—A. Somewhere in Brahmanbaria, I think, they were making matches by hand and they could sell it at less price; these sticks were very much like bamboo sticks or something like that but they could not do it very well.

Q. Do you think they could make boxes also?—A. Yes. Also at Karimganj this was tried by some man who was making these things by hand.

Q. Did he make it on a sufficient scale to enable you to judge whether it would compete with the machine made matches?—A. No. I prefer cottage industries because poor people will be benefited.

Q. You speak of industries in Japan, have you been to Japan?—A. No.

Q. Then you refer to the bamboo mat making industry, this of course is a purely cottage industry, and this can be developed?—A. Yes.

Q. And you want only co-operative societies for procuring raw materials and for marketing the products?—A. Exactly.

Q. Does none such exist at present?—A. None.

Q. Nor is there any society for organising the handloom weaving industry?—A. No, not in proper order. Government is trying to do something in that direction.

Q. Do you think that if there were a few societies which would procure raw material to the weavers and also help them in marketing their produce, the handloom industry will receive a great impetus?—A. Certainly, I do believe it will.

Q. Are people already trained in weaving or will they require to be trained?—A. They were trained, but they require now to be trained.

Q. Was it the practice on your side of the country that even in high families ladies used to weave?—A. Yes.

Q. Is that practice still extant?—A. No.

Q. Is it entirely dead?—A. Entirely dead.

Q. Do you think that there is a reasonable chance of reviving it?—A. I believe so.

Q. Even in high families?—A. Oh, yes.

Mr. A. Chatterton.—Q. Are you talking of spinning or weaving?—A. Both, spinning for high families.

(Mr. A. Chatterton.—They are two different things altogether.)

Hon'ble Pandit M. M. Malaviya.—Q. They used to weave as well as spin in high families in Assam, was it not so?—A. In Assam they still weave as well as spin.

Mr. A. Chatterton.—Q. Do they still weave?—A. Yes, only *cutia*.

Q. In silk?—A. Yes.

Q. But they don't spin silk, do they?—A. They do.

Hon'ble Pandit M. M. Malaviya.—Q. Is there no such thing as a weaving caste in Assam?—A. In Assam proper there is no caste like that I think.

Q. Do Brahmin ladies spin as well as non-Brahmin?—A. Yes, in Assam, but not in the Surma Valley. There is a weaver class in the Surma Valley.

Q. Is there any prejudice against spinning and weaving in the Surma Valley?—A. No, that is gone.

Q. Speaking about banking facilities you say in your note that the existing banks have so far helped Indian concerns but little: have you any personal knowledge on the subject or is that your general impression?—A. That is my general impression.

Q. You say that a State Central Bank should be established for the whole of India, and industrial banks should be started. What do you mean? Do you mean that there should be one industrial bank in every province, or more than one in important industrial centres?—A. More than one at important centres.

Q. You say in the last paragraph of your note "Rival concerns fail to secure, very naturally too, cargo boats which means a failure to carry out a contract for supply. I speak from actual cases that I happened to know. I would like to see the law of the land make it illegal for rail and steam lines or their managers to carry on ordinary business and to take away from them the right of discriminating between customers both as regards the rate and the facility of shipment." Would you take away from them the right of carrying on ordinary business, or what do you mean by it?—A. I mean business other than carrying business. They have still got their own other businesses.

WITNESS No. 391.

HON'BLE BABU RADHA BENOD DAS, Pleader, District Court, Sylhet.

WRITTEN EVIDENCE.

I think I ought to make it clear at the outset that I have no experience in the organisation or carrying on of any industry. But my ideas are those of a layman who has watched with keen interest the industrial development of the country and the industrial policy of the Government.

Capital at present is raised principally from the following two sources :—

Capital.

- (1) The land-owning class and
- (2) The middle-class including the professional classes.

The purely agricultural classes have practically no savings, and when they have, their savings are, as a rule, invested in the purchase of land for extension of agriculture. I think the tea industry of the district of Sylhet has drawn some capital from this source, but it is negligible.

The one difficulty in the raising of capital for industrial purposes arises from the comparative security of investment in land. Instances of industrial failures within recent years are only too many in Bengal. People have little faith in the business enterprise of their own countrymen. They can hardly be held to blame, but, at the same time the maxim is true that "Failures, even costly failures, are the pillars of success." The lack of capital is, indeed, the greatest problem of the Indian industrial situation.

The new sources from which capital can be drawn are (1) Government, (2) the existing sources in far larger proportions than at present, and ultimately (3) British and foreign capital.

But the Government must take the lead by supplying capital to needy industries, on reasonable terms. At a recent meeting of the Assam Legislative Council, I moved a resolution, which was lost, to the following effect :—

That in order to improve the economic condition of the people of this Province, this Council recommends to the Hon'ble the Chief Commissioner that early steps be taken and a scheme be formulated to have an industrial bank established in some suitable place in this Province, with a declared maximum capital divided into shares and with limited liabilities on conditions *inter alia* :—

- (a) That the said bank shall be under Government supervision and control.
- (b) That the Government shall purchase a certain number of shares therein; and
- (c) That the subscribed capital shall be devoted exclusively to—
 - (i) Financing the indigenous industries of the Province.
 - (ii) Establishing a model factory equipped with up-to-date modern scientific appliances for the purpose of manufacturing selected raw materials that are yearly exported from this province to other places for manufacture.

I adhere to the opinion that a bank established on these lines will be able to tap sources of capital hitherto unavailable for industrial purposes. Government may also reserve powers of general supervision over enterprises so financed, e.g., in matter of audit, as also by requiring periodical reports as to the progress of the business. Such supervision may be entrusted in each province to the Department of Industry.

Other forms of Government aid may take the following shapes :—

Other forms of
Government aid.

- (1) Bounties and subsidies.
- (2) Guaranteed dividends for a limited period with subsequent refund to Government of the expenditure incurred in paying dividends at the guaranteed rate.
- (3) Supply of machinery and plant on the hire-purchase system.
- (4) Provision of part of share capital of Companies on the same basis as public subscriptions of capital.
- (5) Guaranteed Government purchase of products for limited but not necessarily short periods.
- (6) Exemption from income and other taxes for limited periods.

In all the above cases, except (5) where the product is not that of a concern otherwise assisted by Government, and also except (6) where the industry in question does not receive any other direct aid from Government, Government aid should be accompanied by Government supervision, and also possibly Government control according to the requirements of each case. But the aim should always be to make the concerns ultimately independent of Government control and supervision.

Pioneering of industries should also have the same ultimate object in view. In industries pioneered by Government, the invariable policy should be to associate Indians with necessary industries.

educational qualifications with the work in order that the concerns may be ultimately made over to independent parties. In Japan, perhaps, more than in any other country, industries initially pioneered by Government are now thriving independently of Government control. There are some possibilities for a sugar factory in Assam, where Government owns a sugarcane farm.

Protection. I have already said that the Government should guarantee the purchase of the products of Indian concerns for a limited period. Government, in my opinion, should observe strict *Sauceshism*, and whenever articles of a tolerably good quality are available in the country, Government should refuse to go in for foreign products.

But perhaps the most necessary form of State aid is the imposition of protective tariffs. The market of India is now in the grip of Germany, the United States and Japan, no less than of England, and without protection India will not be able to compete with these countries. Unfortunately Britishers have no faith in protection. But free-trade is more or less a necessity with England, inasmuch as, for raw materials she depends mostly on foreign countries. India, on the other hand, is a self-contained country, which produces raw materials, and has also her own market. All she needs is the aid of protective tariffs, in order that her own industries may recover her market from the foreigners.

Technical training and research. Technical education in India has so far been of a haphazard character, and without any reference to the actualities of the situation. I have known young men who have gone out to foreign countries for technical education, but who, on their return to India, find no one ready to employ them. The policy should be to start industries and then to send out men to receive the particular form of education necessary to carry on any particular industry. I have, in mind, particularly the case of a young man of Sylhet, who having specialised in some branches of mechanical engineering in America, is now editing a newspaper somewhere in North Bengal. Here comes in the necessity for co-operation between the Departments of Education and Industry.

In the present circumstances of this country as regards facilities for technical and scientific education, there must necessarily be a good deal of dependance upon foreign countries for training and research. But the industrial and education Departments by working in harmonious co-operation, should gradually succeed in providing the most up-to-date facilities for scientific and technical training in this country. I don't know what are the possibilities of Assam as a province for higher scientific training, but in my own district, there are no facilities even for the most rudimentary forms of technical education. Technical schools in each district should be established with particular reference to its own needs and possibilities. The Universities should undertake to give higher technical training.

Training of labour. Labour in India is cheap but inefficient owing to lack of education. Legislation should make primary education free as well as compulsory in the Municipal towns as well as in selected industrial centres, and the scheme of education should be so devised as to give to the men insight into the particular trade or industry in which they may be employed.

Education in schools, besides giving literacy, teaches discipline and gives a tone to the character which makes for general efficiency.

Where, in any industry, technical training of labourers is necessary, the same should be made available to them. There should also be workshops where labourers can be trained as apprentices.

My idea is that every one, from the lowest to the highest, should be trained according to his needs, and for that purpose there should be a net-work of technical schools of the primary, intermediate and higher grades, as well as of workshops, for turning out skilled labourers, overseers, supervisors and engineers of industrial concerns.

Industrial co-operation. The co-operative movement in this country has hitherto confined itself to agriculture. But the needs of co-operation are even greater in the field of industries for the purpose of production as well as of distribution. Co-operative Societies may, when properly developed, finance the smaller and cottage industries just as industrial banks may finance the larger concerns. They will also be able to supply to the members by way of loans, small machinery, which is capital in another shape. These societies can also be turned to very useful purpose as mediums for the sale of the products. They can sell to members as well as to non-members, and thus bring the buyer and the producer into direct contact to the great advantage of both parties.

Cottage industries. In the district of Sylhet, the following cottage industries may be handled with advantage:—

- (1) Wicker-work.
- (2) Handloom-weaving.
- (3) Cutlery.
- (4) Pottery.
- (5) Mat-making.

The weaving industry needs improved looms. The cutlery would be better for small labour-saving machines. All of them suffer from want of capital. Ivory-work was once a thriving industry in Sylhet, but it is now extinct. The industries mentioned above are also in a state of decadence, and unless immediately attended to, will, in all probability, die

out in a few years. At the same time, all they need is encouragement and they can turn out finished articles for the market.

In conclusion, I desire to emphasise the fact that immediate action is necessary on the part of Government for the industrial regeneration of this country. The Indian market having been closed to Germany and Austria-Hungary on account of the war, Japan has been making what has been termed a "peaceful penetration" into our markets. This is just the time for Indian industries to capture the market of the country. The duties of the state in this matter should be conceived in a broader and more liberal spirit than has hitherto been done. Conclusion.

Agriculture is no longer sufficient for the population which is daily increasing. Nor is there anything in the argument that because India is an agricultural country she cannot be also a manufacturing country. The case of the United States of America is a complete answer to such a proposition. But America has not become industrially great without the fostering care of the State. India wants the same paternal aid and care, and it requires no prophet to say that India will in no distant time be a great manufacturing country.

ORAL EVIDENCE, 3RD JANUARY 1918.

In reply to the Hon'ble Sir R. N. Mookerjee, the witness stated that he was a pleader by profession and had no practical experience of industries. The whole of his knowledge had been derived from personal observation and from what he had heard from others.

Sir F. H. Stewart.—Q. You say the "needs of co-operation are even greater in the field of industries, for the purpose of production as well as of distribution."—A. Yes.

Q. Are you referring to Assam, or speaking generally?—A. I am referring to Assam.

Q. Do you know anything of the work of the Co-operative Societies in Assam?—A. There is only a town bank in Sylhet, confined to the town people, the members who have taken shares. I am a shareholder.

Q. It has been suggested in other parts of India that co-operative societies are not likely to do very well for some time, unless some really well educated men from outside take an interest in their management? Is that your opinion?—A. Yes.

Q. Do you interest yourself in the management of the society?—A. I have been asked to be a Director, but have had no time to do so, as I was busily engaged in my own profession. I attend their annual meetings.

Hon'ble Sir R. N. Mookerjee.—Q. Your interest is to lend them money?—A. Yes.

Q. And you want a good dividend?—A. Yes. The Co-operative Society cannot help in financing indigenous industries, because that is confined to members only. I can take a loan, being a member; no outsider can take a loan. That is the difficulty.

Sir F. H. Stewart.—Q. What interest do you receive for the money you put into the society?—A. Generally we get 1-8 per cent; between 1 and 1-8 per cent.

Hon'ble Sir R. N. Mookerjee.—Q. Per month?—A. Per share.

Q. What percentage?—A. 10 to 15 per annum.

Mr. C. E. Low.—Q. In the middle of the first page of your written evidence under the head of 'Capital', you suggest that the subscribed capital should be devoted exclusively to (i) financing the indigenous industries of the Province; (ii) establishing a model factory equipped with up-to-date modern scientific appliances for the purpose of manufacturing selected raw materials that are yearly exported from this province to other places for manufacture. How many different kinds of raw materials do you propose to manufacture?—A. Hides, jute, mustard, rope, timber, raw cotton, coal, limestone, which abound in the Surma Valley.

Q. Would that not be a curious kind of factory?—A. I say anyone of them may be selected. I cite instances. Those are the raw materials; anyone may be selected which is most profitable.

Q. This industrial bank would put its money into financing indigenous industries and into this factory: do you think that is a very safe position for a bank to find itself in?—A. I think so, if properly taken care of and managed.

Q. You think a bank would be safe with its capital out in the financing of industries and in the factory?—A. Yes.

Q. Do you remember what happened in the Punjab?—A. The Punjab bank failures were due to many other causes.

Q. Was that not very largely because they put too much of their money into one industry, namely the cotton industry?—A. It might be so; therefore I want Government supervision and control, so that it can be properly managed. I would have three departments: one giving loans; another becoming managing agents and financing monthly recurring expenditure; and the third financing the conversion of raw materials into finished products.

Q. In your last paragraph you say, "But America has not become industrially great, without the fostering care of the State." What do you allude to there?—A. By fostering care I mean subsidies and bounties. They subsidized various trades and allowed them to compete with foreign markets.

Q. What trades did America subsidize?—A. I cannot cite any particular instances.

Hon'ble Pandit M. M. Maitra.—Q. You have referred to a resolution which you moved at a recent meeting of the Assam Legislative Council. What was the effect of that resolution?—A. It was lost. I pressed for a division and it was lost. All the official and non-official European members voted against it.

Q. When was that?—A. Last October. I have given the date.

Q. Have you got any bank in the capital of Assam, except the branch of the Bank of Bengal?—A. No.

Q. You have no bank except the Bank of Bengal?—A. No, none. I don't know if even the Bank of Bengal has got any branches in Assam. All the tea industries are being financed from Calcutta. They make monthly advances on the hypothecation of crops, and all tea gardens are being managed the same way. The saw mill industry and other industries I know of are also being financed from Calcutta by their Managing Agents, the Allahabad Bank, Finlay Muir & Co., etc.

Q. Are there any Indian banks which do the business of lending money?—A. Simply for the purpose of taking interest, not for financing industries.

Q. Has the co-operative movement made any great progress in your province?—A. Fairly well, but it is confined to members only. That is the difficulty, and it is only for taking loans.

Q. Suppose a bank were started, such as you recommend? Do you think it will have sufficient business to do there?—A. I think so.

Q. What industries would come to it for help?—A. Many that are now in other hands. These would come into the hands of my countrymen. Take the case of light railways, tramways, limestone, which is practically in the hands of Kilburn & Co., tanneries, jute, mustard, timber. Assam has got very big forests, and timber would be a very profitable business, if it was financed in the country under Government help.

Q. Suppose there was an industrial bank started, which could lend some assistance to these industries, do you think there will be people coming forward to invest their money in it?—A. If it is under Government control; otherwise people would have no very great faith in joint-stock concerns.

Witness here gave confidential evidence.

Q. So far as cottage industries are concerned, you think that co-operative credit societies would be sufficient to finance them?—A. Yes, because they require small capital. Banks are wanted only for the big industries.

Babu D. C.
Chuckerbutty.

WITNESS No. 392.

BABU DIJESH CHANDRA CHUCKERBUTTY, M.A., B.L., *Dewan, Gauripur Estate, Assam.*

WRITTEN EVIDENCE.

I.—Financial aid to Industrial Enterprises.

Q. 1.—Yes, in the case of the proposed Sugar Factory in Tinsukia where the Raja was one of the promoters and Srijut L. Barthakur, the manager.

In case of wealthy zemindars, most are unwilling to join industrial movements and amongst those who are induced to do so, there is a marked tendency to keep aloof from joint-stock companies. They seem to favour industrial enterprises without shareholders or only a very limited number. At the same time it is difficult for them to finance industries properly.

Industrial joint-stock concerns have not yet grown popular; here high and low look upon these companies with suspicion. This stands in the way of raising sufficient capital to start industries in a first class style without which competition is impossible.

The only possible way seems to be for the promoters to approach Government for expert advice and when the enterprise is approved of by Government, the company could be either (1) floated under Government control and if the share capital is subscribed, Government may withdraw except for such control as may be found necessary, (2) first started by Government along with the promoters and when it is in working order, it can be converted into a joint-stock company and the financial advance made by Government recouped.

Q. 2.—There are certain successful enterprises, such as tea gardens, railways, etc., where the capital is readily subscribed by all who can spare. But for new enterprises it would be difficult to get capital at all from the public and only those few who have studied industrial concerns and are able to finance might invest.

Q. 2a.—The safest and most natural source would be the public but unless a number of enterprises have been demonstrated to be successful and profitable, these would not inspire confidence and the public would be shy to invest.

Till such time, I think Government would be the only source from which capital could be expected. For financing new enterprises, I think Government could start a bank or create a fund.

Q. 5.—I would prefer (6) and (7).

Q. 6.—I would leave the management to the nominees of shareholders and directors under Government expert supervision with power to interfere for mismanagement.

Q. 8.—In cases where Government is convinced of a new industry being successful here and in other factories where private parties do not come forward, Government should start pioneer industries. If successful, it should be handed over to companies—not to private capitalists. I would not like Government to have permanent Government industries.

Q. 10.—I do not see how private banking agencies could give assistance to a joint-stock company unless it is a very successful concern and the advance is considered perfectly safe. Special Government banks with control over the management could help new enterprises.

Q. 11.—I have heard of weaving industries being developed in this way but have no personal experience. Co-operative Societies.

Q. 12.—I have experience of co-operative credit societies and am convinced that as long as the members forming such a society are not much better educated, it is impossible to expect natural development and improvement. They are being educated now in these methods and there must be educated enthusiastic experts directing the affairs of each such industry till such time as the members actually see that they are making much larger profits under the auspices of the co-operative credit societies, when they would willingly join—even without understanding the principles of co-operation.

All such native industries which are dying out for want of funds and proper marketing, e.g., weaving, fish industry, carpentry, etc.

The object of these co-operative credit societies should be to supply capital, obtain raw materials at the cheapest rates, teach improved methods by experts and sell at best advantage thus doing away with the several middlemen's profits.

Q. 12a.—Trade guilds might be possible only amongst educated commercial people and I do not think that ordinary trades people would appreciate these at all. It is, however, desirable that the advantage and benefits of trade guilds might be demonstrated to specific groups with a view to popularise them. As long as concerted action does not find favour, guilds cannot do much good. It is, however, time to train up trades people, to realise the benefits from guilds. Government should train people to realise the benefits from guild but I could not tell in what way this would be done best.

Q. 14.—I think there should be no limitations on Government aid, even if a new enterprise competes with external trade. I mean that preference should be given to people of the soil, even if Government have to discourage external trade which is at the hands of foreigners.

II.—Technical aid to Industries.

Q. 16.—I have knowledge of benefits given by Government to agriculture.

There is a carpentry class in Tipkai but I have not inspected it and am not able to give any opinion.

Q. 20.—Yes, paper manufacture, pencil and match factory, cabinet, and furniture making. I note only a few industries which can be fed by raw materials locally. Demonstration Factories.

Q. 21.—The journals issued are no doubt interesting but those of them that could be experimented upon in this province should be taken up by Government and suitable people induced to adopt them.

Q. 22.—I can't say specifically but there are subjects on which researches in the United Kingdom are necessary to be able to develop local resources.

Q. 23.—I would not attempt to answer this without fuller information.

Q. 24.—I can't suggest any particular system having no knowledge but an advisory council of research in India would certainly be of great advantage in giving a definite idea of the possibilities in this country.

Q. 25.—Certainly—specially in Assam where mineral resources and forests are abundant, people do not know in what way these could be developed. Industrial surveys.

I know sometime ago, the zamindars in a body approached Government for assisting them in prospecting the mineral resources in the country. There is only a vague idea as to the localities where such minerals are said to exist, but there is no reliable survey. Government could do nothing to assist them and it is neither always practicable for zamindars to have their estates surveyed by experts without great expense.

Assam is full of forests but for want of enterprise, it is found cheaper and easier to get furniture of daily use from Calcutta. Government now supplies timber sawed in sizes and sleepers to the railway but almost all other forest owners still sell their logs in different lengths to Bengal people who tow them on boats. The public do not know what classes of timber there are in forests and never attempt to explore forests with a view to encourage manufacture in furniture locally. A man who wants to have a wooden bedstead has to buy

a *sal* log, have it sawed, engage carpenters and have one made after a month. Enlightened forest owners ought to take that up themselves but when they do not do so I think Government should come forward to show the way.

III.—*Assistance in Marketing Products.*

Commercial
Museums.

Q. 28.—The one in Calcutta is more or less a show to the public. No attempt is made to train people to benefit by these institutions. But educated people who are interested may benefit.

Sales agencies.

Q. 29.—They need not be large, but they ought to be accessible and situated in each province and even in more than one in a province according to requirements and different conditions of localities. There ought to be trained men to explain the exhibits with special reference to their possibilities in the country.

Q. 30.—I think co-operative credit societies should be started under Government supervision to conduct these sales. This will be a practical way of demonstrating to its members the advantages of such institutions.

In case of stray unorganised industries, where such co-operative credit societies cannot be formed, Government agents might collect and sell them at best advantage. This might, however, cost Government more than might be justified.

Exhibitions.

Q. 31.—As they are done now, there is unusual activity amongst people for a few days and the only impressions left in the mind of the ordinary public are products of abnormal and extraordinary growth. The more intelligent classes might profit but then as everything is over in a few days, very little opportunity is afforded to any one unless these exhibitions are followed by practical demonstrations in the interior of villages. If a simple cultivator is induced to make an orchard, or use a new manure or a new crop and is shown that he can make a large profit, much more will have been done by such one example than by issuing leaflets broadcast.

Industrial and agricultural should be separated. The latter with such small industries as might be taken up by people of modest means and education might be added to agricultural exhibitions.

Q. 32.—Yes, but I think large exhibitions in inaccessible places would be more or less a *tamasha*. Small exhibitions in localities from which people might come and attend without difficulty or expenses, followed by demonstrations and practical instructions to the people, seem to me to be the best form. This would apply to agricultural and small industrial exhibitions; big industrial exhibitions should be held in a principal place of the province and educated people invited to attend.

Q. 33.—These exhibitions should aim at showing people what improvements are possible by them to make in the directions of their ordinary pursuits and necessities. The results of intelligent enterprises by their neighbours would be more readily adopted by the people and new ideas about possibilities should be aimed at to be introduced with expert advice and demonstration to induce them to try new experiments.

Q. 36.—Yes, according to the requirements of each province.

Q. 37.—They should be exhibited in commercial museums.

IV.—*Other forms of Government aid to Industries.*

Government
Patronage.

Q. 40.—All I can say that is that raw materials ought to be supplied by Government on very favourable terms and real facility afforded encouraging industries.

I could not give an opinion about conditions.

Land policy.

Q. 41.—Generally Government rules have to be relaxed a little to encourage new enterprises and small industries. I could not say of any specific instances but usually a prayer for any such concession against current rules would not be entertained at all.

Q. 42.—I can't give a definite opinion without further information.

V.—*Training of Labour and Supervision.*

Training of
supervising and
technical staff.

Q. 50.—I should think under the department of industries. I think the Education department should not have any connection with the control of industrial schools—except inspection and suggestions.

Q. 52.—They should be helped by Government to obtain admission in proper places in the United Kingdom and in deserving cases Government may lend money or assist for such instructions.

Mechanical
Engineers.

Q. 54.—I could not say there should however be a uniformity of standards so that Local Governments should recognise each others' certificates.

VI.—*General Official Administration and Organisation.*

Q. 56.—I do not know of any special department.

Q. 57.—Yes, there should be a Board of Industries; I could not formulate a scheme without further inquiries and information.

The Board would be of little use at this stage when industrial movement is not at all popular unless there are funds at their disposal.

Q. 60.—This depends upon the constitution and powers of the Advisory Board. There should be some one to give effect to the advice of the Board and he should be an expert—a practical man.

Q. 62.—I am not for Imperial departments: they would be difficult to reach and such a department would not be able to do justice to the needs of different provinces.

VII.—Organisation of Technical and Scientific Departments of Government.

Q. 63.—I do not know of any special department whose activities are known to the public.

Q. 64.—I am not for any Imperial departments—except for theoretical researches.

Imperial
Departments.

Q. 71.—I would prefer independent units.

Q. 72.—The investigations in each province should deal only with subjects in which they are interested. They can obtain mutual help and assistance but I would rather have them work independently.

Q. 73.—There should be some sort of control and I fail to see what other control can be possible now at this stage. It should be provincial—with some sort of review by the Government of India on proper representation by aggrieved parties.

Q. 74.—As I said before, in theoretical matters there might be an Imperial Institute.

Q. 77.—By introducing them to proper places and giving them study leave.

Q. 80.—Yes, at first in a small way along with the existing colleges. Gradually they can be improved and separately organised under practical commercial people.

Colleges of
Commerce.

Q. 81.—This would make men fit to take up industrial matters and direct their attention towards local resources and possibilities.

VIII.—Government Organisation for the Collection and Distribution of Commercial Intelligence.

Q. 82.—The present system as far as is known to me cannot be correct, as the work is practically done by illiterate and uninterested people on Government orders. Government would have to entertain an expensive staff if this is to be correctly compiled.

Statistics.

Q. 85.—I have no experience but I don't think journals would be of much assistance or help.

Q. 86 & 87.—There is no harm in publishing or helping to publish trade journals, but I don't think they are of much interest to lay men and even if are read, unless these are followed by demonstrations before people who are directly interested, I don't think they would serve any useful purpose.

Trade Journals.

Q. 88.—By Geological surveys, prospecting, etc.

IX.—Other Forms of Government Action and Organisation.

Q. 89—93. I think these would serve, at the present stage, to make industrial activity unpopular. Later on these can be done as found necessary.

Q. 97.—Assam is very poor in communication—specially rail and there are parts of the country which would at once develop if rails were opened. The primitive methods of transport by country boats still obtain here. It is needless to draw attention to this.

Communications.

Q. 99.—Yes, several.

Q. 100.—Yes, the mouths of several feeder rivers are being gradually silted up.

Q. 102.—None that I know of. It strikes one that no advantage is taken in Shillong of the waterfalls: but I do not know enough to tell with authority whether it is possible to turn these powers to account.

Q. 105.—I have nothing to say about Government Forest Department except that Government should not look only to the most profitable way of working their forests at the minimum expense but should explore them and make results known to the public as to possibilities.

Forest Department.

Besides Government forests, Assam is full of forests owned by zemindars. It is regretted that very little enterprise is shown by owners in improving the working of these forests. I should say that Government should help them by experts and show in what ways improvement could be effected and in cases necessary, help in financing projects.

ORAL EVIDENCE, 3RD JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. You are Dewan of the Gauripur State?—A. Yes.

Q. The State does not now interest itself in any industrial work?—A. No.

Q. As Dewan you have no concern with industries?—A. No; as I have stated in answer to the first question, the Raja helped a young boy to get his education in Japan, and when he returned, the Raja wanted to float a joint-stock company for the sugar industry. We had

some correspondence with Government, but the promoters could not satisfy the Government conditions, and the matter was dropped. Of course the promoters say they did not get sufficient encouragement from Government; but certainly I think that even if Government encouraged it, it would have been difficult to get the necessary capital, because I know the Raja had introduced Mr. Barthakur to all his zemindar friends and they had gone all over the province of Bengal to get funds, but did not get sufficient encouragement.

Q. Have you any particulars as to what help you wanted from Government?—A. Only capital. In the first instance we wanted Government to give them agricultural loans, and then to give a lease of some 1,500 acres of land on special cultivation rates. I have got the correspondence with Government with me.

Q. What was the amount of the loan?—A. Only Rs10,000, for starting the cultivation—sugarcane cultivation.

Q. You could not raise any capital for that purpose among yourselves?—A. The Raja had spent some six or seven thousand, and the other promoters about four or five thousand.

Q. You wanted Government to give you a loan of Rs10,000?—A. Yes.

Q. And you thought Rs20,000 would be sufficient to begin with?—A. Yes, only for the cultivation of sugarcane at first. It was intended that sugar cane cultivation would be extended, and then the sugar factory started.

Q. What would you have done with the production of the cane cultivation?—A. After 2 or 3 years it was expected that if there was sufficient sugarcane cultivated, they would manufacture gur and sugar from it.

Mr. C. E. Low.—Q. Did you intend, in the first instance, to crush your cane and make it into gur, and after a time have a sugar factory here?—A. Yes, a sugar factory.

Hon'ble Sir R. N. Mookerjee.—Q. Did they refuse the lease of the land and the loan of money?—A. They refused the loan of money, and said it was not proper to give it under the Act. Then they laid down certain conditions; the first was that all of the Rs 2,20,000 must be subscribed before they recommended the lease to the Government of India, because the Government of Assam held that it could not be classed under special cultivation, although the promoters said that it could. The second condition was that they must submit to the labour rules of the tea industries, and they objected to sub-letting; whereas the promoters' idea was that they should parcel out land to cultivators who could grow sugarcane on their own account and sell to factories; but Government would not allow them to sublet.

Q. The Government contention was that you must first raise Rs. 2,20,000 and then they would recommend Government of India to give the lease on special terms and conditions; and that you would not be allowed to sublet?—A. Yes, and to submit to the labour rules.

Q. Don't you think that was a very reasonable offer of Government? How would Government know that you would not take the lease and do nothing?—A. The difficulty was that no one would subscribe unless they knew that Government had given them the lease of the land.

Q. The Government was willing to do that, provided the company would raise the capital first?—A. Personally I don't blame Government, but such is the state of the country that nobody would subscribe.

Q. What has become of the student?—A. Later on he was taken into Government service in the Agricultural Department. The Raja tried his best, also some of the other promoters who wanted to start the sugar industry. The difficulty was that unless the people saw that the scheme was backed by Government, they would not pay anything. I have got the correspondence with me, and will leave it with you.

I don't think we require it.

Witness.—The promoters had an idea that they had not been treated well by Government.

Q. I don't think any business firm would have that idea. Supposing others asked Government to lease lands, Government must be satisfied that the company would be able to do it. Anyone might write to Government to give them a concession for 1,000 acres of land. They must show that they are in a position to carry out the undertaking?—A. All the most influential men in Assam were connected with it, and they expected that Government would give them special terms and depend upon them. Their idea was that as soon as they could obtain a lease of the land they would at first start cultivation of sugarcane, and then gradually they would convert it into a sugar factory. There was another condition; Government wanted them to have the sugar factory completed in 3 years' time. That was another of the difficulties.

Mr. A. Chatterton.—Q. Have you any experience of the silk industry in Assam?—A. Not much. In the district in which I work, the ordinary people would perhaps rear some silk worms on mulberry plants, and manufacture silk thread, and weave coarse wrappers for themselves.

Q. Do they grow the mulberry as trees or shrubs?—A. Shrubs and trees both; very little, perhaps less than 5 per cent. grow that, and that also for their own use.

Q. They don't sell the products?—A. They are not usually able to weave so much as to sell; perhaps they would manufacture one piece of wrapper in the course of 2 seasons during leisure and use it for their own self.

Q. It is a purely domestic industry?—*A.* Yes. In the other districts it is carried on in a businesslike way. I speak about the district of Goalpara. In those places all that I have seen is that they rear some silk worms and manufacture thread from it, and make their own wrappers.

Q. That is to say, it is the revival of a purely domestic industry?—*A.* Yes, in that part of the country.

Mr. C. E. Low.—*Q.* In reply to question 50 you say you think that technical training should be placed under the Department of Industries, and you think "the Education Department should not have any connection with the control of industrial schools—except inspection and suggestions?"—*A.* Yes.

Q. What are your reasons for making this statement?—*A.* What I mean is that it should be under business men. They should be trained under business men.

Q. Why?—*A.* Because I don't think that the ordinary educational authorities would be suitable men to supervise these institutions efficiently. As educational institutions they can just inspect them to see if everything is being conducted according to rules.

Q. What do you think is the particular difference between industrial and technical education on the one side, and ordinary education on the other, that you prefer to have a special department for it? Would you like to have agricultural education under the Agricultural Department, or under the Education Department?—*A.* If there is a separate organisation under the Education Department I would not object to that; but as it is now, I don't think any good would come of agricultural education theoretically.

Q. In the same way you would like to have industrial education under the Industrial Department?—*A.* Yes.

Q. How does this strike you: the department which is best able to judge of the results of that education and is generally the most concerned with those results should be the department most responsible for it?—*A.* Yes, but they must be practical men.

Q. With reference to your reply to question 82, dealing with statistics, you say, "The present system, as far as is known to me, cannot be correct, as the work is practically done by illiterate and uninterested people on Government orders." Whom are you alluding to?—*A.* The ordinary way it is done is this. We are asked to give figures to Government, the local forecast and area. We ask our tahsildars to supply this, and they depute their ordinary peons to collect the information. These figures are sent to us and we make guess work of it and send them on to Government.

Q. That system only exists in the provinces which used to constitute old Bengal.—*A.* In the permanent settlement areas, the *Gaobara* system does not exist and statistics are collected in the way mentioned.

Hon'ble Pandit M. M. Malaviya.—*Q.* Do you think if Government were to start a bank, or extend its patronage to it in some form, the public would subscribe to its shares?—*A.* I think they will, but that will perhaps depend upon the interest they get from the bank in the ordinary way.

Mr. A. Chatterton.—*Q.* They want the dividends before they begin to subscribe?

Hon'ble Pandit M. M. Malaviya.—*Q.* The assurance of the dividends?—*A.* Yes.

Q. If the connection of Government is in some way established, then they would not insist upon any dividend being guaranteed? Would they?—*A.* Only people interested in the industrial development of the country, but not ordinary people, because even in the villages by ordinary money-lending they would make a larger profit.

Q. You think in the towns the bigger men would subscribe?—Yes, I think they would.

Q. You speak of co-operative credit societies; do you think many of these industries can be organised on a large scale, if you had co-operative credit societies, both for production and sale?—*A.* The experience that I have of co-operative credit societies is rather unfortunate, because I have found that everyone is eager to take money. Simply because it is on a very small rate of interest, they will not pay at all, and we have got to exert our utmost to get our money back.

Q. Are the societies getting increasingly popular?—*A.* In the provinces they are; but in Gauripur, which had the first society in the whole of Assam, I found that after 5 or 6 years, nobody wanted to pay back the money lent to them, and so all the societies have been abolished. We do intend to start new societies under new rules. These were started under the old rules. Simply because the interest is lower than the bazar, nobody wanted to pay back the money, although under the rules they ought to have paid back in 6 months. In those cases they would not pay unless summoned, and threatened with litigation.

Q. Do you ascribe the failure of these societies to the rules being defective?—*A.* Yes.

Q. And you intend to adopt new rules on the model of those prevailing in other provinces?—*A.* Not exactly, but I think with modification, co-operative credit societies ought to be more popular.

Q. And they will supply the necessary funds, and help in properly marketing the products?—*A.* Yes, they might do that.

Q. Are there no factories at present for cabinet-making or furniture-making?—A. None at all on Goalpara side. This is what I think ought to be done at once, because Assam is full of forests, but nobody knows what sorts of timber are grown there.

Q. Is there a school of carpentry started by Government?—A. One has been started by the Local Board for training Meeh pupils in Tipkai. They do very useful work. I had no opportunity of inspecting it before I came.

Q. But you think there is room for several schools of carpentry?—A. I do think so.

Q. Is there any school for hand-loom weaving?—A. Pupils are sent to Serampore by the Local Board. Meeh women are trained in the Tipkai Local Board School. We try to send one or two every 2nd or 3rd year.

Q. Do these students carry on weaving after they return?—A. In Goalpara it is in the hands of the Meehs and Garos. They are trained in improved methods of weaving.

Q. Do you send the women to Serampore?—A. No. The men instruct the women.

Q. Has much progress been made in this direction since you began to send your students to Serampore: what is the extent of the work?—A. Not much; there is one school there only, which has been going on for two years; but something has been done, and a good beginning made.

Q. If a weaving school were started in every town in your province, do you think it would attract a sufficient number of your students?—A. How can it, because in the upper provinces the ladies of the household generally weave and are good at embroidery work; they would not probably come out to schools after a certain age unless expert ladies are sent to train them.

Q. In the upper provinces you don't need a school of weaving?—A. I have little experience of the upper districts: but I don't think anything useful would be done, because ladies have not sufficient time to devote to these things. They do this only as a sort of recreation. Perhaps they will take 5 or 6 months to manufacture a piece of embroidered work. I don't think that would do much good to ladies of the higher classes. They may be useful to professional weaving classes—if there are any such in the upper districts.

Q. Is there no other organisation for manufacturing furniture in Assam?—A. There are some in jails.

Q. Outside jails you say people have to import their bedsteads from Calcutta?—A. It is cheaper if they are imported from Calcutta.

Q. Even now?—A. Yes.

Q. Why don't non-official people start some of these industries?—A. If they do start they will be very successful, but first of all they must know about the woods that are most abundant, and what kinds there are. Nobody knows which kinds can be employed for furniture. I have seen in almost all up-country places, especially in Chota Nagpur, where there is much valuable wood in forests, there are several carpenters and all sorts of furniture are made locally, but in Assam, which is full of forests, you cannot get one article of furniture made.

Q. Do you think if there were bulletins published, giving information as to the kind of timber available, this would encourage the industry?—A. Who would read the bulletins? I don't think much good would come out of it, unless a practical demonstration was made and furniture manufactured with local timber and shown to these people. I want small demonstration factories, not big ones at distant centres.

Mr. A. Chatterton.—Q. About these people who have been sent to Serampore to learn weaving, how many of them do you actually know anything about?—A. I have not got any personal knowledge. I know that one has been sent by our Local Board, and that after coming back he is to instruct the Garo and Meeh women. I have not seen them working myself.

Q. Do you know how many have been sent?—A. One has been sent.

GAUHATI.

WITNESS No. 393.

Srijut Prasanna
Kumar Baruah.

SRIJUT PRASANNA KUMAR BARUAH, *Tea Planter and Honorary Magistrate, Nohabari.*

WRITTEN EVIDENCE.

I.—Financial aid to industrial enterprises.

Capital.

I have no direct experience of the raising of capital for industrial enterprises, except in connection with securing working capital for my tea estate. The conditions under which capital is available for the working of an established tea concern would not be applicable to other industries, nor is it possible to raise capital so easily for starting any new tea estate. For financing going concerns there are Calcutta agents and Marwari bankers in almost all

the districts, who lend money at rates of interest varying from 9 to 12 per cent. and such loans are invariably given on the hypothecation of the year's crop.

I have, however, known some cases of attempts made by small partnership concerns and private individuals to raise money for other industries and the principal difficulty so far as this province is concerned appears to be the fact that the number of Indian capitalists here is strictly limited; of the few who can command some capital, fewer still are willing to invest money in enterprises in which they are not themselves personally engaged as proprietors or large shareholders; as a rule our people have no confidence in the organisers of Joint Stock Companies and they are very loth to invest money in new and untried enterprises.

I do not know of any noteworthy industrial enterprise in the province outside tea. Individuals engaged in shop-keeping or other smaller industries are mainly dependent on Marwari merchants, who charge interest sometimes going up to 24 per cent. per annum.

Q. 4. None excepting in connection with the concession granted to the tea industry in the form of favourable term of land settlement and the loans granted to co-operative credit societies at the earlier stages. I have no doubt that the rapid expansion of the tea industry in this valley has been principally due to the special encouragement it has received from the State. The co-operative movement which is steadily advancing in this and other provinces of India to the great benefit of our agriculturists and artisans would have been nowhere but for the financial backing up it has received from the Government, and the supervision and control exercised by the administration on the working of the societies have been of incalculable value to them. Government assistance.

In considering the question of Government aid to industries, a distinction has to be made between such industries and trades as are already in existence and those that are new and unfamiliar to the people. As regards the former the Government may undertake to help them by money grants-in-aid, bounties and subsidies to encourage their expansion. The other forms of aid, as are mentioned in Question 5, may also be given to existing industries according to their varying conditions and circumstances. In the case of these existing industries Government has simply to consider the extent of the demand for their products and the adequacy of any security that may be offered in cases in which repayment is insisted upon. It is not impossible to imagine cases where in view of the importance of a particular enterprise, Government may also be asked to encourage its expansion by bounties and subsidies without any provision for repayment. Ordinarily, however, I am decidedly against such gratuitous gifts from the Government. Industries supported by such fictitious aids may not be able to stand the test of competition under normal conditions and may succumb when worked on the ordinary principles of demand and supply.

The case appears to me different with new enterprises unfamiliar to the people and the country. Capitalists require to be coaxed to venture into new fields of activity. Then again there are many trades and industries in which India is far behind other foreign countries and which demand some sort of artificial propping to enable them to stand competition with cheaper foreign product, at least for such a time as may be found necessary to put them in a sound financial position.

Taking specifically the various methods suggested for giving Government aid to existing or new industries, I should say that (1) and (2) should not be generally given to any but well established existing industries or new industries deserving special encouragement. Existing industries such as jute, sugar, cotton, etc., may be granted such aids with provision for return, when in view of the circumstances of any particular time as now, any extraordinary increase of their output is deemed necessary. Loans with or without interest (4) may also be granted in other cases. Guaranteed dividends for a limited period (3) such as are sometimes conceded to railways in India and the provision of a part of the share capital of companies (6) may be found useful in the case of industries requiring considerable capital and specially in new ventures started under the auspices of joint-stock companies. To me it appears that Government aid, as is contemplated under heads (5) and (7) would be found most suitable for both existing and new industries and for both small and large scale productions. They are also suited for private individuals, partnership concerns or joint-stock companies.

It seems to me that Government control would be essential when aids under heads (1) and (2) are granted. Control of the nature as is exercised by the Government, over the operation of the Co-operative Credit Societies by constant inspection and checking of accounts may be found suitable in the majority of cases, specially in the case of individual proprietors and partnership concerns. In the case of joint-stock concerns, I am sure the appointment of Government directors with defined powers for the period during which direct assistance lasts may be found a most effective method of control.

I have no experience of Government pioneer factories and I do not know that there have been any considerable experiments made in this direction. Pioneer factories.

I believe there is ample room for such factories in this Province specially in connection with the production of paper pulp, for which I believe there are ample materials in our vast jungles. One or two factories to deal with the Provincial supply of leather may also be successful.

The general condition of the masses in India can only be improved by the introduction of new and the revival of our old cottage industries. This is perhaps more true of Assam.

If pioneer industries are attempted in this valley, I would like to see the resources of the Government available for this purpose, made use of principally in the development of various modern cottage industries as have proved successful in Japan.

I am of opinion that pioneer factories should be handed over to private enterprise and I should think preferably to joint-stock companies or to partnership concerns, no sooner their commercially profitable stage of development is established. I believe this has been the usual course adopted by the Japanese Government in dealing with their pioneer factories. Evidently there would be no reason to close a factory if it proves a commercial success, and the proper time for making it over to private enterprise would appear to be when it has grown into a sound commercial undertaking. I am of opinion that the Government should on no account seek to retain any successful pioneering experiments in their hands with a view to convert them into permanent Government enterprises.

Co-operative
Societies.

I do not personally know of any industries in this province supported by co-operative societies. A few such societies are, however, mentioned in the last report of the Registrar of the Co-operative Societies, Assam. We are told that a co-operative dairy and stores at Sunamganj is going to close. The Kamrup Weaving Societies, however, appear to have proved successful "in as much as the members have almost freed themselves from the rapacious Marwaris." The Registrar further informs us that the Weavers' Society in Sylhet has done admirable work last year. I for one fondly hope that co-operation may one day bring economic salvation not only for our agriculturists but also for the masses at large who in the past made their living by handicrafts of sorts. In this valley weaving has been a traditional occupation of the womenfolk in all classes of society from the highest to the lowest and though there is a caste known as the "Katanies" specially associated with the work of weaving, in pre-British days, all families used to make their requirements of clothing materials by themselves.

It is doubtful whether with the cheap products of European and Indian mills overflowing the market, there is any hope of reviving handloom weaving with cotton yarns. In Bengal they have partly succeeded in the matter of the handloom industry by the production of "dhoties" and "saries" with cotton and other mixed yarns, but the conditions are entirely different here. As regards our silk however the indigenous *eri*, *muga*, *pat*, and *mazankari*, of the valley, I have every reason to believe that, though declining under the stress of various circumstances, not the least of them being competition with cheaper silk from other parts of India and from foreign countries, the industries in these are capable of vast development and may even prove to be the mainstay of the masses of our people next to agriculture.

Eri and *muga* seem to have also vast possibilities of securing a market outside the province, as they have been found to be specially durable and to have caught the fancy of the Europeans. I think it is the bounden duty of the Government to do something to foster and develop this furnishing, if not dying, industry and it is worth noticing here that at the Industrial Conference, held at Jorhat in the year 1915, under the presidency of the Commissioner, Assam Valley District, a pledge was given by him on behalf of the Government, that a weaving school would be started at Gauhati without delay, though nothing seems to have been done since to redeem the pledge.

I may as well say once for all that I believe co-operative organisations among artisans as distinguished from agriculturists should be founded wherever practicable on the basis of communal and craft interests. In Assam as in other parts of Hindu India, special crafts and callings are traditionally associated with special castes and each one of these castes or guild societies may be made the centre of one or more co-operative organisation in every sub-division or district.

Referring, in conclusion, to the general question of Government aid to industries, I have to submit, that so far as this valley is concerned, it is through co-operative banks and other co-operative organisations for production and sale that the people can be best helped and as I have already said all such aid must take the form of encouraging the expansion of the co-operative movement. Cottage industries supported by credit from co-operative organisations which will at once supply capital and materials and arranging for securing a market for the produce, are the primary requirements of the situation, so far as the vast masses of the people are concerned.

Limitations to
Government aid.

I do not think it would be at all expedient for the Government to enter into competition with private enterprise in any field where private enterprise has any chance.

This question involves the discussion of principles of international trade in regard to which the policy of the Government of India is not yet settled and may undergo serious change after the war. But, on the whole, I am disposed to agree with those who like to see India self-contained in her economic resources and I do not see why there should be any limitation on Government aid to a new enterprise in India, because it happens to compete with an established external trade.

II.—Technical aid to Industries.

Industrial Surveys.

I should certainly think that the existing knowledge of the economic resources of the country specially with regard to the mineral resources requires much to be supplemented by further surveys. We know we have got iron and mica mines in different parts of the country, and we also know that gold dust used to be sifted from the waters of some of the rivers of

the upper valley, but the commercial side of these resources is not yet known with sufficient accuracy to induce capitalists to invest money for the exploitation of these resources of wealth. I think if a body of prospectors be formed to report on these resources, it would be the duty of the Government to throw the informations broadcast so as to invite capitalists to try these fields.

III.—Assistance in marketing products.

I have no personal experience of commercial museums, but I think, institutions like these are very desirable in a country like ours, where the people could hardly avail themselves of opportunities to go abroad and see things for themselves. These museums should be the repository of all sorts of manufactured products, as well as of raw materials, both foreign and Indian, and as such should serve the purpose of a central mart like the exchange, where people might come to dispose of the products of their individual cottage industries and where they should also get the raw materials of their respective industries. In my opinion at least one museum of this kind should be established in every large town with agencies in every sub-division for buying and selling finished products and raw materials respectively. These institutions should be entirely under Government control, and should be formed on the basis of the co-operative system as far as practicable. In places where co-operative credit is at discount, local banks should be asked by the Government, for the purpose of financing these institutions; I have no direct experience of such institutions, but I think in order to infuse life and impetus to the already atrophied indigenous cottage industries of the people a workable scheme on the lines sketched above forthwith demands the serious attention of the Government.

Commercial
Museums
and Sale
Agencies

I don't think exhibitions are much useful in their way, far less to those for whom they are mainly intended. They serve no other purpose but a pleasant rendezvous, during their continuance, for all people great and small, and are like fleeting phantoms of delight, without leaving any solid gain for the people. I consider the disbursements on such displays as mere waste of the public exchequer which the people hardly realise that they have had to pay for.

Exhibitions.

In my opinion Government as far as possible should not import all such articles that are produced in India, provided the standard of quality of the articles is in no way inferior to those imported. A list of such articles and the models of the articles themselves, would no doubt have a fitting place in a commercial museum.

As I have hinted above, the commercial museum should be financed by co-operative credit societies or by approved banks and these societies or banks through the museums and their agencies should issue loans on easy terms on good securities. The main difficulties with those who rear cottage industries seem to me to be in the way of marketing the products and banking facilities. If such productive and distributive houses, as I have outlined above, are established, where the people might get ready value for their products, and thus securing for themselves the profits of the middleman, and where also they could get loans on easy terms, as well as the supply of the raw materials, without the least fear of being imposed, I think the old renowned industries of Assam would have a happy resurrection and in no time an all-round improvement in the economic condition of the people would be the inevitable result.

Banking
facilities.

Official administrations and organisation.

I am so far not aware of the existence of any provincial organisation in our province for the development of industries, but I should certainly think that this is a desideratum that needs immediate attention in a country like ours where there are immense industrial possibilities. Considering the abundance of land available in our country and the proclivities of the people, the bulk of which are mainly agriculturists, along with their present economic condition, I should think that granting of facilities for the improvement and expansion of agricultural industries mainly, should have the larger share of attention from the Government; but to accomplish this object, the land policy of the Government, should be recast so that small capitalists also may get lands under terms of concession.

Official
organisa-
tion.

In order to educate the people in useful agricultural industries I should think there should be a Board of Industries consisting of experts, both in manufacturing and agricultural industries, with two or three popular leaders of the people having industrial experience. Demonstration farms, at least one of which should be established in every district, should be under the control and guidance of this Board. In my opinion it should be not only advisory but it should have executive powers with budgetted funds. The functionaries of the Board should be itinerant and they should always be in close touch with the people, giving them not only expert advice but also demonstrating to them the benefits of improved methods of culture. The demonstrations should be made in one or two individual holdings in every village throughout the province.

If a Board consisting of three experts, say in agriculture, sericulture and another in some one of the manufacturing industries of which there is a possibility in this country, and two non-experts having industrial experience, be constituted, I don't think a Director of Industries would be of much service, but a high official with such a designation might be appointed to preside over the deliberations of the Board and to supervise its works.

I should think the Board of Industries should have a free hand in matters of research, experiments and publication of the results thereof, with budgetted funds. The Director of Industries acting only as a Secretary to the Board and having a seat in the Local Legislative Council with a portfolio. The provincial Governments as the supreme authority should determine the spheres of activities of the Board and initiate such undertakings whenever possible on the recommendations of the Board.

Imperial
Department.

I should certainly recommend that an Imperial Department under a single head should be formed and the head be included into the Executive Council of the Viceroy with a portfolio as there are the Law Member and the Member for Education. There should also be an Imperial recurring grant, earmarked only for industrial undertakings and distributed amongst such provincial undertakings that cannot be maintained solely by provincial finances.

I think an Imperial Department under a single head as suggested above would best suit the purpose of correlating the separate activities of the various provinces but in order to familiarise the people with the net results of the various undertakings and activities, both individual, joint-stock or Government aided, there should be a periodical publication directly under the Imperial Department, under some such designation as The Imperial Industrial Gazette. The Government provincial gazettes also should devote a few pages for the industrial intelligence of the various countries.

Land Policy.

As mentioned above Government give concessions of land only to those who apply for it for special cultivation. In our country the tea industry practically covers the term special cultivation, and as such is the only recipient of land concessions, although cotton, jute, etc., coming under this head, though feasible of cultivation in our country are hitherto neglected. I should think Government should not depart from the policy hitherto followed with regard to the special cultivation, at the same time it behoves them not to forget the claims of the hitherto neglected industries of our country, to wit *eri* and *muga*, which have an immense industrial future if they only decide to back them up by granting small holdings to the people under the special cultivation terms.

It seems to me that the 30 years' rule has been working very satisfactorily with the tea concern, and I should certainly recommend to continue this rule till such a time as the available wastes of Assam are fully reclaimed, of course due reservations being made for the convenience of the *ryots*.

In this connection I cannot help remarking that the 30 years' rule, although it has been greatly beneficial to the tea industry, is not totally devoid of its accompanying evils from the *ryot's* points of view on account of too liberal a policy adopted by the Government in the past. In the majority of cases of tea companies floated in England, vast acres of land, as many as 3 to 4 thousand acres, have been settled under this rule with each individual company, although perhaps not more than one-third of the area has been brought under cultivation during the last 30 years. The consequence is ruin and disaster to many of the neighbouring villages and disappointment to many rising capitalists seeking investments in the tea industry. I therefore recommend that, in future for all land grants, Government should compel the recipients to enter into an undertaking defining the period during which they should bring the land under cultivation and in the event of failure of compliance the concessions should be withdrawn.

Publications.

I should certainly recommend that bulletins containing useful informations about improved methods of culture and results accruing therefrom should be published from time to time in the simple language of the country, by the Board above referred to.

General.

As mentioned above I am actively concerned with the tea industry. This industry, although it holds an enviable position at present, will have, I am afraid, to weather many storms in the near future. Assam is a country where local labour and capital are very scarce. The mainstay of the tea industry is the immigrant labour from other parts of India; since the abolition of the *arkatti* system of recruiting, the planters have to depend for the supply of their labour force only on *asadari* recruiting, which is in my opinion as slow in its operation as it is incapable of fully meeting the demand. I consider that for the benefit of an industry as the tea, which has absorbed millions of British capital and which is responsible for the maintenance of nearly four lakhs of people, and which has served as a lever lift to the economic condition of the country, the recruiting laws should be so adapted as to admit of a more free immigration from other parts of India.

As regards the concessions hitherto granted to the industry in connection with the land, I should certainly urge the Government to continue the same policy towards all *bond fide* capitalists, large or small, seeking investment in the industry.

Transport.

Assam is a country full of natural resources, but owing to deficient communication and lack of the principal sinews of industrial enterprises, I mean labour and capital, those resources have been left to blush unseen and waste where they grow. I know Assam can supply raw materials to feed two paper mills, but where is the capital and expert labour to launch such an undertaking? I think paper pulp in Assam is a good case for investigation and I should urge the Local Government to requisition some experts in order to investigate thoroughly into the question and publish the opinion of the experts in course of time so as to attract capitalists, in the event of the experts encouraging such an undertaking.

ORAL EVIDENCE, 5TH JANUARY, 1918.

Mr. C. E. Low.—Q. What is the extent of your interests in the tea industry?—A. I have 415 acres under cultivation, and about 100 acres more, without cultivation.

Q. That is your own personal property?—A. Yes.

Q. Did you obtain this as a grant from Government, or was it your own land to start with?—A. It was hereditary property.

Q. How did you come to start planting tea?—I did not start it myself; my father started it; it is now nearly of 40 years' standing.

Q. Do you know what induced your father to start tea?—A. At the time when my father started the concern, people generally took to tea and there was the tea boom at that time.

Q. Were they local landowners—Assamese landowners?—A. Yes.

Q. Are local men still taking up tea?—A. Yes, but they cannot get land nowadays.

Q. Is the kind of land suitable for tea limited in extent?—A. There is an abundance of land suitable for tea in all parts of the country.

Q. Then why cannot they get it?—A. The first difficulty is that at the time when the smaller capitalists applied for land, there was always interference from Government, and the Government not being satisfied with their financial condition would not give the land. Secondly, when they did get land, big companies always came along and bid higher for the land and so the smaller people could not get it.

Q. Are lands put up to auction?—A. Yes. I myself applied on several occasions for land, but could not get it, because the bigger companies would come down and bid for it. It goes to the highest bidder.

Q. Is there no reservation made in favour of Assamese?—A. No, that is the only difficulty.

Q. What are the terms on which Government give out land for what you describe as special cultivation?—A. On a 30 years' lease.

Q. And on what annual rent or revenue?—A. 12 annas per bigha for 30 years.

Q. Is it the same from the beginning?—A. Yes.

Q. Is it not less to start with?—No.

Q. Do they pay any premium?—A. At first when we apply for land we have to pay for the survey, and all the initial expenses; also the forest valuation.

Q. I thought you said they were put up to auction?—A. In this way; for instance, I am an applicant. When I complete my arrangements, somebody else comes and bids for the land, after I have gone to all the expense and trouble.

Q. And do you actually pay the premium for it?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—You first apply and Government arranges to give you the land, you have the survey made, and after you have spent money, then the auction takes place?—A. Yes. We have just applied for land, and I hear that the Rajghur Tea Company is going to bid for that land. This sort of thing actually happened in the case of the Amraoti Company who applied for 6,000 acres of land. The land was put up for auction and Rs. 14,000 was paid by the Company when it was closed with them.

Q. That was not after somebody had spent money on the survey?—A. Yes.

Q. Was it compensated for?—A. Yes, they are generally paid the survey fees, but not all the expenses; just to cover survey expenses.

Q. You say, "I have no doubt that the rapid expansion of the tea industry in this valley has been principally due to the special encouragement it has received from the State." Do you allude to the fact that Government, or rather the East India Company, made a number of experiments and showed that tea could be grown; or do you mean the terms on which land is given?—A. The terms on which land is given.

Q. Are those terms more favourable than those for land for ordinary cultivation?—A. Yes, they are favourable if the land is granted.

Q. More favourable than for ordinary cultivation, say, for rice?—A. Yes.

Q. Do you know anything about sugar-growing?—A. I have no direct experience.

Q. You say in your second paragraph, "I have, however, known some cases of attempts made by small partnership concerns and private individuals to raise money for other industries, and the principal difficulty, so far as this province is concerned, appears to be in the fact that the number of Indian capitalists here is strictly limited."—A. Yes, they could not raise sufficient funds, so they collapsed.

Q. Have there been any serious failures here? What is your experience of joint-stock concerns?—A. I myself was one of the originators of a joint-stock concern. It was not registered. It was a tea concern. We took up lands but could not raise sufficient funds and could not start.

Q. Have there been any cases of bad or scandalous failures which have alarmed people?—A. No.

Q. You say there are mica mines in different parts of the country. Do you know if those have been examined by the Geological Survey Department?—A. I don't know exactly, but I hear there are mica mines just on the North-East Frontier.

Q. Do you know whereabouts these are?—A. Beyond Sadiya.

Q. You say, "If a Board consisting of three experts, say in agriculture, sericulture and another, in some one of the manufacturing industries of which there is a possibility in this country, and two non-experts having industrial experience, be constituted, I don't think a Director of Industries would be of much service, but a high official with such a designation might be appointed to preside over the deliberations of the Board and to supervise its works." Do you think a Board like that could look after the staff of the department, tell them where to go, what work to do, look through their diaries and see that they do it, and arrange for their promotion, reward or punishment?—A. I think so, because the Board of Industries, if constituted, might hold different parts of the province.

Q. You want the staff to do that, and you think this Board could manage the staff itself. Is it the case of joint-stock companies that the directors do all these things jointly, or by permanent managing agents or managing directors?—A. Generally it is the managing directors who manage joint-stock companies.

Q. Do you think that a Government Board would be able to exercise the same sort of administrative functions as a Board of Directors?—A. I think a Board of Directors would be far more suitable, because if they take 2 or 3 non-officials into their directorate, they would welcome the idea.

Q. I am not criticising the suggestion of a Board; I am only asking you whether a Board would be able to do the ordinary administrative work of the department.—A. I think they would. Of course there should be budgetted funds for all the initiative undertakings.

Q. You say, with reference to these recruiting laws, "I consider that for the benefit of an industry such as the tea, which has absorbed millions of British capital, and which is responsible for the maintenance of nearly four lakhs of people, and which has served as a lever lift to the economic condition of the country, the recruiting laws should be so adapted as to admit of a more free immigration from other parts of India." What exactly do you recommend: do you want the *arkatti* system introduced again?—A. I have not been able to suggest anything. In the Legislative Council there was an Enticement Bill which was not passed into law. Some sort of thing is necessary for tea planters, because they have no hold on the coolies.

Q. Is Act XIII of 1859 resorted to much here?—A. Yes.

Q. But what you want is more free immigration. A restriction on people here would not necessarily help in bringing in more coolies; restriction like the Enticement Bill would not necessarily bring in more coolies; in fact it would be more likely to diminish them. How do you suggest you should get in more coolies?—A. Not exactly the *arkatti* system, but free immigration of those who want to come here, by sending more sirdars into the recruiting districts.

Q. There is nothing in the Act to prevent your doing that?—A. Any slight infringement of the present law causes them to be brought to trial.

Q. Have there not been very grave scandals in the provinces from which recruiting has been carried on?—A. Yes, I know that.

Q. Do you think it would be safe to make a relaxation in view of that?—A. I don't exactly say that there should be a relaxation. The whole *arkatti* system should be revised but I have not been able to suggest anything.

Q. In some parts of India they get a good deal of seasonal labour in for tea cultivation, and I think that has been the case to a limited extent in Assam?—A. Do you mean short-term coolies?

Q. You want people who do some of their work in certain seasons, and who have 5 or 6 months with nothing particular to do. They might come in at certain times?—A. We generally get coolies like that from the recruiting districts.

Q. I have heard two objections made to that proposal: one is that railway fares are too high in some cases, and the other is that some employers have given these people advances, and take advantage of Act XIII of 1859 to prevent them going away again?—A. Not to my knowledge. I have not heard anything of that sort. They generally come and go back again.

Q. What is the cost of bringing in short-term coolies?—A. The railway fare, plus some Rs. 20 to 30 in advances.

Q. If you got a regular inflow of seasonal labour, they would not want advances?—A. They want advances at home themselves.

Q. How much do you say the cost is?—A. Rs. 60 to 70 a head.

Q. How much is the railway fare?—A. I don't get my coolies by rail but by steamer. I think it is Rs. 6-8 from Ranchi, single fare.

Mr. A. Chatterton.—Q. Have you any practical experience of other industries than tea?—A. I have not.

Q. What is the average size of Indian owned tea estates?—A. At present the smallest area is 50 to 60 acres; but they are generally expanding every year.

Q. Have you any cultivation of tea by *ryots*, on a scale of from 5 to 10 acres?—A. On the Dibrugarh side they do that for selling seeds. They are seed-bearing trees.

Q. What do these smaller planters, who have areas of 50 acres, do with their crops? Do they pluck the tea and sell it to neighbouring factories?—A. No, they undertake the old processes of manufacturing tea by means of ovens, not machine made; by drying in big iron pans and rolling it by hand and sell it to local market.

Q. Does that tea fetch as good a price as machine-made teas?—A. Machine-made is far better.

Q. Are there any factories for making tea independent of estates?—A. None.

Q. Do any of the estates buy tea from planters?—A. If a small *ryot* happens to be in the neighbourhood of a big garden, and if he has no machinery, he sells it to a neighbouring planter.

Q. You recommend that one or two factories should be started to deal with the provincial supply of leather; what makes you suggest that?—A. Our people have not taken to leather. Hindus have a prejudice against doing business in leather. I know lots of leather is exported from Assam, and nobody has taken that business seriously.

Q. Are there no tanneries at all in Assam?—A. No.

Q. Where do you get all your leather from?—A. We have no shoe factories here; we import it all from Bengal.

Q. Then you say, "The Kamrup Weaving Societies, however, appear to have proved successful." Have you any personal knowledge of these?—A. I have not, but I saw this from the Registrar's report.

Q. I suppose the same applies to your remarks about paper mills; this is merely information you have gathered; you have made no enquiries yourself?—A. No, but one of our Assamese students is in the Titaghur Paper Mills.

Q. You have no personal experience of commercial museums but you would like to see them started and made into depôts for the sale of products?—A. Yes. The chief difficulty about our cottage industries is in regard to marketing their products, and it has always been interfered with by middlemen. They cannot get proper value for their products, so I think if Government took the initiative in these things, they will be saved from the middleman, and will get proper value for their products.

Q. Are there any agents of the Bombay Swadeshi Stores here; do they come up here and buy the products of cottage industries?—A. Very seldom.

Q. What you really want is not a museum but a depôt?—A. Yes, but at the same time there should be a museum, where improved methods of spinning and weaving and all these new appliances should be kept in view, so as to give a study in them to the people.

Q. You want your museum to be a depôt and a demonstration factory?—A. Yes.

Q. In the last page of your evidence you say that in consequence of land being given in large areas to tea companies, "ruin and disaster" are brought about "to many of the neighbouring villages and disappointment to many rising capitalists seeking investments in the tea industry." Can you give us any examples of that?—A. Most of the villagers cannot get sufficient land for grazing purposes; besides they are always oppressed whenever their cattle encroach into the gardens. The cattle are always impounded, and the poor *ryots* have to pay fines for their cattle.

Q. Who settles these impounding fees?—A. There are pounds settled by Government in every garden.

Hon'ble Sir R. N. Mookerjee.—This does not always refer to European concerns, but also to Indian concerns?—A. Yes, but there are very few Indian concerns.

Q. But still they have the same rules?—A. Yes, but Indian planters have not got such large areas as the Europeans.

Mr. A. Chatterton.—You think this business of impounding cattle brings ruin to *ryots*?—A. Yes at the same time these *ryots* for want of grazing lands and oppression leave their villages and go to distant places.

Q. You mean to say that the *ryot* gives up his land and goes away because the tea companies start in the neighbourhood. A. Yes, there are cases like that.

Sir F. H. Stewart.—Q. Do you manage your own garden?—A. I have got my own man and visit it often.

Q. Do you mind telling us how you are financed?—A. I have got local bankers and finance it through them.

Q. What are the banking facilities here: are there any large banks or branches of banks?—A. There are no regular banks; generally there is one European firm, called the Planters' Stores, who generally finance these tea gardens on Calcutta drafts.

Q. They only finance gardens for which they are agents?—A. Yes. Some planters have got Marwari bankers.

Q. How do you dispose of your teas?—A. I send my tea to Calcutta agents and they sell through brokers at public auctions. Balmer Lawrie & Co. are my agents.

Q. You say that when Government aid is given to industries, "a distinction has to be made between such industries and trades as are already in existence, and those that are new and unfamiliar to the people." And then you go on to say, "In the case of joint-stock concerns, I am sure the appointment of Government directors, with defined powers for the period during which assistance lasts, may be found a most effective method of control." Do you mean powers beyond those of other directors, more than those of other directors?—A. I don't understand.

Q. It has been suggested sometimes that the Government Director may require to have the power of *veto* , or something of that sort. Do you contemplate that, or would you give him the same powers as the rest of the Board?—A. The same powers as the rest of the Board. The Director should serve as Secretary, but he should sit in the Legislative Council with a portfolio.

Q. That is the Director of Industries; but you are speaking of Government directors here, where Government help is given to private concerns. You would not give them more powers than other directors?—A. No.

Q. You say that pioneer factories should be made over to commercial enterprise when they have been established on a sound commercial basis. How would you arrange for these factories to be carried on: should Government go at the start to a responsible firm and say, "would you undertake the management of this?"—A. Yes.

Q. And that firm presumably would have the first chance of taking it over afterwards?—A. Yes.

Q. With reference to your proposed Board of Industries, you say that the Director of Industries should be Secretary to the Board, and should have a seat in the Local Legislative Council. You would make him practically a Secretary to Government?—A. Yes.

Q. You say, "Secretary to the Board": would that mean he would only be a sort of executive officer of the Board and a mouthpiece of the Board?—A. Yes, and he should sit on the Legislative Council with no powers of *veto* .

Q. Supposing there was a difference of opinion between the Director of Industries and the other members of the Board?—A. The Director should have no vote at all. The vote of the Board should be final.

Hon'ble Sir R. N. Mookerjee.—Why should he be in the Legislative Council; what good would it do him?—A. There the non-official members might have a voice in the undertakings of the Board.

Q. The Legislative Council don't decide any executive questions?—A. No, not up to now.

Sir F. H. Stewart.—What is the 30 years' rule?—A. It refers to the period in which land granted by Government is to be brought under cultivation.

Hon'ble Lieut.-Col. P. R. T. Gurdon.—Q. I gather from your reply to Mr. Low that there had been some disinclination on the part of Government to grant land for tea to the Assamese?—A. I didn't say "disinclination."

Q. Perhaps I misunderstood you?—A. Generally there are obstacles raised when they apply for lands. When they do get it and the survey has been made, some big companies come in and say "I will bid for this plot of land," and the applicant loses the land, as they cannot cope with these big companies.

Q. Are you aware that official orders were issued by the Chief Commissioner that preference was to be given to Assamese with regard to land applications for tea?—A. That has been done very recently. Even then this rule is in force that whoever can bid for land will get it.

Q. It is the auction system you are objecting to?—A. Yes. If that is not removed there is not the least possibility of the Assamese getting any land whatever. I have my own experience in this matter. At the present moment I have applied for 400 acres of land, which I have had surveyed. The Rajghur Tea Company has written to the Deputy Commissioner to allow them to bid for the land.

Q. Is it not a fact that there is a rule, under the Assam Land and Revenue Regulations, that, after the application has been made, the land is advertised for sale on a certain date and on that date others who have applied for the land before the notice of sale, can come and bid? That rule has been in force for a good many years; it is no new thing?—A. We strongly object to it, as there is not the least possibility of our getting land. If the Rajghur Tea Company come and bid for that land, I have no chance. It is a very big company with big capital.

Hon'ble Sir R. N. Mookerjee.—Then your idea is that once Government give permission to survey land, there should be no more auctions. The Government should make up its mind beforehand?—A. Yes.

Hon'ble Lieut.-Col. P. R. T. Gordon.—In your answer to Mr. Chatterton about a depôt, I understand you mean a sort of emporium?—*A.* That is what I mean.

Q. Where there should be different manufactures of rural industries to be exhibited for sale?—*A.* Yes.

Q. Where would you place that depôt?—*A.* I should like to put it in a head-quarters town.

Q. And whom would you place in charge of it; would it be a Government depôt, or run by a company?—*A.* It should at first be aided by Government, otherwise people won't take to it; and afterwards, if it can be run on a co-operative basis, so much the better. Government should start it like a pioneer industry.

Q. In your answer to Mr. Chatterton you spoke about the oppression of *ryots*, owing to the opening of tea gardens. Oppression by whom? Is it oppression by the tea planters?—*A.* Not direct oppression.

Q. Who do you mean—oppression by Government?—*A.* By the planters.

Q. In what way?—*A.* Such as the impounding of cattle and by not allowing the village people to pass through their gardens.

Q. Closing the right of way?—*A.* Yes. I know of a case in the Dibrugarh district; a part of the village practically has removed, owing to the neighbouring gardens.

Q. Is it not the fact that in large areas, waste lands are being thrown open for grazing, under the orders of the Assam Administration?—*A.* Yes.

Q. Are larger areas required then?—*A.* It should be at very frequent intervals. Now they are at very long intervals.

Q. Hon'ble Sir R. N. Mookerjee.—Do you mean by "intervals" that they are too far away from each other?—*A.* Yes.

Q. Hon'ble Lieut.-Col. P. R. T. Gordon.—Then these grazing areas have not been properly located?—*A.* We want more grazing grounds and in proper places.

Q. If more grazing grounds were made, would that meet your objection to the *ryots* being forced to leave their ancestral lands?—*A.* That is not the only grievance; there are other things besides. My garden, for instance, is in front of a village, and I have often to close the garden and not allow a thoroughfare. The people are oppressed in that way; in the rainy season they cannot come out.

Q. You cannot have tea and rice cultivation as well? To begin with, the same area, which would be suitable for tea, would not be suitable for rice?—*A.* No, tea is generally grown on high land, and rice on low land.

Q. What you mean is that you require more areas for grazing grounds?—*A.* Yes.

Q. Mr. A. Chatterton.—Does the opening of tea gardens confer any benefit on the local people in the way of providing a market for local produce, and employing labour? Does the price of local labour rise on account of imported demand?—*A.* The Assamese people who grow their paddy grow only sufficient for their own consumption and don't sell to the neighbouring gardens. The gardens get their own supply of rice from the big markets.

Q. I want to know how these Assamese cultivators pay their rent if they don't sell their own produce?—*A.* Very seldom they sell their own produce. They have to depend upon the money-lenders for the payment of the revenue.

Q. Hon'ble Lieut.-Col. P. R. T. Gordon.—Don't they sell things like vegetables and ducks and fowls to tea planters?—*A.* With regard to vegetables, it is generally the up-country people who take up land on the river side and grow all the vegetables that are sold in the local markets.

Q. And in some part of the country don't they sell some *ghan*?—*A.* Yes, they do sell.

Q. Under the heading of "Pioneer factories" you say, "The general condition of the masses in India can only be improved by the introduction of new, and the revival of our old cottage industries." What do you mean by old cottage industries?—*A.* I mean *eri*, *waga*, *pat* and *mazankuri* silk weaving, etc.

Q. How do you think that the silk industry can best be improved: what is your idea?—*A.* My idea is, save the people from the middleman, such as the Marwari. The best facilities should be given for the marketing of their products, not only the yarn but also the finished products. Besides there should be concessions given for land, say small holdings of 10 to 50 acres for growing those trees that are generally required for purposes of silk rearing. That is the only thing necessary; that is why I have suggested there should be emporia where they should be able to dispose of their goods directly, without the help of the middleman.

Q. Are there any other industries which you refer to; any other old cottage industries besides silk?—*A.* Yes, lots. In our country every caste is associated with some sort of profession, weavers, brittiyals, who make gold ornaments. There are some people who make *gharis*, and *pattias*. These are cottage industries.

Q. Would you include basket-making, cane work, and that sort of thing; mat-making?—*A.* Yes.

Q. You know what *sitalpati* is—the manufacture of a very fine kind of mat?—A. Yes, all those sorts of things.

Q. You doubt whether there is any hope of reviving hand-loom weaving with cotton yarns. What do you think about silk; do you think there is no hope of improving the hand-loom for weaving silk?—A. Why not; that is why improved appliances should be sent.

Q. How would you best improve the loom; what is wanted in the present loom?—A. I hear that the Salvation Army have brought out a new loom. Some sort of thing should be suggested to these people by means of demonstrations.

Q. Would it be a good thing to supply weavers with the *ras*? There are some complaints from Upper Assam that *ras* is not procurable at reasonable prices. Would it be a good thing to establish a depôt for the supply of *ras* to weavers?—A. Yes, all sorts of appliances.

Q. I understand you want land to be given out on favourable terms to silk-worm cultivators; land on which the food crop of the worms is grown?—A. Yes.

Q. Such as lands growing *eri*, *kesaru*, etc.?—A. Yes.

Q. You talk about the 30 years' lease rules, which are for special cultivation. Would it satisfy you, say, if lands were given out for a revenue free term for a certain number of years, and then gradually brought up to the full assessment afterwards?—A. In that case it would.

Q. Are you aware that the 30 years' lease rules are being gradually withdrawn from Assam?—A. Yes, but I don't approve of that.

Q. Then you say that the *eri* and *muga* have vast possibilities. What would you propose to do to favour the trade in *eri* and *muga*; how would you proceed; would you have trade agents?—A. Yes, that is why I propose that emporia should be started in every headquarters.

Q. In Assam you mean?—A. Yes.

Q. But you want places outside Assam?—A. No, that should be started by Government. Government should purchase the finished products from the emporia and serve as distributing houses.

Q. In regard to the marketing of *eri* and *muga* you say that "at the Industrial Conference held at Jorhat in the year 1915, under the Presidency of the Commissioner, Assam Valley District, a pledge was given by him, on behalf of the Government, that a weaving school would be started at Gauhati without delay, though nothing seems to have been done to redeem the pledge." Where was that pledge given? I have a copy of the report of the proceedings of the meeting, but it does not contain particulars of the pledge. What is your authority for that statement?—A. I understood it to be a pledge; at least in the way the speech was delivered we thought some sort of thing would be done.

Q. But the word "pledge" is used here.—A. Perhaps I have over-rated it.

Q. Under the heading of land policy you say, "I therefore recommend that in future for all land grants Government should compel the recipients to enter into an undertaking defining the period during which they should bring the land under cultivation, and in the event of failure of compliance, the concessions should be withdrawn." You want to have a clearance clause, I understand, in the lease?—A. Yes.

Q. That, within a certain time, a certain area should be opened out for tea, and that, if the area is not so opened out, you should have the lease cancelled or withdrawn?—A. The lease should be converted into the ordinary periodical lease, and there should be some penalty.

Q. Hon'ble Sir R. N. Mukerjee.—If a man takes a thousand acres and only cultivates 200 acres, your idea is that the 800 acres should be made over to Government?—A. No; but the time should be defined under which the recipient should bring the land under cultivation. If he fails the lease should be converted into a periodical lease.

Q. And a fresh lease given to anyone else?—A. Not to anyone else. It would save speculators in one way, and those who take vast acres of land. We don't want speculators in our industry.

Q. What penalty would you impose, and how should one proceed to act?—A. In the case of a thousand acres, the man must undertake to cultivate 200 acres in 5 years, and after another 5 years another 200 acres, and so on. If he fails, the whole area should be converted into a periodical lease, the ordinary lease.

Q. He would still be in possession of the land, but only pay more revenue?—A. Yes.

Q. Mr. A. Chatterton.—About these cottage industries in Assam, are there hereditary village artisans in the village?—A. Very few.

Q. How do these artisans get pay: is payment in kind still prevalent in the province?—A. In some parts of the country it is.

Q. Hon'ble Sir R. N. Mukerjee.—You are not particularly fond of limiting the giving of land to Assamese by preference?—A. No.

Q. You say, "I should certainly urge the Government to continue the same policy towards all *bona fide* capitalists, large or small, seeking investment in the industry."—A. By smaller capitalists I mean the Assamese.

Q. The large capitalists mean the Europeans, or any Calcutta firm: you don't mind that?—A. I don't mind that so long as our interests are maintained.

Q. Then you object to the rule that preference should be given to Assamese?—A. No, I mean by smaller capitalists the Assamese.

Q. But if two big companies come, one being Assamese?—A. I would decide by priority of application. The auction system should be abolished. If I apply for land first it should be settled with me direct.

Q. You say, "I should certainly urge the Government to continue the same policy." What same policy?—A. The same policy as regards special cultivation terms.

Q. But when outside people come in, a *bona fide* capitalist, you have no objection?—A. I have no objection. When there are so many thousand acres in Assam, let them take it.

Q. Then the Government circular is not right; it is restricted to Assamese?—A. It is not restricted. The Assamese would not get the benefit of it so long as the auction system exists. Even that rule would not help the Assamese in any way.

WITNESS NO. 394.

*Srijut Prabada
Chandra Bardalai*

SEIJUT PRABADH CHANDRA BARDALAI, *Assistant to the Registrar, Co-operative Societies, Assam.*

WRITTEN EVIDENCE.

So far as the Brahmaputra valley is concerned, of which I am in charge of the co-operative Co-operative Societies. Societies. there is no industry worth mentioning which has been directly fostered by formation of co-operative societies. Last year a co-operative society was formed with the sole object of fostering the weaving industry in an advanced village by supplying yarns at cheaper rates than at the bazar. It is still in an experimental stage. The results so far achieved are satisfactory. Indirectly some industries such as weaving, silk-rearing, jewellery-making, etc., have been assisted though to a small extent by purely credit societies by issuing loans to their individual members wherever there were applications for the purpose.

Besides the one purely supplying society mentioned above, the means applied were that in some credit societies their bye-laws have been so amended as to make provision for issuing loans to their members for purchase of weaving materials, etc., instead of allowing them to go to the money-lenders who generally charge a very high rate of interest on their advances and make a condition of selling the finished products to themselves at a cheap rate.

The results obtained in these types of societies are beneficial inasmuch as they have saved the members from the grasp of the money-lenders to some extent. But from the point of view of the development of the industry, they are not much, as the members would have the same amount of finished products without such societies. The reason is that in Assam there are only a few families of professional weavers but the bulk of the population are cultivators. Their womenfolk do the work of weaving in their leisure hours. They are not willing at this stage to give up cultivation for weaving although the latter may hold out promise of more gain. In the Surma Valley of this province, there is an inspector in charge of the Co-operative Societies. Some cash societies have been formed there with the sole object of financing professional weavers where there are, I understand, too many of them. The Inspector, who, I believe, has been called upon to give evidence will be able to furnish more information on this subject.

In my opinion co-operative societies should be encouraged for the following industries:—Weaving, silk-rearing, bell-metal and brass industry, carpentry, dairy and cattle-breeding, jewellery-making, etc.

Organisation.—Co-operative societies for purchase, production or distribution as found suitable should be formed amongst professional men in suitable localities with limited or unlimited liability. There should be a central Bank with the sole object of financing such societies.

Special objects.—The special objects of these societies should be to revive the dying indigenous industries and to foster the existing ones.

In this connection I beg to refer to page 7, paragraph 8 of Sir E. MacLagan Committee's Report which runs as follows:—"The forms of co-operative activity that have proved most popular and successful in England are those connected with purchase, production and distribution. But in most continental countries these branches of work were not undertaken until credit societies had been firmly established, and development in India has followed the continental precedent. The first Act (X of 1904) provided for the formation only and postponed to them all forms of non-credit co-operation. The policy was deliberately adopted, not because the vital importance of the other kinds of co-operation was not fully realised, but because it was held that among a relatively backward population the difficulties involved in the management of productive and distributive businesses were likely to prove a stumbling-block in the way of progress. Credit societies with their simple organisation and methods of management afforded the easiest field in which the principles of co-operation could be learnt and practised and were therefore first pressed forward. With the numerical increase in

societies a knowledge of the main principles underlying co-operative work has gradually spread among the people and in areas where these have been best understood, a desire has arisen for applying them to other branches of business besides the lending and borrowing of money. We wish to make it clear that in our opinion this development is not only inevitable but essential to the balanced development of the economic condition of the country as a whole, and that the demand for non-credit forms of co-operation is in itself a healthy sign. We would insist, however, on two conditions which appear to us vital to success. Firstly, it is essential that the demand for such societies should arise not merely from external suggestion or hope of effecting some small economy, but from the existence of a real need and from a real comprehension on the part of their originators of all that is implied in the term "co-operation;" and secondly, it is scarcely less important that a strong and competent staff should be available for the supervision of such societies and for dealing with the complicated economic problems involved. Where these conditions are satisfied, we welcome the formation of societies for other purposes than credit."

Assam has learnt to some extent the principles and the benefits of co-operative credit but practically nothing has been taught regarding co-operation in industrial development. So long the grounds were being prepared as quoted above. I think the time for sowing the seeds of industrial co-operation in suitable areas has come. With the appointment of a Director of Industries with a suitable staff, which is in contemplation of the Local Government, a new phase of activity will arise on co-operative lines which undoubtedly will prove a blessing to the people.

At present the Commissioner of Excise is also the Registrar of Co-operative Societies and he holds charge of some other departments in addition.

ORAL EVIDENCE, 5TH JANUARY 1918.

Sir F. H. Stewart.—*Q.* Who is the Registrar of Co-operative Societies in this Province?—*A.* Mr. Mackenzie is the Registrar of Co-operative Societies; besides he is also Commissioner of Excise, and he holds charge of some other Departments in addition such as Salt and Registration.

Q. How many Assistants are there under the Registrar of Co-operative Societies for co-operative societies work?—*A.* There are two, one for this Valley and another for the Surma Valley.

Q. How long have you been in this Department?—*A.* I have been serving as Assistant to the Registrar for the last ten years.

Q. Is that ever since the appointment was created?—*A.* No, there was another man before me for some time.

Q. How many co-operative societies are there in your district?—*A.* In my area there are about two hundred societies in all.

Q. What kind of societies are they? Are they for industries or for agriculture?—*A.* They are mostly for agriculture.

Q. Have you any co-operative societies for weaving or any other industry?—*A.* I have put down in my statement that there is only one purely weaving society for supplying weaving materials to the people, and there are four others which issue loans for weaving purposes as well as for agricultural purposes; they are mixed societies.

Q. Do you take any active part in the formation of co-operative societies?—*A.* Yes, the formation and supervision of these co-operative societies are my duties.

Q. Do you manage or supervise them at all after you have formed them, apart from your duties as Assistant Registrar?—*A.* Yes.

Q. Are they progressing well in this province?—*A.* Yes, they are progressing.

Q. Are the members able to manage their affairs satisfactorily?—*A.* In most cases they do.

Mr. A. Chatterton.—*Q.* This weaving society which you mentioned to Sir Francis Stewart, is it in Kamrap?—*A.* It is just near this station on the other side of the river.

Q. How many members belong to it?—*A.* It had 20 members on the 31st March last. The number must have increased by this time.

Q. Have you any information regarding the extent of their transactions?—*A.* It was just started. The capital at the time of starting consisted of Rs. 515.

Q. Are the members who belong to this weaving society all caste weavers?—*A.* No. As I have put down in my written statement, there are only a few families, some at Titabor and some at Sualkuchi who are professional weavers; but generally in Assam the women in every household weave.

Q. But in this particular weaving society who are the members?—*A.* The members are the husbands and brothers.

Q. I want to get at the exact constitution of the society; you have 20 members or more: are these men or women?—*A.* Men.

Q. Are these members themselves weavers?—A. They are not weavers; they take materials for their womenfolk.

Q. So it is rather an amateur society?—A. Yes.

Q. It is not a real professional weavers' society?—A. No.

Q. And these men carry on totally different occupations, they are agriculturists I suppose?—A. Some are agriculturists and some Government servants.

Q. It is a sort of association for supplying weaving materials?—A. Yes.

Q. Are those members of the society educated people? A. Yes.

Q. So it is not a genuine example of a co-operative weaving society?—A. There is no such society in this Valley.

Q. You have been associated with this movement for the last ten years; I suppose you have come across a good many instances in villages where there are a number of silk growers?—A. Yes.

Q. Is there any co-operation among them in any way?—A. No, not that I know of.

Q. Is there any man growing *muga* silk or *tussar* silk who takes an independent lease of land from the Forest Department on which to grow his silk, or does the village, as a whole, work co-operatively, or what?—A. They grow trees on their lands and rear silk there.

Q. Do any of these silk rearers take up plots of land from the Forest Department and grow silk in the forests?—A. I have not come across such a case.

Q. Do they not say that they want help from Government in the way of improved terms for leasing out trees in the forests for silk worm cultivation?—A. I do not think they do. I have no experience of them.

Q. You have not enough information on that point?—A. No.

Mr. C. E. Low.—Q. Does that society which you were talking about to Mr. Chatterton for supplying weaving materials sell the goods which the members make and help them in that way?—A. It is only a distributing society. It purchases things cheap and retails them to the members at cheap rates.

Q. It does not attempt the distribution of their manufactures?—A. No.

Hon'ble Lieutenant-Colonel P. R. T. Gordon.—Q. Regarding this co-operative society which you mentioned to Mr. Chatterton for the supply of yarn to the members at cheaper rates would you suggest any other things besides weaving materials?—A. They supply yarn.

Q. Would you include *ras* *?—A. Yes.

Q. Is there any difficulty in obtaining *ras*?—A. *Ras* is very difficult to get.

Q. Where do they get *ras* from now?—A. Here they get from Pattidarang.

Q. Has the price of *ras* gone up of late years?—A. I have no exact information on that point.

Q. Is it the fact that the people of Assam obtain their *ras* for weaving from Lower Assam?—A. I think they do.

Q. You don't know that for certain?—A. I do not know.

Q. Then as regards the bell-metal industry, have you any experience of the bell-metal industry in Sathibari or in Karinganaj?—A. I have seen lots of things from those places.

Q. Have you any idea as regards the improvement of the industry?—A. By giving expert advice.

Q. Would it be any good to send some men to other parts of India to learn improved methods?—A. Yes.

Q. Would you recommend that?—A. Yes.

Q. Say to Jaipur or some other places like that?—A. Yes.

Q. How could it best be arranged, by the giving of scholarships or how?—A. By giving scholarships and stipends.

Q. Then as regards carpentry and boat building, is there any difficulty in obtaining the necessary timber for the manufacture of furniture or for making boats in the province?—A. No, I do not see any difficulty. At least so far as I know, there is no difficulty in procuring wood, but the people do not know how to make them, that is the difficulty.

Q. Is wood readily available from the Forest Department for furniture and boat building, or are there any restrictions in the way of getting wood?—A. Royalty has to be paid.

Q. Do you think that the royalty is too high or do you think it is too low?—A. I do not think it is too high.

Q. You would not give any special facilities for getting timber cheap?—A. I would not give any special facilities.

* Note.—The *ras*(s) is the reed of the loom.

WITNESS No. 395.

SRIJUT DEVESWAR GOSWAMI, *Managing Proprietor, Barpathar Farm, Golaghat.*

WRITTEN EVIDENCE.

The Sugarcane Industry.

I have a sugarcane farm at Barpathar in the Rangamati mouza of the Golaghat sub-division in the district of Sibsagar and I am the Managing Proprietor of the above farm. Sugar is manufactured in my farm by the *Hadi* process. In my humble opinion the following measures should be adopted to improve the industry of sugar and *gur* (molasses) manufacture in the province of Assam.

(1) Cultivation of sugarcane being an annual affair, it has to be renewed from year to year. Sugarcane requires much manure without which it cannot thrive well. The expense of manufacturing sugar by machinery is also very considerable. It will, therefore, be a great help if it be regarded as a "special cultivation" and certain concessions be granted in respect of land by the Government with a view to improve the industry.

(2) In my opinion grants of 30 years leases should be made to intending adventurers and the lessees should be given sufficient time and opportunity to reclaim and cultivate the land. The grant should not be liable to cancellation even if the lessee failed to cultivate the whole of it within a short period of time. In case a time limit is considered essential it should never be less than ten years for the cultivation of the whole grant and five years for half the same.

(3) In case 30 years' grants be not practicable, revenue may be assessed at half the current rate upon intending sugar-manufacturers. This will mean no loss to the Government, because at present the sugarcane cultivators give up their land after every four or five years. Petty manufactures may also be exempted from the timber valuation, which is not assessed on rayats cultivating less than 50 bighas of land.

(4) Our province is not suitable for the establishment of a big central sugar factory owing to want of sugarcane at one and the same place in a sufficient quantity. Such a factory would be of no use to Assamese villagers as they cannot leave their homes (where they have got *ekpit* land for paddy cultivation) to work in the factory or to supply sugarcane there. The neighbourhood of the rural country where sugarcane could have been cultivated easily is more or less covered by tea plantation. So a central factory will be of no use either to the villagers or to the middle class gentry who cannot start a sugar factory owing to want of funds.

(5) The districts of Lakhimpur and Sibsagar are more suitable for sugarcane cultivation; and within this area sugarcane is one of the principal cultivations of the rayats. Establishment of an experimental farm in one of the districts will benefit the local industries. The method, followed in the Nawabganj farm at Bareilly in the United Provinces of Agra and Oudh, as devised by Mr. W. Hulme, the Government sugar engineer, should be adopted in the experimental farm; and if established at all, it should be in either of the districts of Upper Assam where sugarcane is plenty and grown easily. The smallest sugar plant that could be worked on a commercial basis (as proposed by Mr. W. Hulme), should be adopted for use in the experimental farm.

(6) Manual labour should as far as possible be replaced by improved improved machines worked by cattle. Land suitable for sugarcane cultivation and manure as well should be selected by experiment and the varieties of foreign sugarcane which are suitable for this country ought only to be cultivated. This should be done under the supervision of the Agricultural Department.

Pioneer factories.

(7) Government pioneer factories should be established and worked by purchasing raw materials (sugarcane) from private enterprisers and rayats. These factories, equipped with proper machinery, may be handed over to private capitalists after 4 or 5 years.

(8) In a rich country like the United Provinces small machinery has been needed, devised, and worked well. In Assam too which is but a poor province, big machinery will be out of question.

(9) If the pioneer factory works well in one district others may be started in each district of Assam and handed over after some years to private capitalists which will encourage existing private enterprises in the province.

Government assistance.

(10) Last of all duty should be imposed on foreign sugar and Assam should be given opportunity to manufacture country sugar and *gur* (molasses) for local use. In short it should be the look-out of the benign Government to encourage the industry in all possible ways and as best as it can.

ORAL EVIDENCE, 5TH JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. With reference to these conditions that you put forward, I want to know whether you have applied to Government stating these conditions or anybody else has done so, or what you state is your opinion?—A. I did not apply myself for land on special cultivation rates but I know one gentleman who went to Japan and returned

here and he applied for land and he was not given that on special cultivation terms. His name is Mr. L. Barthakur.

Q. Can you produce any of the letters of the Government before us on that subject?—A. I have not got any letter.

Q. Are you quite sure about what you tell us because we may have to make references to Government on the subject?—A. I know that is certain. Moreover that gentleman is coming as a witness.

Mr. A. Chatterton.—Q. What is the area of the sugarcane farm you are working?—A. 60 acres.

Q. Do you rotate sugarcane with any other crop?—A. Only sugarcane. I allow the land to lie fallow every three years and then I take up other plots. The crop is all very well for the first two years but for the third year it is not good.

Q. Do you grow a ratoon crop?—A. Yes. In the third year I cut up the roots.

Q. Do you manure sugarcane fields?—A. Yes. While opening a new land or forest land I do not use any manure but afterwards I use cow dung and mustard cake.

Q. How much money do you spend on manure for each acre?—A. Rs. 30 per acre if I use oil cake manure and Rs. 8 per acre for cow dung manure.

Q. Can you tell us what weight of cane you get per acre for the first crop?—A. 900 maunds per acre. That is the best crop.

Q. On the second or ratoon crop how much do you get?—A. About the same. Generally we do not wait for a third crop.

Q. What is your average crop?—A. The average may be about 600 maunds.

Q. How do you crush the cane when it is ripe?—A. We have a three-roller mill driven by steam.

Q. You say that you use the *Hadi* process. From a maund of juice how much of sugar do you get?—A. I get about one maund of *rab* from seven maunds of juice and 16 seers of white sugar from one maund of *rab*.

Hon'ble Sir R. N. Mookerjee.—Q. From seven maunds of cane juice you get 16 seers of white sugar?—A. Yes. One seer is lost in drying and it comes to 15 seers per maund of *rab*.

Q. How long have you been carrying on this business?—A. For 26 years.

Q. Are you extending your business?—A. I extended it from a small beginning but for the last few years I have not extended it.

Q. Why?—A. Because there is no other available land for sugarcane.

Q. Is it Government land that you have?—A. It is *patta* land, that is, land assessed to full rate of revenue.

Q. What is the assessment?—A. Rs. 1-9-0 per acre.

Mr. A. Chatterton.—Q. Do you sell any *rab*?—A. I do not sell it as *rab* but as *gar*.

Q. What do you get for a maund of *gar*?—A. The present price is Rs. 8-0 or Rs. 7.

Q. Do you sell white sugar?—A. Yes, previously I used to sell it for Rs. 10 to Rs. 12 but now it is sold at Rs. 15 a maund.

Hon'ble Sir R. N. Mookerjee.—Q. You are making a good profit then?—A. 35 per cent. profit on the capital.

Mr. A. Chatterton.—Q. What do you do with the molasses?—A. That is sold in the market for mixing with tobacco for hookah.

Q. Is there a large demand for the molasses?—A. I can sell all my molasses.

Q. What price do you get for it?—A. Rs. 4-0 a maund.

Q. Do you buy any cane from other people?—A. No.

Q. When do you plant sugarcane here?—A. March and April.

Q. When do you cut it?—It begins from the 15th December and ends about the month of March.

Q. Do you keep your engine and mill running the whole of that time from the beginning of December till the end of March?—A. Sometimes it is closed. I find difficulty in getting the machinery repaired when there is need of repair. I have sometimes to send parts to the railway workshops for repair.

Q. What is the size of your mill? What is the length of the rollers and the diameter?—A. 14 inches diameter and 24 inches length.

Hon'ble Sir R. N. Mookerjee.—Q. What made you take up this industry?—A. I belonged to a respectable family but I was poor and I took up service in a tea garden and after that I took to experimenting in sugar and took up sugarcane cultivation.

Mr. A. Chatterton.—Q. What sort of steam engine have you got? Is it a portable steam engine or a fixed one?—A. Fixed, with a separate boiler. It is not an oil engine but a steam engine.

- Q. What is its horse power?—A. The boiler 10 h.p. and 8 h.p. the steam engine.
- Q. Who is the maker of the engine?—A. The boiler is from Messrs. Ransome Sims and Jeffreys, Limited, and the engine from Messrs. Manlove Elliot and Company, Nottingham, England. For preparing sugar I have got a separate plant.
- Q. How much capital have you sunk (in the concern)?—A. The annual expenditure is about R12,000, that is, the running expenses.
- Q. What is the capital expenditure on the whole of this plant?—A. I have kept no accounts for that. The machinery cost about R13,000 but I cannot give you an idea of the cost of acquiring and opening up the land.
- Q. Do you burn wood or coal?—A. Firewood.
- Q. What do you pay for firewood?—A. I have got my own forest, but I have to cut the trees and the cost of carriage comes to six annas per cartload.
- Q. When you are working your mill how many hours a day do you work?—A. About 12 hours daily.
- Q. During the whole season?—A. Usually for twelve hours but sometimes when the sugarcane supply is small then of course it is closed earlier.
- Q. What do you boil down the juice in?—A. Open fire-heating pans.
- Q. How much more land could you cultivate and work up with this plant?—A. Another 60 acres.
- Q. Do you want artificial irrigation at any time for your sugarcane?—A. Not necessary. It may be good but I have not tried it.
- Q. There is no real necessity for it?—A. No.
- Q. Is there rain in this part of the country in March when you plant your cane?—A. Yes.
- Q. Is your cane thick or thin? What is the diameter or size of the cane that you grow?—A. Two inches in diameter.
- Q. Where do you get your cuttings from?—A. I once got from the Jorhat Government farm some striped Mauritius cuttings and cuttings of 2 other Barbados varieties. I use also local varieties called *bogapura* and others.
- Q. Are you troubled by jackals?—A. I am not troubled to any great extent.
- Q. Who drives this plant for you? Have you got an engineer?—A. I have got some local men who have been trained.
- Q. Where did they get their training?—A. It is not very difficult. I was trained myself and I have also a man who received some training in the Jorhat workshop. I got no training in any workshop.
- Q. What pay do you give to the driver of this plant?—A. R12.
- Q. Do you keep him all the year round or do you keep him only for a few months in the year?—A. I keep him for the season.
- Q. What does the man do during other times?—A. He is employed by me on other things as sirdar, and I pay him less for that period.
- Q. Have you got any steam plant or mechanical plant of any kind on your farm?—A. Nothing except the sugar plant.
- Q. Do you plant sugarcane in trenches?—A. Yes.
- Hon'ble Lt.-Colonel P. R. T. Gordon.—Q. You plant striped Mauritius and other kinds of cane. Which gives the best outturn?—A. Striped Mauritius and *bogapura* yield about the same outturn, but *bogapura* is liable to disease while the other is not.
- Q. Have you any difficulty in obtaining striped Mauritius from the Government farm or do you get it easily?—A. No. I got them free of cost.
- Q. You say there is not much demand for molasses locally. Why do you not sell it to the Jorhat distillery?—A. I have supplied *gur* to that distillery but after that I have not supplied them nor have they asked for it.
- Q. Why is that?—A. On account of the difficulty of communications.
- Q. What price are they prepared to give for molasses?—A. They took *gur* at R5 a maund.
- Q. But no molasses?—A. No.
- Q. You say you employ local labour?—A. Yes, local as well as foreign. I employ ex-garden coolies who live in villages as *rayats*.
- Q. Who are your engineers and mechanics?—A. They are local men.
- Q. They are Bengalis?—A. Yes.
- Hon'ble Sir R. N. Mukerjee.—Q. What pay do you give them?—A. R12 and R8.
- Hon'ble Lt.-Colonel P. R. T. Gordon.—Q. Have you received any application from any Assamese for employment?—A. I employ local Assamese when the rice cultivation season is over.
- Q. Could you employ any apprentices? Would you agree to employ any apprentices if they got stipends?—A. I have no objection.

Hon'ble Sir R. N. Mookerjee.—Q. Is your adjoining land suitable for extending cultivation?—A. There is no fit land around for cultivation. There is no available land and besides it is difficult to obtain land on account of the opposition of some of the tea planters.

Hon'ble Lt.-Colonel P. R. T. Gordon.—Q. What sort of opposition?—A. I myself applied for 1,200 acres in three applications in all at a remote place in order that the planters might not interfere. But one year after my application a part of the land had been already occupied by some planters.

Hon'ble Sir R. N. Mookerjee.—Q. After twelve months from the date of your application that land was given to somebody else?—A. It has not been given, but it has been occupied, that is, it has been surrounded by cutting lines of survey and the planter applied for a grant there. I personally requested the planter not to interfere saying that the Government had already promised to encourage me but he did not listen to it and although there are more than 500 acres of waste land available near by, the planter has surrounded a part of the land of my application.

Q. How did he occupy?—A. By filing an application and opening a Nursery.

Q. But the Government knew that you had applied for that land for sugarcane cultivation?—A. I applied for tea cultivation.

Q. I am talking of sugarcane and is there any land for which you applied but did not get?—A. No.

Q. Why are not others following your example? You are making a good profit?—A. About 6 or 7 persons have taken up sugarcane cultivation only on a small scale.

Q. The land which you applied for, for tea cultivation, is that land suitable for sugarcane cultivation?—A. Yes.

Q. Why did you not extend your sugarcane cultivation instead of going in for tea if you had such a good profit?—A. Because tea can be grown as a permanent cultivation whereas sugarcane has to be done every year.

Q. You think that tea industry is more profitable than sugar cane?—A. In my opinion tea is more profitable because it is permanent and can be sold afterwards whereas a sugarcane plot cannot fetch the same price if sold afterwards.

Mr. A. Chatterton.—Q. How many coolies do you employ on this sugarcane farm?—A. 120 agreement coolies and besides in the cultivation season I get other labour, that is about 20 or 30 over and above these 120 permanent coolies.

Hon'ble Sir R. N. Mookerjee.—Q. Do you know of any other instance from your own personal knowledge where any Assamese applied for tea land and was not given?—A. One is Srinath Bez-Barua of Golaghat, another is Garichatan Barbor's son, and the third is the wife of the headmaster of the High School at Golaghat.

Q. Who decides the cases? The Deputy Commissioner?—A. I cannot say.

Q. In your own case did you prefer any appeal to the Commissioner?—A. My application has not yet been finally disposed of.

Q. But you say that the land has been already occupied. Why did you not appeal to the Commissioner?—A. The planter applied in December last only, and I am waiting to see the decision of the authorities.

WITNESS No. 396.

Nath Adhikari.*

RAI SAHIB AGHOR NATH ADHIKARI, F.R.A.I. (London), *Superintendent,
Normal School, Sibschar.*

WRITTEN EVIDENCE.

Financial aid to Industrial Enterprises.

1. My first experience in raising capital was in connection with the Spinning and Weaving Mill of Rangpur. It was about the year 1890. It was, I believe, the first attempt of its kind on a larger scale in this part of India to raise capital by small shares of Rs. 10 each. Though I did not take any active part in it, I saw several of my friends contributing their shares with much enthusiasm. But with the collapse of the company owing to mismanagement and misuse of funds, people were much disappointed. About the year 1895, I tried in conjunction with the late Mr. Amiritlal Roy, the organiser of the Bengal Provincial Railway Company, to raise capital on the same line for the said railway. I experienced much difficulty. The disaster, the mismanagement and the frauds of the past frightened the contributors. However capital was raised. A friend remarked "we must not lose heart if one or two such enterprises fail. This must be our object-lesson for the future—we have to learn business at our own cost." Again the sudden growth of the so-called insurance companies promising Rs. 100 for each Rs. 10 subscribed, especially in this part of India, and their sudden disappearance during the last three or four years have increased the shyness of capital a good deal. But for enterprises in which our men have given proof of their business capacity, people are still ready to subscribe shares. The tea industry is a business in which

Raising of Capital.

we have not failed, for the managers of our tea-gardens are men who get their training in tea-estates managed by European companies. My late experience in raising capital is in connection with the All-India Tea Company of Sylhet. There was less difficulty in raising the capital for this company.

Capital can still be raised easily by public subscriptions in the form of shares for joint-stock companies, if the promoters can satisfy the public by giving sufficient guarantee for the following arrangements in the management of their concerns:—

(1) *Appointment of Directors.*—If the directors' list does mostly contain the names of a good number of business men and not of Rai Bahadurs and Raja Bahadurs or M.A., B.L.'s and M.A., D.L.'s. The Tata Company collected funds very easily, for people had much confidence in their business capacity.

(2) *The selection of the Managing Director.*—There seems to be a very common belief that any educated man can become a successful business manager. Lawyers are no doubt of the acutest intellect, but it does not follow that any lawyer can successfully manage any business. The Manager of the Rangpur Spinning and Weaving Mill was a pleader. Again the promoters of a company sometimes usurp to themselves the actual managing of the company.

(3) *Supply of labour.*—We often make a wrong estimate on this head of expenditure. Labour is not so cheap in India as we may be disposed to think. The wages may be low but the people are not honest, dutiful, punctual and hard-working—so the amount of work done is much less compared with the wages paid.

(4) *Supply of raw material.*—The supply of cotton and yarn has this year much retarded the working of the cotton mills. It is to a great extent attributable to the war, but such disasters the managers must always be prepared to face.

(5) *Machines and tools for the concern.*—Machines of new design are not always successful. Advertisements sometimes mislead purchasers. Trained mechanics are not engaged. I had one experience of it at Pabna (North Bengal). A surlee-mill went out of order and the work was stopped for a week. A friend of mine, who was a Mechanical Engineer, came to see me from Calcutta. He was requested to examine the machine. He put it right in about half an hour. He had some parts opened by the workmen of the mill. He then removed a piece of wood which accidentally entered the exit hole of the boiler. He charged Rs. 50. For this small business the mill suffered a loss of at least Rs. 500 for want of a little mechanical skill.

(6) *Appointment of trained labourers.*—Sufficient numbers of trained labourers are not appointed and no attempt is made to get unskilled labour trained for the work.

(7) *Suitable sites.*—Unsuitable sites often become a source of unnecessary cost and trouble. Cost of transport absorbs a good deal of the dividend.

(8) *Utilization of bye-products.*—Good arrangements are not made for the utilization of bye-products, consequently the dividend is poor.

(9) *Supply of additional capital.*—For various reasons the estimated or the paid-up capital may fall short of the requirements. Managers in such cases are compelled to borrow money at a high rate of interest which absorbs all the dividend. Guarantee is not given for the supply of this additional capital at a nominal interest.

(10) *Audit of accounts.*—Arrangement is not made to have accounts examined by certificated auditors appointed by Government.

2. Capital for the bigger industrial enterprises is principally drawn from willing contributors in the form of small shares. This is the way in which joint-stock companies raise capital. Mostly those who follow literary professions subscribe their shares to joint-stock companies. The shop-keepers prefer banking business. But most of the people prefer putting their money into land. This gives them at once a *locus standi*; they can work the land themselves; and in any case know how to do so through others. If the credit of the Government or of well-known and trusted men were behind the flotation, confidence would be inspired and the shares more readily taken up. It is, I believe, a fact that companies floated by Europeans are readily subscribed to by Indians but they fight shy of sinking money in purely indigenous companies, unless the promoters are well-known and inspire confidence. If the Government by itself or by granting subsidies to well-known business firms, would project industrial concerns in the various provinces as illustrative of what might be done and done profitably, then the local people would soon take it up for themselves.

3. I do not know of any company in this province where more concerns have been started than could be maintained in full time employment.

The Assam-Bengal Railway Company would never open lines had it not been aided by Government. Government aid in such enterprise is necessary. The Gauhati-Shillong Motor service would never have been run by private firms apart from Government guarantee and aid. It is now run by Messrs. Kilburn & Co. and very profitably according to the last general meeting of share-holders. This practical illustration has had its effect on private firms in Shillong who are now running their own cars to bring up goods and if Government did not preclude them from passenger traffic they would easily and very soon cut out Kilburn's. I would suggest that Government should guarantee and subsidise at least the first firm undertaking original enterprise within the province. If this were successful, it would

be unnecessary afterwards. But in co-operative business Government aid in money should not be given. Co-operation cannot be generated by endowments. Self-reliance and independent effort are the two main pillars of genuine co-operation.

(1) Money grants-in-aid should not be given to joint-stock companies where business is to be carried on solely for the profit of the share-holders. But in the initial stage of some co-operation or central banking business, Government aid may be necessary. Money grants-in-aid may be given in cases like the following :—

- (i) Scholarship to students for receiving technical education in other countries.
- (ii) Grant-in-aid for such inventions as are likely to be of industrial advantage.
- (iii) Opening exhibitions.
- (iv) Publishing instructions for the improvement of any industry.
- (v) Arrangement for demonstrations and lectures.
- (vi) Establishment of a Department of Industry with laboratory and museum under a qualified staff where the intending directors of any industrial concern may get practical help.
- (vii) Establishment of industrial schools and colleges.

(2) Bounties and subsidies may also be required to encourage such ventures which people will not readily subscribe capital to, but which will produce some material good to the country, e.g., utilisation of the power of water-fall. In smaller affairs also subsidies may be necessary. I give one example. There was no easy communication between Kustea (West Bengal) and Pabna (North Bengal). The District Board of Pabna promised a subsidy to a steamer company for opening a regular service between Kustea and Pabna. The District Board fund is a public fund and the money spent on this subsidy is spent for the public.

(3) Guaranteed dividends with or without subsequent refund may also be required to encourage companies to start business of the kind stated above in (2). Railway companies will not open lines in thinly populated localities or in localities where the expenditure for opening such lines may be considerably great and the expected income not such as to pay sufficient dividends to the share-holders. For the sake of convenience of the public and for the development of trade in future, guaranteed dividends may be necessary.

(4) Loans with or without interest may be necessary in encouraging companies to start new industries which the country may be badly in need of, e.g., tannery, paper mill, sugar factory, etc.

(5) Supply of machinery and plant on the hire-purchase system is one of the most effective means of encouraging industry.

(6) Provision of a part of share capital by Government is a guarantee to the public that there is less likelihood of fraud or mismanagement. It is greatly helpful in raising capital.

(7) Guaranteed purchase is of course one of the best means of encouraging industry.

There should be Government control in all of the items of help mentioned above excepting No. (7). Government auditors should examine the accounts periodically, particularly the expenditure. This will produce the desired effect. A larger amount of control may interfere with the legitimate freedom of the managers.

Pioneer factories are necessary in backward provinces. They will be a sort of object-lesson. Pioneer factories.

Government may, for example, open a paper mill in this province, work it out successfully for some years and then hand it over to a company realizing from it cost and expenditure with interest. As soon as private companies project similar concerns, it would then be easy to dispose of and it would have served its purpose.

Concerns like a paper mill, a sugar factory should not be converted into permanent Government enterprise but a hydro-electric establishment or a munition factory may be converted into a Government enterprise.

Industries managed by joint-stock companies are sometimes hampered under the conditions in which they are financed. I give one instance in the case of a particular joint-stock company. The company first estimated its cost for starting business at Rs. 60,000. It doubled this capital and issued a call for Rs. 60,000, i.e., half the estimated capital for the present, promising a dividend of 4 per cent. in the very first year. Owing to mismanagement, it could not issue the dividend but on the contrary issued calls for the next instalment of Rs. 60,000. Share-holders apprehending its ruin, did not respond. The promoters were then compelled to borrow money at such a high rate of interest, that the company at last wound up.

Banking agencies may do a good deal in helping these enterprises by lending money at a low rate of interest provided they find the working of the company thoroughly satisfactory. If Government makes such a rule that it would lend the help of government auditors to check the accounts of an involved or dying company, banks will find it then much easier to issue loans on the merit of the audit report.

With the increase of industrial concerns new banks should be opened but for industrial expansion on a larger scale, abundance of foreign capital is necessary and Government alone can secure this capital.

Co-operative credit.

I have been working here at Silchar as Comptroller of the Co-operative Credit Bank for the last four years. I have not seen any industry developed or assisted by this bank. These banks are still in their infancy and I do not therefore think it desirable to extend their sphere of action by opening other business in their connection. But, that should be our final aim—the aim of making such a profit out of extra business as can be of material help to the societies in reducing interest on loans to the lowest rate possible. I have heard of a co-operative society, somewhere near Benares, which decides village disputes and cultivates sugar-cane by free-labour investing its profits in digging tanks for drinking water for the villagers. This, no doubt, is the spirit of co-operation.

Agricultural operations and industries for which raw material is supplied by agriculture (e.g., husking paddy, ginning cotton, making *gur* or sugar, making canvas from jute, fruit tinning, etc.) seem to be the best field of enterprise for co-operative societies. Godowns may be constructed to store agricultural and industrial products in order to sell them at a time when prices rise high. The work may be further extended—articles may be bought in a cheap market and held for a rise—and the like. As a productive calling agriculture has to depend entirely upon the market.

The special objects of co-operative societies should be to see that the economic condition of the members, or more widely of the villagers improves gradually and that they all become economical. The present form of organisation for the conduct of these societies seems to be satisfactory. We are now to see that central co-operative banks are opened in all district head-quarters to help village societies and to advance loans directly to agriculturists at reasonable rates of interest. Co-operative credit societies can produce little tangible effect on the condition of the agriculturists unless there is a net work of them throughout the district, and the capital at their command is many times increased. The members of village co-operative credit societies are men of limited means and they primarily join the society for the purpose of borrowing money. A very few of them can deposit money enough to meet the demand of the members.

Land-banks may be opened to help big land-owners who may be in need of financial assistance but who cannot be served by the limited funds of co-operative credit societies. For this purpose I recommend the opening of private banks under Government control, from which loans will be issued on mortgage security and re-payable over a period of years. As these will be under Government supervision, the share-holders will consider their money safe and will not object to lowering the rates of interest on which money is to be lent.

Limits of Government assistance.

There are some concerns that start business under Government guarantee or with Government bounty and subsidy. It is, of course, the duty of the Government to look to their interest. But they must not be allowed to carry on their spirit of competition to such an extent as may ruin any private enterprise. As an illustration I may mention the collapse of the Tata line of steamship. The subsidised European companies reduced their rates to such a low point—temporarily of course—that it made all competition impossible. This sort of unfair competition should be put down.

Government aid is required to foster and encourage purely Indian industry. In fair competition with any external trade, Government aid should not be withdrawn. But in cases where the subsidised enterprise is not expected to stand the competition, withdrawal of aid may be necessary. There should again be some limitation in it. For example no withdrawal should be made in favour of non-British and bounty-made sugar, paint and the like, but on the contrary the subsidised sugar factory or the paint manufacture should be encouraged with more aid if necessary in order that it may successfully compete with external trade in these articles. External trade in books, medicine, scientific instruments and the like should never be discouraged. I imagine that Japan is going to be the great obstacle to Indian industrial development in the near future and I understand her trades are heavily subsidised by her Government. She is making a tremendous bid just now to capture the bulk of foreign (non-British) trade in India. Undoubtedly she will be the most formidable competitor of all.

Technical aid to Industries.

Technical aid.

The technical and scientific aid that is being provided by government to industrial enterprise is greatly helpful but not adequate—neither in quality nor in quantity. The Sibpur Engineering College has very recently opened special departments for teaching mining, mechanical engineering and dyeing and bleaching. The mining and mechanical engineers learn the theories but not the art of conducting business. They do not do anything for themselves—of course want of capital is one of the great hindrances, but I believe the want of business training is the greatest. We often times see that a lad of 15 or 16 with little or no education enters a shop on a very small pittance and begins his work from the lowest step which is the serving of tobacco to his master. Gradually he is elevated to the position of salesman and when he is 30, he opens a shop for himself and manages it so excellently that he becomes a man of some lakhs in a few years while the M.A.'s and B.A.'s of our Universities vegetate on Rs. 50 or Rs. 100 a month and when they die, leave their wife and children almost penniless. I have seen good many of my graduate friends starting business but most of them failed—those only survived who took the help of business men. Mr. Heaton, the Principal of the Sibpur Engineering College, in his speech at the last Madras Industrial Conference, pointed out this defect in the training of his Sibpur students.

The Agricultural Department has been helping a good deal in introducing better seeds, better manure and better implements. The Entomological section has also done much to stop insect pests. But the desired result is still at a great distance. I had been deputed for some time (about 1908) to study the method of agricultural instruction given in the Nagpur Agricultural College. The experiments performed by the Professors and the students were all very excellent. But they were so very costly and tedious that economically they could produce little or no profit. I give one example: The cows were kept there in houses which the gentry of the province do not possess. The floor was pucca-terraced with one inch thick cement plaster. The floor slanted into a pucca drain which led into a pucca tank. The arrangement was to show the process how urine could be collected for manuring purpose. The students and the Professors of the college were not agriculturists themselves—they were merely scientific theorists. I do not say that we should do away with theory altogether but what I mean to say is this: In the progress of industries we find all countries begin with art first. We are, as regards industry, in the backward state. Theory at this stage is not very useful and we should therefore sacrifice a portion of it to make room for practical art. But still for fairness' sake we must all gratefully admit that some of the demonstrations of the various research departments—especially the agricultural, show the feasibility of both increasing the quality and quantity of our products by the adoption of methods which are not beyond the means or capacity of even the poorer classes. The Geological Department is making a survey of the whole country and publishing useful information as to the openings there are for capital and enterprise. But we are sadly not in a position to profit by it. We have neither the training nor the capital. The tea industry has benefited considerably through the research of its scientific officers. We know much more than we did of pests and how to deal with them. There are great tracts of abandoned tea in these districts, the chemical constituents of the soil have shown it to be unsuitable. Of late years much has been done in the way of scientific manuring; and in some respects it may be said that the process of manufacture has been revolutionised. What has been done for tea could equally well be done for other industries.

Loan of Government experts may be given to private firms or companies on payment of small fees. I suggest that the fees be regulated according to the profitability of the industry, the nature of the industry, and the amount of the capital; those who can afford to pay higher fees, ought to.

There should ordinarily be no restriction on the publication of the results of researches by Government experts even when they are attached to a private business. In special industries (such as bomb-making) trade secrets may not be divulged. Then again, if the research by a Government expert in a private enterprise costs the company an unusually heavy sum, then the case may be considered a special one and the results of the research may not be published. If the expert is for the time being wholly paid by the company the results of his research should be the property of the company, either to publish or reserve. If, on the other hand, he is merely lent temporarily, on a mere consideration in the shape of payment, the Government should reserve to itself the right to publish or not.

Demonstration factory means a large establishment. But its largeness may be considerably diminished if we select one or two principal industries for each province and fit up a laboratory principally for that purpose. It should have a chemist, a mechanic and an all-round business man as director.

We require a demonstration factory in Assam to experiment in sugar, paper-pulp, beet cultivation and tannin extract principally.

I do not know of any aid to any industry in this part of the province, afforded by the Scientific and Technical Department of the Imperial Institute. The representative committees of the Imperial Institute are now at work and are taking much more seriously than ever was done before, the mobilising of the industrial resources of the Empire, and of rendering the Imperial Institute an effective centre for information. Committees for India, for each of the dominions, for groups of Crown Colonies and protectorates, as well as technical committees dealing with minerals, rubber, timbers, silk, etc., have been organised. This is a move in the right direction.

The Indian committee is "to enquire into and report on the possibilities of further extending the industrial and commercial utilisation of Indian raw materials in this country and elsewhere in the Empire." The Institute has investigated more from the scientific and technical, than from commercial standpoints opium, podophyllum, turpentine, resin, cotton, flax, jute, silk, Burma beans, tanning and paper-making materials, etc. The committee will do excellent service if it investigates more on commercial lines.

In addition to the arrangements for research in India it is sometimes advantageous to have provision for research of special subjects in the United Kingdom. For chemical analysis there are in England far better arrangements than what we have got here in this country. Moreover the chemists of England are highly capable men. For the methods of preparing and testing drugs and chemicals, for refining sugar, for enamelling utensils for processes of stamping, for cheap crockery, for refining metallic ores, for freeing iron from sand (in the manufacture of glass), for tanning leather, for producing dyes, etc., we may refer to England.

The Advisory Council for Research in England can help us a good deal by supplying information regarding the process of manufacture of various articles.

Research problem
in India.

There should be for each province a Director of Industries with a small advisory committee of about a dozen members half of which should be educated Indians connected with industry or commerce. This committee will refer research problems to science colleges and other technological institutions in India.

There should be branches of it in all the district headquarters. The head office should be in a position to provide every kind of information the branches might require for the development of existing industries and in establishing new industries. The work of the district committee should be to put before the public proposals and some ideas in which way certain industries should be carried out and what machinery and what expenditure would be incurred and also what profit could be made out of them. The chief aim of the district committee should be to form companies. If companies are floated people will take a larger interest in the work, than if such concerns are financed by single persons.

Surveys for industrial
purposes.

The existing knowledge of the available resources of the country is not sufficient for economical purposes. The departments carry on business more on official than on commercial lines and their notes on researches are therefore more of an academical character. In agriculture more might be done in the distribution of more suitable seed. Some years ago Rev. Mr. Reese of Silchar sent specimens of cotton and cotton seed to the Manchester Chamber of Commerce. The cotton was from the North Cachar Hills. He was informed that the soil which grew that cotton would readily grow one of a much more productive type. But the distribution of such seeds should be pushed through Government officers.

The survey may be organised with the prime motive of increasing the wealth of the country and helping commercial enterprise. The experts in each department of science should be directed to devote their energy in some special subjects, in consideration of the resources at their command, and devise the best means for utilising them in commercial purposes. For example, Mr. Puran Singh of the Dehra Dun Research Institute may be directed to find out the plants that will yield the largest amount of tannin at a small cost. (Mr. Singh has done something in this direction).

The result of this kind of enquiry may be communicated to the district committee, and the district committee in its turn will communicate it to the people, especially to those who may want to know anything about a particular industry. Small pamphlets in the vernacular will be one of the best media. Much might be done by encouraging schoolmasters to lecture in their own districts on the subjects.

Assistance in Marketing Products.

Commercial
Museums.

The Calcutta Commercial Museum is simply a show room of diverse industries. It is visited mostly by those who do not do anything in industry or who carry on business on a large scale. But it is still an important institution, so any remarks which we may be disposed to make regarding its working may be premature.

We want museums of such small industries as can be managed with small capital and of cottage industries that can be taken up by the majority of the poorer population. The district committees should first prepare a list of small and cottage industries which it wants to encourage and then it should collect such articles for the district museum as will stimulate the growth and development of industries that it contemplates to foster. If we do not aspire to open showy museums, it will, I think, be not at all impracticable to open a useful and instructive one at each district centre. The collection will not be costly if the members put their hearts into it. [I have opened such a museum in the Silchar Normal School house, of course more for educational purposes than for commercial. To arrange the exhibits, I purchased some almirahs and some glass phials. The cost was nominal].

Exhibitions.

There should be fixed days for demonstration in district centres. Intelligent craftsmen are first to be picked out from the villages. They are then to be invited to come to the station to witness the demonstration. In some cases it might be necessary to give them travelling expenses and diet money. The aim should be to teach them thoroughly the art and get models prepared by them at the headquarters. They may then be dismissed with sufficient loans to carry on the trade.

Germany had floating museums of her products visiting all the parts of the world. We cannot for the present aspire to such a big scheme, but we may arrange for visiting towns on the river side. One province does not know what her neighbouring provinces produce. I give below a list of larger, smaller and cottage industries that I hope may be suitable for Assam. The list I must say is not complete. It is merely suggestive :—

- I. *Large industries.*—(1) Paper pulp and paper mill, (2) Sugar factory, (3) Rubber plantation and manufacture, (4) Silk spinning and weaving, (5) Match factory, (6) Lime and limestone, (7) Coal, (8) Petroleum, (9) Tea, (10) Pottery, (11) Sawmill, (12) Tannery, (13) Iron and steel work, (14) Oil-pressing, (15) Glass manufacture, (16) Drugs, chemicals, perfumery and dye-stuffs, (17) Paddy and rice making.
- II. *Small industries.*—(1) Tiles, (2) Poultry, (3) Pen-holder making, (4) Fruit gardening and fruit-tinning, (5) Fish curing, (6) Handloom, (7) Dairy,

(8) Soap making, (9) Button making, (10) Carpentry, (11) Dyeing and bleaching, (12) Celluloid, (13) Perfumery, (14) Varnishes, (15) Paints, (16) Bricks, (17) Lac, (18) Oil, (19) Wheat, (20) Rice, (21) Toy-making, (22) Smithy, (23) Horn and hoof work, (24) Pine-apple and plantain fibre making, (25) Cassava and *Santa* flour making, (26) Cheap umbrella making, (27) Honey making, (28) Brass work, (29) Walking stick making, (30) Enamelling of toys.

III. *Cottage industries*—(1) Handloom, (2) Mat-weaving, (3) Basket weaving, (4) Palm leaf weaving, (5) Window *cheek* making, (6) Crochet work, (7) Papier-maché, picture frames, trays, vases, boxes, etc., (8) Clay modelling—fruits, flowers, leaves and dolls, (9) Drawing, (10) Embroidery, (11) Carpet, (12) Lace and neck-ties, (13) Hosiery, (14) Knitting socks and woollen caps, (15) Tape and lamp wick making, (16) Small coats and pinafore, (17) Jellies and pickles, (18) *Chutneys*, (19) *Bada* and *Panfore* made of *dal* paste and dried, (20) Straw-hat making, (21) Making of dolls with cotton and rags, (22) Rope making, (23) Thread spinning, (24) Vegetable growing, (25) Silk worm rearing, (26) Calico-printing.

Industrial development rests mainly on the market and sales-agencies are one of the chief factors to command it. There should be sales-agencies in all the headquarter stations of the province. The district committee will first send samples of the manufactured articles to these sales-agencies requesting them to display the articles in their show-rooms and try to procure purchasers for them. The sales-agencies will get a reasonable commission on the sale-proceeds.

Industrial exhibitions inspire manufacturers with healthy emulation and enable them to make the products of different provinces known to one another, and they also enable traders and dealers to obtain first-hand information about all articles that they want for the market. The things on which large emphasis should be laid at the beginning should be useful and profitable and for their manufacture should require only ordinary skill and intelligence. Industrial exhibitions, which simply awaken the consciousness of one's own ignorance with regard to everything, depress, rather than inspire. A few things well chosen, and well within the capacity of the people to produce would be more stimulating than a whole cosmos of miscellaneous exhibits. An encyclopædia is useful; it is not stimulating. If arrangements can be made to teach people some of the different arts required, exhibitions will be made more useful. The Allahabad Exhibition of 1911 made excellent arrangements in this direction. But there was one defect. There should have been fixed dates for the demonstration of some of the minor industries. I showed the process of raised map-making but a good many of the visitors who had interest in education missed it as they did not know the date and hour of my lecture.

The Secretary of the Department of Commerce and Industry in consultation with the provincial Directors of Industries might arrange for these exhibitions. The Government policy should be mainly the teaching of any new or the improved western methods in the manufacture of various articles. Encouragement in the shape of rewards should also be given to those who manufacture the most useful things by the easiest method, in comparatively less time and with less cost.

To attract visitors the exhibition should of course be of a popular character but more attention should be paid to demonstration of the best process of manufacturing such articles as may find a good market in this country. To bring sellers and buyers in contact should be the next aim.

Arrangements should be made with foreign mercantile agencies for pushing the sale of Indian manufactures. The British consuls stationed in the various countries may be asked through local dealers to open show-rooms exhibiting Indian industries in art-
wares, fabrics, etc., with descriptive catalogues and prices.

Temporary commissions for special enquiries in the case of decline of the sale of any particular class of goods might sometimes be necessary. They might also be necessary where the goods of other countries more than compete with the products of this.

The district committees may do the duties of trade representatives. In the district show-rooms or museums may be exhibited, with descriptive catalogue and price, the articles that are manufactured in other provinces.

The Government departments which use imported articles should not only publish lists of these articles but also exhibit them in the commercial museum. This will give the intending Indian suppliers an idea of the special characteristics of the articles which the Government wants to patronise.

The rules relating to the purchase of stores by Government will work very well if the agents who are deputed to purchase them take a little more care to enquire which of the articles are available in the country. The agents may also show samples of the articles they want and thus encourage the manufacturers in producing them after the models. Purchasing agents should sometime be called upon to explain the cause of their failure in procuring particular articles and they should be punished if on enquiry it is found that these articles are available. One or two such cases of punishment will improve matters a good deal. Again, if a reward be promised for the manufacture of a particular class of

article for which there is plenty of raw material in this country, it will be a good incentive to purchasing-agents as well to manufacturers.

Banking facilities.

New banking agencies should be started to assist artisans in marketing their products. These banks will advance money to the artisans and purchase their articles at a reasonable price. They will then send those articles abroad charging on them a price that will cover the interest on the money advanced *plus* a small profit. One or two of the most successful co-operative credit societies may open a sale-agency section for experiment.

Other forms of Government aid to Industries.

Supply of raw materials.

In this province of Assam there is abundance of grass and thin bamboo that may be used for making paper-pulp. Government at present gets no profit out of them. Manufacturers may be allowed the free use of them for at least ten years. When the manufacture gets into a thriving condition, royalty may be charged first at a very small rate and subsequently with the gradual development of the industry, at enhanced rate.

Land policy.

Settlement operations and the consequent re-assessment are considered a source of hardship specially by the agriculturing class. I give one example to illustrate a typical complaint. X has a plot of "third class" land in his possession—it grows no crop. He works on it hard to improve its fertility. When he has done it, the village Patwari will at once mark and classify it as "First class." In the re-assessment the rent increases a good deal. Possibly he can not pay it, and the land passes over to Y one of his rich neighbours. So X does not think it wise to work for Y. Of course the fertilised land brings X more crop to enable him to pay the enhanced rate but still he is not satisfied. He thinks that he is justified to reap the full benefit of his labour. X therefore does not work with his whole heart on the land which he possesses but temporarily. His argument is this: if a man who lives in a hired house, makes some substantial addition to the house at his own expense, the owner of the house will not for that reason enhance the rent but in some cases will lower it in consideration of the money spent by the occupant. An enhanced rent of course will be charged from the man who next occupies it.

I do not, however, recommend the extension of permanent settlement into provinces where it does not exist, but I believe a modification of the existing system on the lines suggested in Lord Ripon's resolution of 1881 and 1882 may remove the hardship or lessen it considerably.

When a company wants the settlement of waste-land for the purpose of opening a new industry, the Government may grant it rent-free for some years. Then with the development of the industry rent may be charged, gradually at quarter, half and full rate. With regard to settled land the procedure should be otherwise. The Government will first acquire the land for the company at a reasonable price. Then it will charge quarter rent for the first 10 years, half for the next five and then full. For industries that have already proved a success (*e.g.* tea in Assam) no concession is necessary.

I have no criticisms to offer on the working of the Land-Acquisition Act. Adequate compensation should be given in all cases to such an amount that there might be no necessity for High Court appeal.

Training of Labour and supervision.

Training of labour.

Practically no steps are taken to improve the labourers' skill and efficiency.

Before suggesting remedies, I first point out the deficiencies—natural and acquired—of our labourers. They are (1) weak physique, (2) disregard for punctuality, (3) fraudulent motive to do less work than he is required to do, (4) indifference to the interests of his employer, (5) want of education. For remedy I beg to suggest that the labourer should first be taught the 3 R's in some night school organised for this purpose in or outside the factory compound. Secondly he should be taught a little drawing and clay modelling. Thirdly he should have regular exercise in drill. This general course I recommend for the labourers' night school. This training may remove most of the defects referred to above. In addition to this, managers must see that the labourers get sufficient food and that they live in healthy houses. They should also be taught the simple rules of hygiene and they should be compelled to observe them.

(b) To make him fit for any industry he must be taught a little carpentry or "sloyd" along with drawing and clay modelling. The ordinary works of house-making and gardening are helpful in developing technical skill.

Training of apprentices.

I have seen apprentices being trained in the railway workshops, in the Telegraph Department workshop and in Messrs. Burn & Co.'s workshop. Those that get training at Messrs. Burn & Co.'s secure better employment. I have also seen apprentices being trained in the Sibpur Engineering College and in some of the technical schools in Bengal. The Sibpur men learn carpentry, blacksmith's work and a little electrical manipulation. The technical schools teach carpentry and smithy. The training given to these apprentices does not help them much in opening any trade. They are taught more on the engineer's line than on the trader's—and considering the time that is spent in this kind of apprenticeship, the training received is very poor. The artisan-apprentices are given the same amount of leisure and leave, as are allowed to the regular engineering students who study a good many theoretical subjects in the class-rooms. Again they are taught to spend the same amount of

time on their models as are spent by the students who desire to become overseers or engineers. So the apprentices are made "Babu artisans"—to quote a tea-garden manager who recently employed one of them. A Chinese carpenter is more industrious and skilful than our technical school trained men. So it is more profitable to engage a Chinese carpenter. There is a complaint from the Department of Education that the trained men do not get adequate encouragement from the mill and garden-owners. Here is the reason for their antipathy. Practically there is no such institution in this part of India where apprentices can get thorough business training.

I have seen some weaving schools working the new looms. (Fly shuttle and the automatic.) People show no eagerness to learn the use of these looms. First because the quality of cloth which these looms produce is not very fine. Mill cloth is much cheaper in comparison. Loom-made coarse cloth has no market here. Our hand-loom produce a much finer quality than what can be produced in mills. It is for this reason that hand-loom industry is still surviving. Some experts told me that finer cloth could be made with the fly-shuttle. But better demonstrations are wanting.

I know of another industrial school which was opened at Palna (North Bengal) by Babu Bhagwan Chandra Bose, father of Sir Jagadis Chandra Bose. The apprentices were taught brass and bell-metal work. The school was closed soon for want of capital. Bhagwan Babu was a well-intentioned philanthropist but not a business man.

If we seek any permanent results, we must put our industrial schools under business experts.

If we open industrial schools, where a little theory will also be taught, we must open a separate class for apprentices who will do no theory. They will work hard in the workshops so that they may combine labour with skill.

Night schools for labouring classes offer educational opportunity along three lines:—
(1) A repetition of the work of the regular elementary and secondary school, (2) vocational instruction chiefly along commercial and industrial lines, (3) general informational and cultural instruction for those whose daily work offers little or no opportunities for such instruction. These schools materially help the education of the working people. One feature of special significance is the greater adaptation of these schools to the needs of the people than is found in the ordinary day schools which are largely bound down by traditional subjects and traditional methods.

These night-schools will be opened at convenient centres suggested by the district committee. They will be organised and financed by the Education Department. The minimum age for admission in England is 12 years because the law of the country requires all between the ages of 5 and 14 to attend day schools to learn the 3 R's. But here in India there should be no age restriction. These schools may also receive grants from Local Boards. Tuition in all cases should be free. The ordinary school time will be from 7 to 9 for four evenings every week and twenty-five weeks a year. The greatest difficulty with these schools is irregular attendance. Teachers may be given capitation allowance along with their pay to improve attendance. The course of studies may be as follows:—

- I. *Book-work*.—Reading, writing and arithmetic.
- II. *Hand-work*.—Drawing, clay-modelling, paper-modelling, mat and basket-weaving and "Sloyd."
- III. *Physical exercise*.—Drill and "Kasrat."

His Imperial Majesty the King-Emperor, in reply to the address presented by the Calcutta University, most graciously said: "It is my wish that there may be spread over the land a net-work of schools and colleges from which will go forth loyal, manly and useful citizens able to hold their own in industries and agriculture and other vocations of life." Here "industry" has been put first but our present educational authorities work in the inverted order, i.e., they prepare students for other vocations of life (clerkship, teachership, pleadership, etc.) first, agriculture next and industry never; so we should rather let the two departments—the Department of Education and the Department of Industry work out their schemes independently. Let the Department of Industry begin its work in the right order, i.e., industry first, agriculture next and other vocations of life last. Our Education Department has become much too stereotyped. It has been working on its traditional line—teaching subjects that produce little pecuniary benefit. We want the industrial schools run on such a business method, that every step of it may produce something tangible to attract learners.

I do not know of any institution in this country where our supervisors of all grades and skilled managers may be trained. Messrs. Burn & Co.'s workshop may be a good ground for the training of supervisors—in the absence of better arrangement here. But for the training of skilled managers, we must seek the help of foreign countries.

In foreign countries Indians do not very easily get admission into the industrial concerns where they want to learn any trade. This difficulty may be considerably removed if the managers, supervisors and technical experts of private firms are deputed by the Government for such training.

For industries assisted by Government, technical experts should be trained either in India or elsewhere—considering the nature of the industry and the amount of skill required

to conduct it. The expenses will be borne by the company from which the man will be deputed. Whether a man is to be trained in India or outside—will be decided in a meeting of the directors of the company—one of these directors will, on instruction, represent the Government.

Mechanical Engi-
neers.

There is a want of uniformity in the standard of examination for Mechanical Engineers held in the various provinces. It is desirable that the test should be uniform. The India Government may lay down a common syllabus for all these engineering schools.

Those who are put in charge of prime movers should be qualified men—they must know the theory as also art. Only certificated men should be selected for this purpose.

General Official Administration.

Existing organisation.

For the development of industries there is only one department in this province, the Department of Agriculture. It is under a Director who is an I. C. S. consequently a non-expert. He has of course expert assistants under him, but as headman in the department, he should possess sufficient knowledge of the subject to guide the officers under him and to inspect their work. The reason for putting an I. C. S. at the head of the department is a proof that our agricultural graduates do not possess the capacity of managing business. In Bengal the Education Department was once put under an I. C. S., the I. C. S. officers being mostly all-round men and not merely theorists.

Proposed organisa-
tion.

There should be a Board of Industries in each province. It should be merely advisory. The executive power and budgetted funds will rest with the Director of Industries. The Board will be comprised of official and non-official members—half of whom should be educated Indians connected with agriculture, industry or commerce. Their duty chiefly will be to help the Director with suggestions. The Director of Industries should be a business man and not a non-expert official. He may or may not be an expert. He must be a man of wide practical experience in India and abroad. He will occupy the same position as is now done by the Director of Agriculture.

There is no necessity for the present to form an Imperial Department of Industry. With the expansion of industry, it will be necessary to create one. For the present the Secretary of Commerce and Industry of the India Government will correlate the separate activities of the various provinces. Under his guidance the Directors will meet at convenient centres to exchange their views.

Organisation of Technical and Scientific Department of Government.

Existing organisa-
tion.

There is at present no satisfactory arrangement in the province for the assistance of industries. In connection with the Agricultural Department, five experimental farms have been opened but the assistance that these farms give to the public in the form of demonstration is very meagre—considering the bulk of the agricultural population. "Without a full staff" says Mr. Edwards, the Director of Agriculture in Assam, in his last Annual Report for 1916, "it is impossible to work adequately." I also endorse his opinion.

I do not for the present recommend the formation of any new Imperial Scientific and Technical Department. We must first make a little progress towards such industrial pursuits that may not require much of higher researches.

Provincial organisa-
tion.

Provincial Government should engage the services of the following experts:—(1) A Chemist. (2) A Mechanical Engineer. (3) A Botanist knowing forestry. (4) An Agriculturist knowing entomology. (5) A Bachelor of Commerce of the Birmingham or Manchester University. (6) A certificated Auditor of Accounts.

These experts are to be placed under the direct control of the Director of Industries. I beg to suggest that our present Forest and Agricultural Departments should be placed under the Director of Industries. The following diagram illustrates what I mean:—

Director of Industries—A business man of long experience.

There should be no restriction of age or nationality.

Deputy Director of Industries—An Indian Civil Service with office for the registration of banks, companies, patents, etc.

Assistant Director of Industries. A chemist from England or Russia with a big laboratory.

(1) Agricultural Department under a Superintendent of Agriculture, (An Agriculturist trained in Europe or America.)

(2) Forest Department under a Superintendent of Forests (A forester trained in Europe or America.)

(3) Mining Department under a Superintendent of mines (A geologist trained in Europe or America.)

(4) Factories under an Inspector of Factories (A Mechanical Engineer trained in Europe or America.)

(5) Banks under an Inspector of Banks, (A certificated Auditor with business experience.)

(6) Commerce under an Inspector of Commerce, (A graduate of Manchester Commercial College.)

These experts will all be whole-time Government servants in the Imperial service. The best men should be recruited to fill up these posts and they should therefore be offered

better remuneration. Inexperienced young officers of indifferent qualifications will do no good.

One of the existing scientific institutions may be converted into a technological institution or a branch may be opened in connection with one or more of them. We should have well-equipped laboratories attached—where anybody on payment of small fees, can have specimens of materials analysed for ascertaining their industrial value. Technological Institutions.

As regards investigation and research, each institution will deal with a group of related subjects. These subjects will be selected in consultation with the experts in the Industrial Department of each province. The nature of industry for which the province is fit, the agricultural condition and the prospecting activities will suggest these subjects.

There should be Government control and it should be provincial. Government may from time to time engage experts from amongst those who are already in Government employ to inspect the working of these laboratories.

Unnecessary overlapping of the research activities in the different scientific departments and University colleges should be prevented. Each institution will work on its own line, and each investigator will confine his researches to the subject with which he is most capable of dealing. There should be competition among the different institutions regarding the amount of useful research work done by them. Energy is often dissipated by the useless duplication of enquiries. Co-ordination of research.

The Indian Science Congress has not yet done anything tangible to justify its existence. However it is a conference where our best scientific heads meet to exchange their ideas. It is an infant institution. If the Congress on the line of the Imperial Institute appoints sub-committees in the various provinces to investigate resources with the idea of helping industry and publish their results in vernacular—not in the scientific but in the popular way then it may do some good.

Government scientific and technical experts should be sent to Europe, America and Japan to study the improved methods of mining, agriculture, forestry and manufacture of various useful articles. Government will bear the cost first and then realize it from the private companies who may want a loan of their services. Study of foreign methods.

There is not in the whole province a library in which a copy of the book like Cooley's Cyclopaedia of Practical Receipts—a book almost of every-day reference—can be had—not to speak of other books of reference on scientific and technical subjects. There are some scientific books in the Cotton College library but they are more of the nature of class books than practical guide books. So a good library of guide books in science and industry is badly wanted. A big library of these books may be attached to the Cotton College library at Gauhati and this branch may be open to the public for reference. Smaller libraries of most useful guides may be opened in connection with every Local Board at the headquarter stations only. Reference Libraries.

I do not think it necessary for the present to open a college of commerce in this province. One such college at Calcutta may do for Assam, Bengal, Bihar and Orissa. The college should be organised on the lines of the Manchester College of Commerce. College of Commerce.

Most of our students who come out of schools and colleges find nothing to do. A good many of them try business but fail for want of business-training. If they get it in commercial schools and colleges, they may earn a decent living. Ninety-nine per cent of the school-going population, attend school for learning the art of money-making. If industrial schools are opened and if they are organised on better money-making lines, the present pressure on our University schools and colleges will greatly diminish.

Government Organization for the Collection and Distribution of Commercial Intelligence.

I have no criticisms to offer on the present system of collecting statistics. But with regard to their distribution I beg to suggest that the portion which is likely to be of any help to the public, may be published in the vernacular in an abstract form for free distribution. For the present of course there is no demand for them but with the spread of commerce, the demand for them will increase. Extracts from the "Assam Gazette" relating to industry might very usefully be published in book-form annually. The Gazette contains a good deal of valuable information at times but outside Government servants few ever read it. The local papers simply publish official changes. Statistics.

The "Indian Trade Journal" is a useful publication. Bigger merchants only get a good deal of help from it. "Indian Trade Journal."

Some arrangements should be made for the dissemination of information through the vernacular. These papers should not contain learned articles but should give practical directions on small industries and agriculture.

The publications from the Geological and Forest Departments mostly contain research articles. They may not now be of any practical value, but when people will take to mining and trade in forest resources, they will find in them good many things ready-made for their guidance. These papers should also contain such extracts from the Continental and American papers on Geology and Forestry as may be of some interest to Indian readers. The Industrial Department, when organised, may think of publishing a paper on the lines of the "Scientific American". Special publications.

Peripatetic
demonstration.

We may do more good if we send industrial preachers into the villages to demonstrate before the artisans and peasants the various improved methods in agriculture and industry. Mr. Swan's remark—"one demonstration is more convincing than a dozen monographs" is true to the letter specially in our country where only 5 per cent of the population is literate. And this literate portion again is neither the artisans nor the agriculturists. So paper-publications will not be of much use. In the Bombay Presidency, they send gangs of sugar-boilers to the different villages to show the better methods of preparing *gur*. A similar course should be adopted in all kinds of industrial pursuits.

Other forms of Government action and organization.

Certificates of
quality.

For food-stuffs and medicines certificates of quality should be compulsory. The quality of tea, for example, should be certified. For other products, such as cotton, jute, etc., compulsory certificate may not be insisted upon. The chemist attached to the Industrial Department of the province will examine food-stuffs and grant certificates. With regard to the examination of other articles, non-official experts may be engaged if necessary. They will get adequate remuneration in the form of commission. Penalties should be imposed for the adulteration of food-stuffs and medicines only. The chemical expert of the province or the medical officer of the district will examine the quality and prosecute the offender.

Improved communi-
cations.

Assam is very poor in railway lines. Extension is desirable to increase transport facilities. A railway line from Gauhati to Shillong is necessary for the transport of potato, pine-wood products, corundum, iron, etc. A line from Sylhet to Chhatak is necessary for the transport of lime, lime-stone, potato and oranges.

A line from the foot of the Garo Hills to the bank of the Brahmaputra is necessary for transport of coal, cotton and timber from the hills.

A bridge over the Surma near Sylhet and one over the Brahmaputra near Gauhati are necessary to lessen the trouble and cost of transhipment.

Water-guys are necessary in the forests. Many streams have become choked specially at the confluence. Means should be devised for the protection of the channels by dredging and constructing anicuts where necessary. A great quantity of timber is left to rot in the forests for want of transport facilities.

Railway Rates.

It is a general complaint that railway freight on goods is very high in India specially in Assam. Again rates on some articles are higher than rates on other articles of a similar kind. This remark applies with equal force to shipping freights. Tea is exported by rail and steamer at a considerably lower rate than other agricultural products.

The only effective means to remedy such an anomaly seems to be the empowering of the Railway Board to interfere, to make a re-classification of goods, to make the rates similar and to make the decisions of the Board binding on all railway and steam navigation companies.

Hydro-electric power.

Nothing has yet been done towards ascertaining the possibilities of hydro-electric arrangements in this province. But there are a good many water-falls of sufficient power (in the Khasi and Naga Hills and on the southern slope of the Himalayas) which may be very profitably utilized for industrial operations.

Mining rules.

I have no experience of the difficulties in the working of the Mining and Prospecting rules. This much I may suggest in this connection that Government should give preference to Indian applicants over outsiders in the grant of prospecting license and mining lease.

Corundum is required for the manufacture of munitions of war. It may be had in abundance in the Khasi Hills. The Khasi Hills Prospecting and Mining Company are working the mines.

Forest Department.

The policy of conservation of forest for future continuous supply is greatly helpful to industrial enterprises. But with regard to the working there are complaints which should be investigated. (1) For tea-box making timber, the Forest Department is granting a concession. But no such concession is granted to timber locally used or exported for other purposes. (2) The Calcutta market is flooded with timber from Burma and Australia, but Assam timber practically has no place there though Assam is nearer Calcutta. One of the causes may be high transport charges by rail and steamer, but high royalty seems to be another cause. I would therefore recommend the reduction of royalty in some cases and grant of concessions for a certain period in special cases. The duty on lac should be withdrawn as it does not grow wild, but has to be cultivated. Government should also consider whether more liberal rules cannot be framed in respect of grazing and the existing rules more liberally worked providing greater facilities to the ryots without real injury to the forests. Fuel-wood should be cheapened so that cow-dung may be used by the cultivators for manuring purpose.

The cost of assembling raw products is very high. This is another cause of the rise in the price of timbers. Opening of good roads and tramways and adopting other mechanical means of extraction by State agency may help a good deal in bringing raw forest products in the market at a much cheaper rate. One reason for the high price of forest material is undoubtedly due to the fact that on both banks of the river land has been given for cultivation. If the forest were kept intact on the one side, and double the quantity of land granted for cultivation on the other, it would be possible to get out the forest materials. I believe that neglect of this obvious method of preservation in the near past has generally enhanced the cost of materials. Bamboos and timber have gone up by about 100 per cent in Silechar during the last 15 years.

The concentration of special kinds of trees in limited areas is desirable in localities where there is great demand for timber of a particular species. This can be effected by gradually removing undesirable trees and selling them at a reduced price and thus encouraging the growth of trees for which there is great demand, or by removing the entire existing crop at some selected locality (for experiment) and planting the area with a particular kind of tree. As regards waste land along river side, it may be grown over with *Sisal*, *Sisal* or *Khayer*.

There are no good cart-roads, no tramways and no canals in the forests. There are of course streams and rivers, but a good many of them dry up in winter. A net-work of good cart-roads should be constructed in the forests. Considering the importance of transport, tramways might be constructed in some localities. The channels of water that have been silted up should be dredged specially at the confluence. If practicable, some canals may also be constructed.

General.

I belong to the Education Department and I have been for the present put in charge of a Normal School where my duty is to train teachers. Teachers are generally poor men. I therefore teach them some small industries by which they can earn a little more. They are these:—

- (1) *Fruit-gardening*.—Orange-gardening is the oldest occupation of this Valley. It is *Fruit-gardening*. successful. New varieties should be introduced. I tried the all-season variety but failed. Pine-apple is another grown abundantly. The fruits are much sweeter. I introduced the Singapore variety. The fruit is larger, sweeter and softer. It is a success. Guava may be grown here in larger area. There is a very good market for it in Calcutta. Guava jelly may be manufactured and sent to all parts of India. The *Kasi* and *Kafri* varieties thrive very well. There are many guava gardens in the Jubbulpur District (Central Provinces) which support a good many families. I have introduced the strawberry guava. It thrives very well. This delicious fruit has not yet seen the Calcutta market. It will be quite welcome there. I tried to introduce the foreign fruits. The vine thrives here but it yields sour grapes. However, these may be utilized in making mild wine.
- (2) *Flour-making*.—*Sauti* (it grows wild) flour is a good food for infants and invalids. *Flour making*. It has a good market in Calcutta. A good quantity of it is exported every year from Barisal to Calcutta. Casava may be grown without any cost. Casava flour has also a good market value. Arrowroot will also thrive here.
- (3) *Scent-making*.—There is a kind of *Bisua* grass in this province which yields *Perfumes*. a good quantity of scented roots. This root has a good market in Calcutta. Door-screens for the hot season are made of it. I also show the teachers the method of extracting the scented oily portion from the roots by the ordinary evaporation method. It has good market value. There are also 3 varieties of scented shrubs which may yield a good quantity of scented oil.
- (4) *Screen-making*.—Artistic screens may be made of split bamboo or grass leaves. I *Screens*. teach this art. When painted with oil colours, they look better than the ordinary Japanese screens.
- (5) *Raised map and Raised globe making*.—This art has been so successful that a good *Raised maps and* many of my students have been regularly carrying on this trade—the profit is *globes*. nearly 50 per cent.

These and similar kinds of small industry may be taught by the demonstration method.

India seems suited for the following industries on account of its resources in raw *General* materials:—

Cotton, silk, tannin, glass, paper, pottery, drugs, chemicals, sugar and iron.

Here is a small list of raw materials of which the use in industry is retarded by preventible causes:—

- (1) *Salt*.—A good many useful salts may be manufactured from the common sea-salt. But on account of the prohibition of salt manufacture, other articles also could not profitably be extracted from it.
- (2) *Cotton*.—Its export should be stopped and greater care should be taken to grow better stuff in larger areas. For the sake of protection, foreign yarn should not be exempted from duty and excise duties should not be imposed on Indian goods.
- (3) *Sugar*.—Import of foreign sugar especially bounty-fed sugar should be gradually stopped and encouragement should be given to open sugar factories. Permission should also be given to manufacture rum and alcohol for the utilization of the bye-products.
- (4) *Alcohol*.—Potato grows here in abundance. Alcohol can be very cheaply manufactured from it. Alcohol is required for *alcohol-motors* for driving electric generators. The excise law should be modified to permit the manufacture of this very useful article required for driving our present-day machines.

These are some of the good cases for investigation :—

- (1) *Fibres of various kinds.*—Little use is made of the pine-apple and nettle fibres.
- (2) *Sand.*—It should be examined thoroughly for glass manufacture.
- (3) *Iron.*—Mines should be explored for opening more iron manufacturing firms.
- (4) *Paper-pulp.*—The vegetable resources of the province should be thoroughly examined for this pulp.
- (5) *Mineral water.*—Spring water should be examined for their curative properties.
- (6) *Pottery.*—Clay should be examined for it.
- (7) *Sweet-potato (Red-potato).*—It grows on every soil and it grows abundantly. This underground stem (like the potato) may be examined for sugar manufacture.
- (8) *Beet.*—Its cultivation for sugar manufacture.
- (9) *Wood.*—Thorough investigation is necessary for determining (1) the sort that will suit match manufacture and (2) the sort that will suit wood-engraving.

ORAL EVIDENCE, 5TH JANUARY 1918.

Sir F. H. Stewart.—Q. You refer in your note to the experience you had in raising capital. Was it a considerable sum that was raised for the spinning and weaving mill at Rangpur?—A. Yes, a very considerable sum; it was over 2 lakhs of rupees.

Q. And the Bengal Provincial Railway Company had a larger sum?—A. Yes, a much larger sum, but I do not remember the amount exactly.

Q. Is the railway running now?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. What dividend was the railway paying?—A. A very low rate, only 8 per cent.

Do you call that a low rate. I do not know of any railway paying more than 8 per cent.

Sir F. H. Stewart.—Q. Your latest experience has been with the All-India Tea Company?—A. Yes.

Q. What is the capital of that company?—A. Up-to-date they have collected about a lakh.

Q. Is it a registered company?—A. Yes.

Q. When was it started?—A. It was started two years ago.

Q. Is it working successfully?—A. They have not yet undertaken proper work. They have secured land and have been planting tea seeds only.

Q. What is the idea of the company? Is it to be a tea garden?—A. Yes.

Q. Is it for the retail sale of tea or anything else?—A. It will be a tea garden and for the retail sale of tea also.

Q. You say under the heading "financing agencies", "If Government makes such a rule that it would lend the help of Government auditors to check the accounts of an involved or dying company, banks will find it then much easier to issue loans on the merit of the audit report". But the harm will have been done then, and the auditor's report will only disclose a bad state of affairs? What you want is to prevent the company beforehand from involving itself, is it not?—A. But if a timely notice be given to the Government with regard to the affairs of the company and the auditors come and examine the accounts, the company might not collapse.

Q. Do you think that Government should intervene?—A. Government intervention is necessary because people have much confidence in Government work.

Q. Do you think that Government should go so far as to appoint directors?—A. Yes.

Q. You say that you have been working at Silchar as Comptroller of the Co-operative Credit Bank: that is, you were working in an honorary capacity?—A. Yes.

Q. You say it has not developed or assisted any industry as yet?—A. Not yet.

Q. What does it do?—A. It does only loan business.

Q. At what rate does it lend its money?—A. At 12 annas per cent. per month.

Q. How long ago was the Bank established?—A. It has been in existence for the last 8 years.

Q. When you say that you are the Comptroller, do you mean that you are the manager?—A. No, I only audit the accounts.

Q. Have you any voice in the management at all?—A. No. Of course I give my suggestions and they accept them.

Q. Has it got branches, sub-banks?—A. Yes, there are some branches in the villages, but properly speaking they are not in good working order. I mean the Bank which is located at Silchar has no control over the village banks.

Q. You say that when Government loans experts to any private concern, there should be no restriction on the publication of the results of their researches: don't you think that it

will be a little hard on the private concern?—*A.* I have mentioned everything in my paragraph. If you will kindly read the whole paragraph you will find my answer to the question you have just put to me.

Q. But don't you think it should be possible for the firm to say that the results of the expert's researches should not be published for a definite period, say, for two or three years?—*A.* That will entirely rest with the company who will engage the expert. If the company spends a good deal, then it might not publish the result, but if the expert is engaged only temporarily, then the result might be published. Of course that will be left entirely to the discretion of the company and the expert.

Q. You say that you have opened a museum in the Silchar Normal school; do many people go to see it?—*A.* Yes, a good many people come to see. I held a decennial conference of all my ex-students this year; I held an exhibition in this connection of school-made articles, and it was attended by over 500 visitors including European ladies and gentlemen. It was opened by Miss Lloyd, the head-mistress of the Mission Girls' School.

Q. What sort of articles were you exhibiting?—*A.* I was exhibiting school-made articles, such as raised maps and globes, diagrams to show the changes of the season, changes of day and night, and so on; and also bamboo, cane and paper made articles.

Q. The exhibition was for educational purposes, it was not an industrial exhibition?—*A.* No.

Q. Do you think that the same system of exhibitions could be applied to small industries in order to encourage them?—*A.* Yes.

Q. You go on to give a list of large and small and cottage industries that you hope may be suitable for Assam; there are a large number of them, and you seem to be very optimistic: is it your idea that these should be developed purely by Government help?—*A.* In the case of larger industries Government help might be necessary, but for small industries Government help is not necessary. Cottage industries require the help of the co-operative movement.

Q. Don't you think that when you have your Department of Industries they can perhaps do a very great deal to help the cottage industries?—*A.* No, I do not think so. The Department of Industries would look to the interests of larger industries and not of cottage industries and small industries. These might be left to the people.

Q. If they are left to the people, will they not be in danger of dying out as they are now?—*A.* No. If Government takes interest in these things, if they appoint a board of directors to control and look after these things, and if this board periodically inspect what is going on in these things, then that might be enough. The head of the district, the Deputy Commissioner, may manage all these things.

Q. You are afraid that the Board of Industries would not spare enough time to look after the small industries; supposing that they had power to appoint a special sub-committee in each district, would that not be a suitable arrangement?—*A.* Yes, that would be suitable.

Q. Then further on in your note you give a typical complaint about the hardships suffered by the agricultural class; is that a common sort of complaint in this part of the country?—*A.* Yes, it is a common complaint.

Q. That is, that a man gets a plot of land and improves it and when the re-settlement comes the rent is increased so much that he perhaps cannot afford to pay; do you think that is a common experience?—*A.* Yes, that is a common experience here. I experienced this sort of complaint also in the Central Provinces.

Q. Have you any remedy to suggest?—*A.* Yes, I have suggested one remedy.

Q. I do not quite follow it?—*A.* Enhanced rent might be charged from the man who next occupies it.

Q. That won't help the poor man who is thrown out?—*A.* No, his heirs will go on enjoying the land at the same rate of rent as his predecessors were paying. When he transfers that land to another person who is not in the same line with his ancestors, then Government might enhance the rent.*

Q. You recommend night schools for the labouring classes. Do you think that is practicable in Assam for instance?—*A.* It is not yet practicable. We have started one night school at Silchar and this is working in good order, but we have been following the traditional methods of instruction, teaching them a little dictation, a little arithmetic and all these things.

Q. So this is a school for children only and not for the labourers themselves?—*A.* No. There are only three or four labourers, the rest are mostly boys.

Q. That is simply an elementary school?—*A.* Yes, for teaching, reading, writing, arithmetic and all these things. But it should be organized entirely on a different plan.

Q. Do I understand you to say that the Department of Industries should be entirely separate from that of Education?—*A.* Yes.

Q. And industrial schools and technical schools should be under the Department of Industries?—*A.* Yes.

Q. You say in your note that the "Provincial Government should engage the services of the following experts:—(1) a Chemist, (2) a Mechanical Engineer, (3) a

Botanist knowing forestry, (4) an Agriculturist knowing entomology, (5) a Bachelor of Commerce of the Birmingham or Manchester University, (6) a certificated Auditor of Accounts". Could a comparatively small administration like Assam afford to keep all these experts in its permanent service?—*A.* That is a very difficult question to answer, because it means finance; I do not mean to say that you should strictly adhere to what I have said here, but this is my idea, and if we cannot engage all these men at once, we might make a small beginning with one or two knowing a little of commerce and industry.

Q. Then you say that you would have a Director of Industries and then you would have as Assistant Director of Industries, a chemist from England or Russia with a big laboratory: why would you have a man from Russia specially?—*A.* Russian chemists are expert in agriculture.

Q. Then as sub-branches again you would have six headings, one of which should be commerce under an Inspector of Commerce: what do you mean by an Inspector of Commerce?—*A.* He will help those who carry on trade with instruction and advice. He will go from place to place and help people who are in need of instruction and information.

Q. And you say that he should be a graduate of Manchester Commercial College: do you know the Manchester Commercial College?—*A.* I have read something about it.

Q. You have no personal knowledge?—*A.* I have no personal knowledge.

Q. In your note you refer to the high royalties charged for timber: are they higher in Assam than in any other part of the country?—*A.* I have not compared them, but in Assam the people who deal in these things have always complained of high royalty.

Q. Do you know of any specific instance yourself where business is interfered with by the high rate of royalty?—*A.* Business is not interfered with by the high rate, they carry on business but if the royalty be lowered then more men might come in and the trade might be carried on on a larger scale.

Q. What is the duty on lac to which you refer?—*A.* A duty is levied on lac, but what is the exact rate of duty I do not know. It is a sort of royalty.

Q. Is that royalty charged and collected on lac which grows on trees in the Government forests?—*A.* Yes.

Q. Is there much lac in Assam?—*A.* Yes.

Q. Then you give various instances of things which you have yourself tried, like fruit gardening, scent making, etc. Have you tried any of these at all on a commercial scale?—*A.* Not on a commercial scale but on a small scale, it might be said on a more or less industrial scale. Those to whom I have taught all these things, I mean the teachers who have gone into the villages, have made fruit gardens and sold the produce in the market, and got something out of it.

Q. Have any villagers, whom they instructed, shown any signs of taking that up?—*A.* Yes.

Mr. C. E. Low—Q. In reply to Sir Francis Stewart you said that in the Central Provinces enhanced assessments are imposed on improvements. Have you any instances?—*A.* Yes, I had been deputed by Sir Bamfylde Fuller to study the conditions of primary education in the Central Provinces. I had been at Jubulpore for four months and also to Nagpur, and I went into the villages; there I talked with all sorts of men about various things, and I heard this complaint.

Q. That is a very curious thing. I have been in charge of three districts in Central Provinces and the rule there is that no enhancement on any improvement is to be imposed until the lapse of one settlement period, which is about 20 years: the man makes his improvement, the next settlement comes his rent is not enhanced; when the final settlement comes 20 years later, then it is enhanced; that is to say, he may get exemption for two settlement periods, and not less in any case than one?—*A.* That might be the rule, but they always complain that the patwaris who are responsible for these things put enhanced assessments on improvements.

Q. But the patwaris have nothing to do with land improvements any more than anybody else?—*A.* Nothing whatever.

Q. I do not quite understand how you say that improvements are subject to enhanced assessment. Sir Bamfylde Fuller himself was the author of that rule?—*A.* I did not cross-examine my informants with regard to these things, but that was the complaint.

Q. What do you do here in the way of industrial education in Assam?—*A.* I do nothing in the way of industrial education.

Q. Can you briefly mention what is done in Assam within your knowledge?—*A.* There are some agricultural farms here and they are demonstrating improved agriculture.

Q. Is any industrial education given in the ordinary sense of education?—*A.* No, nothing is done in the way of industrial schools.

Q. Are there no missionary industrial schools?—*A.* There are one or two in the hills, but we do not know anything about these.

Q. Speaking of industrial exhibitions you say "The Secretary of the Department of Commerce and Industry in consultation with the provincial Directors of Industries might

arrange for these exhibitions"? Do you mean the Department of Commerce and Industry of the Government of India?—A. Yes.

Q. Then he will presumably have to visit the provinces in order to do this?—A. He need not visit the provinces, he might communicate with the provincial heads of departments.

Q. But he would not know what is the progress of any particular industry. Do you think he will be able to give any particular assistance?—A. For instance here in this province there might be one exhibition for the silk industry, and also sugarcane, *gur*, molasses and all these things.

Q. Do you think the Secretary of the Department of Commerce and Industry will have time to do this?—A. He need not tour over the provinces, he may communicate his views to the provincial heads, and they will arrange the exhibitions.

Q. Don't you think it would be better if you had a separate Department for Industries?—A. That might be expensive for the present.

Q. Do you think the existing Department of Commerce and Industry has got time to do things like this? Perhaps you are not in a position to say?—A. I am not in a position to say.

Q. Then it is only an *ad interim* arrangement that you propose, is it so?—A. Yes.

Q. You speak about the purchase of stores by Government; supposing you had an industrial department in the different provinces, and stores were purchased locally as far as possible, and only those stores were imported that could not be bought in India, do you think that would be a suitable procedure? That is what the Munitions Board are doing at present.—A. That is my idea, but more attention should be paid to these things so that locally made articles might be purchased on a larger scale.

Q. That is what the Munitions Board are doing: they have Provincial Controllers and all indents from Government departments pass through their hands, and everything made locally is removed from the indent and obtained in India: that is what they are doing now?—A. That is far better.

Mr. A. Chatterjee.—Q. Your remedy for the evils from which the cottage industries are suffering at the present time is to appoint sub-committees in different districts: this is what you explained to Sir Francis Stewart: at any rate that is your view in the matter. Now where are you going to get people to serve on these sub-committees, people who have got the necessary knowledge to do useful work?—A. We cannot now get men with the necessary knowledge to do all these things, but if the sub-committees are established, they will be compelled to acquire the necessary knowledge and they will make themselves better men in order to take part in all these things; that will be a kind of training to our men.

Q. You hope it will: have you any experience of any place where such committees have been formed?—A. No, they have not been formed.

Q. Have such committees been formed in other provinces?—A. I have not seen.

Q. You strongly advocate the establishment of night schools.—A. Yes.

Q. And you say that little boys are going to the night schools: why don't they go to day schools?—A. They work in the fields during the day time.

Q. But they don't work the whole day?—A. They work during the greater part of the day and then they take rest.

Q. Don't you think it will spoil their eyes to try to learn reading and writing at nights?—A. They don't mind that; they take to these things very gladly.

Q. You have got some remarks here about the Indian Science Congress which you say has not done anything tangible to justify its existence. Do you mean that the Congress itself has not done anything or the men belonging to the Congress?—A. The Congress means the men.

Q. So you have come to the opinion that they have not justified their existence so far?—A. It is still an infant institution.

Q. You have no definite information on the subject?—A. No.

Q. Would it not be better not to criticize things that you know nothing about?—A. I have given my opinion so far as I know.

Q. Speaking about the question of railway freights, you say that tea is exported at considerably lower rates than other agricultural products: is that correct? What is the rate charged for tea?—A. I do not know the rates but that is the everyday complaint.

Q. Who makes this complaint?—A. It is made in the papers.

Q. In what paper?—A. I cannot say in what paper, but in some of the lectures delivered at the industrial exhibitions they have also said so.

Q. Which industrial exhibition?—A. I believe this was also mentioned by Maharaja Sir Manindra Chandra Nandi at the last industrial exhibition held in connection with the Indian National Congress at Calcutta.

Q. I would like if possible to get some evidence on the particular point, is it the fact that tea has been exported at lower rates than agricultural products?—A. If you like, when I go back to Silchar I may collect better information and statistics in regard to this thing.

Q. I think it would be better to substantiate a statement of this kind?—A. Here I have got no statistics with me to support my statement, but it is a fact so far as I know. If you like I may send you detailed information.*

Hon'ble Lt.-Col. P. R. T. Gordon.—Q. In your exhaustive note, you criticize the land policy. Is this the land policy of the Assam Administration? I think you mentioned that of the Central Provinces as well. Where have the settlement operations that you refer to been carried out?—A. This also applies to Assam.

Q. In which district have they operated harshly?—A. I heard this complaint in Cachar.

Q. You heard this complaint in Cachar with regard to the Cachar re-settlement, I suppose?—A. Yes.

Q. What was the complaint? Was it that the land has been assessed too high?—A. Yes.

Q. What sort of land? For what particular class of agriculture?—A. Paddy lands.

Q. What is the percentage of the increase of revenue?—A. 28 per cent this year, I believe, if I remember right.

Q. Twenty-eight per cent over the last assessment, do you consider that too high?—A. I myself might not consider that too high, but that is the complaint.

Q. Not more than 28 per cent?—A. Not more than 28 per cent, I think.

Q. With regard to your views as to who should be Director of Industries, I understand that you are in favour of encouraging cottage industries: you say that the Director of Industries should be a business man and not an expert official?—A. Yes.

Q. Would a business man without a knowledge of the province and of the languages of the province be able to make the people understand?—A. By a business man I do not mean to say that he must not have a knowledge of the province and a knowledge of the language.

Q. You mean he must be a business man of the province?—A. Yes.

Q. Not outside the province?—A. No.

Hon'ble Sir R. N. Mookerjee.—Q. Is there such a man available here?—A. Not available now, but if you import a business man from Europe or from America, and then if he stays here for some time, if he is an intelligent man he will in a year or two pick up the language and all the special circumstances of the province.

Q. What would you pay for a man from Europe?—A. Say, Rs. 3,000 a month.

Hon'ble Lt.-Col. P. R. T. Gordon.—Q. Would you bar an official altogether?—A. No.

Q. Supposing it would not be possible to appoint such a highly paid officer, would you bar an official with experience of the province?—A. No, I do not like to bar. Rather as I have said, I would recommend one I. C. S. man. I. C. S. men get an all-round education, they are therefore better men.

Q. Are they expert in the languages of the province?—A. They become expert very soon. In a year or two they become experts. I have seen many who can speak Bengalee and Assamese thoroughly well like any Bengalee or Assamese gentleman.

Q. In your note regarding the Forest Department, you speak about high royalty. Can you refer to any particular cases in which the royalty is too high?—A. I cannot mention any particular case, but that high royalty is charged on all sorts of timber is the general complaint.

Q. Cannot you mention any particular species of timber?—A. Say *nahor* trees.

Q. How much is the royalty on *nahor* trees now?—A. I cannot give the exact figure.

Q. Do you think that is too high, whatever the rate?—A. Yes.

Q. Is the royalty on *sal* too high?—A. No, not so much as it is on *nahor*.

Q. What you object to is the royalty on timber from which furniture is made, that is *cham*?—A. The royalty on *cham* is high.

Q. Do you think it is too high?—A. It is, because within the last few years the price of furniture has doubled.

Q. Do you think the royalty is too high on *sal* wood?—A. Yes.

Q. What about the royalty on timber from which boats are made?—A. There the royalty is not very high.

Q. You have no complaint to make about this?—A. No.

Q. What is the name of the timber used for boats?—A. It is classified as *ajar*; it is a fairly common tree in Assam.

Q. What about royalty on timber used for tea boxes?—A. Tea boxes are made of *simul* wood. The royalty is not very high on timber for tea boxes.

Q. Have you any complaints to make about the arrangements made for the royalty on timber for tea boxes? What are the concessions granted to firms on tea boxes?—A. *Simul* trees which are sold to firms to make tea boxes are sold at a far lower rate than they are sold in the market for people who do not manufacture tea boxes.

Q. Do you think that other people ought to take part in the same concession?—A. Yes.

Q. Do you think an undue preference is given?—A. Yes.

Mr. C. E. Low.—Q. Supposing the same rate were given to people who do not make tea boxes, do you think they would take up more *simul* wood?—A. Yes for other purposes.

Hon'ble Lt.-Col. P. T. R. Gordon.—Q. You said that the duty on lac should be withdrawn; but the duty on lac has been withdrawn; I hear that they have passed orders to that effect?—A. I do not know. I thank you for this information.

Q. But I am not quite certain, I will tell you on Monday.* You think that the duty operates harshly then?—A. Yes.

Q. Is there much business done in lac in your district?—A. Yes in Sylhet and Cachar on the other side of this Valley.

Q. You say that Government should also consider whether more liberal rules should not be framed in respect of grazing. What do you mean by more liberal rules?—A. If I remember rightly, they charge Rs. 10 a year for every buffalo for grazing.

Q. Is that in the Surma Valley?—A. No, in the Assam Valley.

Q. Would you be surprised to hear that the rate is only Rs. 3.—A. Yes, I remember now it might be Rs. 3 per buffalo, and it might be reduced a little.

Hon'ble Sir R. N. Mookerjee.—Q. You wanted the Rs. 10 rate to be reduced, and you now want the Rs. 3 rate to be still reduced?—A. When I was passing through Luning one man was showing me one receipt and that receipt contained Rs. 10; I enquired whether he was paying Rs. 10 for one buffalo and he said yes, if I remember right.

Q. This statement of yours will be published, it will go everywhere, it will go to the Government of India, it will go to the Secretary of State; do you think it is fair to make such a statement without ascertaining these facts? You yourself don't know that the duty is very high?—A. The written statement was submitted to you last year. You come after a year, so I forget the figures—you did not tell me on what points you would examine me. In that case I would come prepared with the figures. People complain that the duty is very high. What I say is that Government might be a little more liberal with regard to these things.†

Mr. A. Chatterton.—Q. I suppose you want a subsistence allowance from Government for keeping buffaloes?—A. People expect to get all sorts of concessions from Government.

Hon'ble Lt.-Col. P. T. R. Gordon. Q.—Buffaloes are grazed in the Government forests, is that not so?—A. Yes.

Q. Regarding fruit gardening, you say 'pine-apple is another grown abundantly'; Have you grown pine apples yourself?—A. Yes.

Q. How much cultivation have you got, how many acres?—A. I only tried half a bigha for the sake of experiment, and it was successful.

Q. Can you refer to any growers of pine-apples on a big scale in the Silchar district? Have you seen Mr. Ianrie's cultivation?—A. No, I have not seen.

Q. Have you seen anybody's cultivation?—A. I have seen some cultivation on both sides of the railway, but I do not know whom they belong to.

Q. Then you have no personal experience except with regard to your small cultivation?—A. No.

Q. You cannot say as to whether there is a prospect of a canning industry being successful?—A. It may be successful.

Supplementary note to the oral evidence of Rai Sahib Aghor Nath Adhikari, Superintendent, Normal School, Silchar (Assam).

I.

In my written evidence, I stated that freight on tea is comparatively lower than that on Railway and other agricultural products of the province. I was directed by the President to submit a note in support of this statement. The following note will, I believe, support my statement:

The railway freight on tea from Gauhati to Calcutta, all the year round, is annas 15 per maund while that on jute is annas 10 per maund from January to June and annas 14-5 from July to December. The price of a maund of tea at the lowest rate is Rs. 30 while that of a maund of jute is Rs. 10 at the highest. But the railway freight per maund is annas 15 on tea and annas 14-5 on jute—a difference of 7 pies only.

* NOTE—The duty on lac has been withdrawn.

† Vide Supplementary Note III.

This is not all. With regard to tea, the railway freight is charged on the net weight of tea, provided a copy of the garden invoice is attached to the railway invoice. I quote below figures from a garden invoice to show that 20 to 25 per cent of the total weight is carried free of charge.

192 chests of tea were sent from a garden. The garden invoice contained two figures—net 17,720 lbs. and gross 22,712 lbs. The goods clerk charged railway freight on 17,720 lbs.; so he neglected the weight of about 5,000 lbs. i.e., the weight of the packing boxes, which the railway company carries free.

The freight on tea therefore is practically lower than that on jute—weight for weight.

Again railway demurrage rules are more liberal for tea than those for other articles of commerce.

Steamer freight per maund from Gauhati to Calcutta is annas 11 on tea, annas 8-6 on jute, annas 10-6 on cane. Tea is thus carried practically at the same rate with jute and cane, the difference in freight being very small.

I do not recommend that this concession on tea should be withdrawn but what I mean to say is this—that similar concession may be extended to other agricultural products of the country.

In support of my statement I beg to quote a few lines from the speech of Maharaja Sir Manindra Chandra Nandi as Chairman of the Reception Committee at the last Industrial Conference in Calcutta: "In the matter of carrying goods, the impression appears to have gone deep in the Indian mind that Indian products are refused the same facilities by railway and shipping authorities all over the country which are easily extended to enterprises under European management. It is evident that so long as the company system of railway management is allowed to be continued, European enterprises will receive preference to purely Indian concerns."

I have suggested a remedy in my written evidence.

II.

Land policy.

There was some discussion on re-assessment. The following supplementary note will suggest what I mean:

It is admitted on all hands that the Government in order to carry on its work has to meet certain expenditure and that expenditure must be contributed by the people themselves. So the Government is entitled to take certain share of the profit which the people derive from the land. The grain rate is commuted into money rate. This rate is not fixed except in the permanently-settled portion of the country but it is enhanced with repeated and periodical settlements time after time. The enhancement is, as far as I know, dependent on the improvement of the land effected by the people after the first settlement. As the improvement is effected by the people and the Government has nothing to do with it, the people should, in my opinion, be allowed to enjoy exclusively the fruits of their labour and exertion. India is an agricultural country and its economical advancement depends mainly on the growth of this industry. If the people be not under the certainty that no demand would be made on them or their heirs in consequence of the improvement of the land, they will not invest capital or effectively put forth their strength for the improvement of the land. At the same time we find that where the duration of the settlement has been the longest the effects of famine has been the least but where it has been the shortest the effect has been the most disastrous; I think that there should be some fixity in the duration of enhancement of revenue. I therefore propose that the revenue should remain fixed and unaltered as long as the lands are in the use and occupation of the settlement holders and their heirs, but the lands shall be liable to enhancement of revenue on alienation according to the capacity of the land at the time, as the Baksha lands in Cachar are liable to assessment of revenue at full rates on alienation. Every proprietor or landholder succeeding to any state or share in an estate by transfer and obtaining possession of the same, is bound to apply within six months from the date of taking possession thereof to the Deputy Commissioner of the district, or the General Register of which the estate is borne, for registration of his name as such proprietor or landholder (*vide* Section 50 A. L. R. R.) so the Deputy Commissioner is likely to get information of every transfer. And this transfer is so very frequent, that there will be no loss in Government revenue.

III.

Grazing-tax.

There was difference of opinion regarding grazing-tax. The following note may clear the point:

The tax on buffalo has risen from Re. 1 to Rs. 3 and Rs. 4 during the last three years. This has to some extent frightened the Nepalese buffalo-keepers who tend their herds on the hills and near the forests. The dairy concerns depend for their produce mostly on these Nepalese settlers. This rapid enhancement in tax from Re. 1 to Rs. 4 may tell upon the trade in butter and ghee—which are, in a vegetarian country like India, the only animal food for the poor and the rich alike. I therefore proposed in my written statement that more liberal rules should be framed in respect of grazing.

WITNESS No. 397.

Rai Bistoram Baruah, Bahadur, Tea Planter, Jorhat.

WRITTEN EVIDENCE.

I.—Financial aid to Industrial Enterprises.

1. I had to borrow money for the tea industry from Marwari merchants and villagers. Capital. Though I was an influential man and a tea planter I had much difficulty in raising loans. These difficulties may be removed by opening co-operative credit societies and grant of Government aid.

Q. 2. Marwari merchants and a few local men are the sources from which capital is principally drawn.

Q. 3. I do not know of any such enterprise.

Q. 4. I am not aware of any financial aid by Government to industrial enterprises. Government aid.

Q. 5. All the eight methods of Government aid are, in my opinion, good. The surrounding circumstances and the nature of each industry will determine which method of aid will be beneficial to it.

Q. 6. There should be Government control of the enterprise where Government subscribes to the share capital. There should be a Government director until the enterprise becomes self-supporting. The powers of such director will be as given by the rules of the concern. The Government director may be retained, if the shareholders so desire, even after it becomes self-supporting.

Q. 9. The people of this country cannot carry on, for want of funds, any business on Financing agencies a large scale. The villagers who produce mustard, pulses, jute, paddy, sugarcane, do not earn any profit as the Marwari merchants who lend them money at an interest rising from 2 per cent to 5 per cent per mensem are enriched by them.

Q. 10. New co-operative credit societies should be opened. The Government would grant loans to these societies from Rs. 5,000 to Rs. 10,000 without interest; and these loans will be repayable after 10 years. The banks and financial agents of Calcutta are unwilling to lend money to the people of this province as they do not know the people and their enterprises. To facilitate grants of loans by outsiders to the industrial enterprises official information bureaux should be created. Co-operative Societies.

Q. 10A. There should be a banking law.

Q. 11. I do not know whether any industry has been developed or assisted by the formation of co-operative societies. Co-operative Societies.

Q. 12. The co-operative societies should be encouraged to aid the production of paddy, sugarcane, mustard, pulses, jute, betelnut and cloth. The organization and special objects of these societies will depend on the nature of the industry and its environments.

Q. 12A. Trade Guilds such as exist in other countries may be of immense service for industrial development.

III.—Assistance in marketing products.

Q. 31. Industrial exhibitions are of immense value in creating a healthy competition in production of good articles and markets for sale of industrial products. Exhibitions.

Q. 32. Government should encourage industrial exhibitions.

Q. 33. They should be both popular in character and attractive to the sellers and buyers.

Q. 37. The principal Government departments which use imported articles should publish list of those articles; and should exhibit them in Commercial museums. Government patronage.

IV.—Other forms of Government aid.

Q. 41. Government should give facilities to the local people to acquire waste land for industrial development. The restrictions now imposed on the local people applying for waste land should be removed. Land policy.

Q. 42. Government should give concessions of land free of rent for the establishment of new or the development of existing industries till they become self-supporting.

(Witness did not give oral evidence.)

WITNESS No. 358.

Mr. N. O. Peters, I.S.O., *Manager, Jorhat Railway, Jorhat.*

WRITTEN EVIDENCE.

I.—Financial Aid to Industries.

- Capital.** Q. 1 to 8. I have had no experience in raising capital for any enterprise; nor are my opinions sufficiently definite to be expressed.
- Government assistance.** Q. 6. State assistance should be given by Government technical experts, and a Government Audit Department must be instituted to safeguard the interests of the Indian capitalists which may induce them to put out their money.
- Co-operative Societies.** Q. 11. I don't know of any industries which have been developed by Co-operative Societies in this Province.
- Q. 12. Co-operative Societies should be encouraged and subsidized in cottage industries, as weaving, sericulture, cane and bamboo furniture.
- Q. 12a. I have no suggestions to make for developing trade with other countries, as conditions of Indians are so very different from the people of Europe, Japan and China.
- Limitations to Government aid.** Q. 13. No State aid should be given to any new enterprise to compete against existing institutions.
- Q. 14. No State aid should be given to new enterprises but a protective tariff be introduced, which should not be higher than the sea freight from the country of export. Government aid might be considered when the exporting countries are being subsidized by their Governments.

II.—Technical Aid to Industries.

- Conditions under which expert assistance should be given.** Q. 17. The loan of services of Government experts when deputed for research work to private enterprise, depends on the conditions. If his services are entirely placed at their disposal the said concern should bear the expenditure of his pay and allowances, but if the Government expert has to give the results of his researches to several enterprises, in this case, the share of payments towards the salary, etc., should be borne by these concerns in proportion to their capital.
- Publication of results of research.** Q. 18. The results of research work should not be published when one firm has borne the charges of the expert, the same ruling for the others who have jointly borne the charges, and not be public property.
- Demonstration factories.** Q. 19. State demonstration factories should be adopted for sericulture, glass and pottery works, hand weaving, and spinning, canning of fruits, curing of fish, both sea and fresh.
- Q. 20. Yes.
- Industrial surveys.** Q. 25. Further detailed surveys should be supplemented with as much technical information and guidance possible. 1st, Agricultural nature of soil, what cereals and fruit would best grow and thrive. 2nd, Forest produce, the quality and quantity of the different timber and grasses, facilities in roads, railways and waterways also conditions of local labour. 3rd, Minerals and oils; we have very few geologists in India at present to exploit the mineral wealth which is vast, especially in the province of Assam. Geological surveys conducted for commercial objects, would bring in its train several new flourishing industries.
- Q. 27. The results should be published in all the leading English and Vernacular papers.
- Consulting Engineers.** Q. 27a. I do not consider the appointing of consulting Engineers, or supplying of plans and estimates to be of sufficient value to industrial enterprises to private firms, or individuals, to justify the expense of maintaining the same. In my opinion the firms and individuals already engaged in Industrial enterprise are capable of running and improving their own business without such help, and any fresh industry could not be on a large enough scale to require such superintendence, I speak of Assam alone. I do not know enough of other parts of India to form an opinion.

III.—Assistance in Marketing Products.

- Commercial Museums.** Q. 28 and 29. I have not sufficient knowledge of commercial museums to express an opinion.
- Sales agencies and exhibitions.** Q. 30. The only sale products that have come under my notice are Assam silks, Manipuri, Abor and Naga cloths, brass ware, and curios worked in ivory and mithun horns. I consider these might all be developed by a system of organized sales agency and industrial exhibitions, and the nature of such exhibitions should be popular. They should aim at the importance to the Assamese of developing every industrial possibility as opposed to the merely scholastic. In my opinion, I think in that of any labour controller, the present-day Assamese is neglecting educational for the scholastic, a state of things bound to bring disappointment

to many, who are unable to pass examinations or having passed them to obtain Government appointments and are thrown back on their parents for support, having no trade or the inclination to learn any. This makes for dissatisfaction for the very schools they were so eager to attend, and ruins many a youth who if apprenticed to his father's trade, would have been a useful artisan.

Q. 30a. No, I don't consider it would be advantageous.

Q. 31 to 33. My opinion of the value of Industrial Exhibitions are that they open out new ideas for the artisan and would give impetus to cottage industries and encourage them to turn out the best they are capable of especially if Government would recognize by giving them rewards. The nature of these exhibitions should be 1st Agricultural produce, 2nd Cottage Industries, 3rd Labour saving machines for Agriculture with Demonstrations, 4th cattle, pony, sheep, goat and poultry, exhibits; the exhibitions should be popular in character and run more on lines of the Indian Fairs which would bring sellers and buyers in contact; these exhibitions should be held every year in each District; the Local Boards should appropriate funds and in large towns the Municipalities should also provide funds.

Q. 34 to 36. Government financial help should not be given to trade representatives, Trade representatives the commercial enterprise of each firm should themselves send their agents to Great Britain, the Colonies, and Foreign Countries, the same as Japan is doing.

Q. 36. The same opinion as for sending Agents.

Q. 37. Yes, Government Departments using imported articles should publish a list of Government patronage. the same in the daily English and Vernacular papers.

Q. 38. The purchase of Government stores provided they have been tested by experts and from reputed firms should as far as practicable be purchased to encourage Indian Industries.

Q. 39. Co-operative credit banks are now run by Government on a small scale, the Co-operation. chief difficulty lies in not being able to run it on a larger scale on account of the Indian agriculturist not being a person with any capital and their holdings being insignificant, money advanced to them being risky, consequently small loans would only help them in a small way, this is one of the reasons why the Indian banks charge such exorbitant rates of interest. This is one of India's hardest problems to be solved.

IV.—Other forms of Government assistance.

Q. 40. The conditions for the supply of Government owned raw forest materials for Supply of Govern- manufacture of *bond fide* Industrial institutions, should at the first start of a factory be half ment owned the usual royalty, and when the industry has got to a profitable basis and paying the interest materials. on the capital, the royalty should revert back to the original royalty charged. No monopoly should be granted for this particular forest produce for which that concession has been granted.

Q. 41. There is no check that I am aware of that is being imposed on industrial Land policy. development.

Q. 42. Government should give land for the establishment of new, and to the development of existing industries, as far as possible, on the present valuation of land, as the country is opened out and communications are improving in this province.

V.—Training of Labour and Supervision.

Q. 44. (a) Primary education in their respective vernaculars would help them but Lack of primary the lack of it does not hinder industrial development. education.

(b) I have found the best means to improve the labourers efficiency and skill is to give a small but regular annual increase to the ones who have shown improvement both in their efficiency and output.

Q. 45(a) and (b). I have found and adopted as the best policy is to be in close touch Methods of improv- with all the men and improve their positions by strict discipline, and start training them ing efficiency of from the ages of 12 to 14 years in the following trades, i.e., fitter, turner, blacksmith, labour. rivetter, moulder, carpenter. If they are put to learn 2 or 3 different trades, they are never efficient or skilled in any.

Q. 46. I have had experience for the past 30 years in training Indian apprentices in Railway Workshops.

Q. 47. No experience in industrial schools.

Q. 48. The boys to be trained for one of the branches in mechanical works, should be recruited between 12-14 years and placed on trial for 3 months, if the boy does not show himself able to grasp the work intelligently, or is inclined to be lazy, he should be dispensed with, as he will never turn out efficient or a hardworking artisan.

Q. 49. I have no experience of day schools for short time employees and I don't recommend the course. I have in my workshops lads training as carpenters, blacksmiths and fitters and they are taught mechanical drawing for 2 hours daily.

Q. 50. Industrial and technical schools and commercial colleges should be under the Control of industrial schools control of the Director of Industries of the province.

Training of
supervisors and
managers.

Q. 51. The training and improvement of supervisors would be to give them an advanced education in the vernacular only, they should be brought up to the standard corresponding with the 3rd or 4th class of Government High School, a good knowledge of drawings, also a course of practical Geometry, is necessary. I find that boys in Assam as soon as they have a little knowledge of English, regard any practical manual work, as derogatory, though they may belong to the labouring classes. These training for supervisors should at least serve an apprenticeship of 5 years and another 3 to 4 years as journeymen before they are made supervisors in their respective technical trades.

The training of managers.

They should pass the matriculation or the senior Cambridge, and should be indentured for 5 years in one of the technical institutions which they have elected for, their studies to be kept up by night schools in which drawing and commercial morality should be taught so as to make good business men.

Q. 52. I don't recommend that Government should give any monetary assistance to supervisors or managers of private concerns, to study conditions and methods in other countries.

Q. 53. By Government appointing men, who are in training in the different technical institutions as managers, and carefully selecting the right man by a board comparing his past records.

Mechanical
Engineers.

Q. 54. There should be an uniformity in the standard of examinations for mechanical Engineers of the various provinces, so that Local Governments will reciprocate by recognizing each others certificates.

Q. 55. The law in Assam does recognize the Prime Movers Act, I have no criticism or suggestion to make.

FI.—Official Organization.

Q. 56. None that I am aware of.

Q. 57 and 58. There should be a Board of Industries with advising committee and to be composed of at least two technical experts.

Q. 59. I do not recommend a Board with powers.

Q. 60. Yes, a Director of Industries should be appointed for each province. He should be a thorough practical technical specialist. He should possess qualifications, of experience in technical concerns, in the matters of machinery.

Q. 61 and 62. The relations between the Director of Industries, Board of Industries and the Provincial Government is that the proceedings of the Board, with the recommendation of the Director of Industries, be submitted to Government for sanction and allotment of funds, if practical to form an Imperial Department under one head to be designated Director-General of Technical Industries. The Governor of each province should have full powers to carry out projects.

Cottage industries.

Q. 62a. As an experimental enterprise the members of the Local Boards should of each district be asked to organize a policy for cottage industries.

Q. 62(b) and (c). Each member of a circle should represent to the chairman what cottage industries are about his villages, and which he recommends to be fostered: the latter should then get the opinion of the Director of Industries of the Province.

FII.—Scientific and Technical Departments.

Q. 63. Yes, there is the Scientific Department of the tea Industry at Toklai which may be capable of giving assistance to industries. I have no further criticism or recommendations to offer.

Q. 64. I recommend the institution of an Imperial and Scientific Department in each province, 1st Agriculture, 2nd Mineral, 3rd Forest products for manufacture, 4th Textile industry and machinery.

Head of imperial
department.

Q. 65. Under a Director-General of Industry and be under an agreement of 5 years and be recruited from one of the Technical works of Great Britain.

Q. 66. He should have powers of control on the Directors of Industries of provinces, take up questions referred to him, his relations to the Imperial Government should be same as the Director-General of Posts and Telegraphs.

Seconding of
experts to
provincial
departments.

Q. 67. When the services of an expert is loaned by the Imperial Department to a Local Government, he should follow out the researches and investigate projects requested by the Local Government, and be attached and under the orders of the Director of Industries of the Local Government, his pay and allowances to be met by the Local Government.

Q. 68. Local Governments should engage their own experts on subjects when they are obtainable in India, and have the necessary qualifications to be under the orders of Director of Industries and to carry out the orders of the Head of a District where special enquiries as to new industries are to be opened, or on already existing industries.

Q. 69. Under the Director of Industries of the province that they are attached,

Q. 70. On a 5 years' agreement and be recruited in Great Britain.

Q. 71. and 71a. The Technological research institutions should be allowed to develop as Technological independent units, according to the needs of the Province. institutes.

Q. 72. Each should deal with a limited group of related subjects.

Q. 73. Yes, they should be under Government control of the Director of Industries of the province.

Q. 77. The State should bear the cost for Government experts who are sent to study Study abroad. conditions and methods in other countries.

Q. 78. I have had no difficulties in consulting technical and scientific works of Reference libraries. reference.

Q. 79. Yes, I think technical libraries are very essential and should if possible be instituted in every Head Quarter station of a district.

Q. 80. Yes, a College of Commerce and Industry is necessary for every province. It College of Commerce. should be organized to be run on nothing but the exchange and treatment of commerce and banking knowledge.

Q. 81. It would train a class of men who would organize industries, who have hitherto aspired to clerkships.

Q. 81a. Municipal and Local Members should have sittings on their boards monthly to Local Bodies. investigate and decide what resources of their district could be exploited for technical industries and allotment of funds towards the technical and scientific Departments of their province, and towards annual Industrial Exhibitions.

VIII.—Commercial Intelligence, etc.

Q. 82 and 83. No criticism to offer and suggest no changes.

Q. 84. I have gained no advantage in the issue of the Indian Trade Journals. Trade Journals.

Q. 85 and 86. I see no need for establishing or assisting an exclusive trade journal, but all matters which would help the different trades and industries should be published in the daily English and vernacular papers which will be more widely read.

Q. 87. I am unable to pass an opinion.

Q. 88. The Director of Industries of each province should ask the District Officer of each District which he controls, to collect information through Sub-Divisional Officers, and officers of the Public Works Department.

IX.—General.

Q. 89. I don't think that Government certificates of quality could be established in the Certificates of general sense, to be really of any service, but a few items could be treated as voluntary, quality. paints, varnishes, oils, iron, steel and cement.

Q. 90. The lists should be made in a central laboratory, and certificates granted accordingly by the Director of Industries of the province.

Q. 91 and 92. I am unable to give the names of materials for manufactured or unmanu- Adulteration. factured goods, as no law passed will be able to cope with and prevent adulteration by unprincipled agents.

Q. 93. Yes, when firms or individuals are found misdescribing their goods, a heavy Misdescription. penalty should be imposed and if continued their firms should be closed.

Q. 96. No, it is not desirable to introduce a system of Registration. Registration of

Q. 97. This province has need of Light Railways which would open out areas where the partnerships. industries of iron, ore, coal and lime, etc., would open out and develop the country, and would greatly help the present tea industry for the conveyance of their stores and teas either to Transport facilities. railways or steamer ghats.

Q. 98. I have no criticisms to make individually.

Q. 99. I am not aware of any Railway exclusives that are wanted to develop new or existing industries.

Q. 100. I am unable to pass an opinion.

Q. 101. No, not that I know of.

Q. 102. I don't know of any. Yes, investigation should be made.

Q. 109. No complaints to make.

Q. 111. The province of Assam must have a lot of iron, ore, coal, oil and limestone which if exploited and worked would form large industries.

Q. 112. The causes retarding the development of the industries mentioned in Q. 111 are through people not coming forward to promote companies to work them.

Q. 112a. Government aid to be given cultivators of reputes and standing for the improvement of raw material.

(Witness did not give oral evidence.)

WITNESS No. 399.

LIEUTENANT-COLONEL E. P. R. GILMAN, *Representative of the Assam Branch of the Indian Tea Association, Barduar Tea Estate, Kamrup.*

WRITTEN EVIDENCE.

- Q. 6.—I think all accounts should be audited by a firm of chartered accountants.
Q. 45.—If possible all apprentices should be on the English lines and should be tried for, say, 3 years, with nominal pay till proficient, and able to do a fair day's work.
Q. 54.—Yes.
Q. 60.—A business man.
Q. 94.—Heavy loss.
Q. 98.—Yes, it should be on the lines now in force in England.
Q. 109.—No.

(Witness did not give oral evidence.)

Mr. O. A. Byrne.

WITNESS No. 400.

MR. O. A. BYRNE, *Proprietor, Tezpur Saw Mills, Tezpur.*

WRITTEN EVIDENCE.

General remarks on the Saw Mill Industry in its relation to the Forest Department.

Importance of saw
mills.

My experience in Assam includes the management of some large tea concerns; from this I consider it may be assumed I possess some commercial training. I am an Engineer by profession and claim some experience in the direction and control of skilled labour. For 18 years I have been managing proprietor of my own saw mills and consider myself entitled to express opinions, regarding the industry in its relation to the Forest Department.

The saw mill, next to tea, is the most important industry, and with the greatest possibilities in the province, but it is absolutely dependent on the Forest Department for its existence.

Owing to foreign competition and timber shortage saw mills carried on a precarious business for years, until the outbreak of war. Since then the deficient supply of foreign boxes compelled users to fall back on local supplies. It is, however, uncertain, if the demand will last, in view of its doing so timely arrangements are necessary to anticipate requirements, and urge the Forest Department to improve the timber supply.

Policy of Forest
Department.

Sir Archdale Earle has shown some interest in the industry, and deputed a special officer to endeavour to improve timber supplies for the mills. He was, however, transferred before completing his task, and matters have been in abeyance since. He was succeeded by an officer from Burma with divergent views, acquired in a country where all conditions are different to Assam, so that continuity of method has not been followed or previous arrangements carried out.

Sir Archdale Earle remitted for two years the crushing "royalty" tax of 35 per cent on our profits thus admitting its unfairness. It has since been reimposed at its previous excessive figure, it is believed at the instance of the Forest Department. It seems the Department is more intent on securing a slight temporary access of revenue, than in encouraging trade and industries which would eventually lead to an expansion of business benefiting both it and the province.

The few varieties of trees, we are allowed to use, possess absolutely no commercial value, are useless as fuel and are better out of the way of first class timber. Notwithstanding this we are taxed to an extent out of all proportion to the value of the material with which we are supplied. The feeling is very strong regarding this impost: all representations for a reduction have been flouted.

Some Forest officers have been helpful and sympathetic, while others, if not actually hostile, have been indifferent and lukewarm.

Constant change in the personnel of the Forest Department is inimical to progress. Each new-comer has different views to his predecessor so that constant changes upset all business procedure.

The success of present and prospective industries entirely depends on the amount of assistance accorded to them by the Forest Department which should be run on business lines by businessmen, broad-minded, with technical and commercial training, unshackled with obsolete rules and impracticable regulations.

The most is not being made of the great potentialities at the disposal of the Forest Department. Improvement in this necessitates the appointment of a Director of Industries with very full powers and the necessary qualifications.

There is even now a great demand for forest produce which after the war will doubtless be greatly enhanced, but excessive "royalty," deficient transport facilities, and obstructive regulations bar the way.

Under favourable auspices, many industries might be started, amongst others Veneer box making, for which there is an enormous demand, has been suggested by Sir Archdale Earle, but this would require considerable capital and private concerns might not care to experiment.

There are openings for match factories, paper mills, boat building, but unless the Commission can bring its influence to bear in the proper quarter none of these suggestions are likely to materialise; nothing will be done and the province will go as it has for the past 30 years.

Other forms of Government action and organization.

Insufficient transport facilities necessarily greatly retard industrial development in Forest transport. Assam. Water transport is the cheapest and most practicable for forest produce. Unfortunately in the dry season this form of transport is impracticable. The absolute necessity for roads then arises, but none exist. Mere tracks are fitfully used and the amount of forest produce that can be extracted from the forest is negligible. The obvious remedy is roads followed by light portable tramways. The Forest Department pays no attention to this very important matter.

The removal of snags and obstructions from the rivers would greatly facilitate transport.

From the point of view that the Forest Department is a commercial undertaking, the public is not satisfied that it is conducted on business lines. It does not encourage the exploitation of its resources, and puts needless obstacles in the way of would-be traders. Its "Reserves" are practically untouched, owing to harassing restrictions imposed and difficulty of extraction and transport. It would seem, as if it were preferred, to let the timber rot than use it. The following is the opinion of the Hon'ble Mr. Gilman, Forest Member, of the Board of Revenue, Madras, : (*Englishman*, 23rd July 1915)—"In my opinion the Forest Department should concentrate its energies on those forests that can be worked to advantage either for timber or fuel. Forests were not reserved merely to be looked at, and when the tree growth in a forest reaches an exploitable age, the forest ought to be worked. There can be no doubt of the fact that when forests are worked friction between the people and the Department is reduced to a minimum. Afforestation may be practised by the people in private lands, panchayat areas." One-sided agreements have been forced on the saw mills and executed under strong protest by all. These documents are mainly composed of penal clauses, restrictions, and rules, which, if strictly enforced, would close down every mill in the province in a week.

A royalty of 5 annas per foot is now levied on first class timber instead of Rs. 6 per tree as hitherto. Having regard to the absence of roads or other facilities for transport, this is an extortionate impost, and will further diminish demand. The same remarks apply to the royalty levied on tea boxes turned out by saw mills. The rules and regulations for saw mills exploiting reserve forests are framed and applied so as to nullify the concession.

The forest officer in charge of a division should be located near the head office and be reasonably accessible. He should be a trained man. At present Darrang Division is being run by an officer with no experience or technical knowledge. His office is situated 25 miles from the station, where almost all traders and timber merchants reside: this causes great inconvenience and discontent. This officer besides forest work is saddled with the duties of political work on the frontier, which occasions frequent absence. This is obviously unfair to the public, as business is more or less hung up, during his absence. Even on the pretext of expediency there is no reason for this appointment as the services of the Kamrup Forest Officer are available, or those of a trained and experienced retired gentleman, who has held charge of Darrang Division for years. Under any circumstances the present appointment is unsatisfactory and indefensible.

It is quite practicable to concentrate special varieties of trees in limited areas. But although there has been a good deal of talk about doing this for years, it has not got beyond that stage, and in my opinion never will, if the present system of procrastination continues. Neither afforestation nor silviculture have been tried to any useful extent. The fact is the areas best suited for such experiments have been ostensibly acquired for "forest reserves," but in reality for "game sanctuaries." The cultivators have been expelled from these areas, and traders prohibited from operating within them. These vast areas, in the most accessible situations, contain no valuable timber to justify their absorption, whereas they contain quantities of second class timber suitable for saw mills. These areas are close to the Brahmaputra and are intersected by numerous rivers, rendering transport practicable. No timber felling is permitted however within these sacred precincts for fear of disturbing the game, which no one ever sees and which as far as the public is concerned might as well be in the mountains of the moon.

Policy of Forest Department.

Concentration of special kinds of trees.

To give some idea of the vast areas monopolised for game reserves the following figures are approximately correct:—

Sibsagar approximately	100,000	acre + 50,000 since added.
Nowgong	80,000	"
Famru	150,000	"
Darrang	80,000	"

Total 390,000 acres + 50,000 = 440,000.

The above figures speak for themselves. These areas should be utilized for afforestation or cultivation. These tracts contain immense quantities of cane which is in great demand for saw mills, and building purposes. It is however locked up; the Forest Department is a loser and the public is inconvenienced, and has to pay exorbitant rates owing to insufficient supplies.

The elephant until recent years was found a valuable adjunct to a saw mill for extracting timber and for transport purposes. Now, however, they are unobtainable unless at a prohibitory rate. This is again due to the ill-considered action of the Forest Department which has stopped "mela shikar," hunting, which used to provide a fair supply of elephants at a moderate price. These animals were young and tractable and were mostly sold in the province so that public requirements could be met. The monopoly of catching elephants has been given to a single individual, who sends all the animals out of the province to its detriment. This person practises Kheddah operations, and catches the old breeding animals and young indiscriminately. This defeats obviously the professed object of the Forest Department, i.e., to prevent undue depletion of supplies. The methods of the Forest Department are nothing if not inconsistent. As a remedial measure no monopoly for elephant catching should be granted, and "mela shikar" should be reinstituted. The capture of female animals might be discouraged, or only a small percentage allowed. These suggestions would infallibly prevent depletion of stock, if coupled with restrictions prohibiting undue exportation.

Jail competition does not injuriously affect us to any extent but Forest Department competition in the sawing and sale of timber scantlings does. The material costs nothing, so it can afford to pay higher rate than we can for labour, with the result that some excessive rates are forced on us. The Local Boards are compelled to take scantlings from the Department. This is an unfair procedure and unfair to mills and traders. The recently instituted regulation of concentrating timber operations within very limited areas is greatly handicapping the saw mill industry, as the following should demonstrate. The trees are not gregarious, but are found growing very widely apart, consequently the quantity available within such circumscribed areas is quite inadequate fully to employ the requisite labour force. We are entirely dependent on the local labour. Consequently it is desirable to have the sphere of operations as conveniently arranged as possible. The practice, however, in vogue is to suit the convenience of the Forest Department.

Mr. Perree, the late Conservator, who framed the new rules, admitted, that he was not quite satisfied that concentration might not be injurious to the mill industry. His fears have been justified, but any request for remedy is ignored. Two or three square mile blocks are quite inadequate.

Other forms of Government Aid to Industries.

The supply might be controlled by the ability of the industry to utilize it in the interest of Government and trade.

Yes, by the enormous acquisition of land ostensibly for forest reserves but in reality for "game sanctuaries." These contain no timber worth reserving but quantities that would be serviceable to saw mills which they are not allowed to utilize. The Forest Department has already more land than it can administer properly. These tracts are intersected by waterways facilitating transport. Unlike other Reserves exploiting within them is absolutely forbidden although they were included in the tracts held out as an inducement by the then Government to promote the saw mill industry. The action of the Forest Department in this matter is a distinct breach of faith. One Conservator, Mr. Hill, recognized this and permitted exploitation, but his successor withdrew sanction.

The exploitation of areas within one mile of waterways should be sanctioned. It would not disturb game in the least as well informed "shikaries" know.

General Official Administration and Organisation.

There should be a non-official Director of Industries. He should be a businessman with technical training and experience.

Financial Aid to Industrial Enterprises.

It would be an advantage to private saw mills to obtain machinery, etc., on the hire-purchase system, as a good deal of the present machinery is obsolete or in an unsatisfactory condition.

Deficiencies in
Forest transport.

Competition from
Forest Department.

Supply of raw
materials.

General.

In order to put the saw mill industry on a sound and commercial basis the rules and regulations for the supplies of raw material by the Forest Department require drastic revision. They should be prepared by broad-minded, intelligent men, with technical and commercial training, merely tinkering with them as hitherto will serve no useful purposes.

I am only concerned with the saw mill industry and Assam contains ample supplies for that, if facilities are afforded by the Forest Department. The forest reserves should be available for exploitation as are unreserved forests and operations should not be hampered by obstructive tactics as at present.

Enormous supplies of raw material are wasting in the forests of Assam and only wait development; the latter is retarded by want of official enterprise and indifference.

To give the Commission a slight idea of the difficulties we experience in obtaining the material necessary to carry on our work, I would request consideration of the following which can be substantiated by documentary evidence. I executed an agreement with the Forest Department in 1900 for my timber supplies to be in force during my tenure of the mills; a clause provided for felling in reserves with previous sanction of the Forest Officer. This privilege was invariably granted until I had to make a complaint to the Local Government regarding the action of the Forest Department in prosecuting one of my contractors wrongfully. After the said complaint the privilege was refused without assigning any reason.

The dilatory methods and arbitrary style of the Forest Department.

In consequence of the foregoing I submitted a petition through the Commissioner, Colonel Gurdon, on 16th December 1914, to the Chief Commissioner.

On the 17th June 1915, I received official intimation that my request⁶ was granted. I at once applied to have effect given to the sanction but was put off with various pretexts until May 1916 when I was again compelled to refer to the Chief Commissioner as my mills were shut down for want of timber and the Forest Officer refused to sell me any on the "trade permit system" on arbitrary and illegal grounds. I then pending effect being given to his own orders requested the Chief Commissioner to do this through my solicitor, but without effect.

On the 7th July 1916, in consequence of the Chief Commissioner's instructions, the Conservator of Forests entered into an agreement with me but its conditions have not been carried out yet. Owing to the arbitrary, inconsiderate and illegal procedure mentioned above, my mills have been closed down for months, and only working about one quarter time for two years; I have been unable to execute my box orders and my clients have been put to great inconvenience.

In accordance with the above-mentioned agreement trees have to be marked first by a Forest Officer. This is quite practicable in a few days but it took two months and then 20 days for issue the permits; by this time the workmen tired of waiting all dispersed. Shortly afterwards the river levels fell and transport became impossible until May next. Under such a régime and conditions, it is not surprising that industries make no progress and investors judiciously flight shy of such a province.

In case of grievances appeal lies to the Chief Commissioner, but this is a very disheartening procedure as it takes anything from six months to two years to obtain a decision.

The District Officer should be empowered to settle differences with appeal to the Chief Commissioner.

The Forest Officer should not have the power of closing down mills. In the event of cancellation of agreements, mills should be allowed timber on the Trade Permit System while settlement is pending.

The present Forest Law is inapplicable to Assam and should be amended. The same law, rules and regulations cannot consistently be applied to all India. It retards trade and industries and not a non-official has a good word to say for it. The conviction exists that unless alterations are made, and quickly, the chances of capturing trade when the expected revival takes place as well as new markets and ousting rivals are remote. The most trivial offences against Forest Law are punishable in the most drastic manner, so that contractors can hardly be induced to work. This is a great obstacle to extraction of timber. In the absence of press assistance to ventilate grievances all chance of redress is hopeless. Here are a few examples of Forest Law:

1. Settlement holders are entitled to secure drift wood, but if a saw is put into it they have to pay for first class timber.

2. My Contractor, Luku Kaehari, was accused of setting fire to the jungle. The real facts were he cleared a place to light a fire to cook his food. He was summoned to appear at Golaghat—distant by rail and road some 150 miles distant. On appearing in court he was told the Forest Officer had not completed his case, the man was released on heavy bail and returned to Tezpur. He again appeared but the case was thrown out for want of jurisdiction. Some time after he was arrested and taken to Newgong about 50 miles distant. There he was convicted, sentenced to three months' rigorous imprisonment and twenty-five rupees fine. He appealed to the Assam Valley Appellate Court which quashed the case and severely condemned the Forest Office procedure. This man had quite enough of forest work, so I lost his services and that of his gang.

3. In the Court of the Magistrate of North Lakhimpur.

Serial No.	Date of report or complaint.	Name and residence of complainant.	Name, parentage and residence of accused.
	14th June 1917.	Shaikh Gohain, R. Mohurir of Boduti, Forest Department.	M. C. Borsikia, son of Bibhuram Somal of Keehukhana, Mouza Dhinaji.

"The offence complained of and date of its alleged commission.—Removing 100 *simul* logs, without a 'trade permit' on 13th June, from unclassified State Forest, under rule 24, page 56, of Assam Forest Manual, and when called on by competent Forest authority to produce his timber and permit refused to do so, page 83, rule 83, of the Assam Forest Manual, and so punishable under rules 33, page 58, of Assam Forest Manual, and 90, page 85, of the Assam Forest Manual."

"The plea of the accused and his examination, if any.—Produces E and A and says he produced it, before the R. M. also another one, which is with his men in the jungle. When the babu searched 'on me,' to stop the timber I said I do, a little lower down, after turning the timber, and I did so, and showed the babu my passes and the marks T. Z. on my timber which I have put on. The babu did not mark the logs. I file a written statement E. and 3."

Remarks in re above Contractor.

Borsikia was authorised by the Tezpur Mills to fell timber under permit No. 9 of 1st April 1917.

This permit was checked by the Forest Officer (Tezpur) in consequence of orders from Deputy Conservator of Forests, Lakhimpur, on the 4th July 1917 and found in order. The Conservator (Mr. Tottenham) was advised of the existence of this Permit, 22nd September 1917 and informed the Deputy Conservator of Forests, Mr. Jacob, the actual prosecutor. At the first hearing the trying Magistrate suggested compounding the case. The Forest Department refused, the Mills reported the matter to the Conservator of Forests, who never replied, and offered to compound the case, rather than be harassed with interminable litigation, loss of timber, and trouble, but not as an admission of the Forest Department's procedure being legal or equitable in fact purely as a matter of expediency and submission to *force majeure*. It is indisputable that Borsikia was provided with a "Permit" and if the Forest Department doubted this, it could easily have inquired before launching a criminal prosecution for what under any circumstances would have been a mere technical offence, and of a compoundable nature.

This case was instituted on the 14th June and the judgment acquitting the accused was delivered on the 22nd of December 1917. During these 6 months there were 5 adjournments, precluding the man's carrying on his occupation, a large quantity of his timber was lost, the mills and tea gardens were put to serious inconvenience, and the Magistrate's time was needlessly wasted. A reign of terror was occasioned amongst the Contractors and workman, and no one could be induced to work, especially the "Miris," who do the "rafting," and who require very tactful handling. It is very evident that procedure, such as described, is not a promising method of fostering the saw mill or any other industry, and if there is any desire or intention on the part of Government to do so a new system must be adopted.

The injurious effect of this on labour can be easily understood, and indicates the necessity for reform if industries are to be encouraged. Incidents like the above could be multiplied indefinitely.

ORAL EVIDENCE, 7TH JANUARY 1918.

Hon'ble Sir R. N. Mookerjee.—Q. What is your regular business; tea or timber?—A. At present I am proprietor of the Tezpur Saw Mills.

Q. You have no tea industry along with it?—A. No, I have some interest in tea shares.

Q. You are not directly concerned with the tea industry?—A. No.

Q. How many years have you been in Assam?—A. Since 1883.

Q. When did you start your saw mills?—A. In the year 1893.

Mr. C. E. Low.—Q. You say in paragraph 5 of your evidence, "Sir Archdale Earle remitted for two years the crushing royalty tax of 33 per cent on our profits, thus admitting its unfairness. It has since been reimposed at its previous excessive figure, it is believed, at the instance of the Forest Department." That tax represents the price of raw materials?—A. Yes.

Q. That is what your wood costs you?—A. Yes, we obtain the wood at a certain rate, as 3 per cub. ft., pay a royalty of 1 anna per each box, and it takes us 12 annas to make the box.

Q. I am talking about the raw material. The Forest Department uses the word royalty, which is really a misnomer, because it is the price at which they sell the raw material?—A. They don't sell it to us in that way; they charge a royalty on the outturn.

Q. But that is the price of the raw material?—A. Yes, but only as far as Government is concerned, besides this we pay the contractors 3 annas per cubic foot.

Sir F. H. Stewart.—Q. There is no other payment for the raw material?—A. No, not to Government.

Mr. A. Chatterton.—Q. Is your profit 3 annas per box or 4 annas?—A. It is approximately 4 annas.

Mr. C. E. Low.—Q. Do you consider that excessive; one-third of the cost of your raw materials before the war?—A. Before the war it was excessive.

Q. You think that if the price of the raw material is one-third of your profits that it is excessive?—A. I think so.

Q. Then you go on to say "thus admitting its unfairness". We understand from papers which the Assam Government have furnished us with that the reason why it was remitted was not because they considered it unfair, but to enable the saw mills to put down improved plant, and improve the style of their shooks?—A. They also took into consideration the fact that the mills were not paying, and that some consideration should be given.

Q. And they thought that the way for the mills to pay was to improve their machinery?—A. Yes.

Q. Was not that what the exact object of the Assam Government was?—A. It was generally accepted by the saw mills as a set-off against the losses that they had previously incurred.

Q. I think the Assam Government meant that it was to enable the mills to improve their machinery?—A. That was subsequently; that was an afterthought; that was not when it was first granted; they said nothing whatever about that.

Q. That is a question of fact on which my information and yours differ. Did you improve the machinery in your mill?—A. Yes.*

Q. I noticed from the figures I had (I don't know if they are correct; they rest on the authority of the forest officials) that the royalty was remitted apparently some time in the rains of 1912, August 1912, and your output of boxes in the year 1911-12 was 24,000, but the first year the royalty was remitted it went down to 12,000, and the next year to 15,000?—A. That was due to our inability to get timber, and to the fact that returns outturn were not submitted during the period royalty was remitted to the Forest Department.

Q. Why could you not get timber?—A. Owing to various reasons, principally to the obstructive regulations of the Forest Department, and also to the dilatory procedure adopted by them in granting permission to fell.

Q. Would the improvement in your machinery enable you to get better prices for your shooks?—A. No, we generally have fixed prices. We do not alter our prices.

Q. Did it enable you to make more shooks out of logs, or did it tempt your consumers to make larger purchases from you?—A. No, I don't think so; the amount was comparatively trivial. The sum that we gained by the remission of royalty was very trivial; it only enabled us to put new parts of machinery, but not any new machinery.

Q. The incidence of the price of the material was on your average outturn about Rs. 100 a month?—A. Yes, but only as far as royalty was concerned.

Q. You still consider that a heavy item in your expenditure?—A. At present we have raised the price of our boxes.

Q. Coming to the question of this contract of yours I understand you got a lease in 1900 by which you were allowed to cut wood in the unserved forests in four districts?—A. And also in the reserved forest, with the consent of Forest Officer in the same districts.

Q. Then, I think, in 1909, in consequence of some criticism by the then Inspector-General of Forests, who was of opinion that definite areas should be assigned to definite mills, instead of their being allowed to cut out of the same area, it was proposed to amend the lease?—A. That was not brought forward until 1915.

* This explanation is perfectly correct. Mr. Low's information is not so, vide No. 1852-Rt., dated 22nd August 1912, from the Chief Secretary, to the Conservator of Forests.

"With the object of assisting the tea-box industry, the condition of which is not at present satisfactory, the Chief Commissioner considers it necessary that the system now in force of realising royalty on the tea boxes should be abandoned as a temporary measure on the distinct understanding that it will be reimposed when the prospects of the industry improve."

It is evident from this that no stipulation regarding devoting the remitted royalty to purchase of machinery was contemplated. The first mention of this occurs in No. 1022, of 17th March 1913, from the Second Secretary to the Chief Commissioner, &c., 9 months after the remission took place.

Q. I think as a matter of fact, whether any action was taken on it or not, that that criticism was passed in 1909. There were negotiations between you and the Forest Department with reference to this contract of 1900; there were negotiations in 1909-10?—A. There were no negotiations.

Q. They wanted you to modify the contract in 1909-10?—A. Nothing more than that they said that I would have to cancel the contract.

Q. They were putting pressure on you in 1909-10 to obtain some modification?—A. Yes.

Q. Were there any other mills drawing their supplies from these same areas, the unreserved forests of those districts?—A. Yes, all the mills in Lakhimpur had the right. There were no blocks assigned to any mill; they could cut wherever they liked.

Q. Does it not seem rather an inconvenient arrangement to have two mills cutting in these same areas; supposing the other fellow broke the law, might you not get blamed for nothing, and *vice versa*?—A. There was no complaint up to that date. There may have been one or two disputes, but nothing worth considering.

Q. From the point of view of the Forest Department, they would have found it extremely difficult to keep any check, because they would not know which mill did the cutting?—A. Yes, they would know, because every tree is marked by each mill on the stump of the tree.

Q. It is supposed to be, but it is not always done?—A. It is not always done, because it is very difficult to get natives to do anything thoroughly. It is to our advantage to have it done, and we do our best, so that no one else may take our timber.

Q. You make a blaze and then you cut the tree?—A. Yes, leaving the mark on the stump, so that there can be no question of whose timber it is.

Q. How many mills were there then working, say, before the war broke out?—A. There was only really one mill besides myself working in that area. The Sissi mills were working higher up.

Q. When did Meekla start?—A. It has been in existence a long time. It does not trade on our allotment; it is right up Dibrugarh, a hundred miles higher up. Practically we have only one rival mill there which is the Boduti mill.

Q. Coming back to this question of royalty, as the Forest Department call it, was there any general representation by the mills against the existence of the royalty?—A. Yes.

Q. All the mills joined?—A. Yes. It was brought before the Legislative Council and I believe Mr. Perree, the Conservator, said that they were going to consider it, but nothing came of it.

Q. Putting aside the war, do you think that in non-war times, and in non-war conditions you expect to get your wood for nothing?—A. No, we said it should be reduced 50 per cent. The Sissi Saw Mill was paying 7 per cent on their whole capital as royalty.

Q. Seven per cent of capital for the purchase of raw materials is low in most cases?—A. That was a tax before the shareholders got anything; so that on that score they objected.

Q. They began to put pressure on you to agree to a modification?—A. Yes.

Q. I have not seen the contract, so that I am rather at a disadvantage?—A. I have got the contract and will leave it with you to see.

Q. On what ground did they want you to alter it?—A. The ground was that the other mills had a different agreement.

Q. I remember this much, that it was stated in the contract that you were to pay such and such a rate, and if the other mills came along and agreed to pay a higher rate, then your rate was to be modified; but this was not a question of rate but of areas that they were discussing with you?—A. No, I don't think that they contemplated altering all the agreements. The other agreements were of a different kind to mine. They could not cancel my agreement legally, and to force me to do it, they threatened to cut off my timber supplies from the Lakhimpore area.

Q. Under what right did they?—A. They quoted clause 9 of the agreement, which does not apply at all, and which gives them no right whatever.

Q. Was the agreement for a definite period?—A. For my tenure of the mills, as long as I had the mills; but if I sold the mills to anyone else, a new agreement had to be executed, as in my case. I bought the mills from the Sissi Saw Mills; the agreement was then cancelled and a new agreement entered into. It was the agreement of 1900.

Hon'ble Sir R. N. Mookerjee.—Q. Was it with the object of increasing the revenue that they asked you to modify the agreement?—A. They did not give me any option at all in the matter.

Mr. C. R. Low.—Q. I think the overt reason was that they wanted areas assigned to certain definite saw mills?—A. They did not inform me of their object.

Hon'ble Sir R. N. Mookerjee.—Q. It was not done with the object of increasing their revenue?—A. No, because they did not increase their rates at all. When I made the agreement in 1909-10, the question of cutting within certain areas had not been brought forward.

I knew nothing at the time. That was not the reason given for their cancelling my agreement. The reason was that they wished to bring my mill into line with the other mills.

Mr. C. E. Low.—Q. Was there a clause in the agreement as to rates?—A. Yes.

Q. You say there was nothing of the same kind about areas?—A. Nothing of the same kind.

Q. As a matter of fact, did you consent to the modification of these areas?—A. Not areas; I consented to signing a new agreement, similar to the other mills, as Mr. Perree represented to me that it would be awkward to work two mills differently. In deference to Mr. Perree I agreed to it. That was in 1909.

Q. Was that new agreement actually entered into, and put into force?—A. Yes.

Q. Was it worded in the same sort of style as the other one?—A. No, it is more elaborate than the other one.

Q. By whom is it drafted?—A. Mr. Perree; at least I presume by Mr. Perree.

Q. What did this revised agreement purport to give you by way of areas?—A. There was nothing about areas; that was a subsequent thing.

Q. There was no alteration, no modification of your areas as given in 1900?—A. No.

Q. Did you enter into any agreement modifying the areas of your 1900 agreement?—A. No, there were no areas specified in the 1900 agreement. We were given districts to cut in. There was no modification of that.

Q. Although you have been pressed to do so, you have not entered into any agreement modifying the areas of your 1900 agreement?—A. In 1909 I signed that agreement. There was nothing in that agreement about areas within which we were to cut. In 1915 this arrangement for working within prescribed boundaries was started by Mr. Perree, restricting us to work within certain areas. That was a decision on the part of the Forest Department, without consulting us in the matter.

Q. Did you fall in with that willingly or otherwise?—A. I got notice of the cancellation of that 1909 agreement, and we were to work on the terms of the old agreement, until the new agreement came into force. I was left out, but the other mills signed the agreement. I was not called on to execute the agreement; the other mills did so. In September 1915, and on finding this out, I applied to have my agreement put into force. Then I was allowed areas which were not in accordance with those promised by Mr. Perree, and I declined to sign the agreement. Then Mr. Perree was transferred, and the matter has been under dispute.

Hon'ble Sir R. N. Mookerjee.—Q. Up to now you have not signed any agreement?—A. No, not for Lakhimpur.

Q. And you are not working?—A. I am working in the other districts, but not in Lakhimpur.

Mr. C. E. Low.—Q. Are you still cutting, as per your agreement of 1900?—A. Yes. In Nowgong I am cutting under a new agreement, because my 1900 agreement did not apply to Nowgong.

Q. You go on to speak of these large areas closed for game reserves: would you go into a little more detail?—A. The reason I raised that point is that the reserve mentioned in Sibsagar was one of the areas I was permitted to fell timber in; and one of the areas which induced me to sign the original 1900 agreement. Consequently, I considered that I had a right to fell timber there.

Q. In that agreement did it say anything of what was to happen if an area at that time unreserved was reserved in the future?—A. No. Government then reserved that and interdicted my felling timber there.
